Abstract	The GUI Guider is built on the Light and Versatile Graphics Library

1 Introduction

The GUI Guider is built on the Light and Versatile Graphics Library (LVGL) library. GUI Guider provides an IDE to design embedded graphic application UI using drag and drop widgets and helps in the editing process. The software facilitates the UI design for graphic application on embedded devices.

This document describes GUI Guider and targets embedded GUI Application developers with a basic knowledge of C on NXP MCU devices.

The major sections of this user guide are:

- Introduction General information and feature list of GUI Guider.
- Installation Steps to install the software and set up the environment.
- GUI Guider Usage Steps to use GUI Guider and design GUI Application.
- Widget Details Description of supported widgets and attributes.
- Event Details Supported events and actions of each widget.
- LVGL hardware acceleration Steps to use PXP/VGLite hardware acceleration.
- Performance Introduces the performance monitor function and tips for performance optimization for NXP MCU devices.
- Debug GUI Guider project Description of how to debug GUI applications designed by GUI Guider in supported IDE and toolchain.
- MicroPython Introduces how to design GUIs, generate MicroPython code, and run Python code in a simulator.
- Porting RTOS Steps to port source code of GUIs for variant RTOS, build, and deploy binary image on NXP MCU.
- Frequently Asked Questions (FAQs) Frequently asked questions and answers.

1.1 Supported features

- IDE
 - Supports Windows 10, MacOS 11 and Ubuntu 20.04
 - Multi-language (English, Chinese) for IDE
 - Multi-LVGL-version (v7.10.1, v8.2.0)
 - LVGLC and Micropython code auto-generation
 - RT-Thread RTOS (Real-Time Operating System)
 - Compatible with MCUXpresso IDE v11.6.x, MCU SDK 2.21.x, and IAR 9.30.1, Keil MDK 5.37.0
- Project management: create, import, edit, delete
- Wizard of creating a new project
- GUI auto-scaling (auto ratio, custom ratio)
- Configurable display type with custom option
- 16-bit and 24-bit color depth support
- What You See Is What You Get (WYSIWYG) UI design by drag and drop
- Multi-page application design
- Shortcut of bring forward and backward, copy, paste, delete, undo, redo
- Code viewer for UI definition JSON file, C code, and Micropython code.
- Navigation bar to view the selected source file
- Widget attributes group and setting, widgets group move
- Screen preview and copy function, default screen setting mouse
- GUI editor zoom in and zoom out, control by mouse scroll

- **GUI Guider User's Guide**
- Multiple fonts support and third-party fonts import
- Customizable Chinese character scope
- Widgets alignment: horizontal (top, center, and bottom), vertical align (left, center, and right), alignment line
- PXP and VGLite acceleration enable and disable
- Support the CPU/FPS monitor
- Supports default style and custom style
- Integrated demo applications
- Information window: project info, memory info and real-time log
- Flexible font size
- Events for list buttons
- Memory leak check
- Optimization level options: size, speed, balance
- Widgets
 - V7 supports 32 widgets
 - Button (5): button, image button, checkbox, button group, switch
 - Form (4): label, drop-down list, text area, calendar
 - Table (9): table, tab, message box, container, chart, canvas, list, window, titleview
 - Shape (7): arc, line, roller, led, spinbox, color picker, spinner
 - Image (3): image, animation image, 3D image
 - Progress (2): bar, slider
 - Gauge (2): gauge, line meter
 - V8 supports 38 widgets
 - Button (6): button, image button, checkbox, button group, switch, radio button
 - Form (5): label, spangroup, drop-down list, text area, calendar
 - Table (10): table, tab, message box, container, chart, canvas, list, window, titleview, menu
 - Gauge (2): meter, digital clock
 - Shape (7): arc, line, roller, led, spinbox, color picker, spinner
 - Image (3): image, animation image, 3D image
 - Progress (2): bar, slider
 - Advanced (2): analog clock, carouse
 - Shadow setting
 - Common functions
 - Animation: animation image, GIF to animation, animation easing, and <u>animation</u> <u>path</u>
 - Support event trigger and action selection, custom action code
 - Support tileview design by drag and drop operation in editor
 - Support parent/child hierarchy for carousel container, tabview, and tileview
 - Supports two widgets theme:
 - Default
 - Dark
 - Support four IDE themes:
 - Dark Blue
 - Light Blue
 - Light
 - Dark

GUI Guider User's Guide

- Chinese display and Chinese input
- Support fonts:
 - .simsun
 - .arial
 - .montserratMedium
 - .Abel_regular
 - .Acme_Regular
 - .Adventpro_regula
 - .AguafinaScript_Regular
 - Alatsi_Regular
 - _____.AlexBrush_Regular
 - .AmaticSC_Regular
 - .Amiko_Regular
 - Antonio_Regular
 - .ArchitectsDaughter
- Target devices
 - NXP i.MX RT595, i.MX RT1010, i.MX RT1015, i.MX RT1020, i.MX RT1024, i.MX RT1050, i.MX RT1062, i.MX RT1064, i.MX RT1160, and i.MX RT1170 (portrait mode and landscape mode)
 - NXP LPC54S018, LPC54628, LPC55S28, LPC55S16, LPC54S018m, and LPC55S69
 - External flash storage for LPC54628

GUI Guider User's Guide

1.2 Hardware requirement of LVGL application

Every modern controller which is able to drive a display is suitable to run LVGL. The minimal requirements are:

- 16, 32, or 64-bit microcontroller or processor.
- 16 MHz clock speed is recommended.
- Flash/ROM: > 64 kB for the very essential components (> 180 kB is recommended).
- RAM:
 - Static RAM usage: ~2 kB depending on the used features and object types.
 - Stack: > 2 kB (> 8 kB is recommended).
 - Dynamic data (heap): > 4 kB (> 32 kB is recommended if using several objects). Set by LV_MEM_SIZE in lv_conf.h.
 - Display buffer: > "Horizontal resolution" pixels (> 10 × "Horizontal resolution" is recommended).
 - One frame buffer in the MCU or in an external display controller.
- Basic C (or C++) knowledge: pointers, structures, and callbacks.

Note: Memory usage may vary depending on architecture, compiler, and build options.

2 Installation

This section describes the prerequisites and steps to install GUI Guider.

2.1 Prerequisites of Windows 10

- PC with Windows 10
- Java Runtime Environment, JRE-8 is verified

2.2 Install GUI Guider on Windows 10

To install GUI Guider on Windows 10, perform the following steps.

- 1. Download the installer from www.nxp.com/gui-guider.
- 2. Double-click the installer to install the software.
- 3. Choose the language.

Ir	nstaller Lan	guage	×

2.3 Set up runtime environment on Windows 10

This section describes the steps to install Java Runtime Environment and the Git command-line tool.

2.3.1 Install Java Runtime Environment

If your computer does not have JRE installed, perform the following steps.

- 1. Get the OpenJDK source package from http://jdk.java.net/archive/.
- 2. Extract the zip file into a folder, for example, C:\Program Files\Java\. The extraction creates a jdk-16 folder with a sub folder named bin. However, you may require administrator privileges to extract the zip file to the location.
- 3. Set the PATH environment variable.
 - a. Select Control Panel.
 - b. Click System.
 - c. Select Advanced system settings.
 - d. Click the Advanced tab.
 - e. Click the Environment Variables button. The Environment Variables dialog box appears.
 - f. Locate the PATH variable.
 - g. Click the Edit button.
 - h. Click the New button.
 - i. Add the location of the bin folder of the JDK installation. For example, C: \WINDOWS\system32;C:\WINDOWS;" C:\Program Files\Java \jdk-16\bin".
- 4. Set a new system variable PATH as JAVA_HOME:
 - a. Under the **System variables**, click **New**. The **New System Variable** dialog box appears.
 - b. Enter the Variable name as JAVA HOME.
 - c. Enter the Variable value as the installation path of the JDK (without the bin subfolder. For example, C:\WINDOWS\system32;C:\WINDOWS;" C: \Program Files\Java\jdk-16").
 - d. Click **OK** to save the changes.
 - e. Click OK to close the Environment Variables dialog box.
 - Your environment is set now.
- 5. Open the command prompt and type java -version and see if it prints the version of the newly installed JDK.

2.4 Uninstall GUI Guider on Windows 10

To uninstall GUI Guider on Windows, perform the following steps.

- 1. Open Control Panel > Programs and Features.
- 2. Select Gui-Guider-<version> and click Uninstall.

2.5 Prerequisites of Ubuntu 20.04

• PC with Ubuntu 20.04

```
GUI Guider User's Guide
```

2.6 Install GUI Guider on Ubuntu 20.04

- 1. Download the installer from www.nxp.com
- 2. Run command to install the software.

```
$ sudo apt install ./Gui-Guider-Setup-1.0.0-GA.deb
```

2.7 Uninstall GUI Guider on Ubuntu 20.04

Run the following command in the command-line tool.

\$ sudo apt remove gui-guider

2.8 Prerequisites of MacOS

The following steps are required before installing GUI Guider on MacOS:

- 1. Install the version compatible with the OS Xcode.
- 2. Install the brew.
- 3. Use brew install JRE, SDL2, and cmake
- 4. Install the MCUXpresso IDE.

2.9 Install GUI Guider on MacOS

To install GUI Guider on MacOS, perform the following steps.

- 1. Download the installer from <u>www.nxp.com</u>.
- 2. Click the installer package.

3 Usage

When GUI Guider is launched, the following options appear.

- Create a new project: Wizard to create a new project.
- Open a recent project: Enables you to open a project from recent projects list.
- Import a local project: Enables you to import a project from the local disk.

3.1 Create a new project

To create a new project, perform the following steps.

1. Click the **Create a new project** button.

					🍄 Dark Blue

3.5 Generated code

To generate source code of GUI project, click the bic icon in the right-upper of edit window. It is possible to generate both the C and Python code automatically.

3.6 Export Code

To export the source code to a destination folder, the destination folder should be specified for the first time. The IDE remembers the path for future export.

Note: Before exporting the code, first generate it.

GUI Guider User's Guide

To export the code, click Tool > Export Code.

3.7 Export project

To share the GUI Guider project more conveniently, we have added the export project function. The IDE remembers the export path which is a common path in the export code function.

To export the project, click Tool > Export project.

The output of the export is the condensed project directory and a compressed file named projectname.zip.

GUIGUIDERUG

GUI Guider User's Guide

3.8 Import fonts

To import fonts, perform the following steps.

Note: GUI Guider supports TFF and WOFF font type.

- 1. Select File > Import Fonts.
 - The **Import Font File** dialog box appears.
- 2. Navigate to the folder where the font that you want to import is located.
- 3. Select the font.
- 4. Click Open.
 - Note: The extended fonts are provided at the following location:
 - Windows: \${GG install path}\environment\extended_fonts
 - Linux: /opt/Gui-Guider/environment/extended_fonts
 - Darwin: /Applications/Gui-Guider.app/Contents/environment/extended_fonts **Note:** The font imported for the current project is available for all widgets of the project.

3.9 Generate fonts

The generated font file is stored in the *<project_name>\generated\guider_customer_ fonts* folder. The purpose is to add new characters which otherwise are supported by the selected font type and size. The function is used for non-English languages. For example, Chinese.

To generate fonts:

- Select File > Generate Fonts. The Generate Fonts dialog box appears.
- 2. Select the font family and size. Ensure that the font family is for the English language. The following image is an example of fonts generated for Chinese.

Generate Font	
Font :	simsun
Size :	16
Word :	你好恩智浦
	Cancel OK

3. Click Submit.

The newly generated font appears normal in the GUI application.

GUI Guider User's Guide

GUIGUIDERUG

GUI Guider User's Guide

3.11 Run simulator

Both the C simulator and the MicroPython simulator are supported. To select a simulator

The simulator opens in a separate window.

Note: When the simulator is launched, the **Generate Code**, **Run Simulator**, and **Run Target** options are disabled until the simulator window is closed. You can use the mouse or the keyboard to interact with the GUI elements in the simulator.

Note: The GUI Guider main window changes to modal state when **Run simulator** is clicked. MicroPython is not supported for lvgl v7.

3.12 Run target

GUI Guider supports one-key build and deploy image on target board. GUI Guider also supports three toolchains: MCUXpresso, IAR, and Keil. Ensure that the corresponding

GUI Guider User's Guide

IDE is installed on your host machine. <u>Table 1</u> provides information on the supported toolchain.

Toolchain	Version	Support OS	Connector
IAR	9.30.1	Win10	USB
MCUXpresso IDE	11.6.0	Win10, OSX11, and Ubuntu 20.04	USB
Keil MDK	5.37	Win10	USB

The following prerequisites must be met to run the target successfully:

- Boards with CMSIS-DAP/mebed/DAPLink interface.
- For LPCXpresso boards, install the DFU jumper for the debug probe.
- Connect the development platform to your PC via USB cable.
 <u>Figure 1</u> shows the window of log, project information, and memory monitor.

🖱 Project 🗹 Binary Size 🗈 Log	

Figure 1. Project log, information, and memory monitor

Typically:

- The flash consumed by the GUI application is text + data
- The RAM consumed by the application is data + bss.

Note:

- Only MCUXpresso IDE supports memory display.
- The project does not support "Run Target" when simulator is selected as board template

3.13 Tileview usage

Tileview is implemented as a standard widget in GUI Guider. You can design the GUI in tileview by drag-and-drop operation.

To use the **tileview** widget, perform the following steps.

- Drag the tileview widget to the editor.
 Note: If you are unable to find the widget, type the name of the widget in the search field and press Enter. The widget name appears in the search results.
- 2. To add a Page in the Attributes group on the right, click the + icon.

- 3. Select the **name_1** tab.
- 4. Drag a button widget to the **tileview** widget.

3.14 GUI auto-scaling

The auto-scaling function in the GUI Guider application, resizes the GUI to adapt the display of a different size. The auto-scaling function is useful when you want to reuse an application designed based on a particular display size. The function can support new project based on application template and local project.

Note: If there is a hard-coded size in the custom code, the position and the size-related code must be adjusted manually in the custom code.

4 Widget details

This section describes the GUI Guider widgets. The following are the common properties in all the widgets.

Property	v7	v8	Description
Name	General Setting > Name	General Setting > Name	Default name: Generated by the widget type and id. Must begin with a letter. Must be at least three characters long. Can only include letter, number, and underscore.
Position (x,y)	General Setting > Position	General Setting > Position	Position of widget, including x and y coordinate. x should be a value between 0 and width of screen. y should be a value between 0 and height of screen.
Size (W,H)	General Setting > Size	General Setting > Size	Size of widget. Set the width and height of the widget.
Scrollbar		General Setting > Scrollbar	The scrollbar option for widgets: OFF, ON, ACTIVE, AUTO.

Table 8. Common properties

GUI Guider User's Guide

 Table 8. Common properties...continued

Property	v7	v8	Description
Shadow color		General Setting > Shadow color	Set the shadow color.
Shadow opacity		General Setting > Shadow opacity	Set the shadow opacity.
Shadow spread		General Setting > Shadow spread	Make the shadow calculation to use a larger or smaller rectangle as base.
Shadow width		General Setting > Shadow width	Set the width of the shadow in pixels.
Shadow position (x, y)		General Setting > Shadow position	Set an offset on the shadow in pixels

4.1 3Dimg

3D animation widget can rotate a given image along with X-axis, Y-axis, Z-axis, or combined.

----------	-------	---------------------

Property	v7	v8	Description
Disable	Part and State > Indicator > Disable	Part and State > Indicator > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Line color	Part and State > Indicator > Line color	Part and State > Indicator > Line color	Indicator Line color. It can be set by color picker or input RGB value.
Line width	Part and State > Indicator > Line width	Part and State > Indicator > line width	Indicator Line width. The values should be between 0 and 20.
state	Part and State > Knob > state	Part and State > Knob > state	Style of knob part. It can be defined by one state or more states.
Disable	Part and State > Knob > Disable	Part and State > Knob > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Knob padding	Part and State > Knob > Line color	Part and State > Knob > Line color	Knob Line color. It can be set by color picker or input RGB value.
background color	Part and State > Knob > size	Part and State > Knob > size	Knob size. The values should between 0 and 20.
Background gradient direction	Part and State > Knob > Background gradient direction	Part and State > Knob > Background gradient direction	Gradient direction of background color in knob part, vertical or horizontal.
Opacity	Part and State > Knob > opacity	Part and State > Knob > opacity	Background opacity of Knob part. The value should be between 0 and 255.

4.5 Bar

The bar object has a background and an indicator on it. The width of the indicator is set according to the current value of the bar.

Vertical bars can be created if the width of the object is smaller than its height.

Not only end, but the start value of the bar can be set, which changes the start position of the indicator.

4.6 Button

The buttons are simple rectangle-like objects. They are derived from <u>Containers</u> so the <u>layout</u> and <u>fit</u> are also available. They can be enabled to automatically transition to the checked state on click.

Figure 15. Button in v8

radius	> Border radius	> Border radius	

4.7 Button matrix

The button matrix objects can display multiple buttons in rows and columns. The main reasons for wanting to use a button matrix instead of a container and individual button objects are:

- The button matrix is simpler to use for grid-based button layouts.
- The button matrix consumes less memory per button.

4.9 Canvas

A canvas inherits from <u>Image</u> where the user can draw anything. Rectangles, texts, images, and lines arcs can be drawn here using the drawing engine of LVGL. Besides some "effects" can be applied as well like rotation, zoom, and blur.

GUI Guider User's Guide

Table 16. Canvas properties

Property	v7	v8	Description
state	Part and State > Main > state	Part and State > Main > state	Style of main part. It can be defined by one state or more states.
Disable	Part and State > Main > disable	Part and State > Main > disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Background color	Part and State > Main > Background color	Part and State > Main > Background color	Background color of widget. It can be set by color picker or input RGB value.
Opacity	Part and State > Main > Opacity	Part and State > Main > Opacity	Background opacity. The value should be between 0 and 255.

4.10 Carousel

The carousel widget can display two or more pieces of content in a carousel format. The following is the usage example of carousel widget.

1. Drag the carousel widget into the editor.

GUI Guider User's Guide

2. Set the page width and page number in the attribute setting window.

Attribute		
Width 150		
Page	+	
→ name_1	Û	
→ name_2	Ŵ	
→ name_3	Û	

3. Navigate to a page by clicking the resource tree.

GUI Guider User's Guide

4. Drag the widget into the carousel page and set widget attributes.

5. Repeat step 4 for each page of the carousel widget.

6. Run the project. The pages are displayed in a carousel format.

Figure 22. Carousel in v8

background color	Part and State > Scrollbar > background color	Scrollbar color of widget. It can be set by color picker or input RGB value.
Opacity	Part and State > Scrollbar > Opacity	Scrollbar opacity. The value should be between 0 and 255.

Table 17. Carousel properties...continued

4.11 Chart

The charts are a basic object to visualize data points. They support *Line* charts (connect points with lines and/or draw points on them) and *Column* charts.

Charts also support division lines, 2 y axis, axis ticks, and texts on ticks. The number of chart points must be 10.

GUI Guider User's Guide

4.13 Color picker

As its name implies, the *Color picker* helps select the color. The *Hue, Saturation*, and *Value* of the color can be selected after each other. The widget has two forms: circle (disc) and rectangle. In both forms, when long pressing the object, the color picker changes to the next parameter of the color (hue, saturation or value). The double-click resets the current parameter.

GUI Guider User's Guide

Property	v7	v8	Description
Rotate center	Attribute > Rotate center	Attribute > Rotate X,Y	Rotate center of widget. The pivot point of the rotation.
Rotate angle	Attribute > Rotate angle	Attribute > Rotate angle	Rotate angle of widget. The angle to rotate the widget.
Image Path	Attribute > Image Path	Attribute > Image Path	Image path of widget. Choose an image.
state	Part and State > Main > state	Part and State > Main > state	Style of main part. It can be defined by one state or more states.
Disable	Part and State > Main > Disable	Part and State > Main > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Opacity	Part and State > Main > Opacity	Part and State > Main > Opacity	Background opacity. The value should be between 0 and 255.
Filter color	Part and State > Main > Filter color	Part and State > Main > Filter color	Filter color. A color can be mixed with every pixel of image.
Filter opacity	Part and State > Main > Filter opacity	Part and State > Main > Filter opacity	Filter color opacity. The value should be between 0 and 255.

4.19 Image button

The image button is very similar to the simple 'Button' object. The only difference is that it displays user-defined images in each state instead of drawing a rectangle. See the <u>Button</u> section for details, before reading this section.

Figure 37. Image button in v7

Figure 38. Image button in v8

Table 26. Image button properties

Property	v7	v8	Description
Text	Attribute > Text	Attribute > Text	Text of widget. Text showed on the widget.
Toggle	Attribute > Toggle	Attribute > Toggle	Toggle of widget. The button could be toggled or not.

GUI Guider User's Guide

Property	v7	v8	Description
Released picture	Attribute > Released picture	Attribute > Released picture	Released picture of widget. The image when widget is released.
Pressed picture	Attribute > Pressed picture	Attribute > Pressed picture	Pressed picture of widget. The image when widget is pressed.
Checked released picture	Attribute > Checked released picture	Attribute > Checked released picture	Checked released picture of widget. The image when widget is checked and released.
Checked pressed picture	Attribute > Checked pressed picture	Attribute > Checked pressed picture	Checked pressed picture of widget. The image when widget is checked and pressed.
state	Part and State > Main > state	Part and State > Main > state	Style of main part. It can be defined by one state or more states.
Disable	Part and State > Main > Disable	Part and State > Main > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Text color	Part and State > Main > Text color	Part and State > Main > Font color	Color of font. It can be set by color picker or input RGB value.
Font family & font size	Part and State > Main > Font family & font size	Part and State > Main > Font family & font size	Font family and size settings for today, the size can be a value between 0 and 100.
Font Align	Part and State > Main > Font Align	Part and State Main > Font Align	Left, center, right
Opacity	Part and State > Main > Opacity	Part and State > Main > Opacity	Background opacity. The value should be between 0 and 255.
Filter color (image recolor)	Part and State > Main > Filter color	Part and State > Main > Filter color	Filter color: A color can be mixed with every pixel of image.
Filter opacity	Part and State > Main > Filter opacity	Part and State > Main > Filter opacity	Filter color opacity. The value should be between 0 and 255.

Table 26. Image button properties...continued

4.20 Label

A label is the basic object type that is used to display text.

GUI Guider User's Guide

Figure 40. Label in v8

Table 27. Label properties

Property	v7	v8	Description
Text	Attribute > Text	Attribute > Text	Text of widget. Text showed on widget.
Long Mode	N/A	Attribute > Mode	Long mode of widget: By default, the width and height of the label is set to LV_ SIZE_CONTENT. Therefore the size of the label is automatically expanded to the text size. Otherwise, if the width or height are explicitly set (using for example, Iv_ obj_set_width or a layout), the lines wider than the label's width can be manipulated according to several long mode policies.
state	Part and State > Main > state	Part and State > Main > state	Style of main part. It can be defined by one state or more states.
Disable	Part and State > Main > Disable	Part and State > Main > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Text color	Part and State > Main > Text color	Part and State > Main > Font color	Color of font. It can be set by color picker or input RGB value.
Font family, font size	Part and State > Main > Font family, font size	Part and State > Main > Font family, font size	Font family and size settings for today, the size can be a value between 0 and 100.
Font Align	Part and State > Main > Font Align	Part and State Main > Font Align	Left, center, right
letter spacing	Part and State > Main > letter spacing	Part and State > Main > letter spacing	Letter space. The space between letters, a value between 0 and 10.
Backgrou color	rRart and State > Main > Background color	Part and State > Main > Background color	Background color. It can be set by color picker or input RGB value.
Opacity	Part and State > Main > Opactity	Part and State > Main > Opacity	The background opacity.
Backgrou gradient direction	rRart and State > Main > Background gradient direction	Part and State > Main > Background gradient direction	Gradient direction of background color: vertical or horizontal.
Padding top, bottom	Part and State > Main > Padding top, bottom	Part and State > Main > Padding top, bottom	Padding in top and bottom side.
Padding left, right	Part and State > Main > Padding left, right	Part and State > Main > Padding left, right	Padding in left and right side.

GUI Guider User's Guide

Table 27. Label properties...continued

Property	v7	v8	Description
Radius	Part and State > Main > Radius	Part and State > Main > Radius	Radius of widget.

4.21 LED

The LED is a rectangle-like (or circle) object. Its brightness can be adjusted. With lower brightness, the colors of the LED become darker.

Table 28. LED properties

Property	v7	v8	Description
Bright	Attribute > Bright	N/A	Brightness of widget.
Led Color	N/A	Attribute > Led Color	Color of widget: it can be set by color picker or input RGB value.

4.22 Line

The line object helps draw straight lines between a set of points.

GUIGUIDERUG User guide

GUI Guider User's Guide

Property	v7	v8	Description
Line start	Attribute > Line start	N/A	Start point of the line.
Line end	Attribute > Line end	N/A	End point of the line.
line_point	Attribute > Line point	Attribute > Line point	Points connected in the line
Add points	Attribute > add points	Attribute > add points	Can add multiple points.
state	Part and State > Main > state	Part and State > Main > state	Style of main part. It can be defined by one state or more states.
Disable	Part and State > Main > Disable	Part and State > Main > Disable	Enable or disable a state. The custom settings will be invalidated when a state is disabled.
Line color	Part and State > Main > Line color	Part and State > Main > Line color	Line color. It can be set by color picker or input RGB value.
Line width	Part and State > Main > Line width	Part and State > Main > Line width	
Line rounder	Part and State > Main > Line rounded	Part and State > Main > Line rounded	Enable line rounding function

4.23 Line meter

The line meter object consists of some radial lines which draw a scale. Setting a value for the Line meter changes the color of the scale lines proportionally.

GUI Guider User's Guide

Figure 46. Line meter renamed as Meter in v8

Table 30. Line meter properties

Property	v7	Description
Min & Max	Attribute > Min & Max	
Line	Attribute > Line	
Angle	Attribute > Angle	
Offset	Attribute > Offset	
state	Part and State > Main > state	
Disable	Part and State > Main > Disable	
Background color	Part and State > Main > Background color

Background gradient direction	Part and State > Main > Background gradient direction	
Radius	Part and State > Main > Radius	
padding top, bottom, left, right	Part and State > Main > padding top, bottom, left, right	max:20
Line color	Part and State > Main > Line color	
Line opacity	Part and State > Main > Line opacity	max:255
Line width	Part and State > Main > Line width	
Scale color	Part and State > Main > Scale color	
Scale width	Part and State > Main > Scale width	
4.24 List

The lists are built from a background <u>Page</u> and <u>Buttons</u> on it. The 'Button' contain an optional icon-like <u>Image</u> (which can be a symbol too) and a <u>Label</u>. Scrolling capability is included for lists that exceed the defined size.

Figure 48. in v8

4.26 Message box

The message boxes act as pop-ups. They are built from a background <u>Container</u>, a <u>Label</u>, and a <u>Button matrix</u> for buttons.

The text is broken into multiple lines automatically (has

LV_LABEL_LONG_MODE_BREAK) and the height is set automatically to involve the text and the buttons (LV_FIT_TIGHT fit vertically).

GUI Guider User's Guide

6 LVGL hardware acceleration

LVGL is a software library that fully implements and customizes a Graphical User Interface (drawing, partial screen refresh, input events, and animations). LVGL has software pixel-based draw engine. Several drawing features in LVGL are performed by hardware (HW) accelerators instead of CPU.

To use the CPU time while HW accelerator is running, an RTOS is required to block the LVGL drawing thread and switch to another task, or idle task, where CPU is suspended to save power. The HW accelerators process pixels faster than CPU resulting in a higher frame rendering rate.

GUI Guider can enable and disable the PXP or VGLite accelerator for the devices that support these features.

Note: It is possible to manually enable or disable the HW accelerator.

Accelerator	i.MX RT1050	i.MX RT1062	i.MX RT1064	i.MX RT1170	i.MX RT1160	i.MX RT595
PXP	\checkmark	\checkmark	\checkmark	\checkmark	\checkmark	X

	Memory size (KB) : 320	
	Auto memory defrag : 🔽	
Figure 75. Enable PXP		-
To enable the PXP accelerator on NXP devices, set the below flag in lv_conf.h. This is required as currently only the color format RGB565 (16 bits) is accelerated on NXP devices.

```
#define LV_COLOR_DEPTH 16
```

PXP is a pixel processing HW engine. To check whether PXP is available on your NXP device, see the Reference Manual document or the board configuration.

To enable PXP in LVGL, set the below flags to 1 in lv_conf.h.

```
#define LV_USE_GPU 1
#define LV_USE_GPU_NXP_PXP 1
#define LV_USE_GPU_NXP_PXP_AUTO_INIT 1
```

In LVGL, PXP is used to accelerate:

- Area fill + optional transparency
- BLIT (BLock Image Transfer) + optional transparency
- Color keying + optional transparency
- Recoloring (color tint) + optional transparency

6.2 VGLite enablement

Enable the VGLite accelerator in GUI Guider.

GUI Guider User's Guide

Memory size (KB) : 320	
Auto memory defrag : 🔽	
Figure 76. VGLite enablement	

To enable the VGLite accelerator on NXP devices, set the below flag in lv_conf.h. This is required as currently only the color format RGB565 (16 bits) is accelerated on NXP devices.

```
#define LV_COLOR_DEPTH 16
```

VGLite is an API that uses the Vector/Raster 2D GPU. To check whether 2D GPU is available on your NXP device, see the Reference Manual document or the board configuration.

To enable VGLite in LVGL, set the below flags to 1 in lv_conf.h.

```
#define LV_USE_GPU 1
#define LV_USE_GPU_NXP_VG_LITE 1
```

In LVGL, VGLite is used to accelerate:

- Area fill + optional transparency
- BLIT (BLock Image Transfer) + optional transparency

6.3 Recommendations to improve acceleration

This section lists general and VGLite recommendations to improve acceleration.

6.3.1 General recommendations

As a rule when a hardware accelerator processes many pixels in a single batch, it provides better performance than processing small number of pixels multiple times.

The reasons are:

- 1. **Caches**: Pixels previously processed by CPU are loaded in cache, and must be cleaned and invalidated. The operation takes a few cycles.
- 2. **Setup time**: Each time HW is used to process pixels, the associated driver configures HW registers, This operation also takes a few cycles.

Thus, NXP has defined a threshold for the minimum number of pixels necessary to trig HW acceleration. These thresholds are defined as preprocessor variables.

For PXP, default values are defined in lv_gpu/lv_gpu_nxp_pxp.h.

- LV_GPU_NXP_PXP_BLIT_SIZE_LIMIT: Size threshold for image BLIT, BLIT with color keying, and BLIT with recolor (OPA > LV_OPA_MAX).
- LV_GPU_NXP_PXP_BLIT_OPA_SIZE_LIMIT: Size threshold for image BLIT and BLIT with color keying with transparency (OPA < LV_OPA_MAX).
- LV_GPU_NXP_PXP_FILL_SIZE_LIMIT: Size threshold for fill operation (OPA > LV_OPA_MAX).
- LV_GPU_NXP_PXP_FILL_OPA_SIZE_LIMIT: Size threshold for fill operation with transparency (OPA < LV_OPA_MAX).

For VGLite, default values are defined lv_gpu/lv_gpu_nxp_vglite.h.

- LV_GPU_NXP_VG_LITE_BLIT_SIZE_LIMIT: Size threshold for image BLIT (OPA > LV_OPA_MAX).
- LV_GPU_NXP_VG_LITE_BLIT_OPA_SIZE_LIMIT: Size threshold for image BLIT with transparency (OPA < LV_OPA_MAX).

© 2022 NXP B.V. All rights reserved.

GUI Guider User's Guide

- LV_GPU_NXP_VG_LITE_FILL_SIZE_LIMIT: Size threshold for fill operation (OPA > LV_OPA_MAX).
- LV_GPU_NXP_VG_LITE_FILL_OPA_SIZE_LIMIT: Size threshold for fill operation with transparency (OPA < LV_OPA_MAX).

6.3.2 VGLite recommendations

The 2D GPU behind VGLite has some constraints on the processed buffers:

- 1. Address alignment: Always ensure that the FrameBuffer and pixel buffers are aligned to LV_ATTRIBUTE_MEM_ALIGN_SIZE. You should use the macro LV_ATTRIBUTE_MEM_ALIGN as attribute for statically allocated pixel buffers.
- 2. **Stride**: Stride is the byte offset between 2 lines of pixels. 2D GPU requires a stride multiple of 16 pixels.

In LVGL: stride = width, so use assets and widgets with a width multiple of 16 pixels.

On platforms like i.MXRT1170 which has both PXP and 2D GPU, prefer 2D GPU as it draws faster than PXP. However, if the GUI contains many pre-rendered semitransparent images, PXP may be better.

On platforms with only 2D GPU acceleration (VGLite), try to draw widgets rather than using pre-rendered images as widget, as semi-transparent image blitting is not yet accelerated.

7 Performance

The high graphics performance means a high frame rate (FPS) with required graphical effects. This chapter provides the introduction to enable/disable FPS/CPU usage monitor and the tips on how to improve the graphics performances on NXP MCU devices. i.MX RT595 is used as an example platform for performance optimization.

7.1 Performance monitor enablement

1. Enable the performance monitor in GUI Guider.

Widgets Assets	د الله الله الله الله الله الله الله الل	Attributes Event Setting

	Ø №	ALL <u>TR</u> ACK	B	50 FPS 50% CPU	
	AILY 949-0				

7.2 Tips to improve the performance

Here is a summary of tips to get a good FPS performance using lvgl:

Use hardware acceleration

GUI Guider User's Guide

The capability of a board with hardware acceleration (PXP or VGLite) is often higher than a board without. Consider using a board with hardware acceleration. For details, see <u>Section 6</u>.

Use Internal SRAM

The SRAM has better performance than other RAM. If a board has enough SRAM, the SRAM is a preferred place to store the frame buffers and other important data.

Use suitable C library

The Newlib library has good memcpy performance then the NewlibNano library, the Newlib library is a preferred library for applications which have lots of data copy.

Use suitable compiler optimization level

In general, the -O2 and -O3 have better performance than other optimization level. GUI Guider can update the optimization level used in the demo example project, shown in Figure 77.

Figure 77. Optimization level

In Figure 77, **Balance** means the -O2 option, **Size** means the -Os option, **Speed** means the -O3 option.

Only redraw the changed things

Make sure that you only invalidate necessary parts of the display.

Adjust display refresh period

The display refresh rate is a hard limit for your frame rate. In general, the frame rate is better when the display refresh period is lower. If the refresh rate of the display is 60 Hz, the refresh period is 1 s / 60 = 0.01667 s = 16.67 ms. GUI Guider supports updating the refresh period, shown in Figure 78.

GUI Guider User's Guide

Figure 78. Display refresh rate

7.3 Improve the performance for i.MX RT boards

This section provides information on how to improve the performance on i.MX RT595 when working with MCUXpresso IDE.

7.3.1 Prerequisites

The prerequisites are:

Design a GUI application using the GUI Guider and port the generated LVGL C source file to the template project imported by MCUXpresso IDE.

7.3.2 Improve the performance

- Update the MCUXpresso setting to use the Release build configuration, -O2 optimization level, and Newlib library. For details, see the MCUXpresso IDE documentation.
- 2. Update the following line in source/lv_conf.h to change the display refresh period.

#	define	T.V	DISP	DEF	REFR	PERTOD	30	/*	[ms]	*	/
#	uettiie.	ЦV	DIGE	יייע	NĽĽ N	FURIOD	50	/	1111.5		£

For example, if the refresh rate of the display is 60 Hz, the value can be set to 16.67. 3. Enable the hardware VGLite acceleration by changing the following line in source/

lv_conf.h.

```
#define LV_USE_GPU_NXP_VG_LITE 0 // change to 1 to
enable VGLite.
```

4. If the NXP "G1120B0MIPI" MIPI Circular Display is selected, the frame buffer can be placed in SRAM. You can updated the following lines in board/display_support.h:

```
#define DEMO_BUFFER0_ADDR 0x28000000U // i.e. Change to
0x20000000U
#define DEMO_BUFFER1_ADDR 0x28200000U //i.e. Change to
0x20100000U
```

115 / 133

© 2022 NXP B.V. All rights reserved

GUI Guider User's Guide

 If the NXP "G1120B0MIPI" MIPI Circular Display is selected and few images are used. The image arrays can also be placed in the SRAM. To place the image array in SRAM, you can add the following macro definition in source/lv_conf.h first.

8 Debug GUI Guider project

MCUXpresso IDE, Keil MDK, and IAR are integrated in GUI Guider which makes it easy to debug GUI application on NXP MCU devices.

8.1 MCUXpresso

To debug the GUI Guider project on MCUXpresso, perform the following steps:

- 1. Open the link https://mcuxpresso.nxp.com/en/select.
- 2. Select the development board. For example, EVK-MIMXRT1064.
- 3. Click the Build MCUXpresso SDK button.
- Select the two middleware LVGL and FreeRTOS from the Build SDK for <target> page.
- 5. Make sure to select the MCUXpresso (toolchain).
- 6. Click the **Download SDK** button.

	Host OS	Toolch	wr/CE	SDK Version SDK Tag	2.11.1 (released 2022-03-24) REL_2.11.1_MINOR_RFP

GUI Guider User's Guide

9 MicroPython

<u>MicroPython</u> is a lean and efficient implementation of the <u>Python 3</u> programming language. MicroPython includes a small subset of the Python standard library and is optimized to run on microcontrollers and in constrained environments.

9.1 Using LVGL in MicroPython

By building LVGL as a MicroPython module, user can have a high-level GUI library for fast prototyping GUI, taking advantage of Python's language features such as *Inheritance, Closures, List Comprehension, Generators, Exception Handling, Arbitrary Precision Integers*, and others.

9.1.1 Advantages

- Develop GUI in Python, a very popular high-level language.
- Use paradigms such as Object-Oriented Programming.
- Usually, GUI development requires multiple iterations to get things right.

With C, each iteration consists of **Change code > Build > Flash > Run**. In MicroPython it is just **Change code > Run**.

9.2 MicroPython in GUI Guider

GUI Guider ships prebuilt MicroPython binaries by default. For more information on how to build, see lv_MicroPython <u>README</u>.

9.2.1 Generate code

When the **Generate code** button on GUI Guider UI is clicked, the code for both C and MicroPython is generated under the folder '<*GUI-Guider-Project-name*>/generated'. The MicroPython file **gui_guider.py** available in the UI.

GUIGUIDERUG

9.2.2 Run simulator

Click the **Run simulator > MicroPython** button. The GUI Guider generates code and launches the simulator in a separate window.

9.2.3 Add custom code

Like C, GUI Guider supports adding custom Python code, either as event action, or as independent 'custom.py' file under the folder 'custom'.

Note: Indentation is a very important concept of Python because without proper indenting the code, IndentationError appears and the code is not compiled. To avoid this, GUI Guider follows the below assumptions during the code generation:

- Each line of a block is indented with four spaces.
- Tab is replaced with four spaces automatically.
- 9.2.3.1 As Event action

<u>Table 49</u> provides a description of the custom Python code options.

GUI Guider User's Guide

9.2.4 Limitations

- Only LVGL v8 is supported.
- Only limited fonts are built in. See <u>Built-in fonts</u> in LVGL.
- Compared to C, MicroPython runs slower. Due to this, some animations are not added in Music player demo.

10 Porting RTOS

This section lists the steps to port GUI APP to RTOS (Real-Time Operating System).

10.1 RT-Thread

To port the LVGL C source file generated by GUI Guider to the RT-Thread project, see the following sections.

10.1.1 Prerequisite

The following are the prerequisites:

- Keil v5.35 or newer
- GUI Guider v1.4.0 GA
- Connect i.MX RT1060 to the host with a USB cable.

Note: In the working environment, all paths are not allowed to have Chinese characters or spaces.

10.1.2 Install Git

Git supports the software package management. Download Git from <u>https://git-scm.com/</u><u>downloads</u>. Install and add the install path into the system environment variable PATH.

10.1.3 Configure the Env tool

To configure the Env tool:

- 1. Download the Env tool: <u>env_released_1.2.0.7z</u>.
- 2. Extract the file env_released_1.2.0.7z to a local folder. For example, D:\rt-thread\.

GUIGUIDERUG

GUI Guider User's Guide

Package_Development_Guide_zn.pdf	 env.bat env.exe env_log_err env_log_std Env_User_Manual_zh.pdf Package_Development_Guide_zh.pdf 	

- 3. In the env directory (D:\rt-thread\env), run env.exe. If it fails to open, you can try to use env.bat.
- 4. Register env utility in the right-click menu.

 Right click on the title bar, and then click settings. 	New console Attach to		- 🍙	×

10.1.4 Download RT-Thread and apply patches

To download RT-Thread:

- 1. Go to the root folder of RT-thread. For example, D:\rt-thread\.
- 2. Run Git clone https://github.com/RT-Thread/rt-thread.git to download RT-thread source code.
- 3. Go to the i.mxrt1060 bsp folder D:\rt-thead\rt-thread\bsp\imxrt\imxrt1060-nxp-evk. Right-click the window and select "ConEmu here" to open env console.

Note: If "SSL certificate problem: unable to get local issuer certificate" is displayed as an error message, then run "git config --global http.sslVerify false".

10.1.5 Enable GUI demo project in RT-Thread

To enable GUI demo project:

1. In env console, go to the imxrt1060 bsp folder D:\rt-thead\rt-thread\bsp\imxrt \imxrt1060-nxp-evk\ and run menuconfig to open config UI.

GUI Guider User's Guide

- Enable LVGL GUI Guider support. Location:
 - Hardware Drivers Config
 - Onboard Peripheral Drivers
 - Enable LVGL for LCD
 - Support NXP GUI Guider
- To download the selected packages, run pkgs --update.

10.1.6 Export source of GUI designed by GUI Guider

To export the source:

- 1. Use GUI Guider to design a GUI application.
- 2. Click Generate Code in the GUI Guider IDE.

 Click File > Export Code on menu bar to export source code of GUI designed by GUI Guider to a template project folder D:\rt-thread\rt-thread\bsp\imxrt\imxrt1060nxp-evk\packages\gui_guider_demo-latest\.

GUI Guider User's Guide

 Run scons --target=mdk5 -s to generate/update Keil project file project.uvprojx which is located at D:\rt-thread\rt-thread\bsp\imxrt\imxrt1060nxp-evk.

10.1.7 Build and compile

To build and compile:

 Double-click Keil project file project.uvprojx in D:\rt-thread\rt-thread\bsp\imxrt \imxrt1060-nxp-evk' and rebuild all the files.
 Note: If the following error appears, update the corresponding source file to replace "lvgl/lvgl.h" with "lvgl.h".
 Error: src.c(10): error: 'lvgl/lvgl.h' file not found s

GUI Guider User's Guide

GUI Guider User's Guide

After performing the above steps, the GUI application designed by GUI Guider can be compiled in RT-Thread and run on i.MX RT1060 board.

10.1.8 Known Issues

 If option Event > load screen > Delete current screen is enabled, then the PC hangs when switching between different screens. The workaround is to disable the Delete current screen when loading a new screen.

11 Frequently Asked Questions (FAQs)

This chapter lists the Frequently Asked Questions (FAQs) about GUI Guider.

Question: How to avoid simulator running the MCU-specific code?

Answer: GUI Guider provides a predefined macro LV_USE_GUIDER_SIMULATOR in lv_conf.h. Do the following changes in your source files:

```
#if !LV_USE_GUIDER_SIMULATOR // or LV_USE_GUIDER_SIMULATOR == 0
...(MCU specific Code)
#endif
```

12 Revision history

This table summarizes revisions to this document.

Revision number	Date	Substantive changes
0	29 October 2020	Initial release.
1	17 November 2020	Updated <u>Work with</u> MCUXpresso IDE.
2	11 January 2021	Added and updated multiple sections.
3	10 May 2021	Added and updated multiple sections for v1.1.

13 Legal information

13.1 Definitions

Draft — A draft status on a document indicates that the content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included in a draft version of a document and shall have no liability for the consequences of use of such information.

13.2 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the Terms and conditions of commercial sale of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk.

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Suitability for use in non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document, including the legal information in that document, is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Security — Customer understands that all NXP products may be subject to unidentified vulnerabilities or may support established security standards or specifications with known limitations. Customer is responsible for the design and operation of its applications and products throughout their lifecycles to reduce the effect of these vulnerabilities on customer's applications and products. Customer's responsibility also extends to other open and/or proprietary technologies supported by NXP products for use in customer's applications. NXP accepts no liability for any vulnerability. Customer should regularly check security updates from NXP and follow up appropriately. Customer shall select products with security features that best meet rules, regulations, and standards of the intended application and make the ultimate design decisions regarding its products and is solely responsible for compliance with all legal, regulatory, and security related requirements concerning its products, regardless of any information or support that may be provided by NXP.

NXP has a Product Security Incident Response Team (PSIRT) (reachable at <u>PSIRT@nxp.com</u>) that manages the investigation, reporting, and solution release to security vulnerabilities of NXP products.

13.3 Trademarks

Notice: All referenced brands, product names, service names, and trademarks are the property of their respective owners.

NXP — wordmark and logo are trademarks of NXP B.V.

AMBA, Arm, Arm7, Arm7TDMI, Arm9, Arm11, Artisan, big.LITTLE, Cordio, CoreLink, CoreSight, Cortex, DesignStart, DynamIQ, Jazelle, Keil, Mali, Mbed, Mbed Enabled, NEON, POP, RealView, SecurCore, Socrates, Thumb, TrustZone, ULINK, ULINK2, ULINK-ME, ULINK-PLUS, ULINKpro, µVision, Versatile — are trademarks or registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.
