FOTA Overview

Today: 90% of Auto Innovation via electronics

NXP is #1

#1 INFOTAINMENT

TUNERS
SOFTWARE-DEFINED DIGITAL RADIO
MULTIMEDIA PROCESSORS
SOUND SYSTEM DSPs & AMPLIFIERS
NFC BT PAIRING
WIRELESS POWER CHARGING
POWER MANAGEMENT

STANDARD PRODUCTS

LOGIC
POWER
DISCRETES

#1 VEHICLE NETWORKING

CAN/LIN/ FLEXRAY
ETHERNET
CENTRAL GATEWAY CONTROLLER
SECURITY
RF

#1 BODY

MICROCONTROLLERS
POSITION/ ANGLE SENSORS
SYSTEM BASIS CHIPS

ADAS & SECURITY

POWERTRAIN & CHASSIS

MICROCONTROLLERS
PRESSURE/ MOTION SENSORS
BATTERY MANAGEMENT
DRIVERS

#1 SECURE CAR ACCESS

IMMOBILIZER/ SECURITY
REMOTE KEYLESS ENTRY
PASSIVE KEYLESS ENTRY/ GO
BI-DIRECTIONAL KEYS
NFC
ULTRA WIDE BAND

#1 SAFETY

MICROCONTROLLERS AIRBAG
ANALOG AIRBAG
MICROCONTROLLERS BRAKING
ANALOG BRAKING
SENSORS BRAKING
TIRE PRESSURE MONITORING

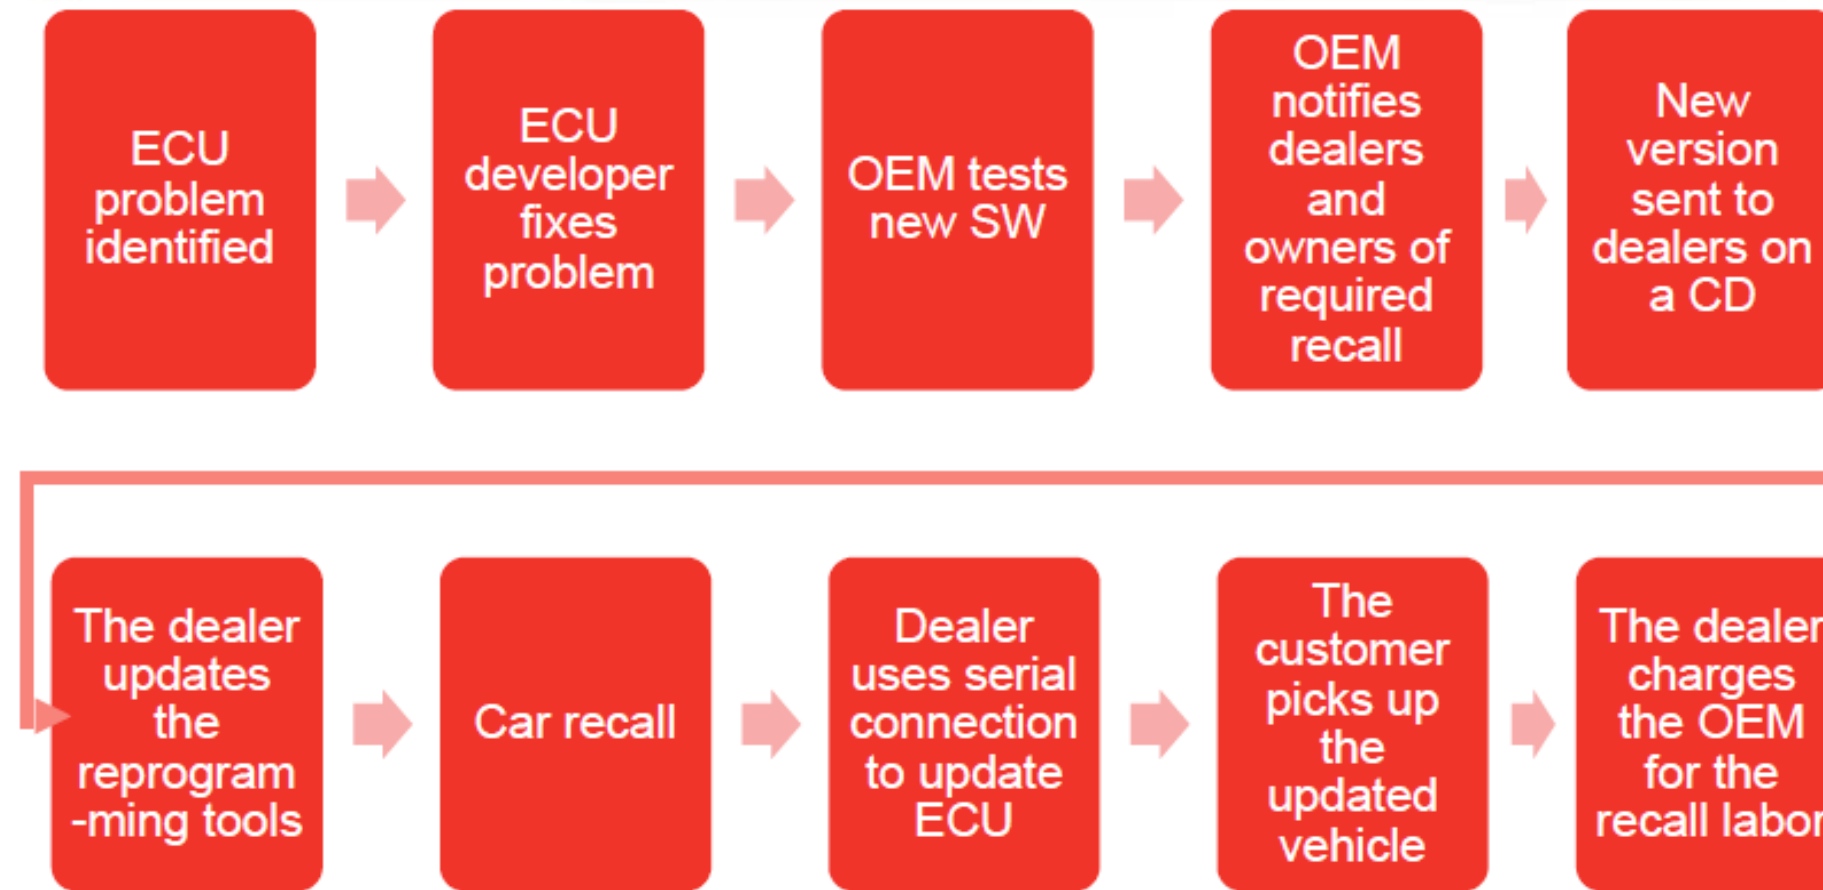

#1 Auto Analog/ RF

#1 Auto MCU (ex JPN)

#1 Auto Merchant MEMS Sensors

FOTA Overview: Common Recall Process

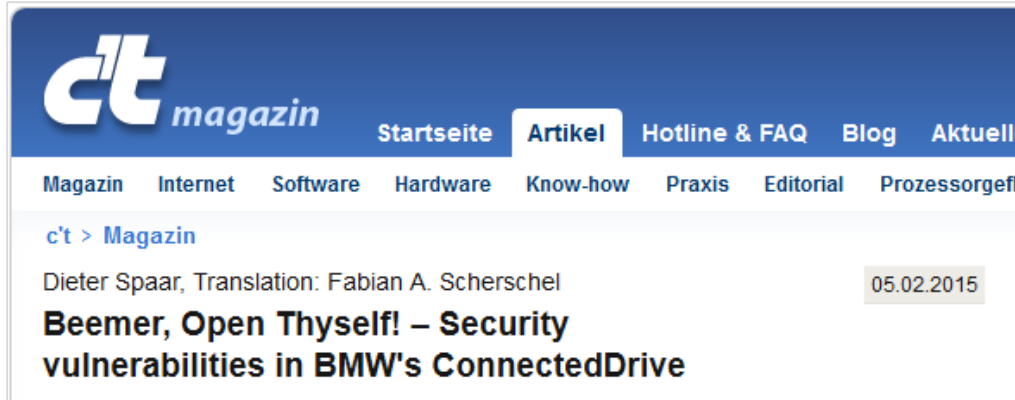

Vector and Redbend (2014). *Update ECUs using Delta- and Over-the-Air-Technology* [PDF Slides]. Retrieved April 22, 2016 from https://vector.com/portal/medien/cmc/events/Webinars/2014/Vector_RedBend_Webinar_Flashing_over_the_air_and_delta_technology_20140121_EN.pdf

FOTA Overview: **Motivations**

- Increasing number of recalls
- Dealer update \$
- As firmware complexity increases, the probability of required firmware updates also increases
- User convenience vs going to dealer
- Safety can be improved with quicker updates

OnStar hack remotely starts cars, GM working on a fix

by Jessica Conditt | @jessconditt | July 30th 2015 At 1:58pm

... is an Attractive Target for Hackers!

Valuable Data

- Collection of data/info
- Storage of data
- Diagnostic functions

 **Protect Privacy**

High Vulnerability

- Increasing number of nodes
- More advanced features
- X-by-Wire

 **Increase Safety**

Easy (Remote) Access

- Fully Connected Car
- External & internal interfaces
- Wired & wireless interfaces

 **Prevent Unauthorized Access**

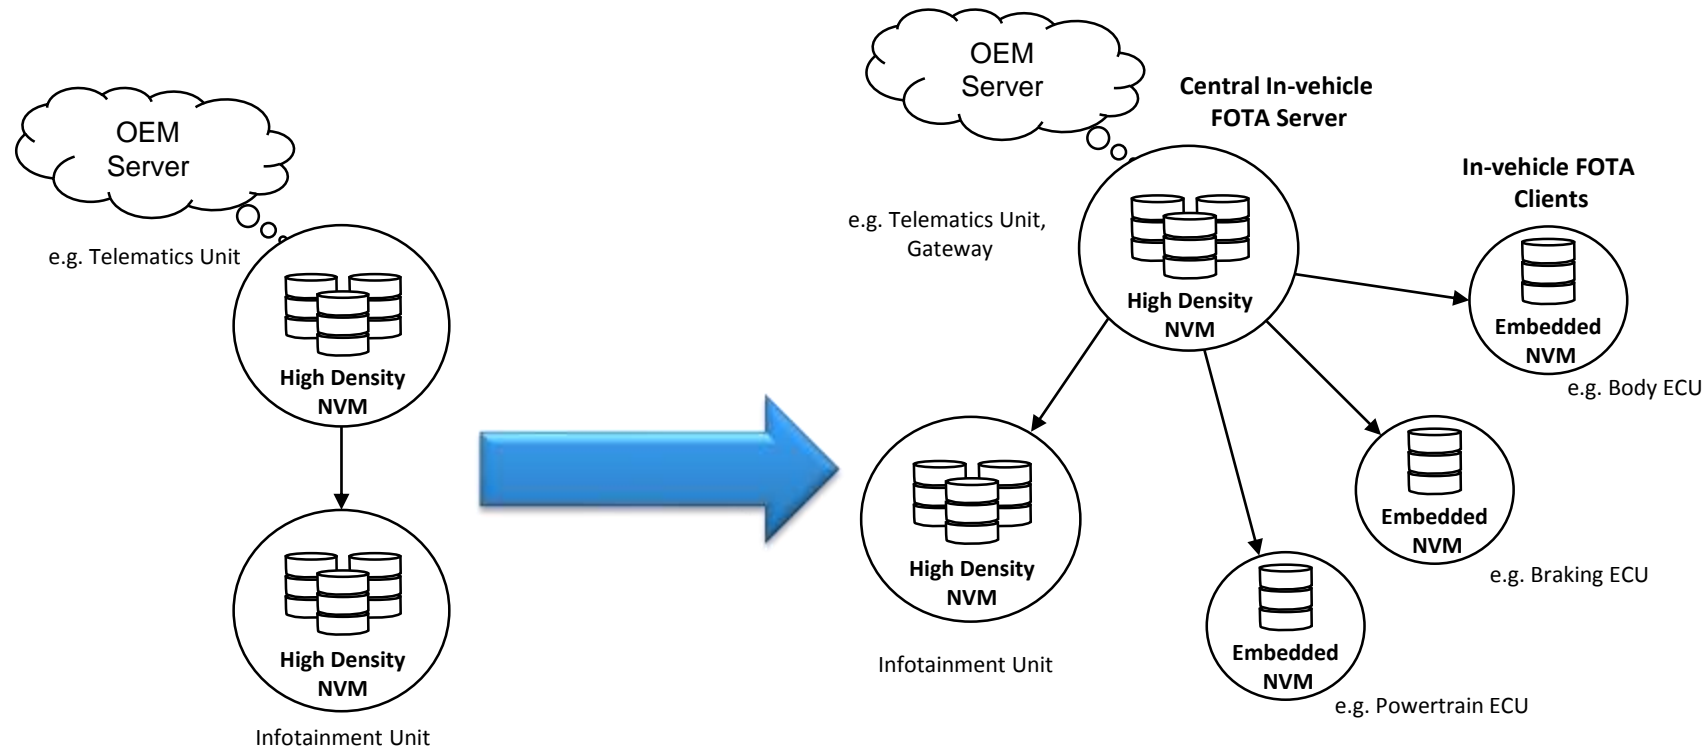

02.

Secure FW Updates

FOTA Overview: MOVING DEEPER INTO THE VEHICLE

FOTA Update of Infotainment & Telematics Systems

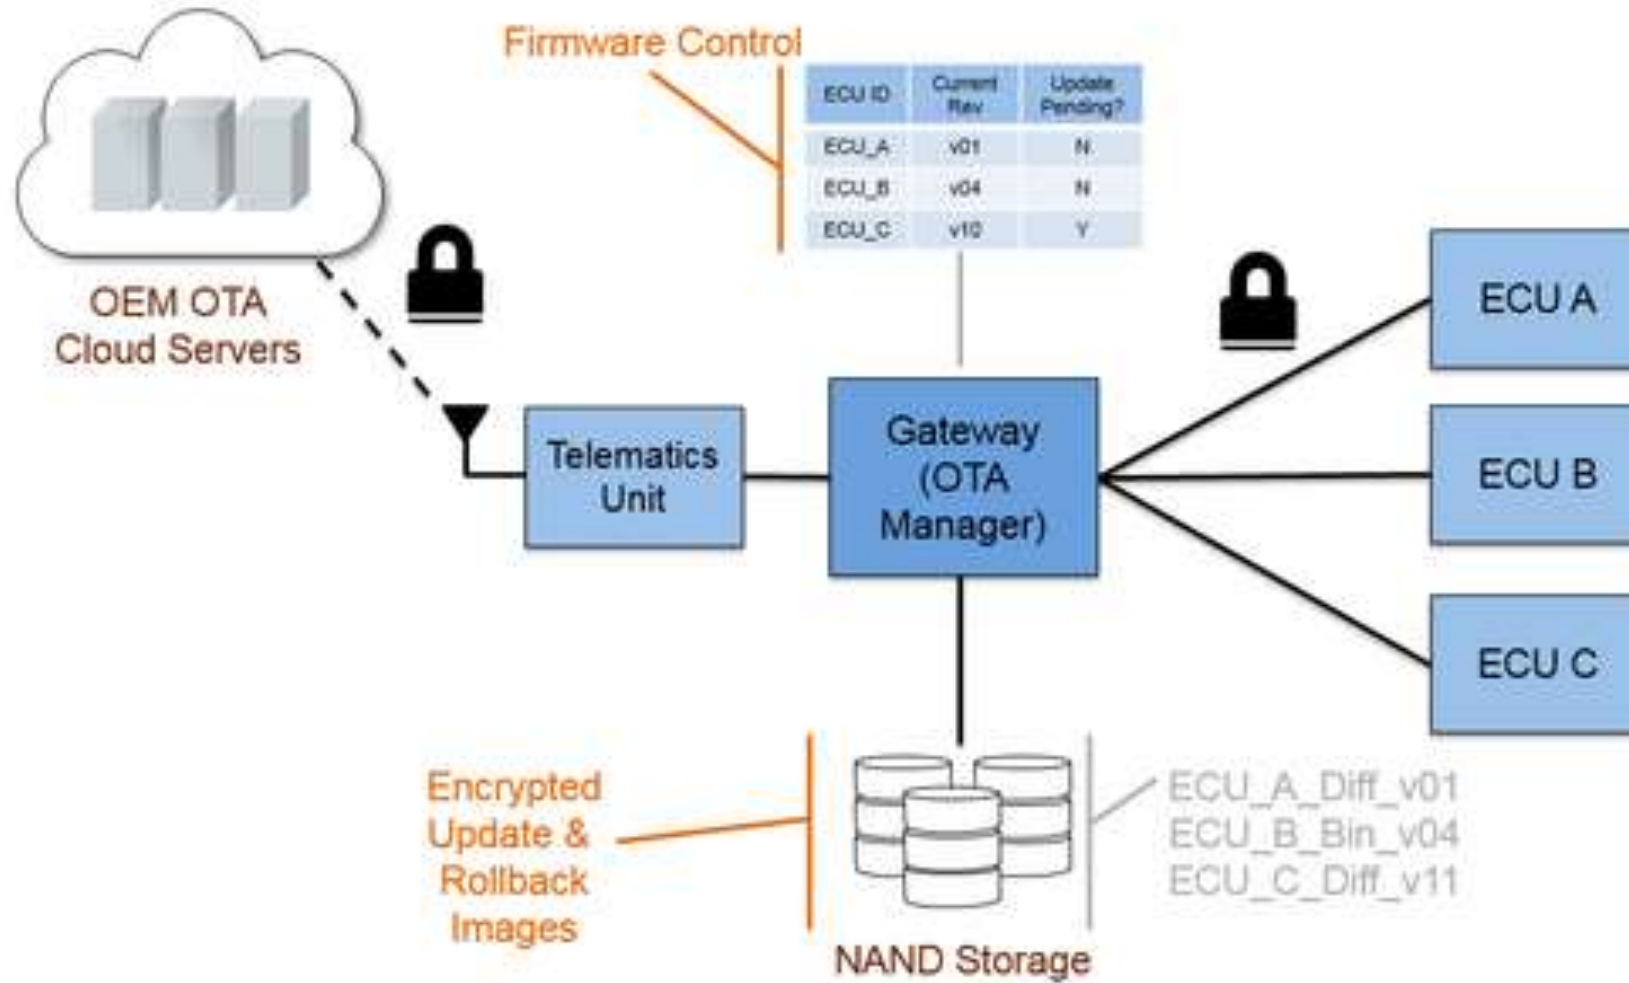

Focused on updates to software on the infotainment & telematics, but not propagating further into the vehicle architecture

FOTA Update of Major ECUs within the vehicle

New Challenges with this architecture:

- Security throughout
- Cost sensitivity of embedded ECUs
- Embedded NVM vs High Density NVM
- Strategy of when & what to update

FOTA Overview: Moving Deeper in the Vehicle

FOTA Overview: **In Place Use Case**

Reset vectors to bootloader, which is never erased

Advantages:

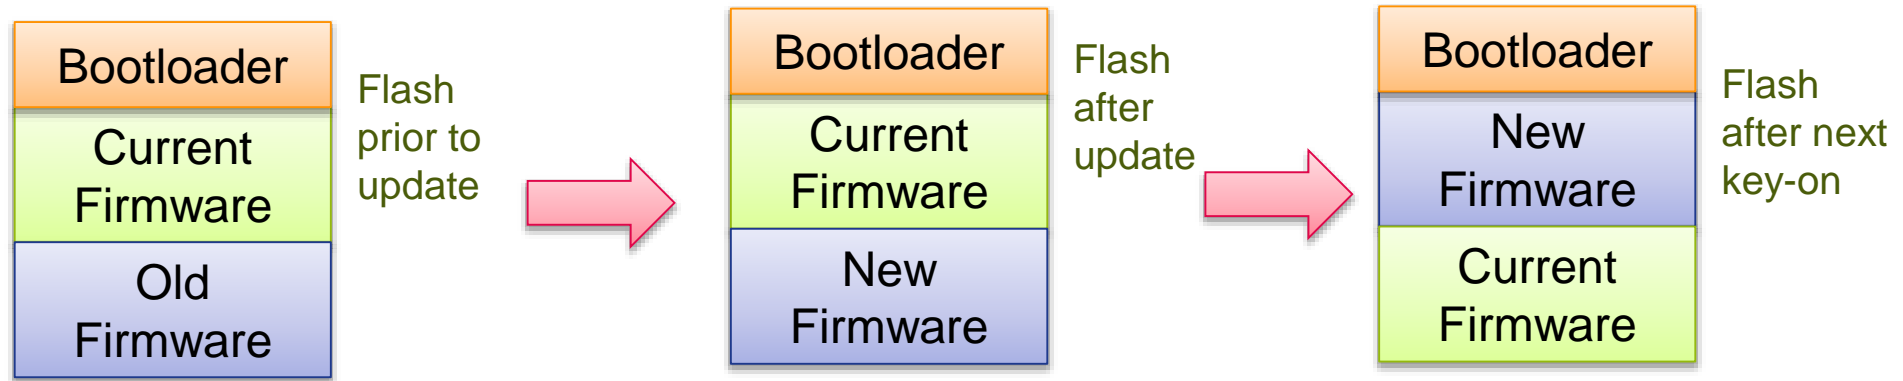

- No need for additional flash

Disadvantage:

- Requires vehicle downtime during update process
- Not possible to instantly “roll-back” if an issue occurs

FOTA Overview: **A/B Swap Use Case**

Reset vectors to bootloader, which is never erased

Advantages:

- Update can be carried out while current application is actively running from flash
- Always have original firmware to roll back to in case of issue
- Vehicle is always available – guaranteed no vehicle downtime regardless of update errors

Disadvantage:

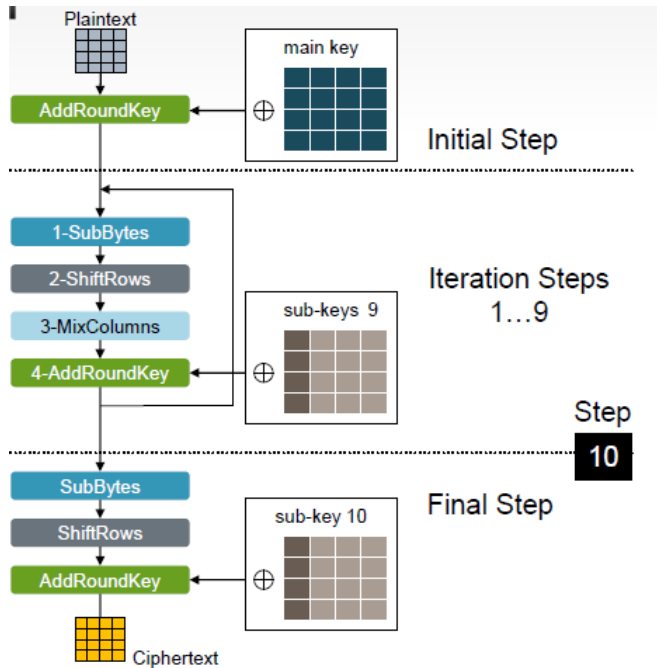

- Requires ~2x flash application storage
- Requires RWW capabilities
- SW remapping is required

FOTA Overview: **Assumptions**

- End node:
 - gets partial or full image for flashing
 - will have at least enough spare erased flash for a full image
 - receives updated software over serial link
 - has boot block which never changes with OTA updates
- Best case: update is performed while running existing software
- Before new firmware becomes active, application/boot firmware can perform:
 - Security validation
 - Functional validation
- New firmware starts on reset following the update completion

Security Overview: AES 128

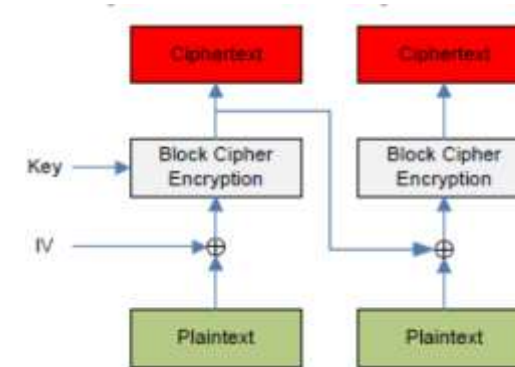

- Crypto and decryption algorithm: AES-128
- AES Encryption/Decryption in ECB or CBC mode

Plaintext

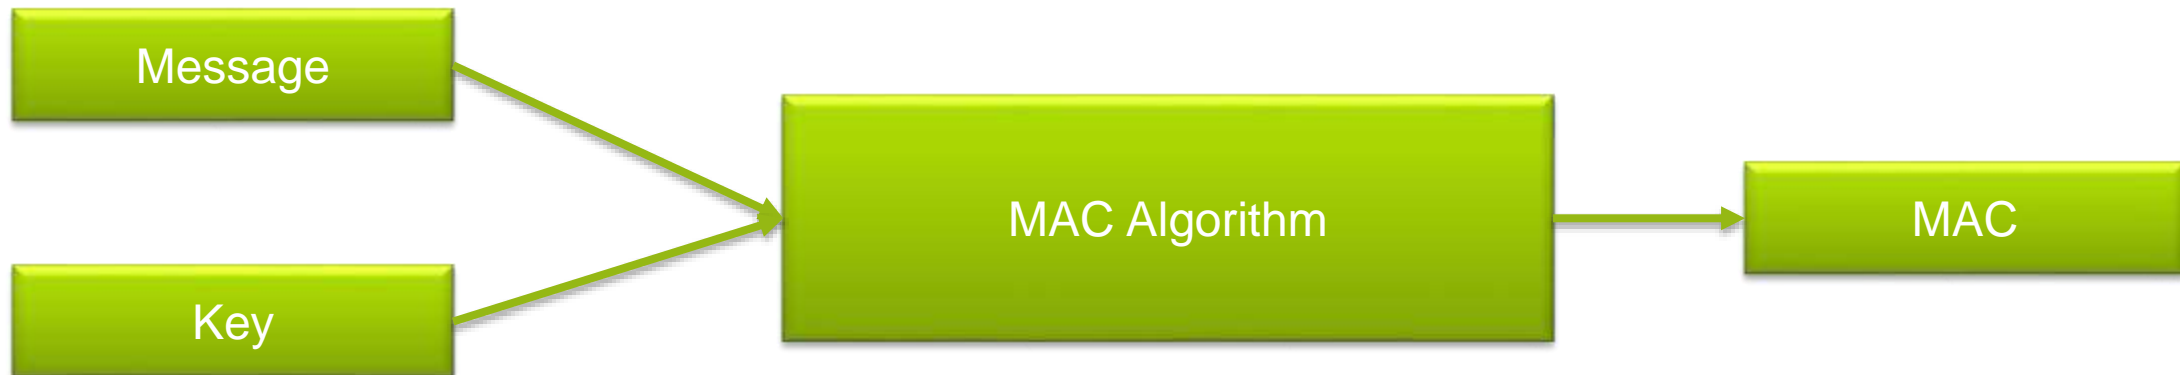

ECB:Ciphertext

CBC:Ciphertext

Security Overview: **CMAC Generator**

- Cipher based Message Authentication Code (CMAC)
- A MAC algorithm inputs:
 - Secret key
 - Message of arbitrary length
- A MAC algorithm output:
 - MAC value
- The MAC value protects both a message's data integrity as well as its authenticity.

03.

S32K1xx Capabilities

S32K14x: Block Diagram

High performance

- ARM Cortex M4F up to 112MHz w FPU
- eDMA from 57xxx family

Software Friendly Architecture

- High RAM to Flash ratio
- Independent CPU and peripheral clocking
- 48MHz 1% IRC – no PLL init required in LP
- Registers maintained in all modes
- Programmable triggers for ADC → no SW delay counters or extra interrupts

Functional safety

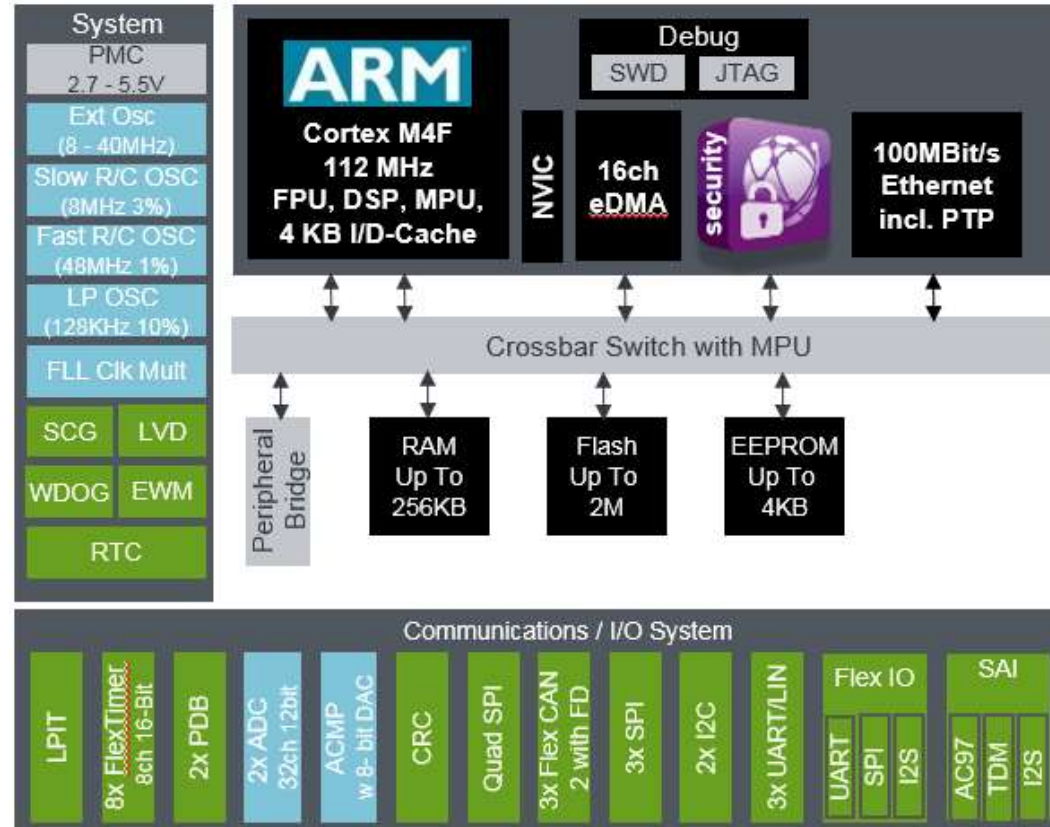

- ISO26262 support for ASIL B or higher
- Memory Protection Unit
- ECC on 512K Flash / 64K Dataflash and RAM
- Independent internal OSC for Watchdog
- Diversity between ADC and ACMP
- Diversity between SPI/SCI and FlexIO
- Core self test libraries
- Scalable LVD protection
- CRC

Low power

- Low leakage technology
- Multiple VLP modes and IRC combos
- Wake-up on analog thresholds

Security

- CSEc (SHE-spec)

Packages & IO

- Open-drain for 3.3 V and hi-drive pins
- Powered ESD protection
- Packages: 100 BGA, 64 LQFP, 100 LQFP

Operating Characteristics

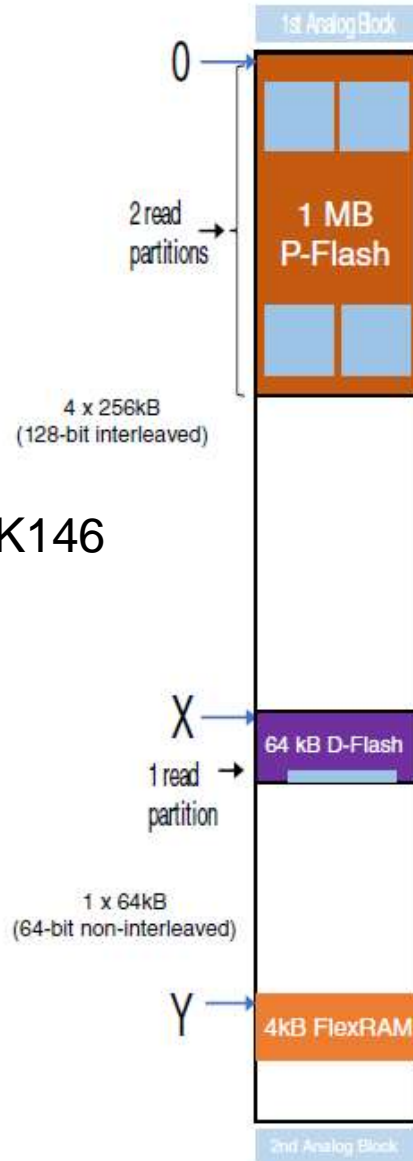

- Voltage range: 2.7V to 5.5V
- Temperature (ambient): -40°C to +125°C

S32K14x: Flash Architecture

S32K144

S32K146

S32K148

S32K14x: **Flash Architecture**

FOTA relevant features:

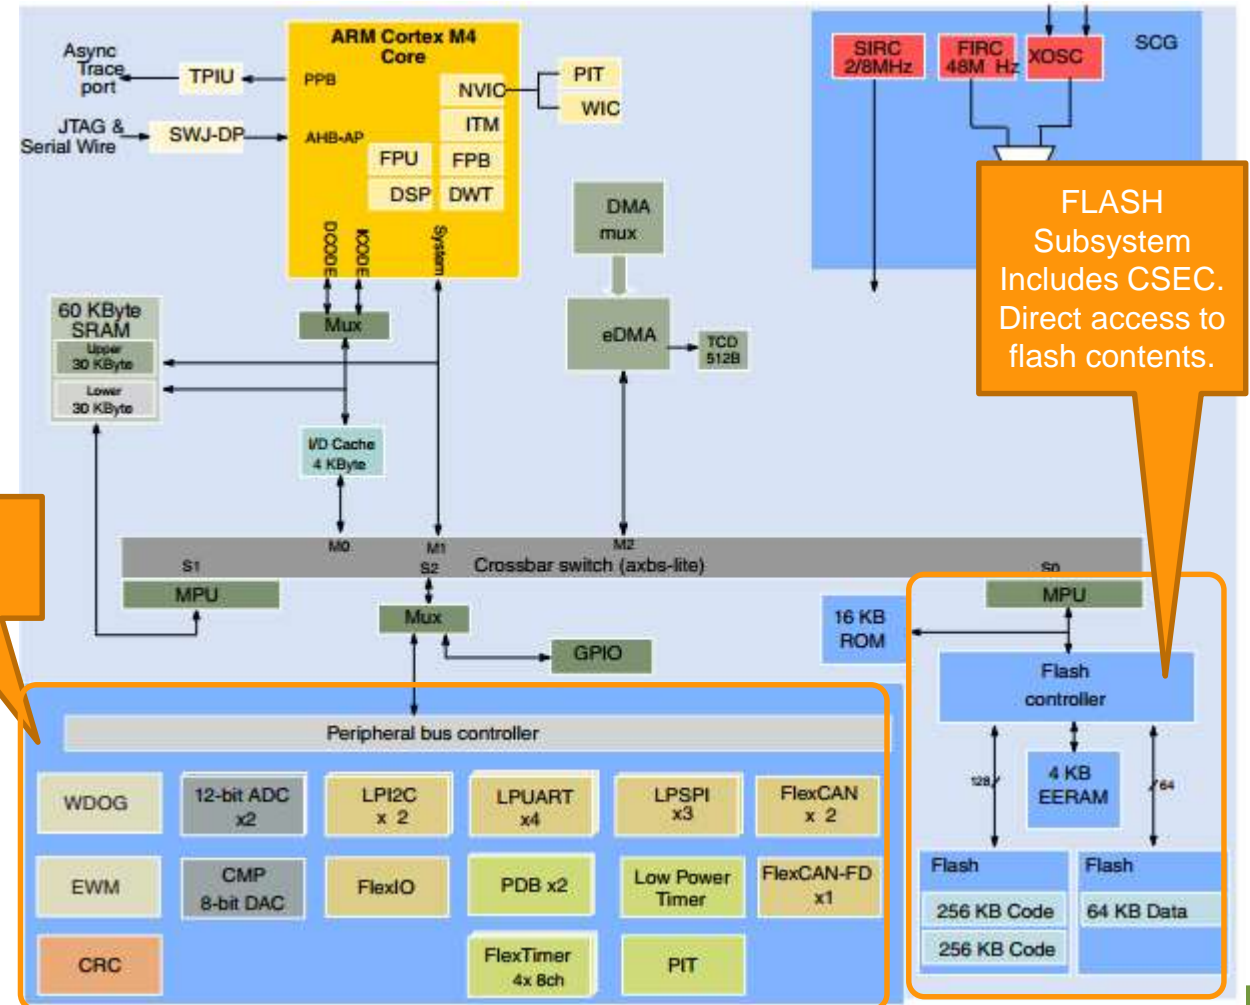

- Sector size (= minimum erase size)
 - **4K Bytes** in Program Flash (bank 0)
 - **2K Bytes** in Data Flash (bank 1)
- Read-While-Write (RWW) features between Bank0 (Program Flash) and Bank1 (Data Flash)

Key additional flash features:

- **C90TFS** (Thin-Film-Storage) technology
- ECC support: **Single Bit Error Correction and Double Bit Error Detection**
 - 32bit ECC word in data flash
 - 64bit ECC word in program flash
- Access time: **Flash clock is about #1/4 of the core clock**

S32K Security Module (CSEc) – Overview

- SHE functionality moves from dedicated master module into the flash system
- **Full SHE Specification compliant** and support of all Global-B security requirements
- **Secure key storage** only accessible by CSEc
- **True Random Number System**
- **Sequential boot / parallel boot** supported
- CSEc supports **AES-128** with ECB, CBC and CMAC mode
- **Crypto Keys**
 - Several General-Purpose keys
 - Special Purpose keys (e.g. Secret, Master and Secure-Boot Key & CMAC)
 - Support of additional encrypted keys in public flash memory.
- **KEY-Properties**
 - Write-protection
 - Secure-Boot-Failure
 - Debug-Connect
 - Wildcard-UID
 - Key-Usage (key or CMAC)
 - Verify-Only
 - 28bit-Update-Counter

No CSEc access to these data

FLASH Subsystem Includes CSEc. Direct access to flash contents.

04.

S32K144 Use Case

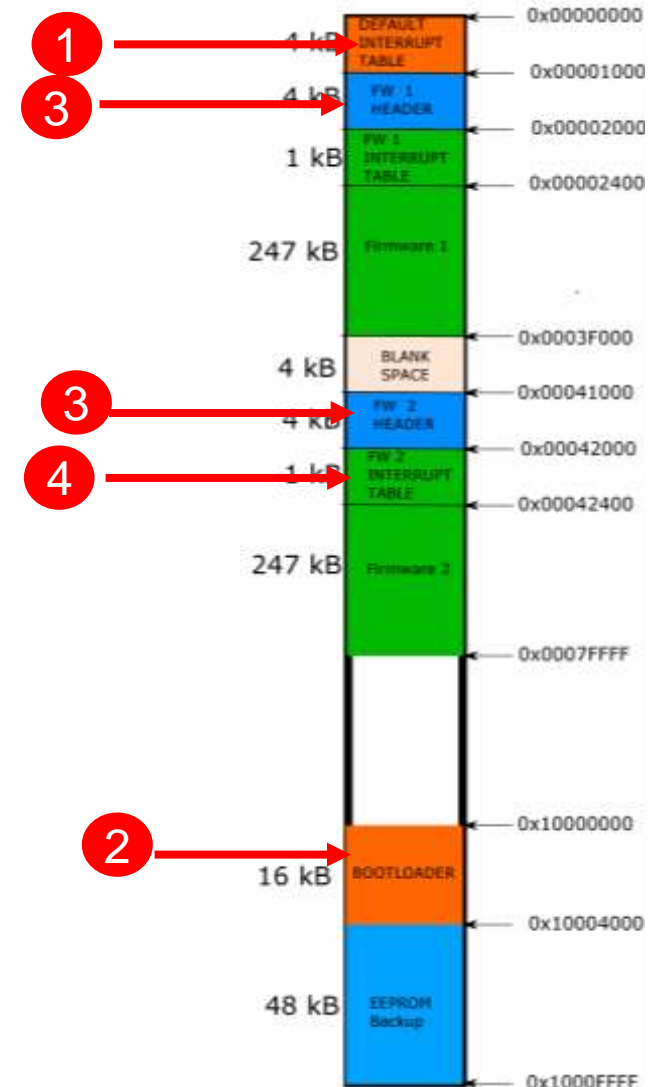

S32K144 use case: Memory Map for A/B Swap

- Default Interrupt table and bootloader not erased.
- 0x000000004 -> stores bootloader Reset Handler
- Reset Handler located at Bootloader space
- FW HEADER:
 - Fw version .
 - Developers information.
 - Signature.
 - Erased/Updated after each firmware update
 - Size: 4kB (sector size)
- FW size 248kB (62 sectors)
- RWW between bootloader and firmware application.
- EEPROM: Store secure keys, application usage.

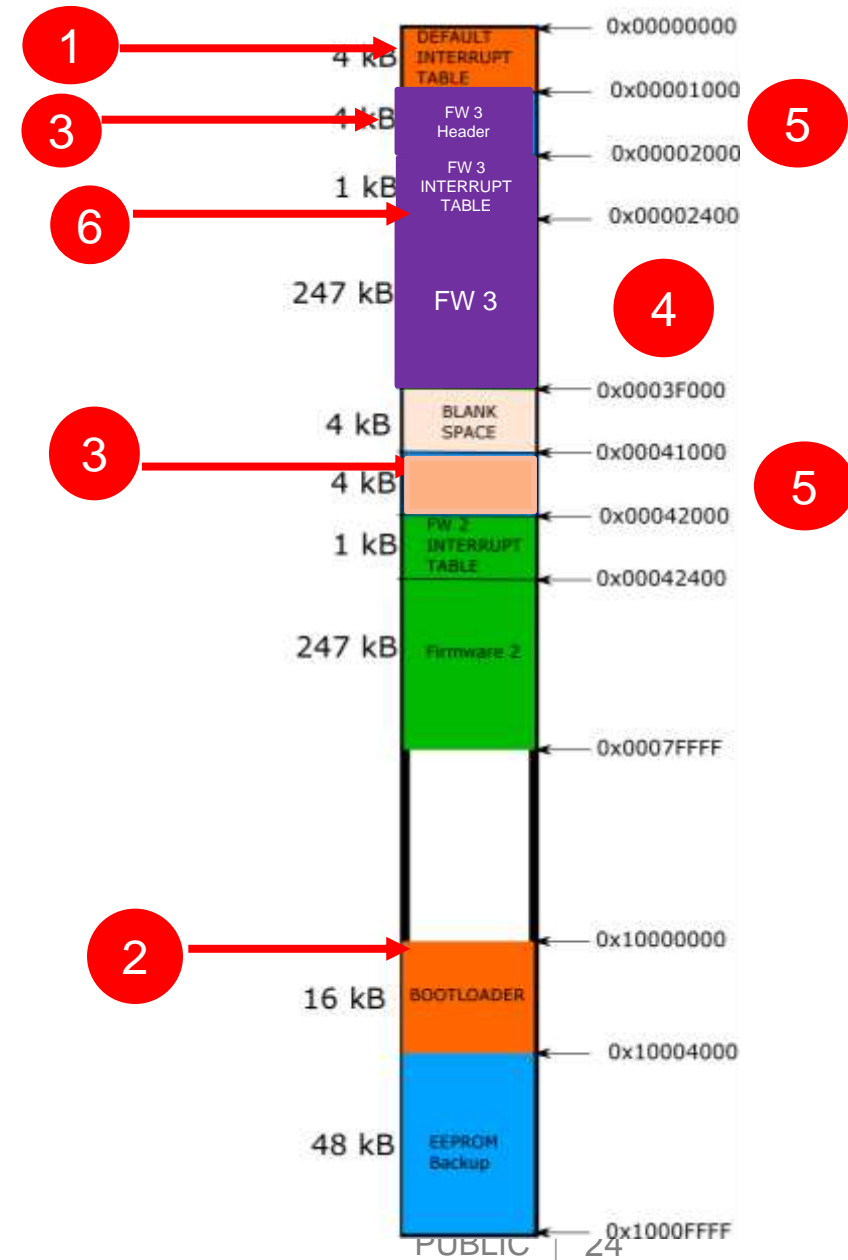

S32K144 use case: **Boot process**

1. After Reset: fetch PC value @ 0x00000004
2. Bootloader init peripherals
3. Bootloader search for oldest and newest image.
 - Check FW Header information
 - Value 0x55AA55AA, at end of fw header
 - Assign FW to be updates (Oldest)
4. Jump to newest application
 1. Relocate VTOR table
 2. PC fetch value from new firmware interrupt table

S32K144 use case: Update Process

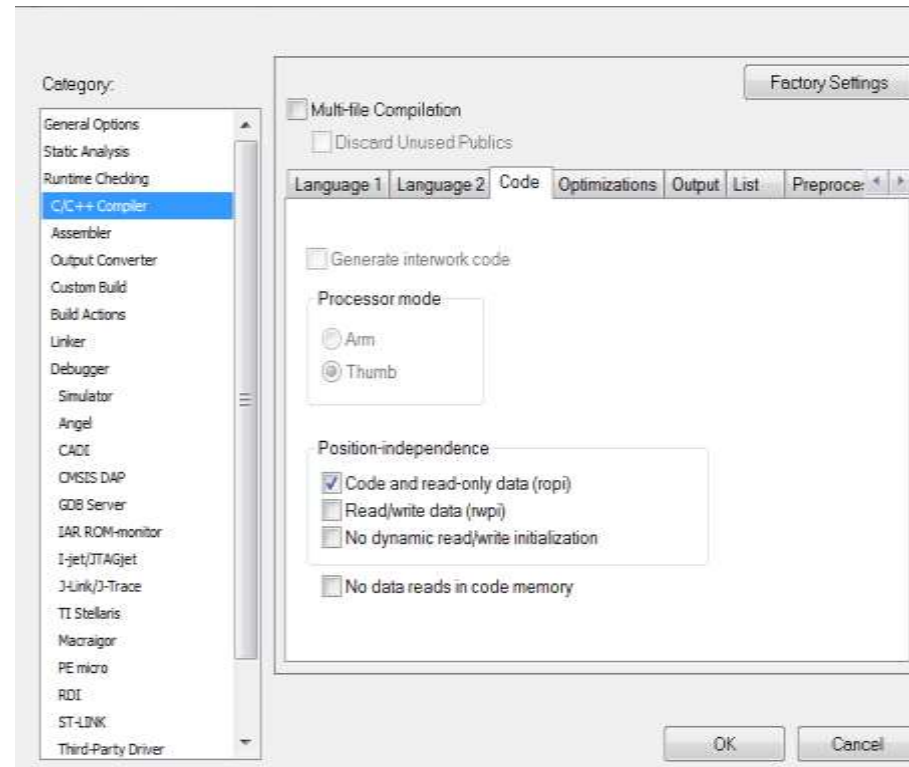

1. After Reset: fetch PC value @ 0x00000004
2. Bootloader init peripherals
3. Bootloader search for oldest and newest image.
 - Check FW Header information
 - Value 0x55AA55AA, at end of fw header
 - Assign FW to be updates (Oldest)
4. Update trigger received.
 - Receive header first
 - Validate is a new version
 - Start updating new firmware in oldest location
5. Update Completed
 - Deinit bootloader peripherals
 - Update new firmware header
 - Erase/Update older firmware header
6. Jump to new application
 - Relocate VTOR table
 - PC fetch value from new firmware interrupt table

S32K144 use case: **A/B Swap Options without Flash Remapping**

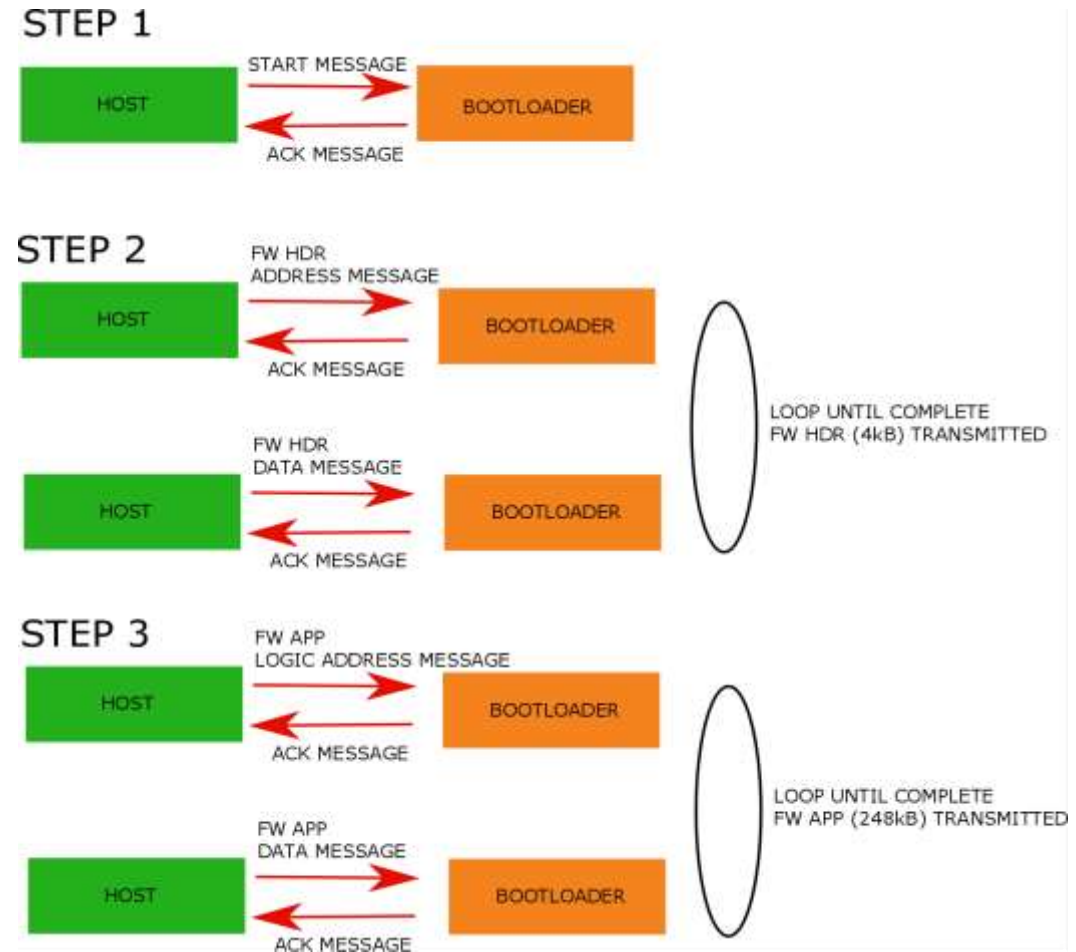

- **Problem:**
 - 2 images in different physical address.
 - No flash swap, flash remapping feature
- **Solutions:**
 - Separate object file for each firmware.
 - Requires more overhead in file management!
 - **Position independent code**
 - Same linker file for all firmware updates
 - No file management
 - No absolute branches
 - Offset to each interrupt table entry needs to be added. Done automatically by bootloader!
 - Addresses of the interrupt table, should be modified.

IAR ropi feature

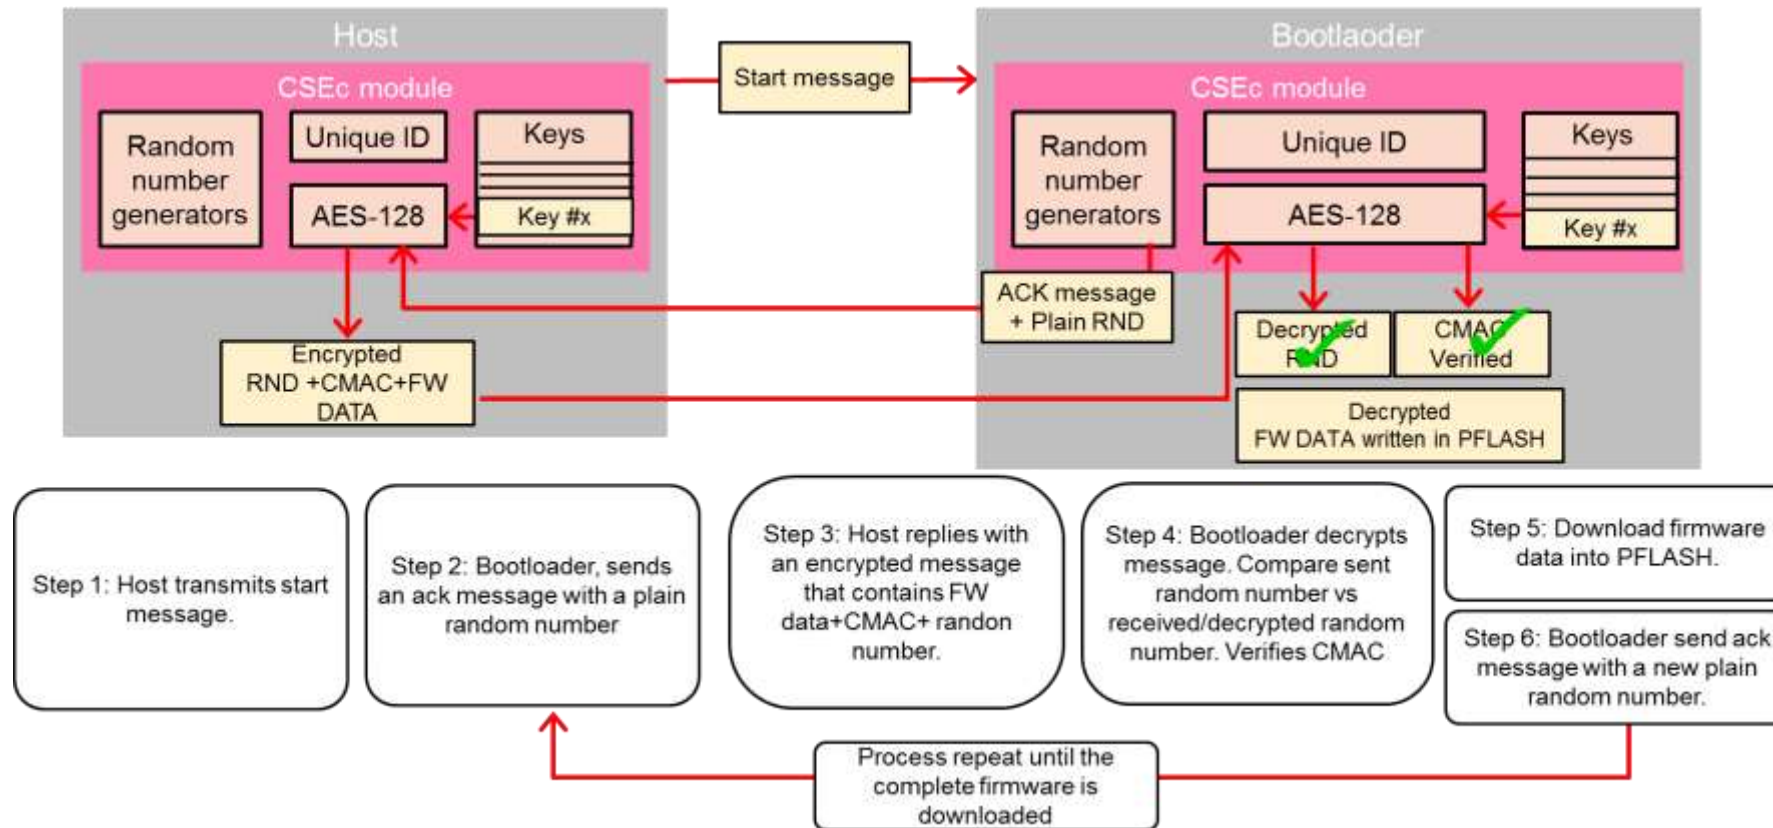

S32K144 use case: **Communication Process**

- Step 1: Trigger update
 - Communication Message from Host to edge node (bootloader fw)
 - Response of ack form host to edge node.
- Step 2: Transmit Header
 - Host sends address
 - Edge node responds with Ack
 - Host sends header data
 - Edge node validate data
 - Edge node responds with Ack
- Step 3: Transmit Application
 - Host sends app logic address
 - Edge node responds with Ack
 - Host sends app data
 - Edge node receives and write data into flash
 - Edge node responds with Ack

S32K144 use case: Secure Communication Process

- Random number: protects against replay attacks →
- Encryption: protects against eavesdropping →
- CMAC →
- Authenticity and freshness of message.
- Confidentiality
- Data integrity

05.

Demo

S32K144 Demo: **Setup**

- 2x S32K144 EVBs
 - 1 EVB Gateway
 - 1 EVB Edge Node
- CANFD communication
- Gateway stores 2x application images in its internal memory.
 - FW application: blinking led and serial print.

S32K144 Demo: Communication messages

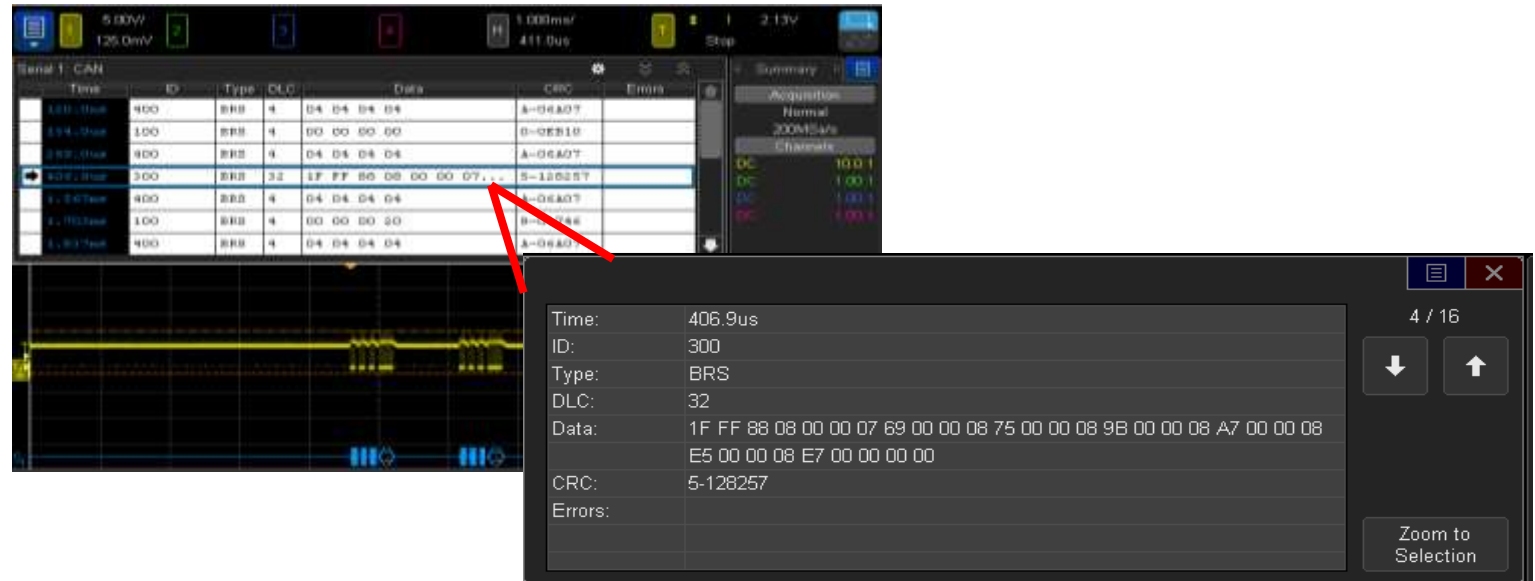

| MESSAGE | ID | CAN PAYLOAD BYTES | CANFD PAYLOAD BYTES | PAYLOAD | DIRECTION | DESCRIPTION |
|---------|-------|-------------------------|---------------------------|--|--------------------|--|
| START | 0x200 | 4 | 4 | 0x15151515 | HOST -> BOOTLOADER | Triggers update process |
| ADDRESS | 0x100 | 4 | 4 | Address of firmware header or firmware logic address End of data: 0x53535353 | HOST -> BOOTLOADER | Contains the address for the fw hdr information or the logic address of the fw application. Contains end of data payload. |
| DATA | 0x300 | 8 | 32 | Firmware header or firmware application data. | HOST -> BOOTLOADER | Contains firmware header or firmware application data., that is downloaded to pflash. |
| ACK | 0x400 | 4 | 4 | Acknowledge payload: 0x04040404 Error payload: 0x55555555 | BOOTLOADER -> HOST | Contains acknowledge payload. Contains error payload. |

S32K144 Demo: CANFD Communication

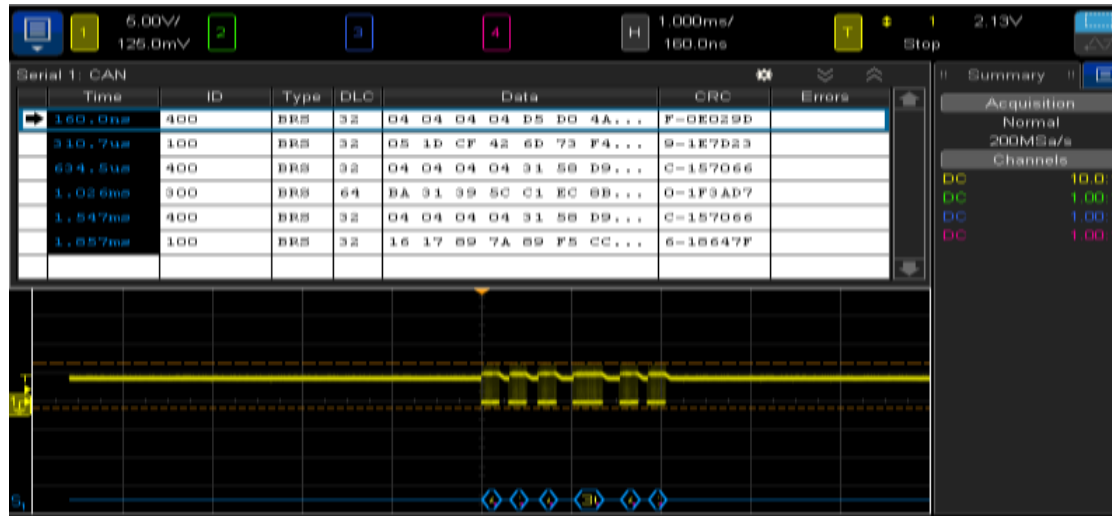

- CANFD @ 2Mbps
- 32B payload
- MSB send first
- FW application plain data is send via CANFD

06.

Summary

S32K1xx – an OTA solution for automotive edge nodes.

- **Structured for Secure or traditional OTA updates**
- **Most scalable portfolio** – based on ARM Cortex
- **Future-proof** - Superior Performance and Features
