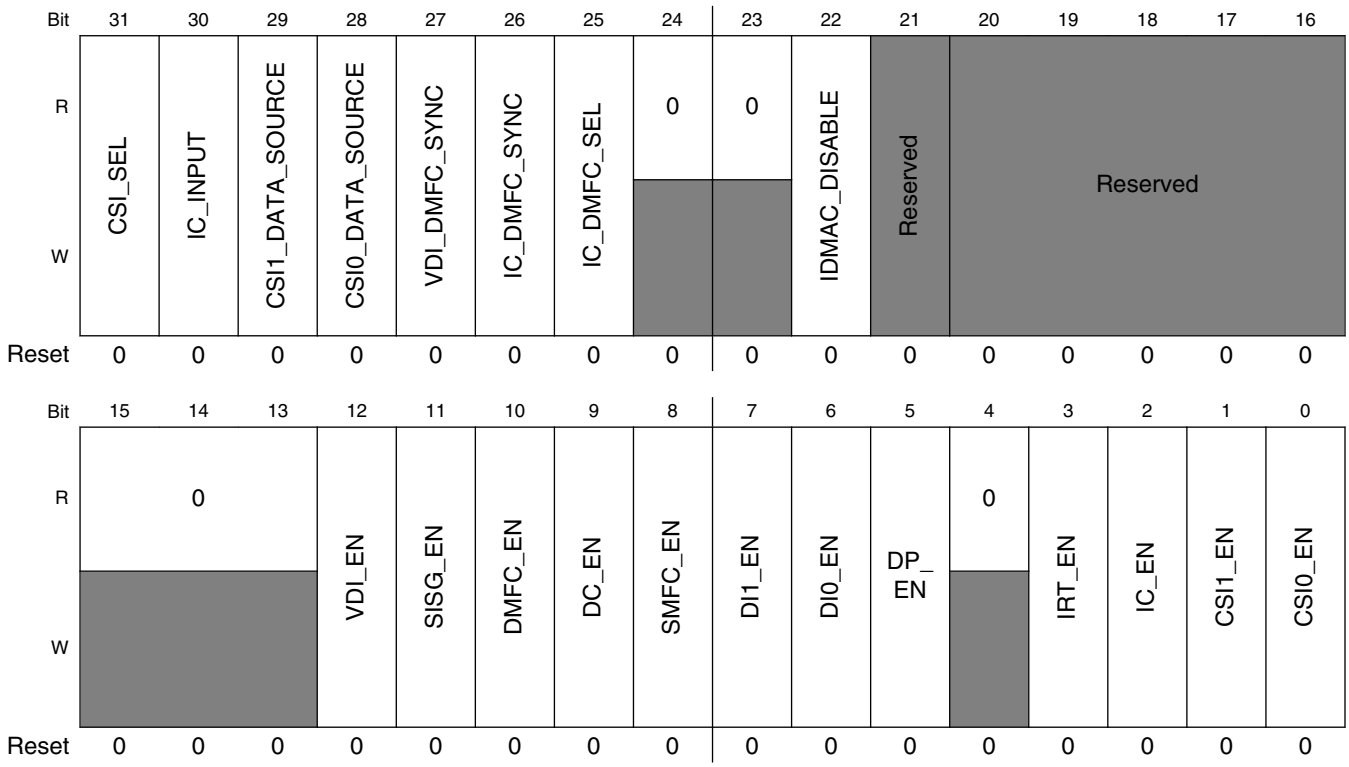
37.5.1 Configuration Register (IPUx_CONF)

Address: Base address + 0h offset



IPUx_CONF field descriptions

Field	Description
31 CSI_SEL	CSI select bit; This bit selects manually between the 2 CSI's. This bit defines which CSI is the input to the IC. This bit is effective only if IC_INPUT is bit cleared 0 CSI0 is selected 1 CSI1 is selected
30 IC_INPUT	IC Input select bit. This bit selects manually between the 2 inputs to the IC 0 CSI0/1 is selected; In order to select between the CSIs use the CSI_SEL bit. 1 VDI
29 CSI1_DATA_ SOURCE	CSI1 data Source This bit selects what is the data source for the CSI1. This is a static mux that should not be changed while CSI1 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface. 0 Parallel interface is connected to CSI1 1 MCT (MIPI) is connected to CSI1
28 CSI0_DATA_ SOURCE	CSI0 data Source This bit selects what is the data source for the CSI0. This is a static mux that should not be changed while CSI0 is working. Data is handles differently if the source is MCT (MIPI) or parallel interface.

Table continues on the next page...

IPUx_CONF field descriptions (continued)

Field	Description
	0 Parallel interface is connected to CSI0 1 MCT (MIPI) is connected to CSI0
27 VDI_DMFC_SYNC	This bit enables the direct path VDIC -> IC_VF -> DMFC for sync flow. If this bit is set IC_DMFC_SEL must be set. 0 the flow is disabled 1 the flow is enabled
26 IC_DMFC_SYNC	IC to DMFC Sync flow This bit defines if the direct flow between IC to DMFC is synchronous or asynchronous 0 async flow 1 Sync flow
25 IC_DMFC_SEL	IC to DMFC select Selects the DMAIC_1 (channel 21) channel's connectivity between the IC and the DMFC 0 DMAIC_1 (channel 21) is routed to the IDMAC 1 DMAIC_1 (channel 21) is routed to DMFC In case DMFC was selected the IDMAC_CH_EN[21] must be clear.
24 Reserved	This read-only field is reserved and always has the value 0.
23 Reserved	This read-only field is reserved and always has the value 0.
22 IDMAC_DISABLE	Image DMA controller (IDMAC) disable bit. This bit allows the user to turn off the clock of the IDMAC if the use case permits it. By default the IDMAC is enabled. 0 IDMAC is enabled 1 IDMAC is disabled
21 -	This field is reserved. Reserved.
20–16 -	This field is reserved. Reserved
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 VDI_EN	VDI enable bit. This bit must be cleared if the ISP_EN bit is set. 0 VDIC is disabled 1 VDIC is enabled
11 SISG_EN	Still Image Synchronization Generator (SISG) Enable bit 0 SISG is disabled 1 SISG is enabled
10 DMFC_EN	Display's Multi FIFO Controller sub-block (DMFC) Enable bit 0 DMFC is disabled 1 DMFC is enabled
9 DC_EN	Display Controller sub-block (DC) Enable bit

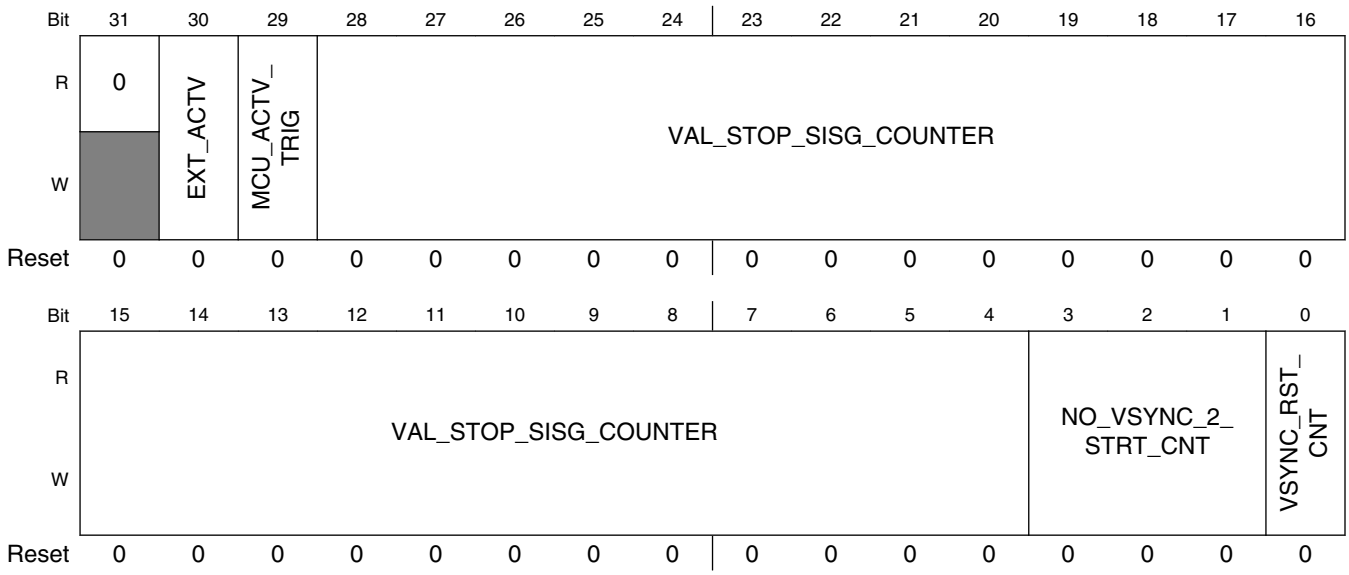
Table continues on the next page...

IPUx_CONF field descriptions (continued)

Field	Description
	0 DC is disabled 1 DC is enabled
8 SMFC_EN	Sensor's Multi FIFO Controller Sub-block (SMFC) Enable bit 0 SMFC is disabled 1 SMFC is enabled
7 DI1_EN	Display Interface Sub-block 1 Enable bit 0 DI1 is disabled 1 DI1 is enabled
6 DI0_EN	Display interface Sub-block 0 Enable bit 0 DI0 is disabled 1 DI0 is enabled
5 DP_EN	Display processor Sub-block Enable bit 0 DP is disabled 1 DP is enabled
4 Reserved	This read-only field is reserved and always has the value 0.
3 IRT_EN	Image Rotation Sub-Block Enable bit 0 IRT is disabled 1 IRT is enabled
2 IC_EN	Image Conversion Sub-Block Enable bit 0 IC is disabled 1 IC is enabled
1 CSI1_EN	Camera Sensor Interface 1 Enable bit 0 CSI1 is disabled 1 CSI1 is enabled
0 CSI0_EN	Camera Sensor Interface 0 Enable bit 0 CSI0 is disabled 1 CSI0 is enabled

37.5.2 SISG Control 0 Register (IPUx_SISG_CTRL0)

Address: Base address + 4h offset

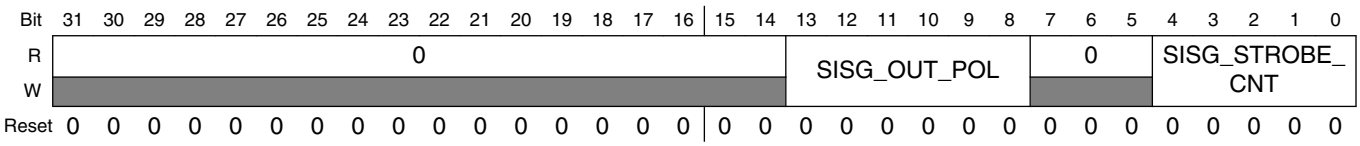


IPUx_SISG_CTRL0 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 EXT_ACTV	External Active Define if an external active trigger will start the counters. The external active trigger is an input signal to the IPU called ext_actv_trig
29 MCU_ACTV_TRIG	Reserved, should be cleared.
28–4 VAL_STOP_SISG_COUNTER	SISG Stop Counters value. This is a predefined value that stops the SISG counters. The user should write to this field the N-1 value of the desired value.
3–1 NO_VSYNC_2_STRT_CNT	VSYCs to Start Counter This bits define how many VSYNCs signals will be counter before activating the SISG counters. If set to 0 starts immediately. If set to N (1..7) starts after N VSYNCs.
0 VSYNC_RST_CNT	VSYNC Resets counters Defines if the counters are stooped following VSYNC or when the counters reach a pre defined value (VAL_STOP_SISG_COUNTER) 1 The counters are stopped at VSYNC 0 The counters are stooped when the counters reach the VAL_STOP_SISG_COUNTER value.

37.5.3 SISG Control 1 Register (IPUx_SISG_CTRL1)

Address: Base address + 8h offset

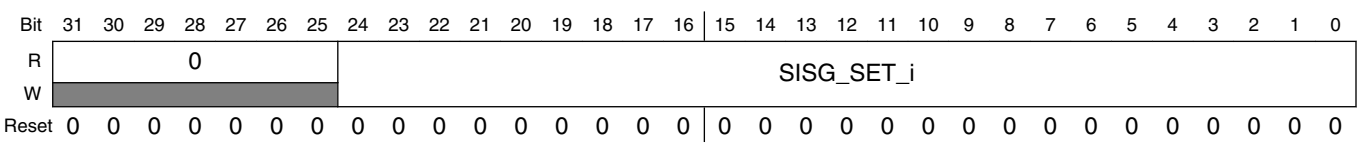


IPUx_SISG_CTRL1 field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SISG_OUT_POL	SISG_OUT_POL This bits defines the polarity of the SISG output signals 1 active high 0 active low
7–5 Reserved	This read-only field is reserved and always has the value 0.
SISG_STROBE_ CNT	SISG Strobe Count The SISG can repeat the sequence for up to 32 cycles; this is used for generating a train of pulses.

37.5.4 SISG Set<i> Register (IPUx_SISG_SET_i)

Address: Base address + Ch offset



IPUx_SISG_SET_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
SISG_SET_i	SISG SET <i> value These bits define the set value of the SISG counter #<i>

37.5.5 SISG Clear <i> Register (IPUx_SISG_CLR_i)

Address: Base address + 24h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_INT_CTRL_1 field descriptions

Field	Description
31 IDMAC_EOF_EN_31	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
30 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
29 IDMAC_EOF_EN_29	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
28 IDMAC_EOF_EN_28	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
27 IDMAC_EOF_EN_27	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IDMAC_EOF_EN_26	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IDMAC_EOF_EN_25	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
24 IDMAC_EOF_EN_24	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 IDMAC_EOF_EN_23	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
22 IDMAC_EOF_EN_22	Enable End of Frame of Channel interrupt. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Field	Description
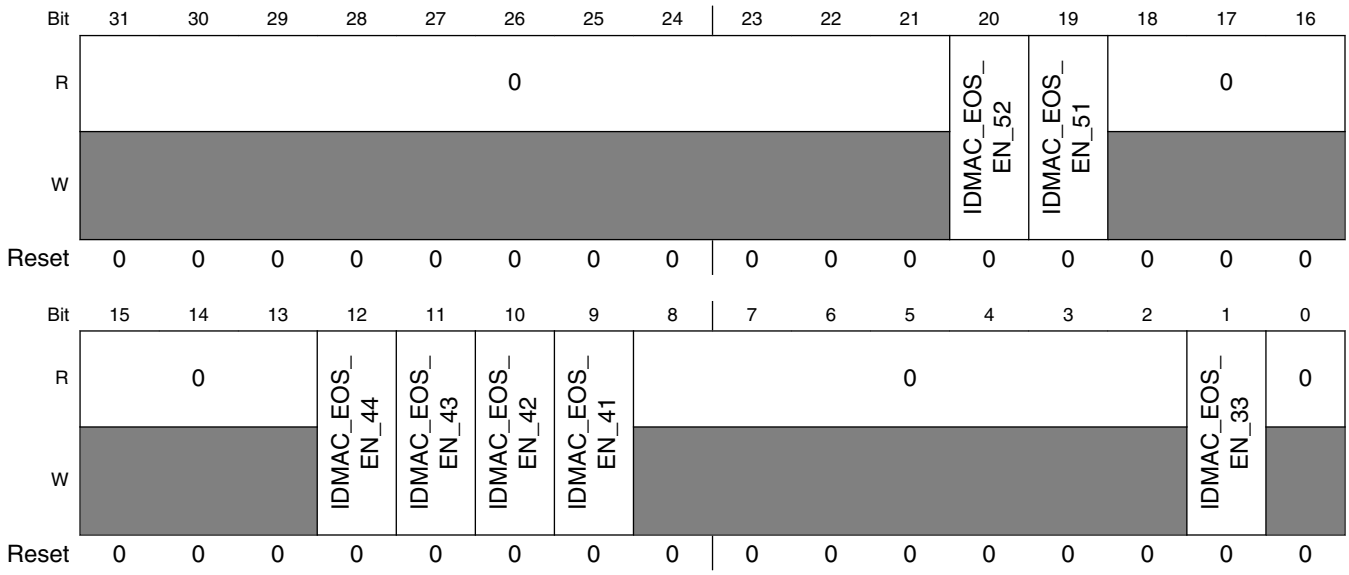
27 IDMAC_EOS_EN_27	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IDMAC_EOS_EN_26	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IDMAC_EOS_EN_25	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
24 IDMAC_EOS_EN_24	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 IDMAC_EOS_EN_23	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
22–20 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
19 IDMAC_EOS_EN_19	End of Scroll indication of Channel interrupt. This bit is the control of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.13 Interrupt Control Register 8 (IPUx_INT_CTRL_8)

This register contains part of IPU interrupts controls. The controls of the End of Scroll indication (EOS) of DMA Channels interrupts [63:32] can be found in this register.

Address: Base address + 58h offset



IPUx_INT_CTRL_8 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
20 IDMAC_EOS_EN_52	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
19 IDMAC_EOS_EN_51	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
18–13 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

Table continues on the next page...

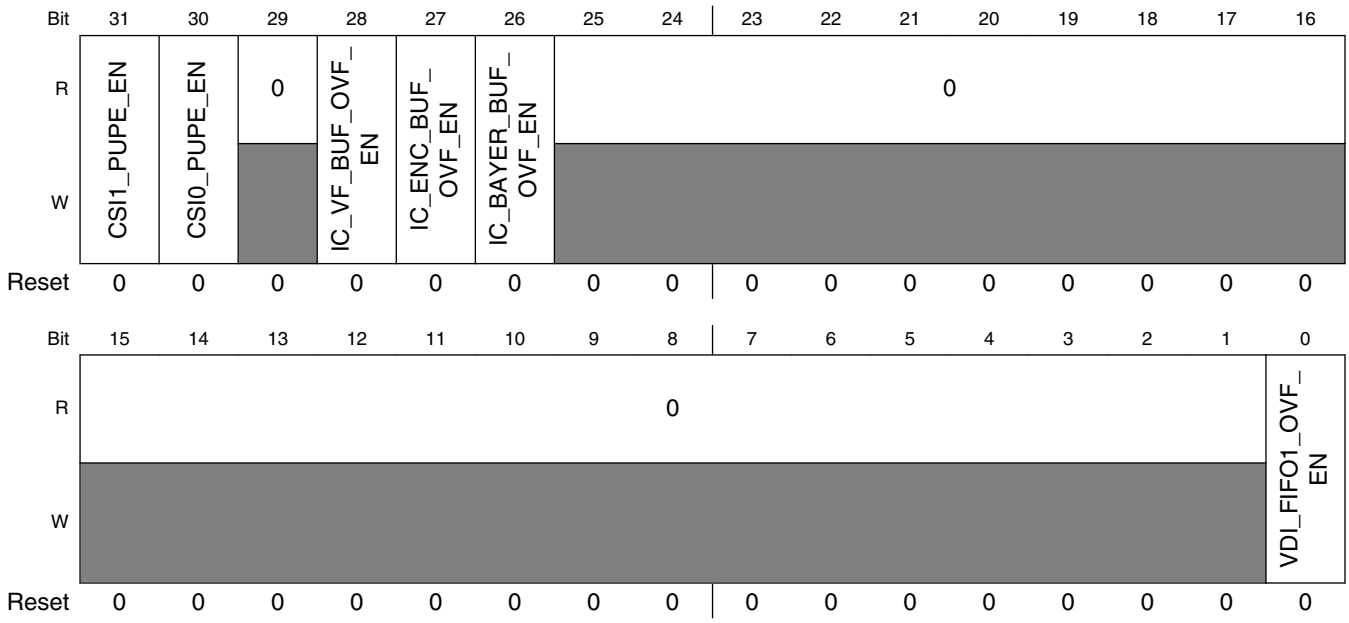
IPUx_INT_CTRL_8 field descriptions (continued)

Field	Description
12 IDMAC_EOS_EN_44	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
11 IDMAC_EOS_EN_43	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
10 IDMAC_EOS_EN_42	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
9 IDMAC_EOS_EN_41	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 IDMAC_EOS_EN_33	End of Scroll of Channel interrupt. This bit is the control of End Of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.14 Interrupt Control Register 9 (IPUx_INT_CTRL_9)

This register contains part of IPU interrupts controls. This register controls error interrupt signals coming from different sub-blocks within

Address: Base address + 5Ch offset



IPUx_INT_CTRL_9 field descriptions

Field	Description
31 CSI1_PUPE_EN	CSI1_PUPE_EN - CSI1 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI1. The error is generated in case where new frame arrived from the CSI1 before the completion of the CSI1's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled.
30 CSI0_PUPE_EN	CSI0_PUPE_EN - CSI0 parameters update error interrupt enable. This bit enables an interrupt that is a result of an error generated by the CSI0. The error is generated in case where new frame arrived from the CSI0 before the completion of the CSI0's parameters update by the SRM 0 Interrupt is disabled. 1 Interrupt is enabled.
29 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

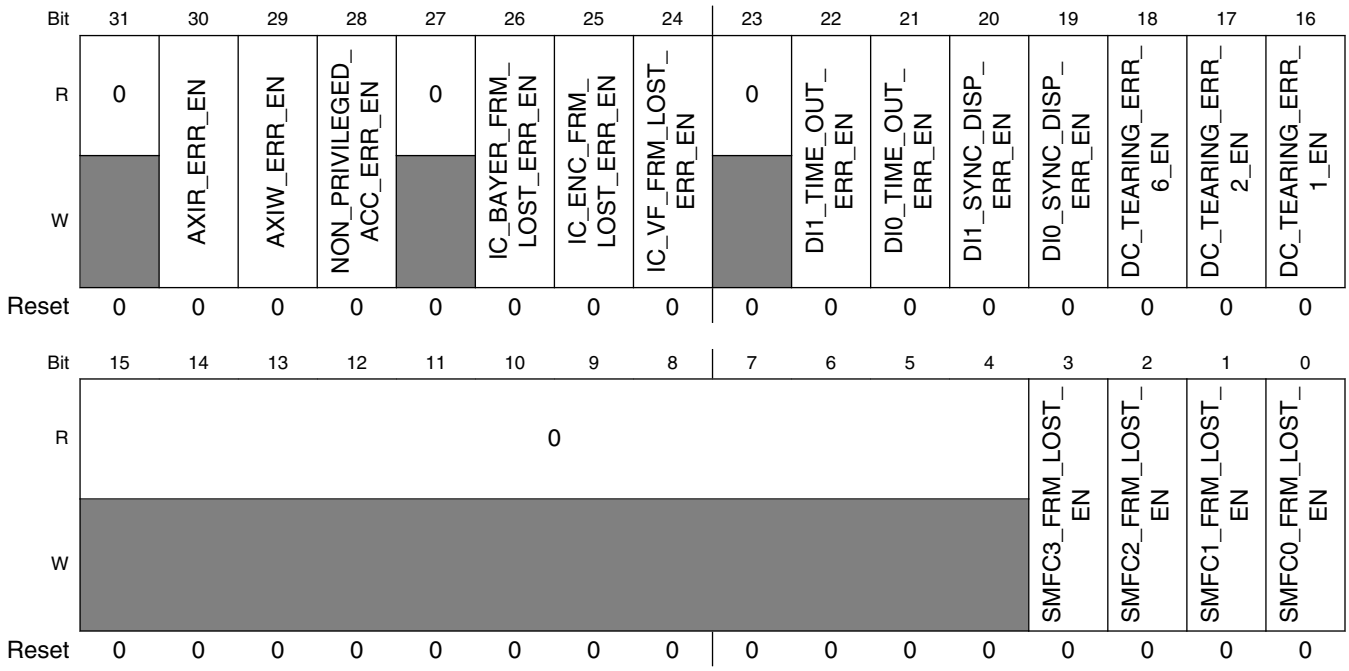
IPUx_INT_CTRL_9 field descriptions (continued)

Field	Description
28 IC_VF_BUF_ OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for view finder coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
27 IC_ENC_BUF_ OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for encoding coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IC_BAYER_ BUF_OVF_EN	This bit enables an interrupt that is a result of the IC Buffer overflow for bayer coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is disabled. 1 Interrupt is enabled.
25–1 Reserved	This read-only field is reserved and always has the value 0.
0 VDI_FIFO1_ OVF_EN	FIFO1 overflow Interrupt1 Enable The VDIC generates FIFO1 overflow interrupt1 when the write pointer of FIFO1 overruns read pointer. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.15 Interrupt Control Register 10 (IPUx_INT_CTRL_10)

This register contains part of IPU interrupts controls. This register controls error interrupt signals coming from different modules within

Address: Base address + 60h offset



IPUx_INT_CTRL_10 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 AXIR_ERR_EN	This bit enables an interrupt that is a result of AXI read access resulted with error response. 0 Interrupt is disabled. 1 Interrupt is enabled.
29 AXIW_ERR_EN	This bit enables an interrupt that is a result of AXI write access resulted with error response. 0 Interrupt is disabled. 1 Interrupt is enabled.
28 NON_ PRIVILEGED_ ACC_ERR_EN	Non Privileged Access Error interrupt enable. The CPMEM and the DP can be accessed by the ARM platform in privileged mode only HPROT[1] =1. An attempt to access these regions in user mode will issue an interrupt. This bit enables the interrupt. 0 Interrupt is disabled. 1 Interrupt is enabled.

Table continues on the next page...

IPUx_INT_CTRL_10 field descriptions (continued)

Field	Description
27 Reserved	This read-only field is reserved and always has the value 0.
26 IC_BAYER_ FRM_LOST_ ERR_EN	This bit enables an interrupt that is a result of IC's Bayer frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IC_ENC_FRM_ LOST_ERR_EN	This bit enables an interrupt that is a result of IC's encoding frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
24 IC_VF_FRM_ LOST_ERR_EN	This bit enables an interrupt that is a result of IC's view finder frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 Reserved	This read-only field is reserved and always has the value 0.
22 DI1_TIME_OUT_ ERR_EN	DI1 time out error interrupt enable This bit enables the interrupt that is a result of a time out error during a read access via DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
21 DI0_TIME_OUT_ ERR_EN	DI0 time outwore interrupt enable This bit enables the interrupt that is a result of a time out error during a read access via DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
20 DI1_SYNC_ DISP_ERR_EN	DI1 Synchronous display error enable This bit enables the interrupt that is a result of an error during access to a synchronous display via DI1 0 Interrupt is disabled. 1 Interrupt is enabled.
19 DI0_SYNC_ DISP_ERR_EN	DI0 Synchronous display error enable This bit enables the interrupt that is a result of an error during access to a synchronous display via DI0 0 Interrupt is disabled. 1 Interrupt is enabled.
18 DC_TEARING_ ERR_6_EN	Tearing Error #6 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 6 0 Interrupt is disabled. 1 Interrupt is enabled.
17 DC_TEARING_ ERR_2_EN	Tearing Error #2 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 2

Table continues on the next page...

IPUx_INT_CTRL_10 field descriptions (continued)

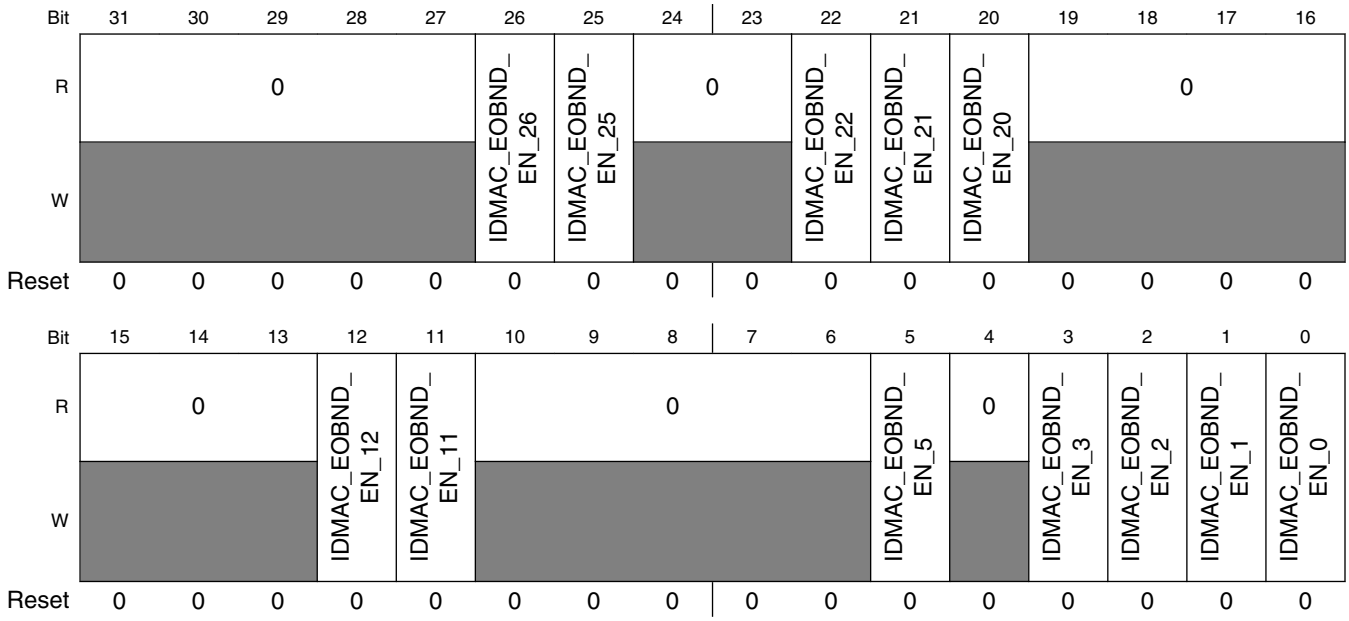
Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
16 DC_TEARING_ERR_1_EN	Tearing Error #1 enable This bit enables the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 1 0 Interrupt is disabled. 1 Interrupt is enabled.
15–4 Reserved	This read-only field is reserved and always has the value 0.
3 SMFC3_FRM_LOST_EN	Frame Lost of SMFC channel 3 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 3. 0 Interrupt is disabled. 1 Interrupt is enabled.
2 SMFC2_FRM_LOST_EN	Frame Lost of SMFC channel 2 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 2. 0 Interrupt is disabled. 1 Interrupt is enabled.
1 SMFC1_FRM_LOST_EN	Frame Lost of SMFC channel 1 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 1. 0 Interrupt is disabled. 1 Interrupt is enabled.
0 SMFC0_FRM_LOST_EN	Frame Lost of SMFC channel 0 interrupt enable bit This bit enables an interrupt that is a result of a Frame Lost of SMFC channel 0. 0 Interrupt is disabled. 1 Interrupt is enabled.

37.5.16 Interrupt Control Register 11 (IPUx_INT_CTRL_11)

This register contains part of IPU interrupts controls. The controls of the end-of-band indication (EOBND) of DMA Channels interrupts [31:0] can be found in this register.

- Hide VDOA_SYNC for all versions
- Show VDOA_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.

Address: Base address + 64h offset



IPUx_INT_CTRL_11 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
26 IDMAC_EOBND_EN_26	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IDMAC_EOBND_EN_25	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
24–23 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is disabled. 1 Interrupt is enabled.
22 IDMAC_EOBND_EN_22	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is disabled. 1 Interrupt is enabled.
21 IDMAC_EOBND_EN_21	end-of-band indication of Channel interrupt. This bit is the control of end-of-band interrupt of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

17 IDMAC_EOF_SDMA_EN_17	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
16 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
15 IDMAC_EOF_SDMA_EN_15	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
14 IDMAC_EOF_SDMA_EN_14	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
13 IDMAC_EOF_SDMA_EN_13	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
12 IDMAC_EOF_SDMA_EN_12	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_EOF_SDMA_EN_11	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
10 IDMAC_EOF_SDMA_EN_10	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

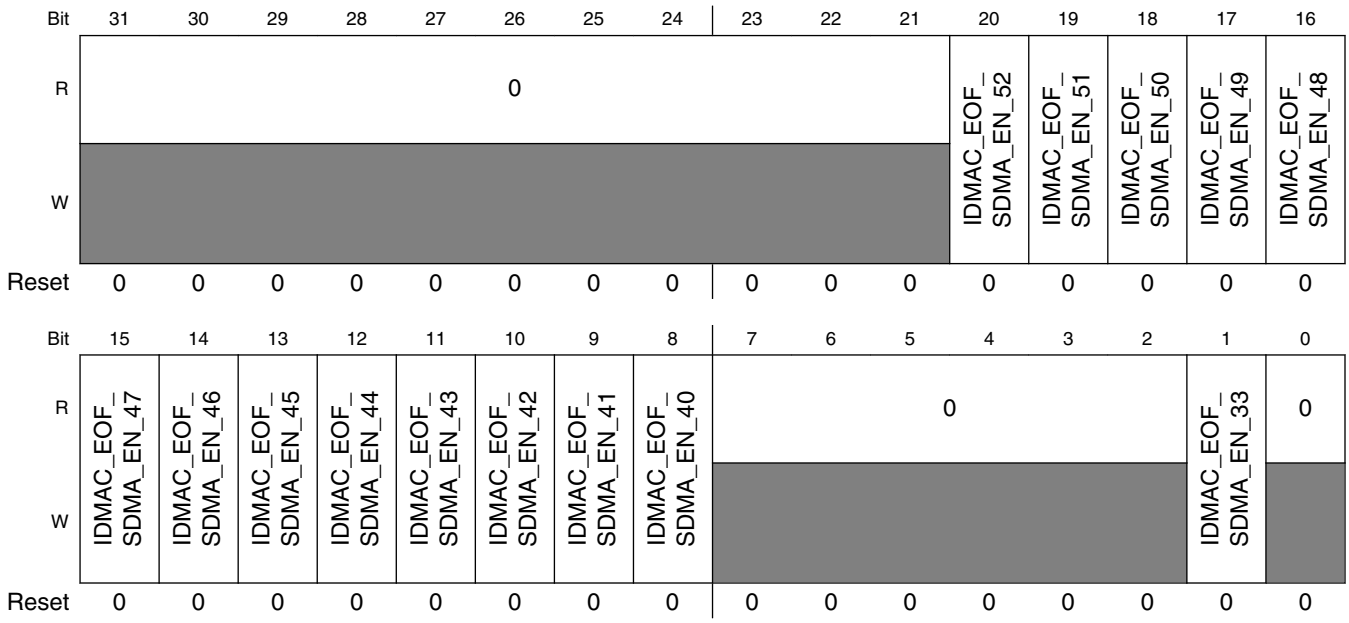
IPUx_SDMA_EVENT_1 field descriptions (continued)

Field	Description
9 IDMAC_EOF_ SDMA_EN_9	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
8 IDMAC_EOF_ SDMA_EN_8	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
7–6 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
5 IDMAC_EOF_ SDMA_EN_5	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
4 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
3 IDMAC_EOF_ SDMA_EN_3	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
2 IDMAC_EOF_ SDMA_EN_2	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_EOF_ SDMA_EN_1	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 IDMAC_EOF_ SDMA_EN_0	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.22 SDMA Event Control Register 2 (IPUx_SDMA_EVENT_2)

This register contains part of IPU SDMA events controls. The controls of EOF (end of frame) of DMA Channels SDMA events [63:32] can be found in this register.

Address: Base address + 7Ch offset



IPUx_SDMA_EVENT_2 field descriptions

Field	Description
31–21 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
20 IDMAC_EOF_SDMA_EN_52	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
19 IDMAC_EOF_SDMA_EN_51	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
18 IDMAC_EOF_SDMA_EN_50	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

IPUx_SDMA_EVENT_2 field descriptions (continued)

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
17 IDMAC_EOF_ SDMA_EN_49	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
16 IDMAC_EOF_ SDMA_EN_48	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
15 IDMAC_EOF_ SDMA_EN_47	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
14 IDMAC_EOF_ SDMA_EN_46	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
13 IDMAC_EOF_ SDMA_EN_45	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
12 IDMAC_EOF_ SDMA_EN_44	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_EOF_ SDMA_EN_43	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
10 IDMAC_EOF_ SDMA_EN_42	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
9 IDMAC_EOF_ SDMA_EN_41	Enable End of Frame of Channel SDMA event. This bit is the control of End Of Frame of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
26 IDMAC_EOBND_SDMA_EN_26	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
25 IDMAC_EOBND_SDMA_EN_25	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
24–23 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
22 IDMAC_EOBND_SDMA_EN_22	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
21 IDMAC_EOBND_SDMA_EN_21	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number.

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
20 IDMAC_EOBND_SDMA_EN_20	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
19–13 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
12 IDMAC_EOBND_SDMA_EN_12	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
11 IDMAC_EOBND_SDMA_EN_11	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
10–6 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
5 IDMAC_EOBND_SDMA_EN_5	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
4 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
3 IDMAC_EOBND_SDMA_EN_3	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
2 IDMAC_EOBND_SDMA_EN_2	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_EOBND_SDMA_EN_1	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

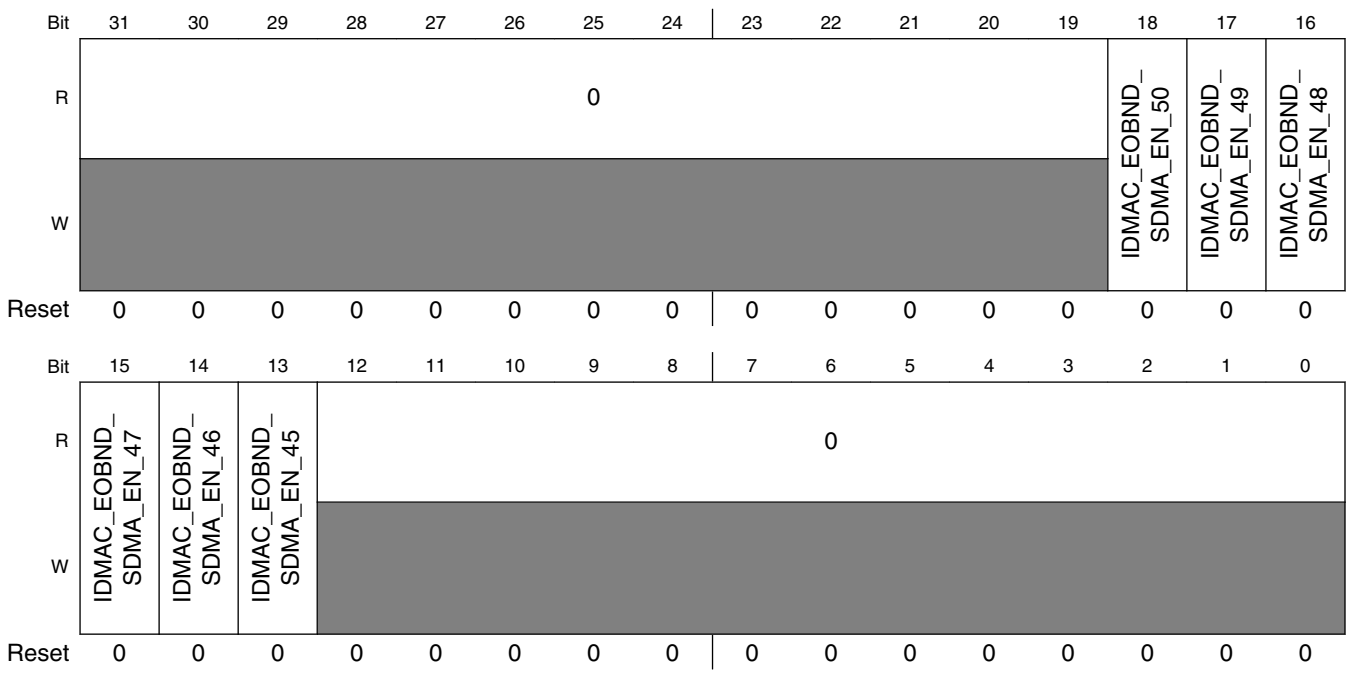
IPUx_SDMA_EVENT_11 field descriptions (continued)

Field	Description
	0 SDMA event is disabled. 1 SDMA event is enabled.
0 IDMAC_EOBND_ SDMA_EN_0	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.28 SDMA Event Control Register 12 (IPUx_SDMA_EVENT_12)

This register contains part of IPU SDMA events controls. The controls of EOBND (End of Band) of DMA Channels SDMA events [63:32] can be found in this register.

Address: Base address + 94h offset



IPUx_SDMA_EVENT_12 field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
	0 SDMA event is disabled. 1 SDMA event is enabled.

Table continues on the next page...

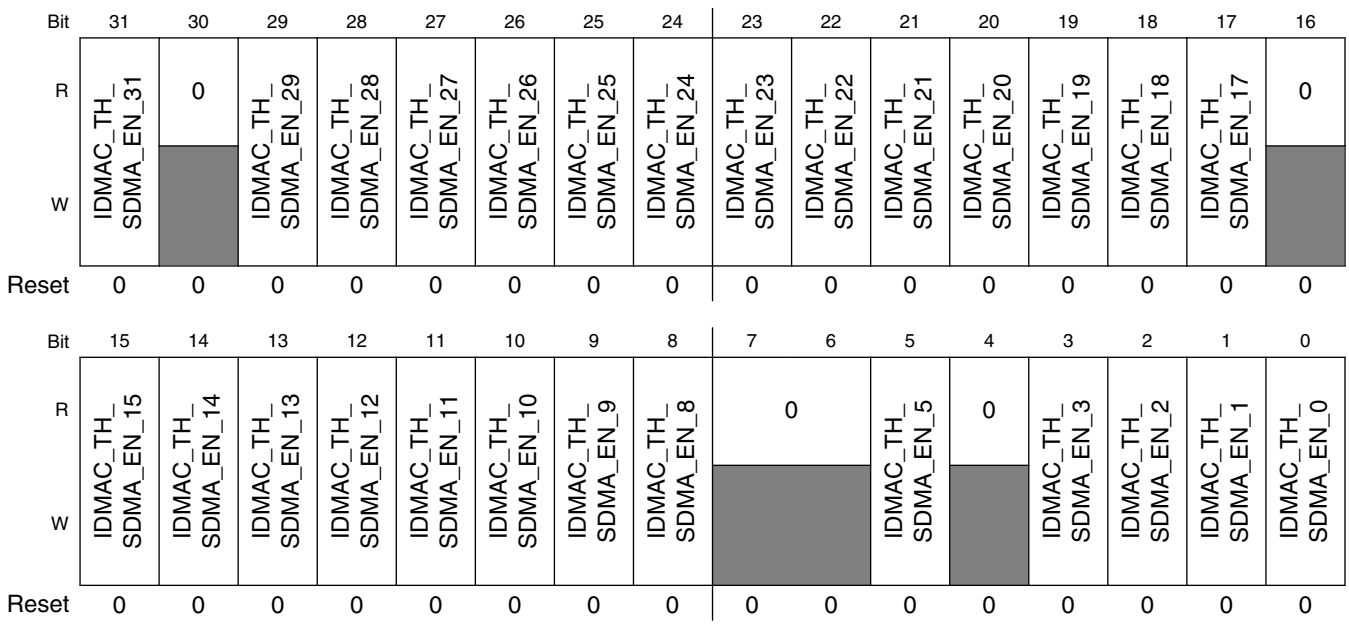
IPUx_SDMA_EVENT_12 field descriptions (continued)

Field	Description
18 IDMAC_EOBND_ SDMA_EN_50	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
17 IDMAC_EOBND_ SDMA_EN_49	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
16 IDMAC_EOBND_ SDMA_EN_48	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
15 IDMAC_EOBND_ SDMA_EN_47	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
14 IDMAC_EOBND_ SDMA_EN_46	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
13 IDMAC_EOBND_ SDMA_EN_45	Enable End of Band of Channel SDMA event. This bit is the control of End Of Band of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.29 SDMA Event Control Register 13 (IPUx_SDMA_EVENT_13)

This register contains part of IPU SDMA events controls. The controls of TH (Threshold) of DMA Channels SDMA events [31:0] can be found in this register.

Address: Base address + 98h offset



IPUx_SDMA_EVENT_13 field descriptions

Field	Description
31 IDMAC_TH_ SDMA_EN_31	Enable Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
30 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
29 IDMAC_TH_ SDMA_EN_29	Enable Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
28 IDMAC_TH_ SDMA_EN_28	Enable Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

Field	Description
10 IDMAC_TH_ SDMA_EN_42	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
9 IDMAC_TH_ SDMA_EN_41	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
8 IDMAC_TH_ SDMA_EN_40	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
7–2 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.
1 IDMAC_TH_ SDMA_EN_33	Threshold of Channel SDMA event. This bit is the control of Threshold of Channel #n. n Indicates the corresponding DMA channel number. *n* Indicates the corresponding DMA channel number. 0 SDMA event is disabled. 1 SDMA event is enabled.
0 Reserved	This read-only field is reserved and always has the value 0. 0 SDMA event is disabled. 1 SDMA event is enabled.

37.5.31 Shadow Registers Memory Priority 1 Register (IPUx_SRM_PRI1)

The register controls the priority of SRM updates. The priority level for each block that has a shadow of its registers in the SRM should be unique. The priority level defines the order of SRM updates. A block with priority set to 010 will be updated before a block with priority set to 001.

Address: Base address + A0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_SRM_PRI1 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12–11 CSI0_SRM_MODE	CSI0 SRM Mode This field controls the SRM logic that handles the CSI0 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the CSI1's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM Platform. The Register will be update now
10–8 CSI0_SRM_PRI	CSI0 SRM priority This bits define the priority of the CSI1 block
7–5 Reserved	This read-only field is reserved and always has the value 0.
4–3 CSI1_SRM_MODE	CSI1 SRM Mode This field controls the SRM logic that handles the CSI1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the CSI0's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
CSI1_SRM_PRI	CSI1 SRM priority This bits define the priority of the CSI0 module

37.5.32 Shadow Registers Memory Priority 2 Register (IPUx_SRM_PRI2)

The register controls the priority of SRM updates. The priority level for each block that has a shadow of its registers in the SRM should be unique. The priority level defines the order of SRM updates. a block with priority set to 010 will be updated before a block with priority set to 001.

Address: Base address + A4h offset

IPUx_SRM_PRI2 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–27 DI1_SRM_MODE	DCI1 SRM Mode This field controls the SRM logic that handles the DI1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DI1 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
26–24 DI1_SRM_PRI	DI1 SRM priority This bits define the priority of the DI1 module
23–21 Reserved	This read-only field is reserved and always has the value 0.
20–19 DI0_SRM_MCU_USE	DI0 SRM is used by ARM platform This bit indicates that the registers of the DI0 are currently being updated by the ARM platform. The ARM platform should set this bit before accessing the SRM part that is relevant to the DI0. The ARM platform should clear this bit when the update procedure is finished. When this bit is set the SRM mechanism will not update the DI0's registers to avoid data coherency problems. 1 DI0 SRM is currently updated by the ARM platform 0 DI0 SRM s currently not updated by the ARM platform
18–16 DI0_SRM_PRI	DI0 SRM priority This bits define the priority of the DI0 module

Table continues on the next page...

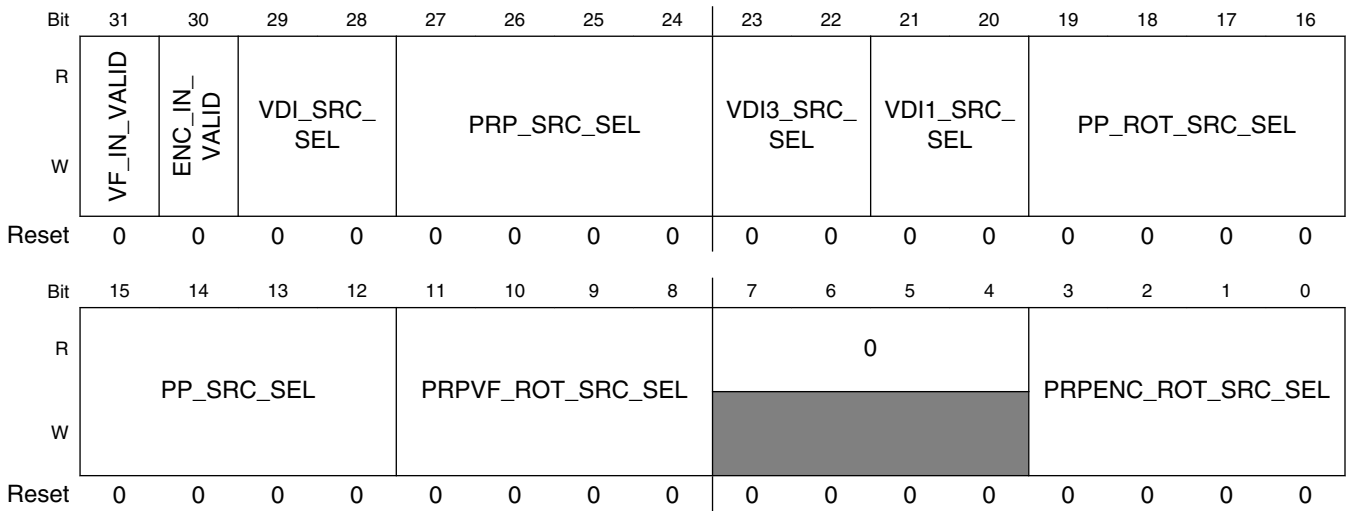
IPUx_SRM_PRI2 field descriptions (continued)

Field	Description
15–14 DC_6_SRM_ MODE	DC Group #6 SRM Mode This field controls the SRM logic that handles the DC Group #6 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DC Group #6's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
13–12 DC_2_SRM_ MODE	DC Group #2 SRM Mode This field controls the SRM logic that handles the DC Group #2 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DC Group #2's region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
11–9 DC_SRM_PRI	DC SRM priority This bits define the priority of the DC module
8–7 DP_A1_SRM_ MODE	DP Async flow #1 SRM Mode This field controls the SRM logic that handles the DP Async flow #1 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP Async flow #1 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
6–5 DP_A0_SRM_ MODE	DP Async flow #0 SRM Mode This field controls the SRM logic that handles the DP Async flow #0 registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP Async flow #0 region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done of the next frame. 10 The SRM logic is controlled by the FSU. Registers are swapped continuously frame by frame 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
4–3 DP_S_SRM_ MODE	DP sync flow SRM Mode This field controls the SRM logic that handles the DP sync flow registers 00 Automatic swapping is disabled; ARM platform is allowed to access the DP sync flow region in the RAM 01 The SRM logic is controlled by the FSU. The update will be done on the next frame. 10 Reserved 11 Update now. The SRM is controlled by the ARM platform. The Register will be update now
DP_SRM_PRI	DP SRM priority This bits define the priority of the DP module

37.5.33 FSU Processing Flow 1 Register (IPUx_FS_PROC_FLOW1)

This register contain controls for IPU's tasks.

Address: Base address + A8h offset



IPUx_FS_PROC_FLOW1 field descriptions

Field	Description
31 VF_IN_VALID	View-finder Input valid. Setting this bit indicates that the buffer in memory for viewfinder is validated by the ARM platform (valid only when RWS_EN is '1'). 0 View-finder should skip buffer in memory. 1 View-finder should use buffer in memory.
30 ENC_IN_VALID	Encoding Input valid. Setting this bit indicates that the buffer in memory for encoding is validated by the ARM platform (valid only when RWS_EN is '1'). 0 Encoding should skip buffer in memory. 1 Encoding should use buffer in memory.
29–28 VDI_SRC_SEL	Source select for the VDIC This field is relevant if the VDIC works in de-interlacing mode (when VDI_CMB_EN bit is clear) 00 ARM platform 01 CSI direct (cb7) 10 Reserved 10 VDOA 11 Reserved
27–24 PRP_SRC_SEL	Source select for the Pre Processing Task 0000 ARM platform

37.5.35 FSU Processing Flow 3 Register (IPUx_FS_PROC_FLOW3)

This register contains controls for IPU's tasks.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

37.5.38 SKIP Register (IPUx_SKIP)

This register controls the different frame skipping supported by the IPU.

Address: Base address + BCh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	VDI_SKIP												VDI_MAX_ RATIO_SKIP				CSI_SKIP_IC_VF					CSI_ MAX_ RATIO_ SKIP_IC_ VF			CSI_SKIP_IC_ ENC					CSI_ MAX_ RATIO_ SKIP_IC_ ENC		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_SKIP field descriptions

Field	Description
31–20 VDI_SKIP	VDI_SKIP These 12 bits define the skipping pattern of the frames send from the VDIC. The VDIC avoids reading fields from the memory if the output frame is skipped. Skipping is relevant only if the source to the VDIC is coming from the CSI. Skipping is done for a set of frames. The number of frames in a set is defined at VDI_MAX_RATIO_SKIP. when VDI_MAX_RATIO_SKIP = 1 => VDI_SKIP[1:0] is used; other bits are ignored when VDI_MAX_RATIO_SKIP = 2 => VDI_SKIP[2:0] are used; other bits are ignored .. .. when VDI_MAX_RATIO_SKIP = 11 => VDI_SKIP[11:0] are used;
19–16 VDI_MAX_ RATIO_SKIP	Maximum Ratio Skip for VDIC

Table continues on the next page...

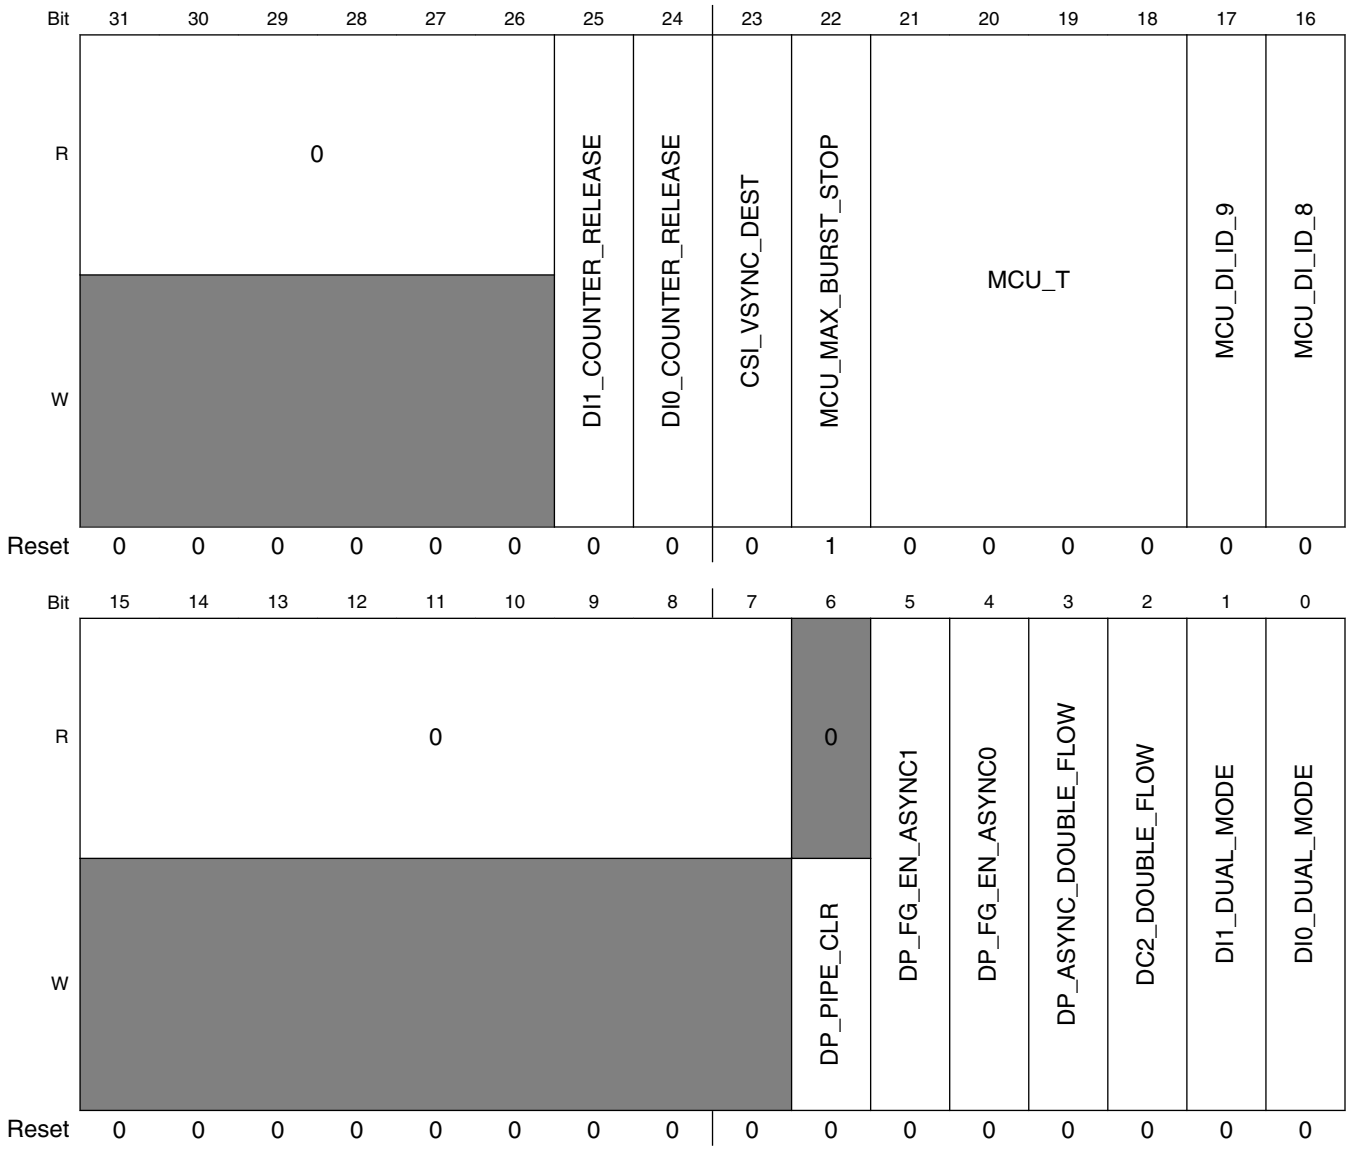
IPUx_SKIP field descriptions (continued)

Field	Description
	These bits define the number of frames in a skipping set. The maximum value of this bits is 11. When set to 0 the skipping is disabled.
15–11 CSI_SKIP_IC_VF	CSI SKIP IC_VF These 5 bits define the skipping pattern of the frames send to the IC for view finder task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_VF. when CSI_MAX_RATIO_SKIP_IC_VF = 1 => CSI_SKIP_IC_VF[1:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF = 2 => CSI_SKIP_IC_VF[2:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF =3 => CSI_SKIP_IC_VF[3:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_VF = 4 => CSI_SKIP_IC_VF[4:0] are used; Setting bit #n of CSI_SKIP_IC_VF means that the #n frame in the set is skipped. For example: if CSI_MAX_RATIO_SKIP_IC_VF = 4 and CSI_SKIP_IC_VF = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_VF is set to 4
10–8 CSI_MAX_ RATIO_SKIP_ IC_VF	CSI Maximum Ratio Skip for IC (view finder task) These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.
7–3 CSI_SKIP_IC_ ENC	CSI SKIP IC_ENC These 5 bits define the skipping pattern of the frames send to the IC for encoding task from one of the CSIs as defined on the CSI_SEL and IC_INPUT bits Skipping is done for a set of frames. The number of frames in a set is defined at CSI_MAX_RATIO_SKIP_IC_ENC. when CSI_MAX_RATIO_SKIP_IC_ENC = 1 => CSI_SKIP_IC_ENC[1:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 2 => CSI_SKIP_IC_ENC[2:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 3 => CSI_SKIP_IC_ENC[3:0] are used; other bits are ignored when CSI_MAX_RATIO_SKIP_IC_ENC = 4 => CSI_SKIP_IC_ENC[4:0] are used; Setting bit #n of CSI_SKIP_IC_ENC means that the #n frame in the set is skipped. For example: if CSI_MAX_RATIO_SKIP_IC_ENC = 4 and CSI_SKIP_IC_ENC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI_MAX_RATIO_SKIP_IC_ENC is set to 4
CSI_MAX_ RATIO_SKIP_ IC_ENC	CSI Maximum Ratio Skip for IC (encoding task) These bits define the number of frames in a skipping set. The maximum value of this bits is 4. When set to 0 the skipping is disabled.

37.5.39 Display General Control Register (IPUx_DISP_GEN)

This register controls various aspects of the display port.

Address: Base address + C4h offset



IPUx_DISP_GEN field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DISP_GEN field descriptions (continued)

Field	Description
25 DI1_COUNTER_RELEASE	DI1 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped
24 DI0_COUNTER_RELEASE	DI1 Counter release By default the DI0 counters responsible for waveform generation for sync flow are frozen. For the first attempt to use the DI in sync flow the user should set this bit 1 counter is released and running 0 counter is cleared and stopped
23 CSI_VSYNC_DEST	CSI_VSYNC destination This bit defines the destination of the VSYNC coming from the CSI's 1 csi1_vsync is connected to DI0; csi0_vsync is connected to DI1 0 csi0_vsync is connected to DI0; csi1_vsync is connected to DI1
22 MCU_MAX_BURST_STOP	ARM platform Maximal burst This bit limit the maximal unspecified length burst. 1 The maximum unspecified burst length is 8-beat 0 The unspecified burst length is unlimited
21–18 MCU_T	The address space for accesses through the AHB-lite slave port is MB and it is split internally (with 32MB resolution) according to bits [28:25] of the address. Using the following notation: Address = (ID[31:29], MSB[28:25], LSB[24:0]) The address is used as follows ("T" is a configurable integer between 0 and 13): MSB<T: access to an external device, with address = (MSB, LSB) T<=MSB<14: access to an external device, with address (MSB-T, LSB)
17 MCU_DI_ID_9	MCU_DI_ID_9 - DI ID via DC channel 9. This bit defines the DI that the ARM platform DC's access via channel #9 1 ARM platform accesses DC's channel #9 via DI1. 0 ARM platform accesses DC's channel #9 via DI0.
16 MCU_DI_ID_8	MCU_DI_ID_8 - DI ID via DC channel 8. This bit defines the DI that the ARM platform DC's access via channel #8 1 ARM platform accesses DC's channel #8 via DI1. 0 ARM platform accesses DC's channel #8 via DI0.
15–7 Reserved	This read-only field is reserved and always has the value 0.
6 DP_PIPE_CLR	DP Pipe Clear This bit clears the internal pipe of the DP. The user may use this bit in case of an error condition This is a self clear bit

Table continues on the next page...

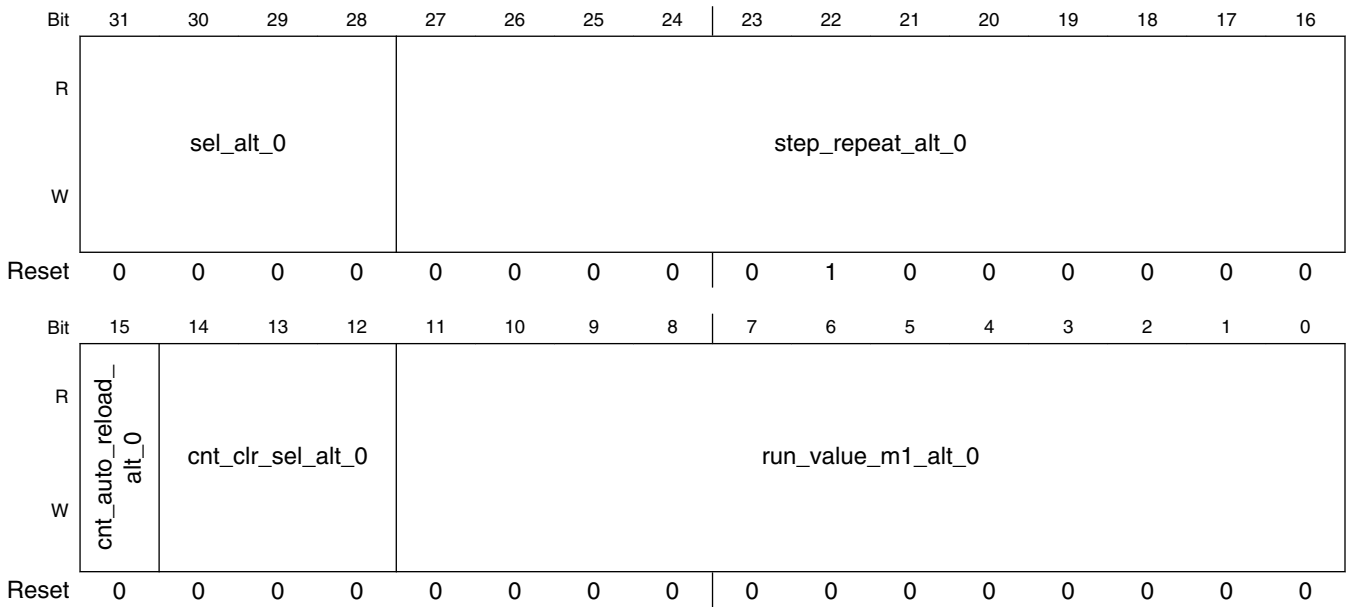
IPUx_DISP_GEN field descriptions (continued)

Field	Description
	1 Clear the internal pipe of the DP 0 Idle - does nothing
5 DP_FG_EN_ASYNC1	FG_EN - partial plane Enable for async flow 1. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled.
4 DP_FG_EN_ASYNC0	FG_EN - partial plane Enable for async flow 0. This bit enables the partial plane channel. 1 partial plane channel is enabled. 0 partial plane channel is disabled.
3 DP_ASYNC_DOUBLE_FLOW	DP Async Double Flow. This bit define how many async flows are currently handles via DP channel (ch24+29) 1 2 flows are handled via DP 0 single flow is handled via DP
2 DC2_DOUBLE_FLOW	DC2 Double Flow. This bit define how many flows are currently handles via DC2 channel (ch41) 1 2 flows are handled via DC2 0 single flow is handled via DC2
1 DI1_DUAL_MODE	DI1 dual mode control 1 DI1 operates in dual mode 0 DI1 is not in dual mode
0 DI0_DUAL_MODE	DI0 dual mode control 1 DI0 operates in dual mode 0 DI0 is not in dual mode

37.5.40 Display Alternate Flow Control Register 1 (IPUx_DISP_ALT1)

This register controls various aspects of the display port.

Address: Base address + C8h offset



IPUx_DISP_ALT1 field descriptions

Field	Description
31–28 sel_alt_0	Select alternative parameters instead of DI Sync Wave Gen counter#. The DI is selected according to DP's synchronous channel destination 0000-disable 0001 instead of counter 1 0010 instead of counter 2 1000 instead of counter 8
27–16 step_repeat_alt_0	This fields defines the amount of repetitions that will be performed by the counter
15 cnt_auto_reload_alt_0	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the step_repeat_alt_0 field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the step_repeat_alt_0 field
14–12 cnt_clr_sel_alt_0	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock.

Table continues on the next page...

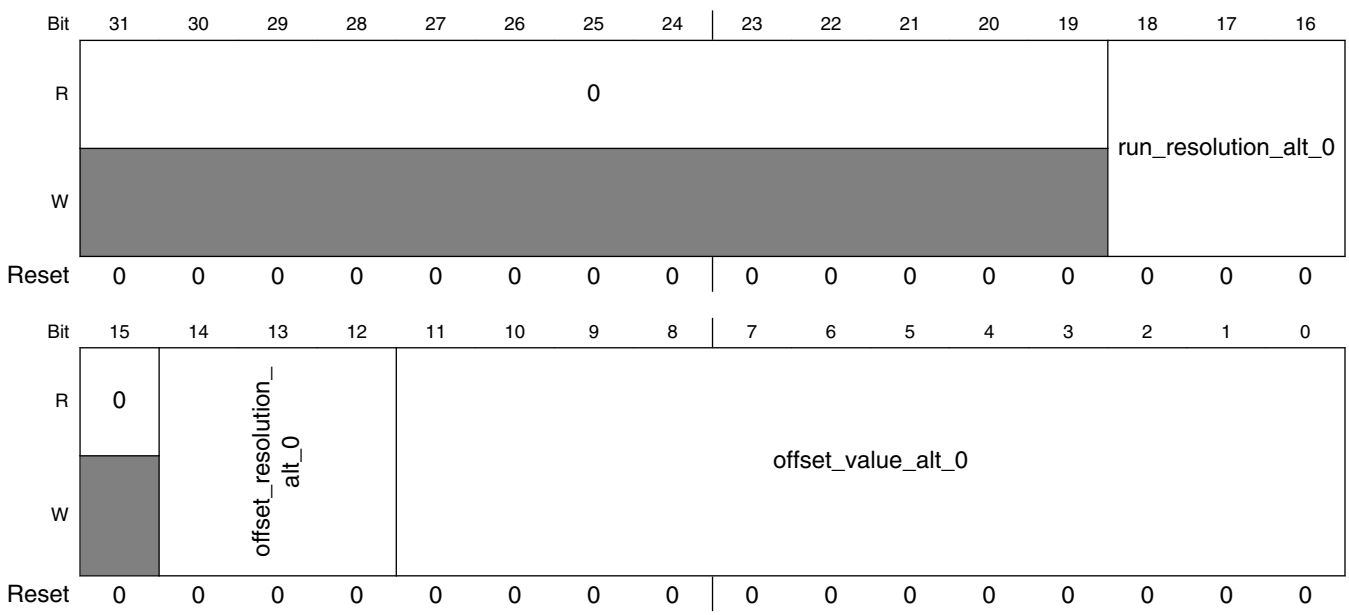
IPUx_DISP_ALT1 field descriptions (continued)

Field	Description
	010 Reserved 011 Reserved 100 Reserved 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
run_value_m1_alt_0	Counter pre defined value This fields defines the counter pre defines value. real value- 1

37.5.41 Display Alternate Flow Control Register 2 (IPUx_DISP_ALT2)

This register controls various aspects of the display port.

Address: Base address + CCh offset



IPUx_DISP_ALT2 field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DISP_ALT2 field descriptions (continued)

Field	Description
18–16 run_resolution_alt_0	Counter Run Resolution This field defines the trigger causing the counter to increment. The counter run resolution should be defined in the same way as in original DI's counter#
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 offset_resolution_alt_0	Counter offset Resolution This field defines the trigger causing the offset counter to increment The counter offset resolution should be defined in the same way as in original DI's counter#
offset_value_alt_0	Counter offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by

37.5.42 Display Alternate Flow Control Register 3 (IPUx_DISP_ALT3)

This register controls various aspects of the display port.

Address: Base address + D0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

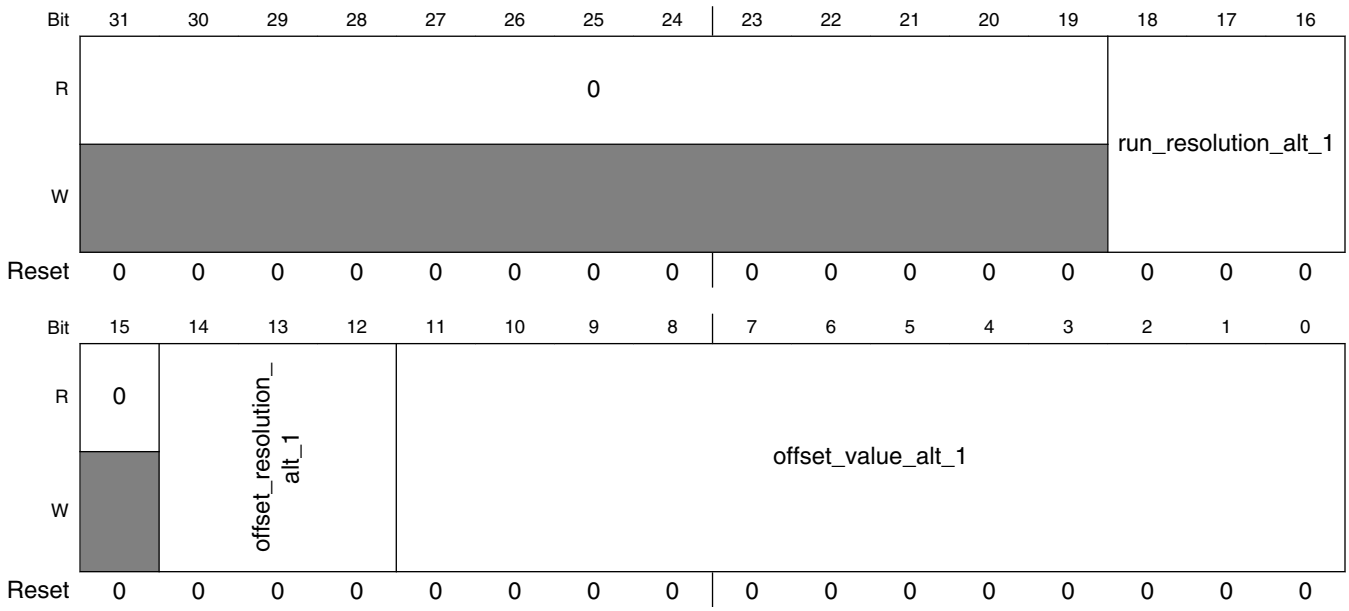
37.5.43 Display Alternate Flow Control Register 4 (IPUx_DISP_ALT4)

This register controls various aspects of the display port.

Address: Base address + D4h offset



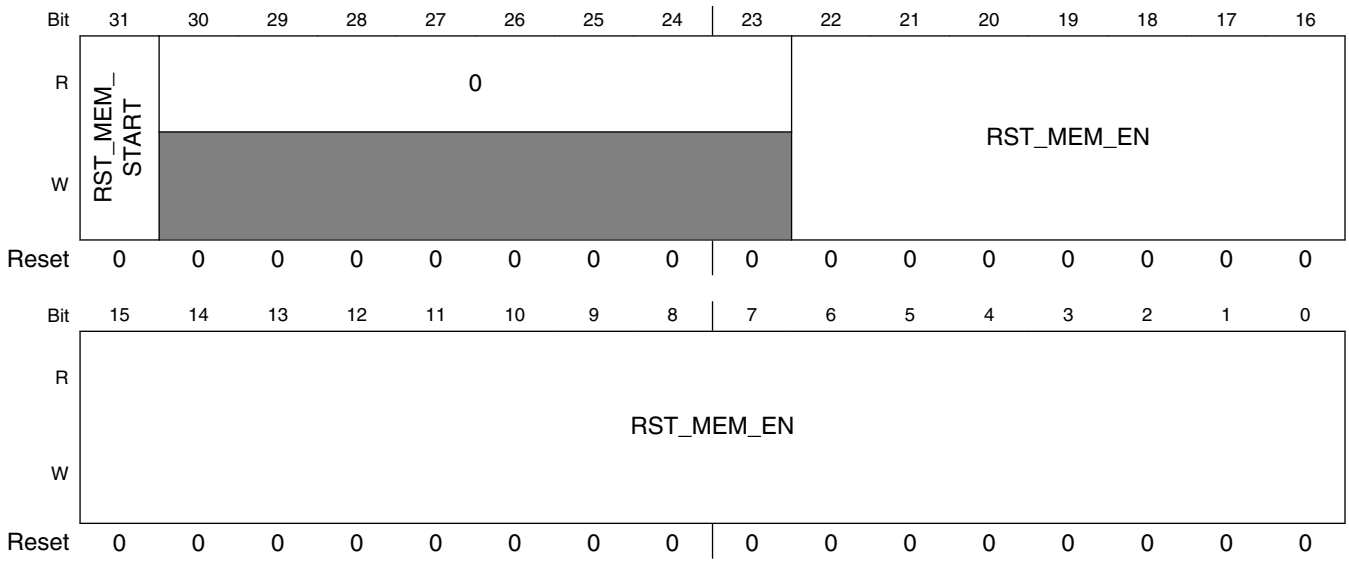
IPUx_DISP_ALT4 field descriptions

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 run_resolution_alt_1	Counter Run Resolution This field defines the trigger causing the counter to increment. The counter run resolution should be defined in the same way as in original DI's counter#
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 offset_resolution_alt_1	Counter offset Resolution This field defines the trigger causing the offset counter to increment The counter offset resolution should be defined in the same way as in original DI's counter#
offset_value_alt_1	Counter offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by

37.5.44 Memory Reset Control Register (IPUx_MEM_RST)

This register controls the memory reset mechanism. IPU has a hardware mechanism for clearing the content of the internal memories. This allows the user to clear the content of or more of the internal memories without the need to perform write accesses to the memories.

Address: Base address + DCh offset



IPUx_MEM_RST field descriptions

Field	Description
31 RST_MEM_ START	Memory Reset Start Writing one to this bit activate the memory reset mechanism. The memories that their corresponding RST_MEM_EN bit is set will be cleared. When the memory reset mechanism completes the memory clearing procedure this bit will be automatically cleared. 1 The memory reset mechanism is activated and busy 0 Idle, the memory reset mechanism is not working.
30–23 Reserved	This read-only field is reserved and always has the value 0.
RST_MEM_EN	Reset Memory Enable Each bit on this field enables the memory reset mechanism for a specific memory. The user should set the relevant bits for the memories that need to be cleared. Below is the list of memories and their corresponding bit. srm = rst_mem_en[0] alpha = rst_mem_en[1] cpmem = rst_mem_en[2]

Table continues on the next page...

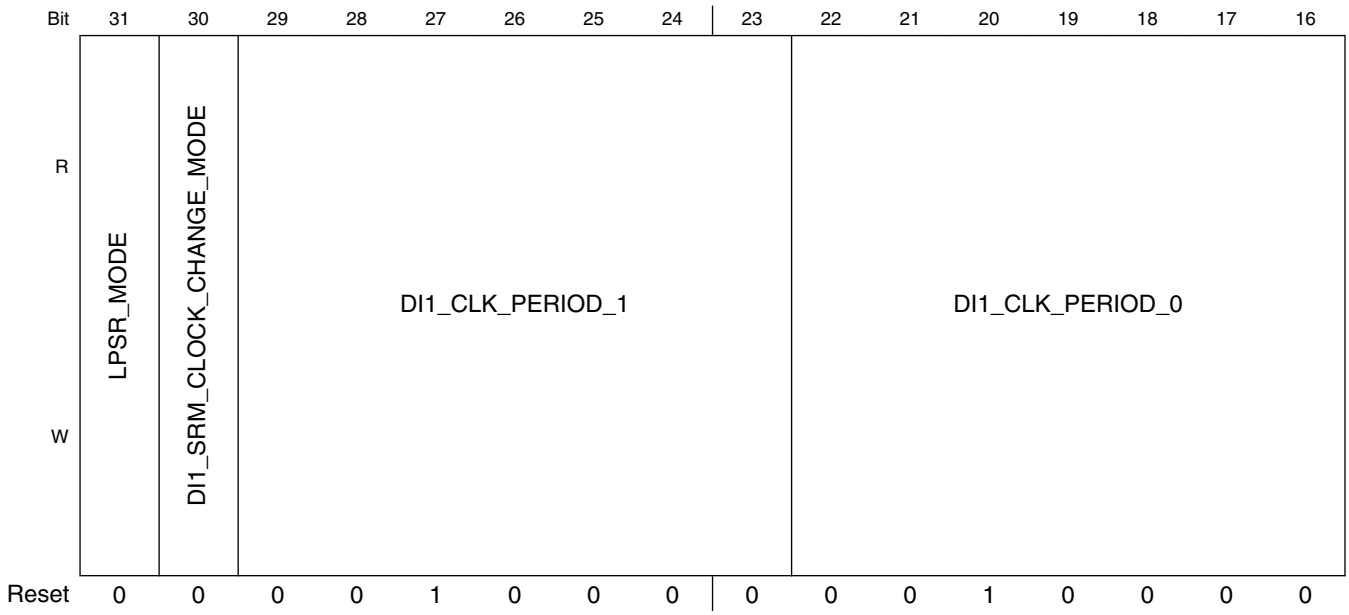
IPUx_MEM_RST field descriptions (continued)

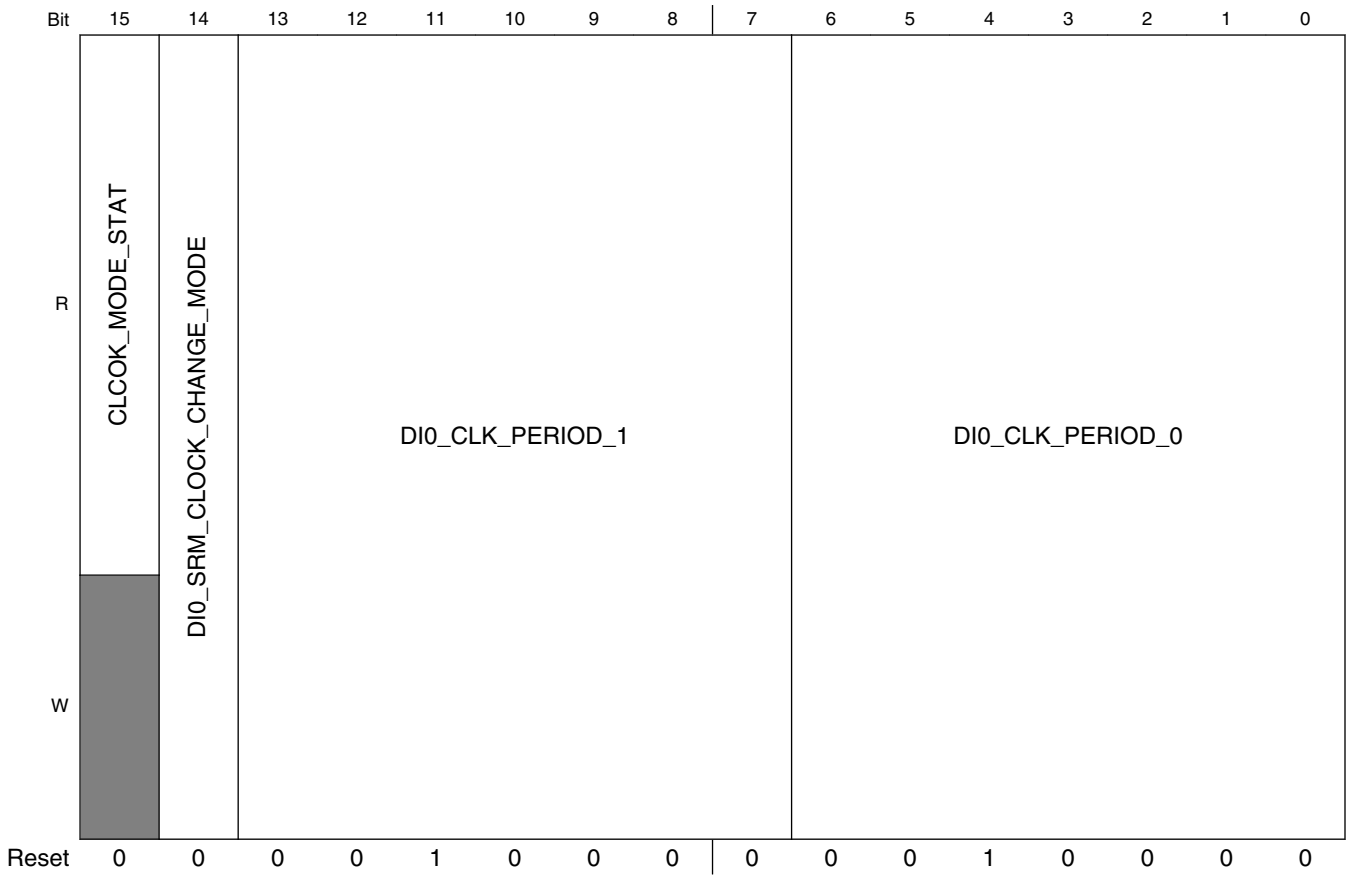
Field	Description
	tpm = rst_mem_en[3] mpm = rst_mem_en[4] bm = rst_mem_en[5] rm = rst_mem_en[6] dstm = rst_mem_en[7] dsom = rst_mem_en[8] lut0 = rst_mem_en[9] lut1 = rst_mem_en[10] ram_smfc = rst_mem_en[11] vdi_fifo2 = rst_mem_en[12] vdi_fifo3 = rst_mem_en[13] icb = rst_mem_en[14] vdi_fifo1 = rst_mem_en[15] dc_template = rst_mem_en[20] dmfc_rd = rst_mem_en[21] dmfc_wr = rst_mem_en[22]

37.5.45 Power Modes Control Register (IPUx_PM)

This register controls the automatic transitions of the IPU between different power modes of the SoC and handles the clock change modes.

Address: Base address + E0h offset





IPUx_PM field descriptions

Field	Description
31 LPSR_MODE	LPSR Mode This bit indicates that the next attempt for entering low power mode is an attempt to move to LPST mode. Setting this bit by the user is essential in order to assure proper response of the IPU to the assertion of the stop request from the CCM. 1 Next low power mode will be LPSR 0 Next low power mode is not LPSR
30 DI1_SRM_ CLOCK_ CHANGE_MODE	SRM clock change mode When the clock is going to be changed to any new ratio other then 1:1, 1:2. 1:4. The user needs to prepare an alternate set of DI setting in the SRM. This bit enable this mode. This bit is self cleared. 1 SRM clock change mode is enabled; the next clock change will be done by updating the DI settings from the SRM 0 SRM clock change mode is disabled.
29–23 DI1_CLK_ PERIOD_1	DI1_CLK period option 1. This parameter defines the period of the clock that the DI1 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI1 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed.

Table continues on the next page...

IPUx_PM field descriptions (continued)

Field	Description
	The value to be programmed to the DI1_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
22–16 DI1_CLK_ PERIOD_0	DI1_CLK period option 0. This parameter defines the period of the clock that the DI1 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI1 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI1_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
15 CLCOK_MODE_ STAT	Clock mode status This is a read only bit indicating what is the current clock mode 1 current clock mode is 1 0 current clock mode is 0
14 DI0_SRM_ CLOCK_ CHANGE_MODE	SRM clock change mode When the clock is going to be changed to any new ratio other then 1:1, 1:2. 1:4. The user needs to prepare an alternate set of DI setting in the SRM. This bit enable this mode. This bit is self cleared. 1 SRM clock change mode is enabled; the next clock change will be done by updating the DI settings from the SRM 0 SRM clock change mode is disabled.
13–7 DI0_CLK_ PERIOD_1	DI0_CLK period option 1. This parameter defines the period of the clock that the DI0 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]). Setting this value to 1.0 (default) means that the DI0 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI0_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with
DI0_CLK_ PERIOD_0	DI0_CLK period option 0. This parameter defines the period of the clock that the DI0 works with. This parameter contains integer part (bits [6:4]) and fractional part (bits [3:0]).

Table continues on the next page...

IPUx_PM field descriptions (continued)

Field	Description
	Setting this value to 1.0 (default) means that the DI0 works on the fastest possible clock. Setting a value smaller than 1.0 is not allowed. The value to be programmed to the DI0_CLK_PERIOD_1 field is equal to: Fast_freq/Target_freq Where: Target_freq = The frequency that the DI clock works with Fast_freq = fastest possible clock that the DI can work with

37.5.46 General Purpose Register (IPUx_GPR)

The register contains general purpose bits.

Address: Base address + E4h offset

IPUx_GPR field descriptions

Field	Description
31 IPU_CH_BUF1_RDY1_CLR	This bit defines the IPU_CH_BUF1_RDY1 properties. This register can be a write one to clear OR write one to set.

Table continues on the next page...

IPUx_GPR field descriptions (continued)

Field	Description
	1 writing one to a bit of this register clears this bit; **IPU_CH_BUF1_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF1_RDY1** is w1s register
30 IPU_CH_BUF1_RDY0_CLR	This bit defines the **IPU_CH_BUF1_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF1_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF1_RDY0** is w1s register
29 IPU_CH_BUF0_RDY1_CLR	This bit defines the **IPU_CH_BUF0_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF0_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF0_RDY1** is w1s register
28 IPU_CH_BUF0_RDY0_CLR	This bit defines the **IPU_CH_BUF0_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF0_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF0_RDY0** is w1s register
27 IPU_ALT_CH_BUF1_RDY1_CLR	This bit defines the **IPU_ALT_CH_BUF1_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF1_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF1_RDY1** is w1s register
26 IPU_ALT_CH_BUF1_RDY0_CLR	This bit defines the **IPU_ALT_CH_BUF1_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF1_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF1_RDY0** is w1s register
25 IPU_ALT_CH_BUF0_RDY1_CLR	This bit defines the **IPU_ALT_CH_BUF0_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF0_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF0_RDY1** is w1s register
24 IPU_ALT_CH_BUF0_RDY0_CLR	This bit defines the **IPU_ALT_CH_BUF0_RDY0** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_ALT_CH_BUF0_RDY0** is w1c register 0 writing one to a bit of this register sets this bit **IPU_ALT_CH_BUF0_RDY0** is w1s register
23 IPU_DI1_CLK_CHANGE_ACK_DIS	Disable DI1's clock change mechanism. 1 clock change mechanism is disabled. DI automatically acknowledges a clock change request 0 clock change mechanism is disabled. DI performs the clock change procedure
22 IPU_DI0_CLK_CHANGE_ACK_DIS	Disable DI0's clock change mechanism. 1 clock change mechanism is disabled. DI automatically acknowledges a clock change request 0 clock change mechanism is disabled. DI performs the clock change procedure
21 IPU_CH_BUF2_RDY1_CLR	This bit defines the **IPU_CH_BUF2_RDY1** properties. This register can be a write one to clear OR write one to set. 1 writing one to a bit of this register clears this bit; **IPU_CH_BUF2_RDY1** is w1c register 0 writing one to a bit of this register sets this bit **IPU_CH_BUF2_RDY1** is w1s register

Table continues on the next page...

IPUx_CH_DB_MODE_SEL1 field descriptions (continued)

Field	Description
	0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
20 DMA_CH_DB_ MODE_SEL_52	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
19 DMA_CH_DB_ MODE_SEL_51	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
18 DMA_CH_DB_ MODE_SEL_50	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
17 DMA_CH_DB_ MODE_SEL_49	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
16 DMA_CH_DB_ MODE_SEL_48	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
15 DMA_CH_DB_ MODE_SEL_47	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
14 DMA_CH_DB_ MODE_SEL_46	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
13 DMA_CH_DB_ MODE_SEL_45	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
12 DMA_CH_DB_ MODE_SEL_44	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number.

Table continues on the next page...

Field	Description
9 DMA_CH_ALT_DB_MODE_SEL_41	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
1 DMA_CH_ALT_DB_MODE_SEL_33	Double Buffer Mode Select. This bit indicates if a double buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Double buffer is not used for this channel. 1 Double buffer is used for this channel.

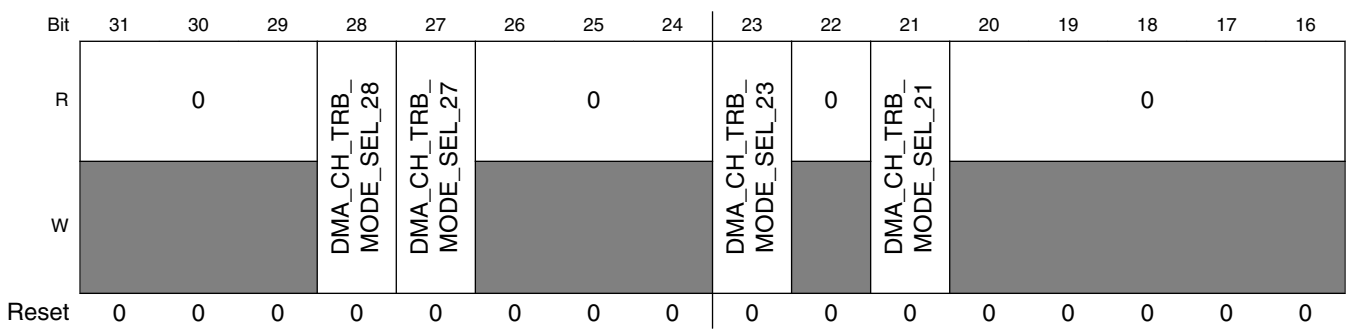
37.5.51 Alternate Channel Triple Buffer Mode Select 0 Register (IPUx_ALT_CH_TRB_MODE_SEL0)

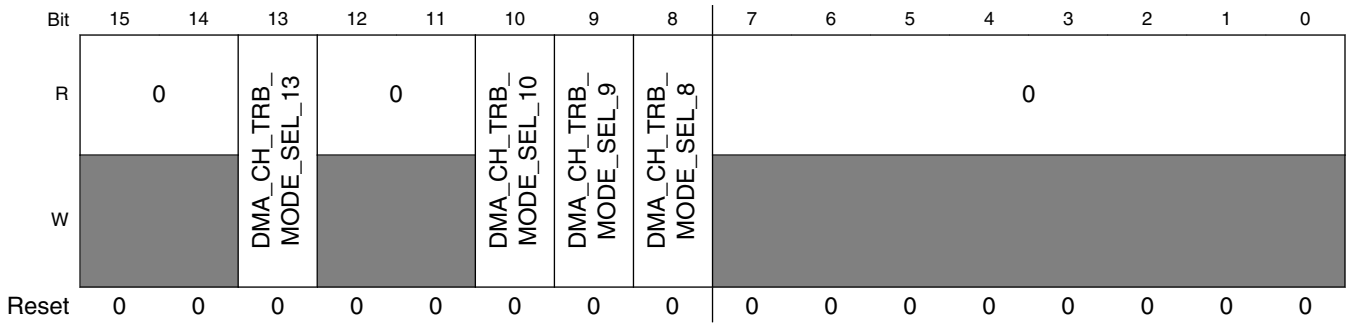
The register contains triple buffer mode select control information for 32 IPU's DMA channels.

When the channel is configured for triple buffer mode. The double buffer mode settings configured on the corresponding DB_MODE_SEL bit are overridden.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

Address: Base address + 178h offset





IPUx_ALT_CH_TRB_MODE_SEL0 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
28 DMA_CH_TRB_MODE_SEL_28	Triple Buffer Mode Select. This bit indicates if a triple buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
27 DMA_CH_TRB_MODE_SEL_27	Triple Buffer Mode Select. This bit indicates if a triple buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
26–24 Reserved	This read-only field is reserved and always has the value 0. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
23 DMA_CH_TRB_MODE_SEL_23	Triple Buffer Mode Select. This bit indicates if a triple buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
22 Reserved	This read-only field is reserved and always has the value 0. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
21 DMA_CH_TRB_MODE_SEL_21	Triple Buffer Mode Select. This bit indicates if a triple buffer is used for this channel. *n* Indicates the corresponding DMA channel number. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.
20–14 Reserved	This read-only field is reserved and always has the value 0. 0 Triple buffer is not used for this channel. 1 Triple buffer is used for this channel.

Table continues on the next page...

IPUx_INT_STAT_7 field descriptions

Field	Description
31 IDMAC_EOS_EN_31	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
30 Reserved	This read-only field is reserved and always has the value 0. 0 Interrupt is cleared. 1 Interrupt is requested.
29 IDMAC_EOS_EN_29	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
28 IDMAC_EOS_EN_28	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
27 IDMAC_EOS_EN_27	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
26 IDMAC_EOS_EN_26	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
25 IDMAC_EOS_EN_25	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.
24 IDMAC_EOS_EN_24	End of Scroll indication of Channel interrupt. This bit is the status bit of End of Scroll interrupt of Channel #n. *n* Indicates the corresponding DMA channel number. 0 Interrupt is cleared. 1 Interrupt is requested.

IPUx_INT_STAT_9 field descriptions

Field	Description
31 CSI1_PUPE	CSI1_PUPE - CSI1 parameters update error interrupt. This bit indicates on an interrupt that is a result of an error generated by the CSI1. The error is generated in case where new frame arrived from the CSI1 before the completion of the CSI1's parameters update by the SRM 0 Interrupt is cleared. 1 Interrupt is requested.
30 CSI0_PUPE	CSI0_PUPE - CSI0 parameters update error interrupt. This bit indicates on an interrupt that is a result of an error generated by the CSI0. The error is generated in case where new frame arrived from the CSI0 before the completion of the CSI0's parameters update by the SRM 0 Interrupt is cleared. 1 Interrupt is requested.
29 Reserved	This read-only field is reserved and always has the value 0.
28 IC_VF_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for view finder coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
27 IC_ENC_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for encoding coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
26 IC_BAYER_BUF_OVF	This bit indicates on an interrupt that is a result of the IC Buffer overflow for Bayer coming from the IC. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
25–1 Reserved	This read-only field is reserved and always has the value 0.
0 VDI_FIFO1_OVF	FIFO1 overflow Interrupt1 The VDIC generate FIFO1 overflow interrupt1 when write pointer of FIFO1 overrun read pointer. 0 Interrupt is cleared. 1 Interrupt is requested.

37.5.61 Interrupt Status Register 10 (IPUx_INT_STAT_10)

IPU status registers are not stored in the SRM during power gating mode.This register contains part of IPU interrupts status bits. This register holds error interrupt indications coming from different modules within All the bits in this register are write one to clear.

Address: Base address + 224h offset

IPUx_INT_STAT_10 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30 AXIR_ERR	This bit indicates on an interrupt that is a result of AXI read access resulted with error response. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
29 AXIW_ERR	This bit indicates on an interrupt that is a result of AXI write access resulted with error response. The user needs to write 1 to this bit in order to clear it. 0 Interrupt is cleared. 1 Interrupt is requested.
28 NON_ PRIVILEGED_ ACC_ERR	Non Privileged Access Error interrupt. This bit indicates on an interrupt that is a result of access the CPMEM or the DP memory in user mode 0 Interrupt is cleared. 1 Interrupt is requested.
27 Reserved	This read-only field is reserved and always has the value 0.
26 IC_BAYER_ FRM_LOST_ ERR	This bit indicates on an interrupt that is a result of IC's Bayer frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
25 IC_ENC_FRM_ LOST_ERR	This bit indicates on an interrupt that is a result of IC's encoding frame lost.

Table continues on the next page...

IPUx_INT_STAT_10 field descriptions (continued)

Field	Description
	0 Interrupt is disabled. 1 Interrupt is enabled.
24 IC_VF_FRM_LOST_ERR	This bit indicates on an interrupt that is a result of IC's view finder frame lost. 0 Interrupt is disabled. 1 Interrupt is enabled.
23 Reserved	This read-only field is reserved and always has the value 0.
22 DI1_TIME_OUT_ERR	DI1 time out error interrupt This bit indicates on the interrupt that is a result of a time out error during a read access via DI1
21 DI0_TIME_OUT_ERR	DI0 time out error interrupt This bit indicates on the interrupt that is a result of a time out error during a read access via DI0
20 DI1_SYNC_DISP_ERR	DI1 Synchronous display error interrupt This bit indicates on the interrupt that is a result of an error during access to a synchronous display via DI1
19 DI0_SYNC_DISP_ERR	DI0 Synchronous display error interrupt This bit indicates on the interrupt that is a result of an error during access to a synchronous display via DI0
18 DC_TEARING_ERR_6	Tearing Error #6 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 6
17 DC_TEARING_ERR_2	Tearing Error #2 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 2
16 DC_TEARING_ERR_1	Tearing Error #1 interrupt This bit indicates on the interrupt that is a result of tearing error while the anti tearing mechanism is activated for DC channel 1
15–4 Reserved	This read-only field is reserved and always has the value 0.
3 SMFC3_FRM_LOST	Frame Lost of SMFC channel 3 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 3 0 Interrupt is cleared. 1 Interrupt is requested.
2 SMFC2_FRM_LOST	Frame Lost of SMFC channel 2 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 2 0 Interrupt is cleared. 1 Interrupt is requested.
1 SMFC1_FRM_LOST	Frame Lost of SMFC channel 1 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 1 0 Interrupt is cleared. 1 Interrupt is requested.

Table continues on the next page...

IPUx_INT_STAT_10 field descriptions (continued)

Field	Description
0 SMFC0_FRM_LOST	Frame Lost of SMFC channel 0 interrupt. This bit indicates on an interrupt that is a result of a result of a Frame Lost of SMFC channel 0 0 Interrupt is cleared. 1 Interrupt is requested.

37.5.62 Interrupt Status Register 11 (IPUx_INT_STAT_11)

IPU status registers are not stored in the SRM during power gating mode.This register contains part of IPU interrupts status bits. The status bits of the end-of-band indication (EOBND) of DMA Channels interrupts [31:0] can be found in this register.

- Hide VDOA_SYNC for all versions
- Show VDOA_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.

13 DMA_CH_CUR_BUF_45	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
12 DMA_CH_CUR_BUF_44	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
11 DMA_CH_CUR_BUF_43	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
10 DMA_CH_CUR_BUF_42	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
9 DMA_CH_CUR_BUF_41	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

Table continues on the next page...

IPUx_CUR_BUF_1 field descriptions (continued)

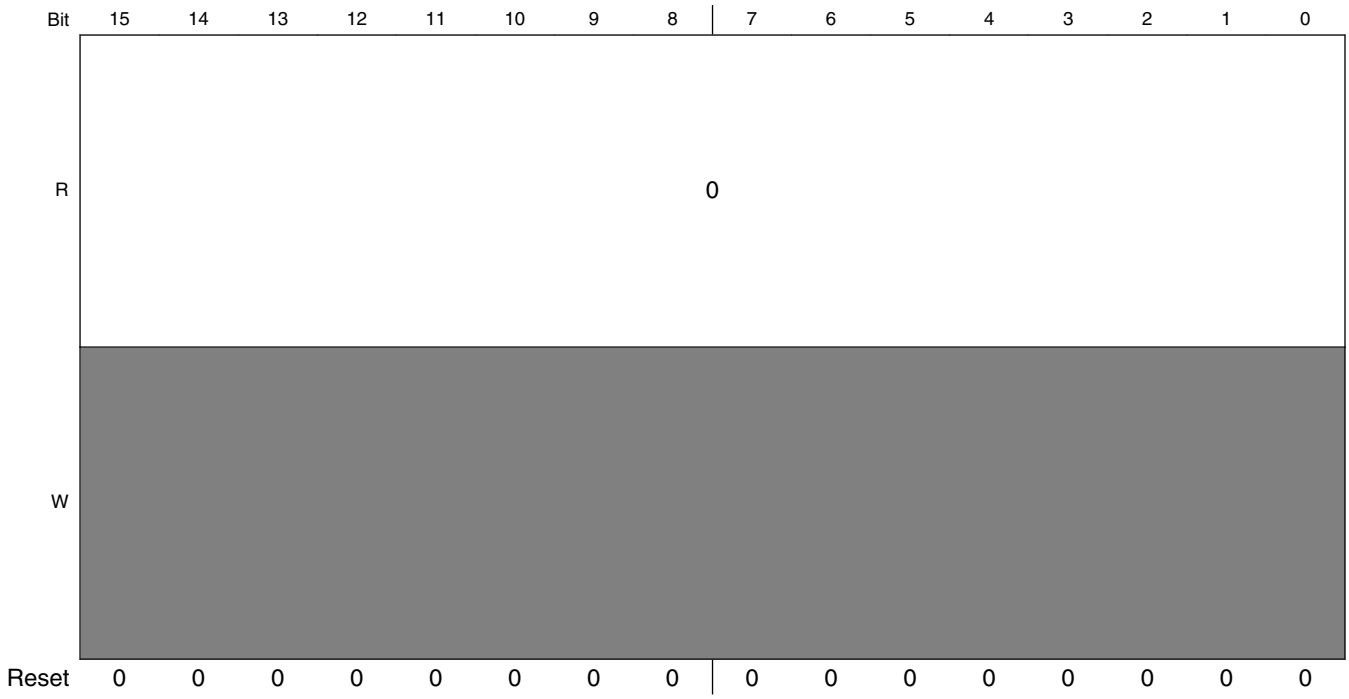
Field	Description
8 DMA_CH_CUR_BUF_40	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
7–2 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
1 DMA_CH_CUR_BUF_33	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

37.5.69 Alternate Current Buffer Register 0 (IPUx_ALT_CUR_0)

This register contains the current buffer status information bit for each DMA channel.

Address: Base address + 244h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0		DMA_CH_ALT_CUR_BUF_29	0				DMA_CH_ALT_CUR_BUF_24	0							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0



IPUx_ALT_CUR_0 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
29 DMA_CH_ALT_ CUR_BUF_29	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
28–25 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
24 DMA_CH_ALT_ CUR_BUF_24	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

37.5.70 Alternate Current Buffer Register 1 (IPUx_ALT_CUR_1)

This register contains the current buffer status information bit for each DMA channel. The register is shown in VDI Plane Size Register 4 , and the register fields are described in VDI Plane Size Register 4 .

Address: Base address + 248h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
	0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
8–2 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
1 DMA_CH_ALT_ CUR_BUF0_n	Current Buffer. This bit indicates which buffer is in use by DMA when double buffer mode is selected. *n* Indicates the corresponding DMA channel number. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.
0 Reserved	This read-only field is reserved and always has the value 0. 0 Current buffer used by DMA is buffer 0. 1 Current buffer used by DMA is buffer 1.

37.5.71 Shadow Registers Memory Status Register (IPUx_SRM_STAT)

The register contains status bits of SRM updates. There is a bit for each block. The bit is set when the SRM is currently updating the module's registers. When the SRM completes updating the registers of the block the bit is cleared. SW should not update the block's registers while it is being updated by the SRM.

Address: Base address + 24Ch offset

IPUx_DISP_TASKS_STAT field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11 DC_ASYNC2_CUR_FLOW	Current asynchronous #2 flow via the DC 1 alternate flow 0 main flow
10–8 DC_ASYNCH2_STAT	Status of the Asynchronous flow #2 through the DC 000 IDLE - the task is idle 001 PRIM_ACTIVE - The primary flow of this task is currently active 010 ALT_ACTIVE - The alternate flow of this task is currently active 011 UPDATE_PARAM - The FSU is busy updating parameters from the SRM 100 PAUSE - The task is paused 101 Reserved 110 Reserved 111 Reserved
7–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_DISP_TASKS_STAT field descriptions (continued)

Field	Description
5–4 DC_ASYNC1_ STAT	Status of the Asynchronous flow #1 through the DC (ch 28) 00 IDLE - The task is idle 01 ACTIVE - This task is currently active 10 WAIT_FOR_ READY - The task is waiting for a buffer to be ready
3 DP_ASYNC_ CUR_FLOW	Current asynchronous flow via the DP 1 alternate flow 0 main flow
DP_ASYNC_ STAT	Status of the Asynchronous flow through the DP 000 IDLE - the task is idle 001 PRIM_ACTIVE - The primary flow of this task is currently active 010 ALT_ACTIVE - The alternate flow of this task is currently active 011 UPDATE_PARAM - The FSU is busy updating parameters from the SRM 100 PAUSE - The task is paused 101 Reserved 110 Reserved 111 Reserved

37.5.74 Triple Current Buffer Register 0 (IPUx_TRIPLE_CUR_BUF_0)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

- Hide VPU_SUB_FRAME_SYNC for all versions
- Show VPU_SUB_FRAME_SYNC for IPUv3H version.
- The table below tagged with other settings (like IPU3M_only) should be hidden in IPUv3H version.
- This requires some sophisticated conditional tag settings

Address: Base address + 258h offset

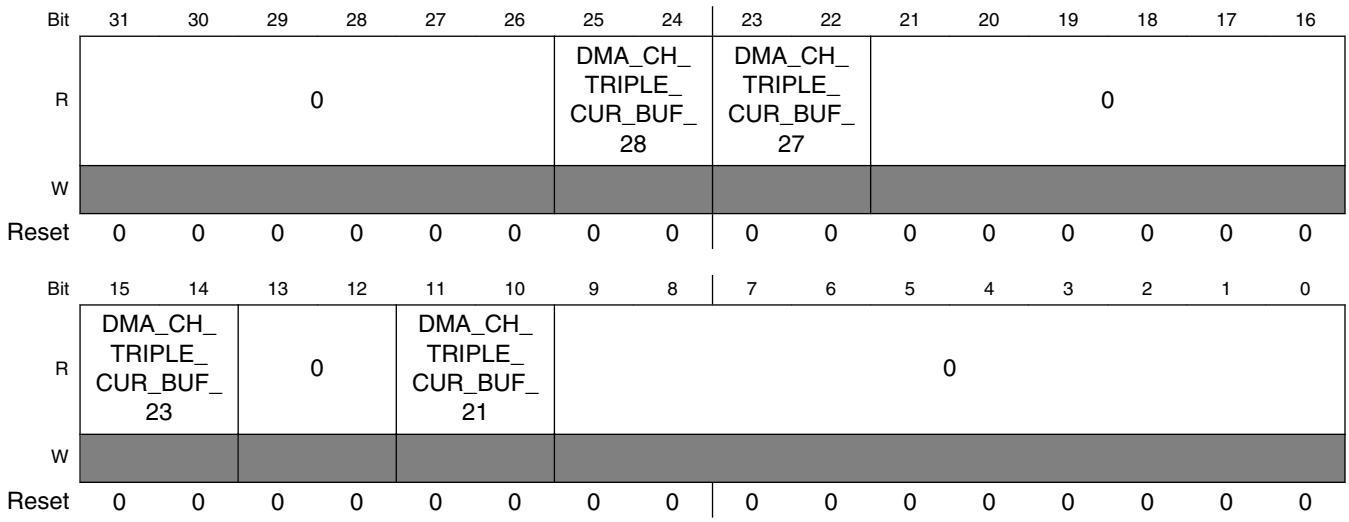
IPUx_TRIPLE_CUR_BUF_0 field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–26 DMA_CH_ TRIPLE_CUR_ BUF_13	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
25–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 DMA_CH_ TRIPLE_CUR_ BUF_10	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
19–18 DMA_CH_ TRIPLE_CUR_ BUF_9	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
17–16 DMA_CH_ TRIPLE_CUR_ BUF_8	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
Reserved	This read-only field is reserved and always has the value 0.

37.5.75 Triple Current Buffer Register 1 (IPUx_TRIPLE_CUR_BUF_1)

This register contains the current buffer status information for triple buffer mode for each DMA channel.

Address: Base address + 25Ch offset



IPUx_TRIPLE_CUR_BUF_1 field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 DMA_CH_TRIPLE_CUR_BUF_28	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
23–22 DMA_CH_TRIPLE_CUR_BUF_27	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.

Table continues on the next page...

IPUx_TRIPLE_CUR_BUF_1 field descriptions (continued)

Field	Description
21–16 Reserved	This read-only field is reserved and always has the value 0.
15–14 DMA_CH_ TRIPLE_CUR_ BUF_23	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
13–12 Reserved	This read-only field is reserved and always has the value 0.
11–10 DMA_CH_ TRIPLE_CUR_ BUF_21	Current Buffer for triple buffer mode. This bits indicate which buffer is in use by the DMA when triple buffer mode is selected. Each pair of bits indicate the corresponding DMA channel (bits [1:0] correspond to ch #0; (bits [3:2] correspond to ch #1, etc.) 11 NA 00 Current buffer used by DMA is buffer 0. 01 Current buffer used by DMA is buffer 1. 10 Current buffer used by DMA is buffer 2.
Reserved	This read-only field is reserved and always has the value 0.

37.5.76 IPU Channels Buffer 0 Ready 0 Register (IPUx_CH_BUF0_RDY0)

The register contains buffer 0 ready control information for 32 IPU's DMA channels (31-0). This register can be a write one to set or a write one to clear according to the **IPU_CH_BUF0_RDY0_CLR bit**.

The register is shown in IPU Channels Buffer 0 Ready 0 Register (IPU_CH_BUF0_RDY0), and the register fields are described in IPU Channels Buffer 0 Ready 0 Register (IPU_CH_BUF0_RDY0).

Address: Base address + 268h offset

Field	Description
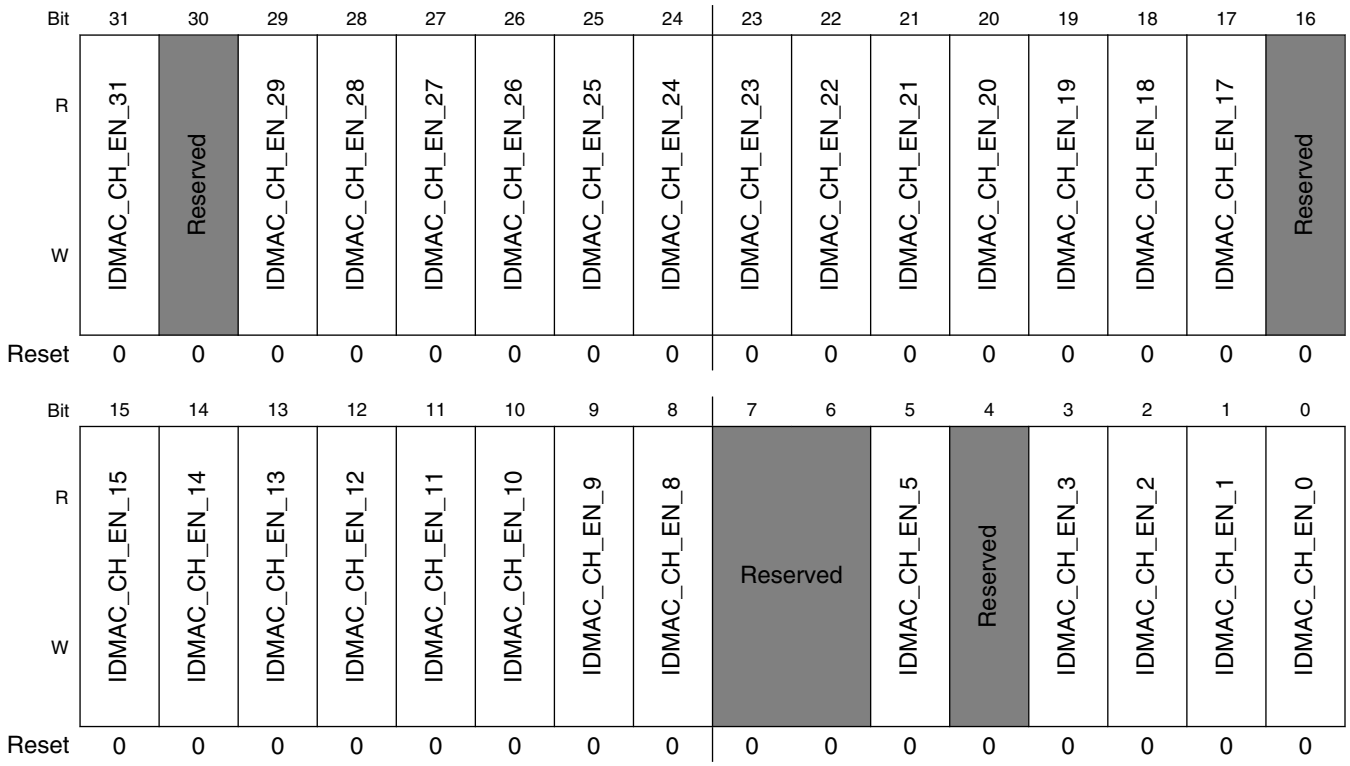
19–17 USED_BUFS_MAX_W	Limit the number of pending non real time write requests. The value can be between 0 to 6. This field has no affect if USED_BUFS_EN_W is cleared
16 P_ENDIAN	Pixel Endianness. The pixel Endianness must not be changed while any of the IDMAC channels is enabled. 0 little endian 1 Big endian
15–6 -	This field is reserved. Reserved, should be cleared.
5 RDI	Read Data Interleaving. This bit must match the slave read data interleaving support. If the AXI slave connected to the IPU supports read data interleaving then this bit must be set. If the AXI slave does not support read data interleaving then the IDMAC can utilize this and issue more address phases on read. In that case it is recommended to have this bit cleared. 0 The AXI slave does not support read data interleaving 1 The AXI slave supports read data interleaving
4–3 WIDPT	Write Interleaving Depth These 2 bits define the Write Interleaving Depth of the AXI port. This bits should be configured by the user according to the AXI slave's Write Interleaving Depth. WIDPT defines the maximal number of active bursts (yet to be responded) with different IDs. IDMAC will block data phase if the next data's ID is new (no such ID active) and the number of active IDs is equal to WIDPT. 00 Write Interleaving Depth of 1 01 Write Interleaving Depth of 2 10 Write Interleaving Depth of 3 11 Write Interleaving Depth of 4
MAX_REQ_READ	Maximum Read Requests. This fields sets the maximum pending requests allowed in the AXI Read requests queue.

37.5.87 IDMAC Channel Enable 1 Register (IPUx_IDMAC_CH_EN_1)

Address: Base address + 8004h offset



IPUx_IDMAC_CH_EN_1 field descriptions

Field	Description
31 IDMAC_CH_EN_31	IDMAC Channel enable bit [i] 0 IDMAC channel is disabled 1 IDMAC channel is enabled
30 -	This field is reserved. Reserved.
29 IDMAC_CH_EN_29	IDMAC Channel enable bit [i] 0 IDMAC channel is disabled 1 IDMAC channel is enabled

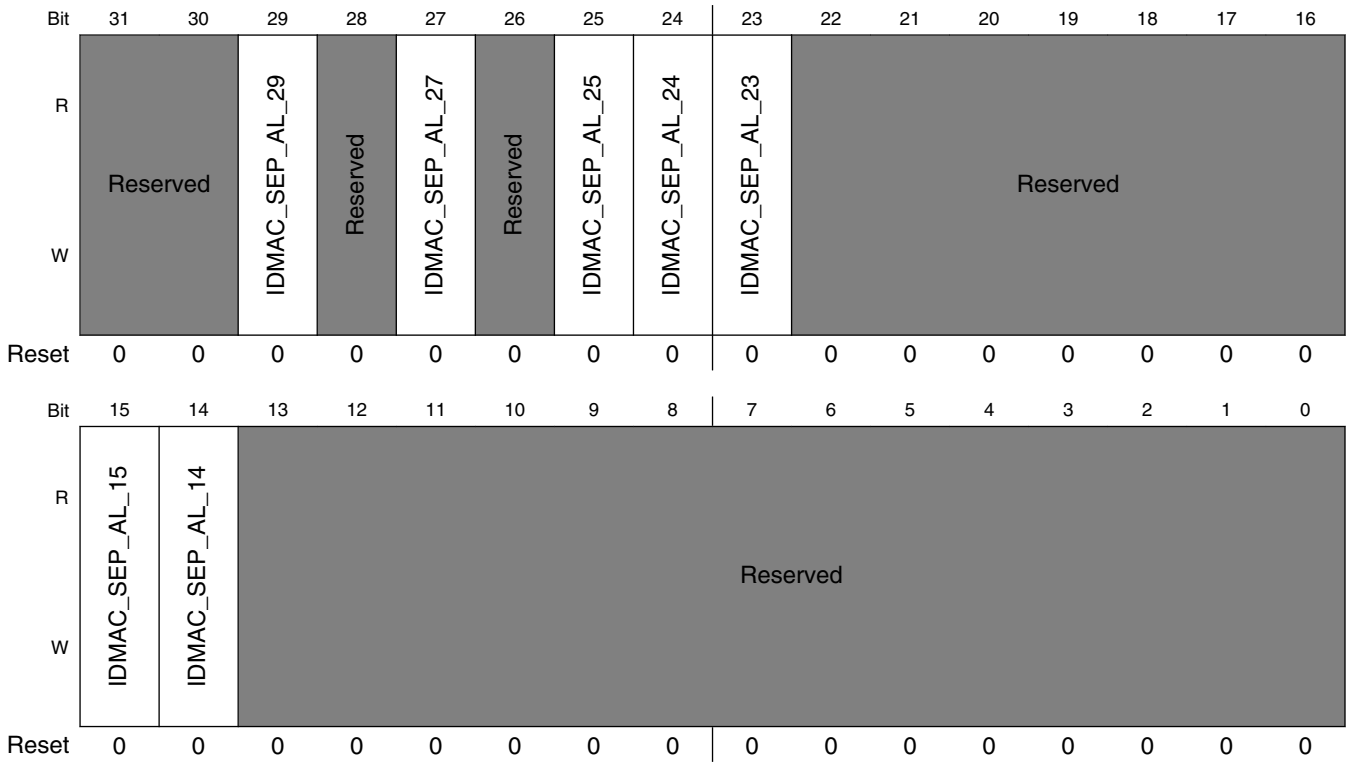
37.5.89 IDMAC Separate Alpha Indication Register (IPUx_IDMAC_SEP_ALPHA)

Address: Base address + 800Ch offset



IPUx_IDMAC_SEP_ALPHA field descriptions

Field	Description
31–30 -	This field is reserved. Reserved.
29 IDMAC_SEP_AL_29	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel. In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
28 -	This field is reserved. Reserved.
27 IDMAC_SEP_AL_27	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel.

Table continues on the next page...

IPUx_IDMAC_SEP_ALPHA field descriptions (continued)

Field	Description
	In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
26 -	This field is reserved. Reserved.
25 IDMAC_SEP_AL_25	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel. In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
24 IDMAC_SEP_AL_24	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel. In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
23 IDMAC_SEP_AL_23	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel. In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
22–16 -	This field is reserved. Reserved.
15 IDMAC_SEP_AL_15	IDMAC Separate alpha indication bit [i] A sub block may need to read data from the system's memory where the pixel data and the alpha transparency data are located in separate buffers. In that case the Alpha transparency data is read by the special Alpha channel. In a case where the alpha should be read from a separate buffer, the user should set the channels corresponding. 0 Channel [i] does not read Alpha transparency data from a separate buffer. 1 Channel [i] reads Alpha transparency data from a separate buffer.
14 IDMAC_SEP_AL_14	IDMAC Separate alpha indication bit [i]

Table continues on the next page...

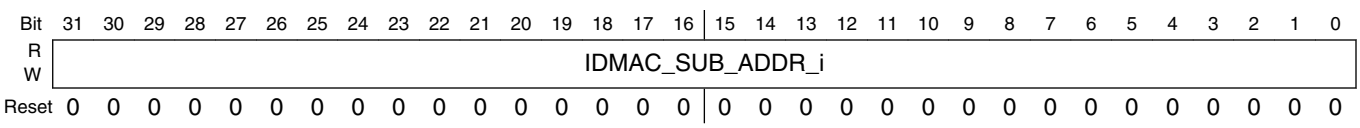
37.5.97 IDMAC Channel Alternate Address 0 Register (IPUx_IDMAC_SUB_ADDR_0)

Address: Base address + 802Ch offset

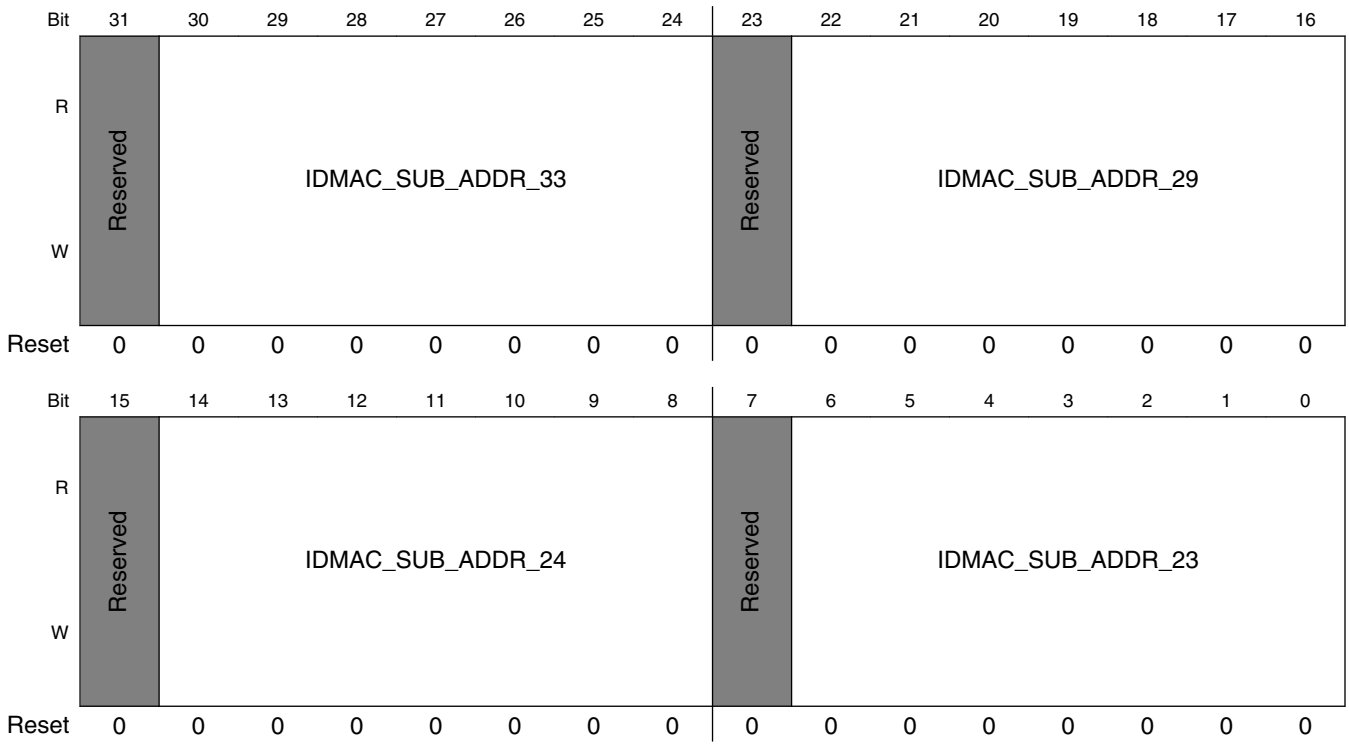


IPUx_IDMAC_SUB_ADDR_0 field descriptions

Field	Description
IDMAC_SUB_ADDR_i	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

37.5.98 IDMAC Channel Alternate Address 1 Register (IPUx_IDMAC_SUB_ADDR_1)

Address: Base address + 8030h offset



IPUx_IDMAC_SUB_ADDR_1 field descriptions

Field	Description
31 -	This field is reserved. Reserved.
30–24 IDMAC_SUB_ADDR_33	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
23 -	This field is reserved. Reserved.
22–16 IDMAC_SUB_ADDR_29	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

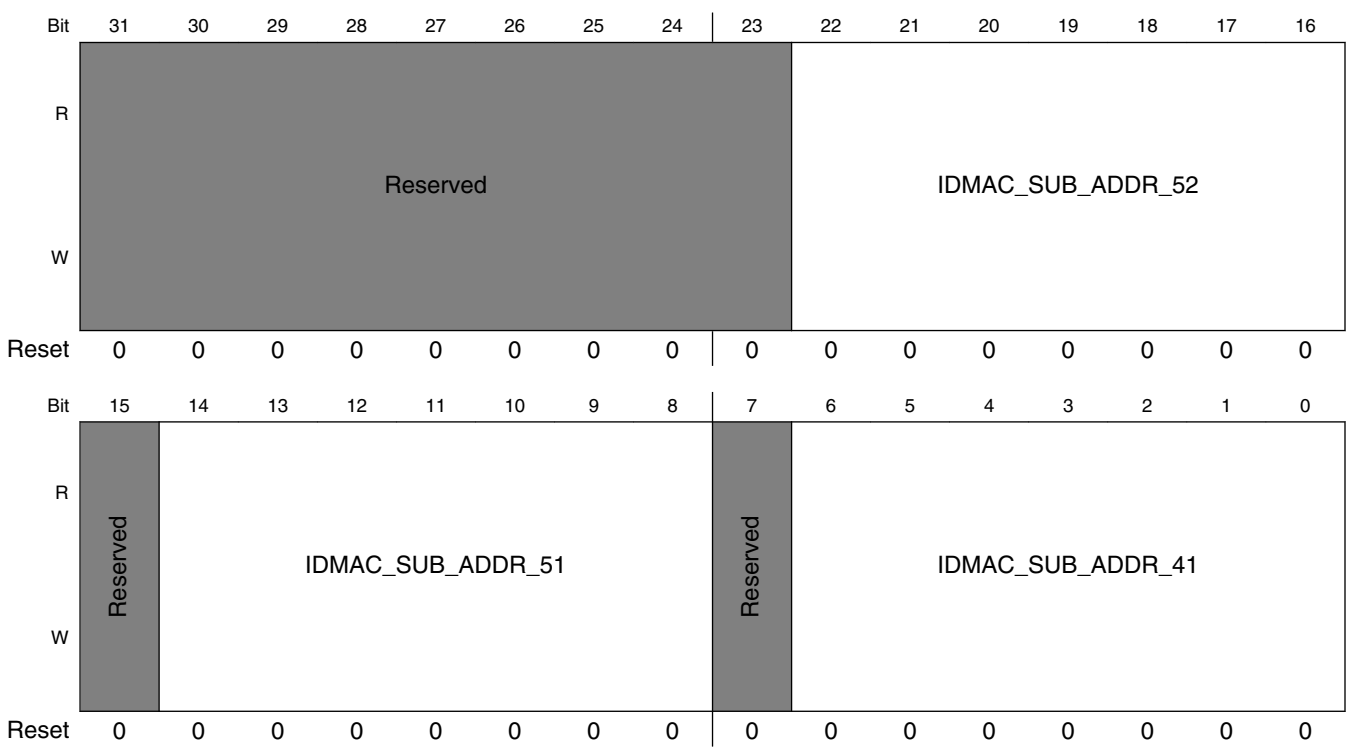
Table continues on the next page...

IPUx_IDMAC_SUB_ADDR_1 field descriptions (continued)

Field	Description
15 -	This field is reserved. Reserved.
14–8 IDMAC_SUB_ADDR_24	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
7 -	This field is reserved. Reserved.
IDMAC_SUB_ADDR_23	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

37.5.99 IDMAC Channel Alternate Address 2 Register (IPUx_IDMAC_SUB_ADDR_2)

Address: Base address + 8034h offset



IPUx_IDMAC_SUB_ADDR_2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved.

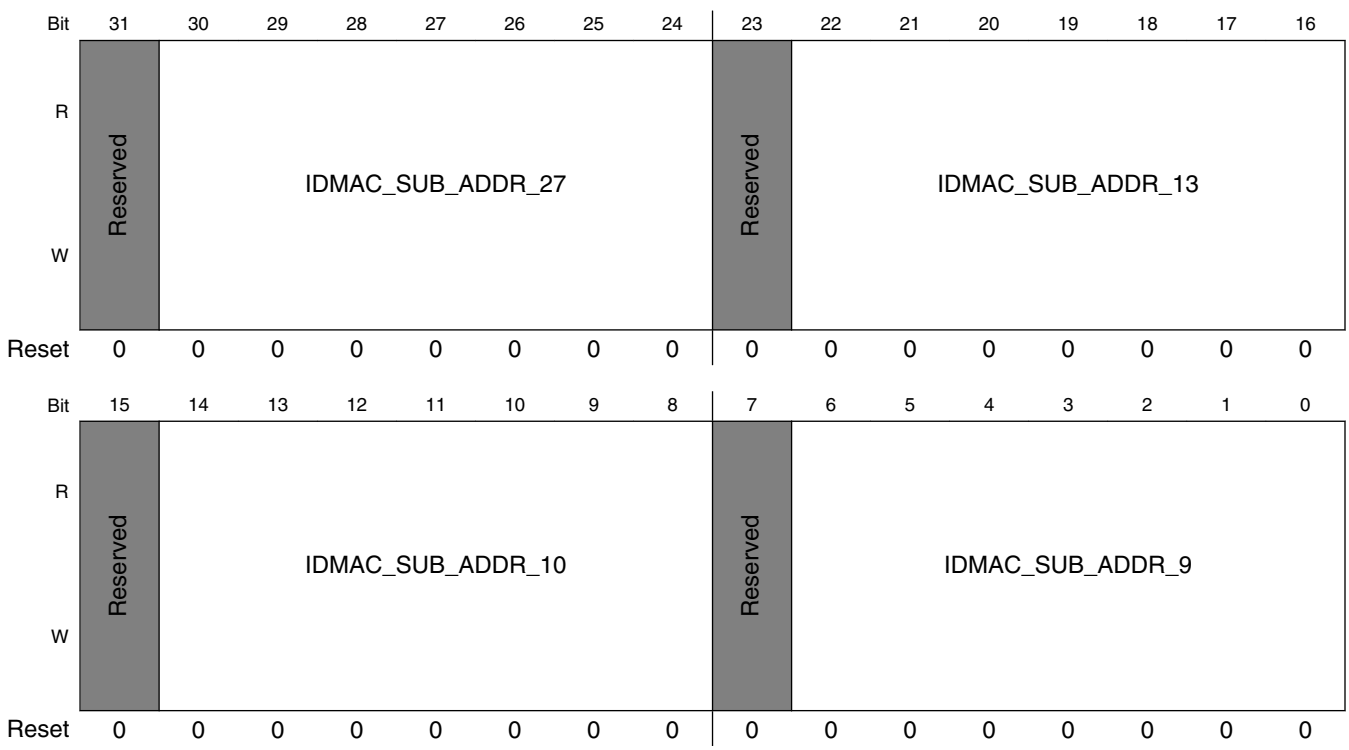
Table continues on the next page...

IPUx_IDMAC_SUB_ADDR_2 field descriptions (continued)

Field	Description
22–16 IDMAC_SUB_ ADDR_52	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
15 -	This field is reserved. Reserved.
14–8 IDMAC_SUB_ ADDR_51	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
7 -	This field is reserved. Reserved.
IDMAC_SUB_ ADDR_41	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

37.5.100 IDMAC Channel Alternate Address 3 Register (IPUx_IDMAC_SUB_ADDR_3)

Address: Base address + 8038h offset

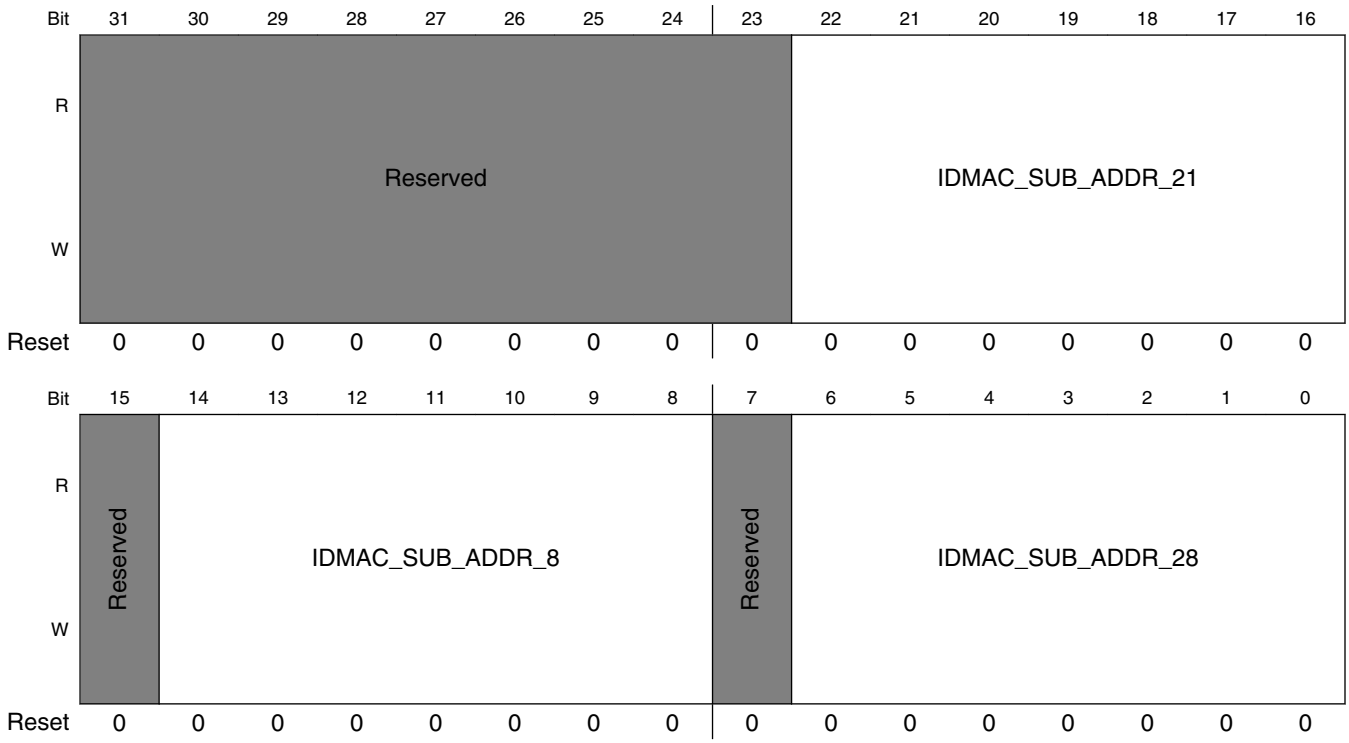


IPUx_IDMAC_SUB_ADDR_3 field descriptions

Field	Description
31 -	This field is reserved. Reserved.
30–24 IDMAC_SUB_ADDR_27	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
23 -	This field is reserved. Reserved.
22–16 IDMAC_SUB_ADDR_13	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
15 -	This field is reserved. Reserved.
14–8 IDMAC_SUB_ADDR_10	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
7 -	This field is reserved. Reserved.
IDMAC_SUB_ADDR_9	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

37.5.101 IDMAC Channel Alternate Address 4 Register (IPUx_IDMAC_SUB_ADDR_4)

Address: Base address + 803Ch offset

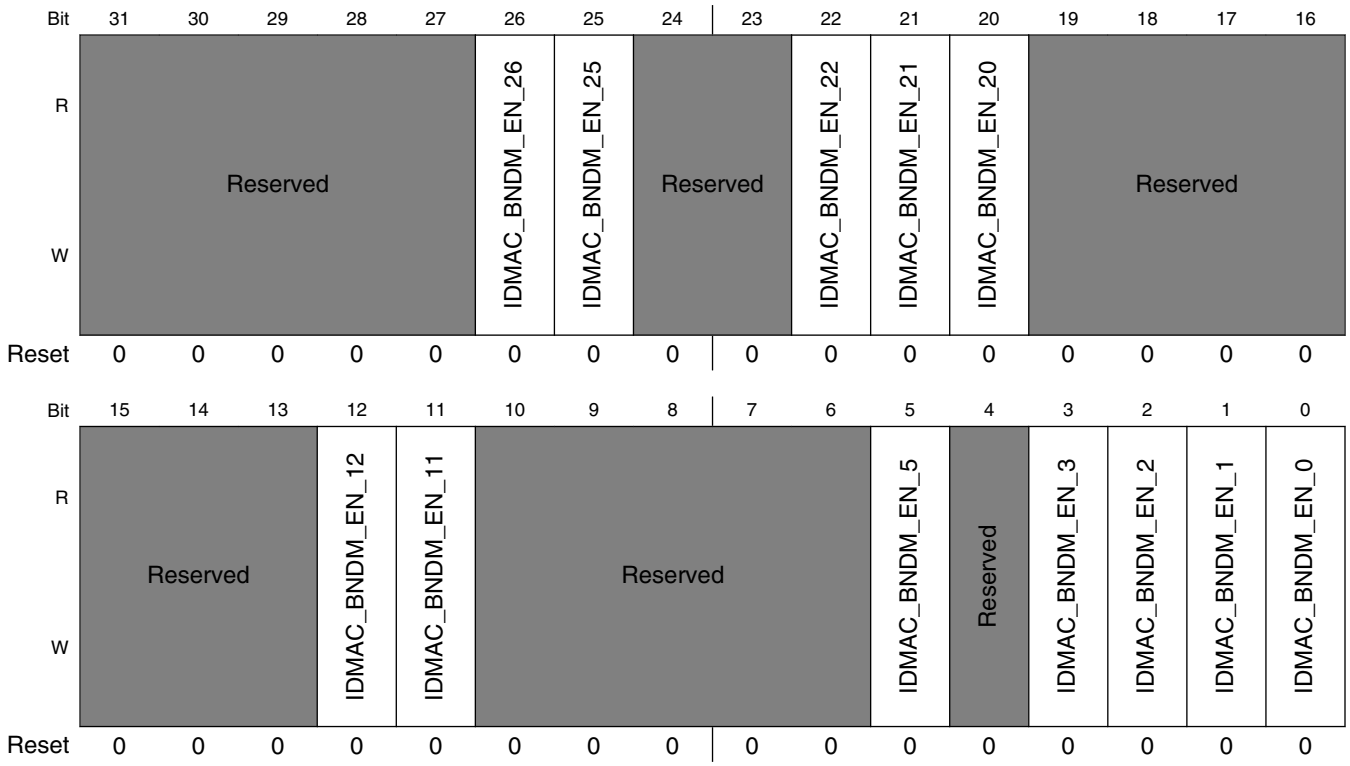


IPUx_IDMAC_SUB_ADDR_4 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved.
22–16 IDMAC_SUB_ADDR_21	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
15 -	This field is reserved. Reserved.
14–8 IDMAC_SUB_ADDR_8	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.
7 -	This field is reserved. Reserved.
IDMAC_SUB_ADDR_28	The CPMEM alternative entry [i] holds the parameters of the channel that is number appears in IDMAC_SUB_ADDR_i. The user must set each IDMAC_SUB_ADDR_i field to a unique channel. Alternative CPMEM entry is relevant only for channels supporting alternate flows.

37.5.102 IDMAC Band Mode Enable 1 Register (IPUx_IDMAC_BNDM_EN_1)

Address: Base address + 8040h offset



IPUx_IDMAC_BNDM_EN_1 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved.
26 IDMAC_BNDM_EN_26	IDMAC Band Mode Enable bit [i] This bit controls if the channel currently works in band mode. When alternate flow is running via this channel, both the main flow and the alternate flow should have the same band mode configuration. 0 IDMAC channel [i] is not in band mode 1 IDMAC channel [i] is in band mode
25 IDMAC_BNDM_EN_25	IDMAC Band Mode Enable bit [i] This bit controls if the channel currently works in band mode. When alternate flow is running via this channel, both the main flow and the alternate flow should have the same band mode configuration. 0 IDMAC channel [i] is not in band mode 1 IDMAC channel [i] is in band mode

Table continues on the next page...

IPUx_DP_GRAPH_WIND_CTRL_ASYNC0 field descriptions

Field	Description
31–24 DP_GWAV_ ASYNC0	GWAV - Graphic Window Alpha Value Defines the alpha value of graphic window used for alpha blending between graphic window and full plane. The Value the number that writing to GWAV register. The Actual Value the number, that insert to calculation in Combining Module. If Value = < 0.5- 1/256 (01111111) then Actual Value = Value. If Value >= 0.5 (10000000), then Actual Value = Value + 1/256. 00000000 Actual value is 00000000; Graphic window totally opaque i.e. overlay on LCD screen 01111111 Actual value is 01111111; 10000000 Actual value is 10000001 10000001 Actual value is 10000010 11111110 Actual value is 11111111 11111111 Actual value is 100000000;Graphic window totally transparent i.e. not displayed on LCD screen
23–16 DP_GWCKR_ ASYNC0	GWCKR - Graphic Window Color Keying Red Component Defines the red component of graphic window color keying. 00000000 No red 11111111 Full red
15–8 DP_GWCKG_ ASYNC0	GWCKG - Graphic Window Color Keying Green Component Defines the green component of graphic window color keying. 00000000 No Green 11111111 Full Green

Table continues on the next page...

IPUx_DP_GRAPH_WIND_CTRL_ASYNC0 field descriptions (continued)

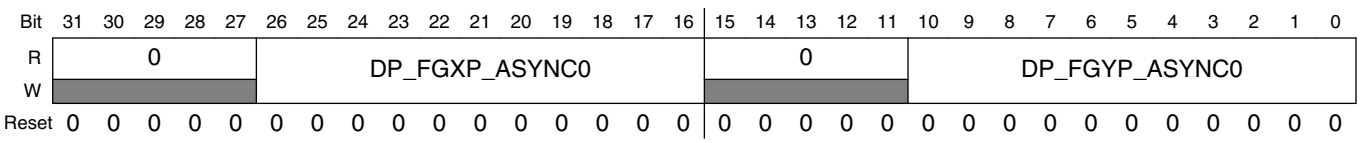
Field	Description
DP_GWCKB_ ASYNC0	GWCKB - Graphic Window Color Keying Blue Component Defines the blue component of graphic window color keying. 00000000 No blue 11111111 Full blue

37.5.121 DP Partial Plane Window Position Async 0 Flow Register (IPUx_DP_FG_POS_ASYNC0)

The DP partial plane Window Position Register is used to determine the starting position of the partial plane window relative to BG window position.

This Register is used for the synchronous flow only.

Address: Base address + 1_8068h offset



IPUx_DP_FG_POS_ASYNC0 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 DP_FGXP_ ASYNC0	FGXP partial plane Window X Position. partial plane Window X Position - Specifies the number of pixels between the start of full plane window X position and the beginning of the first data of new line.
15–11 Reserved	This read-only field is reserved and always has the value 0.
DP_FGYP_ ASYNC0	FGYP partial plane window Y position partial plane Window Y Position - Specifies the number of lines between the start of full plane windows Y position and the beginning of the first data.

37.5.122 DP Cursor Position and Size Async 0 Flow Register (IPUx_DP_CUR_POS_ASYNC0)

The LCD Cursor Position Register is used to determine the starting position of the cursor relative to BG windows position.

Address: Base address + 1_806Ch offset

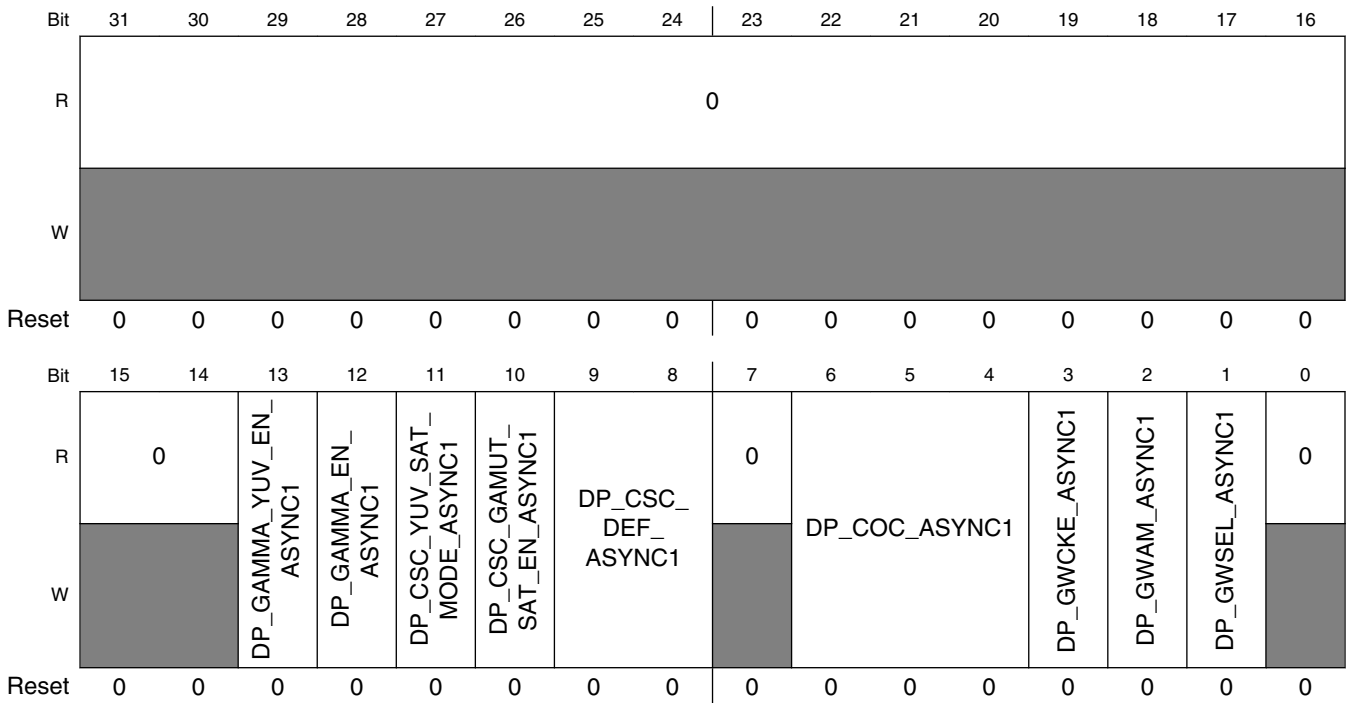
DP_CSC_B1_ASYNC0	B0 parameter of color conversion.

37.5.129 DP Common Configuration Async 1 Flow Register (IPUx_DP_COM_CONF_ASYNC1)

This register contains common configuration parameters for the DP.

Address: Base address + 1_80BCh offset



IPUx_DP_COM_CONF_ASYNC1 field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13 DP_GAMMA_YUV_EN_ASYNC1	GAMMA's YUV mode enable for async flow 1 0 YUV mode is OFF. 1 YUV mode is ON.
12 DP_GAMMA_EN_ASYNC1	GAMMA_EN - Gamma correction block enable bit 0 disable 1 enable
11 DP_CSC_YUV_SAT_MODE_ASYNC1	CSC_YUV_SAT_MODE YUV saturation mode for color space conversion 0 Y/U/V range 0 -255 1 Y range 16-235, U/V range 16-240

Table continues on the next page...

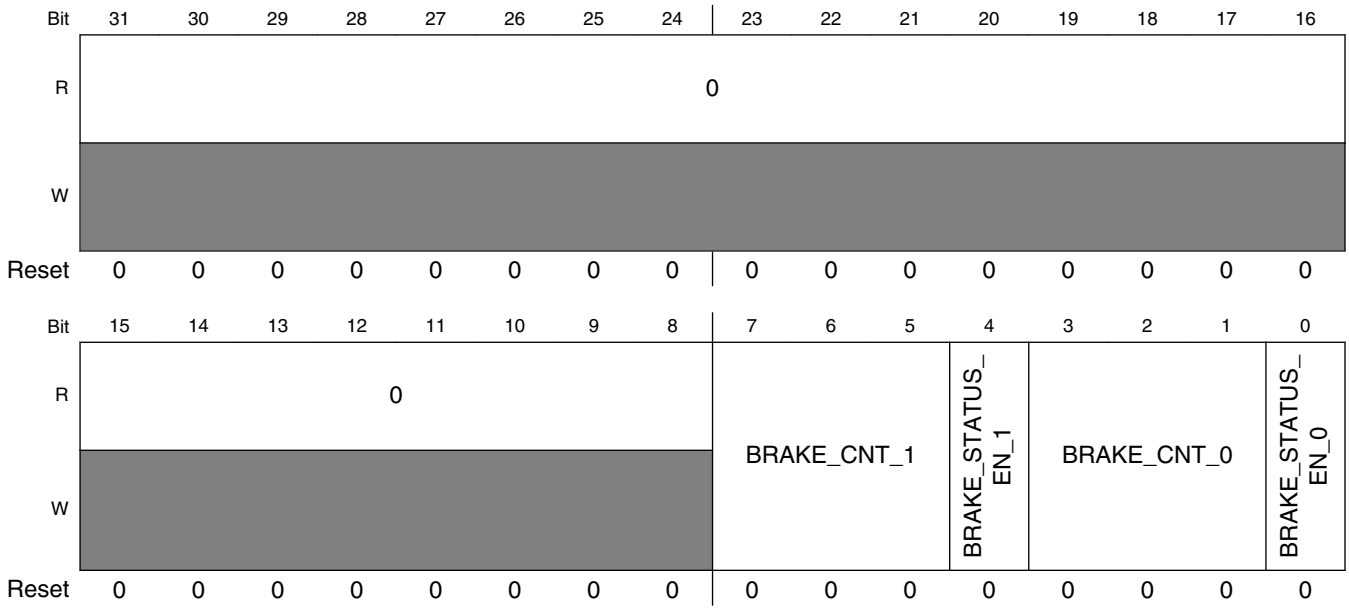
IPUx_DP_COM_CONF_ASYNC1 field descriptions (continued)

Field	Description
10 DP_CSC_ GAMUT_SAT_ EN_ASYNC1	CSC_GAMUT_SAT_EN Indicate if GAMUT saturation is enabled 0 disable GAMUT mapping 1 enable GAMUT mapping
9–8 DP_CSC_DEF_ ASYNC1	CSC_DEF Enable or disable Color Space Conversion. 00 CSC disable 01 CSC enable after combining 10 CSC enable before combining on BG channel 11 CSC enable before combining on FG channel
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 DP_COC_ ASYNC1	COC - Cursor Operation Control Controls the format of the cursor and the type of arithmetic operations 000 Transparent, cursor is disabled. 001 Full cursor. 010 Reversed cursor. 011 AND between full plane and cursor. 100 Reserved 101 OR between full plane and cursor. 110 XOR between full plane and cursor. 111 Reserved
3 DP_GWCKE_ ASYNC1	GWCKE - Graphic Window Color Keying Enable Enable or disable graphic window color keying. 1 Enable color keying of graphic window 0 Disable color keying of graphic window
2 DP_GWAM_ ASYNC1	GWAM - Graphic Window Alpha Mode Select the use of Alpha to be global or local. 1 Global Alpha. 0 Local Alpha.
1 DP_GWSEL_ ASYNC1	GWSEL - Graphic Window Select Select graphic window to be on partial plane or full plane. 1 Graphic window is partial plane. 0 Graphic window is full plane.
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.130 DP Debug Control Register (IPUx_DP_DEBUG_CNT)

This is the debug unit control register. This register is not stored in the SRM.

Address: Base address + 1_80BCh offset



IPUx_DP_DEBUG_CNT field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7–5 BRAKE_CNT_1	The async flow can be broken multiple times. It possible to control which breaking event will cause the interrupt. This field counts the breaking events for unit #1
4 BRAKE_ STATUS_EN_1	This bit enables the break/status unit #1
3–1 BRAKE_CNT_0	The async flow can be broken multiple times. It possible to control which breaking event will cause the interrupt. This field counts the breaking events for unit #0
0 BRAKE_ STATUS_EN_0	This bit enables the break/status unit #0

37.5.131 DP Graphic Window Control Async 1 Flow Register (IPUx_DP_GRAPH_WIND_CTRL_ASYNC1)

This register contains common configuration parameters for the DP.

Address: Base address + 1_80C0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

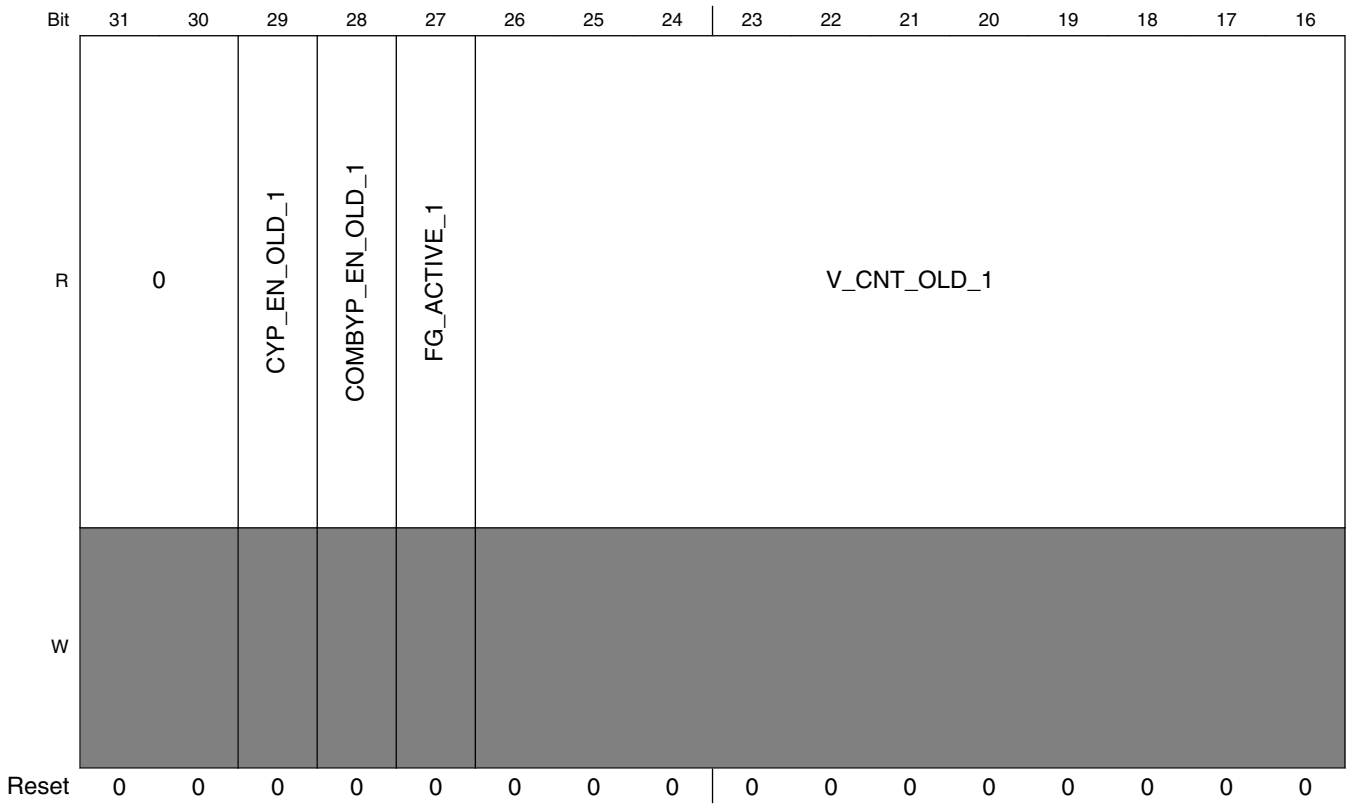
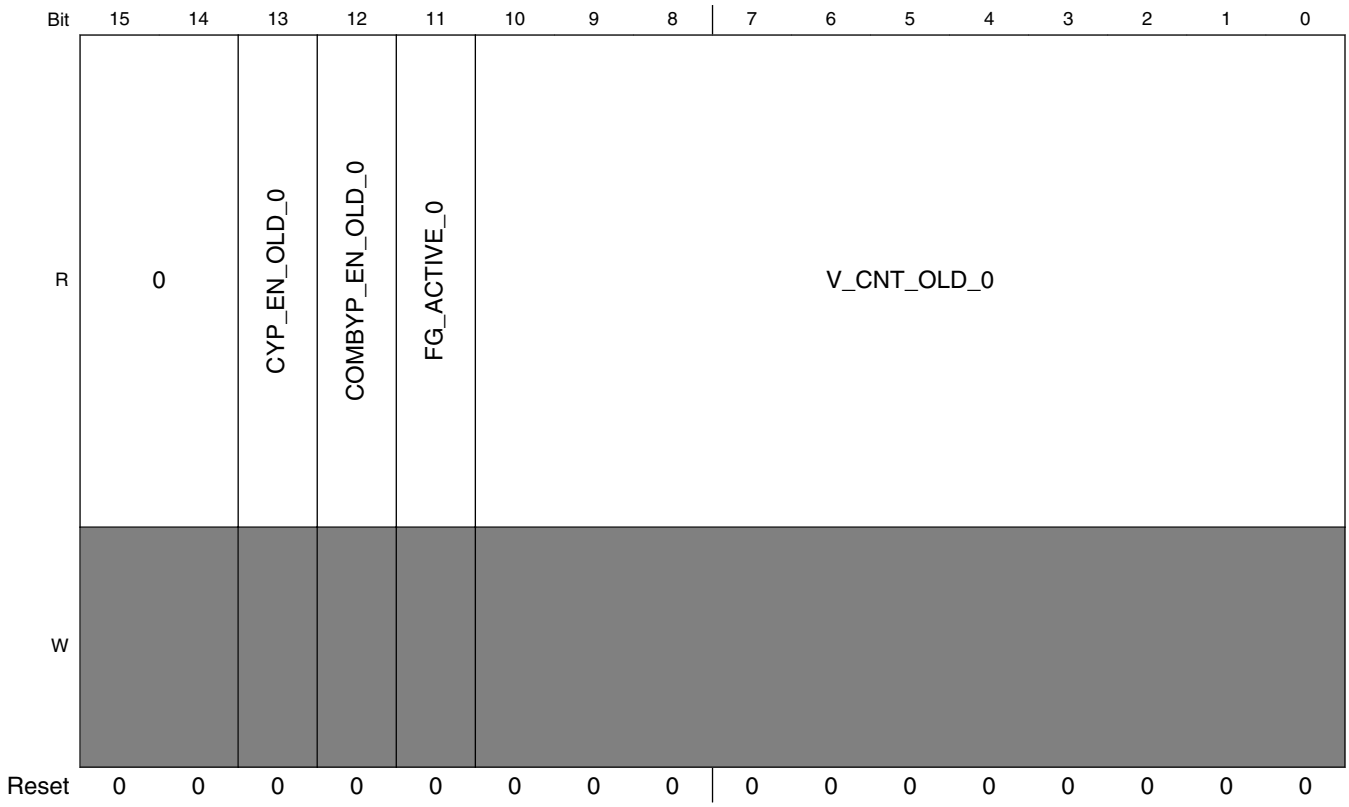
IPUx_DP_GRAPH_WIND_CTRL_ASYNC1 field descriptions

Field	Description
31–24 DP_GWAV_ASYNC1	GWAV - Graphic Window Alpha Value Defines the alpha value of graphic window used for alpha blending between graphic window and full plane. The Value the number that writing to GWAV register. The Actual Value the number, that insert to calculation in Combining Module. If Value = < 0.5- 1/256 (01111111) then Actual Value = Value. If Value >= 0.5 (10000000), then Actual Value = Value + 1/256. 00000000 Actual value is 00000000; Graphic window totally opaque i.e. overlay on LCD screen 01111111 Actual value is 01111111; 10000000 Actual value is 10000001 10000001 Actual value is 10000010 11111110 Actual value is 11111111 11111111 Actual value is 100000000;Graphic window totally transparent i.e. not displayed on LCD screen
23–16 DP_GWCKR_ASYNC1	GWCKR - Graphic Window Color Keying Red Component Defines the red component of graphic window color keying. 00000000 No red 11111111 Full red
15–8 DP_GWCKG_ASYNC1	GWCKG - Graphic Window Color Keying Green Component Defines the green component of graphic window color keying. 00000000 No Green 11111111 Full Green
DP_GWCKB_ASYNC1	GWCKB - Graphic Window Color Keying Blue Component Defines the blue component of graphic window color keying. 00000000 No blue 11111111 Full blue

37.5.132 DP Debug Status Register (IPUx_DP_DEBUG_STAT)

Address: Base address + 1_80C0h offset





IPUx_DP_DEBUG_STAT field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29 CYP_EN_OLD_1	The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #1)
28 COMBYP_EN_OLD_1	the async1 flow has been broken in the middle of combining (This filed is relevant for debug unit #1)
27 FG_ACTIVE_1	Displaying the partial frame has been started (This filed is relevant for debug unit #1)
26–16 V_CNT_OLD_1	The exact row where the async flow has been broken (This filed is relevant for debug unit #0)
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 CYP_EN_OLD_0	The async flow has been broken in the middle of a cursor (This filed is relevant for debug unit #0)
12 COMBYP_EN_OLD_0	the async flow has been broken in the middle of combining (This filed is relevant for debug unit #0)
11 FG_ACTIVE_0	Displaying the partial frame has been started for async flow (This filed is relevant for debug unit #0)
V_CNT_OLD_0	The exact row where the async flow has been broken (This filed is relevant for debug unit #0)

37.5.133 DP Partial Plane Window Position Async 1 Flow Register (IPUx_DP_FG_POS_ASYNC1)

The DP partial plane Window Position Register is used to determine the starting position of the partial plane window relative to BG window position.

This Register is used for the synchronous flow only.

Address: Base address + 1_80C4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

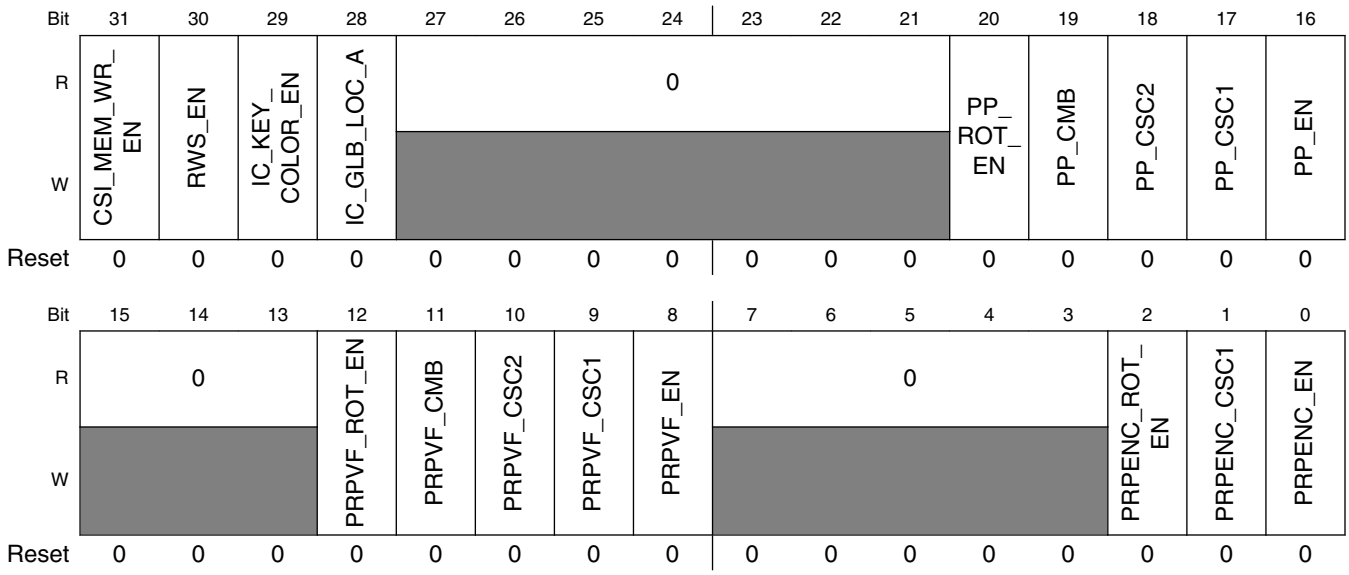
IPUx_DP_CSC_ASYNC1_1 field descriptions

Field	Description
31–30 DP_CSC_S2_ASYNC1	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
29–16 DP_CSC_B2_ASYNC1	B0 parameter of color conversion.
15–14 DP_CSC_S1_ASYNC1	S0 parameter of color conversion. 00 scale factor of 2 01 scale factor of 1 10 scale factor of 0 11 scale factor of -1
DP_CSC_B1_ASYNC1	B0 parameter of color conversion.

37.5.141 IC Configuration Register (IPUx_IC_CONF)

This register contains control parameter for IC 3 tasks (pre-processing for encoding, pre-processing for view-finder and post processing).

Address: Base address + 2_0000h offset



IPUx_IC_CONF field descriptions

Field	Description
31 CSI_MEM_WR_EN	CSI direct memory write enable. This bit enables writing data from sensor directly to memory even when a raw sensor is not attached. 0 CSI direct writing to memory is disabled. 1 CSI direct writing to memory is enabled.
30 RWS_EN	Raw sensor enable. This bit indicate if a Raw sensor is attached (Bayer format). This bit is used together with the CSI_MEM_WR_EN bit as follows: CSI_MEM_WR_EN=0, RWS_EN=0 - data is fed from the CSI to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=0 - data is fed from the CSI to the IC for processing and also for writing to the system memory; CSI_MEM_WR_EN=0, RWS_EN=1 - data is fed from the CSI to the system memory (via the IC) and from the system memory to the IC for processing; CSI_MEM_WR_EN=1, RWS_EN=1 - non-valid configuration. 0 Raw sensor is not attached. 1 Raw sensor is attached.
29 IC_KEY_COLOR_EN	Key Color enable. This bit enables the key color feature.

Table continues on the next page...

IPUx_IC_CONF field descriptions (continued)

Field	Description
	0 Key color is disabled. 1 Key color is enabled.
28 IC_GLB_LOC_A	Global Alpha. This bit select the source of Alpha parameter. 0 Alpha parameter is local. 1 Alpha parameter is global.
27–21 Reserved	This read-only field is reserved and always has the value 0.
20 PP_ROT_EN	Post-Processing Rotation Task enable. This bit enable Post-Processing Rotation Task. 0 Rotation is disabled. 1 Rotation is enabled.
19 PP_CMB	Post-Processing Task combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled.
18 PP_CSC2	Post-Processing Task color conversion RGB-->YUV enable. This bit enables YUV-->RGB. Reserved 0 RGB-->YUV is disabled. 1 RGB-->YUV is enabled.
17 PP_CSC1	Post-Processing Task color conversion YUV-->RGB enable. This bit enables YUV-->RGB. 0 YUV-->RGB is disabled. 1 YUV-->RGB is enabled.
16 PP_EN	Post-Processing Task enable. This bit enables the Post-Processing task. 0 Task is disabled. 1 Task is enabled.
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 PRPVF_ROT_EN	Preprocessing Rotation Task for viewfinder enable. This bit enable Preprocessing Rotation Task for viewfinder. 0 Rotation is disabled. 1 Rotation is enabled.
11 PRPVF_CMB	Preprocessing Task for View-Finder combining enable. This bit enables combining. 0 Combining is disabled. 1 Combining is enabled.
10 PRPVF_CSC2	Reserved
9 PRPVF_CSC1	Pre-processing task for view-finder first color conversion enable. This bit enables first color conversion. 0 First color conversion is disabled. 1 First color conversion is enabled.
8 PRPVF_EN	Preprocessing Task for View-Finder enable. This bit enables the View-Finder task.

Table continues on the next page...

IPUx_IC_CONF field descriptions (continued)

Field	Description
	0 Task is disabled. 1 Task is enabled.
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 PRPENC_ROT_EN	Preprocessing Rotation Task for encoding enable. This bit enable Preprocessing Rotation Task for encoding. 0 Rotation is disabled. 1 Rotation is enabled.
1 PRPENC_CSC1	Preprocessing Task for encoding color conversion enable. This bit enables color conversion. 0 Color conversion is disabled. 1 Color conversion is enabled.
0 PRPENC_EN	Preprocessing Task for encoding enable. This bit enables the encoding task. 0 Task is disabled. 1 Task is enabled.

37.5.142 IC Preprocessing Encoder Resizing Coefficients Register (IPUx_IC_PRP_ENC_RSC)

This register contains the resizing and downsizing parameters for Preprocessing task for encoding.

Address: Base address + 2_0004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	PRPENC_DS_R_V		PRPENC_RS_R_V														PRPENC_DS_R_H		PRPENC_RS_R_H													
Reset	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_IC_PRP_ENC_RSC field descriptions

Field	Description
31–30 PRPENC_DS_R_V	Preprocessing task for encoding Downsizing vertical Ratio. This field contains the downsizing vertical coefficient of Preprocessing for Encoding.
29–16 PRPENC_RS_R_V	Preprocessing task for encoding Resizing vertical Ratio. This field contains the resizing vertical coefficient of Preprocessing for Encoding. Resizing Ratio is equal to PRPENC_RS_R_V: M

Table continues on the next page...

IPUx_IC_PRP_ENC_RSC field descriptions (continued)

Field	Description
	Where M = 2^13; SI - input size; SO - output size PRPENC_RS_R_V = floor(M*(SI-1)/(SO-1));
15–14 PRPENC_DS_R_H	Preprocessing task for encoding Downsizing horizontal Ratio. This field contains the downsizing horizontal coefficient of Preprocessing for Encoding. Values: 00 1 01 2 10 4 11 RSV
PRPENC_RS_R_H	Preprocessing task for encoding Resizing horizontal Ratio. This field contains the resizing horizontal coefficient of Preprocessing for Encoding. Resizing Ratio is equal to PRPENC_RS_R_H: M Where M = 2^13; SI - input size; SO - output size PRPENC_RS_R_H = floor(M*(SI-1)/(SO-1));

37.5.143 IC Preprocessing View-Finder Resizing Coefficients Register (IPUx_IC_PRP_VF_RSC)

This register contains the resizing and downsizing parameters for preprocessing task for display.

Address: Base address + 2_0008h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_IC_PRP_VF_RSC field descriptions

Field	Description
31–30 PRPVF_DS_R_V	Preprocessing task for encoding Downsizing vertical Ratio. This field contains the downsizing vertical coefficient of Preprocessing for View-Finder.
29–16 PRPVF_RS_R_V	Preprocessing task for encoding Resizing vertical Ratio. This field contains the resizing vertical coefficient of Preprocessing for View-Finder. Resizing Ratio is equal to PRPVF_RS_R_V: M

Table continues on the next page...

IPUx_IC_PRP_VF_RSC field descriptions (continued)

Field	Description
	Where M = 2^13; SI - input size; SO - output size PRPVF_RS_R_V = floor(M*(SI-1)/(SO-1));
15–14 PRPVF_DS_R_H	Preprocessing task for encoding Downsizing horizontal Ratio. This field contains the downsizing horizontal coefficient of Preprocessing for View-Finder. Values: 00 1 01 2 10 4 11 RSV
PRPVF_RS_R_H	Preprocessing task for view-finding resizing horizontal ratio. This field contains the resizing horizontal coefficient of preprocessing Task For View-finder. Resizing Ratio is equal to PRPVF_RS_R_H: M Where M = 2^13; SI - input size; SO - output size PRPVF_RS_R_H = floor(M*(SI-1)/(SO-1));

37.5.144 IC Postprocessing Encoder Resizing Coefficients Register (IPUx_IC_PP_RSC)

This register contains the resizing and downsizing parameters for Post-Processing task for display.

Address: Base address + 2_000Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI0_SENS_CONF field descriptions

Field	Description
31 CSI0_DATA_EN_POL	Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry.
30 Reserved	This read-only field is reserved and always has the value 0.
29 CSI0_FORCE_EOF	Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action
28 CSI0_JPEG_MODE	JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts withe the assertion of VSYNC. The frame ends on the next VSYNC or by setting the **CSI0_FORCE_EOF bit.**
27 CSI0_JPEG8_EN	JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled
26–24 CSI0_DATA_DEST	These bits enable the destination of the data coming from the CSI. CSI0_DATA_DEST[0] - Reserved CSI0_DATA_DEST[1] - destination is IC CSI0_DATA_DEST[2] - destination is IDMAC via SMFC
23–16 CSI0_DIV_RATIO	DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: SENSB_MCLK rate = HSP_CLK rate /(DIV_RATIO+1)
15 CSI0_EXT_VSYNC	External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode.
14–11 CSI0_DATA_WIDTH	Data width. This field defines the number of bits per color. Values: 0000 4 bits per color 0001 8 bits per color 0010 9 bits per color 0011 10 bits per color 0100 11 bits per color 0101 12 bits per color 0110 13 bits per color 0111 14 bits per color 1000 15 bits per color 1001 16 bits per color

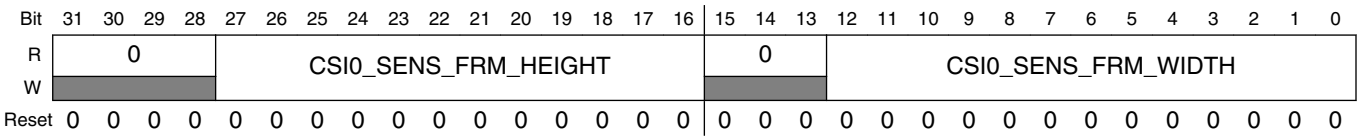
Table continues on the next page...

IPUx_CSI0_SENS_CONF field descriptions (continued)

Field	Description
10–8 CSI0_SENS_ DATA_FORMAT	Data format from the sensor. This field defines the data format for the input of the CSI sensor. Values: 000 full RGB or YUV444 001 YUV422 (YUYV...) 010 YUV422 (UYVY...) 011 Bayer or Generic data 100 RGB565 101 RGB555 110 RGB444 111 JPEG
7 CSI0_PACK_ TIGHT	CSI0 Pack Tight When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways. 1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed 0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits.
6–4 CSI0_SENS_ PRTCL	Sensor Protocol. This bit defines the Sensor timing/data mode protocol. Values: 000 Gated clock mode 001 Non-gated clock mode 010 CCIR progressive mode (BT.656) 011 CCIR interlaced mode (BT.656) 100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock) 101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock) 110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock) 111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock)
3 CSI0_SENS_ PIX_CLK_POL	Invert Pixel clock input. This bit selects the polarity of pixel clock. 0 pixel clock is directly applied to internal circuitry. 1 pixel clock is inverted before applied to internal circuitry.
2 CSI0_DATA_ POL	Invert data input. This bit selects the polarity of data input. 0 data lines are directly applied to internal circuitry. 1 data lines are inverted before applied to internal circuitry.
1 CSI0_HSYNC_ POL	Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal. 0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry. 1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry.
0 CSI0_VSYNC_ POL	Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal. 0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry. 1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry.

37.5.152 CSI0 Sense Frame Size Register (IPUx_CSI0_SENS_FRM_SIZE)

Address: Base address + 3_0004h offset

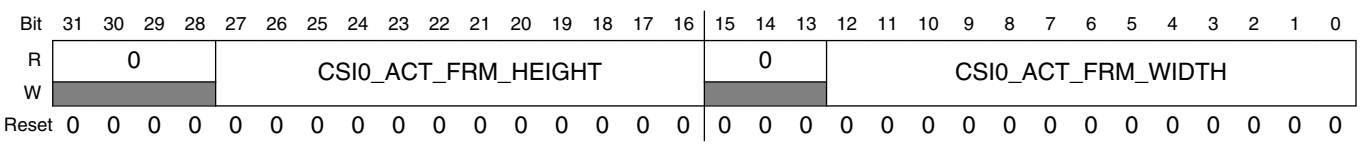


IPUx_CSI0_SENS_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI0_SENS_ FRM_HEIGHT	Sensor frame height minus 1. This field defines the sensor frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI0_SENS_ FRM_WIDTH	Sensor frame width minus 1. This field defines the sensor frame column number minus 1.

37.5.153 CSI0 Actual Frame Size Register (IPUx_CSI0_ACT_FRM_SIZE)

Address: Base address + 3_0008h offset

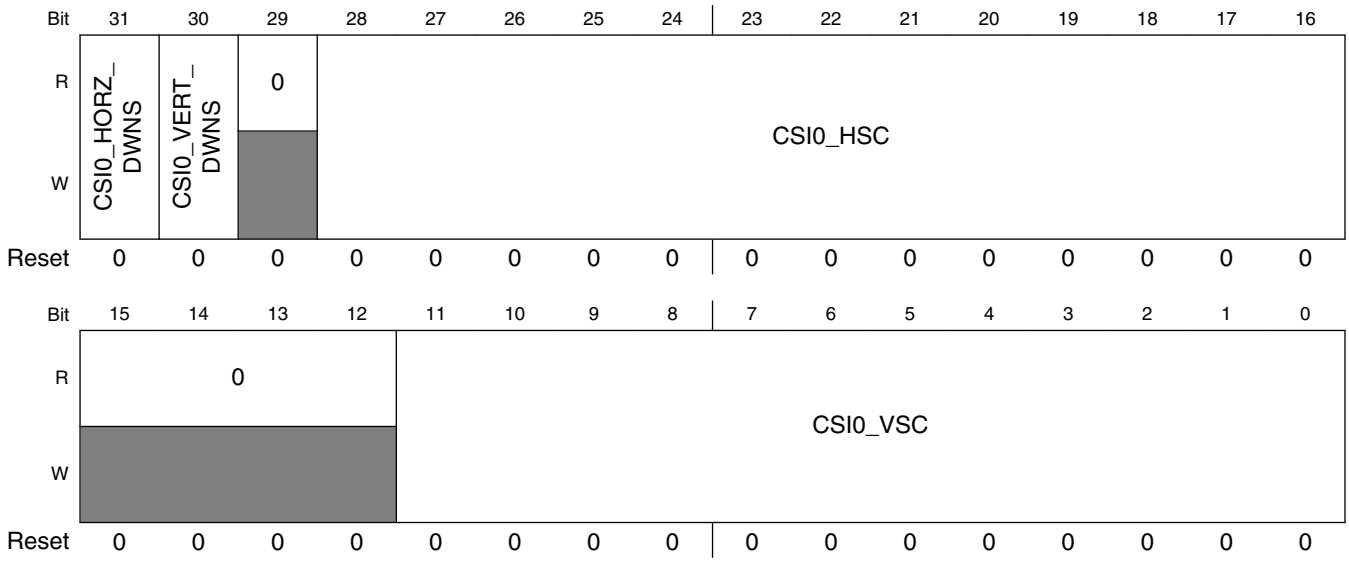


IPUx_CSI0_ACT_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI0_ACT_ FRM_HEIGHT	Actual frame height minus 1. This field defines the CSI output frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI0_ACT_ FRM_WIDTH	Actual frame width minus 1. This field defines the CSI output frame columns number minus 1.

37.5.154 CSI0 Output Control Register (IPUx_CSI0_OUT_FRM_CTRL)

Address: Base address + 3_000Ch offset

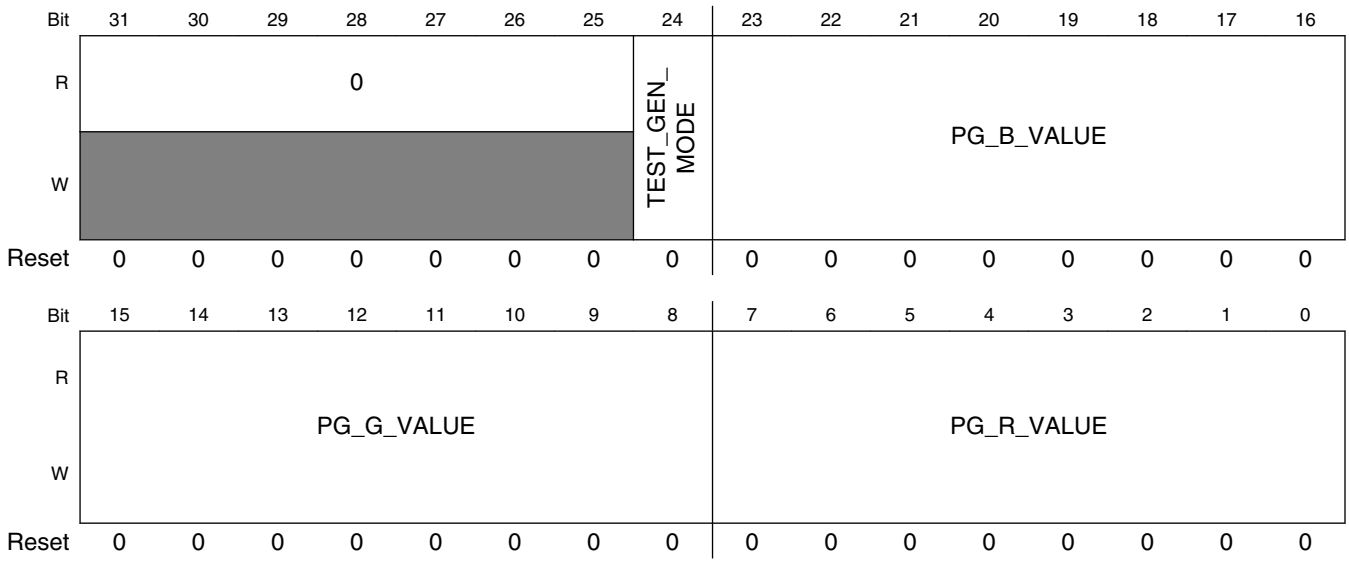


IPUx_CSI0_OUT_FRM_CTRL field descriptions

Field	Description
31 CSI0_HORZ_DWNS	Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
30 CSI0_VERT_DWNS	Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
29 Reserved	This read-only field is reserved and always has the value 0.
28–16 CSI0_HSC	Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field.
15–12 Reserved	This read-only field is reserved and always has the value 0.
CSI0_VSC	Vertical skip. This field defines the number of rows to skip.

37.5.155 CSIO Test Control Register (IPUx_CSI0_TST_CTRL)

Address: Base address + 3_0010h offset

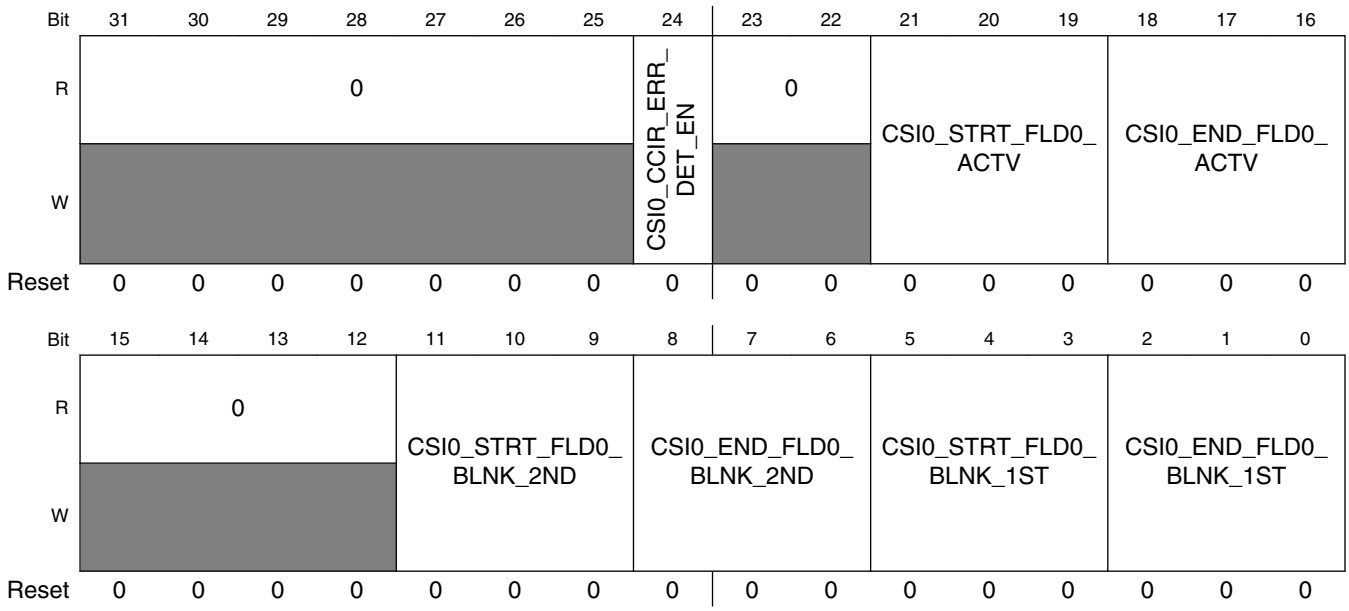


IPUx_CSI0_TST_CTRL field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 TEST_GEN_ MODE	Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active.
23–16 PG_B_VALUE	Pattern generator B value. This field selects the B value for the generated pattern of even pixel.
15–8 PG_G_VALUE	Pattern generator G value. This field selects the G value for the generated pattern of even pixel.
PG_R_VALUE	Pattern generator R value. This field selects the R value for the generated pattern of even pixel.

37.5.156 CSIO CCIR Code Register 1 (IPUx_CSI0_CCIR_CODE_1)

Address: Base address + 3_0014h offset



IPUx_CSI0_CCIR_CODE_1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CSI0_CCIR_ERR_DET_EN	Enable error detection and correction for CCIR interlaced mode with protection bit. 0 Error detection and correction is disabled. 1 Error detection and correction is enabled.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI0_STRT_FLD0_ACTV	Start of field 0 active line command (interlaces mode). (In progressive mode, start of active line command mode).
18–16 CSI0_END_FLD0_ACTV	End of field 0 active line command (interlaces mode). (In progressive mode, end of active line command mode).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI0_STRT_FLD0_BLNK_2ND	Start of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI0_END_FLD0_BLNK_2ND	End of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).

Table continues on the next page...

IPUx_CSI0_CCIR_CODE_1 field descriptions (continued)

Field	Description
5–3 CSI0_STRT_ FLD0_BLNK_ 1ST	Start of field 0 first blanking line command (interlaces mode). (In progressive mode this field indicates start of blanking line command).
CSI0_END_ FLD0_BLNK_ 1ST	End of field 0 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.157 CSIO CCIR Code Register 2 (IPUx_CSI0_CCIR_CODE_2)

Address: Base address + 3_0018h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_CSI0_CCIR_CODE_2 field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI0_STRT_ FLD1_ACTV	Start of field 1 active line command (interlaces mode). (In progressive mode this field is ignored).
18–16 CSI0_END_ FLD1_ACTV	End of field 1 active line command (interlaces mode). (In progressive mode this field is ignored).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI0_STRT_ FLD1_BLNK_ 2ND	Start of field 1 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI0_END_ FLD1_BLNK_ 2ND	End of field 1 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
5–3 CSI0_STRT_ FLD1_BLNK_ 1ST	Start of field 1 first blanking line command (interlaces mode). (In progressive mode this field is ignored).
CSI0_END_ FLD1_BLNK_ 1ST	End of field 1 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.158 CSIO CCIR Code Register 3 (IPUx_CSI0_CCIR_CODE_3)

Address: Base address + 3_001Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_CSI0_CCIR_CODE_3 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
CSI0_CCIR_ PRECOM	CCIR pre command. This field defines the sequence which comes before the CCIR command. For BT.656 the code should be written to bits [23:0] while bits [29:24] are ignored (3X8bit) For BT.1120 the code should be written to bits [29:0] (3X10bit)

37.5.159 CSI0 Data Identifier Register (IPUx_CSI0_DI)

Address: Base address + 3_0020h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_CSI0_DI field descriptions

Field	Description
31–24 CSI0_MIPI_DI3	CSI0_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI.
23–16 CSI0_MIPI_DI2	CSI0_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI.
15–8 CSI0_MIPI_DI1	CSI0_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI
CSI0_MIPI_DI0	CSI0_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI; This is the main stream.

37.5.160 CSI0 SKIP Register (IPUx_CSI0_SKIP)

This register controls the frame skipping supported between CSI0 and the SMFC.

Address: Base address + 3_0024h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0						CSI0_ID_2_SKIP		CSI0_SKIP_SMFC					CSI0_MAX_RATIO_SKIP_SMFC		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI0_SKIP field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 CSI0_ID_2_SKIP	CSI0 to SMFC Skipping ID. Data from the CSI0 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI0 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits 00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11
7–3 CSI0_SKIP_SMFC	CSI0 SKIP SMFC These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI0_MAX_RATIO_SKIP_SMFC. when CSI0_MAX_RATIO_SKIP_SMFC = 1 => CSI0_SKIP_SMFC[0] is used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 2 => CSI0_SKIP_SMFC[1:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 3 => CSI0_SKIP_SMFC[2:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 4 => CSI0_SKIP_SMFC[3:0] are used; other bits are ignored when CSI0_MAX_RATIO_SKIP_SMFC = 5 => CSI0_SKIP_SMFC[4:0] are used; Setting bit #n of CSI0_SKIP_SMFC means that the #n frame in the set is skipped. For example: if CSI0_MAX_RATIO_SKIP_SMFC = 4 and CSI0_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI0_MAX_RATIO_SKIP_SMFC is set to 4

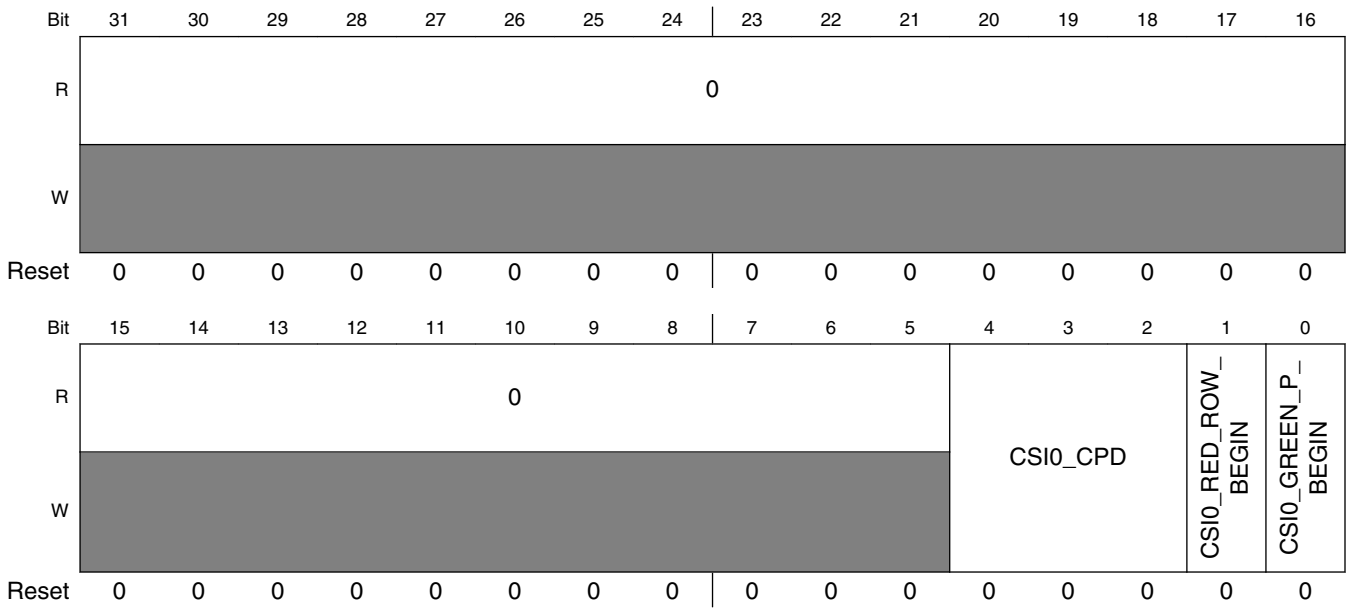
Table continues on the next page...

IPUx_CSI0_SKIP field descriptions (continued)

Field	Description
CSI0_MAX_ RATIO_SKIP_ SMFC	CSI0 Maximum Ratio Skip for SMFC These bits define the number of frames in a skipping set. The skipping number is equal to CSI0_MAX_RATIO_SKIP_SMFC+1; The maximum value of this bits is 5. When set to 0 the skipping is disabled.

37.5.161 CSI0 Compander Control Register (IPUx_CSIO_CPD_CTRL)

Address: Base address + 3_0028h offset



IPUx_CSIO_CPD_CTRL field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4–2 CSI0_CPD	CSI0_CPD These bits enable the compander in the path to different destination. CSI0_CPD[0] - CSI0_CPD[1] - Enable for the compander for data sent to the IC CSI0_CPD[2] - Enable for the compander for data sent to the IDMAC via SMFC If all the 3 bits are zero the compander is disabled Reserved
1 CSI0_RED_ ROW_BEGIN	Color of first row in the frame. Reserved

Table continues on the next page...

IPUx_CSIO_CPD_CTRL field descriptions (continued)

Field	Description
	0 First row in the frame is GBGB. 1 First row in the frame is GRGR.
0 CSI0_GREEN_P_BEGIN	Color of first component in the frame. Reserved 0 First component in the frame is blue or red, depending from RED_ROW bit. 1 First component in the frame is green

37.5.162 CSI0 Red Component Compander Constants Register <i> (IPUx_CSIO_CPD_RC_i)

These registers contain CONSTANT <i> parameters used for companding of red component.

Address: Base address + 3_002Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

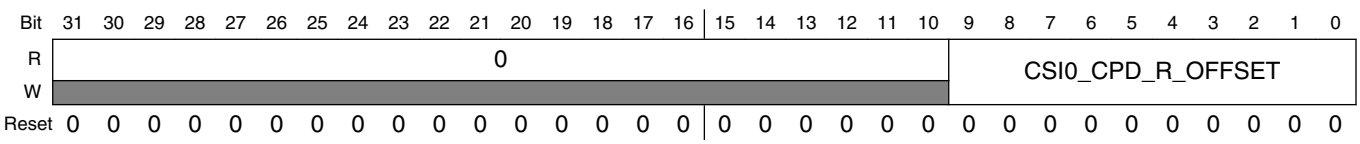
29–20 CSI0_CPD_B_ OFFSET	Reserved
19–10 CSI0_GB_ OFFSET	Reserved
CSI0_GR_ OFFSET	Reserved

37.5.171 CSI0 Compander Offset Register 2 (IPUx_CSI0_CPD_OFFSET2)

This register contain Offset parameters used for companding.

Address: Base address + 3_00F0h offset



IPUx_CSI0_CPD_OFFSET2 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
CSI0_CPD_R_ OFFSET	CSI0 Red component offset The value is between -512 to 511. The value is added to the red component before companding. Clipping: If the result of the red components value + the offset is smaller than 0, the result is zero If the result of the red components value + the offset is greater than 1023, the result is 1023 Reserved

37.5.172 CSI1 Sensor Configuration Register (IPUx_CSI1_SENS_CONF)

Address: Base address + 3_8000h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	CSI0_DATA_EN_POL	0	CSI1_FORCE_EOF	CSI1_JPEG_MODE	CSI1_JPEG8_EN	CSI1_DATA_DEST			CSI1_DIV_RATIO							
W

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI1_SENS_CONF field descriptions

Field	Description
31 CSI0_DATA_EN_POL	Invert IPP_IND_SENSB_DATA_EN input. This bit selects the polarity of IPP_IND_SENSB_DATA_EN signal. 0 IPP_IND_SENSB_DATA_EN is directly applied to internal circuitry. 1 IPP_IND_SENSB_DATA_EN is inverted before applied to internal circuitry.
30 Reserved	This read-only field is reserved and always has the value 0.
29 CSI1_FORCE_EOF	Force End of frame This is a self clear bit allowing the user to force an End-of-frame event; This bit can be used in cases where the frame sent by the sensor was not completed. 1 force end of frame 0 no action
28 CSI1_JPEG_MODE	JPEG Mode - this bit defines the mode of the control signals when working in JPEG mode 1 The data is valid as long as HSYNC and VSYNC signals are active; HSYNC is valid for single frame 0 The frame starts withe the assertion of VSYNC. The frame ends on the next VSYNC or by setting the **CSI0_FORCE_EOF bit**
27 CSI1_JPEG8_EN	JPEG8 enable bit 1 JPEG8 detection is enabled 0 JPEG8 is disabled

Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

Field	Description
26–24 CSI1_DATA_DEST	These bits enable the destination of the data coming from the CSI. CSI1_DATA_DEST[0] - Reserved CSI1_DATA_DEST[1] - destination is IC CSI1_DATA_DEST[2] - destination is IDMAC via SMFC
23–16 CSI1_DIV_RATIO	DIV Ratio Clock division ratio minus 1. This field defines the division ratio of HSP_CLK into SENSB_MCLK: SENSB_MCLK rate = HSP_CLK rate /(DIV_RATIO+1)
15 CSI1_EXT_VSYNC	External VSYNC enable. This bits select between external and internal VSYNC. 0 Internal VSYNC mode. 1 External VSYNC mode.
14–11 CSI1_DATA_WIDTH	Data width. This fields defines the number of bits per color. Values: 0000 4 bits per color 0000 Reserved 0001 8 bits per color 0010 9 bits per color 0010 Reserved 0011 10 bits per color 0100 11 bits per color 0100 Reserved 0101 12 bits per color 0101 Reserved 0110 13 bits per color 0110 Reserved 0111 14 bits per color 0111 Reserved 1000 15 bits per color 1000 Reserved 1001 16 bits per color
10–8 CSI1_SENS_DATA_FORMAT	Data format from the sensor. This field defines the data format for the input of the CSI sensor. Values: 000 full RGB or YUV444 001 YUV422 (YUYV...) 010 YUV422 (UYVY...) 011 Bayer or Generic data 100 RGB565 101 RGB555 110 RGB444 111 JPEG
7 CSI1_PACK_TIGHT	**CSI1 Pack Tight** When the data format is YUV or RGB and the component's width is 9-16 bits, it can be sent to the memory in 2 different ways

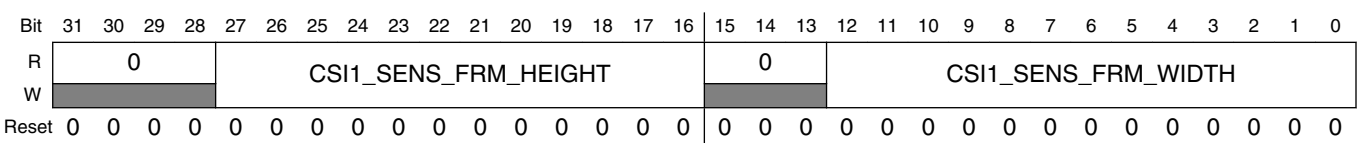
Table continues on the next page...

IPUx_CSI1_SENS_CONF field descriptions (continued)

Field	Description
	1 Three 10 bits components are packed into a 32 bit word. Color extension/reduction is performed 0 Each component is written as a 16 bit word where the MSB is written to bit #15, color extension is done for the remaining least significant bits.
6–4 CSI1_SENS_PRTCL	Sensor Protocol. This bit defines the Sensor timing/data mode protocol. Values: 000 Gated clock mode 001 Non-gated clock mode 010 CCIR progressive mode (BT.656) 011 CCIR interlaced mode (BT.656) 100 CCIR progressive (BT.1120 DDR mode: data arrives on every edge of the clock) 101 CCIR progressive (BT.1120 SDR mode: data arrives only on the positive edge of the clock) 110 CCIR interlaced mode (BT.1120 DDR mode: data arrives on every edge of the clock) 111 CCIR interlaced mode (BT.1120 SDR mode: data arrives only on the positive edge of the clock)
3 CSI1_SENS_PIX_CLK_POL	Invert Pixel clock input. This bit selects the polarity of pixel clock. 0 pixel clock is directly applied to internal circuitry. 1 pixel clock is inverted before applied to internal circuitry.
2 CSI1_DATA_POL	Invert data input. This bit selects the polarity of data input. 0 data lines are directly applied to internal circuitry. 1 data lines are inverted before applied to internal circuitry.
1 CSI1_HSYNC_POL	Invert IPP_IND_SENSB_HSYNC input. This bit selects the polarity of IPP_IND_SENSB_HSYNC signal. 0 IPP_IND_SENSB_HSYNC is directly applied to internal circuitry. 1 IPP_IND_SENSB_HSYNC is inverted before applied to internal circuitry.
0 CSI1_VSYNC_POL	Invert IPP_IND_SENSB_VSYNC input. This bit selects the polarity of IPP_IND_SENSB_VSYNC signal. 0 IPP_IND_SENSB_VSYNC is not inverted before applied to internal circuitry. 1 IPP_IND_SENSB_VSYNC is inverted before applied to internal circuitry.

37.5.173 CSI1 Sense Frame Size Register (IPUx_CSI1_SENS_FRM_SIZE)

Address: Base address + 3_8004h offset



IPUx_CSI1_SENS_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

IPUx_CSI1_SENS_FRM_SIZE field descriptions (continued)

Field	Description
27–16 CSI1_SENS_ FRM_HEIGHT	Sensor frame height minus 1. This field defines the sensor frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI1_SENS_ FRM_WIDTH	Sensor frame width minus 1. This field defines the sensor frame column number minus 1.

37.5.174 CSI1 Actual Frame Size Register (IPUx_CSI1_ACT_FRM_SIZE)

Address: Base address + 3_8008h offset

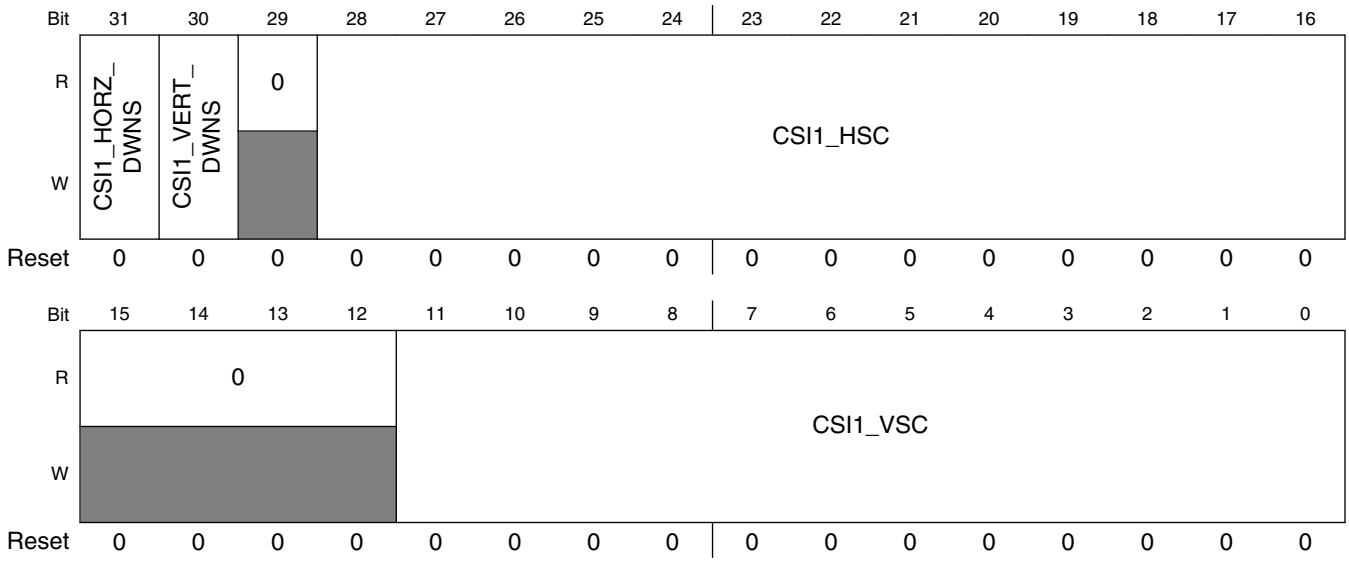
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0				CSI1_ACT_FRM_HEIGHT												0			CSI1_ACT_FRM_WIDTH													
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

IPUx_CSI1_ACT_FRM_SIZE field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CSI1_ACT_ FRM_HEIGHT	Actual frame height minus 1. This field defines the CSI output frame rows number minus 1.
15–13 Reserved	This read-only field is reserved and always has the value 0.
CSI1_ACT_ FRM_WIDTH	Actual frame width minus 1. This field defines the CSI output frame columns number minus 1.

37.5.175 CSI1 Output Control Register (IPUx_CSI1_OUT_FRM_CTRL)

Address: Base address + 3_800Ch offset

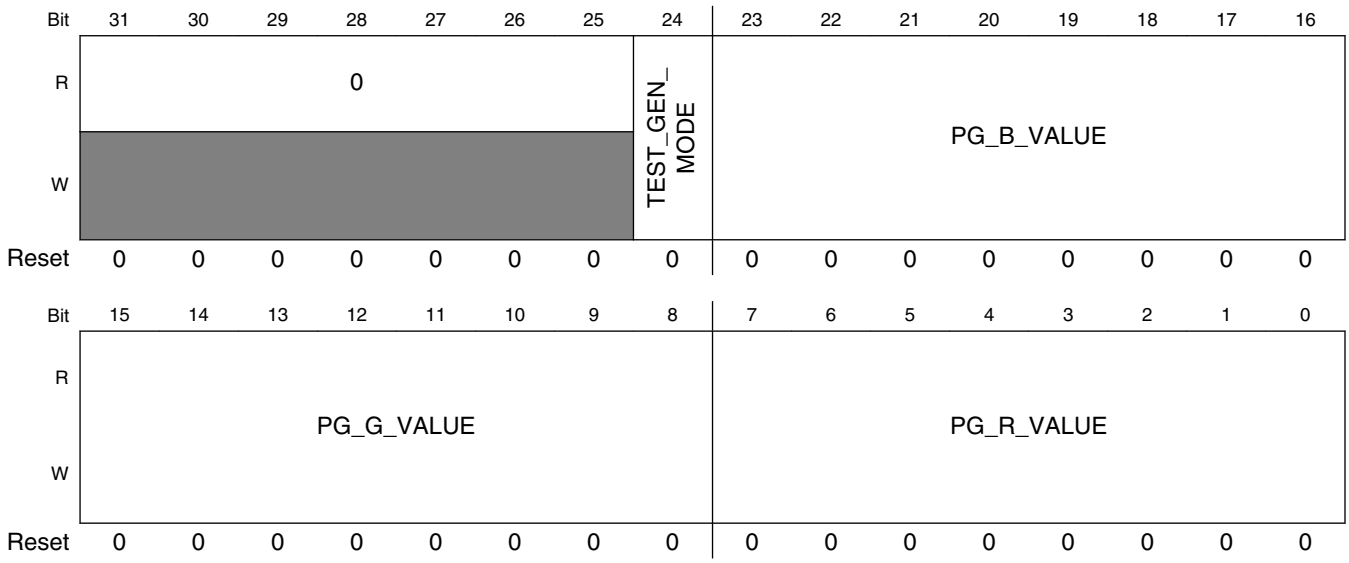


IPUx_CSI1_OUT_FRM_CTRL field descriptions

Field	Description
31 CSI1_HORZ_DWNS	Enable horizontal downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
30 CSI1_VERT_DWNS	Enable vertical downsizing (decimation) by 2. 0 Downsizing disabled 1 Downsizing enabled
29 Reserved	This read-only field is reserved and always has the value 0.
28–16 CSI1_HSC	Horizontal skip. This field defines the number of columns to skip. In Interlaced mode this number refers to the number of lines per field
15–12 Reserved	This read-only field is reserved and always has the value 0.
CSI1_VSC	Vertical skip. This field defines the number of rows to skip.

37.5.176 CSI1 Test Control Register (IPUx_CSI1_TST_CTRL)

Address: Base address + 3_8010h offset

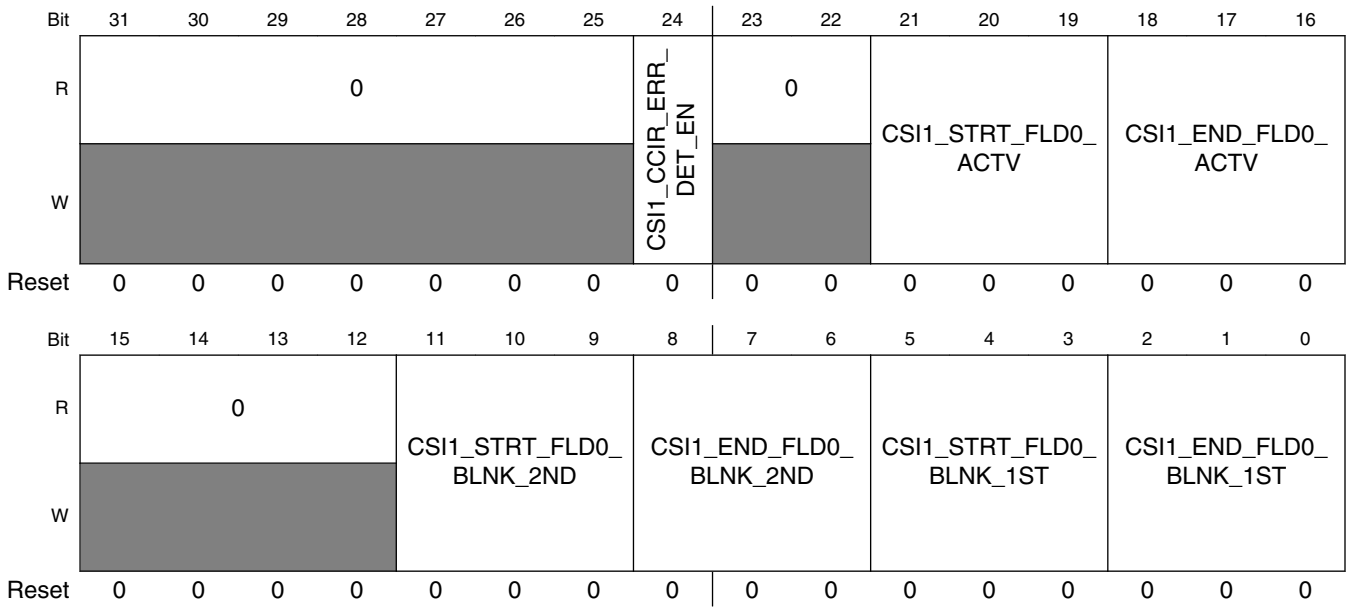


IPUx_CSI1_TST_CTRL field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 TEST_GEN_ MODE	Test generator mode. This bit activates the signal generation. 0 Test signal generator is inactive. 1 Test signal generator is active.
23–16 PG_B_VALUE	Pattern generator B value. This field selects the B value for the generated pattern of even pixel.
15–8 PG_G_VALUE	Pattern generator G value. This field selects the G value for the generated pattern of even pixel.
PG_R_VALUE	Pattern generator R value. This field selects the R value for the generated pattern of even pixel.

37.5.177 CSI1 CCIR Code Register 1 (IPUx_CSI1_CCIR_CODE_1)

Address: Base address + 3_8014h offset



IPUx_CSI1_CCIR_CODE_1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CSI1_CCIR_ERR_DET_EN	Enable error detection and correction for CCIR interlaced mode with protection bit. 0 Error detection and correction is disabled. 1 Error detection and correction is enabled.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–19 CSI1_STRT_FLD0_ACTV	Start of field 0 active line command (interlaces mode). (In progressive mode, start of active line command mode).
18–16 CSI1_END_FLD0_ACTV	End of field 0 active line command (interlaces mode). (In progressive mode, end of active line command mode).
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 CSI1_STRT_FLD0_BLNK_2ND	Start of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).
8–6 CSI1_END_FLD0_BLNK_2ND	End of field 0 second blanking line command (interlaces mode). (In progressive mode this field is ignored).

Table continues on the next page...

IPUx_CSI1_CCIR_CODE_1 field descriptions (continued)

Field	Description
5–3 CSI1_STRT_ FLD0_BLNK_ 1ST	Start of field 0 first blanking line command (interlaces mode). (In progressive mode this field indicates start of blanking line command).
CSI1_END_ FLD0_BLNK_ 1ST	End of field 0 first blanking line command (interlaces mode). (In progressive mode this field is ignored).

37.5.178 CSI1 CCIR Code Register 2 (IPUx_CSI1_CCIR_CODE_2)

Address: Base address + 3_8018h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

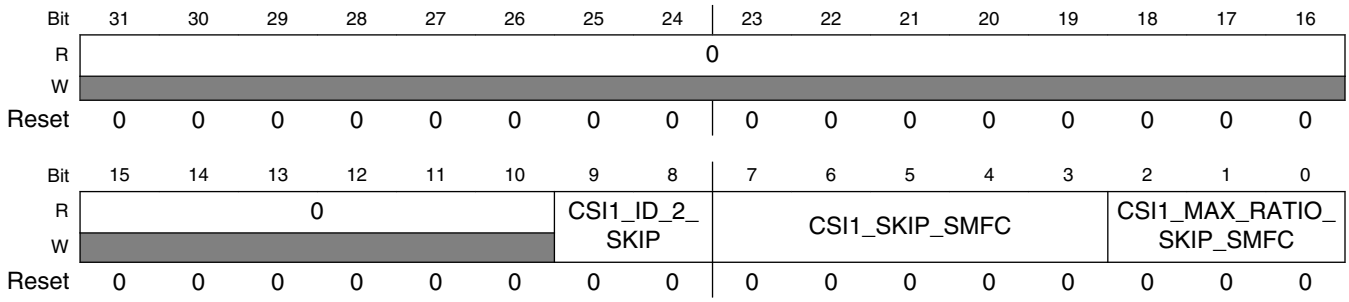
IPUx_CSI1_DI field descriptions

Field	Description
31–24 CSI1_MIPI_DI3	CSI1_MIPI_DI3 This field holds the Data Identifier #3 handled by the CSI.
23–16 CSI1_MIPI_DI2	CSI1_MIPI_DI2 This field holds the Data Identifier #2 handled by the CSI.
15–8 CSI0_MIPI_DI1	CSI1_MIPI_DI1 This field holds the Data Identifier #1 handled by the CSI
CSI1_MIPI_DI0	CSI1_MIPI_DI0 This field holds the Data Identifier #0 handled by the CSI; This is the main stream.

37.5.181 CSI1 SKIP Register (IPUx_CSI1_SKIP)

This register control the frame skipping supported between CSI1 and the SMFC.

Address: Base address + 3_8024h offset



IPUx_CSI1_SKIP field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 CSI1_ID_2_SKIP	CSI1 to SMFC Skipping ID. Data from the CSI1 to the SMFC has an ID associated with it. The ID is received from the MIPI interface. The skipping mechanism between the CSI1 and the SMFC can be used for only one ID. There is no skipping for data coming with ID different from the ID programed in this bits 00 - Skipping mechanism is activated on frames with ID equal to 00 01 - Skipping mechanism is activated on frames with ID equal to 01 10 - Skipping mechanism is activated on frames with ID equal to 10 11 - Skipping mechanism is activated on frames with ID equal to 11
7–3 CSI1_SKIP_SMFC	CSI1 SKIP SMFC These 5 bits define the skipping pattern of the frames send to the SMFC. Skipping is done for a set of frames. The number of frames in a set is defined at CSI1_MAX_RATIO_SKIP_SMFC. when CSI1_MAX_RATIO_SKIP_SMFC = 1 => CSI1_SKIP_SMFC[0] is used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 2 => CSI1_SKIP_SMFC[1:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 3 => CSI1_SKIP_SMFC[2:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 4 => CSI1_SKIP_SMFC[3:0] are used; other bits are ignored when CSI1_MAX_RATIO_SKIP_SMFC = 5 => CSI1_SKIP_SMFC[4:0] are used; Setting bit #n of CSI1_SKIP_SMFC means that the #n frame in the set is skipped. For example: if CSI1_MAX_RATIO_SKIP_SMFC = 4 and CSI1_SKIP_SMFC = 11010 Frames #0 & Frame #2 will not be skipped as bit0 and bit2 are cleared Frames #1 & Frame #3 will be skipped as bit1 and bit3 are set bit #4 is ignored as CSI1_MAX_RATIO_SKIP_SMFC is set to 4

Table continues on the next page...

IPUx_CSI1_SKIP field descriptions (continued)

Field	Description
CSI1_MAX_ RATIO_SKIP_ SMFC	CSI1 Maximum Ratio Skip for SMFC These bits define the number of frames in a skipping set. These bits define the number of frames in a skipping set. The skipping number is equal to CSI1_MAX_RATIO_SKIP_SMFC+1; The maximum value of this bits is 5. When set to 0 the skipping is disabled.

37.5.182 CSI1 Compander Control Register (IPUx_CSI1_CPD_CTRL)

Address: Base address + 3_8028h offset

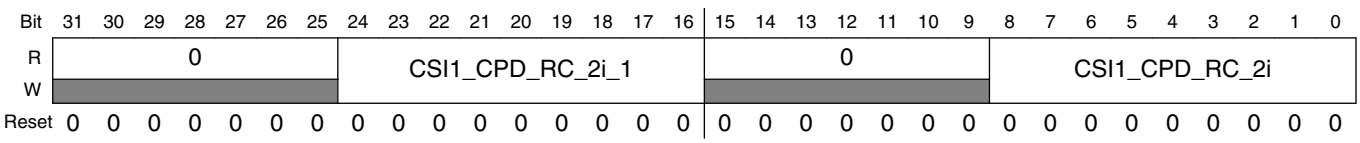
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.183 CSI1 Red Component Compander Constants Register <i> (IPUx_CSI1_CPD_RC_i)

These registers contain CONSTANT <i> parameters used for companding of red component.

Address: Base address + 3_802Ch offset



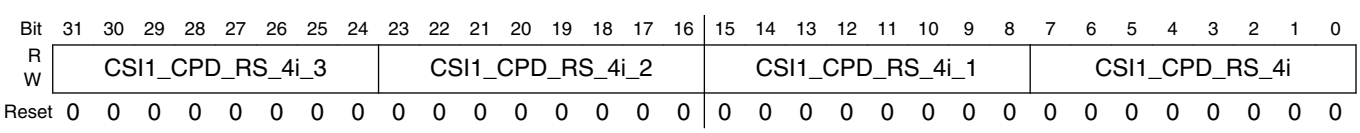
IPUx_CSI1_CPD_RC_i field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 CSI1_CPD_RC_2i_1	CONSTANT <2*i+1> parameter of Compander, Red component. Reserved
15–9 Reserved	This read-only field is reserved and always has the value 0.
CSI1_CPD_RC_2i	CONSTANT <2*i> parameter of Compander, Red component. Reserved

37.5.184 CSI1 Red Component Compander SLOPE Register <i> (IPUx_CSI1_CPD_RS_i)

These registers contain SLOPE <i> parameters used for companding of red component.

Address: Base address + 3_804Ch offset



IPUx_CSI1_CPD_RS_i field descriptions

Field	Description
31–24 CSI1_CPD_RS_4i_3	SLOPE<4*i+3> parameter of Compander, Red component. Reserved
23–16 CSI1_CPD_RS_4i_2	SLOPE<4*i+2> parameter of Compander, Red component. Reserved
15–8 CSI1_CPD_RS_4i_1	SLOPE<4*i+1> parameter of Compander, Red component. Reserved
CSI1_CPD_RS_4i	SLOPE<4*i> parameter of Compander, Red component. Reserved

37.5.185 CSI1 GR Component Compander Constants Register <i> (IPUx_CSI1_CPD_GRC_i)

These registers contain CONSTANTi parameters used for companding of green components in GRGR rows.

Address: Base address + 3_805Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_CSI1_CPD_OFFSET1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–20 CSI1_CPD_B_OFFSET	CSI1 Blue component offset The value is between -512 to 511. The value is added to the blue component before companding. Clipping: If the result of the blue components value + the offset is smaller than 0, the result is zero If the result of the blue components value + the offset is greater than 1023, the result is 1023 Reserved
19–10 CSI1_CPD_GB_OFFSET	CSI1 Green Blue component offset The value is between -512 to 511. The value is added to the blue component before companding. Clipping: If the result of the green-blue components value + the offset is smaller than 0, the result is zero If the result of the green-blue components value + the offset is greater than 1023, the result is 1023

Table continues on the next page...

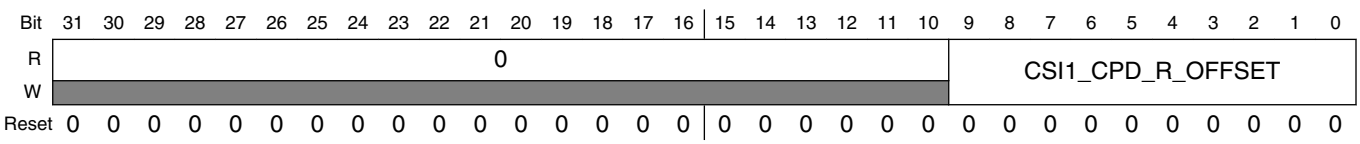
IPUx_CSI1_CPD_OFFSET1 field descriptions (continued)

Field	Description
	If the input format is RGB/YUV then CSI1_GB_OFFSET must be equal to CSI1_GR_OFFSET Reserved
CSI1_CPD_GR_OFFSET	CSI1 Green Red component offset The value is between -512 to 511. The value is added to the green-red component before companding. Clipping: If the result of the green-red components value + the offset is smaller than 0, the result is zero If the result of the green-red components value + the offset is greater than 1023, the result is 1023 Reserved

37.5.192 CSI1 Compander Offset Register 2 (IPUx_CSI1_CPD_OFFSET2)

These registers contain Offset parameters used for companding.

Address: Base address + 3_80F0h offset



IPUx_CSI1_CPD_OFFSET2 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
CSI1_CPD_R_OFFSET	CSI1 Red component offset The value is between -512 to 511. The value is added to the red component before companding. Clipping: If the result of the red components value + the offset is smaller than 0, the result is zero If the result of the red components value + the offset is greater than 1023, the result is 1023 Reserved

37.5.193 DI0 General Register (IPUx_DI0_GENERAL)

Address: Base address + 4_0000h offset

IPUx_DI0_GENERAL field descriptions

Field	Description
31 di0_pin8_pin15_sel	This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8
30–28 di0_disp_y_sel	DI0 Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected
27–24 DI0_CLOCK_STOP_MODE	DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped. Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame

Table continues on the next page...

IPUx_DI0_GENERAL field descriptions (continued)

Field	Description
23 DI0_DISP_CLOCK_INIT	Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame)
22 di0_mask_sel	DI0 Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2
21 di0_vsync_ext	DI0 External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU
20 di0_clk_ext	DI0 External Clock. This bit selects the source of the DI0's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU
19–18 DI0_WATCHDOG_MODE	DI0 watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles
17 di0_polarity_disp_clk	DI0 Output Clock's polarity This bits define the polarity of the DI0's clock. 1 The output clock is active high 0 The output clock is active low
16 Reserved	This read-only field is reserved and always has the value 0.
15–12 di0_sync_count_sel	For synchronous flow error: selects synchronous flow synchronization counter in DI:
11 di0_err_treatment	In case of synchronous flow error there are 2 ways to handle the display 1 to wait (stop clock) 0 Drive the last component
10 di0_erm_vsync_sel	DI0 error recovery block's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism.

Table continues on the next page...

IPUx_DI0_GENERAL field descriptions (continued)

Field	Description
	1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC
9 di0_polarity_cs1	DI0 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low
8 di0_polarity_cs0	DI0 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low
di0_polarity_i_1	DI0 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low

37.5.194 DI0 Base Sync Clock Gen 0 Register (IPUx_DI0_BS_CLKGEN0)

Address: Base address + 4_0004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

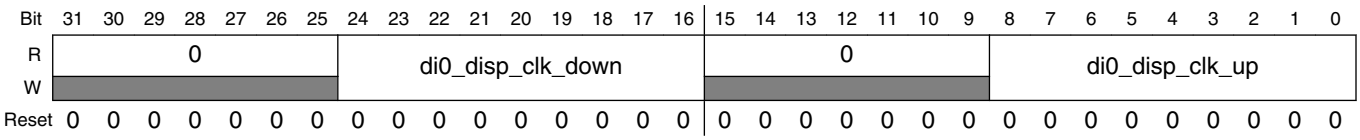
IPUx_DI0_BS_CLKGEN0 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_disp_clk_ offset	DI0 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock.
15–12 Reserved	This read-only field is reserved and always has the value 0.
di0_disp_clk_ period	DI0 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock.

37.5.195 DI0 Base Sync Clock Gen 1 Register (IPUx_DI0_BS_CLKGEN1)

Address: Base address + 4_0008h offset

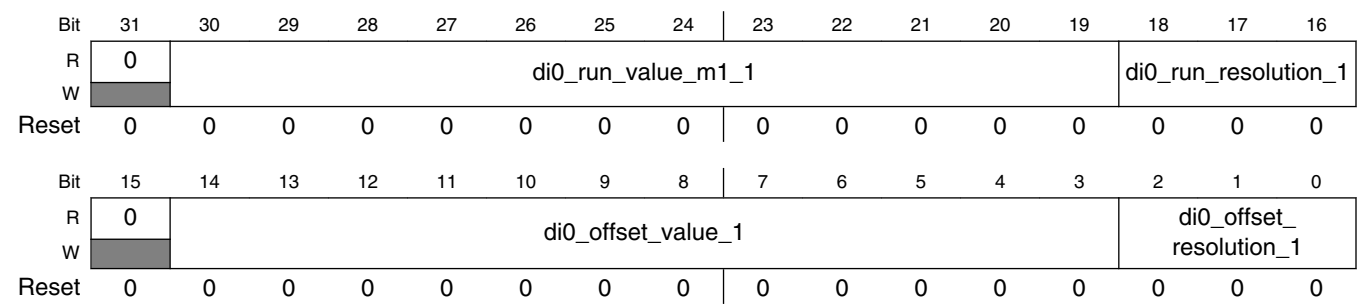


IPUx_DI0_BS_CLKGEN1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di0_disp_clk_down	DI0 display clock falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is a time interval between display's access start point and display's interface clock falling edge.
15–9 Reserved	This read-only field is reserved and always has the value 0.
di0_disp_clk_up	DI0 display clock rising edge position This parameter contains an integer part (bits 8:1) and a fractional part (bit 0). The position value is a time interval between display's access start point and display's interface clock rising edge.

37.5.196 DI0 Sync Wave Gen 1 Register 0 (IPUx_DI0_SW_GEN0_1)

Address: Base address + 4_000Ch offset



IPUx_DI0_SW_GEN0_1 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.

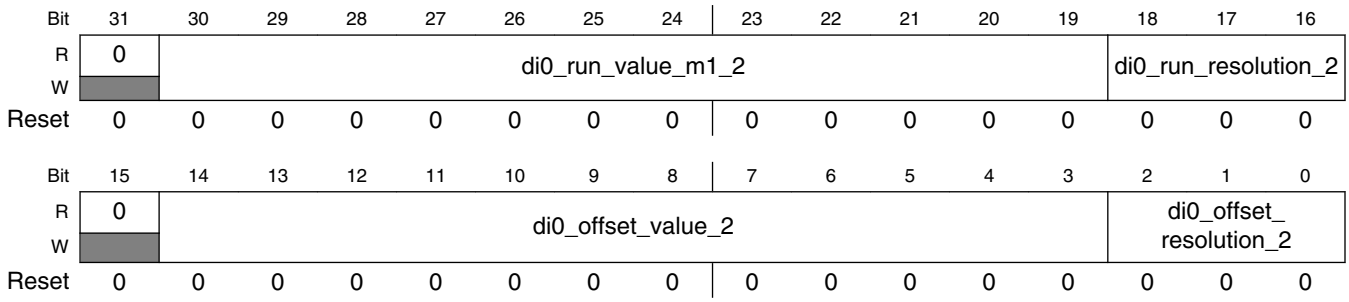
Table continues on the next page...

IPUx_DI0_SW_GEN0_1 field descriptions (continued)

Field	Description
30–19 di0_run_value_m1_1	DI0 counter #1 pre defined value This fields defines the counter #1 pre defines value. When the counter is auto reload mode (di0_cnt_auto_reload_1 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di0_step_repeat field.
18–16 di0_run_resolution_1	DI0 counter #1 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSIs according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di0_offset_value_1	DI0 counter #1 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di0_offset_resolution_1	DI0 counter #1 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSIs according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.

37.5.197 DI0 Sync Wave Gen 2 Register 0 (IPUx_DI0_SW_GEN0_2)

Address: Base address + 4_0010h offset



IPUx_DI0_SW_GEN0_2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–19 di0_run_value_m1_2	DI0 counter #2 pre defined value This fields defines the counter #2 pre defines value. When the counter is auto reload mode (di0_cnt_auto_reload_2 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di0_step_repeat field.
18–16 di0_run_resolution_2	DI0 counter #2 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock 010 The Counter is triggered by counter #1 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di0_offset_value_2	DI0 counter #2 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di0_offset_resolution_2	DI0 counter #2 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_6	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_6	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_6	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

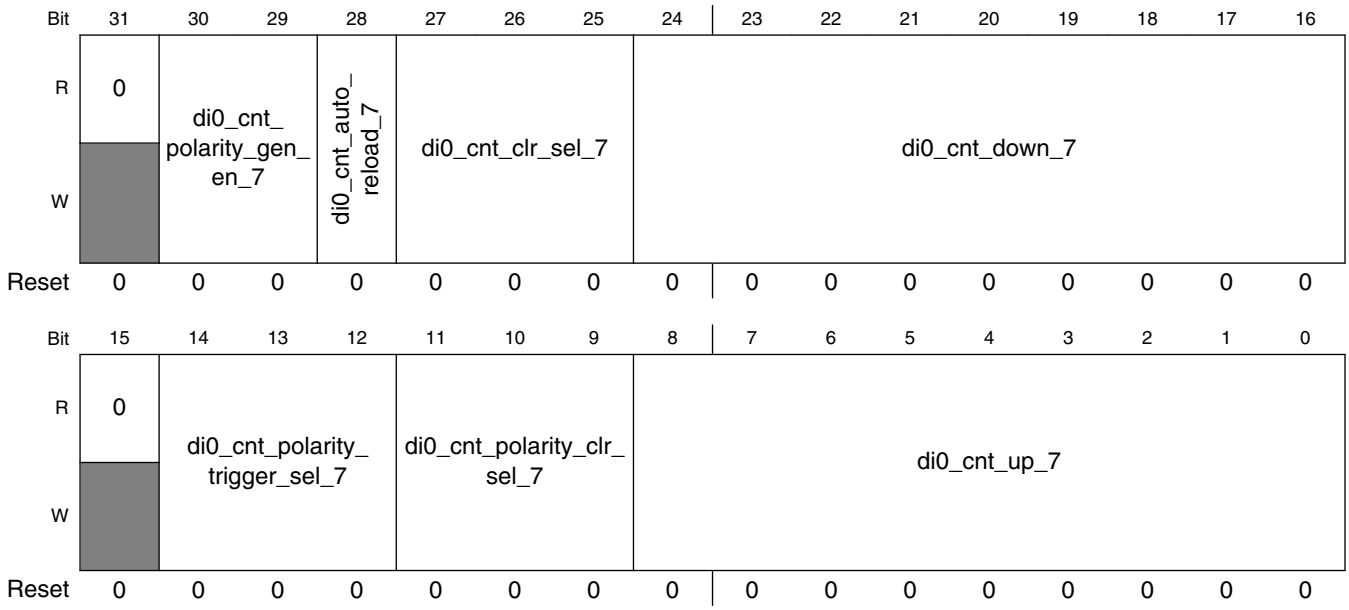
Table continues on the next page...

IPUx_DI0_SW_GEN1_6 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_6	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_6	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_6	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Reserved
di0_cnt_up_6	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.211 DI0 Sync Wave Gen 7 Register 1 (IPUx_DI0_SW_GEN1_7)

Address: Base address + 4_0048h offset



IPUx_DI0_SW_GEN1_7 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_7	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_7	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_7	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Table continues on the next page...

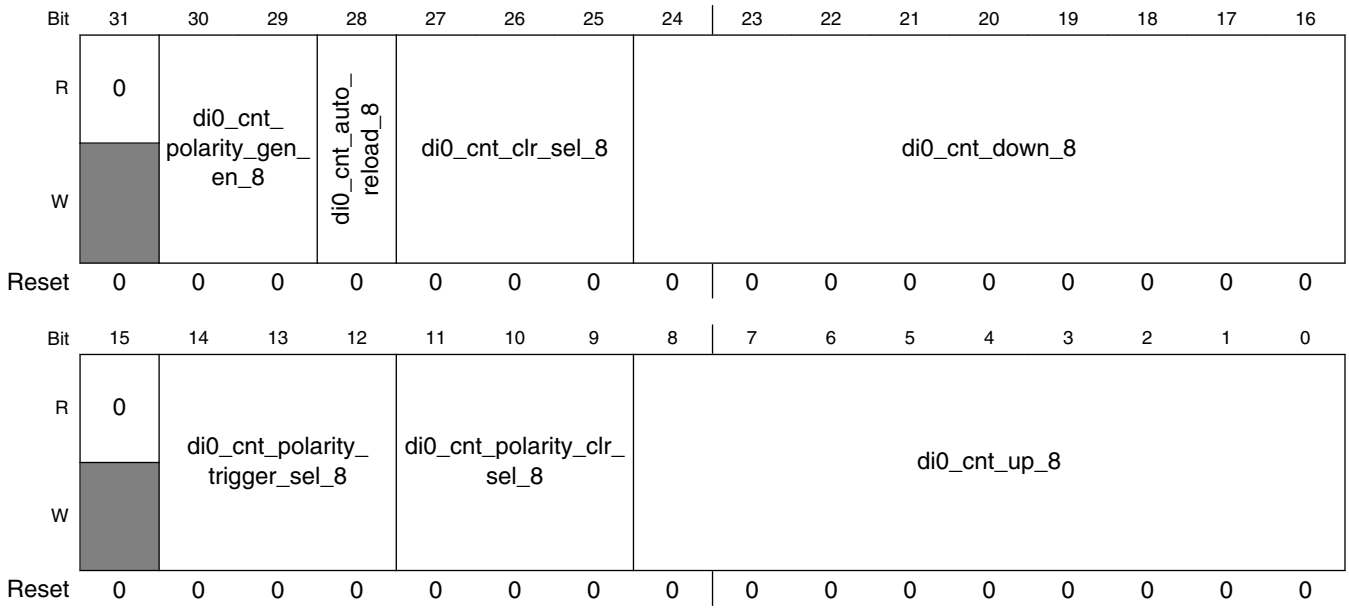
Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_7	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_7	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_7	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di0_cnt_up_7	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.212 DI0 Sync Wave Gen 8 Register 1 (IPUx_DI0_SW_GEN1_8)

Address: Base address + 4_004Ch offset



IPUx_DI0_SW_GEN1_8 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di0_cnt_polarity_gen_en_8	DI0 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di0_cnt_auto_reload_8	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_8	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

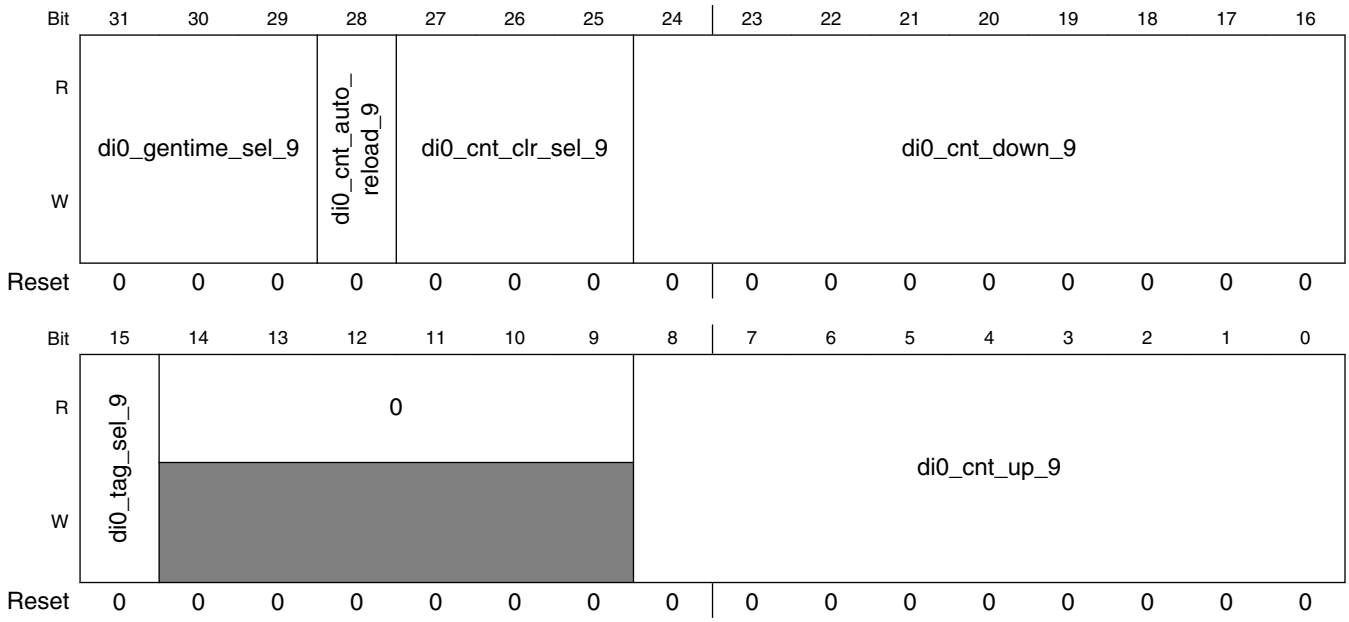
Table continues on the next page...

IPUx_DI0_SW_GEN1_8 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_8	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di0_cnt_polarity_trigger_sel_8	DI0 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di0_cnt_polarity_clr_sel_8	DI0 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di0_cnt_up_8	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.213 DI0 Sync Wave Gen 9 Register 1 (IPUx_DI0_SW_GEN1_9)

Address: Base address + 4_0050h offset



IPUx_DI0_SW_GEN1_9 field descriptions

Field	Description
31–29 di0_gentime_sel_9	Counter #9 main waveform select This field defines the counter that counter #9's auxiliary waveform will be attached too. 000 Counter #9's waveform is attached to counter #1's waveform 001 Counter #9's waveform is attached to counter #2's waveform 010 Counter #9's waveform is attached to counter #3's waveform 011 Counter #9's waveform is attached to counter #4's waveform 100 Counter #9's waveform is attached to counter #5's waveform 101 Counter #9's waveform is attached to counter #6's waveform 110 Counter #9's waveform is attached to counter #7's waveform 111 Counter #9's waveform is attached to counter #8's waveform
28 di0_cnt_auto_reload_9	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di0_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di0_step_repeat_<i> field
27–25 di0_cnt_clr_sel_9	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

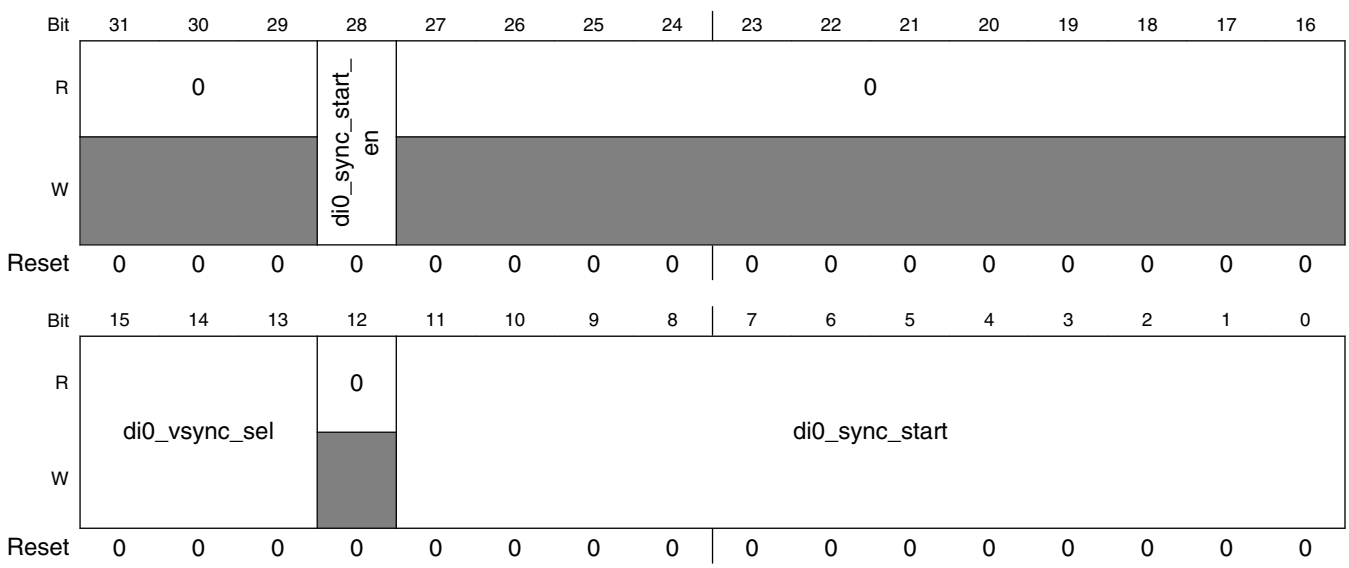
Table continues on the next page...

IPUx_DI0_SW_GEN1_9 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di0_cnt_down_9	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 di0_tag_sel_9	Counter #9 can send a synchronous tag when counter #9 reach its predefined value or when it's triggering counter reaches its pre defined value. 1 tag source is counter #9 0 Tag's source is the triggering counter.
14–9 Reserved	This read-only field is reserved and always has the value 0.
di0_cnt_up_9	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.214 DI0 Sync Assistance Gen Register (IPUx_DI0_SYNC_AS_GEN)

Address: Base address + 4_0054h offset



IPUx_DI0_SYNC_AS_GEN field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28 di0_sync_start_en	di0_sync_start_en
27–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 di0_vsync_sel	VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8
12 Reserved	This read-only field is reserved and always has the value 0.
di0_sync_start	DI0 Sync start This field defines the number of low (including blanking rows) on the which the DI0 starts preparing the data for the next frame.

37.5.215 DI0 Data Wave Gen <i> Register (IPUx_DI0_DW_GEN_i)

The DI0_DW_GEN_<i> register holds pointers for the waveform generators.

These registers have different bit arrangements for parallel and serial display. When using a parallel display VDI Plane Size Register 4 is applicable. When using a serial interface VDI Plane Size Register 4 is applicable.

Table 37-667. Register Field Descriptions for Serial Display

Field	Description
31-24 di0_serial_period_<i>	DI0 Serial Period <i> This field defines the period of the time base serial display clock. The units are the internal DI clock
23-16 di0_start_period_<i>	DI0 start period This field defines the amount of cycles between the point where the access is ready to be launched to the actual point where the time base serial display clock restarts. The units are the internal DI clock
15-14 di0_cst_<i>	DI0 Chip Select pointer for waveform <i> This field points to a register that defines the waveform of the CS pin. For serial displays the down value as defined on DI0_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i>

Table continues on the next page...

Table 37-667. Register Field Descriptions for Serial Display (continued)

Field	Description
	10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
13-9	Reserved
8-4 di0_serial_valid_bits<i>	DI0 Serial valid bits. This field defines the amount of valid bits to be transmitted within the 32 bits internal word aligned to bit[0]. The actual amount of valid bits is di0_serial_valid_bits_<i> + 1
3-2 di0_serial_rs_<i>	DI0 Serial RS This field points to a register that defines the waveform of the RS pin. For serial displays the down value as defined on DI0_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>
1-0 di0_serial_clk_<i>	DI0 serial clock<i> This field points to a register that defines the waveform of the Serial clock pin. 00 The waveform is defined according to the settings on DI0_DW_SET0_<i> 01 The waveform is defined according to the settings on DI0_DW_SET1_<i> 10 The waveform is defined according to the settings on DI0_DW_SET2_<i> 11 The waveform is defined according to the settings on DI0_DW_SET3_<i>

IPUx_DI0_SER_CONF field descriptions

Field	Description
31–28 DI0_SERIAL_LLA_PNTR_RS_R_1	RS 3 waveform pointer for read low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
27–24 DI0_SERIAL_LLA_PNTR_RS_R_0	RS 2 waveform pointer for read low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
23–20 DI0_SERIAL_LLA_PNTR_RS_W_1	RS 1 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the low level write access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
19–16 DI0_SERIAL_LLA_PNTR_RS_W_0	RS 0 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the low level write access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
15–8 DI0_SERIAL_LATCH	DI0 Serial Latch This field defines how many cycles to insert between serial read accesses start to data sampling in the
7–6 Reserved	This read-only field is reserved and always has the value 0.

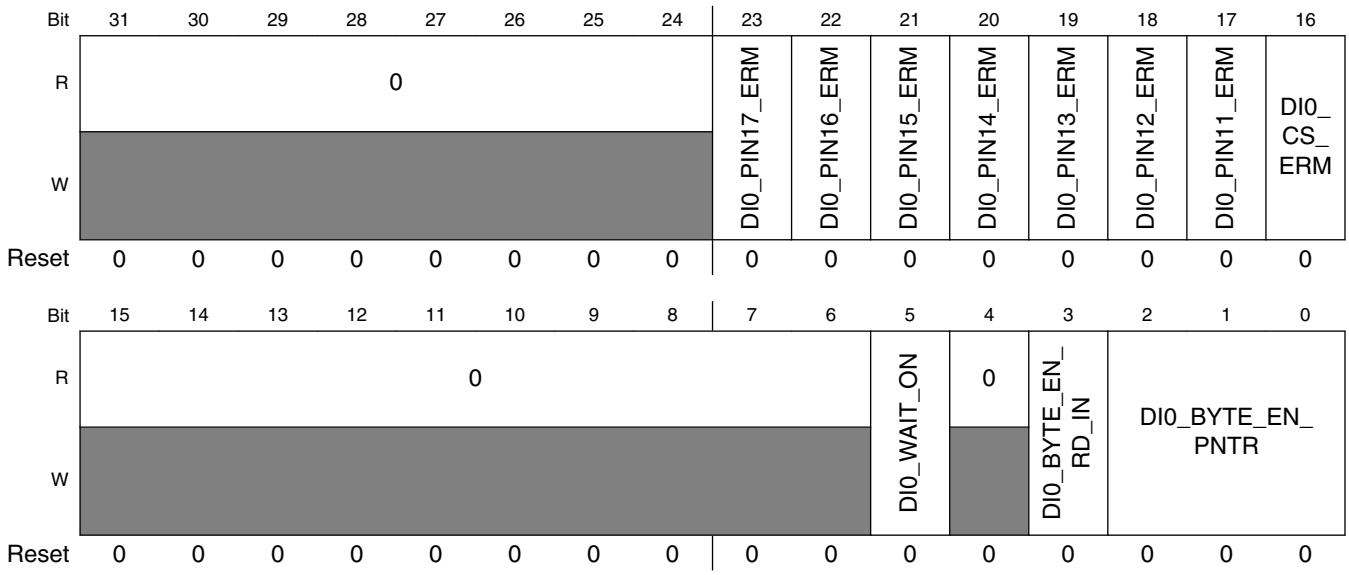
Table continues on the next page...

IPUx_DI0_SER_CONF field descriptions (continued)

Field	Description
5 DI0_LLA_SER_ACCESS	Direct Low Level Access to Serial display 1 ARM platform access is performed via a direct path to the serial display in LLA mode, in this mode only the ARM platform in LLA mode can access the serial port 0 ARM platform access to the serial display port is not done directly, hence other source are allowed to access the serial port. The arbitration is done automatically
4 DI0_SER_CLK_POLARITY	Serial Clock Polarity The output polarity of the SER_CLK pin 1 The clock is inverted 0 The clock is not inverted
3 DI0_SERIAL_DATA_POLARITY	Serial Data Polarity The output polarity of the SER_DATA pin 1 The data is inverted 0 The data is not inverted
2 DI0_SERIAL_RS_POLARITY	Serial RS Polarity The output polarity of the SER_RS pin 1 The RS is inverted 0 The RS is not inverted
1 DI0_SERIAL_CS_POLARITY	Serial Chip Select Polarity The output polarity of the SER_CS pin 1 The CS is inverted 0 The CS is not inverted
0 DI0_WAIT4SERIAL	Wait for Serial When the parallel display share pins with the serial port. Accessing the parallel port is not allowed till the serial port completes its access. 1 The parallel port should wait to the serial port as the pins are shared 0 The parallel port should not wait to the serial port as the pins are not shared

37.5.223 DI0 Special Signals Control Register (IPUx_DI0_SSC)

Address: Base address + 4_0160h offset



IPUx_DI0_SSC field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 DI0_PIN17_ERM	DI0 PIN17 error recovery mode. This bit defines the error recovery mode of the PIN17 pin. 1 The PIN17 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN17 pin following a display error detection
22 DI0_PIN16_ERM	DI0 PIN16 error recovery mode. This bit defines the error recovery mode of the PIN16 pin. 1 The PIN16 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN16 pin following a display error detection
21 DI0_PIN15_ERM	DI0 PIN15 error recovery mode. This bit defines the error recovery mode of the PIN15 pin. 1 The PIN15 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN15 pin following a display error detection
20 DI0_PIN14_ERM	DI0 PIN14 error recovery mode. This bit defines the error recovery mode of the PIN14 pin.

Table continues on the next page...

IPUx_DI0_SSC field descriptions (continued)

Field	Description
	1 The PIN14 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN14 pin following a display error detection
19 DI0_PIN13_ERM	DI0 PIN13 error recovery mode. This bit defines the error recovery mode of the PIN13 pin. 1 The PIN13 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN13 pin following a display error detection
18 DI0_PIN12_ERM	DI0 PIN12 error recovery mode. This bit defines the error recovery mode of the PIN12 pin. 1 The PIN12 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN12 pin following a display error detection
17 DI0_PIN11_ERM	DI0 PIN11 error recovery mode. This bit defines the error recovery mode of the PIN11 pin. 1 The PIN11 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC 0 Nothing is done to the PIN11 pin following a display error detection
16 DI0_CS_ERM	DI0 GLUELOGIC error recovery mode. This bit defines the error recovery mode of the GLUELOGIC. 1 The GLUELOGIC is release in case of a synchronous display error. The release will be done on the next VSYNC 0 Nothing is done to the GLUELOGIC following a display error detection
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 DI0_WAIT_ON	Wait On This field defines the DC's response to WAIT signal 1 The DC holds the flow as long as WAIT is asserted 0 The DC continues the flow regardless the WAIT signal
4 Reserved	This read-only field is reserved and always has the value 0.
3 DI0_BYTE_EN_RD_IN	Byte Enable Read In This bit selects the source of the byte enable pins 1 The write byte enable signals are routed via bits [17:16] of the display's data, The read byte enable signals are routed via bits [19:18 of the display's data 0 The byte enable signals are routed via bits [17:16] of the display's data for both read and write
DI0_BYTE_EN_PNTR	Byte Enable Pointer This pointer selects the pin asserted along with the byte enables signals 000 wave form of byte enable as pin_11

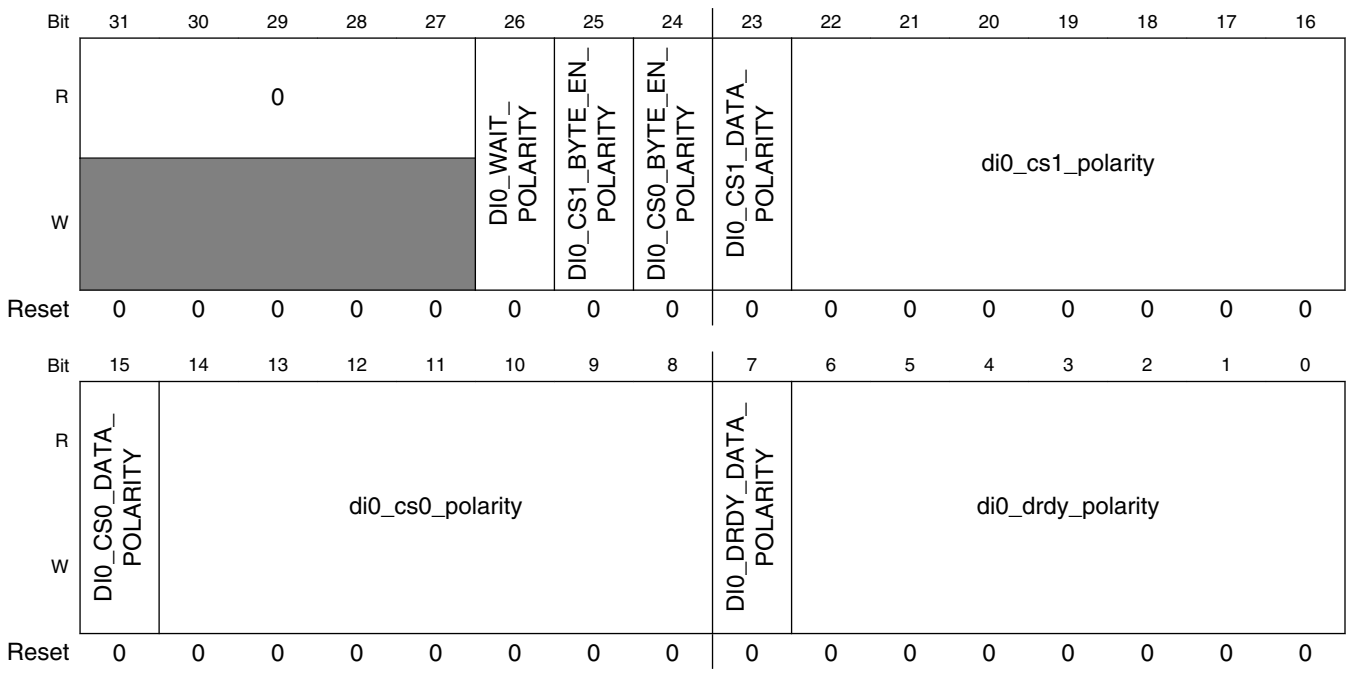
Table continues on the next page...

IPUx_DI0_SSC field descriptions (continued)

Field	Description
	001 wave form of byte enable as pin_12 111 wave form of byte enable as suitable CS pin

37.5.224 DI0 Polarity Register (IPUx_DI0_POL)

Address: Base address + 4_0164h offset



IPUx_DI0_POL field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 DI0_WAIT_POLARITY	WAIT polarity This bit defines the polarity of the wait signal input coming from the displa1 1 active high 0 active low
25 DI0_CS1_BYTE_EN_POLARITY	Byte Enable associated with CS1 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low
24 DI0_CS0_BYTE_EN_POLARITY	Byte Enable associated with CS0 polarity This bit defines the polarity of the byte enable signals to the display

Table continues on the next page...

IPUx_DI0_POL field descriptions (continued)

Field	Description
	1 active high 0 active low
23 DI0_CS1_DATA_POLARITY	Data Polarity associated with CS1
22–16 di0_cs1_polarity	DI0 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
15 DI0_CS0_DATA_POLARITY	Data Polarity associated with CS0
14–8 di0_cs0_polarity	DI0 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
7 DI0_DRDY_DATA_POLARITY	Data Polarity associated with DRDY
di0_drdy_polarity	DI0 output dynamic pin's polarity for synchronous access This bits define the polarity of each of the DI's outputs when synchronous display access is asserted The pins' default polarity is the same as defined in the di0_drdy_polarity bits 1 The output pin is active high 0 The output pin is active low

37.5.225 DI0 Active Window 0 Register (IPUx_DI0_AW0)

Address: Base address + 4_0168h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

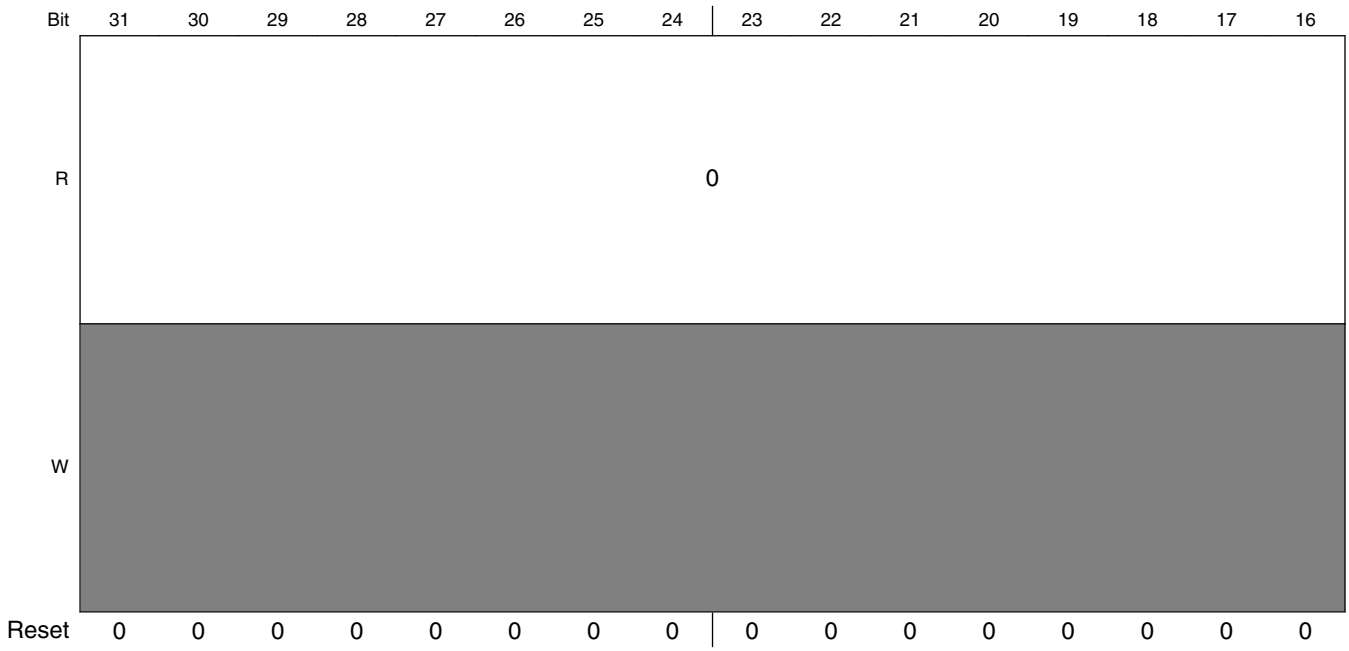
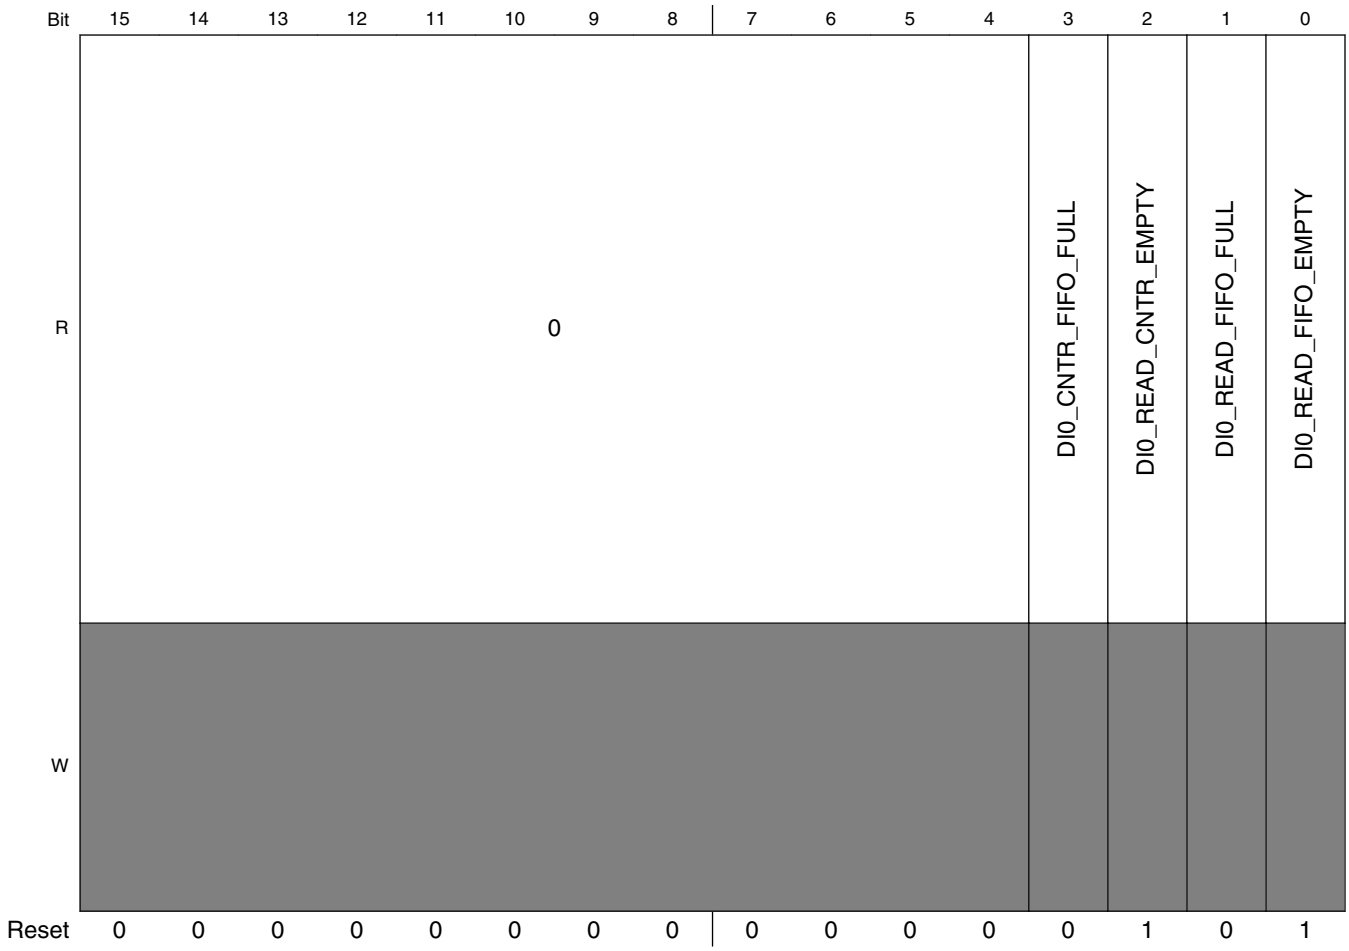
IPUx_DI0_SCR_CONF field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
DI0_SCREEN_ HEIGHT	This field defines the number of display rows (Number_of_ROWS = DI0_SCREEN_HEIGHT+1) This field is used for VSYNC calculation and for anti-tearing

37.5.228 DI0 Status Register (IPUx_DI0_STAT)

Address: Base address + 4_0174h offset





IPUx_DI0_STAT field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
3 DI0_CNTR_ FIFO_FULL	This bit indicates a full state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer.
2 DI0_READ_ CNTR_EMPTY	This bit indicates an empty state of the DI0 FIFO. This FIFO is part of the DI0 synchronizer.
1 DI0_READ_ FIFO_FULL	This bit indicates a full state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer.
0 DI0_READ_ FIFO_EMPTY	This bit indicates an empty state of the DI0 FIFO when performing a read. This FIFO is part of the DI0 synchronizer.

37.5.229 DI1General Register (IPUx_DI1_GENERAL)

Address: Base address + 4_8000h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_DI1_GENERAL field descriptions

Field	Description
31 di1_pin8_pin15_sel	This bit routes PIN8 over PIN15 1 PIN8 is routed to PIN15, PIN8 is also routed to PIN8 0 PIN15 is routed to PIN15, PIN8 is routed to PIN8
30–28 di1_disp_y_sel	DI1 Display Vertical coordinate (Y) select. This field defines which one of the 8 counters will be used as a display's line counter. 000 counter #1 is selected 111 counter #8 is selected
27–24 DI1_CLOCK_STOP_MODE	DI clock stop mode When performing a clock change. The DI stops the clock to the display. These field defines when the clock will be stopped Stopping at EOL/EOF is supported for the case where the data is coming from the IDMAC (DMA access). In case that only direct accesses is performed, the user should set this field to 0000 0001-1001 stop at the next event of one of the counters (counter #1 to counter #9) 0000 stop at the next edge of the display clock 1100 stop at EOL (end of a line), but if stop request is during blanking interval, stop now 1101 stop at EOF (end of a frame), but if stop request is during blanking interval, stop now 1110 stop at EOL (end of a line), but if stop request is during blanking interval, stop at the end of the next line 1111 stop at EOF (end of a frame), but if stop request is during blanking interval, stop at the end of the next frame

Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

Field	Description
23 DI1_DISP_CLOCK_INIT	Display clock's initial mode For synchronization error conditions the display clock can be stopped on the next VSYNC 1 The display's clock is running after the next VSYNC (indicating new frame) 0 The display's clock is stopped after the next VSYNC (indicating new frame)
22 di1_mask_sel	DI1 Mask select. IPP_PIN_2 output of the DI that functions as MASK signal can come from 2 sources: counter #2 or extracted from the MASK data coming from the memory. 1 IPP_PIN_2 is coming from extracted MASK data coming from the memory 0 IPP_PIN_2 is coming from counter #2
21 di1_vsync_ext	DI1 External VSYNC. This bit selects the source of the VSYNC signal 1 External to the IPU 0 Internally generated by the IPU
20 di1_clk_ext	DI1 External Clock. This bit selects the source of the DI's clock 1 The source of the clock is external to the IPU 0 The clock is internally generated by the IPU
19–18 DI1_WATCHDOG_MODE	DI1 watchdog mode In case of a display error where the DI clock is stopped (defined at di0_err_treatment). An internal watchdog counts DI clocks. If this timer reached its pre defined value the DI will skip the current frame and restart on the frame. This 2 bits define the number of DI clock cycles that the timer counts. 00 The timer counts 4 DI cycles 01 The timer counts 16 DI cycles 10 The timer counts 64 DI cycles 11 The timer counts 128 DI cycles
17 di1_polarity_disp_clk	DI1 Output Clock's polarity This bits define the polarity of the DI's clock. 1 The output clock is active high 0 The output clock is active low
16 Reserved	This read-only field is reserved and always has the value 0.
15–12 di1_sync_count_sel	For synchronous flow error: selects synchronous flow synchronization counter in DI:
11 di1_err_treatment	In case of synchronous flow error there are 2 ways to handle the display 1 to wait (i.e. stop clock) 0 Drive the last component
10 di1_erm_vsync_sel	DI1 error recovery module's VSYNC source select The error recovery block detect a case where the DI's VSYNC is asserted before the EOF. This bit selects the source of the VSYNC signal monitored by this mechanism.

Table continues on the next page...

IPUx_DI1_GENERAL field descriptions (continued)

Field	Description
	1 vsync_post - an internal VSYNC signal asserted 2 lines after the DI's VSYNC 0 vsync_pre - an internal VSYNC signal asserted 2 lines before the DI's VSYNC
9 di1_polarity_cs1	DI1 Chip Select's 1 polarity This bits define the polarity of the DI's CS1. 1 The CS1 is active high 0 The CS1 is active low
8 di1_polarity_cs0	DI1 Chip Select's 0 polarity This bits define the polarity of the DI's CS0. 1 The CS0 is active high 0 The CS0 is active low
di1_polarity_i_1	DI1 output pin's polarity This bits define the polarity of each of the DI's outputs. 1 The output pin is active high 0 The output pin is active low

37.5.230 DI1 Base Sync Clock Gen 0 Register (IPUx_DI1_BS_CLKGEN0)

Address: Base address + 4_8004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

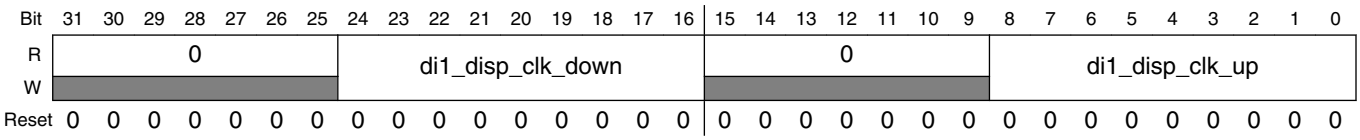
IPUx_DI1_BS_CLKGEN0 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di1_disp_clk_ offset	DI1 Display Clock Offset The DI has the ability to delay the display's clock This field defines the amount of IPU's clock cycles added as delay on this clock.
15–12 Reserved	This read-only field is reserved and always has the value 0.
di1_disp_clk_ period	DI1 Display Clock Period This field defines the Display interface clock period for display write access. This parameter contains an integer part (bits 11:4) and a fractional part (bits 3:0). It defines a fractional division ratio of the HSP_CLK clock for generation of the display's interface clock.

37.5.231 DI1 Base Sync Clock Gen 1 Register (IPUx_DI1_BS_CLKGEN1)

Address: Base address + 4_8008h offset

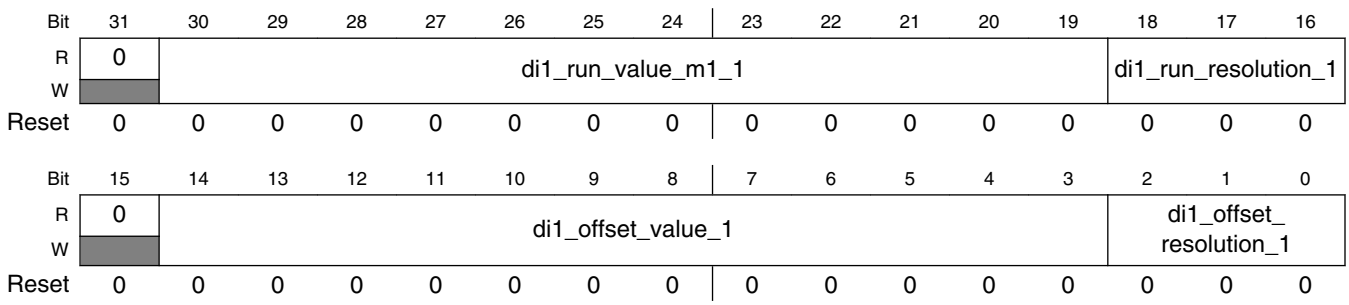


IPUx_DI1_BS_CLKGEN1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24–16 di1_disp_clk_down	DI1 display clock falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is a time interval between display's access start point and display 's interface clock falling edge.
15–9 Reserved	This read-only field is reserved and always has the value 0.
di1_disp_clk_up	DI1 display clock rising edge position This parameter contains an integer part (bits 8:1) and a fractional part (bit 0). The position value is a time interval between display's access start point and display 's interface clock rising edge.

37.5.232 DI1 Sync Wave Gen 1 Register 0 (IPUx_DI1_SW_GEN0_1)

Address: Base address + 4_800Ch offset



IPUx_DI1_SW_GEN0_1 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.

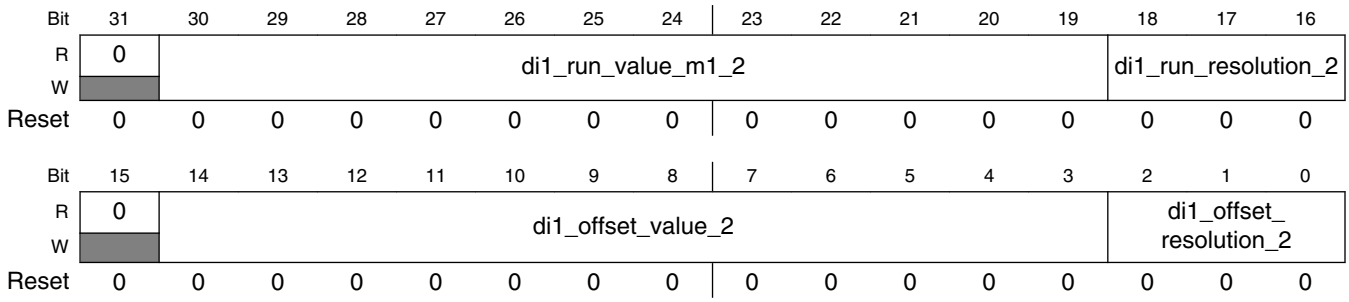
Table continues on the next page...

IPUx_DI1_SW_GEN0_1 field descriptions (continued)

Field	Description
30–19 di1_run_value_m1_1	DI1 counter #1 pre defined value This fields defines the counter #1 pre defines value. When the counter is auto reload mode (di1_cnt_auto_reload_1 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di1_step_repeat field.
18–16 di1_run_resolution_1	DI1 counter #1 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di1_offset_value_1	DI1 counter #1 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di1_offset_resolution_1	DI1 counter #1 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 NA 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.

37.5.233 DI1 Sync Wave Gen 2 Register 0 (IPUx_DI1_SW_GEN0_2)

Address: Base address + 4_8010h offset



IPUx_DI1_SW_GEN0_2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–19 di1_run_value_m1_2	DI1 counter #2 pre defined value This fields defines the counter #2 pre defines value. When the counter is auto reload mode (di1_cnt_auto_reload_2 bit is set), the counter automatically restarts. otherwise the counter restarts for the amount of time defined on the corresponding di1_step_repeat field.
18–16 di1_run_resolution_2	DI1 counter #2 Run Resolution This field defines the trigger causing the counter to increment. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
15 Reserved	This read-only field is reserved and always has the value 0.
14–3 di1_offset_value_2	DI1 counter #2 offset value The counter can start counting after a pre defined delay This field defines the amount of cycles that the counter will be delayed by
di1_offset_resolution_2	DI1 counter #2 offset Resolution This field defines the trigger causing the offset counter to increment 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Table continues on the next page...

IPUx_DI1_SW_GEN0_2 field descriptions (continued)

Field	Description
	011 NA 100 NA 101 CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.

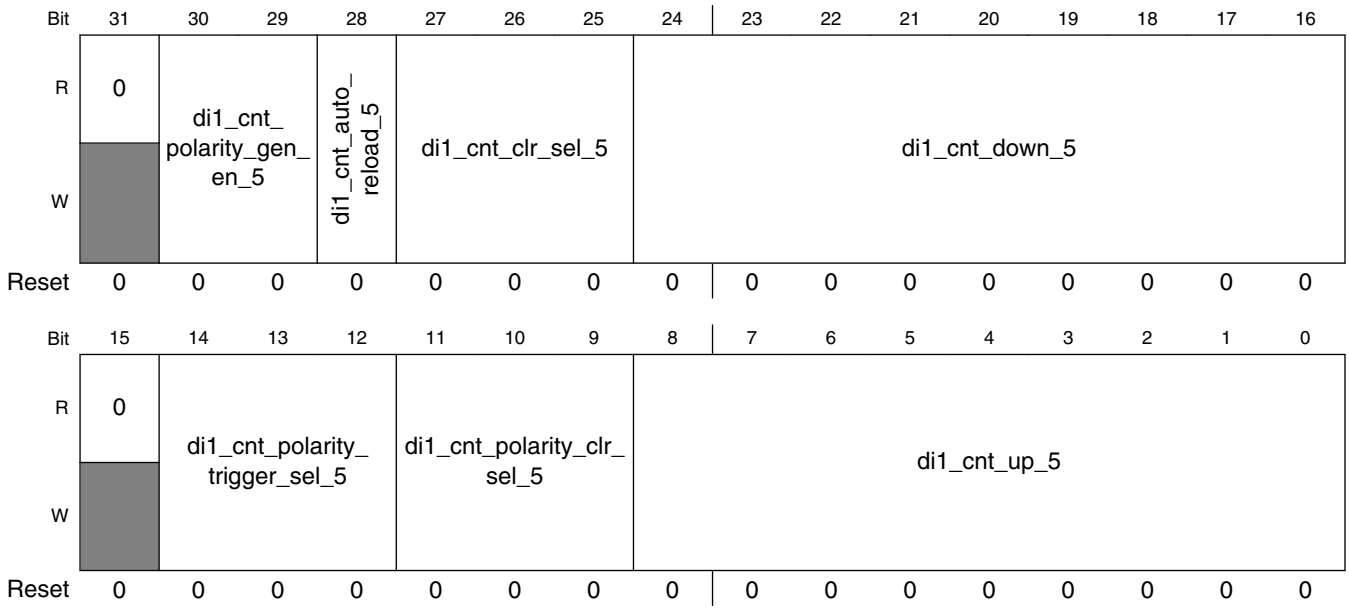
14–12 di1_cnt_polarity_trigger_sel_4	DI1 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 - Counter is disabled 001 - The counter is triggered by the same trigger that triggers the displays clock. 010 - The Counter is triggered by counter #1 011 - The Counter is triggered by counter #2 100 - The Counter is triggered by counter #3 101 - CSI VSYNC. The VSYNC is a trigger coming from one of the CSI's according to the CSI_VSYNC_DEST bit. — 110 External VSYNC 111 Counter is always on.
11–9 di1_cnt_polarity_clr_sel_4	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Reserved 110 Reserved 111 Reserved
di1_cnt_up_4	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.245 DI1 Sync Wave Gen 5 Register 1 (IPUx_DI1_SW_GEN1_5)

Address: Base address + 4_8040h offset



IPUx_DI1_SW_GEN1_5 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di1_cnt_polarity_gen_en_5	DI1 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di1_cnt_auto_reload_5	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_5	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

Table continues on the next page...

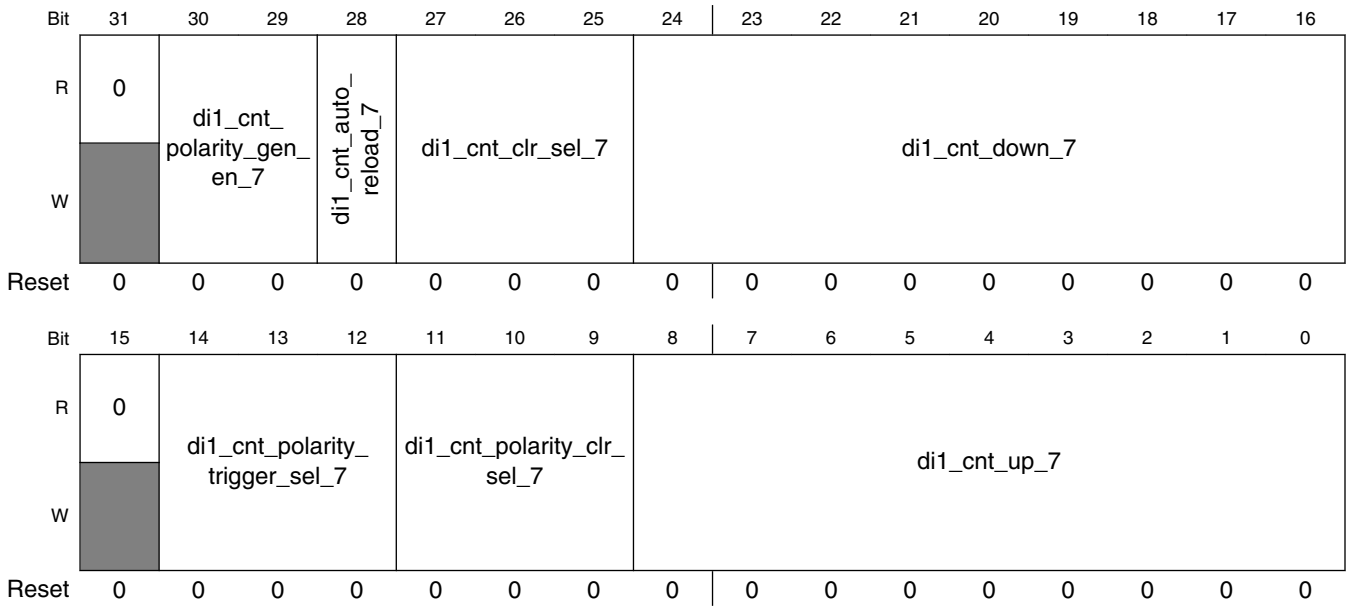
di1_cnt_up_6	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.247 DI1Sync Wave Gen 7 Register 1 (IPUx_DI1_SW_GEN1_7)

Address: Base address + 4_8048h offset



IPUx_DI1_SW_GEN1_7 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di1_cnt_polarity_gen_en_7	DI1 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di1_cnt_auto_reload_7	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_7	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

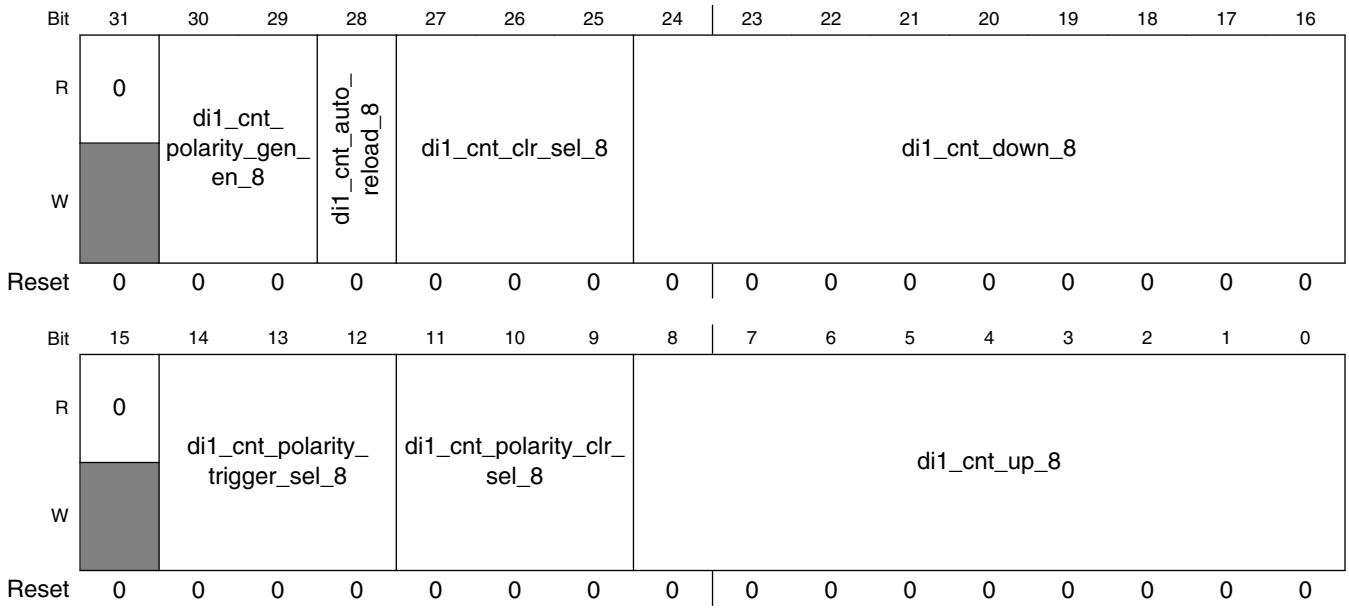
Table continues on the next page...

IPUx_DI1_SW_GEN1_7 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_7	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di1_cnt_polarity_trigger_sel_7	DI1 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di1_cnt_polarity_clr_sel_7	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di1_cnt_up_7	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.248 DI1 Sync Wave Gen 8 Register 1 (IPUx_DI1_SW_GEN1_8)

Address: Base address + 4_804Ch offset



IPUx_DI1_SW_GEN1_8 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–29 di1_cnt_polarity_gen_en_8	DI1 Counter polarity generator enable The counter's output polarity can be changed on the fly. 00 Dynamic polarity change is disabled 01 The counters UP and DOWN value are calculated according to the trigger selected by cnt_polarity_trigger_sel field. When selecting this mode the UP and DOWN values has to be a multiple of 2. 10 Dynamic polarity change is enabled 11 Outputs polarity is dynamically changed every time the counter reaches its pre defined value
28 di1_cnt_auto_reload_8	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_8	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

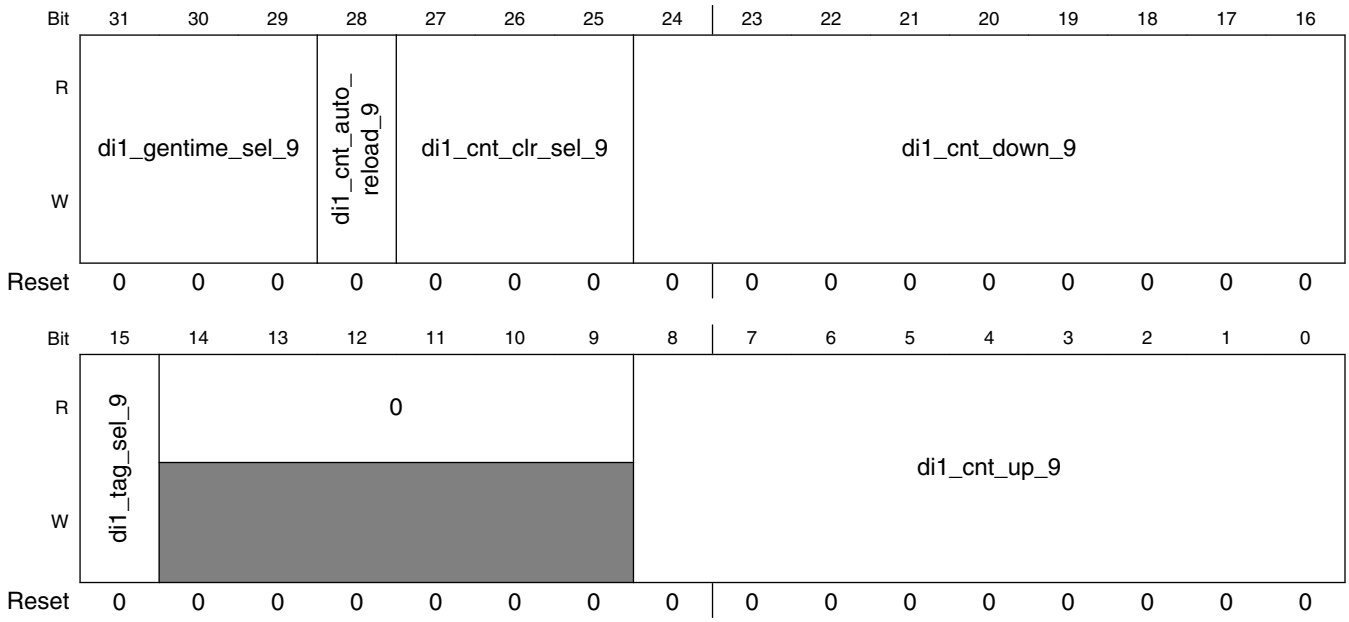
Table continues on the next page...

IPUx_DI1_SW_GEN1_8 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_8	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 di1_cnt_polarity_trigger_sel_8	DI1 Counter's toggling trigger select This field selects the counter's trigger causing the output to toggle 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1 011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
11–9 di1_cnt_polarity_clr_sel_8	DI1 counter's polarity Clear select This field selects the input to the counter telling the counter wether to invert the output 000 Output is always inverted 001 Output is kept the same (no inversion) 010 Output is inverted if the output of counter #1 is set 011 Output is inverted if the output of counter #2 is set 100 Output is inverted if the output of counter #3 is set 101 Output is inverted if the output of counter #4 is set 110 Output is inverted if the output of counter #5 is set 111 Output is inverted if the output of counter #6 is set
di1_cnt_up_8	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.249 DI1 Sync Wave Gen 9 Register 1 (IPUx_DI1_SW_GEN1_9)

Address: Base address + 4_8050h offset



IPUx_DI1_SW_GEN1_9 field descriptions

Field	Description
31–29 di1_gentime_sel_9	Counter #9 main waveform select This field defines the counter that counter #9's auxiliary waveform will be attached too. 000 Counter #9's waveform is attached to counter #1's waveform 001 Counter #9's waveform is attached to counter #2's waveform 010 Counter #9's waveform is attached to counter #3's waveform 011 Counter #9's waveform is attached to counter #4's waveform 100 Counter #9's waveform is attached to counter #5's waveform 101 Counter #9's waveform is attached to counter #6's waveform 110 Counter #9's waveform is attached to counter #7's waveform 111 Counter #9's waveform is attached to counter #8's waveform
28 di1_cnt_auto_reload_9	Counter auto reload mode 1 The counter will automatically be reloaded forever, ignoring the value of the di1_step_repeat_<i> field 0 The counter will not be automatically reloaded, It will be reloaded for the amount of repeat times defined on the di1_step_repeat_<i> field
27–25 di1_cnt_clr_sel_9	Counter Clear select This field defines the source of the signals that clears the counter. 000 Counter is disabled 001 The counter is triggered by the same trigger that triggers the displays clock. 010 The Counter is triggered by counter #1

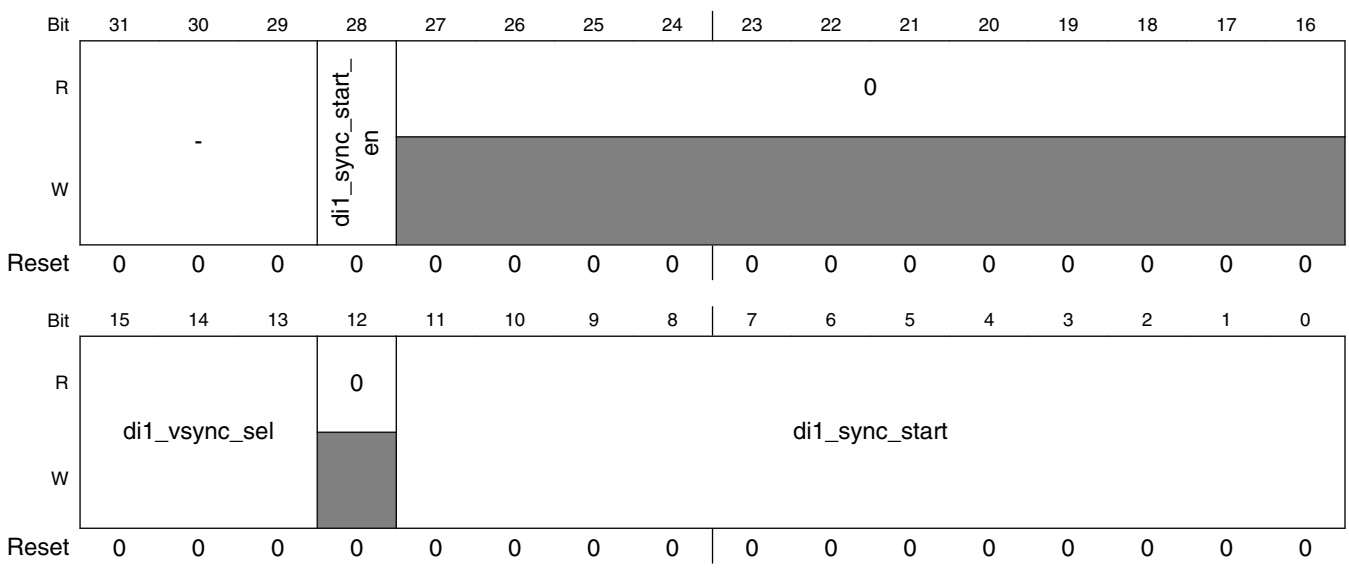
Table continues on the next page...

IPUx_DI1_SW_GEN1_9 field descriptions (continued)

Field	Description
	011 The Counter is triggered by counter #2 100 The Counter is triggered by counter #3 101 The Counter is triggered by counter #4 110 The Counter is triggered by counter #5 111 Counter is always on.
24–16 di1_cnt_down_9	Counter falling edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's falling edge.
15 di1_tag_sel_9	Counter #9 can send a synchronous tag when counter #9 reach its predefined value or when it's triggering counter reaches its pre defined value. 1 tag source is counter #9 0 Tag's source is the triggering counter.
14–9 Reserved	This read-only field is reserved and always has the value 0.
di1_cnt_up_9	Counter rising edge position This parameter contains an integer part (bits 24:17) and a fractional part (bit 16). The position value is the amount of cycles between the trigger's start point and the waveform's rising edge.

37.5.250 DI1 Sync Assistance Gen Register (IPUx_DI1_SYNC_AS_GEN)

Address: Base address + 4_8054h offset



IPUx_DI1_SYNC_AS_GEN field descriptions

Field	Description
31–29 -	Reserve
28 di1_sync_start_en	di1_sync_start_en
27–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 di1_vsync_sel	VSYNC select This field defines which of the counters functions as VSYNC signal 000 VSYNC is coming from counter #1 001 VSYNC is coming from counter #2 111 VSYNC is coming from counter #8
12 Reserved	This read-only field is reserved and always has the value 0.
di1_sync_start	DI1 Sync start This field defines the number of low (including blanking rows) on the which the DI1 starts preparing the data for the next frame.

37.5.251 DI1 Data Wave Gen <i> Register (IPUx_DI1_DW_GEN_i)

The DI1_DW_GEN_<i> register holds pointers for the waveform generators.

These registers have different bit arrangements for parallel and serial display. When using a parallel display VDI Plane Size Register 4 is applicable. When using a serial interface VDI Plane Size Register 4 is applicable.

Table 37-704. Register Field Descriptions for Serial display

Field	Description
31-24 di1_serial_period_<i>	DI1 Serial Period <i> This field defines the period of the time base serial display clock. The units are the internal DI clock
23-16 di1_start_period_<i>	DI1 start period This field defines the amount of cycles between the point where the access is ready to be launched to the actual point where the time base serial display clock restarts. The units are the internal DI clock.
15-14 di1_cst_<i>	DI1 Chip Select pointer for waveform <i> This field points to a register that defines the waveform of the CS pin. For serial displays the down value as defined on DI1_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i>

Table continues on the next page...

Table 37-704. Register Field Descriptions for Serial display (continued)

Field	Description
	10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i>
13-9	Reserved
8-4 di1_serial_valid_bits_<i>	DI1 Serial valid bits. This field defines the amount of valid bits to be transmitted within the 32 bits internal word aligned to bit[0]. The actual amount of valid bits is di1_serial_valid_bits_<i> + 1
3-2 di1_serial_rs_<i>	DI1 Serial RS This field points to a register that defines the waveform of the RS pin. For serial displays the down value as defined on DI1_DW_SET*_<i> is measured from the assertion of the last serial display time base clock. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i> 10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i>
1-0 di1_serial_clk_<i>	DI1 serial clock<i> This field points to a register that defines the waveform of the Serial clock pin. 00 The waveform is defined according to the settings on DI1_DW_SET0_<i> 01 The waveform is defined according to the settings on DI1_DW_SET1_<i> 10 The waveform is defined according to the settings on DI1_DW_SET2_<i> 11 The waveform is defined according to the settings on DI1_DW_SET3_<i>

Address: Base address + 4_8058h offset

Field	Description
31–28 DI1_SERIAL_LLA_PNTR_RS_R_1	RS 3 waveform pointer for read low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
27–24 DI1_SERIAL_LLA_PNTR_RS_R_0	RS 2 waveform pointer for low level access This pointer defines which waveform set will be chosen when the read low level access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
23–20 DI1_SERIAL_LLA_PNTR_RS_W_1	RS 1 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the write low level access is targeted to RS group 1. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
19–16 DI1_SERIAL_LLA_PNTR_RS_W_0	RS 0 waveform pointer for write low level access This pointer defines which waveform set will be chosen when the write low level access is targeted to RS group 0. 0000 Waveform set #1 0001 Waveform set #2 1011 Waveform set #12 1100 Reserved 1101 Reserved 1100 Reserved
15–8 DI1_SERIAL_LATCH	DI1 Serial Latch This field defines how many cycles to insert between serial read accesses start to data sampling in the
7–6 Reserved	This read-only field is reserved and always has the value 0.

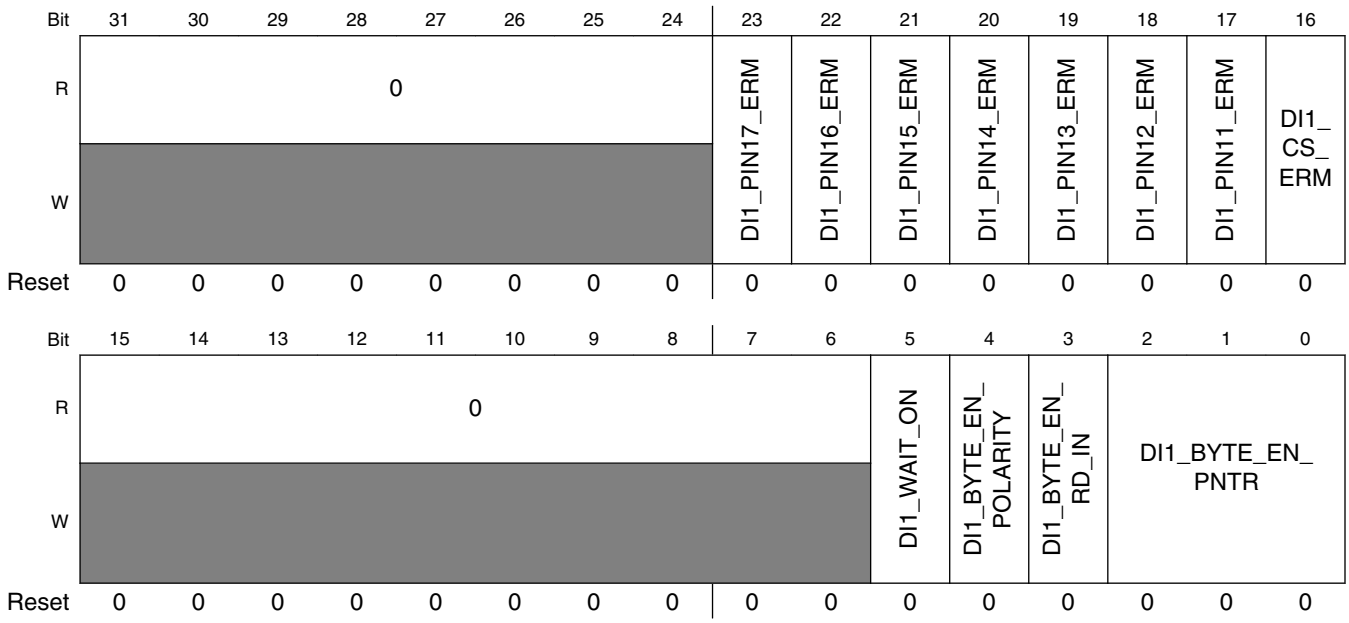
Table continues on the next page...

IPUx_DI1_SER_CONF field descriptions (continued)

Field	Description
5 DI1_LLA_SER_ACCESS	Direct Low Level Access to Serial display 1 ARM platform access is performed via a direct path to the serial display in LLA mode, in this mode only the ARM platform in LLA mode can access the serial port 0 ARM platform access to the serial display port is not done directly, hence other source are allowed to access the serial port. The arbitration is done automatically
4 DI1_SER_CLK_POLARITY	Serial Clock Polarity The output polarity of the SER_CLK pin 1 The clock is inverted 0 The clock is not inverted
3 DI1_SERIAL_DATA_POLARITY	Serial Data Polarity The output polarity of the SER_DATA pin 1 The data is inverted 0 The data is not inverted
2 DI1_SERIAL_RS_POLARITY	Serial RS Polarity The output polarity of the SER_RS pin 1 The RS is inverted 0 The RS is not inverted
1 DI1_SERIAL_CS_POLARITY	Serial Chip Select Polarity The output polarity of the SER_CS pin 1 The CS is inverted 0 The CS is not inverted
0 DI1_WAIT4SERIAL	Wait for Serial When the parallel display share pins with the serial port. Accessing the parallel port is not allowed till the serial port completes its access. 1 The parallel port should wait to the serial port as the pins are shared 0 The parallel port should not wait to the serial port as the pins are not shared

37.5.259 DI1 Special Signals Control Register (IPUx_DI1_SSC)

Address: Base address + 4_8160h offset



IPUx_DI1_SSC field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 DI1_PIN17_ERM	DI1 PIN17 error recovery mode. This bit defines the error recovery mode of the PIN17 pin. 1 The PIN17 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN17 pin following a display error detection.
22 DI1_PIN16_ERM	DI1 PIN16 error recovery mode. This bit defines the error recovery mode of the PIN16 pin. 1 The PIN16 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN16 pin following a display error detection.
21 DI1_PIN15_ERM	DI1 PIN15 error recovery mode. This bit defines the error recovery mode of the PIN15 pin. 1 The PIN15 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN15 pin following a display error detection.
20 DI1_PIN14_ERM	DI1 PIN14 error recovery mode. This bit defines the error recovery mode of the PIN14 pin.

Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

Field	Description
	1 The PIN14 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN14 pin following a display error detection.
19 DI1_PIN13_ERM	DI1 PIN13 error recovery mode. This bit defines the error recovery mode of the PIN13 pin. 1 The PIN13 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN13 pin following a display error detection.
18 DI1_PIN12_ERM	DI1 PIN12 error recovery mode. This bit defines the error recovery mode of the PIN12 pin. 1 The PIN12 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN12 pin following a display error detection.
17 DI1_PIN11_ERM	DI1 PIN11 error recovery mode. This bit defines the error recovery mode of the PIN11 pin. 1 The PIN11 pin is cleared in case of a synchronous display error. The clear will be done on the next VSYNC. 0 Nothing is done to the PIN11 pin following a display error detection.
16 DI1_CS_ERM	DI1 GLUELOGIC error recovery mode. This bit defines the error recovery mode of the GLUELOGIC. 1 The GLUELOGIC is release in case of a synchronous display error. The release will be done on the next VSYNC. 0 Nothing is done to the GLUELOGIC following a display error detection.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 DI1_WAIT_ON	Wait On This field defines the DC's response to WAIT signal 1 The DC holds the flow as long as WAIT is asserted. 0 The DC continues the flow regardless the WAIT signal.
4 DI1_BYTE_EN_POLARITY	Byte Enable polarity This bit defines the polarity of the byte enable signals to the display. 1 active high. 0 active low.
3 DI1_BYTE_EN_RD_IN	Byte Enable Read In This bit selects the source of the byte enable pins 1 The write byte enable signals are routed via bits [17:16] of the display's data, The read byte enable signals are routed via bits [19:18 of the display's data 0 The byte enable signals are routed via bits [17:16] of the display's data for both read and write
DI1_BYTE_EN_PNTR	Byte Enable Pointer This pointer selects the pin asserted along with the byte enables signals

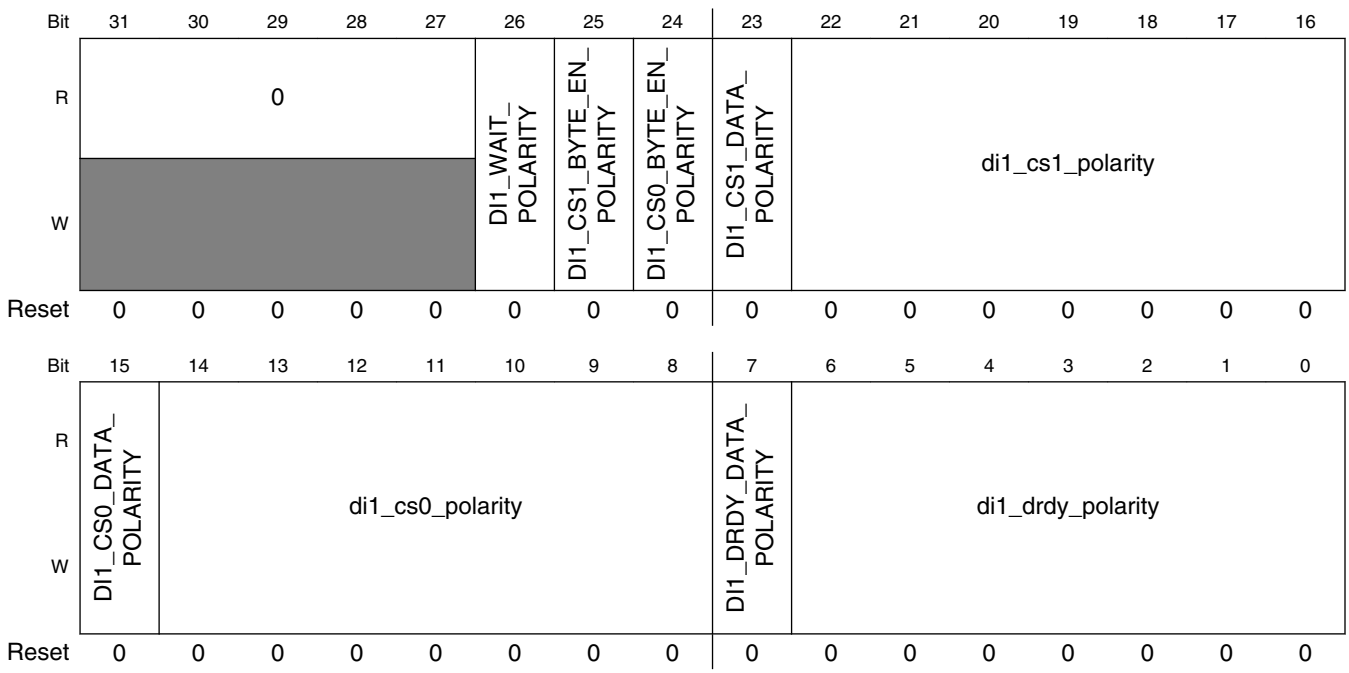
Table continues on the next page...

IPUx_DI1_SSC field descriptions (continued)

Field	Description
	000 wave form of byte enable as pin_11 001 wave form of byte enable as pin_12 111 wave form of byte enable as suitable CS pin

37.5.260 DI1 Polarity Register (IPUx_DI1_POL)

Address: Base address + 4_8164h offset



IPUx_DI1_POL field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 DI1_WAIT_POLARITY	WAIT polarity This bit defines the polarity of the wait signal input coming from the displa1 1 active high 0 active low
25 DI1_CS1_BYTE_EN_POLARITY	Byte Enable associated with CS1 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low

Table continues on the next page...

IPUx_DI1_POL field descriptions (continued)

Field	Description
24 DI1_CS0_BYTE_EN_POLARITY	Byte Enable associated with CS0 polarity This bit defines the polarity of the byte enable signals to the display 1 active high 0 active low
23 DI1_CS1_DATA_POLARITY	Data Polarity associated with CS1
22–16 di1_cs1_polarity	DI1 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
15 DI1_CS0_DATA_POLARITY	Data Polarity associated with CS0
14–8 di1_cs0_polarity	DI1 output pin's polarity for CS1 This bits define the polarity of each of the DI's outputs when CS1 is asserted 1 The output pin is active high 0 The output pin is active low
7 DI1_DRDY_DATA_POLARITY	Data Polarity associated with DRDY
di1_drdy_polarity	DI1 output dynamic pin's polarity for synchronous access This bits define the polarity of each of the DI's outputs when synchronous display access is asserted The pins' default polarity is the same as defined in the di0_drdy_polarity bits 1 The output pin is active high 0 The output pin is active low

37.5.261 DI1Active Window 0 Register (IPUx_DI1_AW0)

Address: Base address + 4_8168h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

IPUx_SMFC_WMC field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–25 WM3_CLR	Watermark "clear" level of DMASMFC channel 3. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
24–22 WM3_SET	Watermark "set" level of DMASMFC channel 3 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
21–19 WM2_CLR	Watermark "clear" level of DMASMFC channel 2. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
18–16 WM2_SET	Watermark "set" level of DMASMFC channel 2. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–9 WM1_CLR	Watermark "clear" level of DMASMFC channel 1. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
8–6 WM1_SET	Watermark "set" level of DMASMFC channel 1. 000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.
5–3 WM0_CLR	Watermark "clear" level of DMASMFC channel 0. 000 clear watermark level when FIFO is full on 1/8 of their size. 001 clear watermark level when FIFO is full on 2/8 of their size. 110 clear watermark level when FIFO is full on 7/8 of their size. 111 clear watermark level when FIFO is full.
WM0_SET	Watermark "set" level of DMASMFC channel 0.

Table continues on the next page...

IPUx_SMFC_WMC field descriptions (continued)

Field	Description
	000 set watermark level when FIFO is full on 1/8 of their size. 001 set watermark level when FIFO is full on 2/8 of their size. 110 set watermark level when FIFO is full on 7/8 of their size. 111 set watermark level when FIFO is full.

37.5.267 SMFC Burst Size Register (IPUx_SMFC_BS)

This register holds the burst size value for each DMASMFC channel. The burst size is the number of IDMAC's active accesses that will done for each IDMAC's burst. This number is a function of PFS, BPP & NPB parameters in the IDMAC's CPMEM. These are the parameters corresponding to the IDMAC's channel used. The table below describes what should be the burst size according to PFS, BPP & NPB settings

Table 37-721. SMFC Burst Size

BPP	PFS	BURST_SIZE
8	6	NPB[6:4]
16	6	NPB[6:3]
All other	All other	NPB[6:2]

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–12 BURST3_SIZE	Burst Size of SMFCDMA channel 3. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
11–8 BURST2_SIZE	Burst Size of SMFCDMA channel 2. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
7–4 BURST1_SIZE	Burst Size of SMFCDMA channel 1. The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)
BURST0_SIZE	Burst Size of SMFCDMA channel 0.

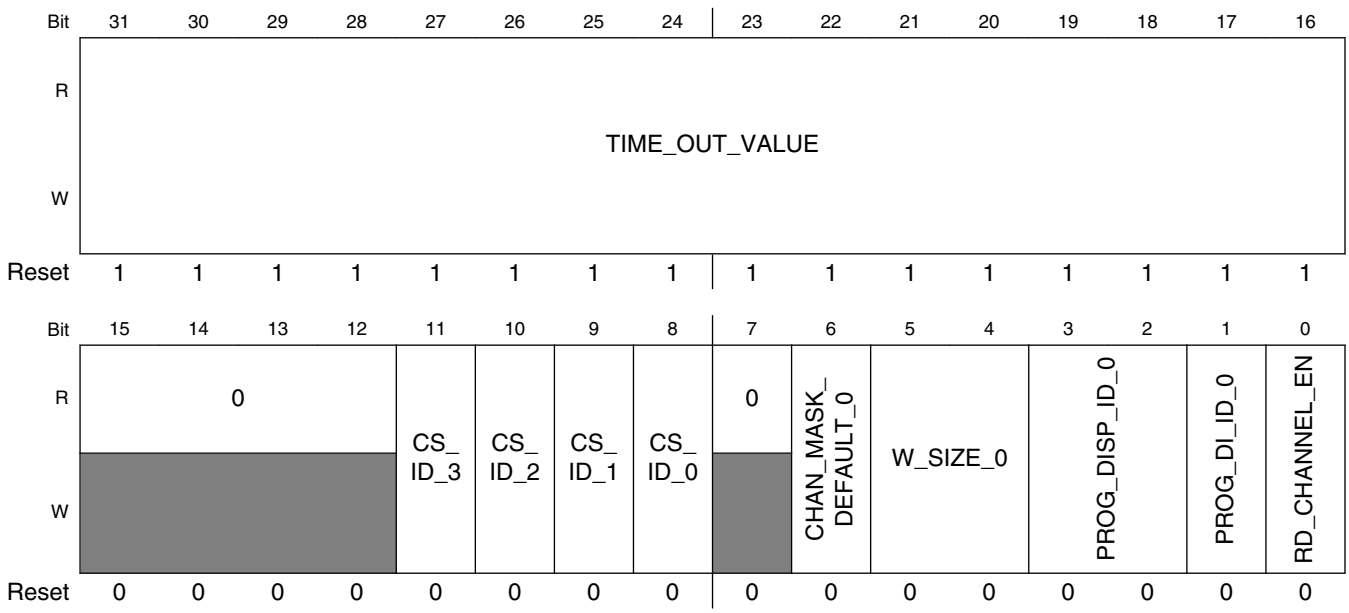
Table continues on the next page...

IPUx_SMFC_BS field descriptions (continued)

Field	Description
	The value programed here should be BURST_SIZE-1 (for example: for a burst size of 1, write 0 to these bits)

37.5.268 DC Read Channel Configuration Register (IPUx_DC_READ_CH_CONF)

Address: Base address + 5_8000h offset



IPUx_DC_READ_CH_CONF field descriptions

Field	Description
31–16 TIME_OUT_ VALUE	Time out value. In case of a error during read accesses to the display, where no response from the display was received. A time-out counter will terminate the current access and perform the next commend defined in the microcode. This field defines the amount of the hsp_clk cycles counted before the time-out event is issued. This event is tied to the interrupt controller and can generate an error interrupt.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 CS_ID_3	This bit maps an asynchronous display to a chip select 1 display #3 is connected to CS1 0 display #3 is connected to CS0
10 CS_ID_2	This bit maps an asynchronous display to a chip select 1 display #2 is connected to CS1 0 display #2 is connected to CS0

Table continues on the next page...

IPUx_DC_READ_CH_CONF field descriptions (continued)

Field	Description
9 CS_ID_1	This bit maps an asynchronous display to a chip select 1 display #1 is connected to CS1 0 display #1 is connected to CS0
8 CS_ID_0	This bit maps an asynchronous display to a chip select 1 display #0 is connected to CS1 0 display #0 is connected to CS0
7 Reserved	This read-only field is reserved and always has the value 0.
6 CHAN_MASK_DEFAULT_0	Event mask bit for the read channel When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked
5–4 W_SIZE_0	Word Size The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used
3–2 PROG_DISP_ID_0	The field defines which one of the 4 displays can be read. 00 display #0 01 display #1 10 display #2 11 display #3
1 PROG_DI_ID_0	This bit select the DI which a read transaction can be performed through 1 DI #1 0 DI #0
0 RD_CHANNEL_EN	This bit enables the read channel. 1 The Read channel is enabled 0 The Read channel is disabled

37.5.269 DC Read Channel Start Address Register (IPUx_DC_READ_SH_ADDR)

Address: Base address + 5_8004h offset

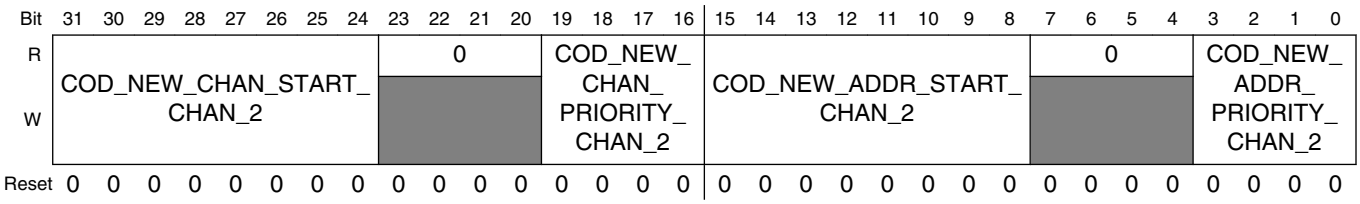
IPUx_DC_RL2_CH_2 field descriptions

Field	Description
31–24 COD_EOFIELD_START_CHAN_2	This field is a pointer to the address within the microcode memory where the routine that handles the end of field event resides (associated with channel #2)
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–16 COD_EOFIELD_PRIORITY_CHAN_2	This field defines the priority of the end of field event (associated with channel #2) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
15–8 COD_EOL_START_CHAN_2	This field is a pointer to the address within the microcode memory where the routine that handles the end of line event resides (associated with channel #2)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_EOL_PRIORITY_CHAN_2	This field defines the priority of the end of line event (associated with channel #2) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.287 DC Routine Link Register 3 Channel 2 (IPUx_DC_RL3_CH_2)

Address: Base address + 5_804Ch offset

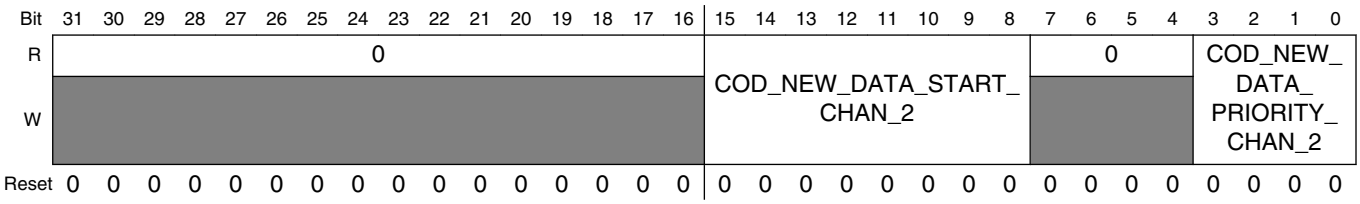


IPUx_DC_RL3_CH_2 field descriptions

Field	Description
31–24 COD_NEW_CHAN_START_CHAN_2	This field is a pointer to the address within the microcode memory where the routine that handles the new channel event resides (associated with channel #2)
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–16 COD_NEW_CHAN_PRIORITY_CHAN_2	This field defines the priority of the end of line event (associated with channel #2) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
15–8 COD_NEW_ADDR_START_CHAN_2	This field is a pointer to the address within the microcode memory where the routine that handles the new address event resides (associated with channel #2)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_ADDR_PRIORITY_CHAN_2	This field defines the priority of the end of line event (associated with channel #2) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.288 DC Routine Link Register 4 Channel 2 (IPUx_DC_RL4_CH_2)

Address: Base address + 5_8050h offset

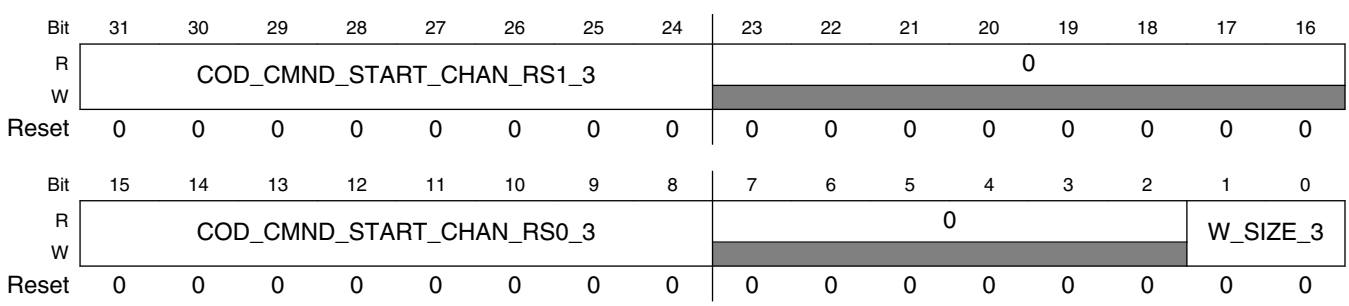


IPUx_DC_RL4_CH_2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 COD_NEW_DATA_START_CHAN_2	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #2)
7–4 Reserved	This read-only field is reserved and always has the value 0.
COD_NEW_DATA_PRIORITY_CHAN_2	This field defines the priority of the end of line event (associated with channel #2) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

37.5.289 DC Command Channel 3 Configuration Register (IPUx_DC_CMD_CH_CONF_3)

Address: Base address + 5_8054h offset



IPUx_DC_CMD_CH_CONF_3 field descriptions

Field	Description
31–24 COD_CMND_START_CHAN_RS1_3	This field is a pointer to the address within the microcode memory where the routine that handles the command start event resides (associated with channel #3); This field is relevant when RS is equal to 1
23–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 COD_CMND_START_CHAN_RS0_3	This field is a pointer to the address within the microcode memory where the routine that handles the command start event resides (associated with channel #3); This field is relevant when RS is equal to 0
7–2 Reserved	This read-only field is reserved and always has the value 0.
W_SIZE_3	Word Size associated with channel #3 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used

37.5.290 DC Command Channel 4 Configuration Register (IPUx_DC_CMD_CH_CONF_4)

Address: Base address + 5_8058h offset

IPUx_DC_CMD_CH_CONF_4 field descriptions

Field	Description
31–24 COD_CMND_START_CHAN_RS1_4	This field is a pointer to the address within the microcode memory where the routine that handles the command start event resides (associated with channel #4); This field is relevant when RS is equal to 1
23–16 Reserved	This read-only field is reserved and always has the value 0.

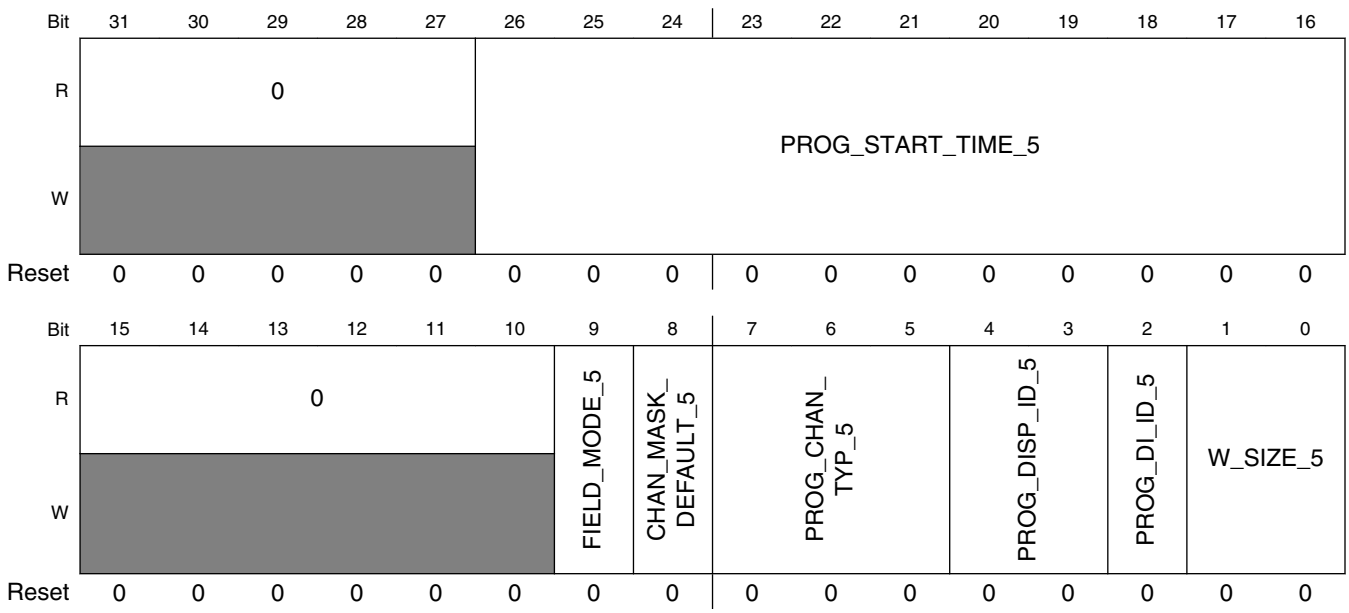
Table continues on the next page...

IPUx_DC_CMD_CH_CONF_4 field descriptions (continued)

Field	Description
15–8 COD_CMND_START_CHAN_RS0_4	This field is a pointer to the address within the microcode memory where the routine that handles the command start event resides (associated with channel #4); This field is relevant when RS is equal to 0
7–2 Reserved	This read-only field is reserved and always has the value 0.
W_SIZE_4	Word Size associated with channel #4 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used

37.5.291 DC Write Channel 5Configuration Register (IPUx_DC_WR_CH_CONF_5)

Address: Base address + 5_805Ch offset



IPUx_DC_WR_CH_CONF_5 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 PROG_START_TIME_5	This field defines the delay between display 's vertical synchronization pulse and the start time point of DC's channel 5 window. The delay is defined in pairs of rows. It is used for tearing elimination

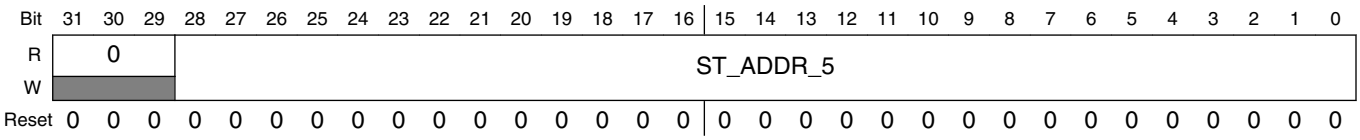
Table continues on the next page...

IPUx_DC_WR_CH_CONF_5 field descriptions (continued)

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 FIELD_MODE_5	Field mode bit for channel #5 This bit defines if the channel works in field mode or frame mode; This bit is relevant if the flow is sync flow 1 Field mode 0 Frame mode
8 CHAN_MASK_DEFAULT_5	Event mask bit for channel #5 When more then one event is used during a flow (EOF, EOL, NL, NF, EOFIELD, etc.) masks all the event besides the event that is defined as the highest priority event 1 All the events are used - no mask 0 Only the highest priority event is used, the rest are masked
7–5 PROG_CHAN_TYP_5	This field define the mode of operation of channel #5 000 Disable 001 Reserved 010 Reserved 100 Normal mode without anti-tearing. For sync display this is the only mode allowed 101 Normal mode with anti-tearing 110 Reserved 111 Additional command channel is added to the flow handled by DC channel #5
4–3 PROG_DISP_ID_5	The field defines which one of the 4 displays is associated with channel #5. 00 display #0 01 display #1 10 display #2 11 display #3
2 PROG_DI_ID_5	This bit select the DI which a transaction associated with channel #5 can be performed to. When channel 28 is connected to DI0, channel 23 must be connected to DI1 even if ch23 is not used. This is done by writing 1 to this bit. 1 DI #1 0 DI #0
W_SIZE_5	Word Size associated with channel #5 The data coming from the IDMAC is 32bit wide. This field defines the size of the word used by the DC 00 8 bits are used - a 32 bit words includes 4X8bit valid words. 01 16 LSB bits - a 32 bit words includes 2 X16bit valid words. 10 24 MSB bits are used (RGB) - 8 LSB bits are ignored by the DC 11 32 bits are used

37.5.292 DC Write Channel 5Address Configuration Register (IPUx_DC_WR_CH_ADDR_5)

Address: Base address + 5_8060h offset

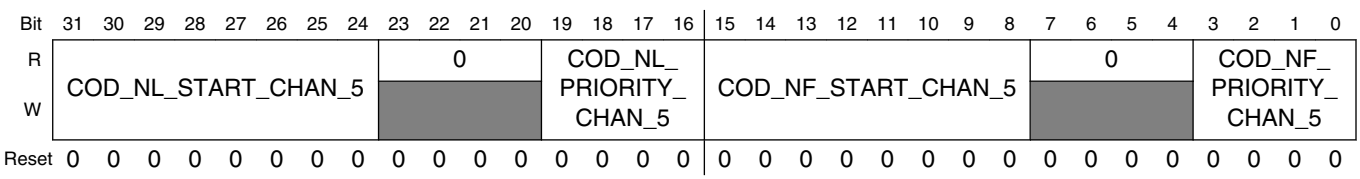


IPUx_DC_WR_CH_ADDR_5 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
ST_ADDR_5	This field defines the start address within the display's memory space where the write transactions will be done to for channel #5.

37.5.293 DC Routine Link Register 0 Channel 5 (IPUx_DC_RL0_CH_5)

Address: Base address + 5_8064h offset



IPUx_DC_RL0_CH_5 field descriptions

Field	Description
31–24 COD_NL_ START_CHAN_5	This field is a pointer to the address within the microcode memory where the routine that handles the new line event resides (associated with channel #5)
23–20 Reserved	This read-only field is reserved and always has the value 0.
19–16 COD_NL_ PRIORITY_ CHAN_5	This field defines the priority of the new line event (associated with channel #5) The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved

IPUx_DC_RL6_CH_9 field descriptions

Field	Description
31–24 COD_NEW_DATA_START_CHAN_R_9_1	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #9, second region)
23–16 Reserved	This read-only field is reserved and always has the value 0.

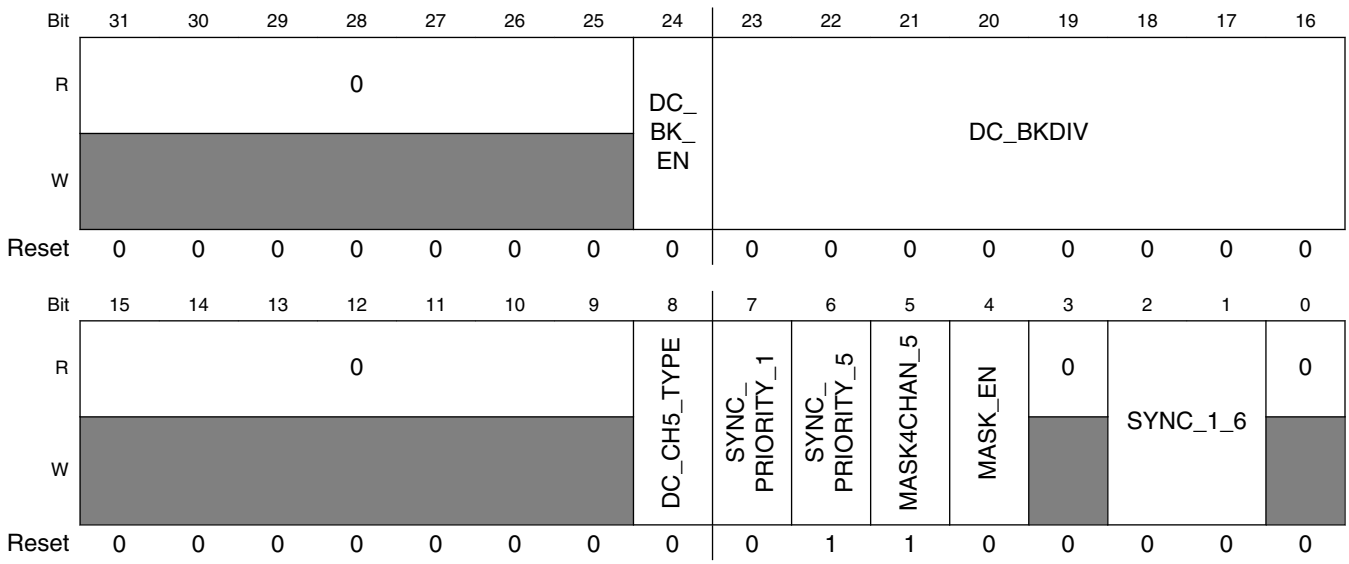
Table continues on the next page...

IPUx_DC_RL6_CH_9 field descriptions (continued)

Field	Description
15–8 COD_NEW_DATA_START_CHAN_R_9_0	This field is a pointer to the address within the microcode memory where the routine that handles the new data event resides (associated with channel #9, first region)
Reserved	This read-only field is reserved and always has the value 0.

37.5.321 DC General Register (IPUx_DC_GEN)

Address: Base address + 5_80D4h offset



IPUx_DC_GEN field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 DC_BK_EN	Cursor blinking enable 1 blinking is enabled 0 blinking is disabled
23–16 DC_BKDIV	Blinking Rate This field defines the blinking rate. The blinking occurs every N-th frame While N is defined by DC_BKDIV
15–9 Reserved	This read-only field is reserved and always has the value 0.
8 DC_CH5_TYPE	Channel 5 is used for synchronous flow. When this channel is used for accessing asynchronous display that is activated in a synchronous way

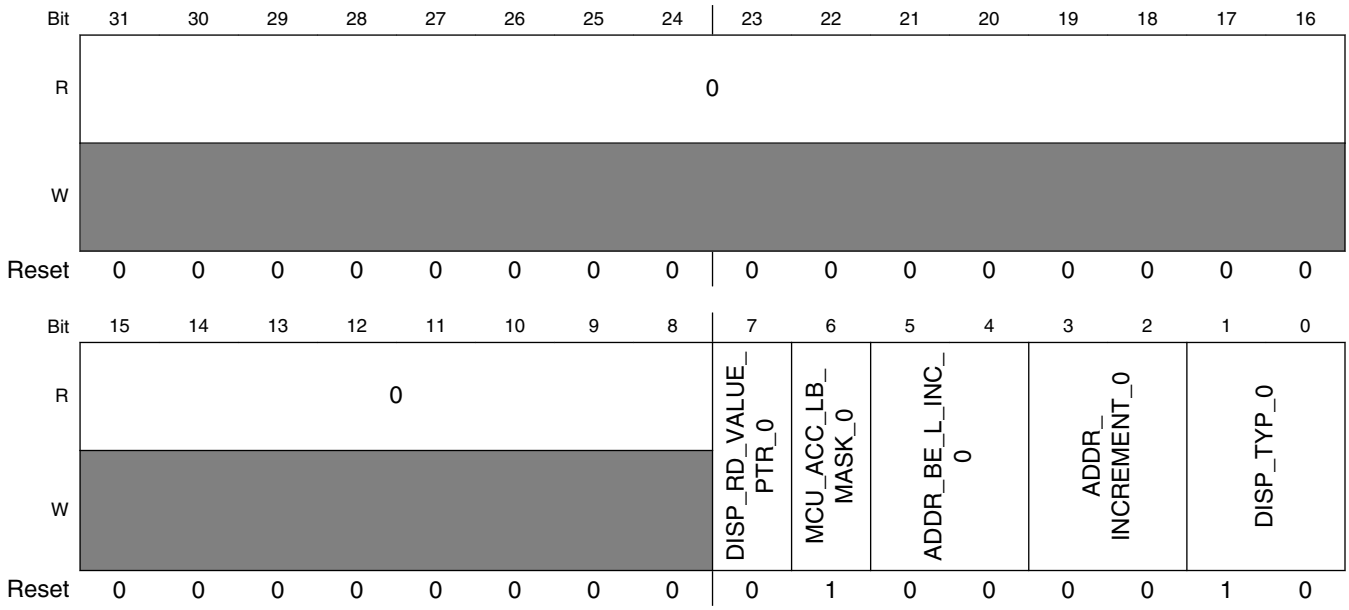
Table continues on the next page...

IPUx_DC_GEN field descriptions (continued)

Field	Description
	1 Enable the asynchronous interface via channel 5 0 normal mode, synchronous flow via channel 5
7 SYNC_ PRIORITY_1	When 2 sync flows are running, this bit sets the priority of channel #1. both SYNC_PRIORITY_5 and SYNC_PRIORITY_1 should not have the value of 0 This bit should be 1 high Priority 0 low Priority
6 SYNC_ PRIORITY_5	When 2 sync flows are running, this bit sets the priority of channel #5. both SYNC_PRIORITY_5 and SYNC_PRIORITY_1 should not have the value of 0 This bit should be 1 high priority 0 low Priority
5 MASK4CHAN_5	Sync flow can be associated with a mask channel. Only one sync flow can have a mask. This bit is ignored if MASK_EN is clear 1 mask channel is associated to the sync flow via DP 0 mask channel is associated to the sync flow via DC (without DP)
4 MASK_EN	Enable of the mask channel 1 mask channel is enabled 0 mask channel is disabled
3 Reserved	This read-only field is reserved and always has the value 0.
2–1 SYNC_1_6	This field 00 Channel 1 of the DC handles async flow 01 Illegal 10 Channel 1 of the DC handles sync flow 11 illegal
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.322 DC Display Configuration 1 Register 0 (IPUx_DC_DISP_CONF1_0)

Address: Base address + 5_80D8h offset



IPUx_DC_DISP_CONF1_0 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_VALUE_PTR_0	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value. 1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 0 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 0
6 MCU_ACC_LB_MASK_0	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_0	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_0 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3

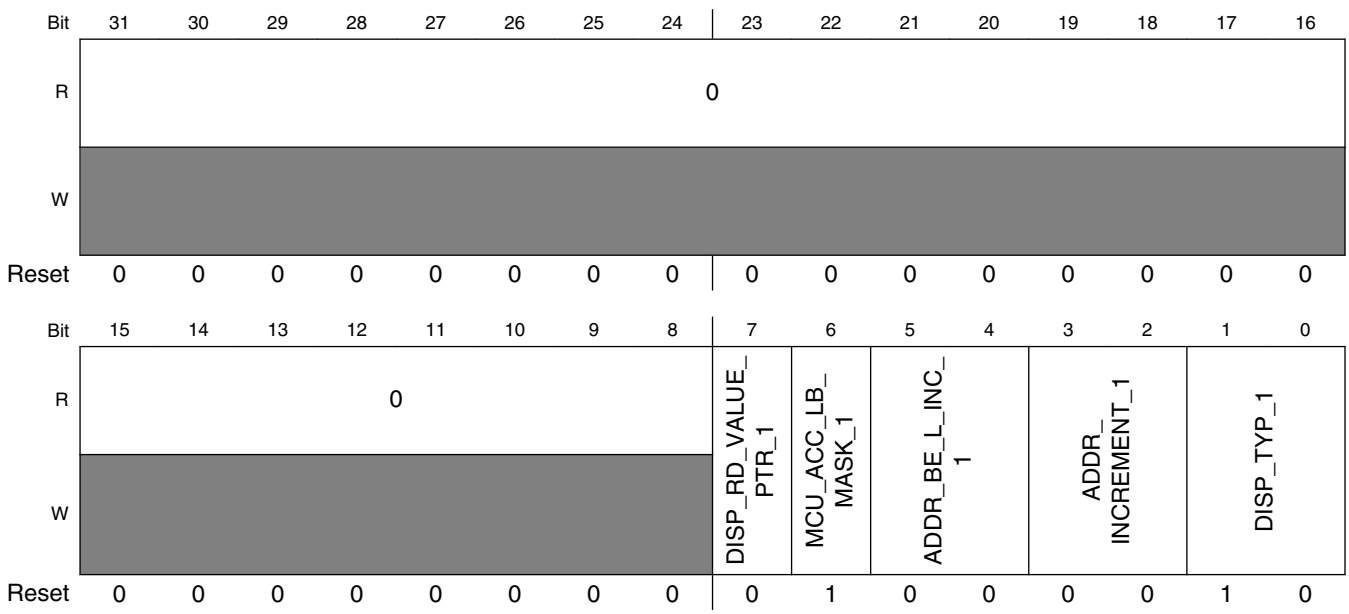
Table continues on the next page...

IPUx_DC_DISP_CONF1_0 field descriptions (continued)

Field	Description
3–2 ADDR_ INCREMENT_0	This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4
DISP_TYP_0	This field defines the type of the display 00 Serial accesses display 01 Reserved 10 parallel display, without byte_enable support 11 parallel display, with byte_enable support

37.5.323 DC Display Configuration 1 Register 1 (IPUx_DC_DISP_CONF1_1)

Address: Base address + 5_80DCh offset



IPUx_DC_DISP_CONF1_1 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_ VALUE_PTR_1	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value.

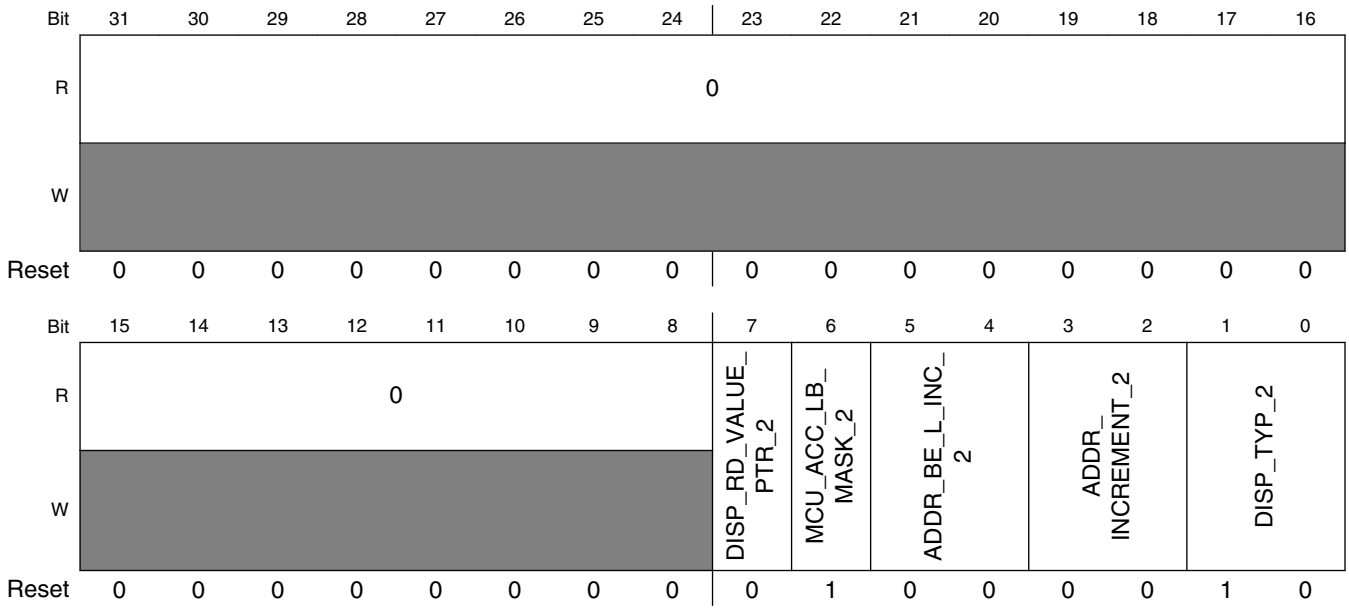
Table continues on the next page...

IPUx_DC_DISP_CONF1_1 field descriptions (continued)

Field	Description
	1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 1 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 1
6 MCU_ACC_LB_MASK_1	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_1	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_1 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3
3–2 ADDR_INCREMENT_1	This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4
DISP_TYP_1	This field defines the type of the display 00 Serial accesses display 01 Reserved 10 parallel display, without byte_enable support 11 parallel display, with byte_enable support

37.5.324 DC Display Configuration 1 Register 2 (IPUx_DC_DISP_CONF1_2)

Address: Base address + 5_80E0h offset



IPUx_DC_DISP_CONF1_2 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_VALUE_PTR_2	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value. 1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 2 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 2
6 MCU_ACC_LB_MASK_2	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_2	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_2 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3

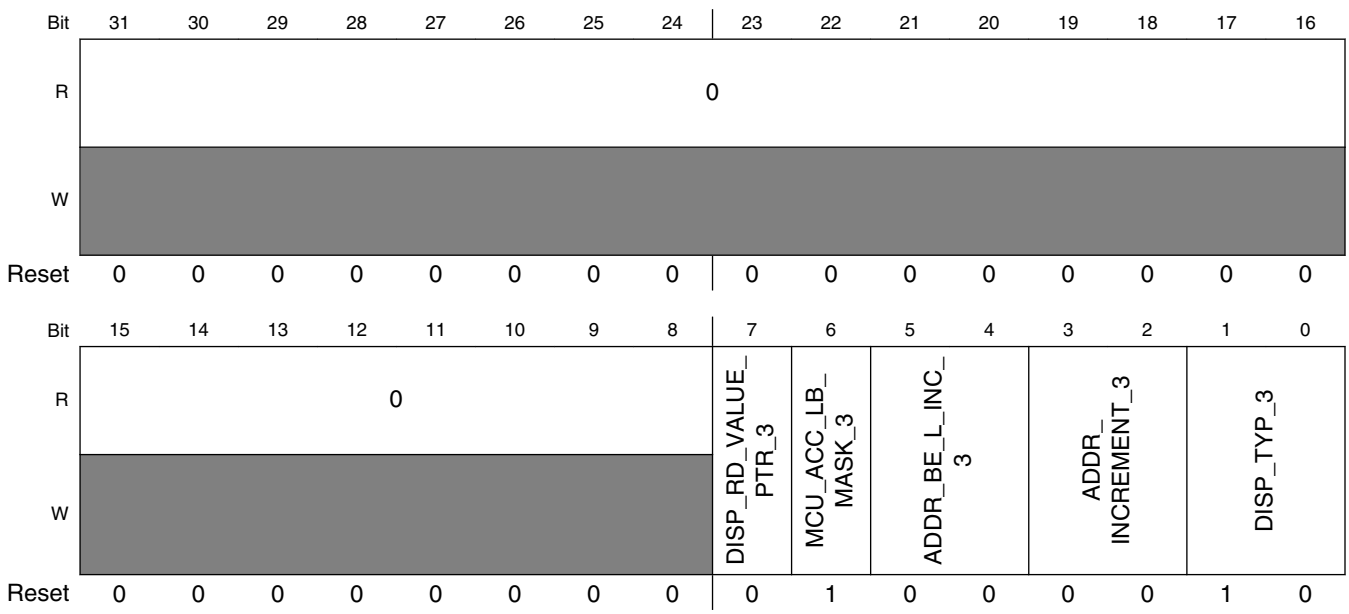
Table continues on the next page...

IPUx_DC_DISP_CONF1_2 field descriptions (continued)

Field	Description
3–2 ADDR_ INCREMENT_2	This field is the increment step for auto increment mode 00 Increment the address by 1 01 Increment the address by 2 10 Increment the address by 3 11 Increment the address by 4
DISP_TYP_2	This field defines the type of the display 00 Serial accesses display 01 Reserved 10 parallel display, without byte_enable support 11 parallel display, with byte_enable support

37.5.325 DC Display Configuration 1 Register 3 (IPUx_DC_DISP_CONF1_3)

Address: Base address + 5_80E4h offset



IPUx_DC_DISP_CONF1_3 field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 DISP_RD_ VALUE_PTR_3	When the display works in wait for status mode. The IPU polls the display and compare the value to the value stored on the status DI_READ_DATA_ACK_VALUE and mask it with DI_READ_DATA_MASK. The DC holds 2 sets of mask and value. This field holds a pointer to the corresponding set of mask and value.

Table continues on the next page...

IPUx_DC_DISP_CONF1_3 field descriptions (continued)

Field	Description
	1 DI_READ_DATA_ACK_VALUE_1 & DI_READ_DATA_MASK_1 are used for display 3 0 DI_READ_DATA_ACK_VALUE_0 & DI_READ_DATA_MASK_0 are used for display 3
6 MCU_ACC_LB_MASK_3	The DC compares between the current access to the a calculated address. The calculated address is the next consecutive address following the last address. This bit defines the comparing mode 1 The 2 addresses are fully compared 0 The 2 addresses are compared, but the ADDR[0] bit of the new address is ignored
5–4 ADDR_BE_L_INC_3	This bits define the increment mode when the latest access was done with some of the byte enable signals are low, in that case different increment should be done instead of the normal auto increment of the address IF MCU_ACC_LB_MASK_3 is 0 then only 00 and 10 values are allowed. 00 No increment 01 Increment by 1 10 Increment by 2 11 Increment by 3

IPUx_DC_MAP_CONF_2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–26 MAPPING_ PNTR_BYTE2_5	Mapping pointer #5 for Byte 2 This field is a pointer to the set of MD_OFFSET_<i> and MD_MASK_<i> used for mapping byte #2
25–21 MAPPING_ PNTR_BYTE1_5	Mapping pointer #5 for Byte 1 This field is a pointer to the set of MD_OFFSET_<i> and MD_MASK_<i> used for mapping byte #1
20–16 MAPPING_ PNTR_BYTE0_5	Mapping pointer #5 for Byte 0 This field is a pointer to the set of MD_OFFSET_<i> and MD_MASK_<i> used for mapping byte #0
15 Reserved	This read-only field is reserved and always has the value 0.
14–10 MAPPING_ PNTR_BYTE2_4	Mapping pointer #4 for Byte 2 This field is a pointer to the set of MD_OFFSET_<i> and MD_MASK_<i> used for mapping byte #2
9–5 MAPPING_ PNTR_BYTE1_4	Mapping pointer #4 for Byte 1 This field is a pointer to the set of MD_OFFSET_<i> and MD_MASK_<i> used for mapping byte #1

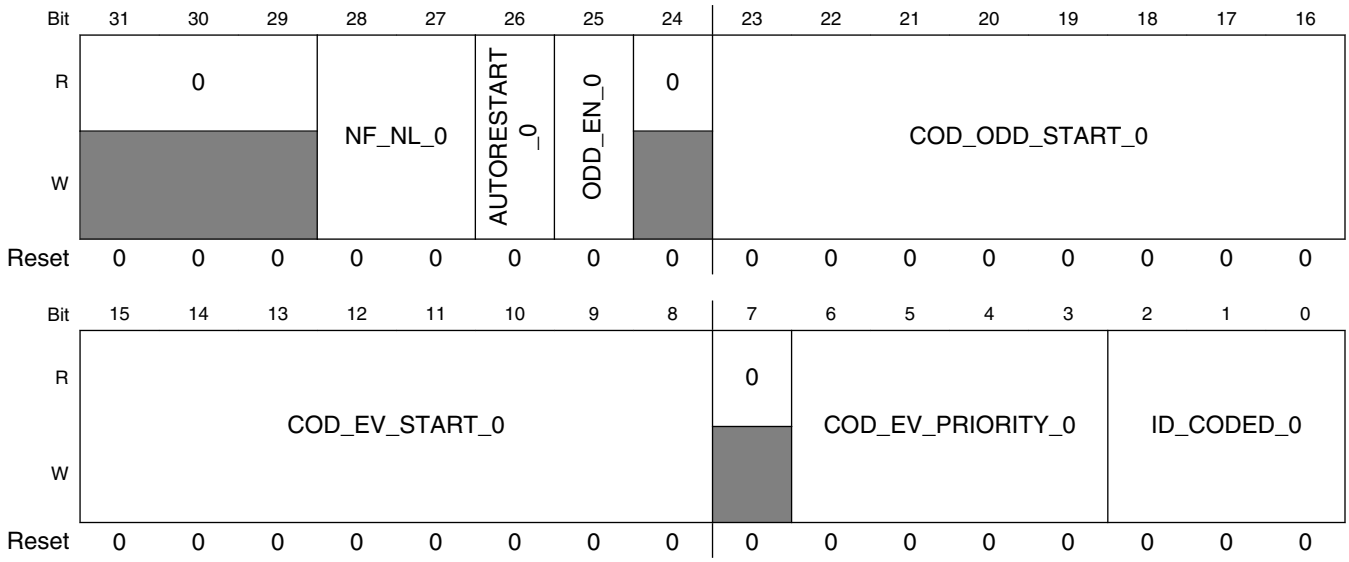
23–16 MD_MASK_23	Mapping unit's mask value #23 This field defines the mask value #23 within the 8bit word coming from the DC.
15–13 Reserved	This read-only field is reserved and always has the value 0.
12–8 MD_OFFSET_22	Mapping unit's offset parameter #22 This field defines the offset parameter #22 within the 24bit word coming from the DC.
MD_MASK_22	Mapping unit's mask value #22 This field defines the mask value #22 within the 8bit word coming from the DC.

37.5.361 DC User General Data Event 0 Register 0 (IPUx_DC_UGDE0_0)

Address: Base address + 5_8174h offset



IPUx_DC_UGDE0_0 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–27 NF_NL_0	the user may attach his general event #0 to New-line New-Frame and New-field events. One of these event triggers the user's general event #0's counter. The actual internal trigger is the pixel following the occurrence of the selected event. 00 New Line 01 New Frame 10 New Field 11 Reserved
26 AUTORESTART_0	User's general event #0 auto restart mode 0 disable 1 User's general event #0's counter is automatically restarted.
25 ODD_EN_0	The user's general event #0 may be split into 2 internal signals. One one mode all the events are sent on one signal, on the second mode odd events are sent over one signal while even events are sent over the other signal (ODD_MODE) 1 ODD_MODE is enabled 0 ODD_MODE is disabled
24 Reserved	This read-only field is reserved and always has the value 0.
23–16 COD_ODD_START_0	This field holds a pointer in the microcode holding the routine to be performed following the user general event #0. When ODD_MODE is enabled, only the odd events will use this pointer

Table continues on the next page...

IPUx_DC_UGDE0_0 field descriptions (continued)

Field	Description
	When ODD_MODE is disabled this field is ignored
15–8 COD_EV_ START_0	This field holds a pointer in the microcode holding the routine to be performed following the user general event #0. When ODD_MODE is enabled, only the even events will use this pointer When ODD_MODE is disabled, all the events will use this pointer
7 Reserved	This read-only field is reserved and always has the value 0.
6–3 COD_EV_ PRIORITY_0	This field defines the priority of the user general event #0 The priority between the events should be set to a unique value. i.e. two events must not have the same priority (except 0000 - disable) 0000 disable 0001 Priority #1 (lowest) 0010 Priority #2 1101 Priority #13 (highest) 1110 Reserved 1111 Reserved
ID_CODED_0	This field defines the number of DC channel number that user's general event #0 will be associated to. 000 DC channel_0 001 DC channel_1 010 DC channel_2 011 DC channel_5 (DP_SYNC) 100 DC channel_6 (DP ASYNC) 101 Reserved 110 Reserved. 111 Reserved.

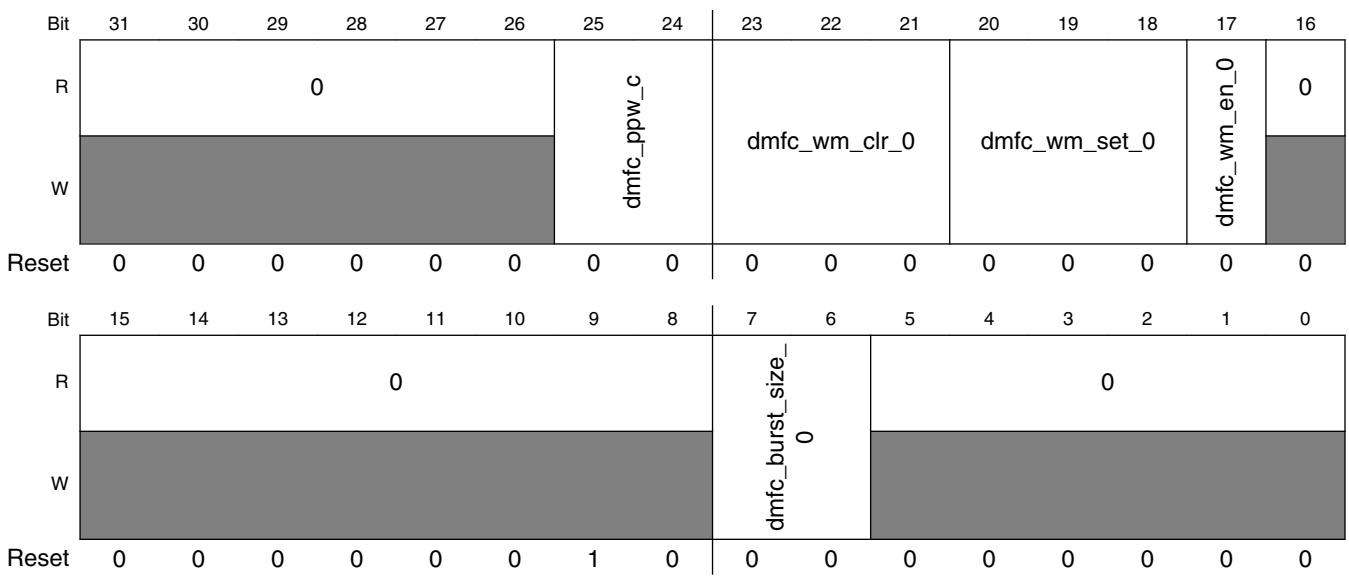
3 DC_TRIPLE_BUF_DATA_EMPTY_0	This bit indicates a FIFO empty state on the DC FIFO accessing DI0 when read from the display flow is used
2 DC_TRIPLE_BUF_DATA_FULL_0	This bit indicates a FIFO full state on the DC FIFO accessing DI0 when read from the display flow is used
1 DC_TRIPLE_BUF_CNT_EMPTY_0	This bit indicates a FIFO empty state on the DC FIFO accessing DI0 when write to the display flow is used
0 DC_TRIPLE_BUF_CNT_FULL_0	This bit indicates a FIFO full state on the DC FIFO accessing DI0 when write to the display flow is used

37.5.383 DMFC Read Channel Register (IPUx_DMFC_RD_CHAN)

Address: Base address + 6_0000h offset



IPUx_DMFC_RD_CHAN field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 dmfc_ppw_c	Pixel Per Word coded. This field defines the size of the read data from the display. 00 8 bit per pixel 01 16 bit per pixel 10 24 (rgb) bit per pixel or 32 bit per pixel 11 Reserved
23–21 dmfc_wm_clr_0	Watermark Clear This field defines the watermark's level of the DMFC read FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of free bursts at the FIFO (dmfc_wm_clr_0 > dmfc_wm_set_0)
20–18 dmfc_wm_set_0	Watermark Set This field defines the watermark's level of the DMFC read FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of free bursts at the FIFO (dmfc_wm_clr_0 > dmfc_wm_set_0)
17 dmfc_wm_en_0	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
16–8 Reserved	This read-only field is reserved and always has the value 0.
7–6 dmfc_burst_size_0	Read burst Size This field defines the burst size of the DMFC's read accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, going to the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
Reserved	This read-only field is reserved and always has the value 0.

IPUx_DMFC_WR_CHAN field descriptions

Field	Description
31–30 dmfc_burst_size_2c	Burst size of IDMAC's channel 43 This field defines the burst size of the IDMAC's channel 43 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
29–27 dmfc_fifo_size_2c	DMFC FIFO size for IDMAC's channel 43 This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 43 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
26–24 dmfc_st_addr_2c	DMFC Start Address for IDMAC's channel 43 This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 43. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
23–22 dmfc_burst_size_1c	Burst size of IDMAC's channel 42 This field defines the burst size of the IDMAC's channel 42 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings.

Table continues on the next page...

Field	Description
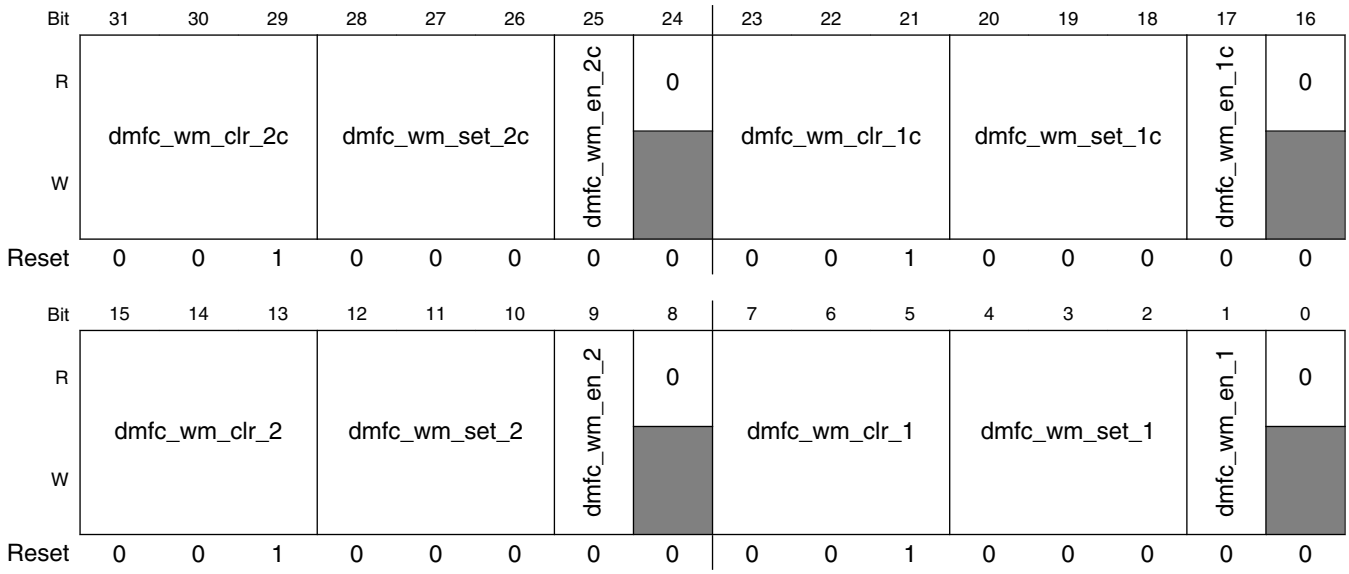
	Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
7–6 dmfc_burst_size_1	Burst size of IDMAC's channel 28 This field defines the burst size of the IDMAC's channel 28 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 1hbit
5–3 dmfc_fifo_size_1	DMFC FIFO size for IDMAC's channel 28 This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 28 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
dmfc_st_addr_1	DMFC Start Address for IDMAC's channel 28 This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 28. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7

37.5.385 DMFC Write Channel Definition Register (IPUx_DMFC_WR_CHAN_DEF)

Address: Base address + 6_0008h offset



IPUx_DMFC_WR_CHAN_DEF field descriptions

Field	Description
31–29 dmfc_wm_clr_2c	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
28–26 dmfc_wm_set_2c	Watermark Set This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
25 dmfc_wm_en_2c	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
24 Reserved	This read-only field is reserved and always has the value 0.
23–21 dmfc_wm_clr_1c	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
20–18 dmfc_wm_set_1c	Watermark Set

Table continues on the next page...

IPUx_DMFC_WR_CHAN_DEF field descriptions (continued)

Field	Description
	This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
17 dmfc_wm_en_1c	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
16 Reserved	This read-only field is reserved and always has the value 0.
15–13 dmfc_wm_clr_2	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
12–10 dmfc_wm_set_2	Watermark Set This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
9 dmfc_wm_en_2	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
8 Reserved	This read-only field is reserved and always has the value 0.
7–5 dmfc_wm_clr_1	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
4–2 dmfc_wm_set_1	Watermark Set This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
1 dmfc_wm_en_1	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
0 Reserved	This read-only field is reserved and always has the value 0.

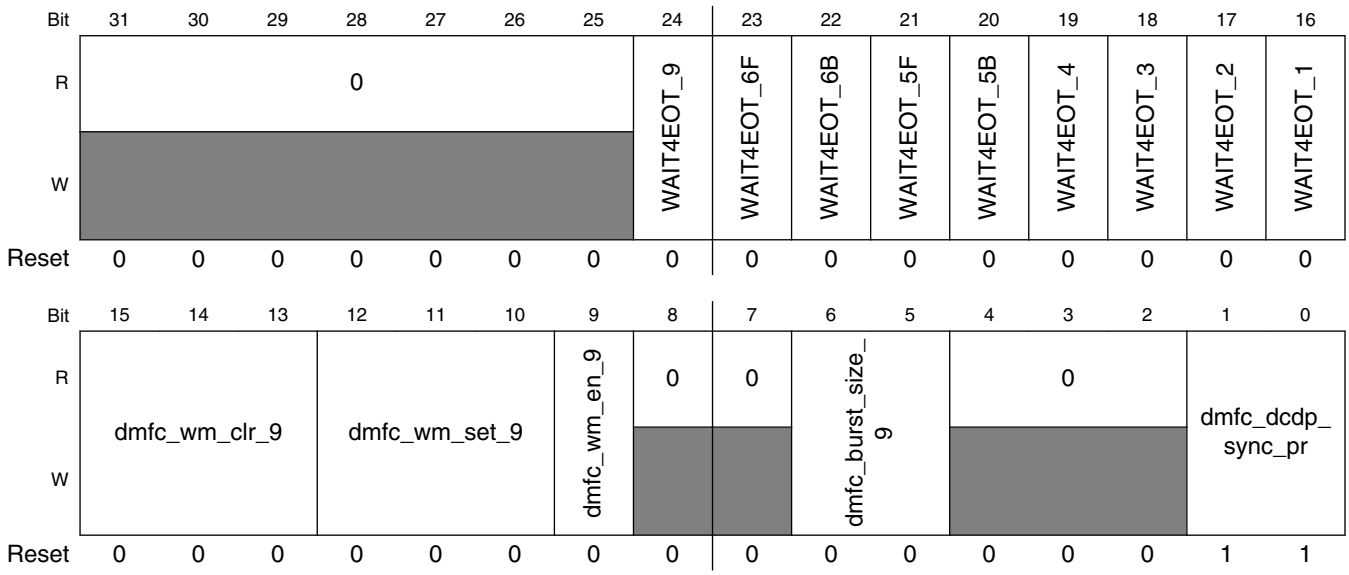
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.388 DMFC General 1 Register (IPUx_DMFC_GENERAL_1)

Address: Base address + 6_0014h offset



IPUx_DMFC_GENERAL_1 field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 WAIT4EOT_9	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #9 is in wait4eot mode 0 FIFO #9 is in normal mode
23 WAIT4EOT_6F	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6F is in wait4eot mode 0 FIFO #6F is in normal mode
22 WAIT4EOT_6B	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6B is in wait4eot mode 0 FIFO #6B is in normal mode

Table continues on the next page...

IPUx_DMFC_GENERAL_1 field descriptions (continued)

Field	Description
21 WAIT4EOT_5F	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #5F is in wait4eot mode 0 FIFO #5F is in normal mode
20 WAIT4EOT_5B	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #5B is in wait4eot mode 0 FIFO #5B is in normal mode
19 WAIT4EOT_4	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #4 is in wait4eot mode 0 FIFO #4 is in normal mode
18 WAIT4EOT_3	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #3 is in wait4eot mode 0 FIFO #3 is in normal mode
17 WAIT4EOT_2	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #2 is in wait4eot mode 0 FIFO #2 is in normal mode
16 WAIT4EOT_1	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #1 is in wait4eot mode 0 FIFO #1 is in normal mode
15–13 dmfc_wm_clr_9	Watermark Clear This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)

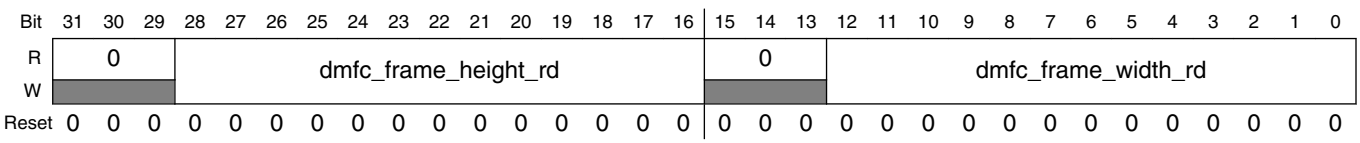
Table continues on the next page...

IPUx_DMFC_GENERAL_1 field descriptions (continued)

Field	Description
12–10 dmfc_wm_set_9	Watermark Set This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
9 dmfc_wm_en_9	Watermark enable. This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
8 Reserved	This read-only field is reserved and always has the value 0.
7 Reserved	This read-only field is reserved and always has the value 0.
6–5 dmfc_burst_size_9	Burst size of IDMAC's channel 44 This field defines the burst size of the IDMAC's channel 44 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. This channel is targeted for MASK - the FIFO size is always 32X128; The base address is always the upper half of the 8th segment 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
4–2 Reserved	This read-only field is reserved and always has the value 0.
dmfc_dcdp_sync_pr	DMFC's memory access priority settings for simultaneous synchronous flows from DC & DP 00 Forbidden - should not be used. 01 DC has higher priority over DP 10 DP has higher priority over DC 11 Round Robin

37.5.389 DMFC General 2 Register (IPUx_DMFC_GENERAL_2)

Address: Base address + 6_0018h offset



IPUx_DMFC_GENERAL_2 field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–16 dmfc_frame_ height_rd	Frame height for read channel from the display to the IDMAC; Units are pixels
15–13 Reserved	This read-only field is reserved and always has the value 0.
dmfc_frame_ width_rd	Frame width for read channel from the display to the IDMAC; Units are pixels

37.5.390 DMFC IC Interface Control Register (IPUx_DMFC_IC_CTRL)

Address: Base address + 6_001Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_DMFC_IC_CTRL field descriptions

Field	Description
31–19 dmfc_ic_frame_ height_rd	Frame's height for the channel coming from IC. Units are lines
18–6 dmfc_ic_frame_ width_rd	Frame's width for the channel coming from IC. Units are pixels
5–4 dmfc_ic_ppw_c	Pixel Per Word coded from IC. This field defines the size of the data coming from the IC. 00 8 bit per pixel 01 16 bit per pixel 10 24 bit per pixel 11 Reserved
3 Reserved	This read-only field is reserved and always has the value 0.
dmfc_ic_in_port	DMFC input port

Table continues on the next page...

IPUx_DMFC_IC_CTRL field descriptions (continued)

Field	Description
	When data is coming from the IC, the IC channel replaces one of the IDMAC's channels connected to the DMFC. This field defines which IDMAC's channel is replaced by the IC channel. 000 CH28 001 CH41 010 Reserved, IC channel is disabled 011 Reserved, IC channel is disabled 100 CH23 101 CH27 110 CH24 111 CH29

37.5.391 DMFC Write Channel Alternate Register (IPUx_DMFC_WR_CHAN_ALT)

Address: Base address + 6_0020h offset

IPUx_DMFC_WR_CHAN_ALT field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–14 dmfc_burst_size_2_alt	Burst size of IDMAC's channel 41 (for alternate flow) This field defines the burst size of the IDMAC's channel 41 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
13–11 dmfc_fifo_size_2_alt	DMFC FIFO size for IDMAC's channel 41 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 41 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel

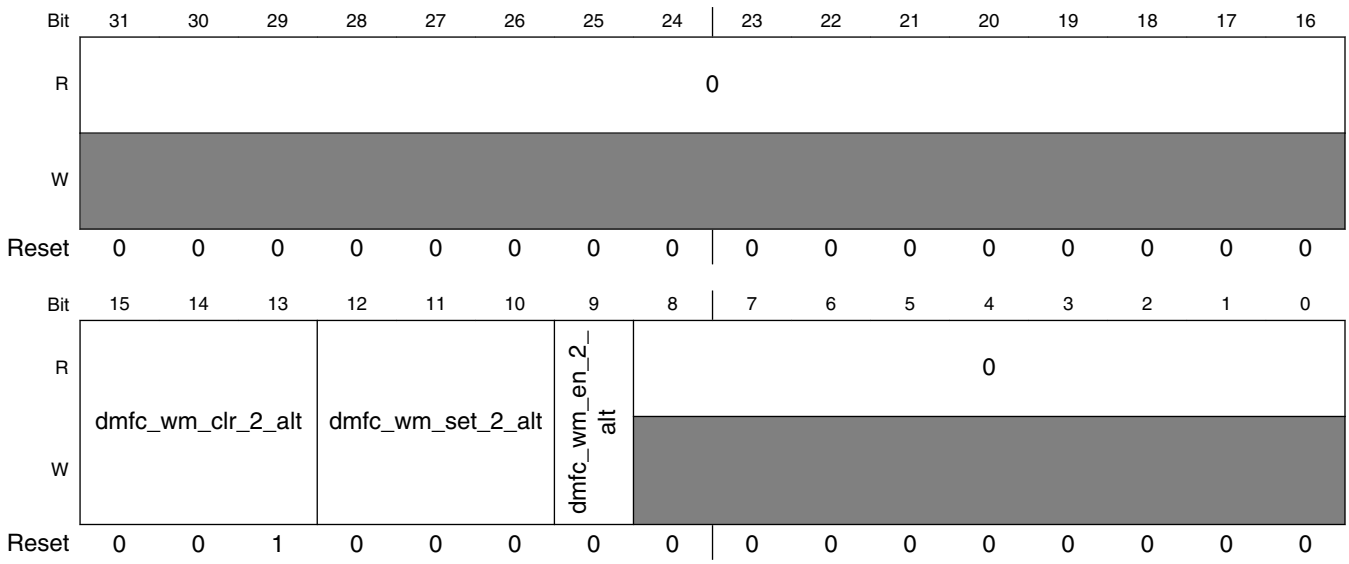
Table continues on the next page...

IPUx_DMFC_WR_CHAN_ALT field descriptions (continued)

Field	Description
	011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
10–8 dmfc_st_addr_2_alt	DMFC Start Address for IDMAC's channel 41 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 41. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
Reserved	This read-only field is reserved and always has the value 0.

37.5.392 DMFC Write Channel Definition Alternate Register (IPUx_DMFC_WR_CHAN_DEF_ALT)

Address: Base address + 6_0024h offset



IPUx_DMFC_WR_CHAN_DEF_ALT field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.

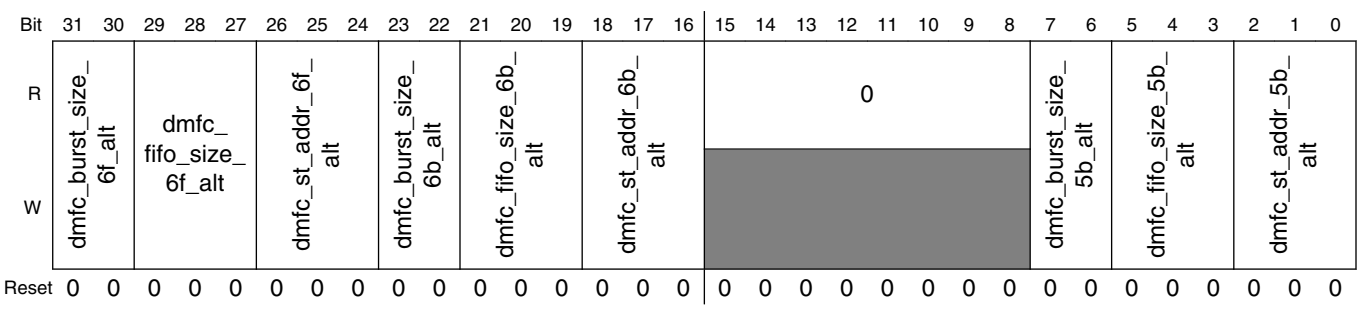
Table continues on the next page...

IPUx_DMFC_WR_CHAN_DEF_ALT field descriptions (continued)

Field	Description
15–13 dmfc_wm_clr_2_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
12–10 dmfc_wm_set_2_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
9 dmfc_wm_en_2_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
Reserved	This read-only field is reserved and always has the value 0.

37.5.393 DMFC MFC Display Processor Channel Alternate Register (IPUx_DMFC_DP_CHAN_ALT)

Address: Base address + 6_0028h offset



IPUx_DMFC_DP_CHAN_ALT field descriptions

Field	Description
31–30 dmfc_burst_size_6f_alt	Burst size of IDMAC's channel 29 (for alternate flow) This field defines the burst size of the IDMAC's channel 29 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
29–27 dmfc_fifo_size_6f_alt	DMFC FIFO size for IDMAC's channel 29 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 29 000 All (512X128 words) the DMFC's FIFO is allocated to this channel

Table continues on the next page...

IPUx_DMFC_DP_CHAN_ALT field descriptions (continued)

Field	Description
	001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
26–24 dmfc_st_addr_6f_alt	DMFC Start Address for IDMAC's channel 29 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 29. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
23–22 dmfc_burst_size_6b_alt	Burst size of IDMAC's channel 24 (for alternate flow) This field defines the burst size of the IDMAC's channel 24 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
21–19 dmfc_fifo_size_6b_alt	DMFC FIFO size for IDMAC's channel 24 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 24 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
18–16 dmfc_st_addr_6b_alt	DMFC Start Address for IDMAC's channel 24 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 24. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7
15–8 Reserved	This read-only field is reserved and always has the value 0.

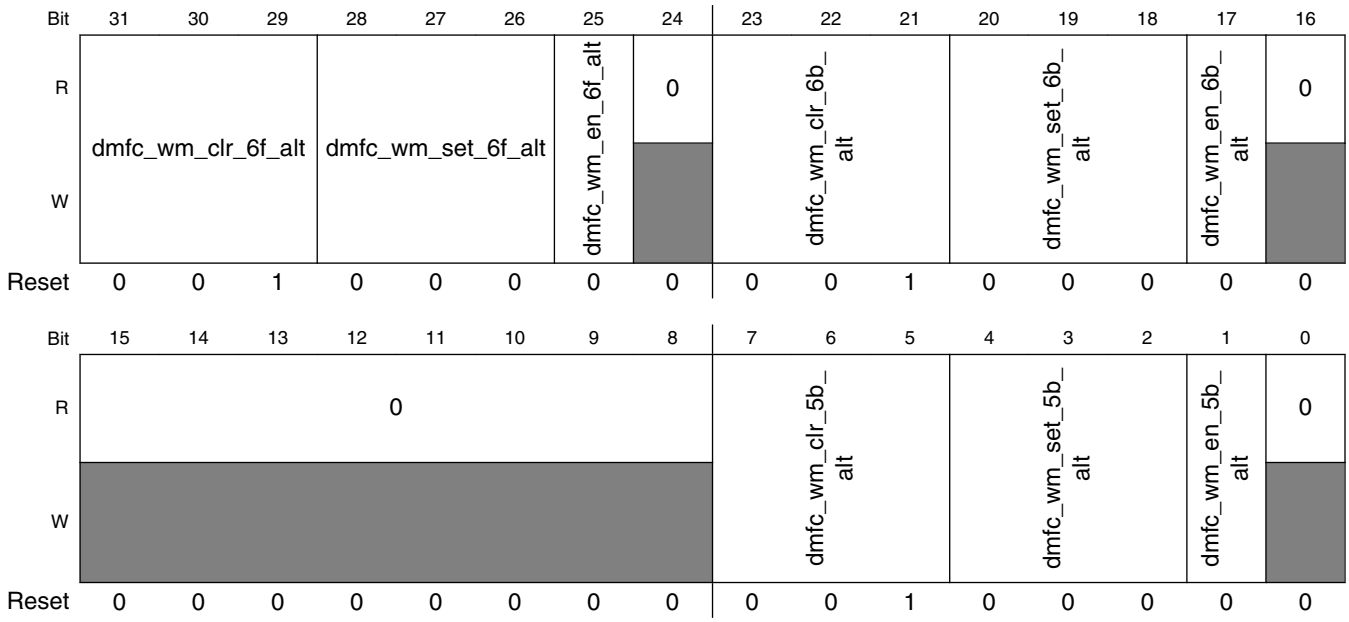
Table continues on the next page...

IPUx_DMFC_DP_CHAN_ALT field descriptions (continued)

Field	Description
7–6 dmfc_burst_size_5b_alt	Burst size of IDMAC's channel 23 (for alternate flow) This field defines the burst size of the IDMAC's channel 23 write accesses. This settings must match the settings in the corresponding IDMAC channel's settings. 00 32 words of 128 bit (4 pixels of 32 bit each, coming from the IDMAC) 01 16 words of 128 bit 10 8 words of 128 bit 11 4 words of 128 bit
5–3 dmfc_fifo_size_5b_alt	DMFC FIFO size for IDMAC's channel 23 (for alternate flow) This field defines the FIFO partition for the DMFC channel connected to IDMAC's channel 23 000 All (512X128 words) the DMFC's FIFO is allocated to this channel 001 256X128 words are allocated to this channel 010 128X128 words are allocated to this channel 011 64X128 words are allocated to this channel 100 32X128 words are allocated to this channel 101 16X128 words are allocated to this channel 110 8X128 words are allocated to this channel 111 4X128 words are allocated to this channel
dmfc_st_addr_5b_alt	DMFC Start Address for IDMAC's channel 23 (for alternate flow) This field defines the base address at the DMFC's FIFO of the partition allocated to the channel connected to IDMAC's channel 23. The FIFO is partitioned to 8 equal segments. Each segment is 64X128 words The value of this field is the number of the segment 000 Segment 0 001 Segment 1 111 Segment 7

37.5.394 DMFC Display Channel Definition Alternate Register (IPUx_DMFC_DP_CHAN_DEF_ALT)

Address: Base address + 6_002Ch offset



IPUx_DMFC_DP_CHAN_DEF_ALT field descriptions

Field	Description
31–29 dmfc_wm_clr_6f_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
28–26 dmfc_wm_set_6f_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
25 dmfc_wm_en_6f_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
24 Reserved	This read-only field is reserved and always has the value 0.
23–21 dmfc_wm_clr_6b_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)

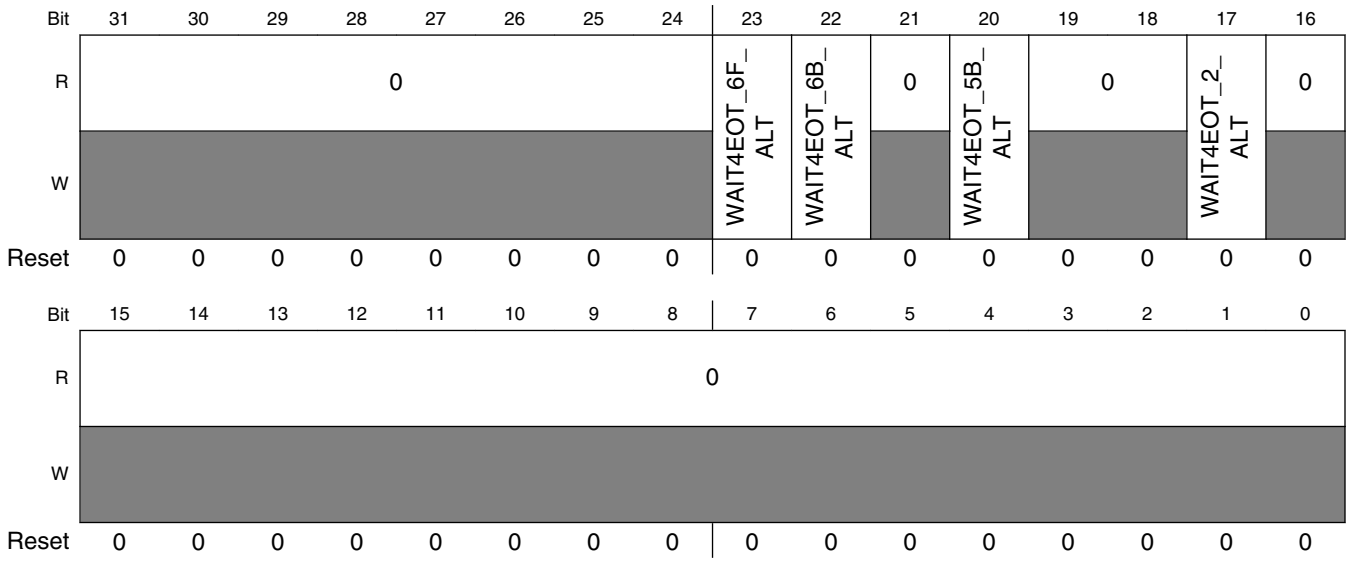
Table continues on the next page...

IPUx_DMFC_DP_CHAN_DEF_ALT field descriptions (continued)

Field	Description
20–18 dmfc_wm_set_ 6b_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
17 dmfc_wm_en_ 6b_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
16–8 Reserved	This read-only field is reserved and always has the value 0.
7–5 dmfc_wm_clr_ 5b_alt	Watermark Clear (for alternate flow) This field defines the watermark's level of the DMFC's write FIFO. Crossing this level will clear the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set)
4–2 dmfc_wm_set_ 5b_alt	Watermark Set (for alternate flow) This field defines the watermark's level of the DMFC write FIFO. Crossing this level will send the watermark signal to the IDMAC. The WM level is the amount of occupied bursts at the FIFO (dmfc_wm_clr > dmfc_wm_set
1 dmfc_wm_en_ 5b_alt	Watermark enable. (for alternate flow) This bit enables the watermark feature of the FIFO 1 WM feature is enabled 0 WM feature is disabled
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.395 DMFC General 1 Alternate Register (IPUx_DMFC_GENERAL1_ALT)

Address: Base address + 6_0030h offset



IPUx_DMFC_GENERAL1_ALT field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23 WAIT4EOT_6F_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6F is in wait4eot mode (for alternate flow) 0 FIFO #6F is in normal mode (for alternate flow)
22 WAIT4EOT_6B_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #6B is in wait4eot mode (for alternate flow) 0 FIFO #6B is in normal mode (for alternate flow)
21 Reserved	This read-only field is reserved and always has the value 0.
20 WAIT4EOT_5B_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode.

Table continues on the next page...

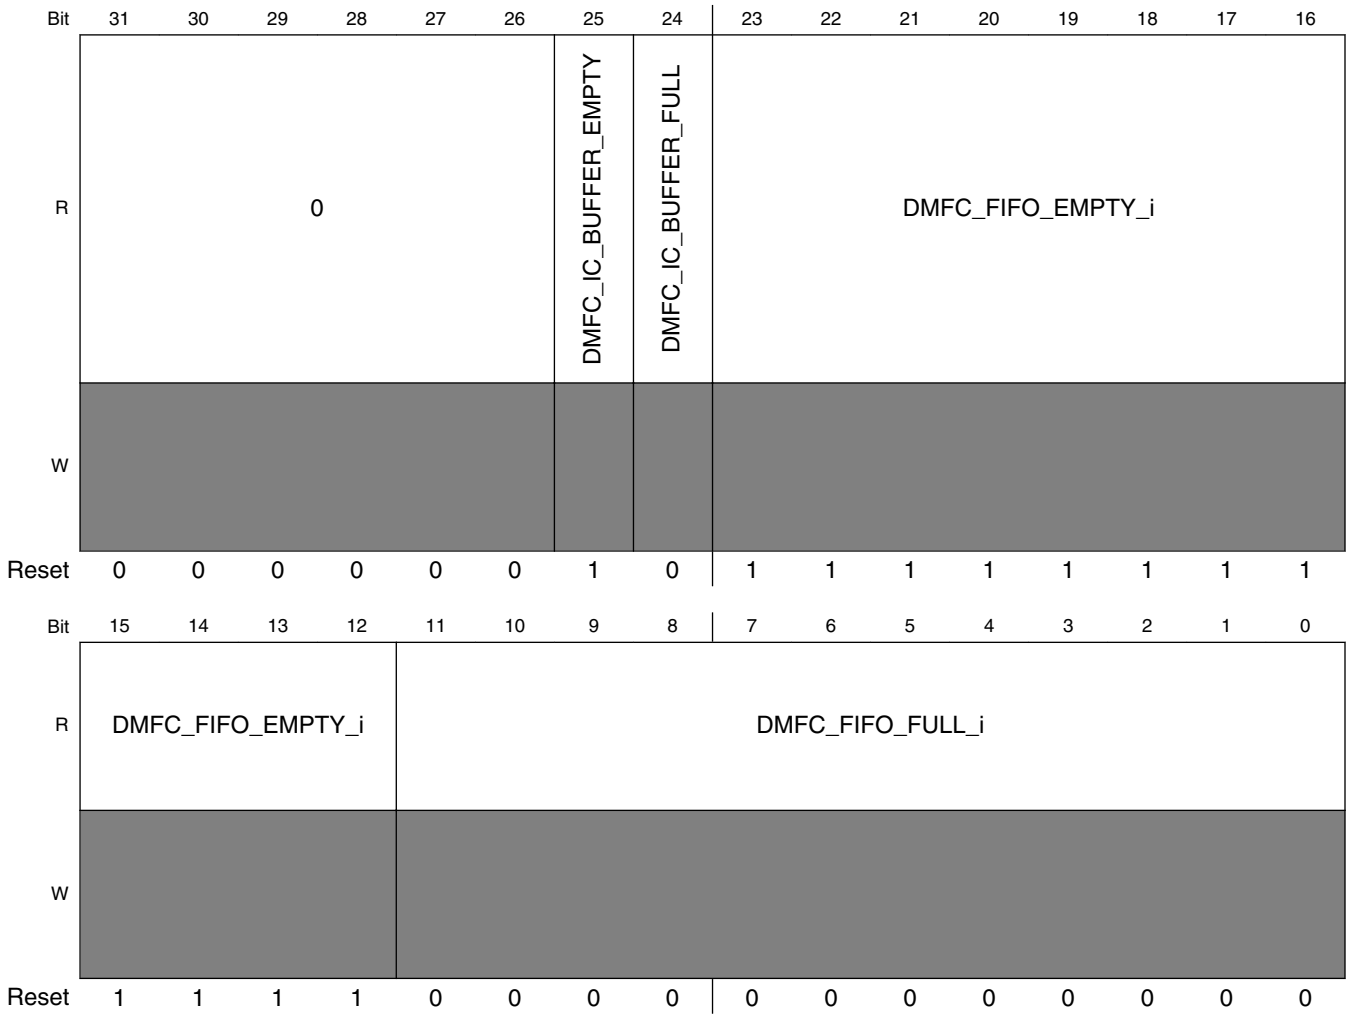
IPUx_DMFC_GENERAL1_ALT field descriptions (continued)

Field	Description
	1 FIFO #5B is in wait4eot mode (for alternate flow) 0 FIFO #5B is in normal mode (for alternate flow)
19–18 Reserved	This read-only field is reserved and always has the value 0.
17 WAIT4EOT_2_ALT	In normal operation the DMFC sends requests to the IDMAC whenever there is room in the FIFO. When this bit is set the DMFC sends the request only after the current transfer is terminated, (wait4eot mode) When the FIFO is larger then the size of the line, the user should work in wait4eot mode. 1 FIFO #2 is in wait4eot mode (for alternate flow) 0 FIFO #2 is in normal mode (for alternate flow)
Reserved	This read-only field is reserved and always has the value 0.

37.5.396 DMFC Status Register (IPUx_DMFC_STAT)

This register contains DMFC's status bits. All the bits in this register are read-only.

Address: Base address + 6_0034h offset



IPUx_DMFC_STAT field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25 DMFC_IC_ BUFFER_ EMPTY	This bit indicates on a IC FIFO, inside the DMFC, empty condition. 0 IC FIFO not empty 1 IC FIFO is empty

Table continues on the next page...

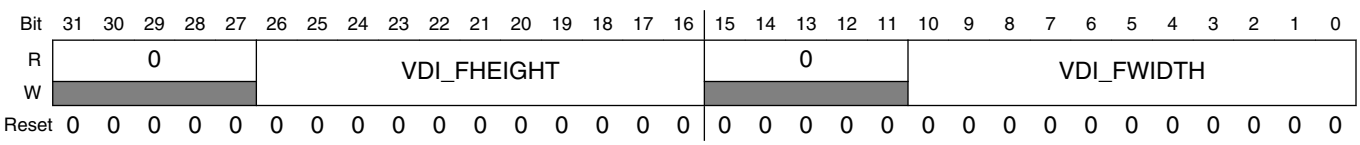
IPUx_DMFC_STAT field descriptions (continued)

Field	Description
24 DMFC_IC_ BUFFER_FULL	This bit indicates on a IC FIFO, inside the DMFC, full condition. 0 IC FIFO not full 1 IC FIFO is full
23–12 DMFC_FIFO_ EMPTY_i	This bit indicates on a DMFC FIFO#<i> empty condition. Mapping of these bit to an actual FIFO number is as follows: bit 0 => 0 bit 1=> 1 bit 2 => 2 bit 3 =>1c bit 4 => 2c bit 5 => 5b bit 6 => 5f bit 7 => 6b bit 8 => 6f bit 9 => 9 bit 10 => 10 (ARM platform access) bit 11 => 11 (ARM platform access) 0 FIFO #<i> is not empty 1 FIFO #<i> is empty
DMFC_FIFO_ FULL_i	This bit indicates on a DMFC FIFO#<i> full condition. Mapping of these bit to an actual FIFO number is as follows: bit 0 => 0 bit 1=> 1 bit 2 => 2 bit 3 =>1c bit 4 => 2c bit 5 => 5b bit 6 => 5f bit 7 => 6b bit 8 => 6f bit 9 => 9 bit 10 => 10 (ARM platform access) bit 11 => 11 (ARM platform access) 0 FIFO #<i> is not full 1 FIFO #<i> is full

37.5.397 VDI Field Size Register (IPUx_VDI_FSIZE)

The register used to control size of VDIC input fields.

Address: Base address + 6_8000h offset



IPUx_VDI_FSIZE field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–16 VDI_FHEIGHT	Frame height The value to be written to this register is the frame's height minus 1. The frame height should not be smaller than 16. When VDI_CMB_EN bit is clear: • The frame height should not be greater than 1080. • The frame's height must be even (which means that both fields have the same height) • The frame's height in 4:2:0 format, must be multiple of 4 (which means that both chroma fields have the same height)

Table continues on the next page...

IPUx_VDI_FSIZE field descriptions (continued)

Field	Description
	When VDI_CMB_EN bit is set: • The frame height should not be greater than 1200.
15–11 Reserved	This read-only field is reserved and always has the value 0.
VDI_FWIDTH	Frame width. The value to be written to this register is the frame's width minus 1. The Frame width should not be smaller than 16. The width must be even. When VDI_CMB_EN bit is clear • The Frame width should not be greater than 720968. When VDI_CMB_EN bit is set: • The Frame width should not be greater than 1920.

37.5.398 VDI Control Register (IPUx_VDI_C)

The register used to control modes of operations of VDIC module.

Address: Base address + 6_8004h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

IPUx_VDI_C field descriptions

Field	Description
31 -	VDIC top filed (automatic) This defines what would be the top field to be processed when the data is coming from the CSI 0 top field is field 0 1 top field is field 1
30 -	VDIC top filed (manual) This defines what would be the next top field to be processed when the data is coming from the memory

Table continues on the next page...

IPUx_VDI_C field descriptions (continued)

Field	Description
	0 top field is field 0 1 top field is field 1
29–28 Reserved	This read-only field is reserved and always has the value 0.
27–25 VDI_VWM3_CLR	VDIC WaterMark "clear" level for channel 3. 0 clear watermark level when FIFO3 is full on 1/8 of their size. 1 clear watermark level when FIFO3 is full on 2/8 of their size. 7 clear watermark level when FIFO3 is full.
24–22 VDI_VWM3_SET	VDIC WaterMark "set" level for channel 3. 0 set watermark level when FIFO3 is full on 1/8 of their size. 1 set watermark level when FIFO3 is full on 2/8 of their size. 7 set watermark level when FIFO3 is full.
21–19 VDI_VWM1_CLR	VDIC WaterMark "clear" level for channel 1 or channel 4 (channels 1 and 4 are not working simultaneously). 0 clear watermark level when FIFO1 is full on 1/8 of their size. 1 clear watermark level when FIFO1 is full on 2/8 of their size. 7 clear watermark level when FIFO1 is full.
18–16 VDI_VWM1_SET	VDIC WaterMark "set" level for channel 1 or channel 2 (channels 1 and 4 are not working simultaneously). 0 set watermark level when FIFO1 is full on 1/8 of their size. 1 set watermark level when FIFO1 is full on 2/8 of their size. 7 set watermark level when FIFO1 is full.
15–12 VDI_BURST_ SIZE3	Burst Size for channel 3. The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
11–8 VDI_BURST_ SIZE2	Burst Size for channel 2. The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
7–4 VDI_BURST_ SIZE1	Burst Size for channels 1 or 4 (channels 1 and 4 are not working simultaneously). The VDIC's burst size is restrict by the IDMAC's restriction - This value must match the IDMAC settings and follow the IDMAC's restrictions 0 Burst size is 1 access. 1 Burst size is 2 accesses. 15 Burst size is 16 accesses.
3–2 VDI_MOT_SEL	Motion select.

Table continues on the next page...

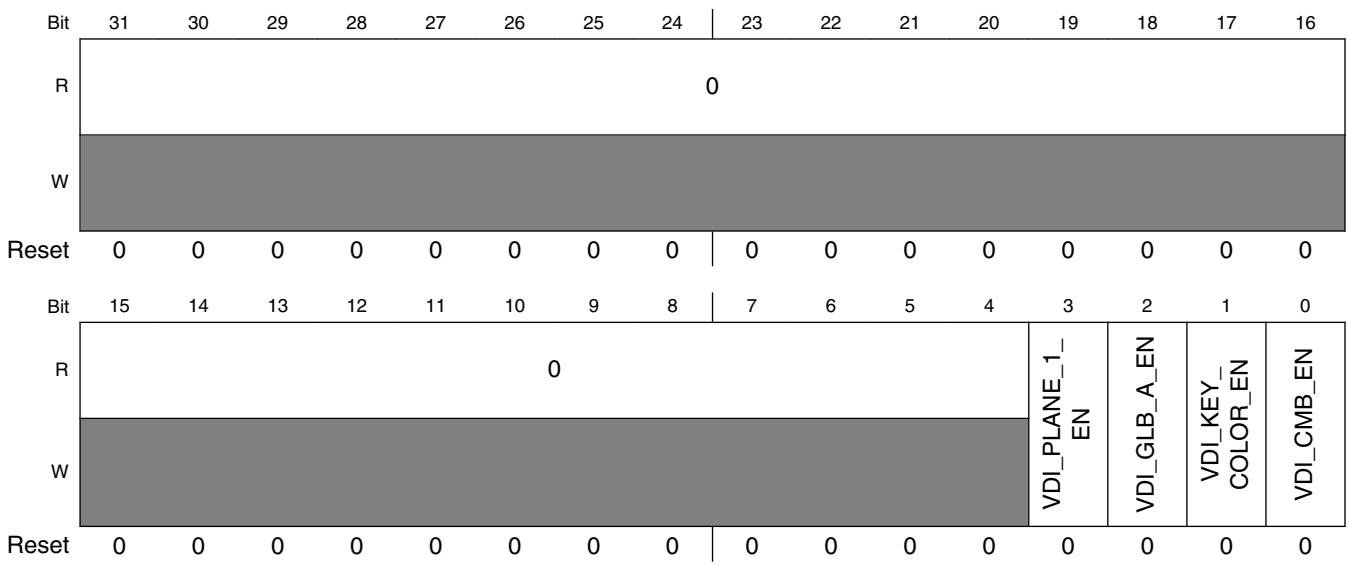
IPUx_VDI_C field descriptions (continued)

Field	Description
	0 Motion determined by ROM "1" (shared toward medium/high motion). 1 Motion determined by ROM "2" (This option will not work well for high motion). 2 Full motion, only vertical filter is used 3 Forbidden.
1 VDI_CH_422	Chroma format at input and output of VDIC. 0 Chroma format is 420. 1 Chroma format is 422.
0 Reserved	This read-only field is reserved and always has the value 0.

37.5.399 VDI Control Register 2 (IPUx_VDI_C2_)

The register used to control modes of operations of VDIC module.

Address: Base address + 6_8008h offset



IPUx_VDI_C2_ field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
3 VDI_PLANE_1_EN	Plane 1 enable 0 plane #1 is disabled 1 plane #1 is enabled

Table continues on the next page...

IPUx_VDI_C2_ field descriptions (continued)

Field	Description
2 VDI_GLB_A_EN	Global alpha enable 0 Alpha is local 1 Alpha is global
1 VDI_KEY_ COLOR_EN	Key Color Enable 0 Key Color disabled. 1 Key color enabled
0 VDI_CMB_EN	Combining enable 0 Combining disabled. The VDIC works in de-interlacing mode 1 Combining enabled. The de-interlacing mode is not functional

37.5.400 VDI Combining Parameters Register 1 (IPUx_VDI_CMDP_1)

The register holds combining paramemters.

Address: Base address + 6_800Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 38
Keypad Port (KPP)

38.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

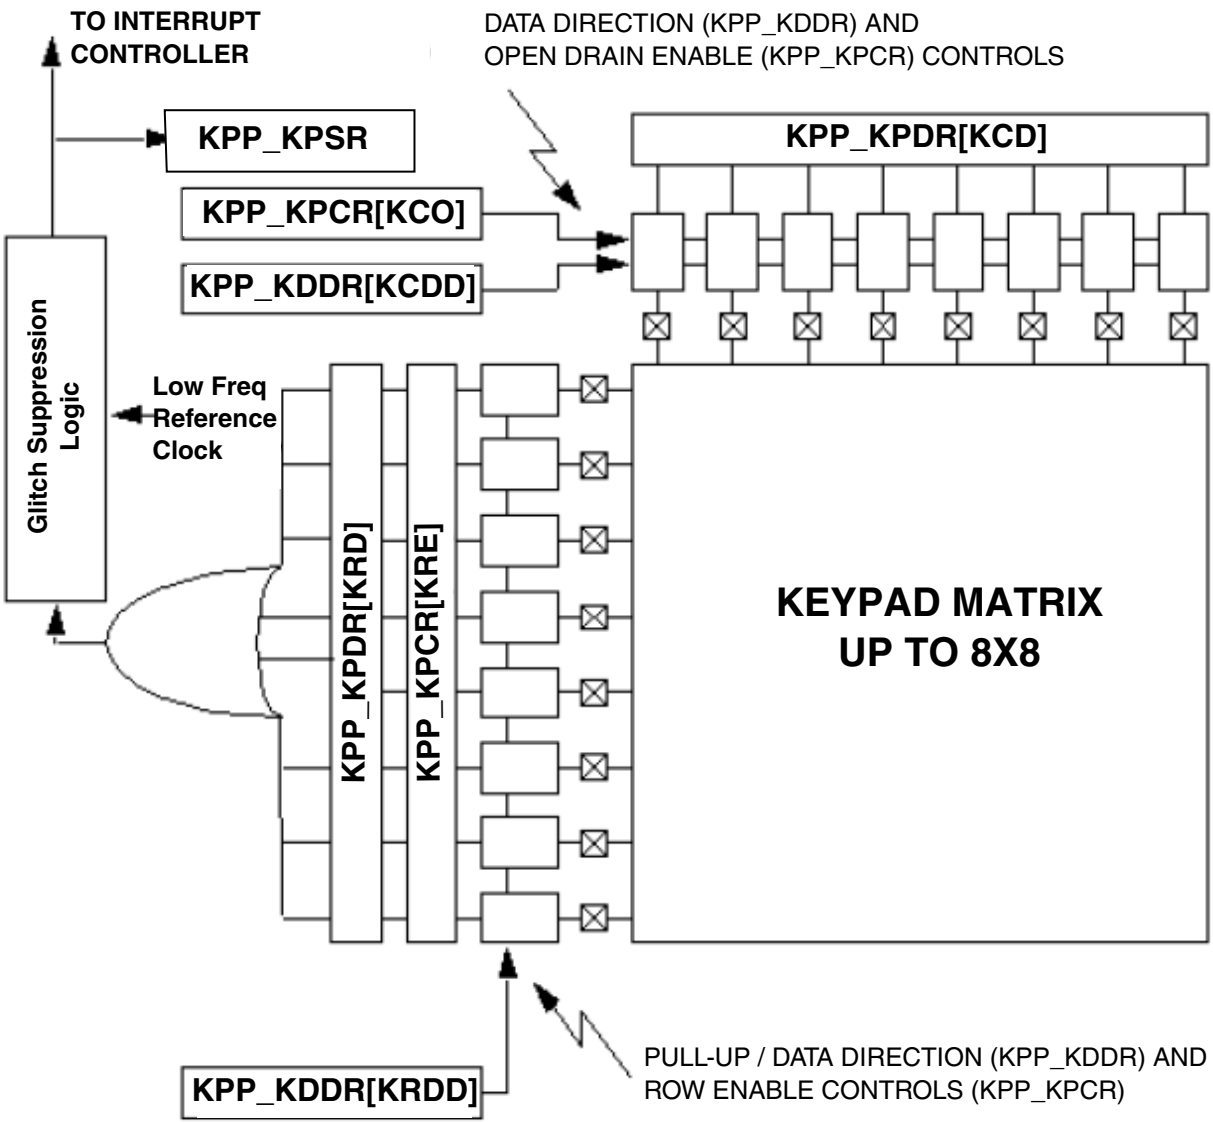

Figure 38-1. KPP Peripheral Block Diagram

38.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

38.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

38.2 Clocks

The table found here describes the clock sources for KPP.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 38-1. KPP Clocks

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

38.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

Table 38-2. KPP External Signals

Signal	Description	Pad	Mode	Direction
KEY_COL0	Column input or output pin, from chip	KEY_COL0	ALT3	I/O
KEY_COL1	Column input or output pin, from chip	KEY_COL1	ALT3	I/O

Table 38-2. KPP External Signals (continued)

Signal	Description	Pad	Mode	Direction
		GPIO_5	ALT2	
		SD2_DAT0	ALT4	

38.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

38.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

Table 38-3. Keypad Port Column Modes

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

38.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

38.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

38.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

38.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

38.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

38.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

38.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock source.

This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

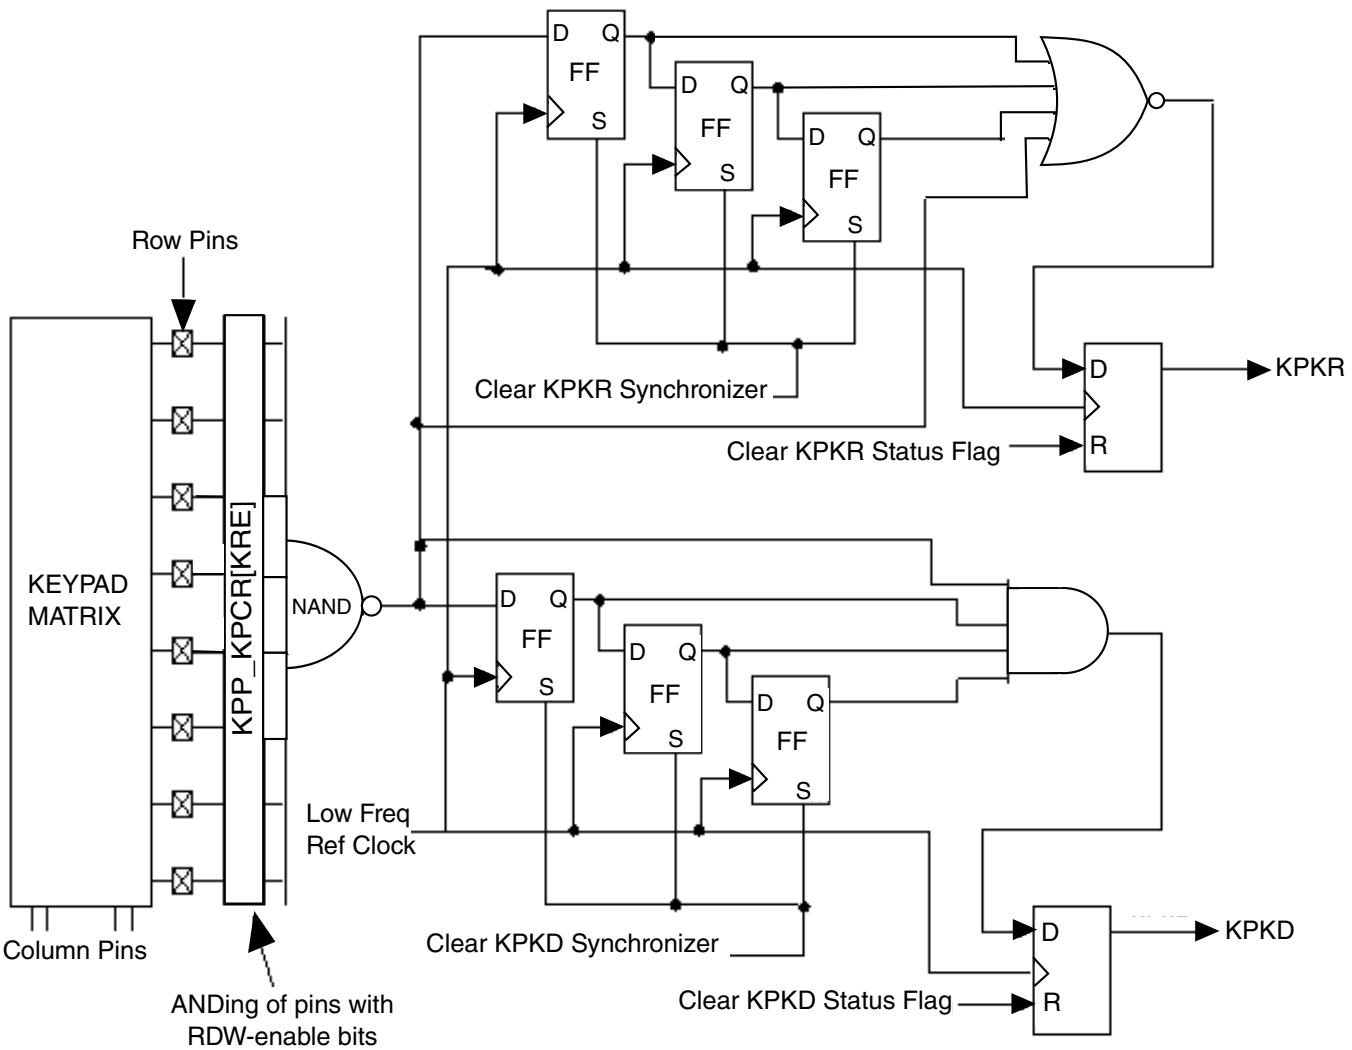

Figure 38-2. Keypad Synchronizer Functional Diagram

38.4.6 Multiple Key Closures

Using the key press and Key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly.

See the following figures for illustrations of the interfacing of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected. Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

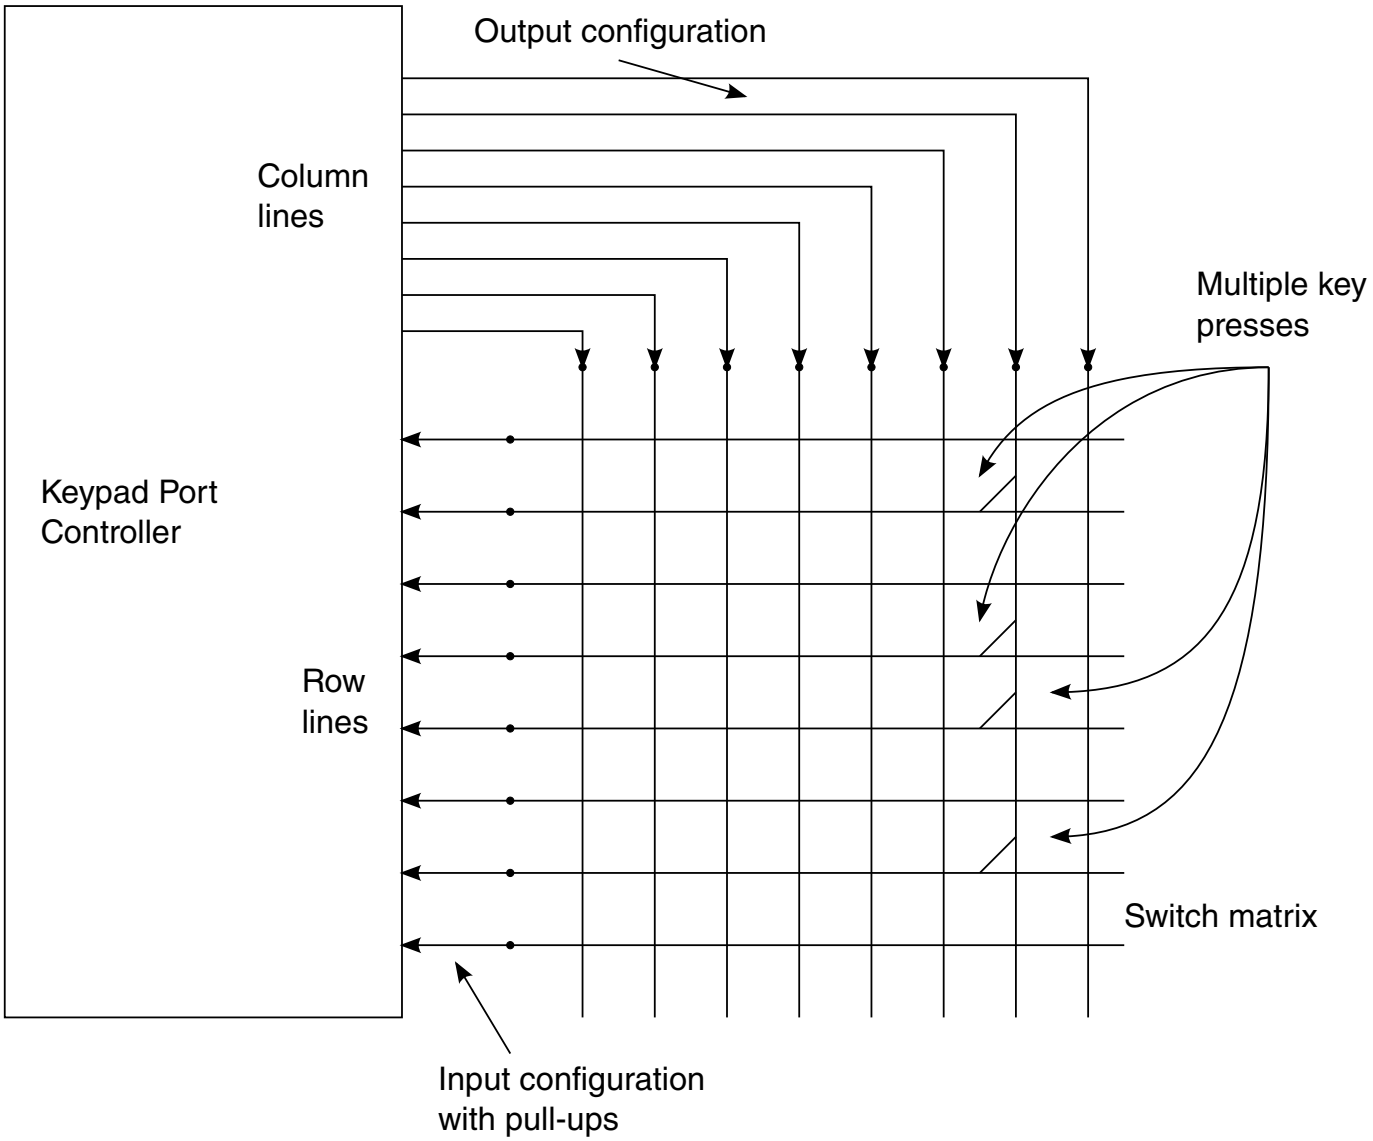

Figure 38-3. Multiple Key Presses on Same Column Line (Simplified View)

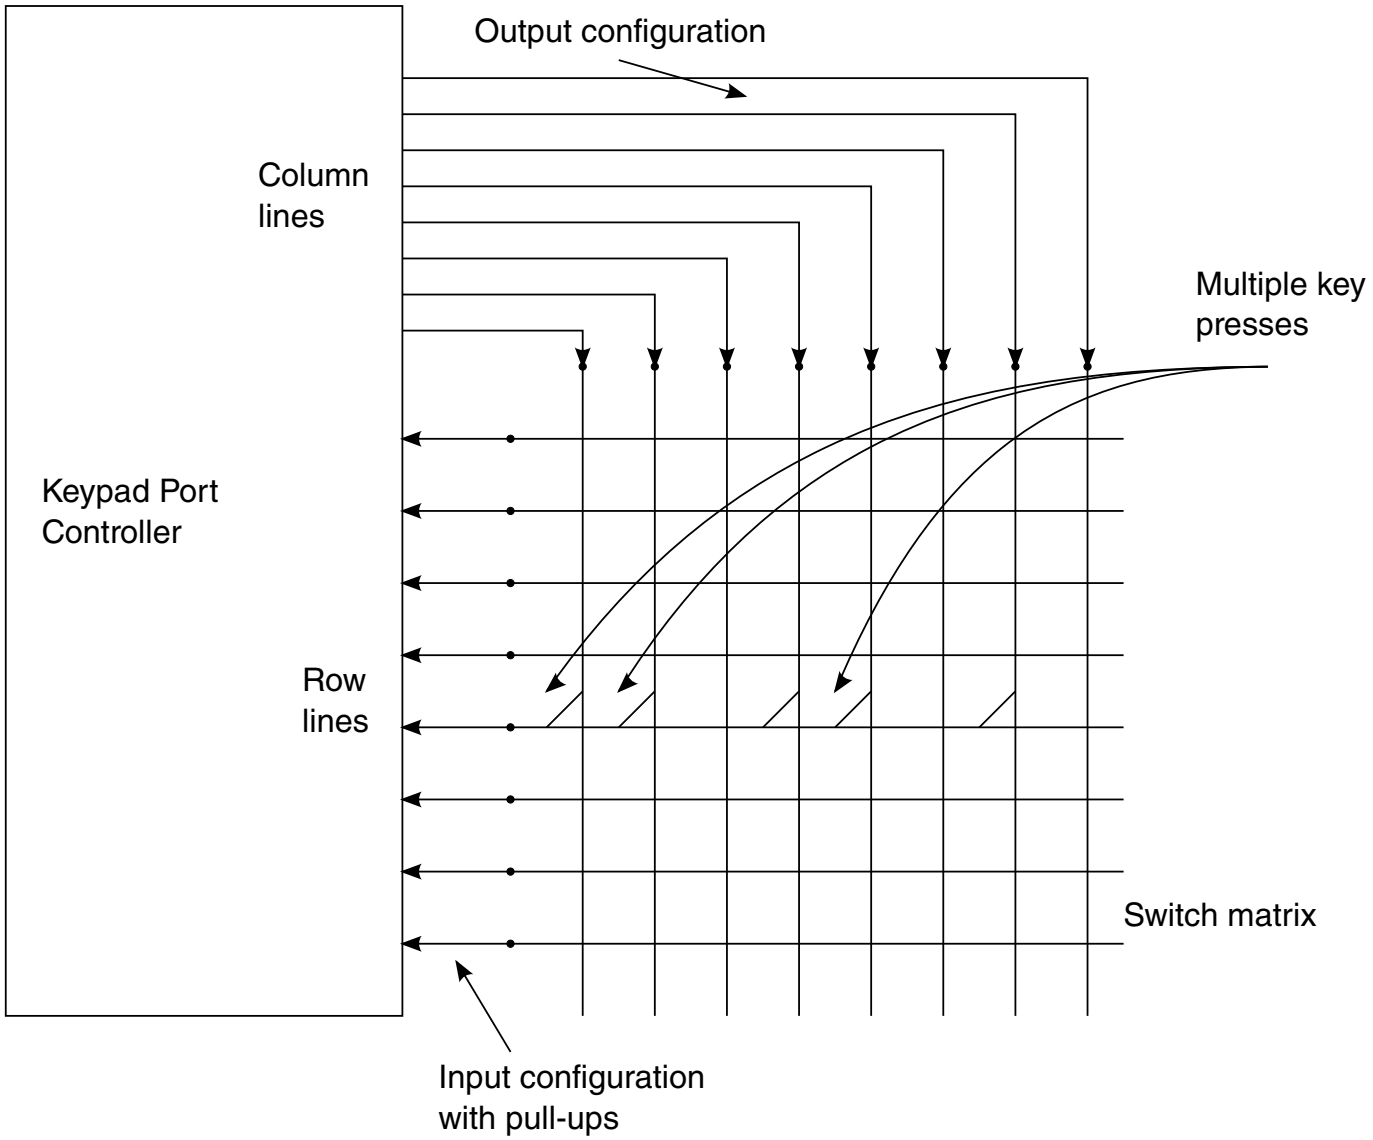

Figure 38-4. Multiple Key Presses on Same Row Line (Simplified View)

NOTE

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

38.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As can be seen in Figure 38-5, three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see Figure 38-6).

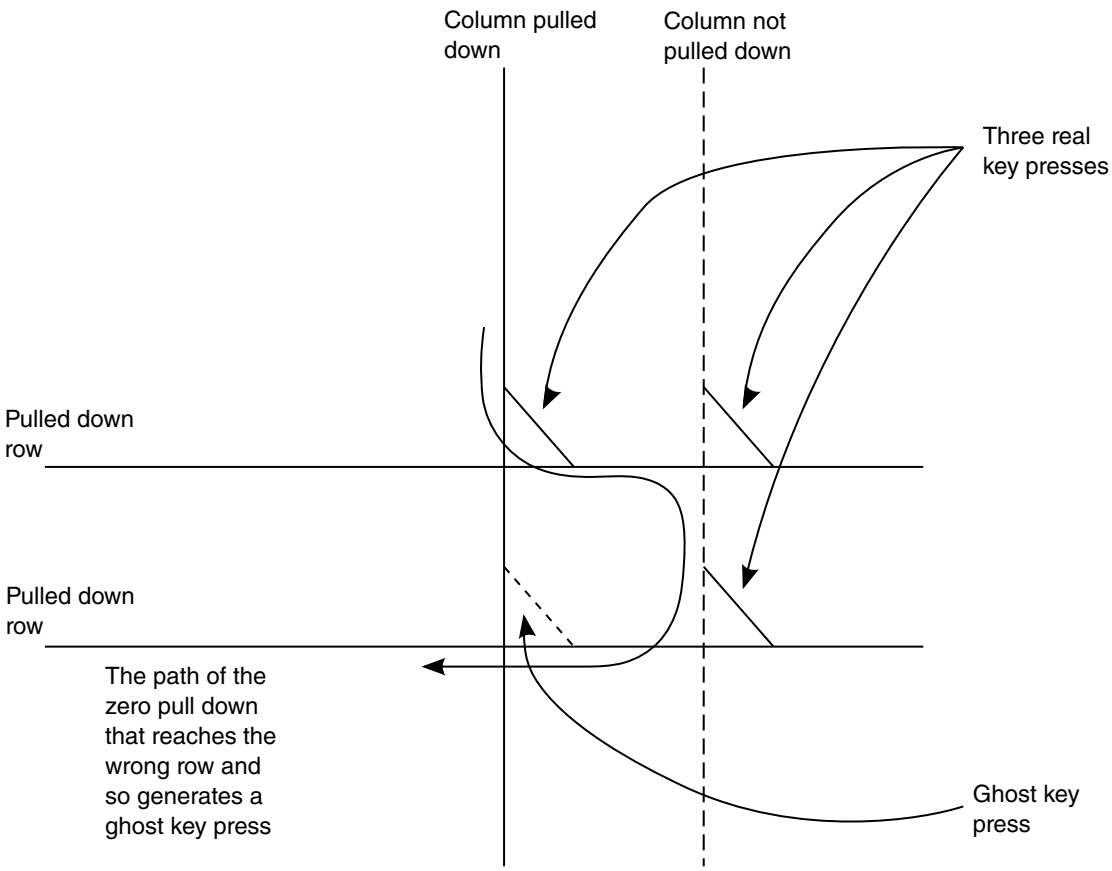

Figure 38-5. Decoding Wrong Three- Key-Presses

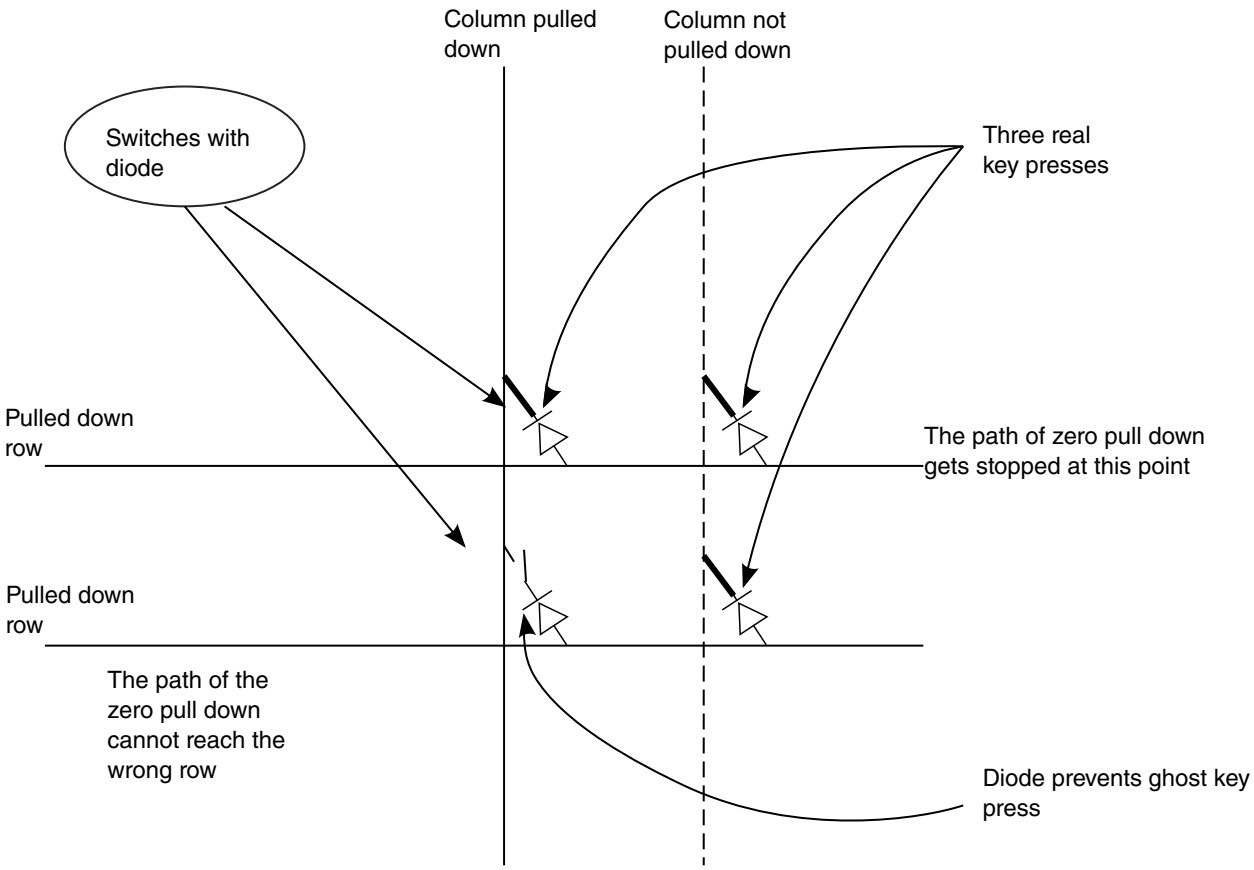

Figure 38-6. Matrix with "Ghost" Key Protections

38.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in Figure 38-7, two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should to be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

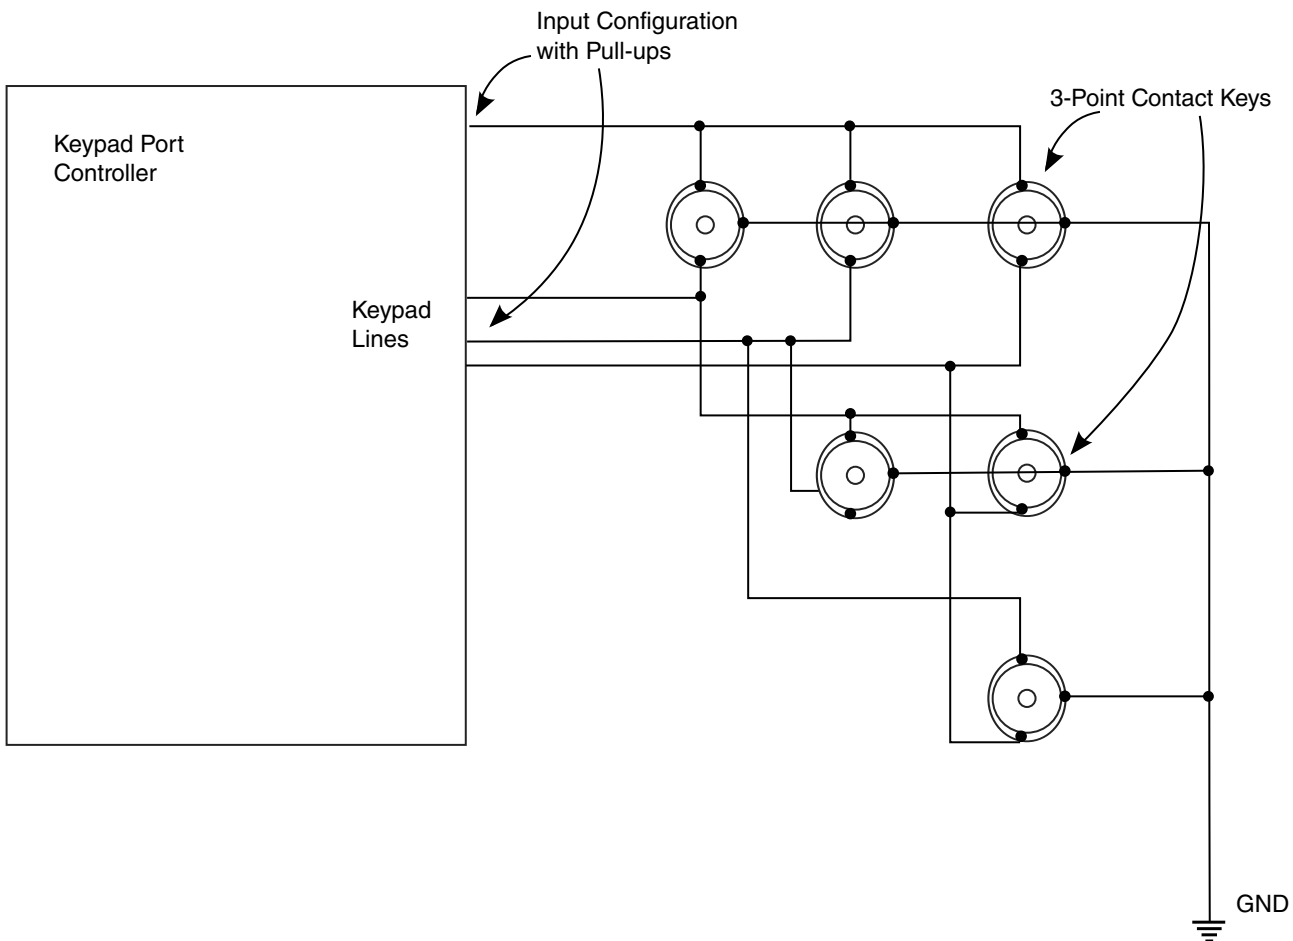

Figure 38-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

38.5 Initialization/Application Information

38.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP_KPCR[KRE]).
2. Write 0s to KPP_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP_KPCR[KCO]).
4. Configure columns as output (KPP_KDDR[KCDD]) and rows as input (KPP_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).
7. (The system is now in standby mode, and awaiting a key press.)

38.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

38.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

38.6 KPP Memory Map/Register Definition

The KPP contains four registers.

KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20B_8000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	38.6.1/3554
20B_8002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	38.6.2/3555
20B_8004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	38.6.3/3557
20B_8006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	38.6.4/3557

38.6.1 Keypad Control Register (KPP_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP_KPCR register is byte- or half-word-addressable.

Address: 20B_8000h base + 0h offset = 20B_8000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input. **NOTE:** Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin. 0 **TOTEM_POLE** — Column strobe output is totem pole drive. 1 **OPEN_DRAIN** — Column strobe output is open drain.

Table continues on the next page...

KPP_KPCR field descriptions (continued)

Field	Description
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set. 0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

38.6.2 Keypad Status Register (KPP_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP_KPSR register is byte- or half-word-addressable.

Address: 20B_8000h base + 2h offset = 20B_8002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write								
Reset	0	0	0	0	0	1	0	0

Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write					KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

KPP_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.

Table continues on the next page...

KPP_KPSR field descriptions (continued)

Field	Description
	0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit. Reads return a value of "0". 0 No effect 1 Set bits which sets keypad release synchronizer chain
2 KDSC	Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit. Reads return a value of "0". 0 No effect 1 Set bits that clear the keypad depress synchronizer chain
1 KPKR	Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents. Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1". 0 No key release detected 1 All keys have been released
0 KPKD	Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents. 0 No key presses detected 1 A key has been depressed

38.6.3 Keypad Data Direction Register (KPP_KDDR)

The bits in the KPP_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP_KDDR register is byte- or half-word addressable.

NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

Address: 20B_8000h base + 4h offset = 20B_8004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCDD								KRDD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — COLn pin is configured as an input. 1 **OUTPUT** — COLn pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW*n* pin as an output (where *n* = 7 through 0). 0 **INPUT** — ROWn pin configured as an input. 1 **OUTPUT** — ROWn pin configured as an output.

38.6.4 Keypad Data Register (KPP_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 20B_8000h base + 6h offset = 20B_8006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read Write	KCD								KRD							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPDR field descriptions

Field	Description
15–8 KCD	Keypad Column Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to column ports 1 Read/Write "1" from/to column ports
KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports

Chapter 39
LVDS Display Bridge (LDB)

39.1 Overview

The LVDS Display Bridge (LDB) connects the IPU (Image Processing Unit) to an External LVDS Display Interface.

The purpose of the LDB is to support flow of synchronous RGB data from the IPU to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

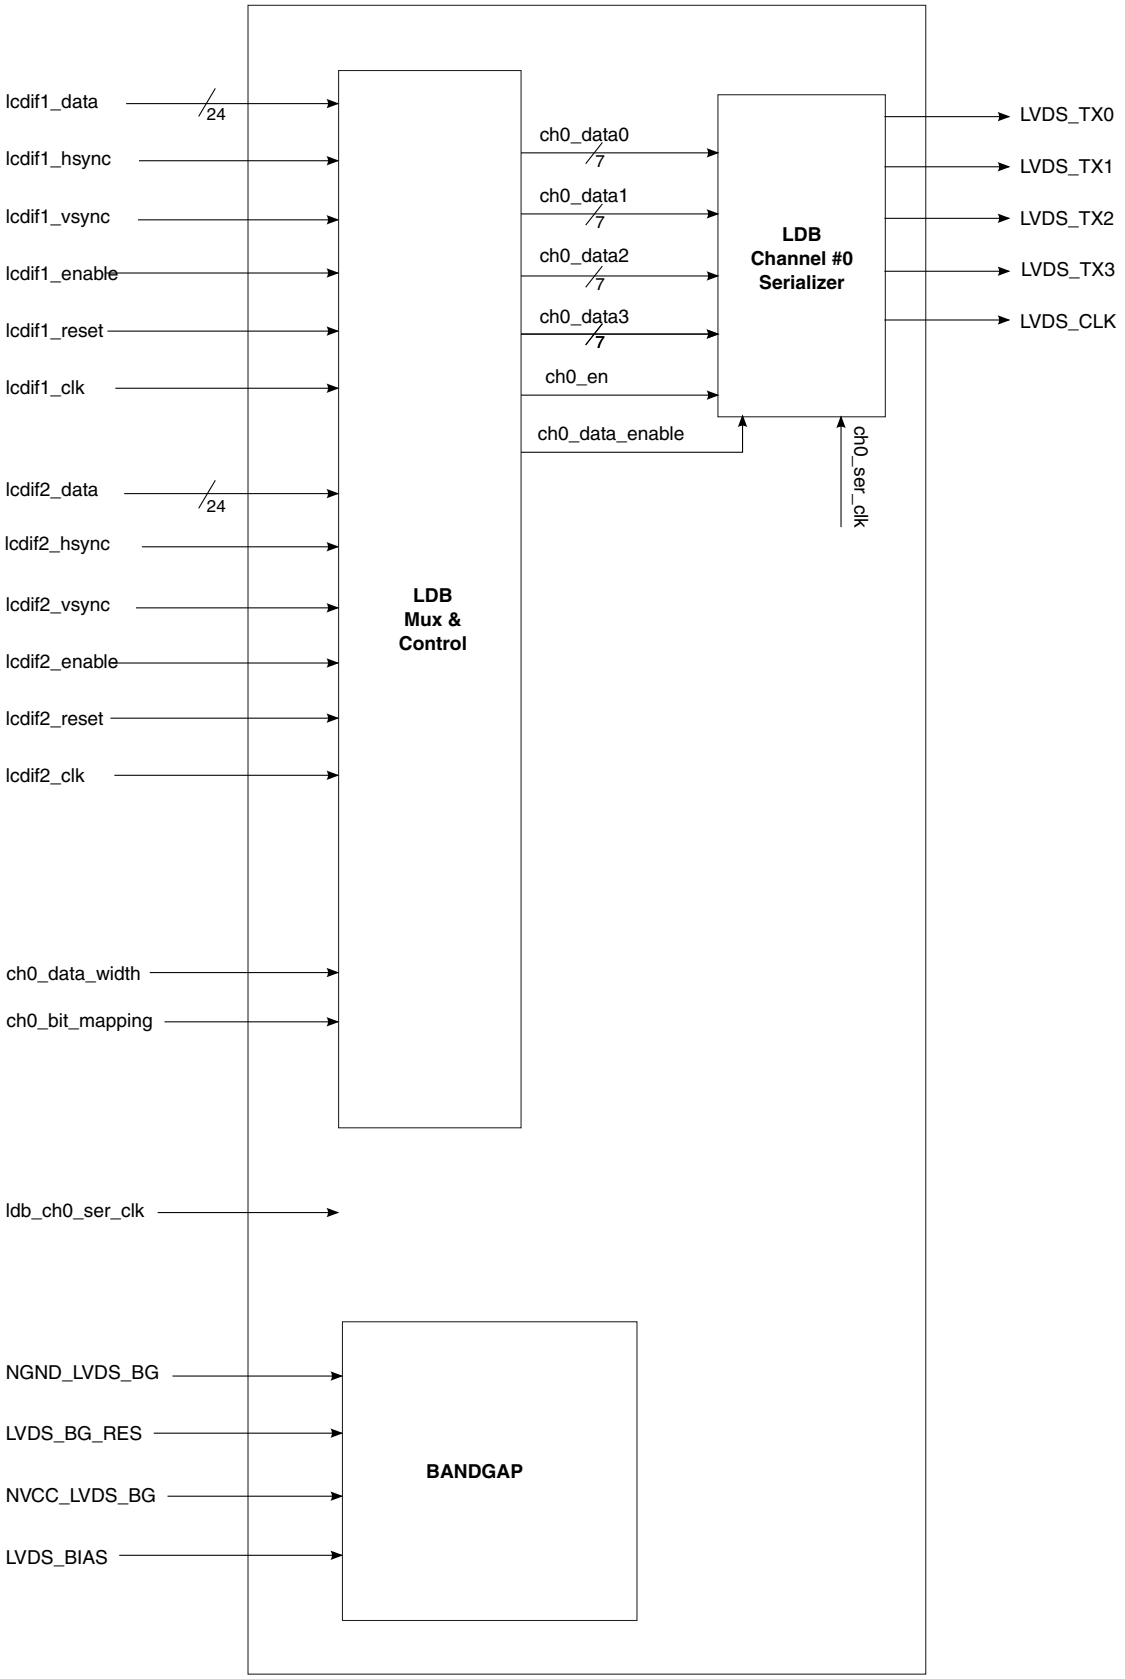

Figure 39-1. LDB Block Diagram

Table 39-1. LDB - Block Description

Block	Description
LDB Mux and Control	Gets control signals from SoC and determines parameters of LDB
Channel Serializers	LDB has 2 channel serializers. The serializer does parallel to serial conversion 7:1 to 3 or 4 data lines
Bandgap	Provides reference current to the LVDS I/O pads.

Table 39-2. LDB IP Parametric Table

Name	IPU
Function	Connectivity to displays with LVDS interface
External I/O Pins Those are LVDS I/O pads	LVDS Display port: 2 channels, consists of: • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 20 I/O pads.
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1
Clock sources and range	IPU_DI0_CLK, IPU_DI1_CLK- Display interface clock: 20-170 MHz DI0_SERIAL_CLK, DI1_SERIAL_CLK - Serializer clock: 140-595 MHz

39.1.1 Relevant Standards

Below are the relevant standards to LDB:

1. ANSI EIA-644-A. Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits.
2. SPWG Notebook Panel Specification (V3.8 from 03/2007) http://www.spwg.org/specifications.htm.
3. PSWG standards (Panel Standardization Working Group) - set of standards for panels using LVDS. All are available from http://www.vesa.org.
4. DISM Standard JEIDA-59-1999

39.2 External Signals

The following table describes the external signals of LDB:

Table 39-3. LDB External Signals

Signal	Description	Pad	Mode	Direction
LVDS0_CLK_N	LVDS0 Negative Clock Signal	LVDS0_CLK_N	No Muxing	I/O
LVDS0_CLK_P	LVDS0 Positive Clock Signal	LVDS0_CLK_P	No Muxing	I/O
LVDS0_DATA[3:0]_N	LVDS0 Negative Data Signals	LVDS0_TX[3:0]_N	No Muxing	I/O
LVDS0_DATA[3:0]_P	LVDS0 Positive Data Signals	LVDS0_TX[3:0]_P	No Muxing	I/O
LVDS1_CLK_N	LVDS1 Negative Clock Signal	LVDS1_CLK_N	No Muxing	I/O
LVDS1_CLK_P	LVDS1 Positive Clock Signal	LVDS1_CLK_P	No Muxing	I/O
LVDS1_DATA[3:0]_N	LVDS1 Negative Data Signals	LVDS1_TX[3:0]_N	No Muxing	I/O
LVDS1_DATA[3:0]_P	LVDS1 Positive Data Signals	LVDS1_TX[3:0]_P	No Muxing	I/O

39.3 Clocks

A table with the LDB Clock Sources can be found here.

Table 39-4. LDB Clock Sources

Name	Symbol	Source	Rate	Comments
IPU DI0 interface pixel clock	IPU_DI0_CLK	Clock control Module	Up to 170 MHz	See note below [1]
IPU DI1 interface pixel clock	IPU_DI1_CLK	Clock control Module	Up to 170 MHz	This input also goes to IPU DI1 as input. See note below
CH0 interface serializer clock	DI0_SERIAL_CLK	Clock control Module	Up to 595 MHz	This is x7 the rate of the DI0 interface pixel clock. See note below.
CH1 interface serializer clock	DI1_SERIAL_CLK	Clock control Module	Up to 595 MHz	This is x7 the rate of the DI1 interface pixel clock. See note below

1. In case of single-channel or separate-channels use-case, the IPU DI_CLK is identical to the LVDS DI_CLK. In case of dual-channel use-case, the IPU DI_CLK has x2 higher frequency than that of the LVDS DI_CLK. Still both need to be synchronized

39.4 Input and Output Ports

39.4.1 Input Parallel Display Ports

One or Two parallel RGB input ports are supported (configurable). Only synchronous access mode is supported.

Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- Overall: LDB supports rates needed by WUXGA 16:10 aspect ratio (1920 x 1200 @ 60 frames per second, data rate supported up to 170 MHz)
- For single input data interface case: Up to 170 MHz pixel clock (WUXGA 1920x1200)
- For dual input data interface case: Up to 85 MHz per interface. (WXGA 1366x768 @ 60 frames per second, 35% blanking).

39.4.2 Output LVDS Ports

There is 2 LVDS channels. The output of each is used to communicate RGB data and controls to external LCD displays.

The LVDS ports may be used as follows:

- Single channel output
- Dual channel output (one input source, two channels outputs for two displays)
- Split channel output (one input source, splitted to 2 channels on output)
- Separate 2 channel output (2 input sources from IPU).

The output LVDS port complies to the EIA-644-A standard.

39.5 Processing

LDB data processing stages are as follows:

- Receive input data from 1 or 2 (configurable) parallel input interfaces. 18/24 RGB data + up to 4 controls and map them to LVDS channels.
  - If needed (dual-channel) split the input bus to two half-rate busses.
- Re-arrange the input data according to channel configuration, and muxing scheme.
- Serialize the 22/28 bit input bus (per channel) on 3-4 output serial data lines (7:1)

39.5.1 Mapping of Input Data Busses

Mapping of Parallel input interfaces (DI0, DI1) to output LVDS channels (Channel 0, Channel 1). See Table 39-5.

Table 39-5. Channel Mapping

Use Case	LVDS Channel 0	LVDS Channel 1
Single Channel DI0	DI0	Disabled
Single Channel DI1 on Channel 1	Disabled	DI1
Separate Channels	DI0	DI1
Dual Channels DI0	DI0	DI0
Dual Channels DI1	DI1	DI1
Split Channel DI0	DI0 (first pixel)	DI0 (second pixel)
Split Channel DI1	DI1 (first pixel)	DI1 (second pixel)

39.5.2 Bit Mapping

LDB supports two mapping standards:

- SPWG mapping
- JEIDA mapping

Table 39-6. SPWG/PSWG/VESA 18/24 bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDSn_DATA0	G0	R5	R4	R3	R2	R1	R0
LVDSn_DATA1	B1	B0	G5	G4	G3	G2	G1
LVDSn_DATA2	DE	VS	HS	B5	B4	B3	B2
LVDSn_DATA3 (for 24 bpp only)	CTL	B7	B6	G7	G6	R7	R6

Table 39-7. JEIDA 24bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDSn_DATA0	G2	R7	R6	R5	R4	R3	R2
LVDSn_DATA1	B3	B2	G7	G6	G5	G4	G3
LVDSn_DATA2	DE	VS	HS	B7	B6	B5	B4
LVDSn_DATA3	CTL	B1	B0	G1	G0	R1	R0

NOTE

Several options of control usage can be available. some display devices use only DE, some others use all 3 controls, some use only HS, VS. "CTL" is an optional general purpose control which is usually unused by display.

39.6 LDB Memory Map/Register Definition

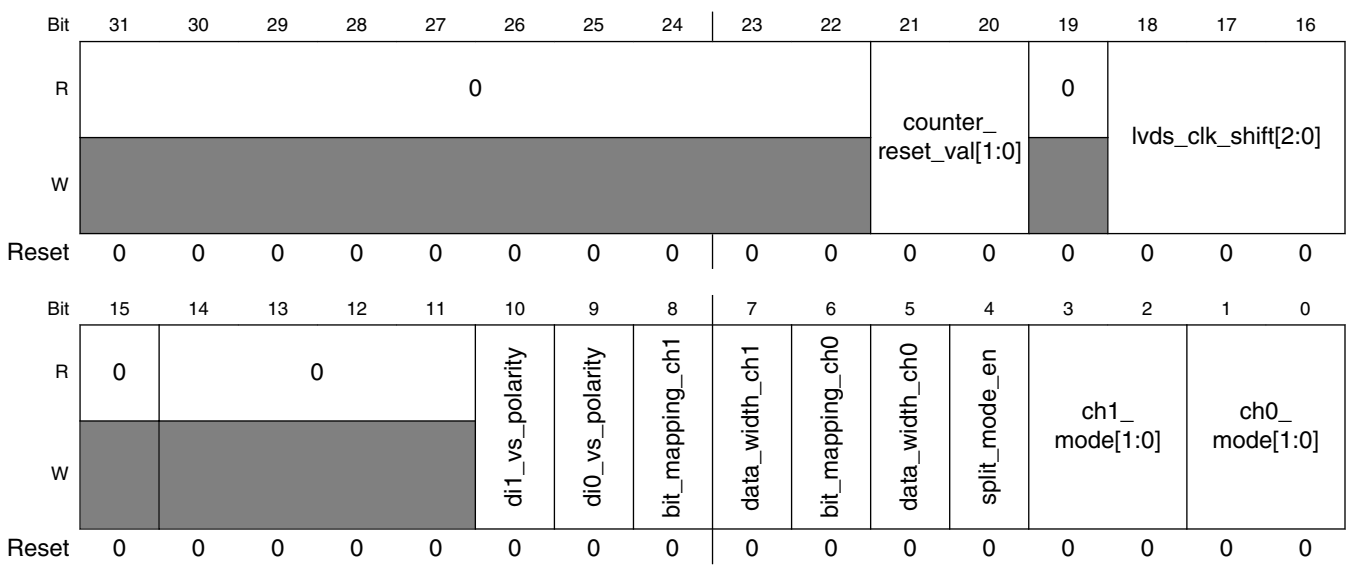
LDB memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
20E_0008	LDB Control Register (LDB_CTRL)	32	R/W	0000_0000h	39.6.1/3565

39.6.1 LDB Control Register (LDB_CTRL)

The register is implemented in the IOMUX Controller block (IOMUXC), as the register IOMUXC_GPR2.

Address: 20E_0008h base + 0h offset = 20E_0008h



LDB_CTRL field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 counter_reset_val[1:0]	Reset value for the LDB counter which determines when the shift registers are loaded with data. **NOTE:** Used for debug purposes only. In normal functional operation must be '00' 00 Reset value is 5 01 Reset value is 3 10 Reset value is 4 11 Reset value is 6
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 lvds_clk_shift[2:0]	Shifts the LVDS output clock in relation to the data. **NOTE:** Used for debug purposes only. In normal functional operation must be '000' 000 Output clock is '1100011' (normal operation) 001 Output clock is '1110001' 010 Output clock is '1111000' 011 Output clock is '1000111' 100 Output clock is '0001111' 101 Output clock is '0011111' 110 Output clock is '0111100' 111 Output clock is '1100011'
15 Reserved	This read-only field is reserved and always has the value 0.
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 di1_vs_polarity	Vsync polarity for IPU's DI1 interface. 0 ipu_di1_vsync is active high. 1 ipu_di1_vsync is active low.
9 di0_vs_polarity	Vsync polarity for IPU's DI0 interface. 0 ipu_di0_vsync is active high. 1 ipu_di0_vsync is active low.
8 bit_mapping_ch1	Data mapping for LVDS channel 1. 0 Use SPWG standard. 1 Use JEIDA standard.
7 data_width_ch1	Data width for LVDS channel 1. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch1 is set) 0 Data width is 18 bits wide (lvds1_tx3 is not used) 1 Data width is 24 bits wide.
6 bit_mapping_ch0	Data mapping for LVDS channel 0. 0 Use SPWG standard. 1 Use JEIDA standard.

Table continues on the next page...

LDB_CTRL field descriptions (continued)

Field	Description
5 data_width_ch0	Data width for LVDS channel 0. **NOTE:** This bit must be set when using JEIDA standard (bit_mapping_ch0 is set) 0 Data width is 18 bits wide (lvds0_tx3 is not used) 1 Data width is 24 bits wide.
4 split_mode_en	Enable split mode. **NOTE:** In this mode both channels should be enabled and working with the same DI (ch0_mode and ch1_mode should both be either '01' or '11') 0 Split mode is disabled. 1 Split mode is enabled.
3–2 ch1_mode[1:0]	LVDS channel 1 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.
ch0_mode[1:0]	LVDS channel 0 operation mode 00 Channel disabled. 01 Channel enabled, routed to DI0 10 Channel disabled. 11 Channel enabled, routed to DI1.

Chapter 40
MIPI - Camera Serial Interface Host Controller (MIPI_CSI)

40.1 Overview

The CSI-2 Host Controller is a digital core that implements all protocol functions defined in the MIPI CSI-2 Specification, providing an interface between the System and the MIPI D-PHY, allowing the communication with a MIPI CSI-2 compliant Camera Sensor.

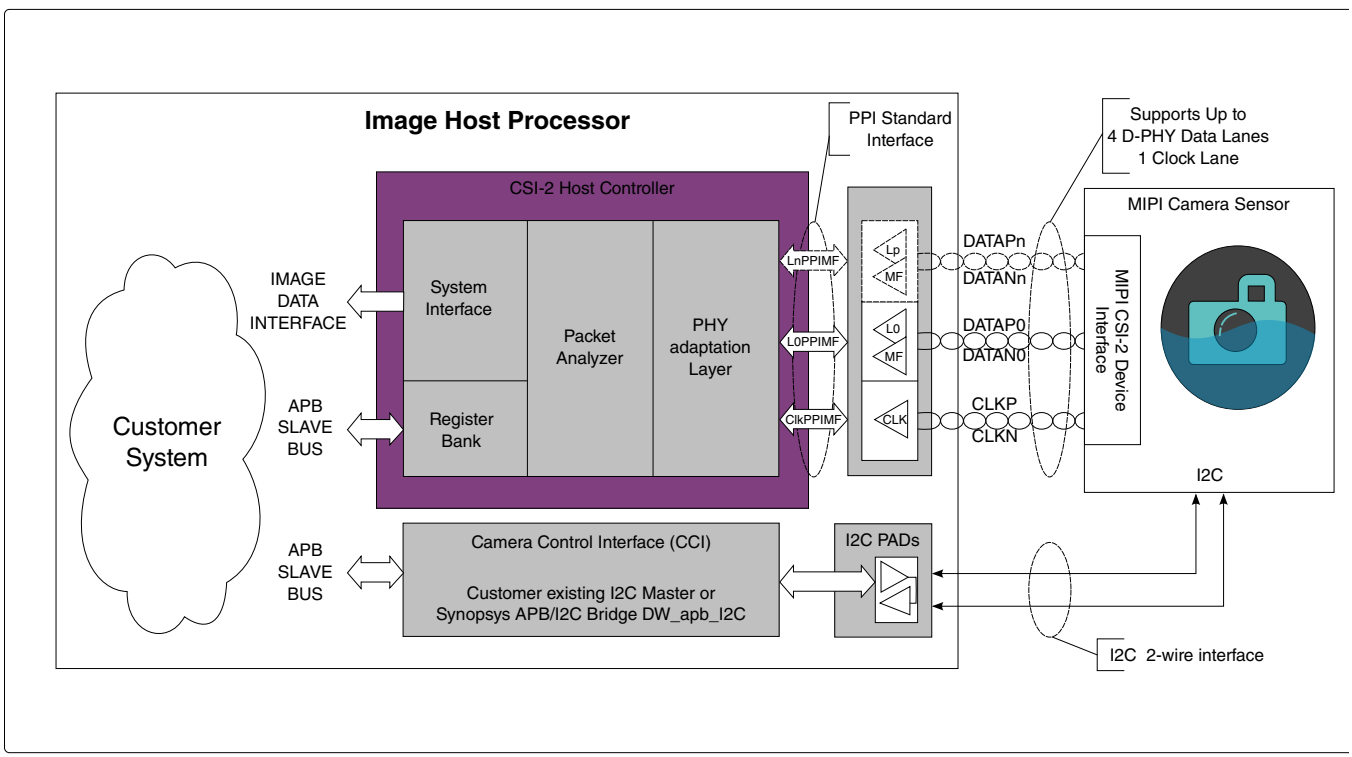


Figure 40-1. Block Diagram presenting the CSI-2 Host Controller function.

40.2 Features

The MIPI CSI-2 Host Controller supports the following features:

- Compliant with MIPI Alliance Standard for Camera Serial Interface 2 (CSI-2), Version 1.00 - 29 November 2005
- Interface with MIPI D-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specification for D-PHY, Version 1.00.00 - 14 May 2009
- Supports up to 4 D-PHY Rx Data Lanes
- Dynamically configurable multi-lane merging
- Long and Short packet decoding
- Timing accurate signaling of Frame and Line synchronization packets
- Support for several frame formats such as:
  - General Frame or Digital Interlaced Video with or without accurate sync timing
  - Data type (Packet or Frame level) and Virtual Channel interleaving
- 32-bit Image Data Interface delivering data formatted as recommended in CSI-2 Specification;
- Supports all primary and secondary data formats:
  - RGB, YUV and RAW color space definitions
  - From 24-bit down to 6-bit per pixel
  - Generic or user-defined byte-based data types
- Error detection and correction:
  - PHY level
  - Packet level
  - Line level
  - Frame level

40.3 Architecture

The following figure presents the overall architecture of the CSI-2 Host Controller. The main blocks are the following:

- PHY Adaptation Layer, which is responsible for managing the D-PHY interface, including PHY error handling;
- Packet Analyzer, where data lane merging is implemented if required, together with header decoding, error detection and correction, frame size error detection and CRC error detection;
- Image Data Interface. This block separates CSI-2 packet header information and reorders data according to memory storage format, and it also generates timing

accurate video synchronization signals. Several error detections are also performed at frame-level and line-level;

- Register Bank, accessible through a standard AMBA-APB slave interface, providing access to the CSI-2 Host Controller registers for configuration and control. There is also a fully programmable interrupt generator to inform the system upon certain events;

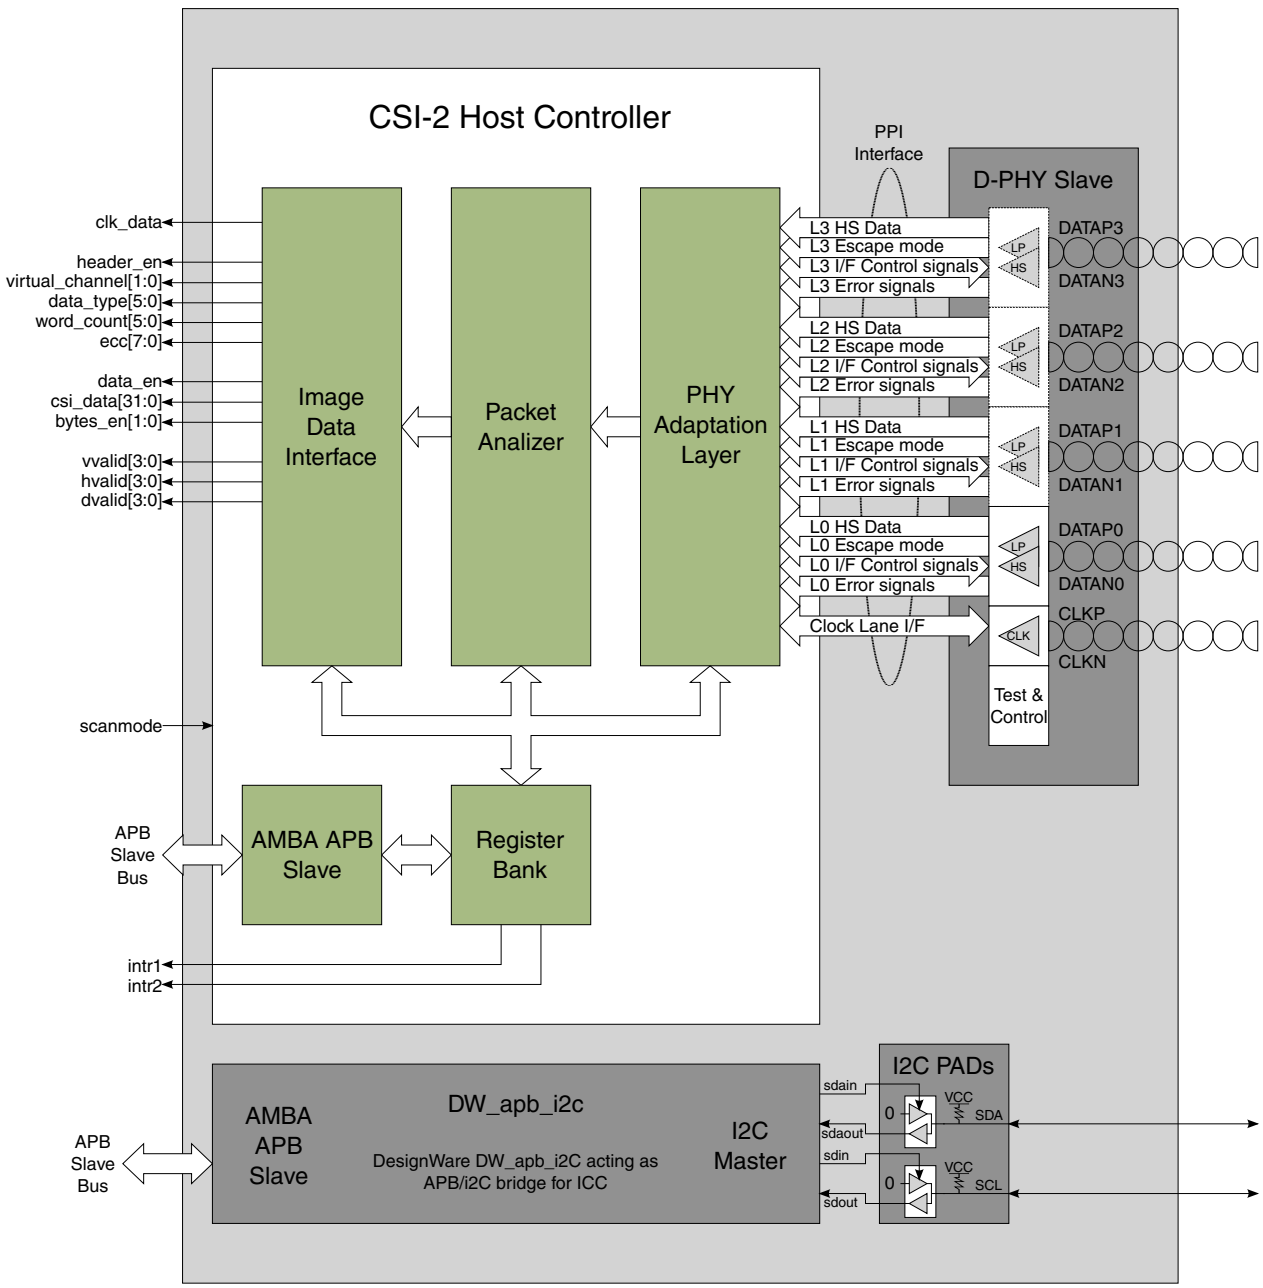

Figure 40-2. Architecture of the CSI-2 Host Controller.

40.3.1 Startup Sequence

The following information is provided as a guideline to allow a safe startup of the system operation.

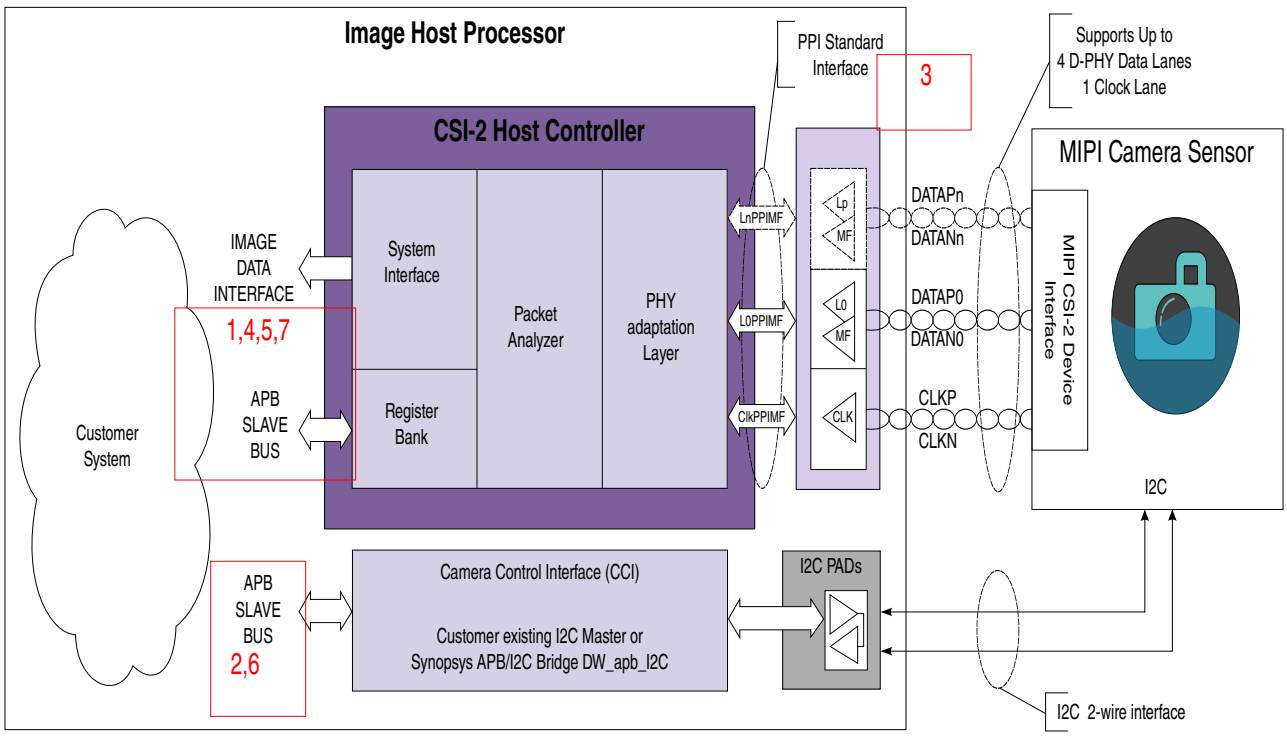

Figure 40-3. Block diagram presenting the recommended Startup Sequence.

1. Deassert CSI2 presetn signal (global reset);
2. **Configure MIPI Camera Sensor to have all Tx lanes in PL-11 state (STOPSTATE) if required** - According to D-PHY Specification the D-PHY master should be initialized at LP-11 state (STOPSTATE), nevertheless a CCI command may be required to switch-on the MIPI interface;
3. **D-PHY initialization** - Access the D-PHY programming interface to initialize and program the D-PHY according to the selected operating mode of the D-PHY. This is D-PHY dependent, and this programming should be carried out according to the D-PHY databook;
4. **CSI2 Controller programming** - Program the CSI2 Host Controller registers according to the operating mode required:
   - **Number of Lanes (register N_LANES);**
   - **Deassert PHY shutdown (register PHY_SHUTDOWNZ);**
   - **Deassert PHY reset (register PHY_RSTZ);**
   - **Deassert CSI reset (register CSI2_RESETN);**

- **(Optional) Program Data IDs for matching error reporting (registers DATA_IDS_1 and DATA_IDS_2);**
- **(Optional) Program the interrupt masks (registers MASK1 and MASK2);**

5. **CSI2 Controller programming** - Read the PHY status register (PHY_STATE) to confirm that all data and clock lanes of the D-PHY are in Stop State (i.e. ready to receive data);
6. **Configure the MIPI Camera Sensor** - Access Camera Sensor using CCI interface to initialize and configure the Camera Sensor to start transmitting a clock on the D-PHY clock lane;
7. **CSI2 Controller programming** - Read the PHY status register (PHY_STATE) to confirm that the D-PHY is receiving a clock on the D-PHY clock lane;

NOTE

Additional steps may be required to correctly configure the specific D-PHY and MIPI Camera Sensor(s) that are part of the system, as well as any other requirements that is integral part of the relevant MIPI Specifications.

40.3.2 Interrupt mechanism

The CSI-2 Host Controller provides an interrupt mechanism that is usable mostly for monitoring errors and debugging.

There are two interrupt signals, *intr1* and *intr2*, which are synchronous with the AMBA-APB clock signal. Registers MASK1 and MASK2 are used to select which bits of registers ERR1 and ERR2 are able to generate interrupts by asserting signals *intr1* and *intr2*, respectively. Both ERR1 and ERR2 will always contain the information of events, irrespective of the state of MASK1 and MASK2. Registers ERR1 and ERR2 will self-clear after a read access. Interrupt signals *intr1* and *intr2* will be de-asserted upon read access of register ERR1 and ERR2, respectively.

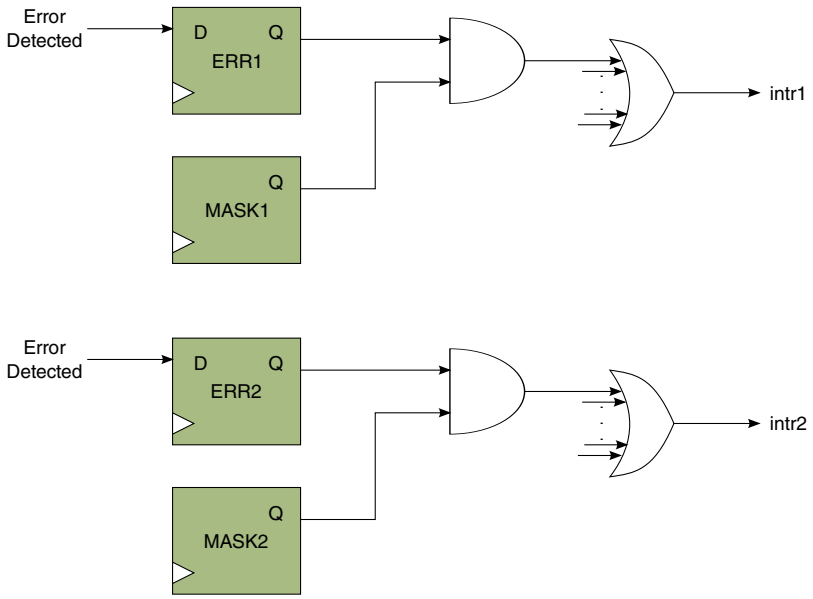

Figure 40-4. Block Diagram presenting the Interrupt mechanism.

40.3.3 Signals

Table 40-1. D-PHY External interface signals

Pin Name	Width	Direction	Description
AVDD	1	Input	D-PHY Analog power supply.
VDD	1	Input	D-PHY Digital power supply.
AVDDREF	1	Input	D-PHY Analog supply for reference generator.
AGND	1	Input	D-PHY Analog supply ground return.
VSS	1	Input	D-PHY Digital supply ground return.
AGNDREF	1	Input	D-PHY Analog supply ground return for reference generator.
REXT	1	Input	D-PHY External resistor connection (REXT and REXTV should be shorted at the chip pad connection).
REXTV	1	Input	D-PHY External resistor connection (REXT and REXTV should be shorted at the chip pad connection)
CSI2_CLKP	1	Input	D-PHY Positive D-Phy differential clock line Receiver input
CSI2_CLKN	1	Input	D-PHY Negative D-Phy differential clock line Receiver input
CSI2_DATAP0	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 0
CSI2_DATAN0	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 0

Table continues on the next page...

Table 40-1. D-PHY External interface signals (continued)

CSI2_DATAP1	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 1
CSI2_DATAN1	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 1
CSI2_DATAP2	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 2
CSI2_DATAN2	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 2
CSI2_DATAP3	1	Input	D-PHY Positive D-Phy differential data line Receiver input , Lane 3
CSI2_DATAN3	1	Input	D-PHY Negative D-Phy differential data line Receiver input , Lane 3

40.4 Timing Interfaces

40.4.1 Image Data Interface

At the Image Data Interface, signal *header_en* is used to indicate that new data is being transferred. It rises when a new packet becomes available at the interface and falls as soon as a packet finishes. Between two consecutive packets, there is always a fall and a rise of *header_en*, since the CSI-2 transmitter must enter Low-Power State between an End of Transmission and the following Start of Transmission.

An example of transferring two short packets is presented in the following figure. The fields of the header packet become available simultaneously to the rise of *header_en*, which falls after one clock cycle, as no new data is to be transferred. This is the behavior of the circuit, independently of the number of active lanes.

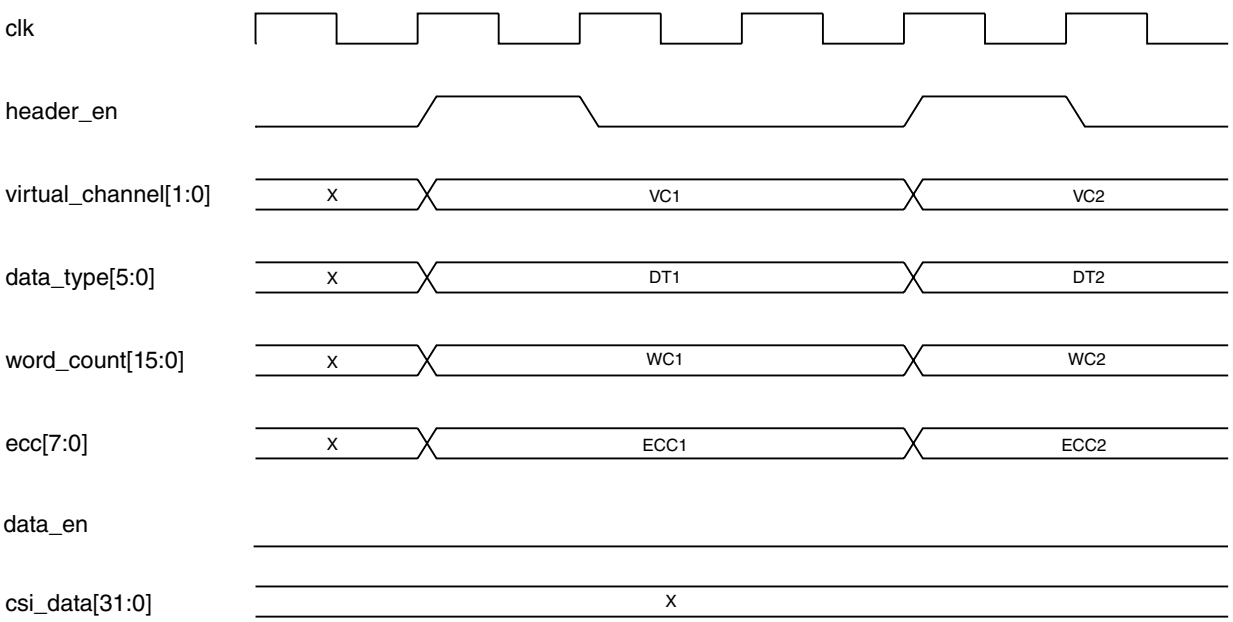

Figure 40-5. Image Data Interface example with two short packets.

When transferring long packets, the data provided by the payload on all lanes is transferred separately on *csi_data* bus, while the header fields remain stable until the transfer of the packet has completed.

Signal *data_en* is used to indicate that a new 32-bit word is available in *csi_data*, and it can only be set if *header_en* is also set. The following Figure shows an example of transferring a long packet received from 4 data lanes. Since a new 32-bit word is transferred at each clock cycle, signal *data_en* remains set until all data is transferred.

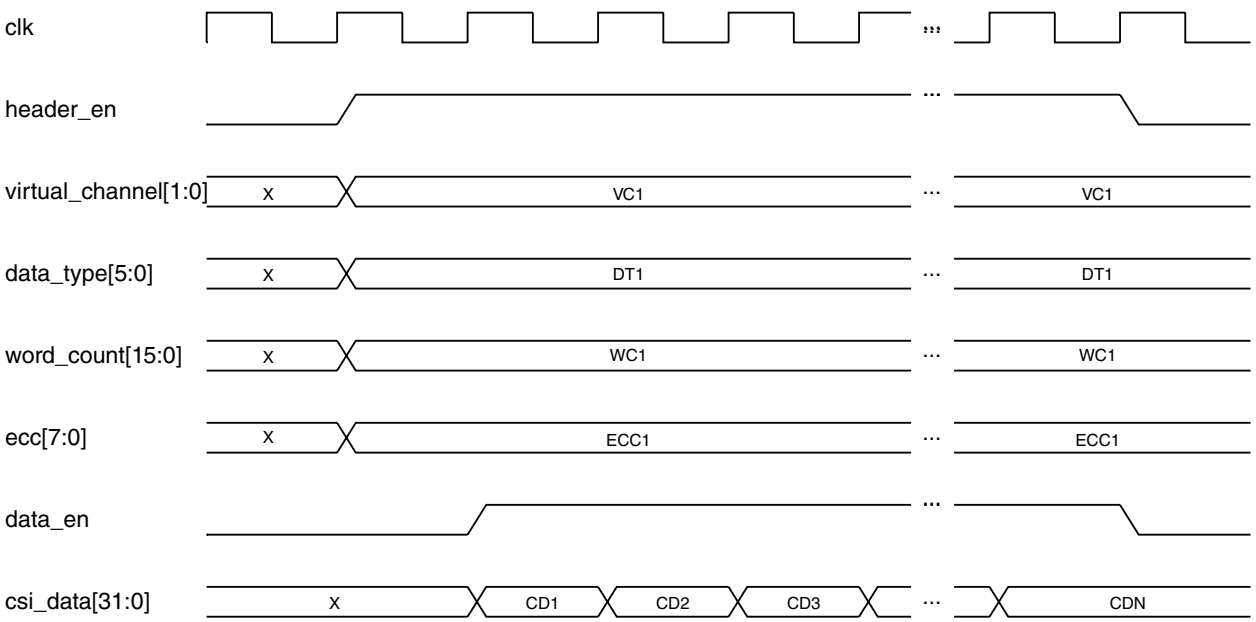

Figure 40-6. Timing interface for a long packet, receiving data from 4 lanes.

If less than 4 lanes are used, a 32-bit word might take more than one clock cycle to be received. In this case, *data_en* is set only when a new word has been fully received and becomes available at the interface. As shown in the following figure, when data is received from two lanes a new word is released every two clock cycles. Both *header_en* and *data_en* return to 0 as soon as all the data has been transferred.

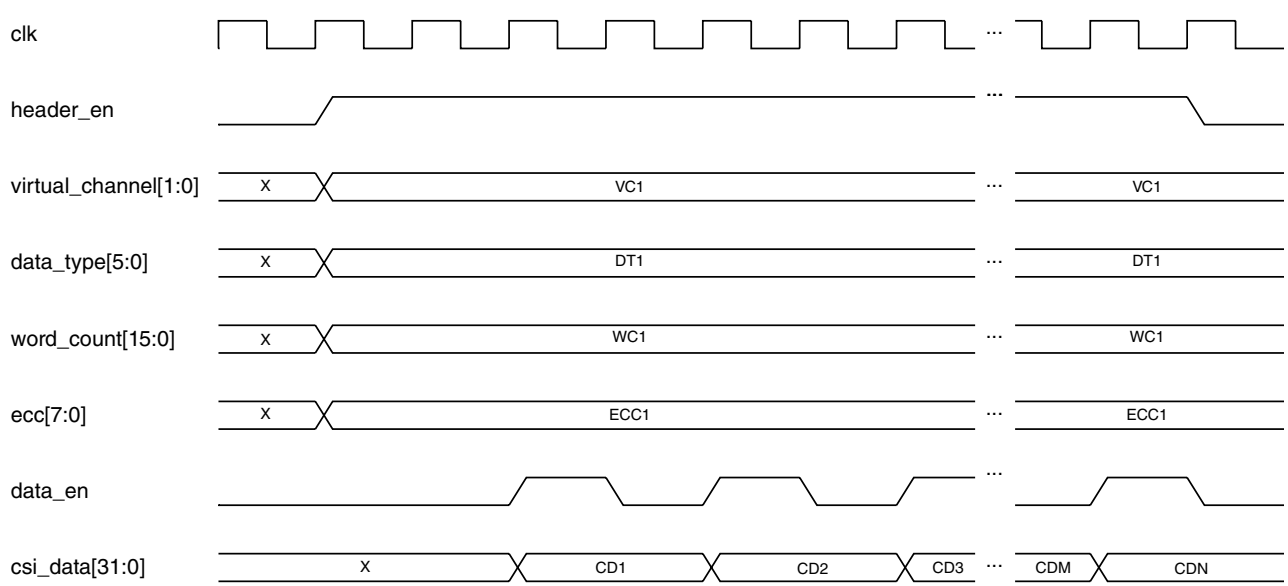

Figure 40-7. Timing interface for a long packet, receiving data from 2 lanes.

If data is transferred using only 1 lane, a new 32-bit word becomes available every four clock cycles. In the case of 3 lanes, a new word is available at clock cycle except every fourth.

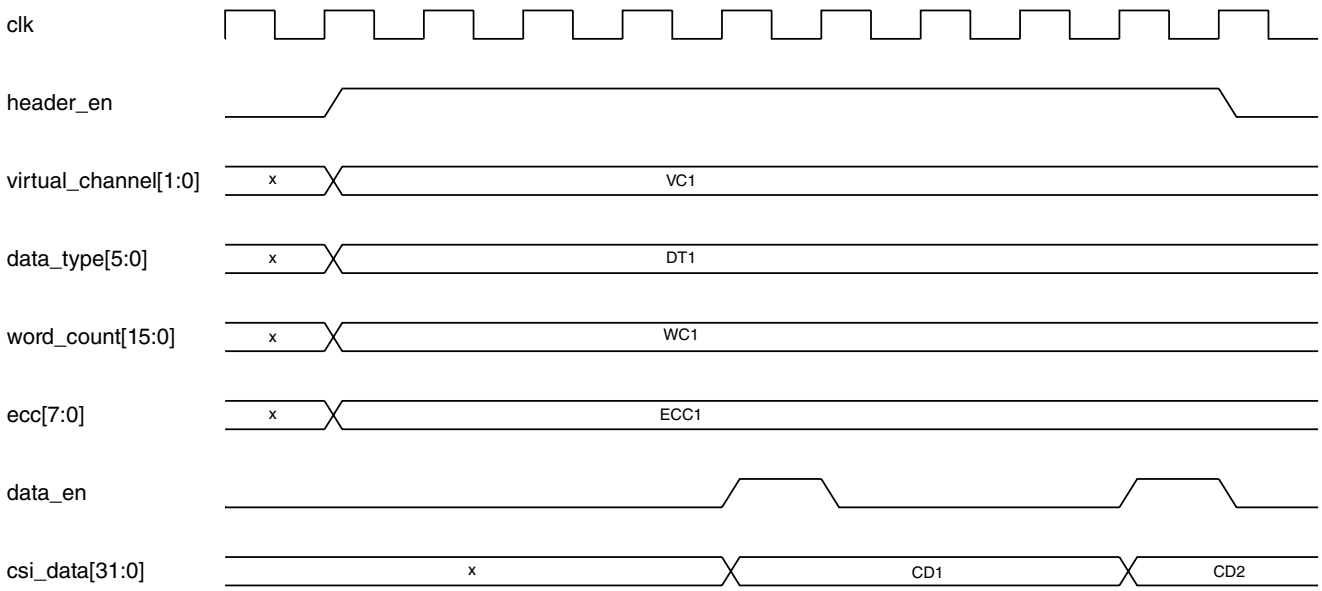

Figure 40-8. Timing interface for a long packet, receiving data from 1 lane.

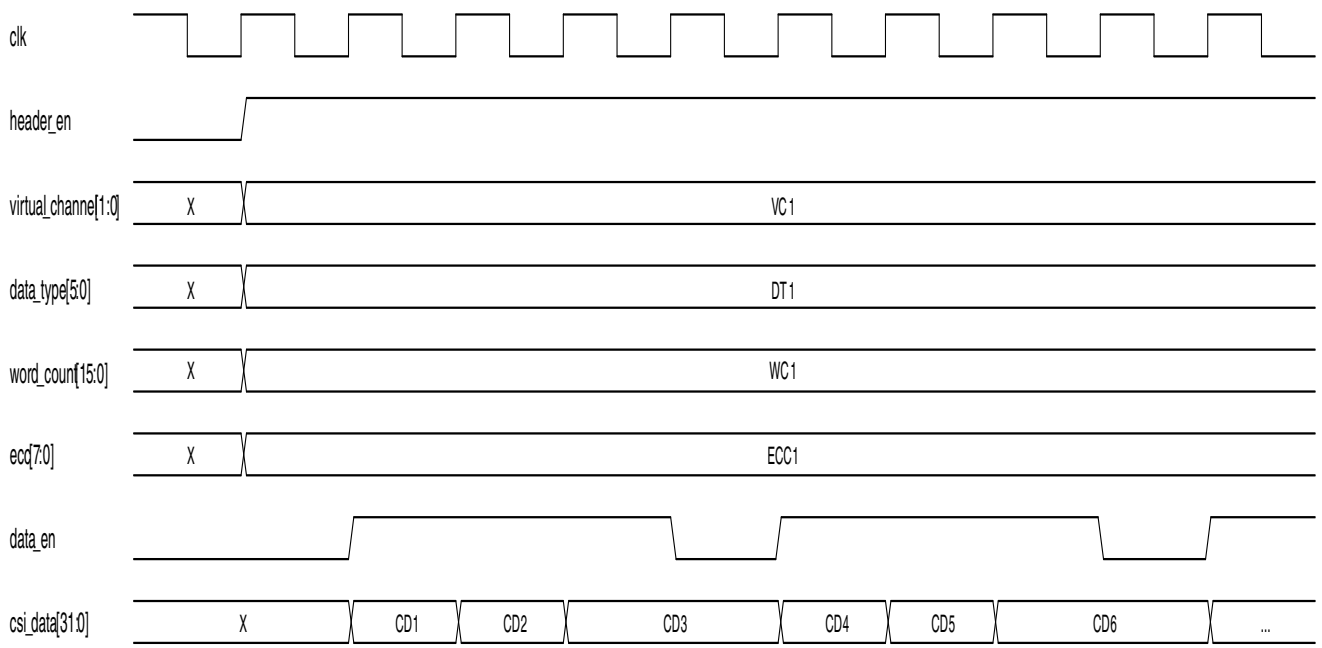

Figure 40-9. Timing interface for a long packet, receiving data from 3 lanes.

Signals *dvalid*, *hvalid* and *vvalid*, are used provide information about Frame Start, Frame End, Line Start and Line End packets. These signals are included in the interface for synchronization purposes.

dvalid is used to indicate when data is being transferred, excluding header information. Data sent through Blank or Null packets do not activate *dvalid*.

hvalid is set on detection of Line Start packets and unset by Line End ones. These packets can be used as a reference for synchronization, even though relevant data can be more or less delayed between them, as it might be surrounded by Blanking Periods, before and after the data. Because Line Start and Line End packets are optional, in case they are not available, *hvalid* adopts the same behavior of *dvalid*, and is not activated by Blank or Null packets. In the case a new Line Start packet is received without a Line End packet being received, a pulse will be generated in *hvalid* to signal that a new Line Start packet was received.

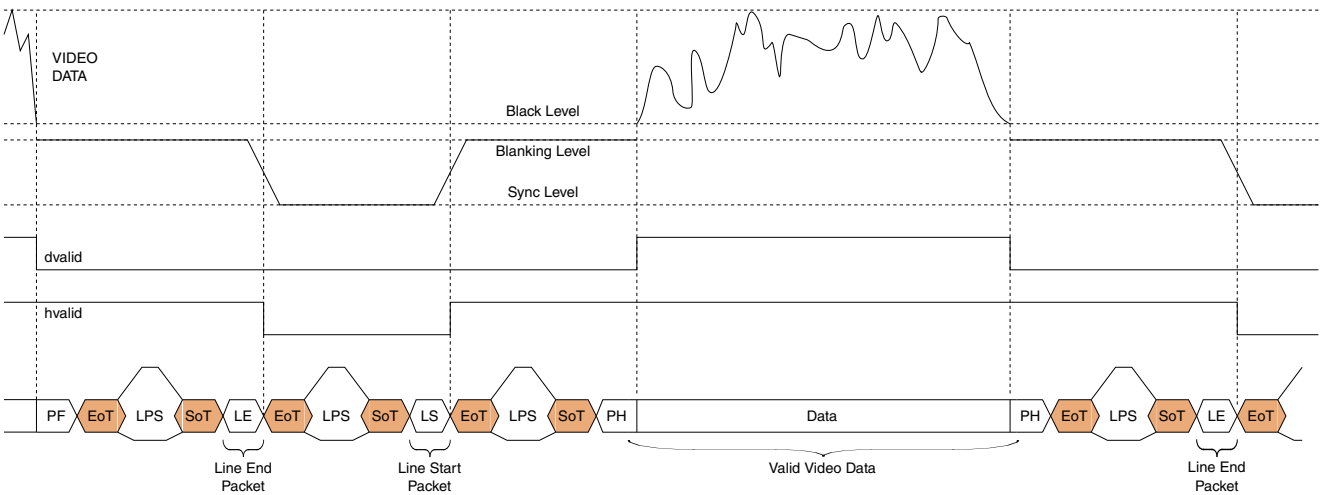

Figure 40-10. HVALID synchronization signal.

vvalid is set on detection of Frame Start packets and unset by Frame End ones. As these packets are mandatory, *vvalid* is always reliable for video applications to synchronize frame updating. In the case a new Frame Start packet is received without a Frame End packet being received, a pulse will be generated in *hvalid* to signal that a new Frame Start packet was received.

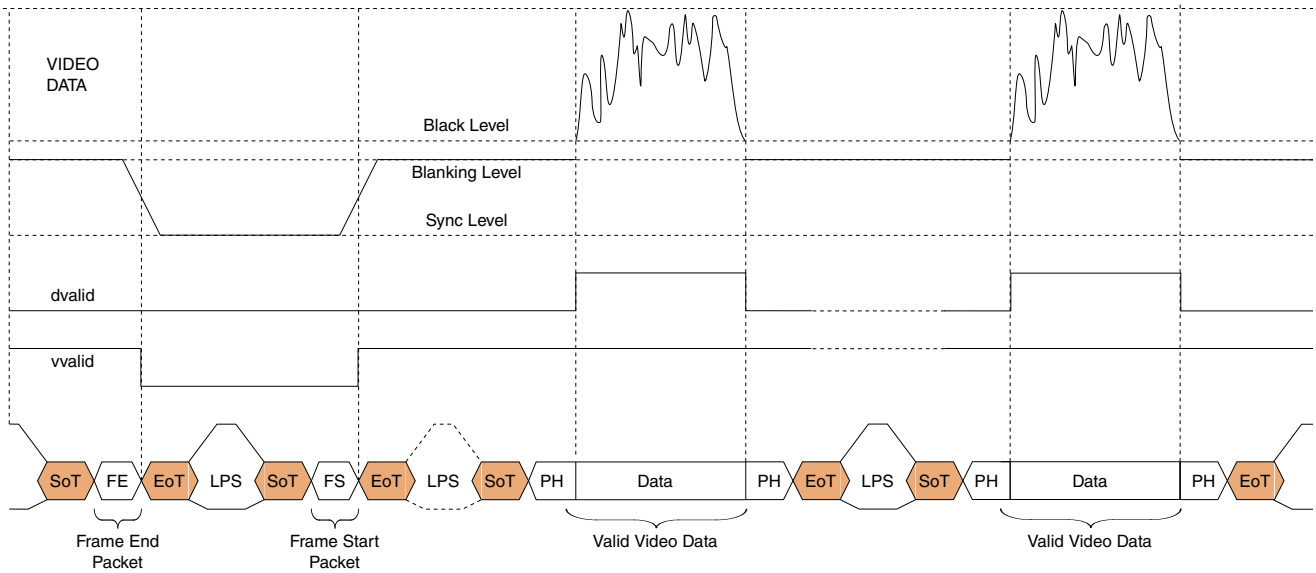

Figure 40-11. VVALID synchronization signal.

40.5 Payload Data Output Format

The Image Data Interface delivers payload data in a common data storage format, as suggested in CSI-2 Specification and described below.

The following sections describe how different data formats are transferred in output bus *csi_data*.

40.5.1 General/Arbitrary Data Reception

In the generic case and for arbitrary data, the first byte of payload data transmitted maps the least significant byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the most significant byte of the 32-bit memory word.

The following Figure illustrates the generic CSI-2 byte to 32-bit memory word mapping rule.

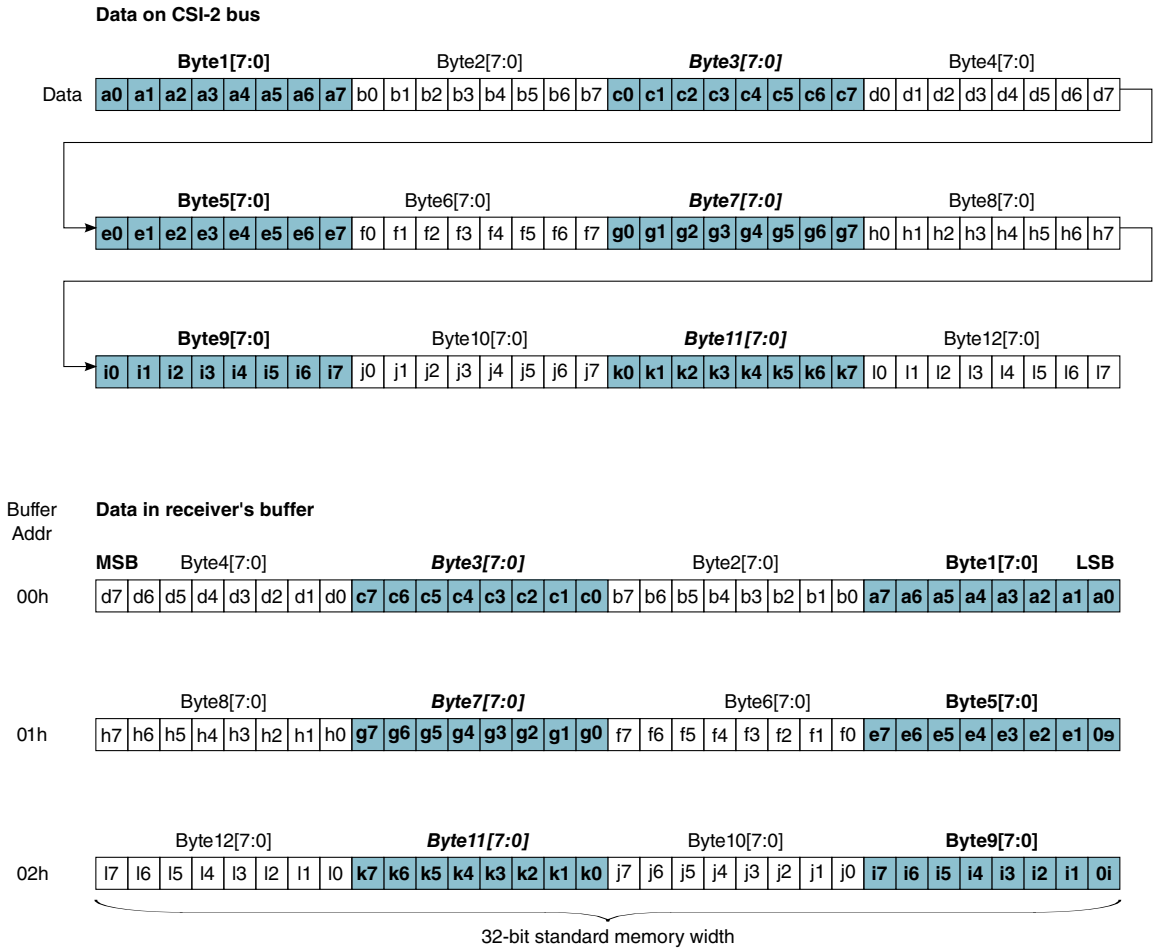

Figure 40-12. General/Arbitrary Data Reception.

40.5.2 RGB888 Data Reception

The RGB888 data format byte to 32-bit memory word mapping follows the generic CSI-2 rule.

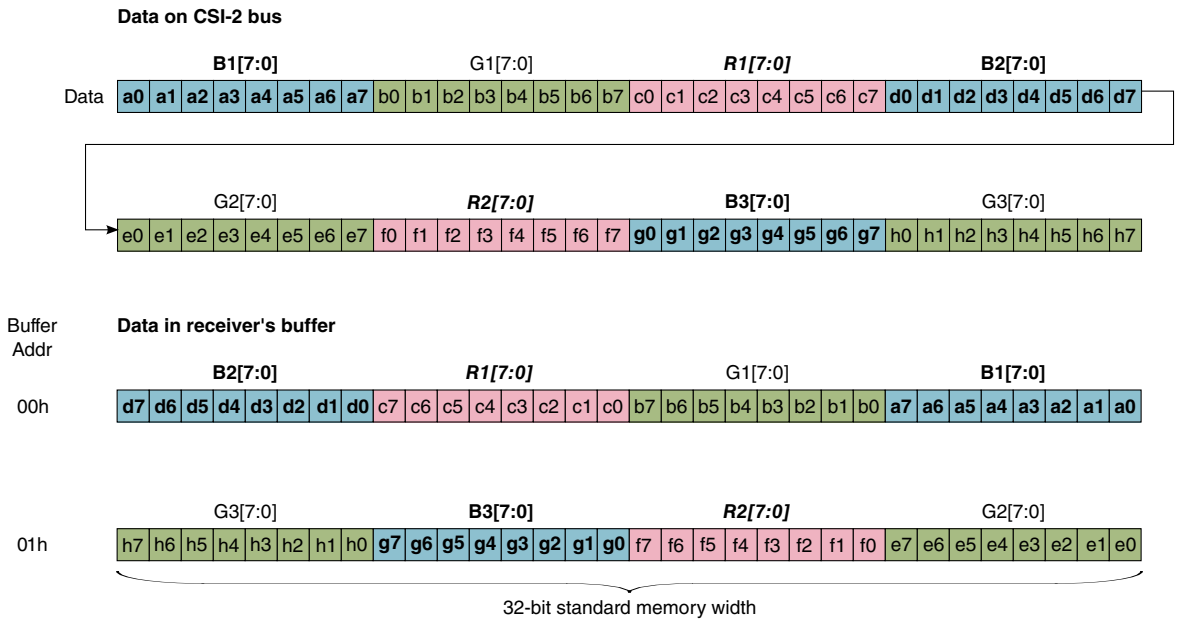

Figure 40-13. RGB888 Data Format Reception.

40.5.3 RGB666 Data Reception

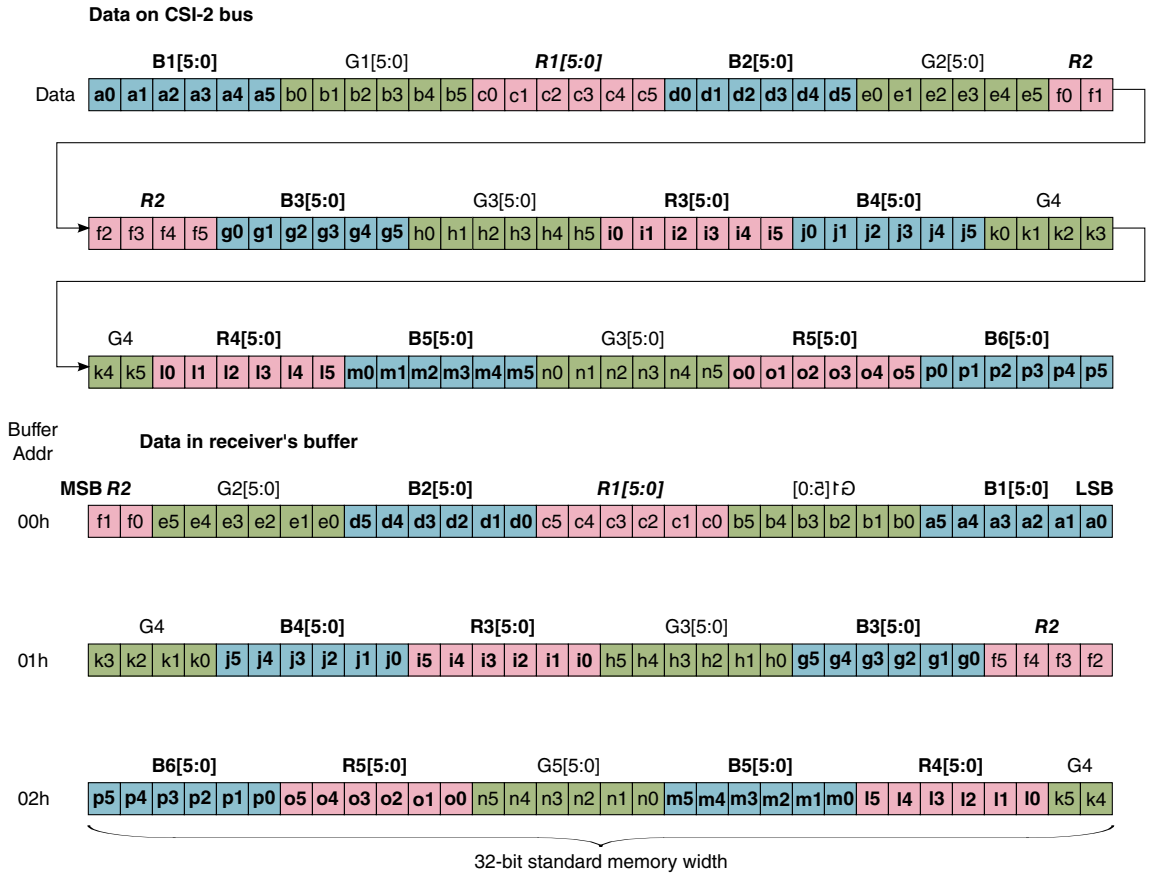

Figure 40-14. RGB666 Data Format Reception.

40.5.4 RGB565 Data Reception

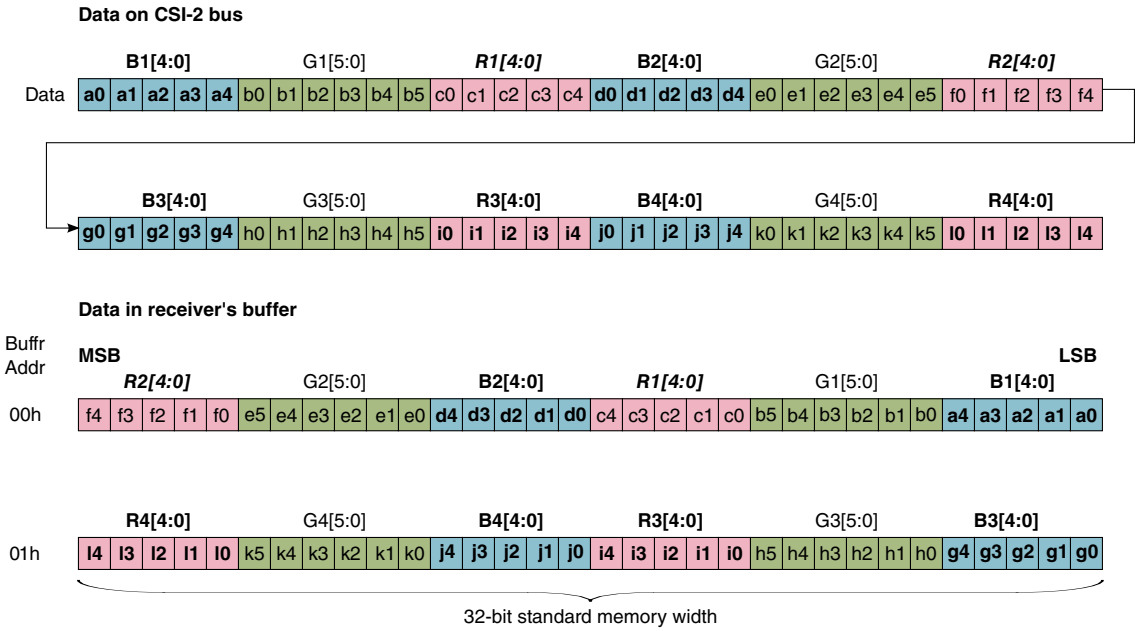

Figure 40-15. RGB565 Data Format Reception.

40.5.5 RGB555 Data Reception

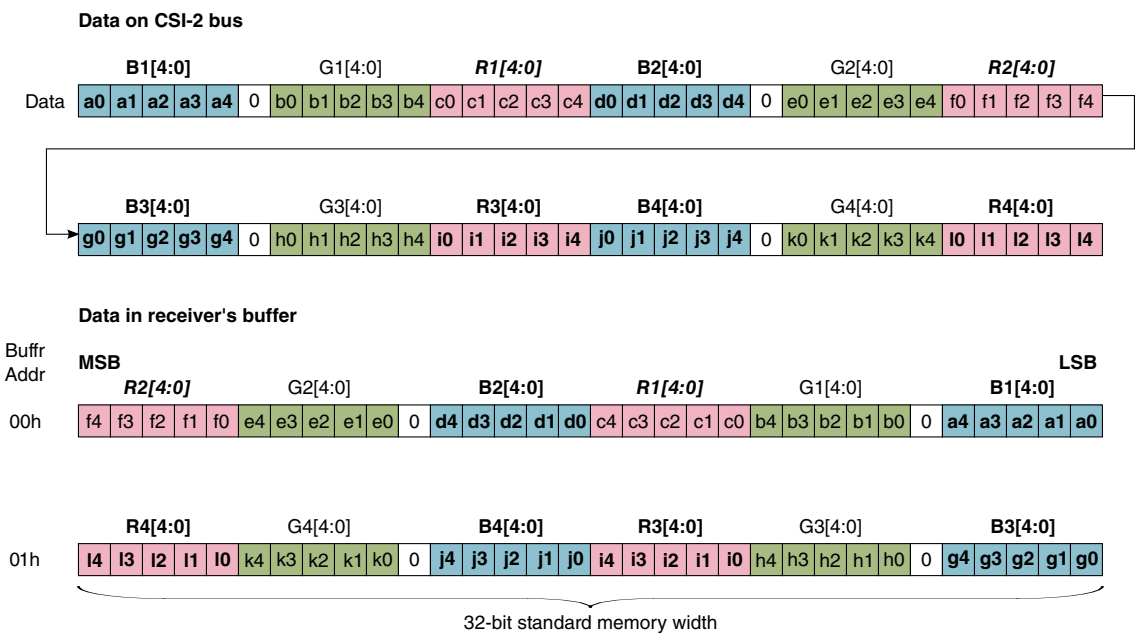

Figure 40-16. RGB555 Data Format Reception.

40.5.6 RGB444 Data Reception

The RGB444 data format byte to 32-bit memory word mapping has a special transform as shown in the following Figure:

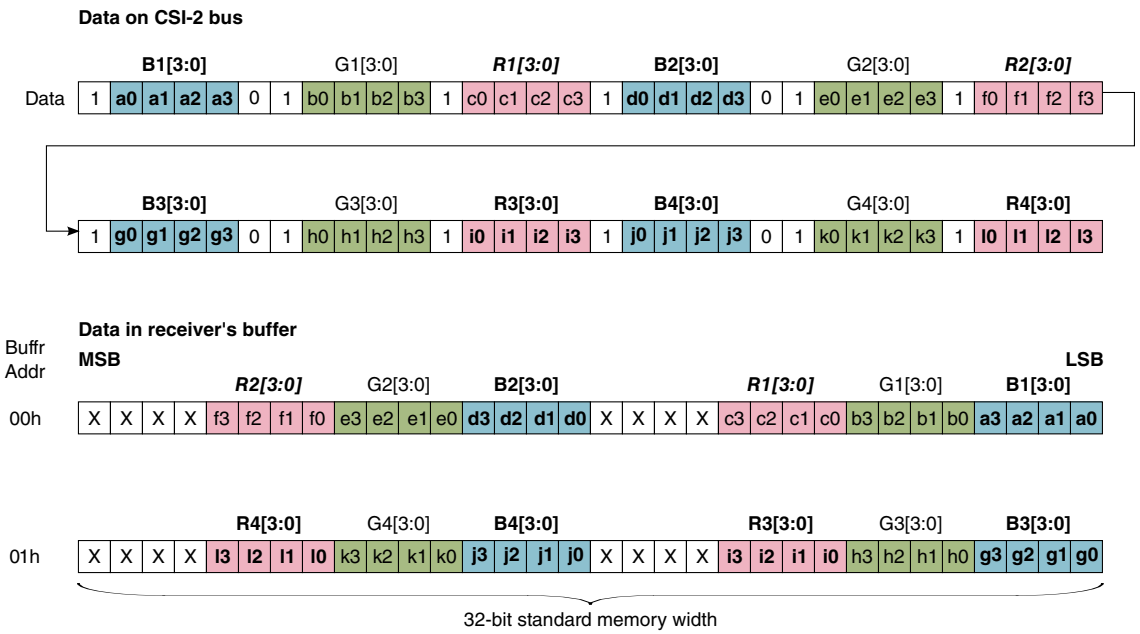

Figure 40-17. RGB444 Data Format Reception.

40.5.7 YUV422 8-bit Data Reception

The YUV422 8-bit data format the byte to 32-bit memory word mapping does not follow the generic CSI-2 rule.

For YUV422 8-bit data format the first byte of payload data transmitted maps the most significant byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the least significant byte of the 32-bit memory word.

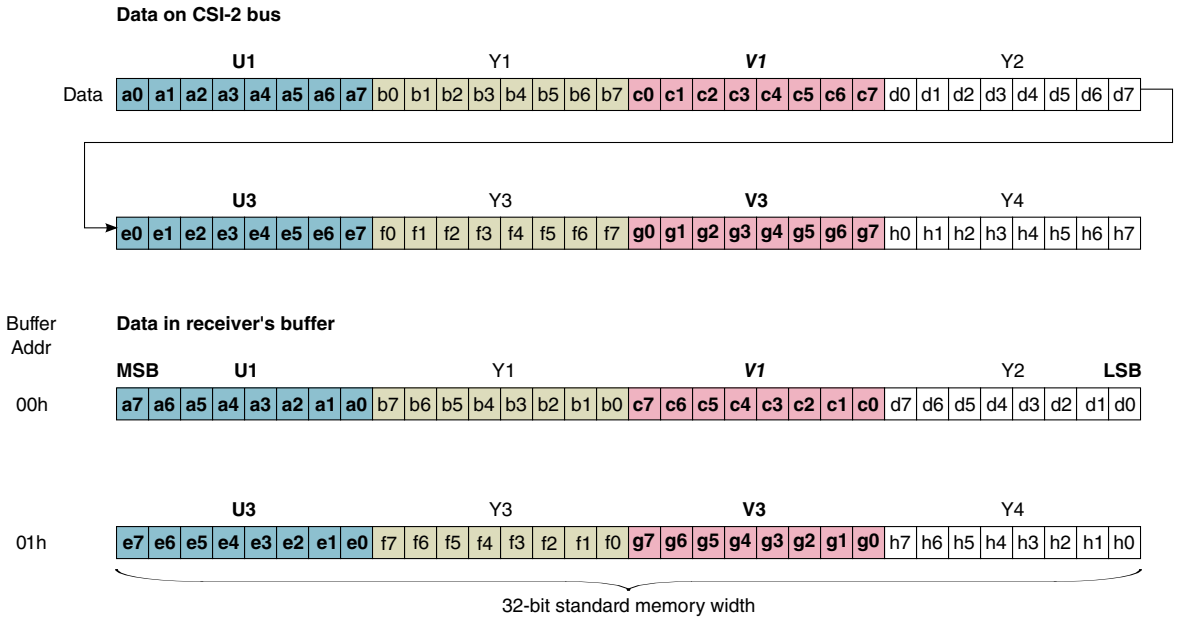

Figure 40-18. YUV422 8-bit Data Format Reception.

40.5.8 YUV422 10-bit Data Reception

The YUV422 10-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

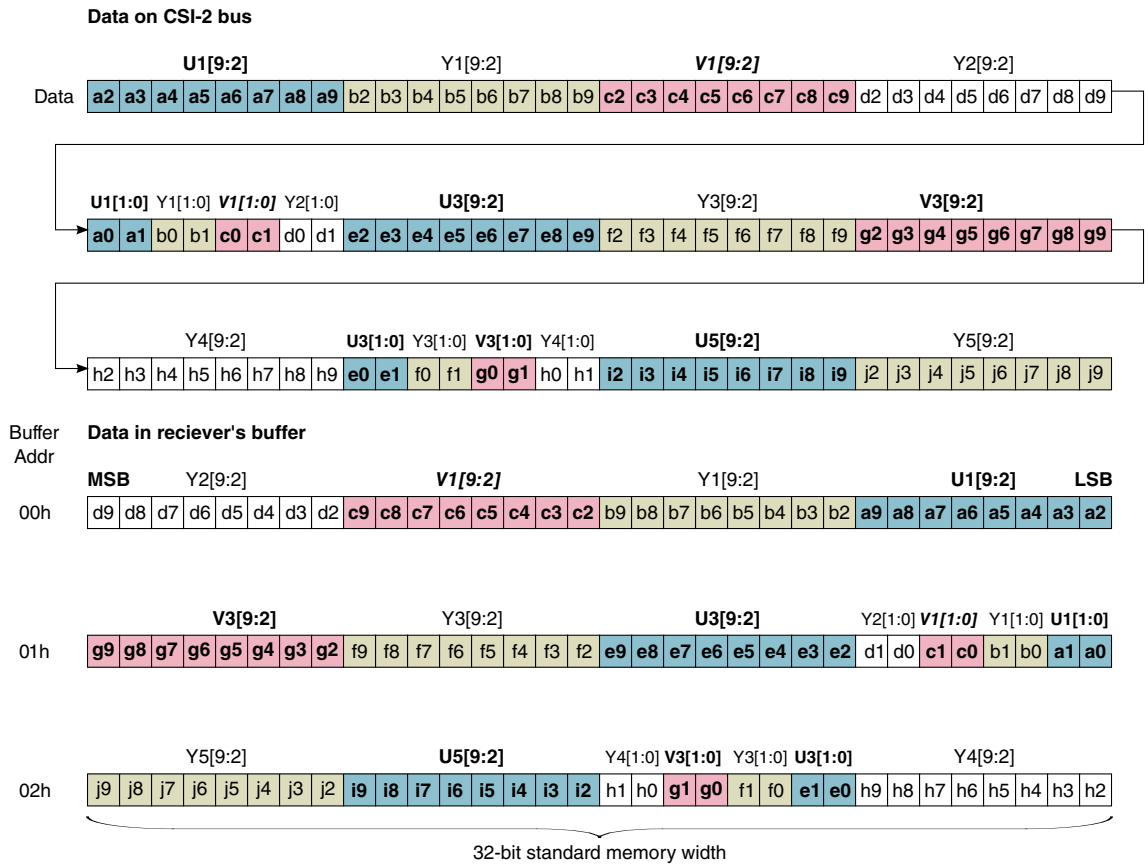

Figure 40-19. YUV422 10-bit Data Format Reception.

40.5.9 YUV420 8-bit (Legacy) Data Reception

The YUV420 8-bit (legacy) data format the byte to 32-bit memory word mapping does not follow the generic CSI-2 rule.

For YUV422 8-bit (legacy) data format the first byte of payload data transmitted maps the MS byte of the 32-bit memory word and the fourth byte of payload data transmitted maps to the LS byte of the 32-bit memory word.

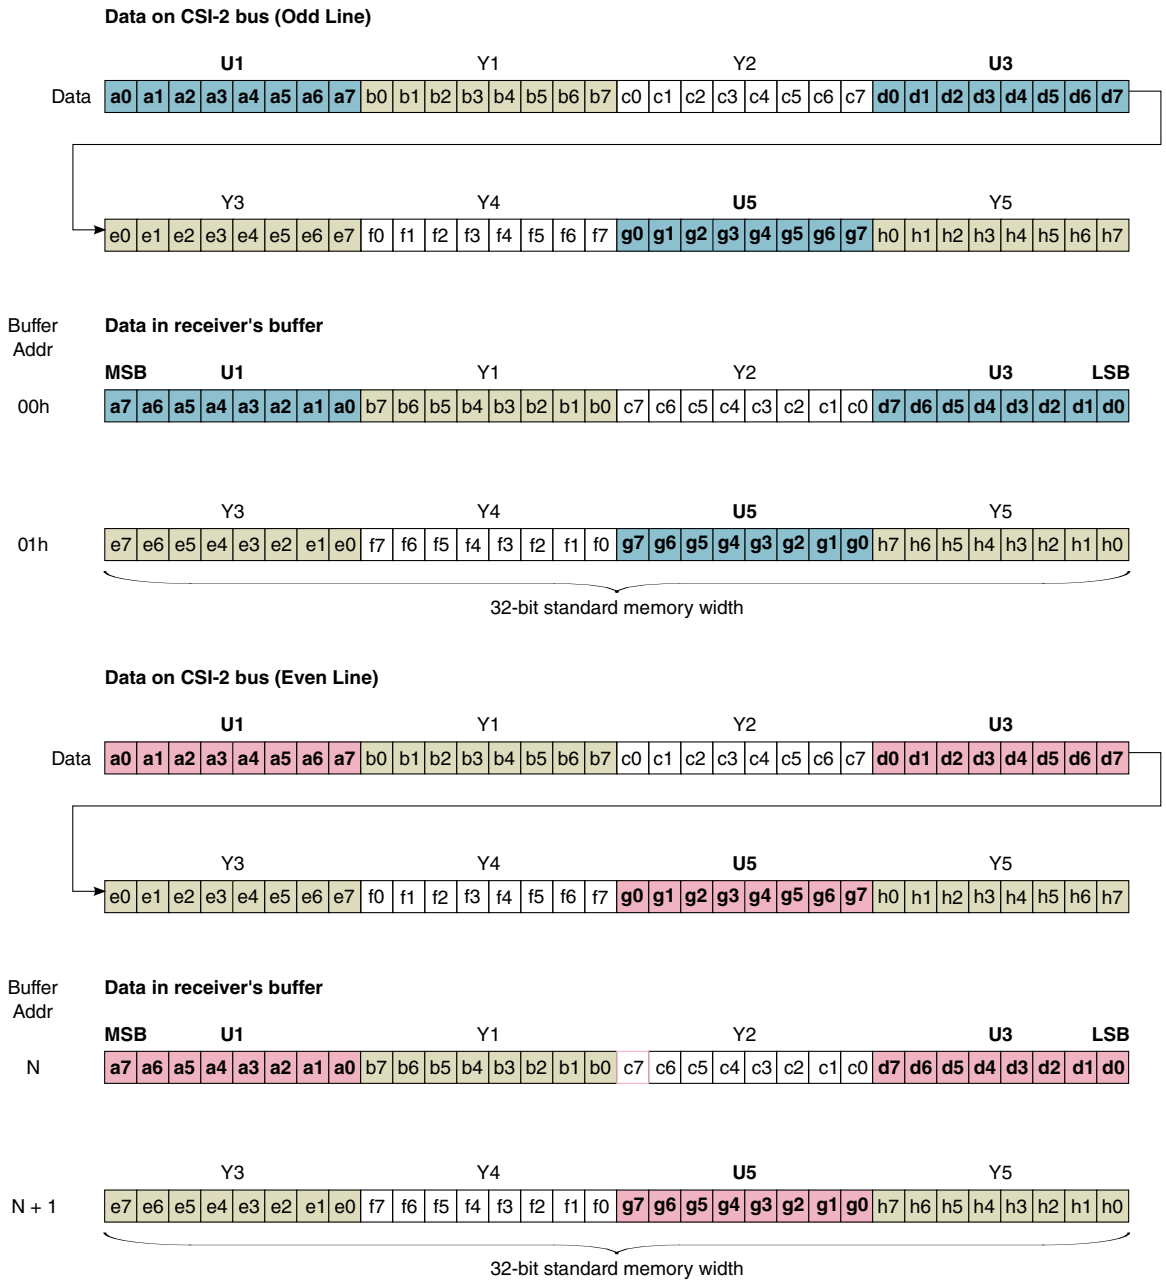

Figure 40-20. YUV420 8-bit Legacy Data Format Reception.

40.5.10 YUV420 8-bit Data Reception

The YUV420 8-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

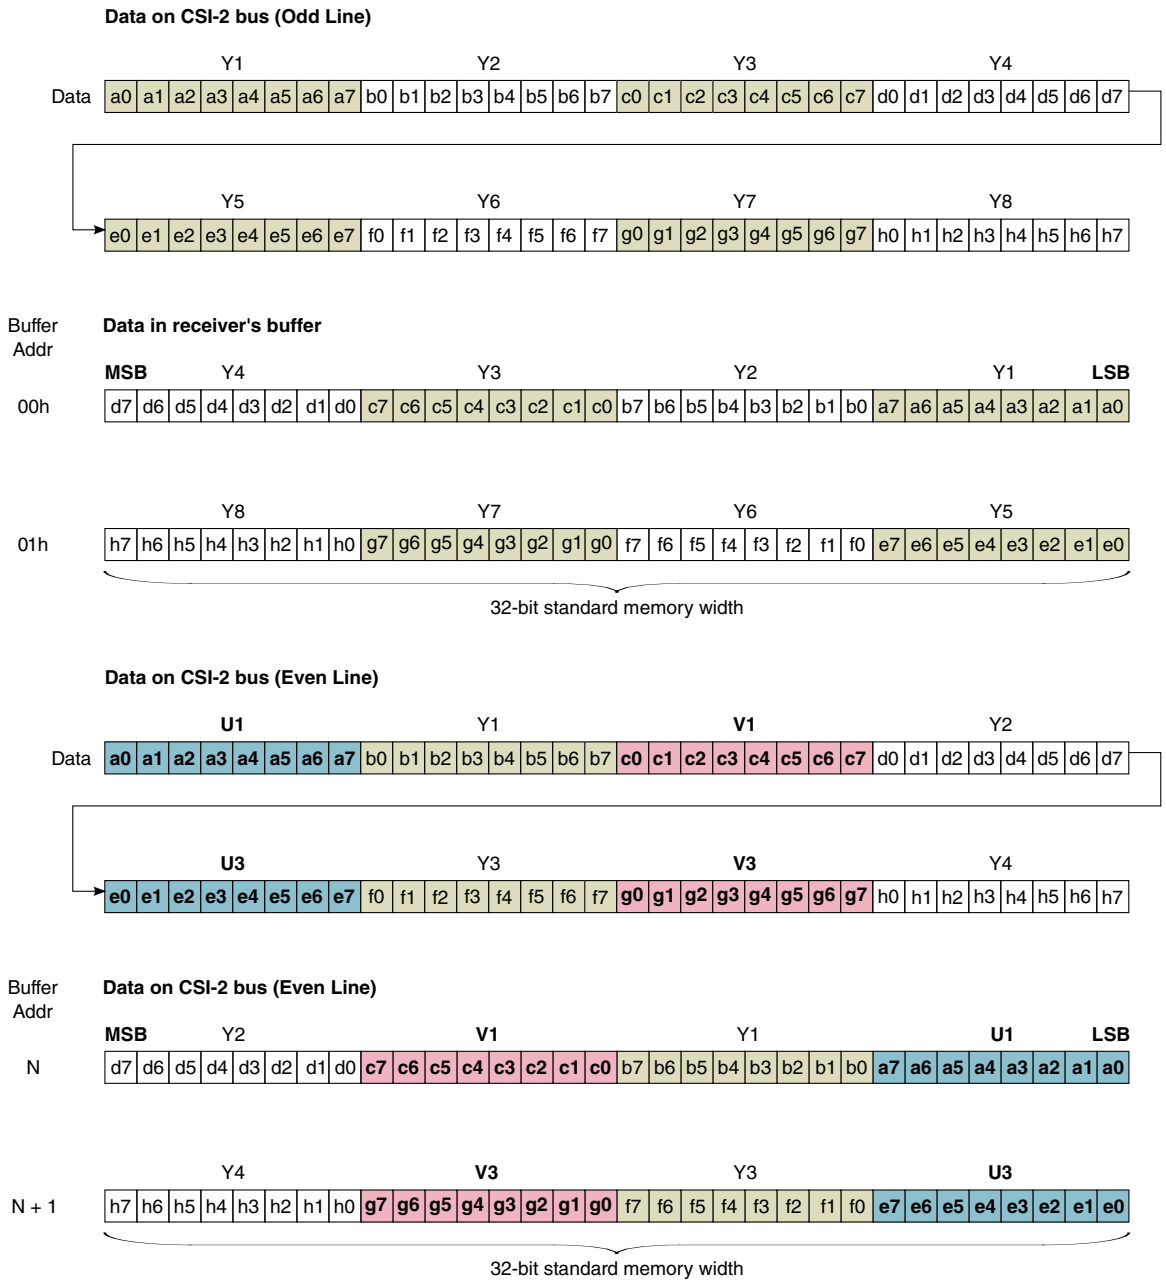

Figure 40-21. YUV420 8-bit Data Format Reception.

40.5.11 YUV420 10-bit Data Reception

The YUV420 10-bit data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

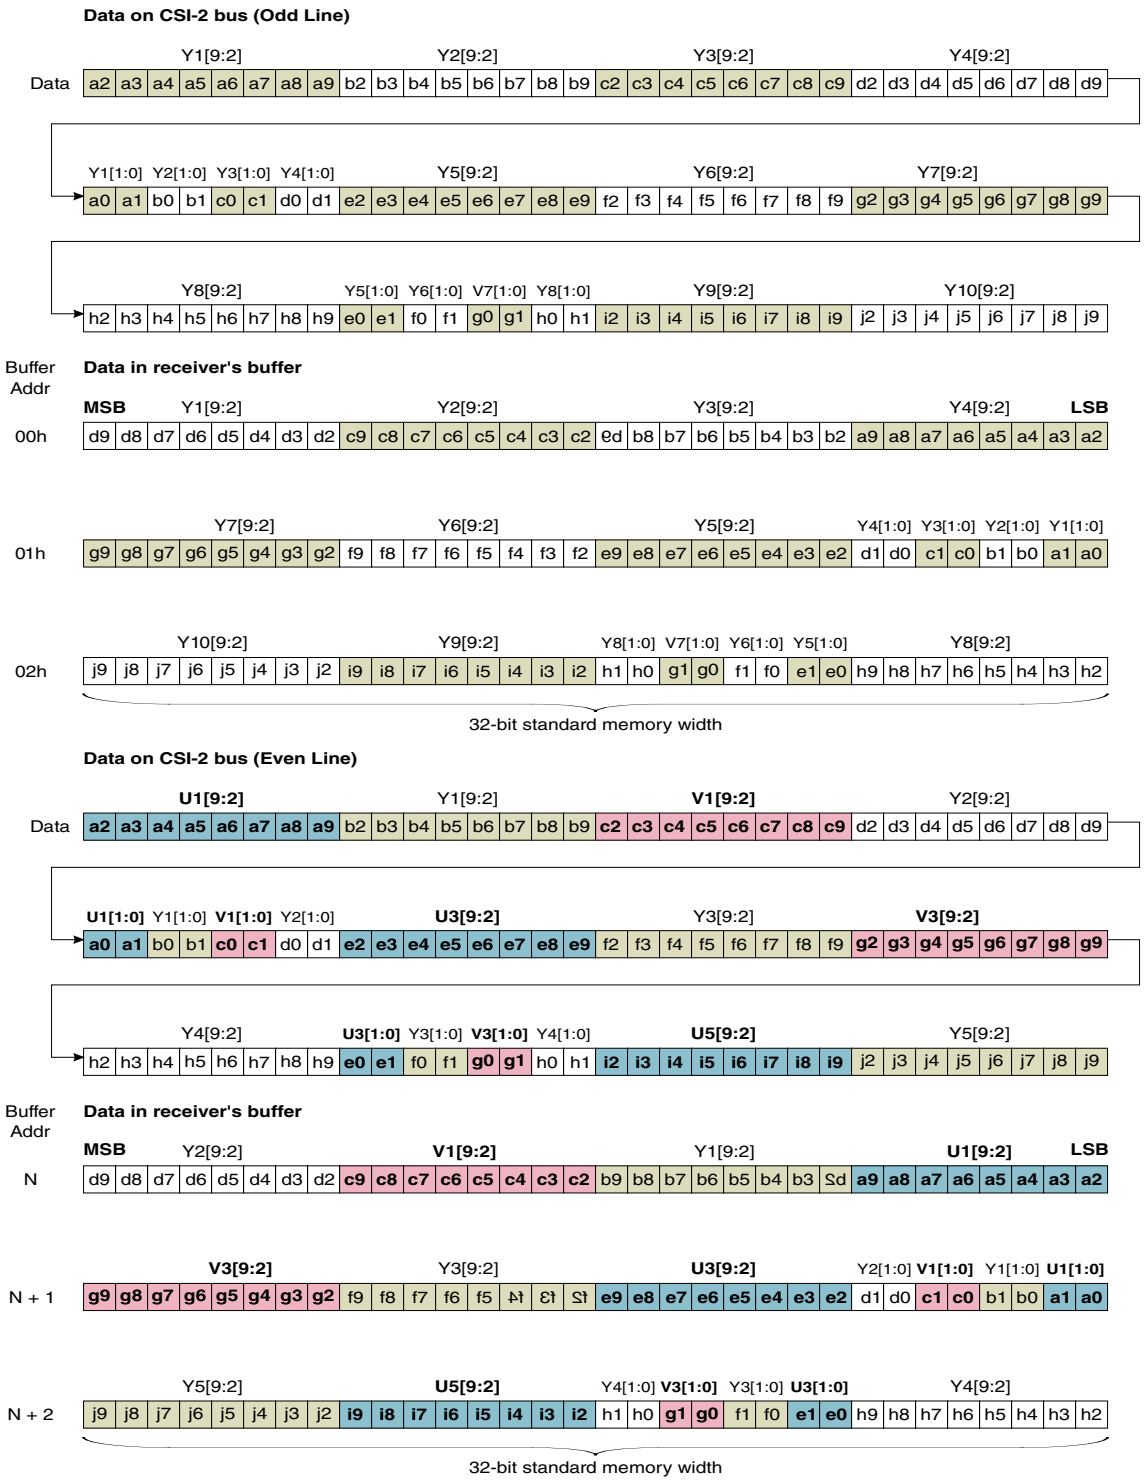

Figure 40-22. YUV420 10-bit Data Format Reception.

40.5.12 RAW6 Data Reception

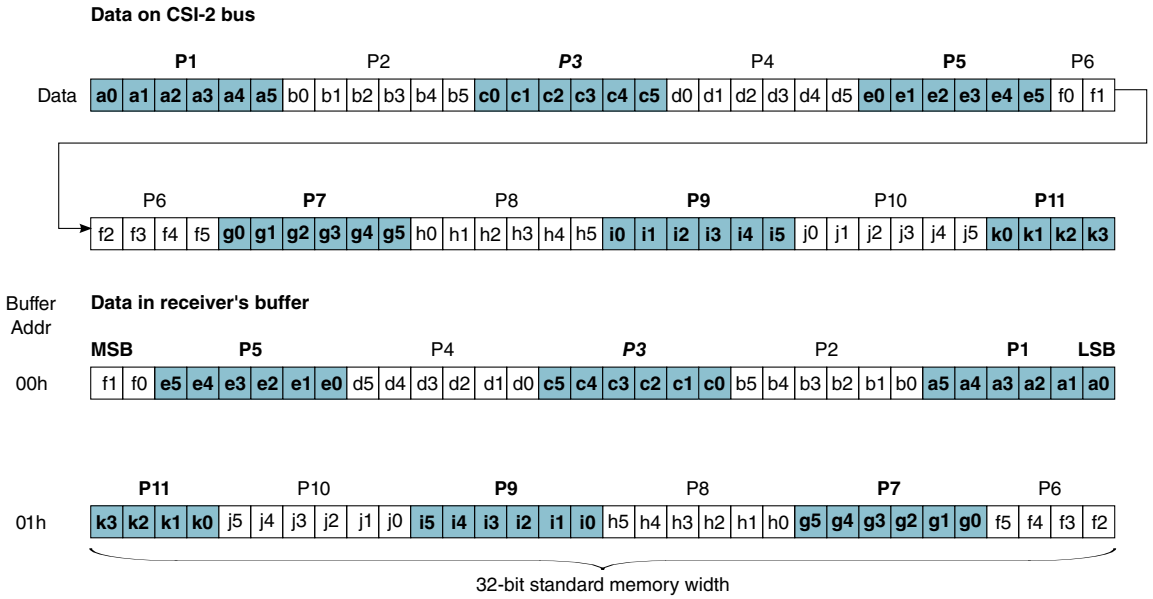

Figure 40-23. RAW6 Data Format Reception.

40.5.13 RAW7 Data Reception

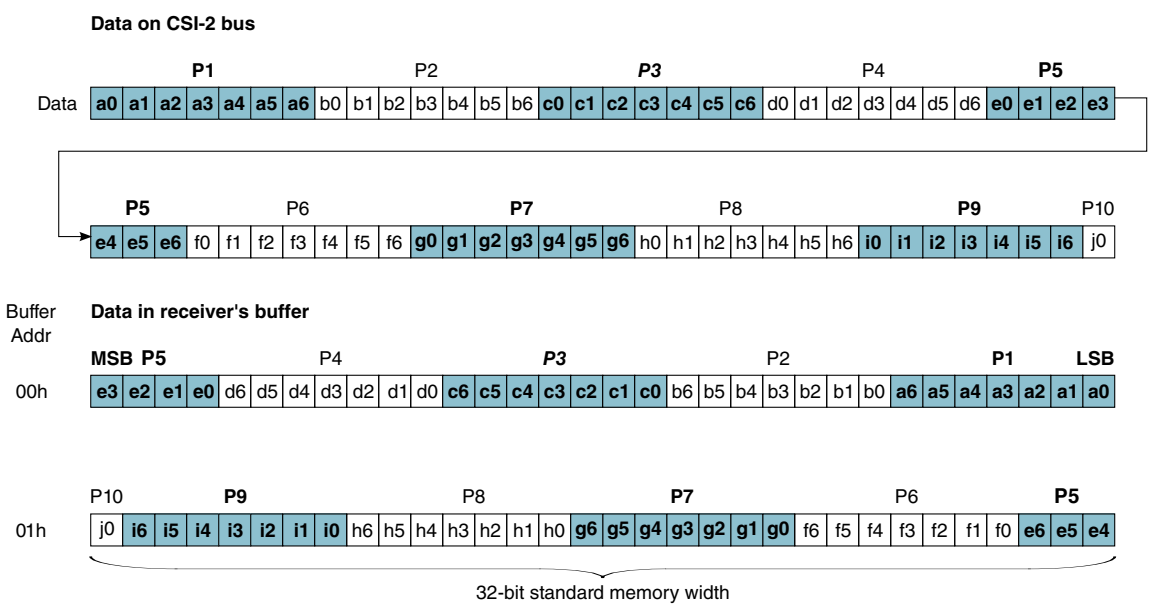

Figure 40-24. RAW7 Data Format Reception.

40.5.14 RAW8 Data Reception

The RAW8 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

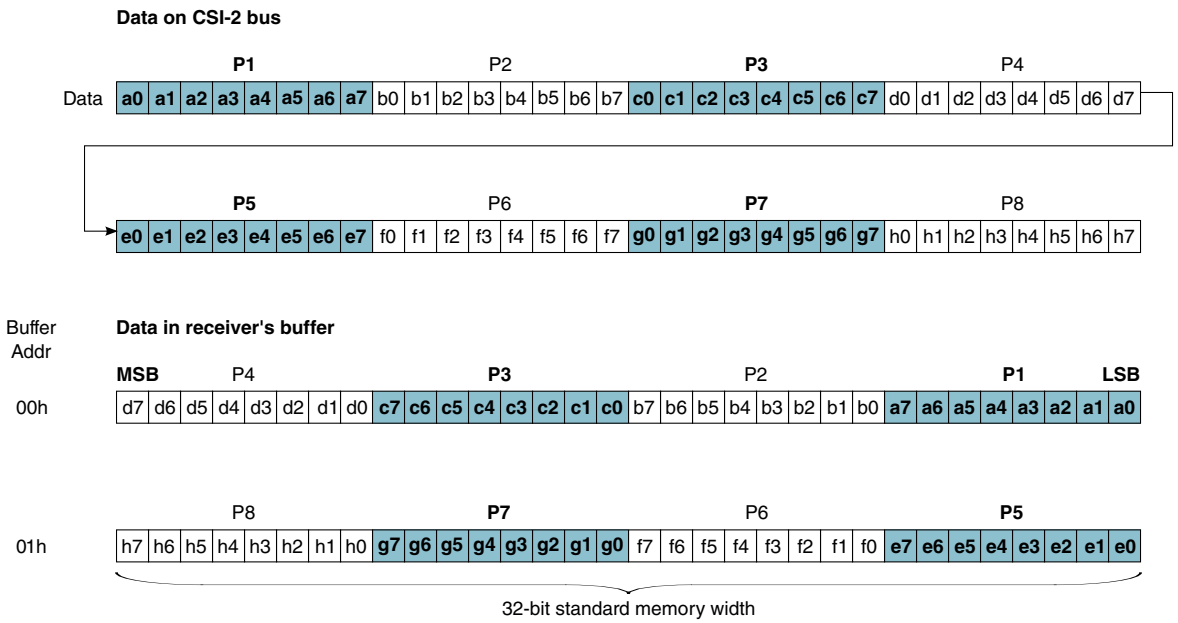

Figure 40-25. RAW8 Data Format Reception.

40.5.15 RAW10 Data Reception

The RAW10 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

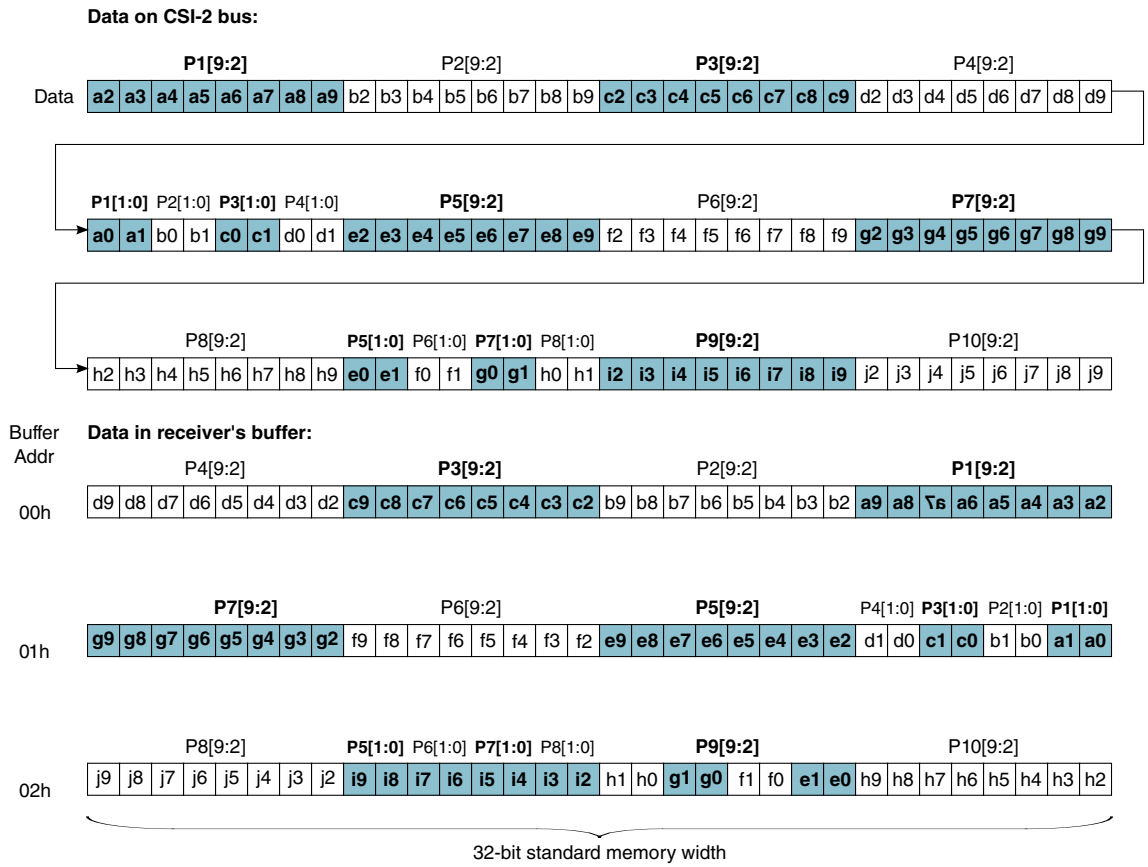

Figure 40-26. RAW10 Data Format Reception.

40.5.16 RAW12 Data Reception

The RAW12 data format the byte to 32-bit memory word mapping follows the generic CSI-2 rule.

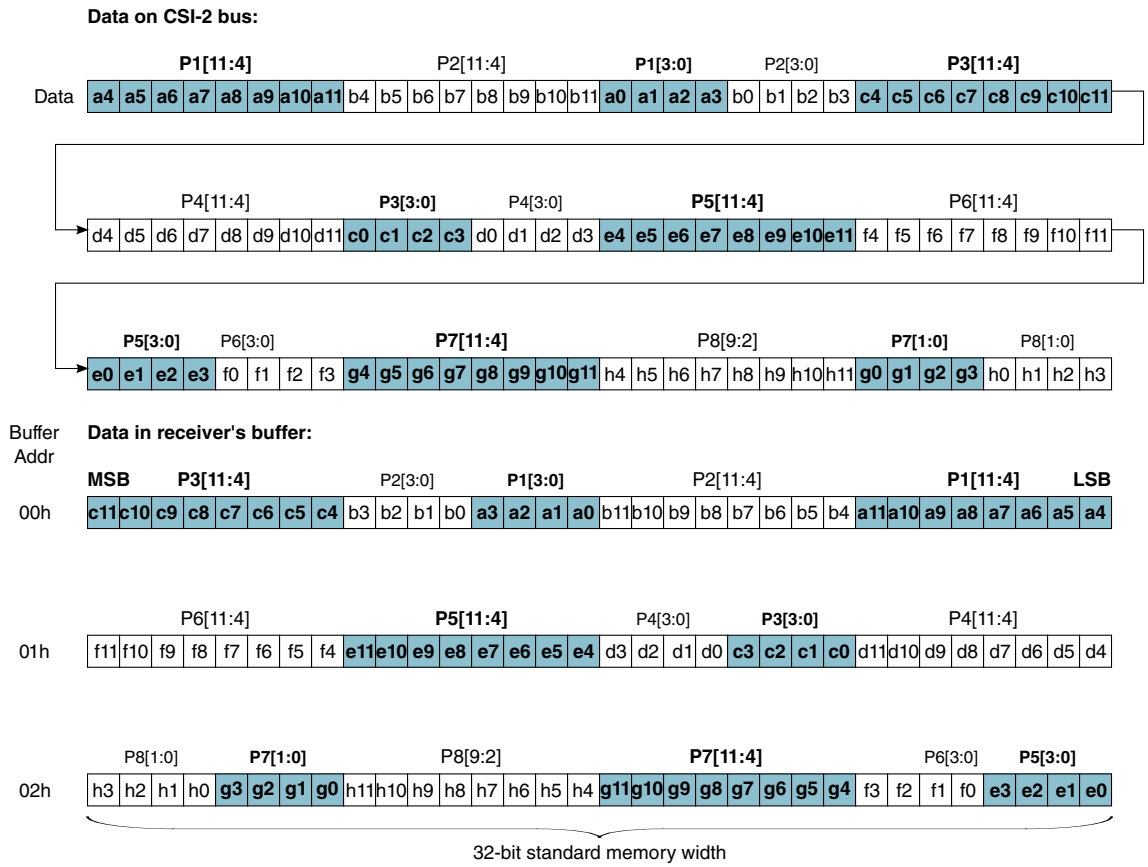

Figure 40-27. RAW12 Data Format Reception.

40.5.17 RAW14 Data Reception

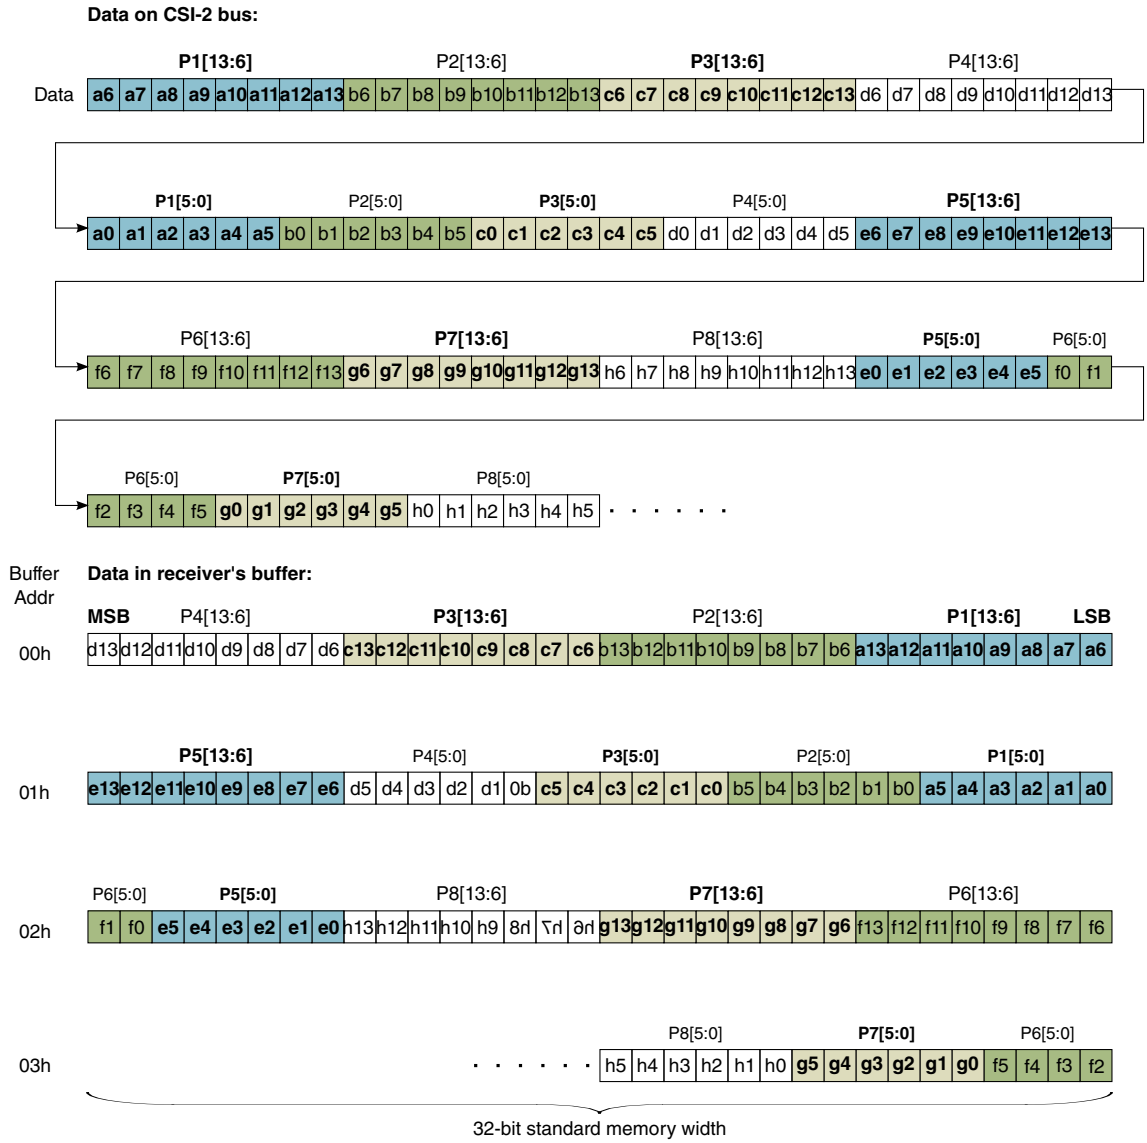

Figure 40-28. RAW 14 Data Format Reception.

40.6 MIPI_CSI Memory Map/Register Definition

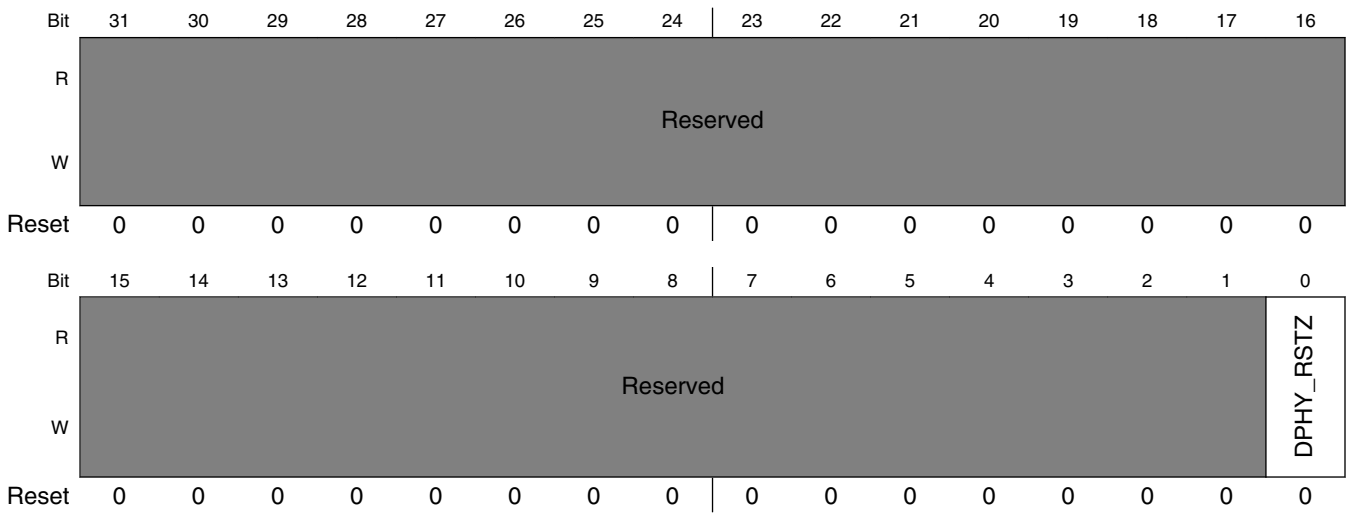
R W	Reserved															PHY_ SHUTDOWNZ
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_CSI_PHY_SHUTDOWNZ field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 PHY_ SHUTDOWNZ	Shutdown input. This line is used to place the complete module in power down. All analog blocks are in power down mode and digital logic is cleared. Active Low **Default Value:** 0

40.6.4 Phy reset control (MIPI_CSI_DPHY_RSTZ)

Address: 21D_C000h base + Ch offset = 21D_C00Ch

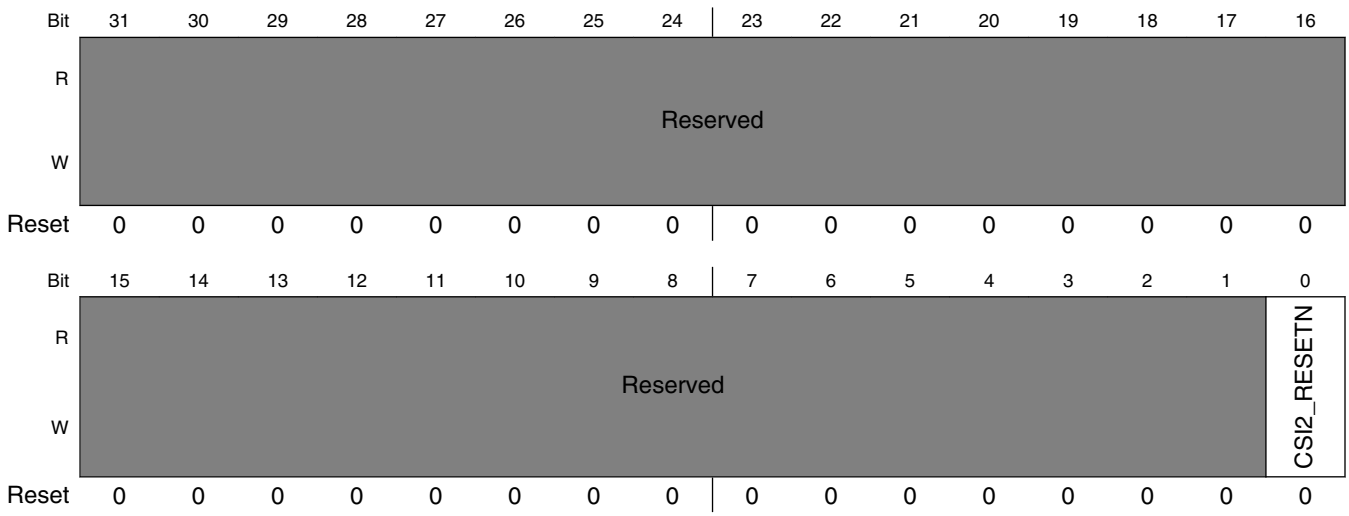


MIPI_CSI_DPHY_RSTZ field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 DPHY_RSTZ	DPHY reset output. Active Low **Default Value:** 0

40.6.5 CSI2 controller reset (MIPI_CSI_CSI2_RESETN)

Address: 21D_C000h base + 10h offset = 21D_C010h

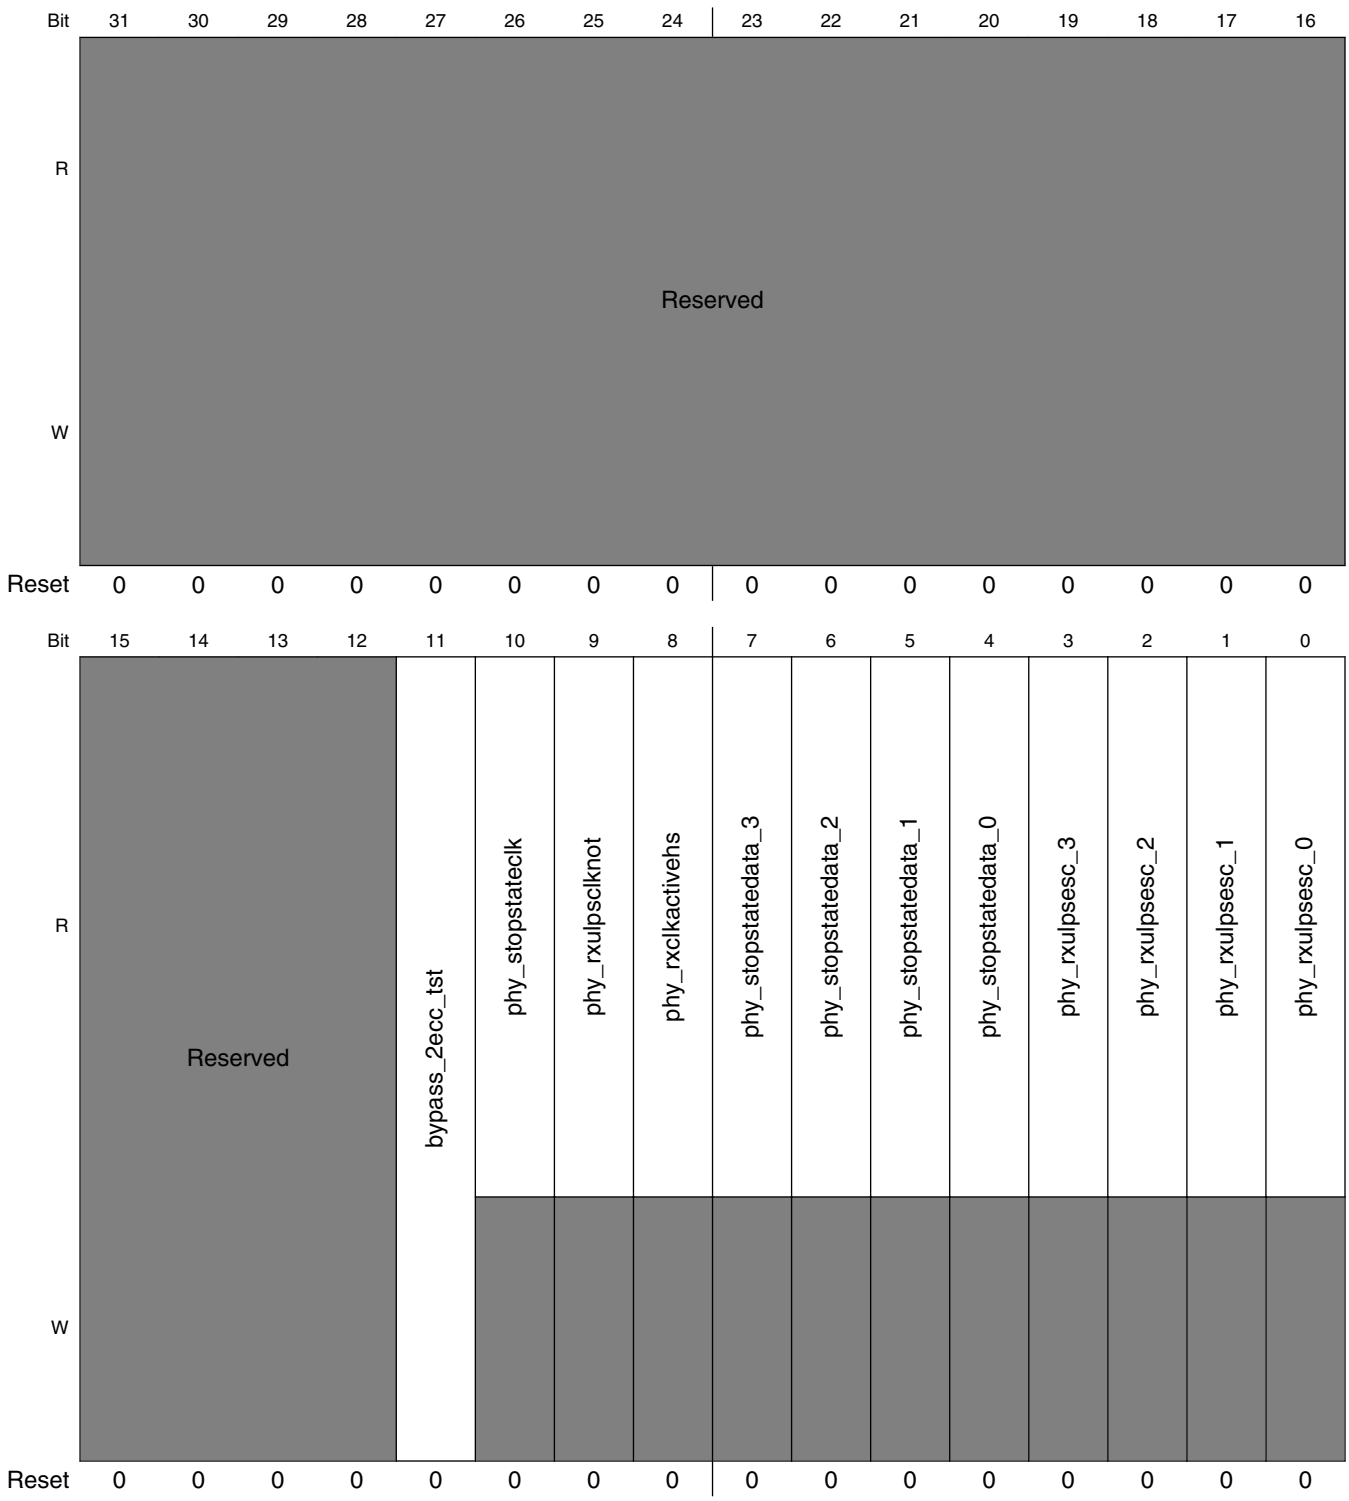


MIPI_CSI_CSI2_RESETN field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 CSI2_RESETN	CSI-2 controller reset output. Active Low **Default Value:** 0

40.6.6 General settings for all blocks (MIPI_CSI_PHY_STATE)

Address: 21D_C000h base + 14h offset = 21D_C014h



MIPI_CSI_PHY_STATE field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 bypass_2ecc_tst	Payload Bypass test mode for double ECC errors **Default Value:** 0
10 phy_stopstateclk	Clock Lane in Stop state **Default Value:** 0
9 phy_rxulpsclknot	Active Low. This signal indicates that the Clock Lane module has entered the Ultra Low Power state **Default Value:** 0
8 phy_rxclkactivehs	Indicates that the clock lane is actively receiving a DDR clock **Default Value:** 0
7 phy_ stopstatedata_3	Data Lane 3 in Stop state **Default Value:** 0
6 phy_ stopstatedata_2	Data Lane 2 in Stop state **Default Value:** 0
5 phy_ stopstatedata_1	Data Lane 1 in Stop state **Default Value:** 0
4 phy_ stopstatedata_0	Data Lane 0 in Stop state **Default Value:** 0
3 phy_rxulpsesc_3	Lane module 3 has entered the Ultra Low Power mode **Default Value:** 0
2 phy_rxulpsesc_2	Lane module 2 has entered the Ultra Low Power mode **Default Value:** 0
1 phy_rxulpsesc_1	Lane module 1 has entered the Ultra Low Power mode **Default Value:** 0
0 phy_rxulpsesc_0	Lane module 0 has entered the Ultra Low Power mode **Default Value:** 0

40.6.7 Data IDs for which IDI reports line boundary matching errors (MIPI_CSI_DATA_IDS_1)

Address: 21D_C000h base + 18h offset = 21D_C018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Chapter 41
MIPI DSI Host Controller (MIPI_DSI)

41.1 Overview

The DSI Host Controller is a digital core that implements all protocol functions defined in the MIPI DSI Specification, providing an interface between the System and the MIPI D-PHY, and allowing communication with a MIPI DSI-compliant Display.

41.2 Features

The MIPI DSI Host Controller supports the following features:

Compliant with MIPI Alliance Specification for Display Serial Interface (DSI), Version 1.01.00 - 21 February 2008;

- Fully Compliant with MIPI Alliance Standard for Display Pixel Interface (DPI-2), Version 2.00 15 September 2005 with Pixel Data bus width up to 24bits
- Compliant with MIPI Alliance Standard for Display Bus Interface (DBI-2) Version 2.00 - 29 November 2005. Supported DBI types are:
  - Type B
  - 16bit, 9bit and 8bit Data bus width
- DBI and DPI interface can coexist but only one is operational
- Support all commands defined in MIPI Alliance Specification for Display Command Set (DCS), Version 1.02.00 - 23 July 2009

Interface with MIPI D-PHY following PHY Protocol Interface (PPI), as defined in MIPI Alliance Specification for D-PHY, Version 1.00.00 - 14 May 2009;

Supports up to 2 D-PHY Data Lanes:

- Bidirectional Communication and Escape Mode Support through Data Lane 0.
- Programmable display resolutions, from 160x120(QQVGA) to 1280x720(XVGA).
- Multiple Peripheral Support capability, configurable Virtual Channels.

- Video Mode Pixel Formats, 16bpp(RGB565), 18 bpp(RGB666) packed, 18 bpp(RGB666) loosely, 24 bpp(RGB888).
- Supports the transmission of all generic commands;
- ECC and Checksum capabilities;
- End of Transmission Packet (EoTp) support;
- Supports ultra low power mode
- Schemes for fault recovery.

41.2.1 System Overview

The DSI Host Controller is a digital core that implements all protocol functions defined in the MIPI DSI Specification, providing an interface between the System and the MIPI D-PHY, allowing the communication with a MIPI DSI compliant Display.

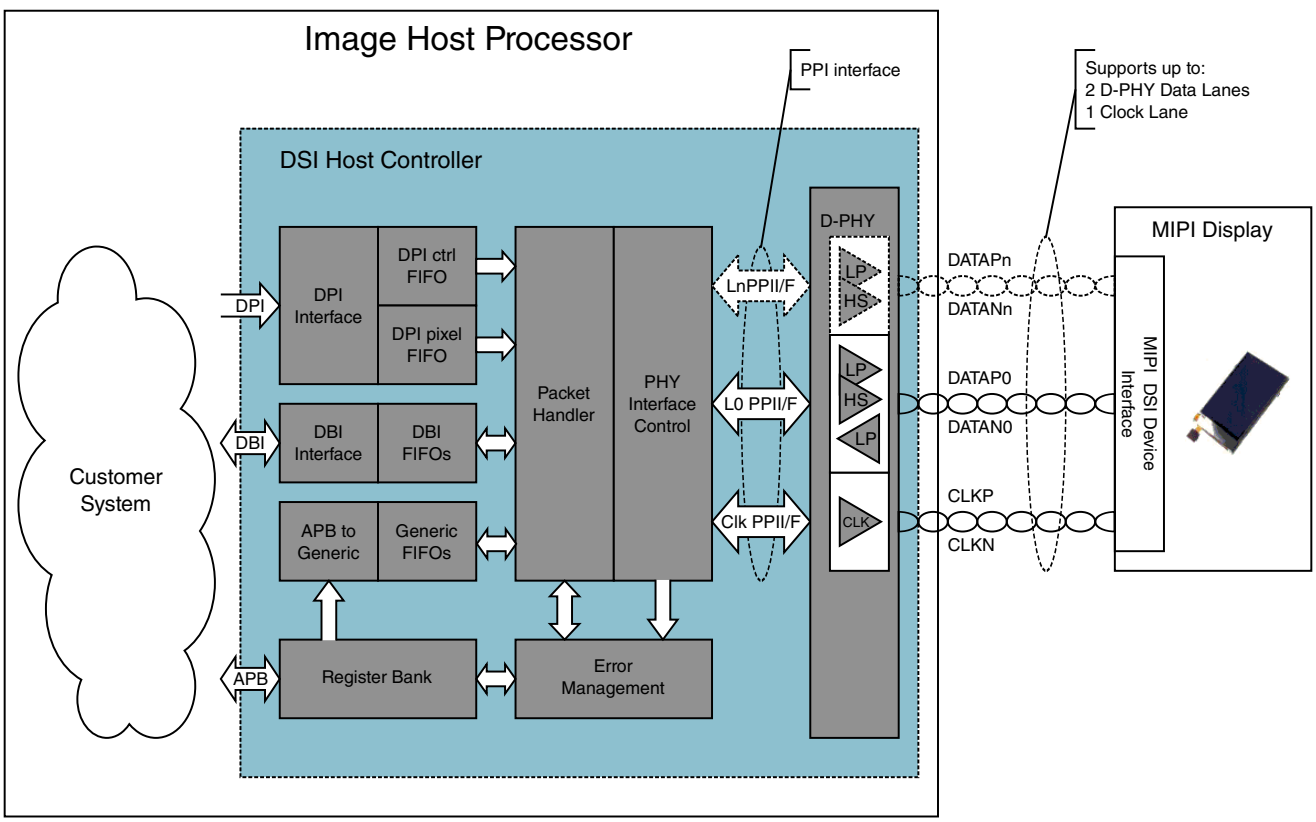

Figure 41-1. Block Diagram.

41.3 Clocks

The table found here describes the clock sources for MIPI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 41-1. MIPI Clocks

Clock name	Clock Root	Description
ac_clk_125m	ahb_clk_root	Bus clock
pixel_clk	axi_clk_root	Pixel clock
cfg_clk	video_27m_clk_root	Configuration clock
ips_clk	ipg_clk_root	Peripheral clock
ips_clk_s	ipg_clk_root	Peripheral access clock
pll_refclk	video_27m_clk_root	Video reference clock (27MHz)

41.4 Architecture

This section describes the DSI Host Controller block interfaces, protocols, functionality, and implementation.

41.4.1 Architecture Overview

The following figure presents the overall architecture of the DSI Host Controller. The main blocks are the following:

DPI interface captures data and control signals from the DPI interface and conveys them in a FIFO for video control signals and another one for the pixel data.

DBI interface encapsulates DCS commands in DSI packets that are then conveyed into command and payload FIFOs. For commands that require a response from the device, the block uses an incoming data FIFO to acquire data from peripheral.

Register Bank is accessible through a standard AMBA-APB slave interface, providing access to the DSI Host Controller registers for configuration and control. There is also a fully programmable interrupt generator to inform the system upon certain events.

PHY Interface Control is responsible for managing the D-PHY PPI interface. It acknowledges current operation and enables LP transmission/reception or a High Speed transmission. It also performs data splitting between available D-PHY Lanes for High Speed transmission.

Packet Handler schedules activity inside the link. It performs several functions based on the interfaces that are currently operational (DPI and/or DBI) and the video transmission mode that is used (burst mode or non-burst mode with sync pulses or sync events). It

builds long or short packet generating correspondent ECC and CRC codes. This block also handles packet reception: Validates packet header by checking ECC, performs header correction for single bit erros and notifies and abort reception for multiple header errors. Depending on the packet type, generic read response or DCS command, route the output data to the respective port (generic or DBI)

APB to Generic block bridges APB operations into FIFOs holding the Generic commands. The block interfaces with 3 FIFOS, a command FIFO, a write payload FIFO and a read payload FIFO.

Error Management notifies and monitors error conditions on the DSI link. It controls timers used to determine if a time out condition occurred and triggers interruption for errors.

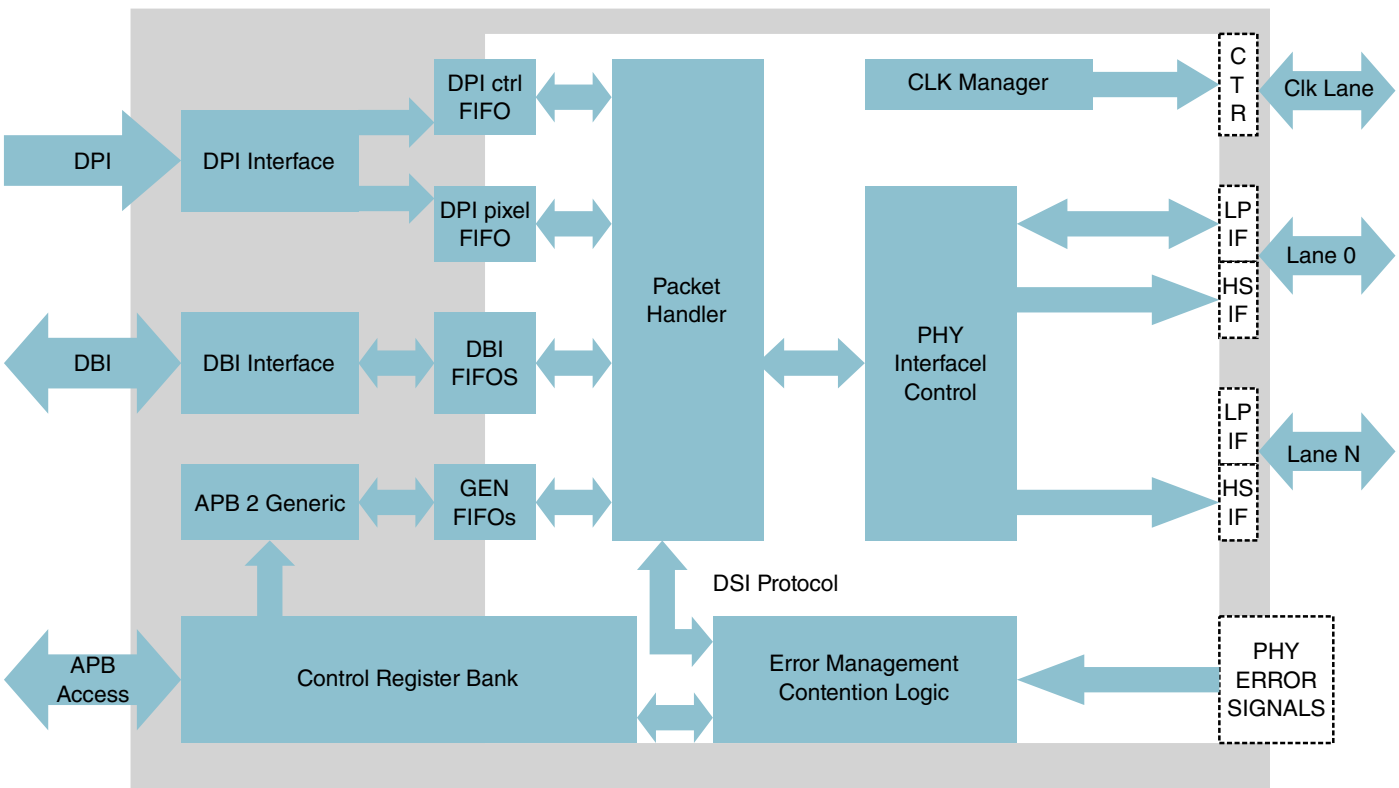

Figure 41-2. DSI Host Controller Architecture

41.4.2 DBI-2 interface

The DBI-2 interface encapsulates DCS commands in DSI packets to be transmitted through the D-PHY link. Some commands require a response from the device and the interface provides read data from the device/peripheral.

The support DBI types is Type B interface

The selection type maps the related pins on the DSI core pinout. DBI interface used RGB additive color mixing method and the pixel data format is selected on register DBI_CFG register. The field **in_dbi_conf** defines the input pixel data format and field **out_dbi_conf** defines the output pixel data that is determined by the display device. This interface needs to be associated with a particular DSI Virtual Channel that is programmed on field **dbi_vid**.

The following figures show how the pixel to byte conversion is done for each mode. All the diagrams are representing the case were the interface is working as type B.

The DBI interface type B signals list .

DBICSX: Chip select, it is low active .

DBIRDX: Read signal, the read data should be captured at the DBIRDX rising edge .

DBIWRX: Write signal, the write data will be switch at DBIWRX falling edge.

DBIDATIN[15:0]: Write data

DBIDCX: Data commnad select, Data is indicated when high and command is indicated when low .

DBITE: Tearing effect.

DBI interface receives commands and decodes information for the command packetizing format. Depending on the command type, DSI core output the related DSI packet type (DCS short write packet; DCS read packet or DCS long write). If the DCS commands have variable size this needs to be configured on the DBI_CMDSIZE register. The following table presents DCS packet types:

Table 41-2. DSI packet types for DCS commands

DCS command	Command ID	DCS parameter	DSI packet type
enter_idle_mode	0x39h	0	6'h05
enter_invert_mode	0x21h	0	6'h05
enter_normal_mode	0x13h	0	6'h05
enter_partial_mode	0x12h	0	6'h05
enter_sleep_mode	0x10h	0	6'h05
exit_idle_mode	0x38h	0	6'h05

set_column_address	0x2Ah	4	6'h39
set_page_address	0x2Bh	4	6'h39
set_partial_area	0x30h	4	6'h39
set_scroll_area	0x33h	6	6'h39
write_LUT	0x2Dh	N	6'h39
write_memory_continue	0x3Ch	N	6'h39
write_memory_start	0x2Ch	N	6'h39
get_address_mode	0x0Bh	1(read)	6'h06
get_blue_channel	0x08h	1(read)	6'h06
get_diagnostic_result	0x0Fh	1(read)	6'h06
get_display_mode	0x0Dh	1(read)	6'h06
get_green_channel	0x07h	1(read)	6'h06
get_pixel_format	0x0Ch	1(read)	6'h06
get_power_mode	0x0Ah	1(read)	6'h06
get_red_channel	0x06h	1(read)	6'h06

Table continues on the next page...

Table 41-2. DSI packet types for DCS commands (continued)

DCS command	Command ID	DCS parameter	DSI packet type
get_scan_line	0x45h	2(read)	6'h06
get_signal_mode	0x0Eh	1(read)	6'h06
read_DDB_continue	0xA8h	n(read)	6'h06
read_DDB_start	0xA1h	n(read)	6'h06
read_memory_continue	0x3Eh	n(read)	6'h06
read_memory_start	0x2Eh	n(read)	6'h06

All packets that have 1 or 0 parameters index to the command are considered short packet and all other shall be considered long packets.

There are several register fields to configure DBI input pixel data and DBI pixel data retrieval. It is required to have prior knowledge of display supported feature to avoid incorrectly core configuration. Some guidelines are presented below to clarify how core uses the configuration for its operation.

Field **in_dbi_conf** in register DBI_CFG configures the color depth and the pixel format used by the input interface. Field **out_dbi_conf** configures the colour depth and the pixels format used by the output interface. Here the colour depth is directly related with formats supported by the peripheral. If the peripheral returns pixel data with a specific colour depth this colour depth should be consistent with the register configuration. If this is not respected, the byte to pixel converter will use an incorrect pixel mapping and it will corrupt output data.

Field **out_dbi_conf** should not be programmed for a higher number of interface pins than **in_dbi_conf**. As an example an incorrect pin configuration happens if **in_dbi_conf** defines 9 bit interface and **out_dbi_conf** defines 16 bit since pins 16 to 10 will not be available.

Field **lut_size_conf** configures the size of the DCS write_LUT command; this command will program the peripheral's colour space conversion table. This register is directly related with the capabilities of the peripheral. If the peripheral supports a colour depth of 16/18/24 bits per pixel it is expected that this register is configured for 48/128/192 bytes respectively. These coefficients should be loaded to the peripheral before normal operation of pixel data transmission is started. The DCS specification only refers to the conversion of formats equal or above 12bpp. This means that any format outside this scope might not be convertible to a higher colour depth mode by the peripheral. Taking this in consideration, when **in_dbi_conf** selects a colour depth below 12bpp, the **out_dbi_conf** should be configured such that colour depth has not a higher value. As an example, if **in_dbi_conf** is configured for 8bits/8bpp interface and **out_dbi_conf** is configured for 8bits/12bpp, this results in an incorrect configuration because the DCS

specification does not contemplates conversions from 8bpp to 12bpp. This configuration is possible inside the core but might lead into incorrect results. Nevertheless it is left for the system to configure these registers according with the desired operation.

For Read back commands the DBI specification states that the reading process does not use any acknowledge mechanism to know that the requested data is ready. There are mechanisms for the system to get this information by polling the Command Status Register CMD_PKT_STATUS. This register, besides other information, contains the status on the DBI read back payload FIFO and also contains a special busy flag **dbi_rd_cmd_busy** that can be used to understand if the read command is complete. By using the DBI read back FIFO status bits that report if the FIFO is full or empty the processor can read these bits to understand if it can read another byte/sample from the interface (probing the empty flag) or when it should stop reading bytes/samples from the interface. In addition, the Read Command Busy flag is asserted when a read command is issued by the interface and cleared once the reading process ends and the read data is fully stored inside the read back FIFO. The system needs to issue the read command and then periodically probe this status bit to acknowledge if the read back operation is complete. Once this information is available the system can assume that the entire data is stored inside the read back FIFO and the interface can deliver all the desired data.

41.4.3 DPI-2 Interface

The DPI-2 interface captures data and control signals and conveys them to FIFO interfaces that will transmit them to the DSI link. Two different streams of data are presented at the interface: video control signals and pixel data. Depending on the interface color coding, the pixel data is handled differently throughout the dpipixdata bus.

Interface pixel color coding is presented in the table below.

Table 41-3. DPI interface pixel color coding mapping.

Signal Line	16-bit			18-bit		24-bit
	Config1	Config2	Config3	Config1	Config2	
D23	Not used	Not used	Not used	Not used	Not used	R7

D1	B1	B1	B0	B1	B1	B1
D0	B0	B0	Not used	B0	B0	B0

The DPI interface can be configured to increase flexibility and promote correct usage of this interface for several systems. These configuration options are described below:

- Polarity control. All the control signals are programmable to change polarity according to system requirements.
- After core reset, DPI waits for the first VSYNC active transition to start signals sampling, including pixel data and preventing image transmission in the middle of a frame.
- If interface pixel color coding is 18 bits and the 18 bit loosely packet stream is enabled, the number of lines programmed in the pixels per lines configuration is a multiple of four. This means that in this mode the 2 LSB in the configuration will be always inferred as zero. Specification states that in this mode the pixel line size should be a multiple of 4.
- To avoid pixel underflows and overflows the configured number of pixel will originate the respective memory spaces. This will happen even if the dpidataen pin is active during more or less time than necessary.
- In order to keep the memory organized in respect to the packet scheduling the number of pixels per packet parameter will be used to separate the memory space of different video packets.

For the **dpishutd** and **dpicolorm** sampling and transmission the DPI video signalling must be active. This means that if video signals like VSYNC and HSYNC are not being actively generated the DPI commands these are not transmitted through the DSI link. The

DSI commands packets have the highest priority in the class of Non Video packets. Because of such constraint and in order for commands to be correctly transmitted, the first VSYNC active pulse needs to happen for the commands sampling and transmission. When shutting down the display, it is necessary for DPI video to keep active for one frame after the command being issued. This guarantees that the commands are correctly transmitted before actually disabling the Video generation in the DPI interface.

41.4.4 Error control and timeout timers

The DSI host controller implements a set of timers and conditions to notify errors.

The core has a set of registers to control the timers that will be used to determine if a time out has occurred. It also contains a set of interruption status registers that are cleared upon read operation. These registers also trigger an interruption pin that can be used by the system to act upon an error within the DSI connection.

41.4.5 Timeout timers

Bit **to_hs_tx** on register ERROR_ST1 is set when a High Speed Transmission Time Out occurs rising an interrupt pin.

The time out is configured in **hstx_to_cnt** field of register TO_CNT_CFG. A 16 bit counter measures the time when High Speed is active. If that counter reaches the value defined by register **hstx_to_cnt**, bit **to_hs_tx** is asserted.

Bit to_lp_rx on register ERROR_ST1 is set signaling contention detection when a Low Power Reception Time Out occurs rising an interrupt pin. The time out is configured in **lprx_to_cnt** field of register TO_CNT_CFG. A 16 bit counter measures the time when Low Power reception is active. If that counter reaches the value defined by register **lprx_to_cnt**,bit **to_lp_rx** is asserted.

Time units for this 16bit counters are configured in cycles defined in **TO_CLK_DIVISION** field in register CLKMGR_CFG. The value written to **TO_CLK_DIVISION** defines the time unit for the Time out limits using Lane byte clock as input. This mechanism increases the range to define these limits.

41.4.6 Error control

Two registers ERROR_ST0 and ERROR_ST1 are associated with error condition reporting. This resister can trigger interrupt pins to inform the system about the occurrence of errors.

The coreConsultant GUI allows different interrupt pin configuration that can support:

- No interrupt pin on DSI core for notification of error although system can check for error by reading error status registers ERROR_ST0 and ERROR_ST0.
- DSI core has one interrupt pin interrupt that is set High when an error occurs either in register ERROR_ST1 or ERROR_ST2.
- DSI core has 2 interrupts associated with each error status register. Pins interrupt0 and interrupt1 are respectively associated with ERROR_ST1 and ERROR_ST2. This mechanism allows faster association of interrupts with the status register that generated the error.

The triggering of the interrupt pins, when defined, can be masked by programming the mask registers ERROR_MSK0 and ERROR_MSK1. When any bit of this registers is set to 1 it will inhibit the interrupt for that specific error. Nevertheless the error bit will always be set on the respective ERROR_ST register. Registers ERROR_ST1 and ERROR_ST2 are always cleared when read.

The figure below illustrates the location of some of the errors.

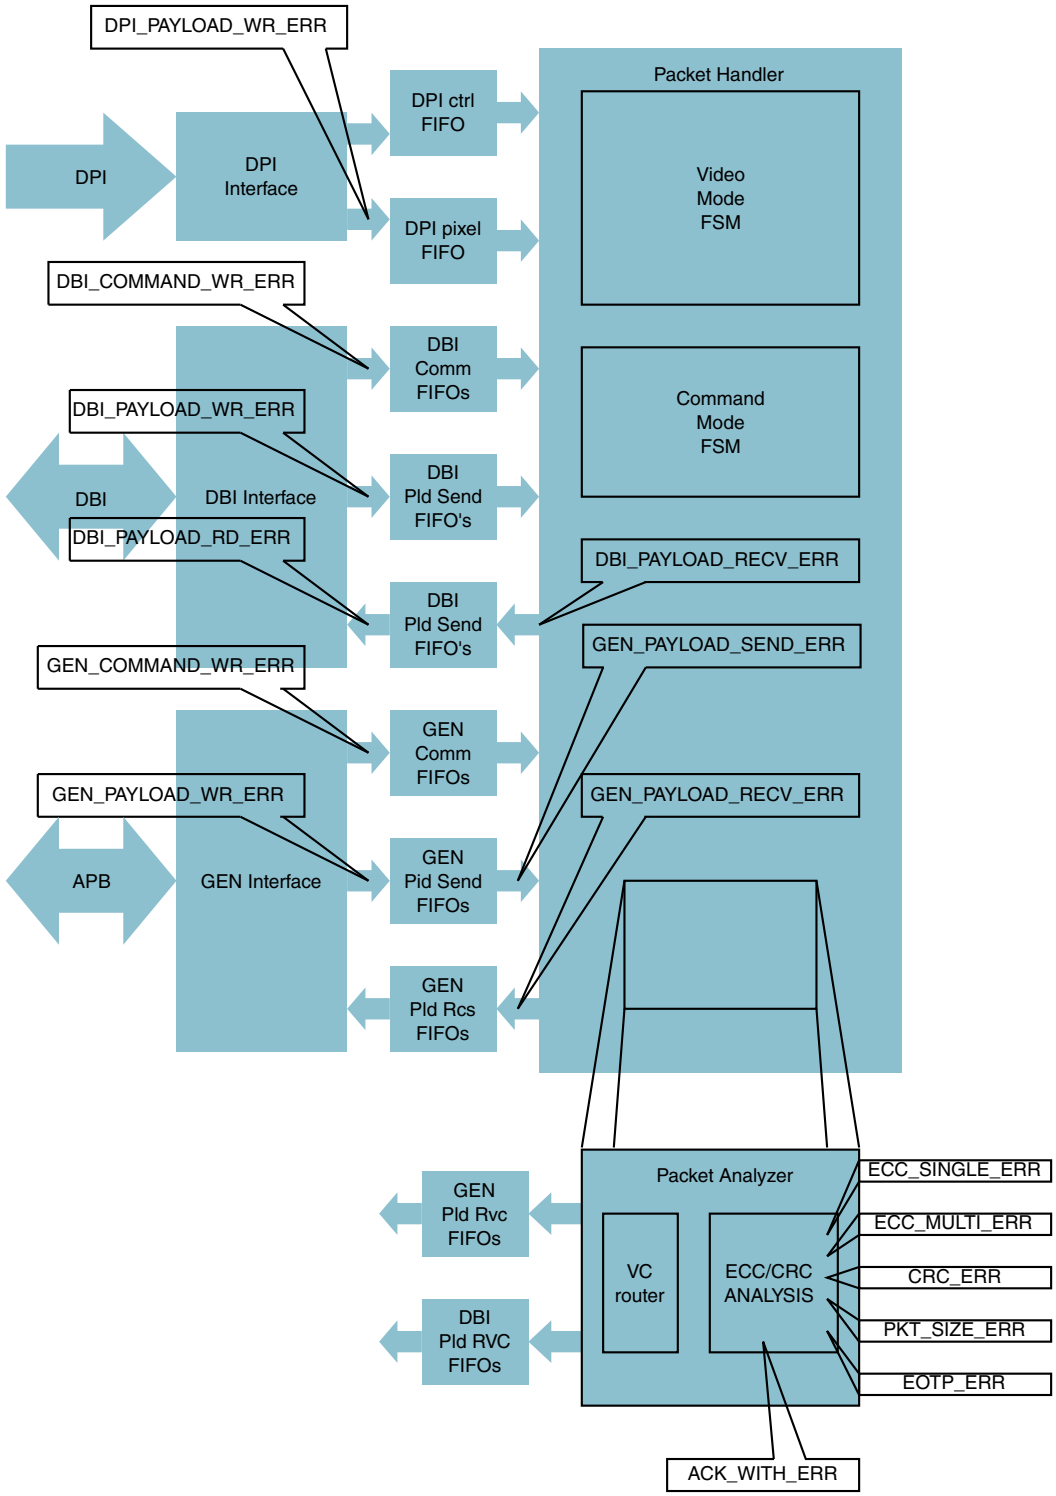

Figure 41-16. Error sources diagram

41.4.7 Generic packets

DSI host Core support generic packets transmission and reception as described in the DSI-2 specification. These packets are channeled through the APB register bank.

Register GEN_PLD_DATA is used to write payload of generic packets and when read it returns the payload of a read back operation. Register GEN_HDR contains the generic packet header type and header data. Writing to this register triggers the transmission of the packet implying that for long generic packets data needs to be written in advance on register GEN_PLD_DATA.

The valid packets available to be transmitted through the Generic interface are:

Table 41-4. Generic interface available packets

Generic Write Short Packet 0 Parameters	Generic Write Short Packet 1 Parameters	Generic Write Short Packet 2 Parameters	Generic Read Short Packet 0 Parameters
Generic Read Short Packet 1 Parameters	Generic Read Short Packet 2 Parameters	Maximum Read Packet Configuration	Generic Long Write Packet
DCS Write Short Packet 0 Parameters	DCS Write Short Packet 1 Parameters	DCS Read Short Packet 0 Parameters	DCS Write Long Packet

A set of bits in register CMD_PKT_STATUS report the status of the FIFOs associated with generic packet support.

Generic packets are always transported using one of the DSI transmission modes: Video Mode or Command Mode. If none of these modes are selected the packets will not be transmitted through the link and the related FIFOs will eventually get overflowed.

If system does not requires Generic packets support this functionality can be disabled in coreConsultant GUI and the interfaces with the 2-port RAMs that buffer command, payload and read data are removed.

41.4.8 Signals

A Clock Lane and a Data Lane (Lane0) with TX HS features are always required. Data Lanes can be up to a maximum of 2.

Table 41-5. D-PHY external interface

Pin Name	Width	Direction	Description
DPHY Supply			
AVDD	1	Input	D-PHY Analog power supply.
VDD	1	Input	D-PHY Digital power supply.
AVDDREF	1	Input	D-PHY Analog supply for reference generator.

Table continues on the next page...

Table 41-5. D-PHY external interface (continued)

Pin Name	Width	Direction	Description
AGND	1	Input	D-PHY Analog supply ground return.
VSS	1	Input	D-PHY Digital supply ground return
AGNDREF	1	Input	D-PHY Analog supply ground return for reference generator.
DPHY external pins			
REFCLK	1	Input	D-PHY Reference clock used for Master-side serial clock generation in Clock Multiplying Unit (PLL)
CFG_CLK	1	Input	D-PHY Configuration clock used for the initialization of the PHY. It is also used for exiting ULPS state.
REXT	1	Input	D-PHY External resistor connection (REXT and REXTV should be shorted at the chip pad connection)
REXTV	1	Input	D-PHY External resistor connection (REXT and REXTV should be shorted at the chip pad connection)
CLKP	1	Input	D-PHY Positive D-Phy differential clock line transceiver output.
CLKN	1	Input	D-PHY Negative D-Phy differential clock line transceiver output.
DATAP0	1	Input	D-PHY Positive D-Phy differential data line transceiver output, Lane 0
DATAN0	1	Input	D-PHY Negative D-Phy differential data line transceiver output, Lane 0
DATAP1	1	Input	D-PHY Positive D-Phy differential data line transceiver output, Lane 1
DATAN1	1	Input	D-PHY Negative D-Phy differential data line transceiver output, Lane 1

41.5 Programming

41.5.1 DSI and D-PHY initialization sequence

This chapter describes the procedure for DSI and D-PHY initialization. This process is based on APB register interface access.

- By default register PHY_RSTZ is activating the PHY resets **physhutdownz**, **phyrstz** and disabling **enableclk** and register PHY_TEST_CTRL0 is by default asserting the **testclr** pin. All the PHY reset pins are being activated by default.
- Configure Register PHY_IF_CFG with correct the number of lanes to be used by the controller.
- Configure the TX_ESC clock frequency to a frequency lower than 20MHz that is the maximum allowed frequency for D-PHY ESCAPE mode. This is done by writing in Register CLKMGR_CFG, field TX_ESC_CLK_DIVISION.
  TX_ESC_CLK_DIVISION divides Byte Clock and generates a TX_ESC clock for the D-PHY. (Note: Byte clock is limited to 125MHz (1GHz/8bits) and by writing TX_ESC_CLK_DIVISION=0x07 TX_ESC clock will always be lower than 20MHz)

- Configure the DPHY PLL clock frequency through the TEST Interface to operate at 1GHz, assuming that the REF_CLK is provided with a frequency of 27MHz
  - Write @ PHY_TST_CTRL0 - 32'h00000000 this disables the **testclr** pin enabling the interface to write new values to the DPHY internal registers.
  - Write @ PHY_TST_CTRL1 - 32'h00010044 this enables the **testen** pin bit 17 of this Core register and configures the **testdatain** to 8'h44. This operation initiate the configuration process of the test code number 0x44.
  - Write @ PHY_TEST_CTRL0 - 32'h0000002 followed by a new write to PHY_TEST_CTRL0 - 32'h00000000. This operation toggles the **testclk** (bit 2) and the **testdin** will be sampled on the falling edge of **testclk** latching a new test code.
  - Write @ PHY_TEST_CTRL1 - 32'h00000074 disabling the testen pin and configuring **testdatain** to 8'h74. This operation prepares the interface to load in test code 0x44 the 0x74 value.
  - Write @ PHY_TEST_CTRL0 - 32'h00000002 followed by a new write to PHY_TEST_CTRL0 - 32'h00000000. This operation toggles the **testclk** and the **testdin** will be sampled on the rising edge of **testclk** latching a new content data to the configured test code.
- Write @ PHY_RSTZ - 32'h00000007. This operation asserts **physhutdownz**, **phyrstz** and **enableclk** releasing the PHY from power down. The PHY will startup the PLL locking procedure to 1GHz operation.
- Read @ PHY_STATUS - 32'hxxxxxxx1, until bit 0 **phylock** is detected at 1 signaling that PLL is locked and that a stable byte clock is being provided to the DSI host controller.
- Read @ PHY_STATUS - 32'hxxxxx1x1, until bit 2 **phystopstateclklane** is read '1' identifying that Clock Lane is in Stop State. Clock lane need to be in Stop state so that the D-PHY can switch to other operational states such as the High Speed mode.
- Write register PHY_IF_CTRL bit 0 to generate High Speed clock (**txrequestHSclk**).
- Only after: 1) PLL locked and 2) Clock lane in Stop-State; the PHY will drive the correct LP sequence to configure the receiver end for HS.
- D-PHY starts transmitting HS clock on the Clock Lane.

41.6 MIPI_DSI Memory Map/Register Definition

21E_0064	D-PHY Test interface control 0 (MIPI_DSI_PHY_TST_CTRL0)	32	R/W	0000_0001h	41.6.26/ 3673

Table continues on the next page...

MIPI_DSI memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
21E_0068	D-PHY Test interface control 1 (MIPI_DSI_PHY_TST_CTRL1)	32	R/W	0000_0000h	41.6.27/ 3673

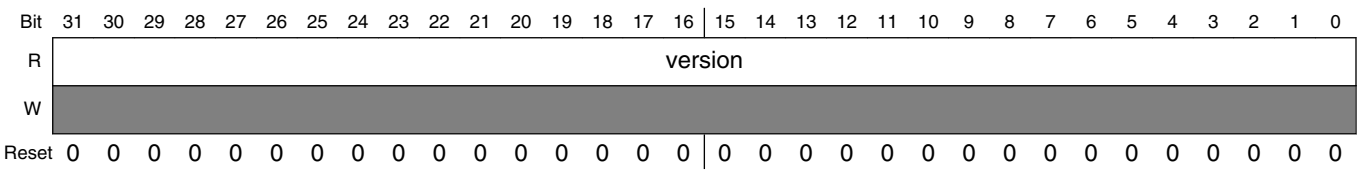
41.6.1 Version of the DSI host ctrl (MIPI_DSI_VERSION)

Size: 32 bits

Offset: 0x0

Memory Access: R

Address: 21E_0000h base + 0h offset = 21E_0000h



MIPI_DSI_VERSION field descriptions

Field	Description
version	Version of the DSI host controller

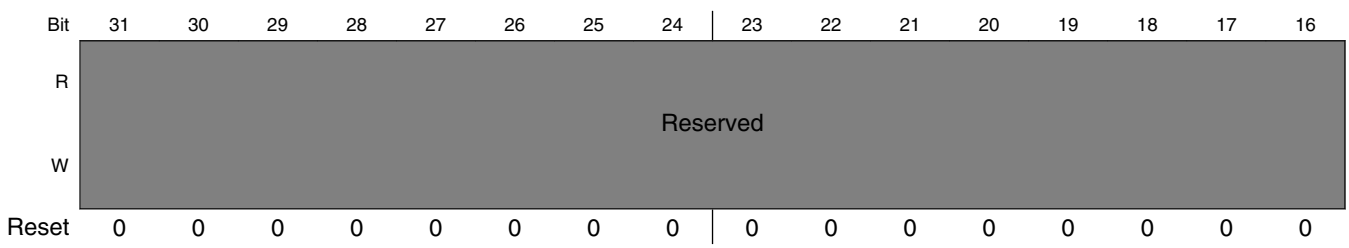
41.6.2 Core power up (MIPI_DSI_PWR_UP)

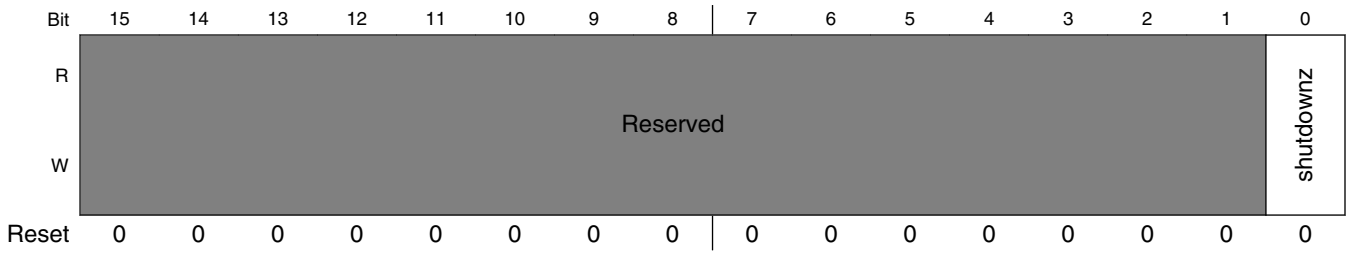
Size: 32 bits

Offset: 0x4

Memory Access: R/W

Address: 21E_0000h base + 4h offset = 21E_0004h





MIPI_DSI_PWR_UP field descriptions

Field	Description
31–1 -	This field is reserved. Reserved
0 shutdownz	Core power up 0 reset; 1 power up)

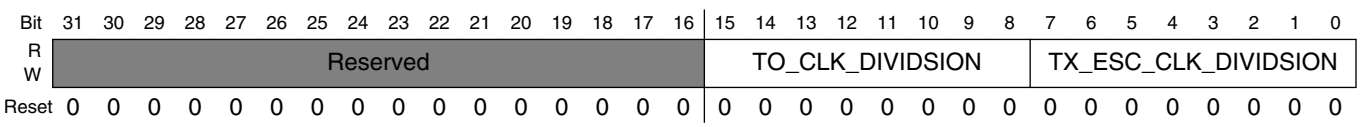
41.6.3 Number of active data lanes (MIPI_DSI_CLKMGR_CFG)

Size: 32 bits

Offset: 0x8

Memory Access: R/W

Address: 21E_0000h base + 8h offset = 21E_0008h



MIPI_DSI_CLKMGR_CFG field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15–8 TO_CLK_ DIVIDSION	Division factor for Time Out clock used as timing unit in the configuration of HS to LP and LP to HS transition error.
TX_ESC_CLK_ DIVIDSION	Division factor for TX ESCAPE clock source (lanebyteclk pin), values 0 and 1 stop TX_ESC clock generation.

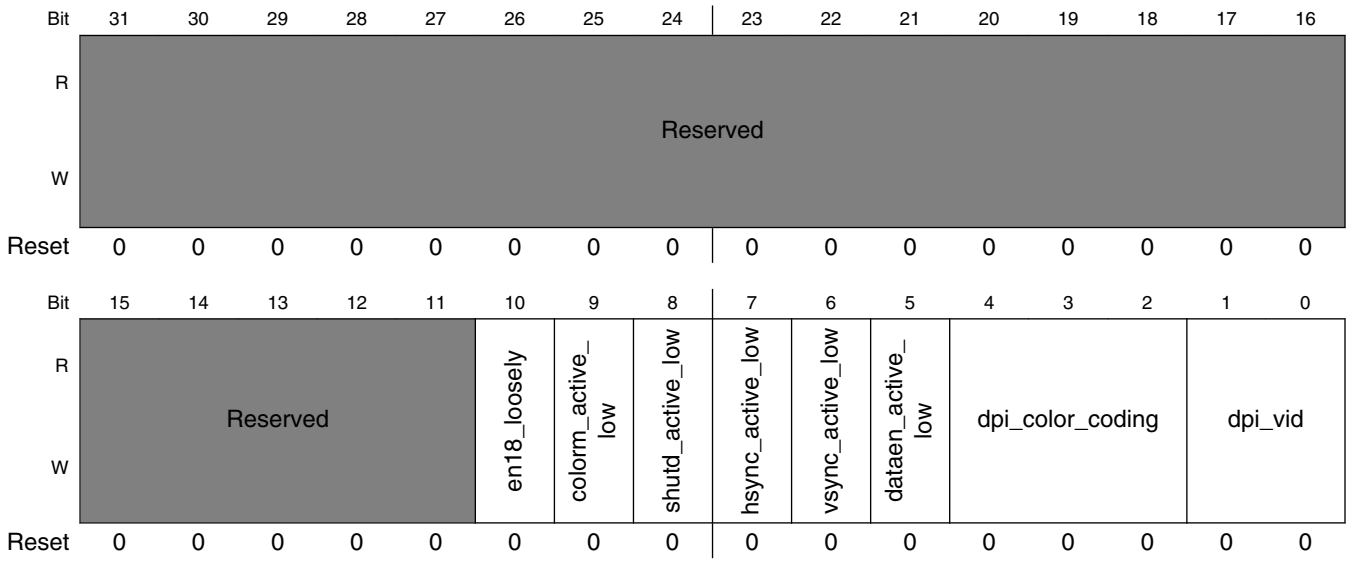
41.6.4 DPI interface configuration (MIPI_DSI_DPI_CFG)

Size: 32 bits

Offset: 0xc

Memory Access: R/W

Address: 21E_0000h base + Ch offset = 21E_000Ch



MIPI_DSI_DPI_CFG field descriptions

Field	Description
31–11 -	This field is reserved. Reserved
10 en18_loosely	Enable 18 loosely packet pixel stream.
9 colorm_active_low	Set to configure Color Mode pin (dpicolcorm) as Active low
8 shutd_active_low	Set to configure Shut Down pin (dpishutdn) as Active low
7 hsync_active_low	Set to configure Horizontal Synchronism pin (dpihsync) as Active low
6 vsync_active_low	Set to configure Vertical Synchronism pin (dpivsync) as Active low
5 dataen_active_low	Set to configure Data enable pin (dpidaten) as Active low
4–2 dpi_color_coding	DPI color coding. 0 16bit config1 1 16bit config2; 2 16bit config3; 3 18bit config1; 4 18bit config2; 5 to 7 24 bit.
dpi_vid	Configures the DPI Virtual Channel ID that will be indexed to the Video mode packets.

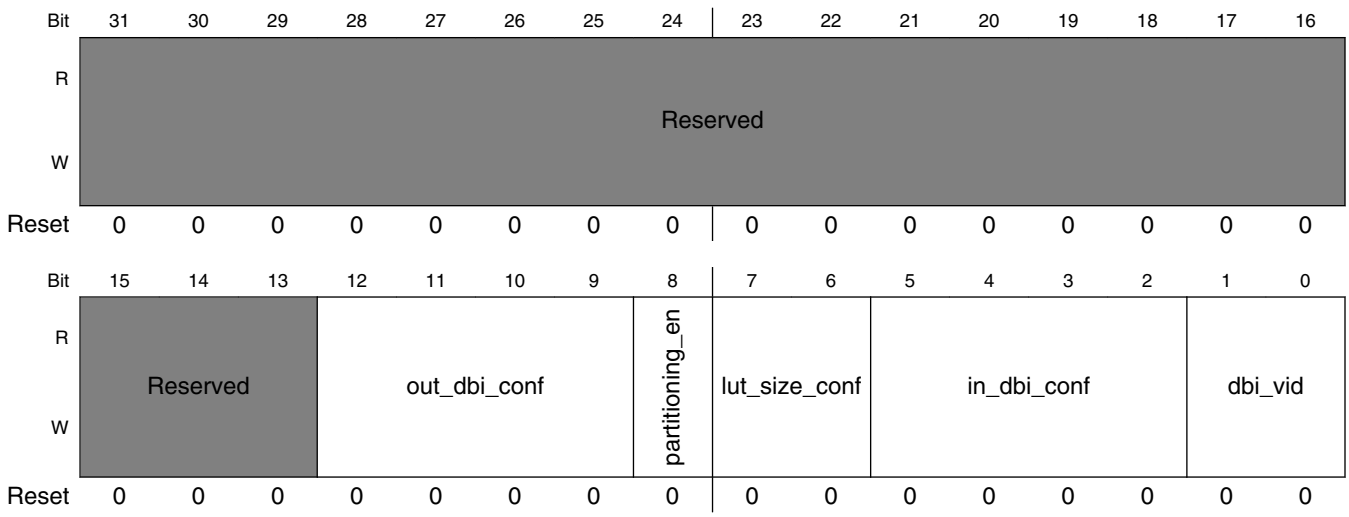
41.6.5 DBI interface configuration (MIPI_DSI_DBI_CFG)

Size: 32 bits

Offset: 0x10

Memory Access: R/W

Address: 21E_0000h base + 10h offset = 21E_0010h



MIPI_DSI_DBI_CFG field descriptions

Field	Description
31–13 -	This field is reserved. Reserved
12–9 out_dbi_conf	Configures the DBI output pixel data configuration; 0 8bit 8bpp; 1 8bit 12bpp; 2 8bit 16bpp; 3 8bit 18bpp; 4 8bit 24bpp; 5 9bit 18bpp; 6 16bit 8bpp; 7 16bit 12bpp; 8 16bit 16bpp; 9 16bit 18bpp, option1; 10 16bit 18bpp, option2; 11 16bit 24bpp, option1; 12 16bit 24bpp, option2
8 partitioning_en	Enables write memory continue through input command (system needs to ensure correct partitioning of Long Write commands)

Table continues on the next page...

MIPI_DSI_DBI_CFG field descriptions (continued)

Field	Description
7–6 lut_size_conf	Configures the size used to transport Write Lut commands; 0 16-bit color display; 1 18-bit color display; 2 24-bit color display; 3 16-bit color display
5–2 in_dbi_conf	Configures DBI input pixel data configuration; 0 8bit 8bpp; 1 8bit 12bpp; 2 8bit 16bpp; 3 8bit 18bpp; 4 8bit 24bpp; 5 9bit 18bpp; 6 16bit 8bpp; 7 16bit 12bpp; 8 16bit 16bpp; 9 16bit 18bpp, option1; 10 16bit 18bpp, option2; 11 16bit 24bpp, option1; 12 16bit 24bpp, option2
dbi_vid	Configures the DBI Virtual Channel ID that will be indexed to the DCS packets.

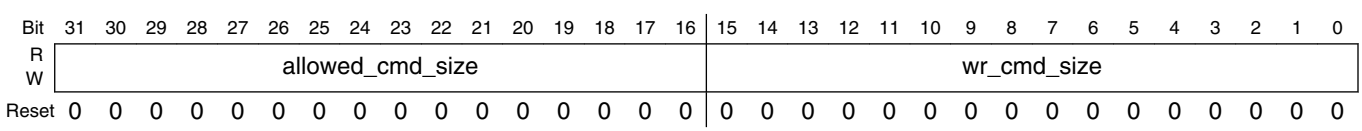
41.6.6 DBI command size configuration (MIPI_DSI_DBIS_CMDSIZE)

Size: 32 bits

Offset: 0x14

Memory Access: R/W

Address: 21E_0000h base + 14h offset = 21E_0014h



MIPI_DSI_DBIS_CMDSIZE field descriptions

Field	Description
31–16 allowed_cmd_size	Configures the maximum allowed size of a DCS write memory command. This register is used to partition a write memory command into several write memory continues. It is only used if bit 'partitioning_en' is disabled. Size of DSI packet payload is the actual payload size minus 1 since the DCS command is in the DSI packet payload.

Table continues on the next page...

MIPI_DSI_DBIS_CMDSIZE field descriptions (continued)

Field	Description
wr_cmd_size	Configures the size of the DCS write memory commands. Size of DSI packet payload is the actual payload size minus 1 since the DCS command is in the DSI packet payload.

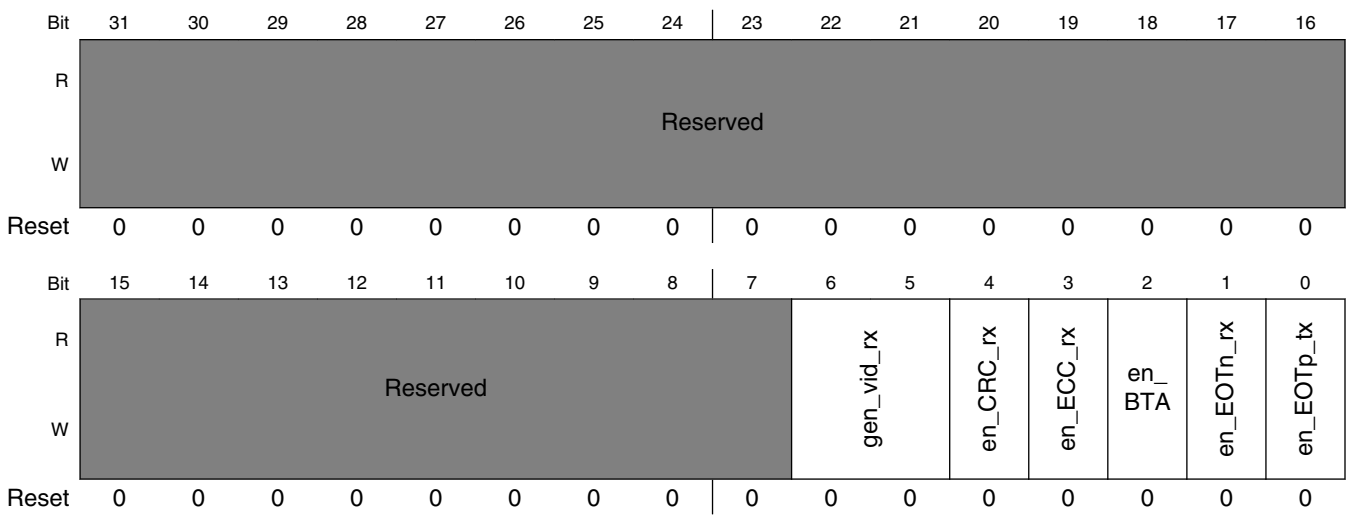
41.6.7 Packet handler configuration (MIPI_DSI_PCKHDL_CFG)

Size: 32 bits

Offset: 0x18

Memory Access: R/W

Address: 21E_0000h base + 18h offset = 21E_0018h



MIPI_DSI_PCKHDL_CFG field descriptions

Field	Description
31–7 -	This field is reserved. Reserved
6–5 gen_vid_rx	Generic interface read-back Virtual Channel identification
4 en_CRC_rx	Enables CRC reception and error reporting
3 en_ECC_rx	Enables ECC reception, error correction and reporting
2 en_BTA	Enables Bus Turn-Around request
1 en_EOTn_rx	Enables EOTp reception
0 en_EOTp_tx	Enables EOTp transmission

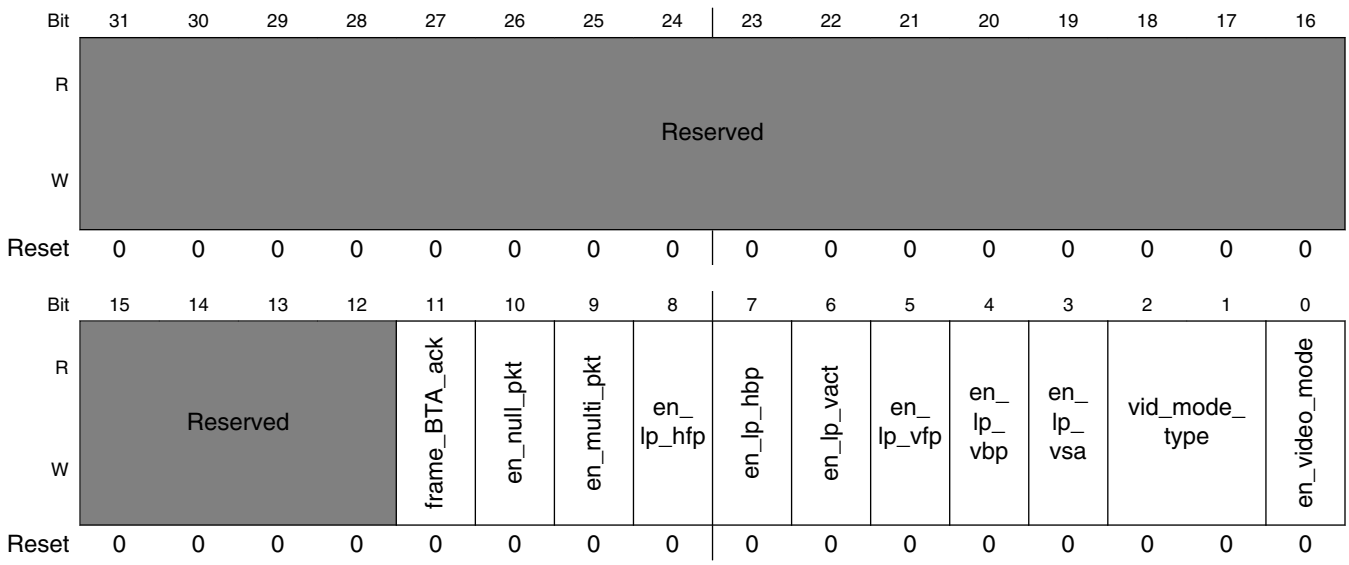
41.6.8 Video Mode Configuration (MIPI_DSI_VID_MODE_CFG)

Size: 32 bits

Offset: 0x1c

Memory Access: R/W

Address: 21E_0000h base + 1Ch offset = 21E_001Ch



MIPI_DSI_VID_MODE_CFG field descriptions

Field	Description
31–12 -	This field is reserved. Reserved
11 frame_BTA_ack	Enables the request for an acknowledge response at the end of a frame
10 en_null_pkt	Enables the tranmission of null packets in the HACT period
9 en_multi_pkt	Enables the tranmission of multi video packets in the HACT period
8 en_lp_hfp	Enables return to Low Power inside HFP period when timing allows
7 en_lp_hbp	Enables return to Low Power inside HBP period when timing allows
6 en_lp_vact	Enables return to Low Power inside VACT period when timing allows
5 en_lp_vfp	Enables return to Low Power inside VFP period when timing allows
4 en_lp_vbp	Enables return to Low Power inside VBP period when timing allows

Table continues on the next page...

MIPI_DSI_VID_MODE_CFG field descriptions (continued)

Field	Description
3 en_lp_vsa	Enables return to Low Power inside VSA period when timing allows
2–1 vid_mode_type	Selects video mode transmission type. 0: Non-burst with Sync pulses; 1: Non-burst with Sync events; 2-3: Burst with Sync pulses.
0 en_video_mode	Enables DPI Video mode transmission

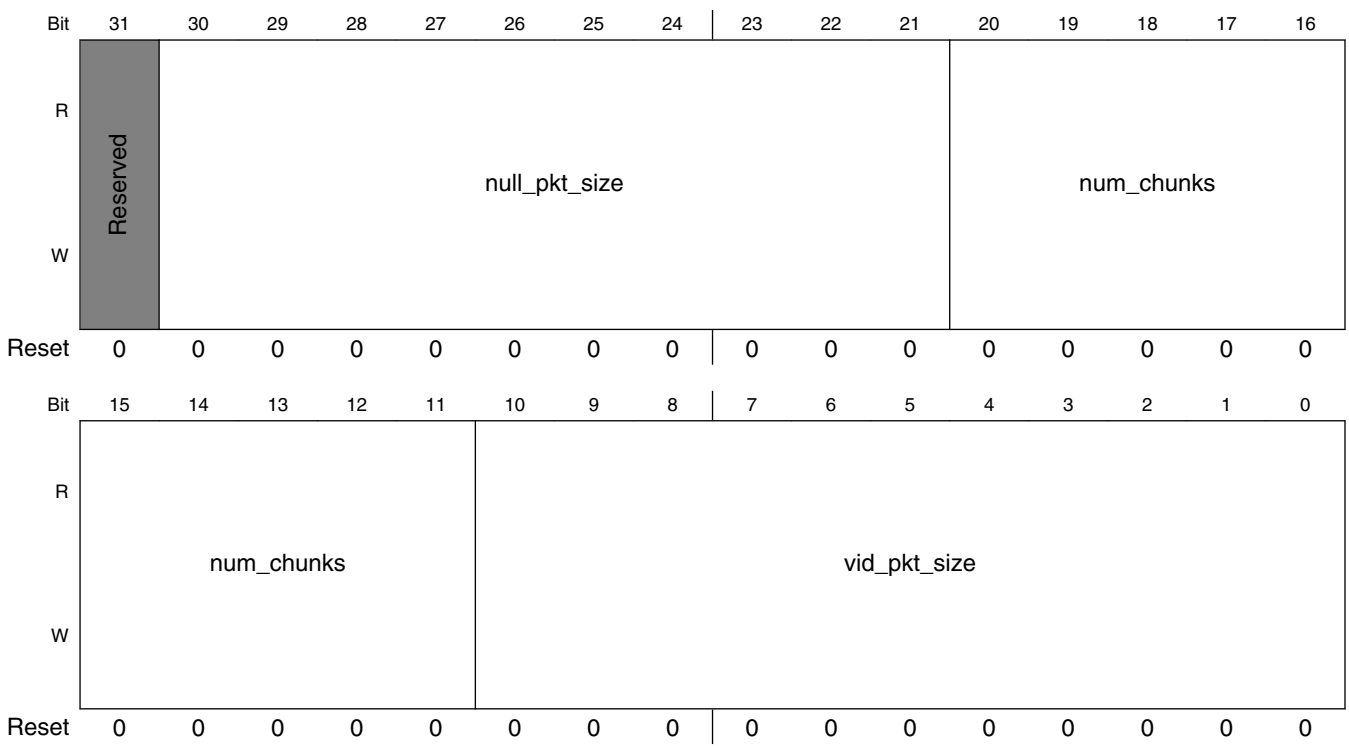
41.6.9 Video packet configuration (MIPI_DSI_VID_PKT_CFG)

Size: 32 bits

Offset: 0x20

Memory Access: R/W

Address: 21E_0000h base + 20h offset = 21E_0020h



MIPI_DSI_VID_PKT_CFG field descriptions

Field	Description
31 -	This field is reserved. Reserved

Table continues on the next page...

MIPI_DSI_VID_PKT_CFG field descriptions (continued)

Field	Description
30–21 null_pkt_size	Configures the number of bytes in a null packet
20–11 num_chunks	Configures the number of chunks to be transmitted during a Line period. (A chunk is a video packet or a null packet)
vid_pkt_size	Configures the number of pixel on a single video packet. (If using 18 bit mode and not enabling loosely packet stream this value must be a multiple of 4)

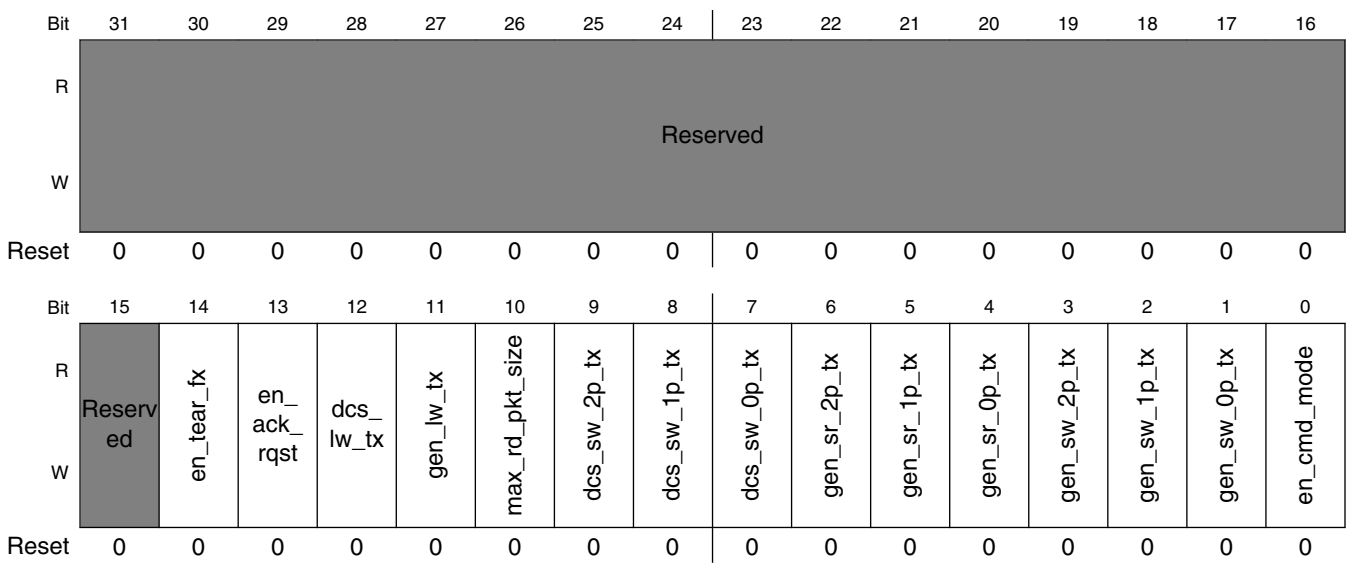
41.6.10 Command mode configuration (MIPI_DSI_CMD_MODE_CFG)

Size: 32 bits

Offset: 0x24

Memory Access: R/W

Address: 21E_0000h base + 24h offset = 21E_0024h



MIPI_DSI_CMD_MODE_CFG field descriptions

Field	Description
31–15 -	This field is reserved. Reserved
14 en_tear_fx	Enables the tearing effect acknowledge request
13 en_ack_rqst	Enables the acknowledge request after each packet transmission

Table continues on the next page...

MIPI_DSI_CMD_MODE_CFG field descriptions (continued)

Field	Description
12 dcs_lw_tx	Configures the DCS Long Write Packet command transmission type. 0 High Speed; 1 Low Power
11 gen_lw_tx	Configures the Generic Long Write Packet command transmission type. 0 High Speed; 1 Low Power
10 max_rd_pkt_size	Configures the Maximum Read Packet Size command transmission type. 0 High Speed; 1 Low Power
9 dcs_sw_2p_tx	Configures the DCS Short Write Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
8 dcs_sw_1p_tx	Configures the DCS Short Write Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
7 dcs_sw_0p_tx	Configures the DCS Short Write Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power
6 gen_sr_2p_tx	Configures the Generic Short Read Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
5 gen_sr_1p_tx	Configures the Generic Short Read Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
4 gen_sr_0p_tx	Configures the Generic Short Read Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power
3 gen_sw_2p_tx	Configures the Generic Short Write Packet with 2 Parameters command transmission type. 0 High Speed; 1 Low Power
2 gen_sw_1p_tx	Configures the Generic Short Write Packet with 1 Parameters command transmission type. 0 High Speed; 1 Low Power
1 gen_sw_0p_tx	Configures the Generic Short Write Packet with 0 Parameters command transmission type. 0 High Speed; 1 Low Power

Table continues on the next page...

MIPI_DSI_CMD_MODE_CFG field descriptions (continued)

Field	Description
0 en_cmd_mode	Enables the Command Mode Protocol for transmissions.

41.6.11 Line timer configuration (MIPI_DSI_TMR_LINE_CFG)

Size: 32 bits

Offset: 0x28

Memory Access: R/W

Address: 21E_0000h base + 28h offset = 21E_0028h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	hline_time																hbp_time								hsa_time							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_TMR_LINE_CFG field descriptions

Field	Description
31–18 hline_time	Configures the size of the total line counted in lane byte cycles
17–9 hbp_time	Configures the Horizontal Back Porch period in lane byte clock cycles
hsa_time	Configures the Horizontal Synchronism Active period in lane byte clock cycles

41.6.12 Vertical timing configuration (MIPI_DSI_VTIMING_CFG)

Size: 32 bits

Offset: 0x2c

Memory Access: R/W

Address: 21E_0000h base + 2Ch offset = 21E_002Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MIPI_DSI_VTIMING_CFG field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 v_active_lines	Configures the Vertical Active period measured in horizontal lines
15–10 vfp_lines	Configures the Vertical Front Porch period measured in horizontal lines
9–4 vbp_lines	Configures the Vertical Back Porch period measured in horizontal lines
vsa_lines	Configures the Vertical Synchronism Active period measured in horizontal lines

41.6.13 D-PHY timing configuration (MIPI_DSI_PHY_TMR_CFG)

Size: 32 bits

Offset: 0x30

Memory Access: R/W

Address: 21E_0000h base + 30h offset = 21E_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	Reserved				phy_hs2lp_time								phy_lp2hs_time				bta_time

MIPI_DSI_PHY_TMR_CFG field descriptions

Field	Description
31–28 -	This field is reserved. Reserved
27–20 phy_hs2lp_time	Configures the maximum time that the PHY takes to go from High Speed to Low Power transmission measured in lane byte clock cycles
19–12 phy_lp2hs_time	Configures the maximum time that the PHY takes to go from Low Power to High Speed transmission measured in lane byte clock cycles
bta_time	Configures the maximum time required to perform the Bus Turn Around operation measured in lane byte clock cycles

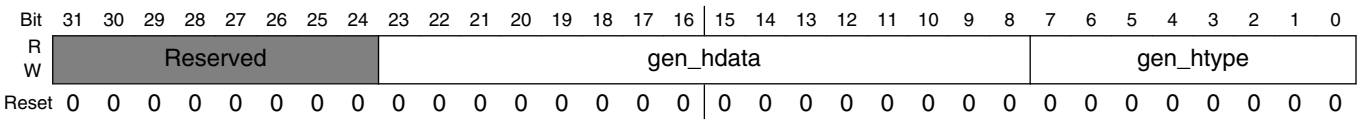
41.6.14 Generic packet Header configuration (MIPI_DSI_GEN_HDR)

Size: 32 bits

Offset: 0x34

Memory Access: R/W

Address: 21E_0000h base + 34h offset = 21E_0034h



MIPI_DSI_GEN_HDR field descriptions

Field	Description
31–24 -	This field is reserved. Reserved
23–8 gen_hdata	Configures the packet data to be transmitted through the generic interface
gen_htype	Configures the packet type to be transmitted through the generic interface. Writing to this register triggers packet transmission (Payload must be written in advance)

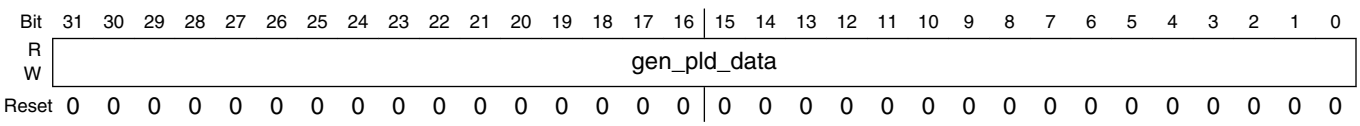
41.6.15 Generic payload data in/out (MIPI_DSI_GEN_PLD_DATA)

Size: 32 bits

Offset: 0x38

Memory Access: R/W

Address: 21E_0000h base + 38h offset = 21E_0038h



MIPI_DSI_GEN_PLD_DATA field descriptions

Field	Description
gen_pld_data	This register contains the input/output generic packet data. Write access to it writes the content of the packet payload. Read access reads the incoming generic read data

41.6.16 Command packet status (MIPI_DSI_CMD_PKT_STATUS)

Size: 32 bits

Offset: 0x3c

Memory Access: R/W

Address: 21E_0000h base + 3Ch offset = 21E_003Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MIPI_DSI_CMD_PKT_STATUS field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15 reserved2	This field is reserved. Reserved
14 dbi_rd_cmd_busy	Set when a read command is issued and cleared once the entire response is stored in the FIFO
13 dbi_pld_r_full	Reports the full status of the DBI read payload FIFO
12 dbi_pld_r_empty	Reports the empty status of the DBI read payload FIFO
11 dbi_pld_w_full	Reports the full status of the DBI write payload FIFO
10 dbi_pld_w_empty	Reports the empty status of the DBI write payload FIFO
9 dbi_cmd_full	Reports the full status of the DBI command FIFO
8 dbi_cmd_empty	Reports the empty status of the DBI command FIFO
7 reserved1	This field is reserved. Reserved
6 gen_rd_cmd_busy	Set when a read command is issued and cleared once the entire response is stored in the FIFO
5 gen_pld_r_full	Reports the full status of the generic read payload FIFO
4 gen_pld_r_empty	Reports the empty status of the generic read payload FIFO

Table continues on the next page...

MIPI_DSI_CMD_PKT_STATUS field descriptions (continued)

Field	Description
3 gen_pld_w_full	Reports the full status of the generic write payload FIFO
2 gen_pld_w_ empty	Reports the empty status of the generic write payload FIFO
1 gen_cmd_full	Reports the full status of the generic command FIFO
0 gen_cmd_empty	Reports the empty status of the generic command FIFO

41.6.17 Time Out timers configuration (MIPI_DSI_TO_CNT_CFG0)

Size: 32 bits

Offset: 0x40

Memory Access: R/W

Address: 21E_0000h base + 40h offset = 21E_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MIPI_DSI_TO_CNT_CFG0 field descriptions

Field	Description
31–16 lprx_to_cnt	Configures the time out counter that will trigger a Low Power Reception Time Out Contention Detection. (Measured in TO_CLK_DIVISION cycles)
hstx_to_cnt	Configures the time out counter that will trigger a High Speed Transmission Time Out Contention Detection (Measured in TO_CLK_DIVISION cycles)

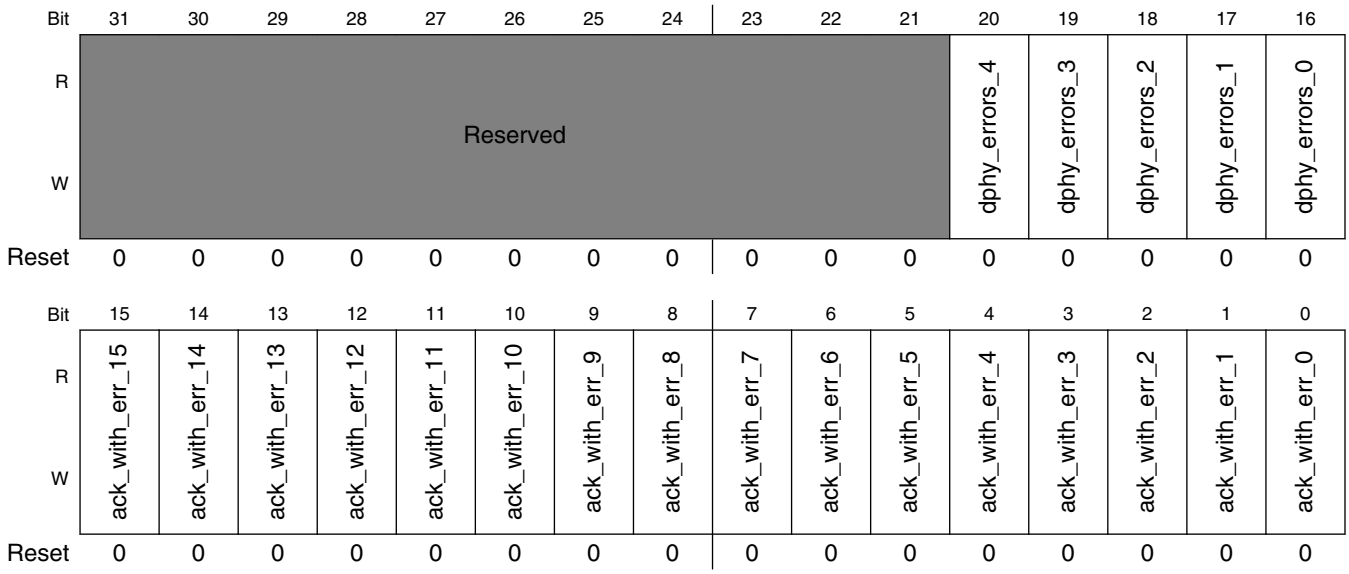
41.6.18 Interrupt status register 0 (MIPI_DSI_ERROR_ST0)

Size: 32 bits

Offset: 0x44

Memory Access: R/W

Address: 21E_0000h base + 44h offset = 21E_0044h



MIPI_DSI_ERROR_ST0 field descriptions

Field	Description
31–21 -	This field is reserved. Reserved
20 dphy_errors_4	ErrContentionLP1 LP1 Contention Error from Lane 0
19 dphy_errors_3	ErrContentionLP0 LP0 Contention Error from Lane 0
18 dphy_errors_2	ErrControl Control Error from Lane 0
17 dphy_errors_1	ErrSyncEsc Low-Power Data Transmission Synchronization Error from Lane 0
16 dphy_errors_0	ErrEsc Escape Entry Error from Lane 0
15 ack_with_err_15	Retrieves DSI Protocol Violation from Display Acknowledge Error Report
14 ack_with_err_14	Retrieves Reserved (specific to device) from Display Acknowledge Error Report
13 ack_with_err_13	Retrieves Invalid Transmission Length from Display Acknowledge Error Report
12 ack_with_err_12	Retrieves DSI VC ID Invalid from Display Acknowledge Error Report
11 ack_with_err_11	Retrieves DSI Data Type Not Recognized from Display Acknowledge Error Report
10 ack_with_err_10	Retrieves Checksum Error (Long packet only) from Display Acknowledge Error Report
9 ack_with_err_9	Retrieves ECC Error, multi-bit (detected, not corrected) from Display Acknowledge Error Report
8 ack_with_err_8	Retrieves ECC Error, single-bit (detected and corrected) from Display Acknowledge Error Report

Table continues on the next page...

MIPI_DSI_ERROR_ST0 field descriptions (continued)

Field	Description
7 ack_with_err_7	Retrieves Reserved (specific to device) from Display Acknowledge Error Report
6 ack_with_err_6	Retrieves False Control Error from Display Acknowledge Error Report
5 ack_with_err_5	Retrieves HS Receive Timeout Error from Display Acknowledge Error Report
4 ack_with_err_4	Retrieves Low-Power Transmit Sync Error from Display Acknowledge Error Report
3 ack_with_err_3	Retrieves Escape Mode Entry Command Error from Display Acknowledge Error Report
2 ack_with_err_2	Retrieves EoT Sync Error from Display Acknowledge Error Report
1 ack_with_err_1	Retrieves SoT Sync Error from Display Acknowledge Error Report
0 ack_with_err_0	Retrieves SoT Error from Display Acknowledge Error Report

41.6.19 Interrupt status register 1 (MIPI_DSI_ERROR_ST1)

Size: 32 bits

Offset: 0x48

Memory Access: R/W

Address: 21E_0000h base + 48h offset = 21E_0048h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MIPI_DSI_ERROR_ST1 field descriptions

Field	Description
31–18 -	This field is reserved. Reserved
17 dbi_illegal_comm_err	Attempt to write an illegal command on the DPI interface and core blocked by transmission
16 dbi_pld_recv_err	During a DBI read back packet, the payload FIFO went full and received data was corrupted
15 dbi_pld_rd_err	During a DCS read data, the payload FIFO went empty and data was send to the interface corrupted
14 dbi_pld_wr_err	System tried to write payload data through the DBI interface and the FIFO was full, therefore the Command was not written
13 dbi_cmd_wr_err	System tried to write a command through the DBI but the command FIFO was full, therefore the command was not written
12 gen_pld_recv_err	During a generic interface packet read back, the payload FIFO went full and received data was corrupted
11 gen_pld_rd_err	During a DCS read data, the payload FIFO went empty and data was send to the interface corrupted
10 gen_pld_send_err	During a generic interface packet build, the payload FIFO went empty and data was sent corrupted
9 gen_pld_wr_err	System tried to write a payload data through the generic interface and FIFO was full, therefore the payload was not written
8 gen_cmd_wr_err	System tried to write a command through the generic interface and FIFO was full, therefore the command was not written
7 dpi_pld_wr_err	During a DPI pixel line storage the payload FIFO went full and data stored is corrupted
6 eopt_err	EOTp Packet not received at the end of the incoming peripheral transmission
5 pkt_size_err	Packet size error was detected during packet reception
4 crc_err	CRC error was detected in the received packet payload
3 ecc_multi_err	ECC multiple error was detected in a received packet
2 ecc_sinlge_err	ECC single error was detected and corrected in a received packet
1 to_lp_rx	Low Power Reception Time Out Counter reached the end and Contention Detection as been detected
0 to_hs_tx	High Speed Transmission Time Out Counter reached the end and Contention Detection as been detected

phy_testdin	PHY test interface input 8-bit data bus for internal register programming and test functionalities access

Chapter 42
MIPI HSI Host Controller (MIPI_HSI)

42.1 Overview

MIPI_HSI is an interface intended to connect an application processor to a cellular modem controller in cellular handsets, but it can be used in other applications.

This document describes the micro-architecture for the MIPI_HSI host controller and the block level functionality and implementation in detail.

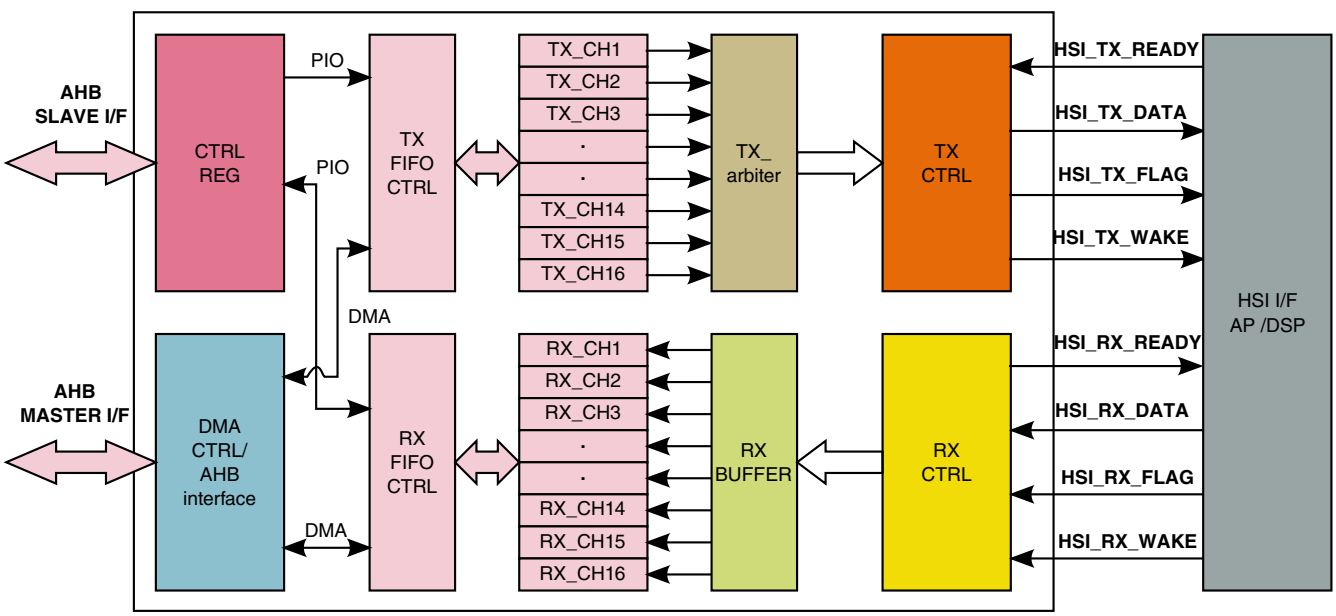

Figure 42-1. Top-Level Architecture

42.1.1 Features

The features of MIPI_HSI include the following:

- AHB slave interface support for PIO and configure.
- Supports PIO and DMA access mode
- Supports AHB Master interface to SOC interconnect
- Compatible with the MIPI_HSI specification version1.0 & MIPI_HSI Physical Layer v1.01.00 specification
- Full-Duplex High Speed Serial interface
- Supports 16 logical channels for both transmit and receive operations
- Each channel is configurable and can be enabled and disabled
- Bandwidth for each channel is programmable
- Supports both stream mode and frame mode for data transmission and reception
- Maximum bandwidth up to 100Mbs in both transmit and receive directions
- Configurable transmit and receive FIFO
- Programmable transmission bit rate
- Support round-robin arbitration for transmission mode
- Run-time configurability of channel ID bits
- Data time out feature supported for receive operation

42.2 External Signals

42.2.1 External Signals Overview

MIPI_HSI has 8 associate I/O signals.

- HSI_RX_DATA: Serial data bus
- HSI_RX_FLAG: Flag signal. If data on HSI_RX_DATA is toggling then flag stays constant and if data is constant then flag should toggle. It can be used with HSI_RX_DATA.
- HSI_RX_READY: Link data flow control signal. It indicates HSI RX is ready to receive.
- HSI_RX_WAKE: Link Control signal used to wake up the receiver.
- HSI_TX_DATA: Serial data out
- HSI_TX_FLAG: Flag signal. If data on HSI_TX_DATA is toggling, then flag stays constant and if data is constant, then flag should toggle.
- HSI_TX_READY: Link data flow control signal. It indicates HSI RX of other die is ready.
- HSI_TX_WAKE: Assertion of this signal shows that HSI TX wants to transfer some data. This signal is used to wake up HSI RX of other die.

42.2.2 Ports Table

See the following table for the signal properties of the I/Os.

Table 42-1. Properties of I/O Signals

Name	Port	Function	Reset State	Pull up
HSI_RX_DATA	I	Serial data bus	N/A	N/A
HSI_RX_FLAG	I	Flag signal. If data on HSI_RX_DATA is toggling then flag stays constant and if data is constant then flag should toggle. It can be used with HSI_RX_DATA.	N/A	N/A
HSI_RX_READY	O	Link data flow control signal. It indicates HSI RX is ready to receive	N/A	N/A
HSI_RX_WAKE	I	Link Control signal used to wake up the receiver so that transmitter starts a transmission	N/A	N/A
HSI_TX_DATA	O	Serial data out	0	N/A
HSI_TX_FLAG	O	Flag signal. If data on tx_data is toggling, then flag stays constant and if data is constant, then flag should toggle.	0	N/A
HSI_TX_READY	I	Link data flow control signal. It indicates HSI RX of other die is ready	N/A	N/A
HSI_TX_WAKE	O	Assertion of this signal shows that HSI TX wants to transfer some data. This signal is used to wake up HSI RX of other die	0	N/A

42.3 Clocks

The table found here describes the clock sources for MIPI HSI.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 42-2. MIPI HSI Clocks

Clock name	Clock Root	Description
h_clk	ahb_clk_root	AHB clock
tx_ref_clk	hsi_tx_clk_root	Tx reference clock

42.4 Functional Description

The following sections provide a brief functional description of the major system blocks, including the Data Channel Buffer, DMA AHB interface, register bank as well as AHB slave Bus interface, dual-port memory wrapper, clock & reset manager and clock generator.

42.4.1 DMA AHB /PIO AHB slave and Data Channel Buffer

The HSI uses one configurable data buffer so data can be transferred between the system bus (AHB slave Bus or AHB Master Bus) and the HSI controller.

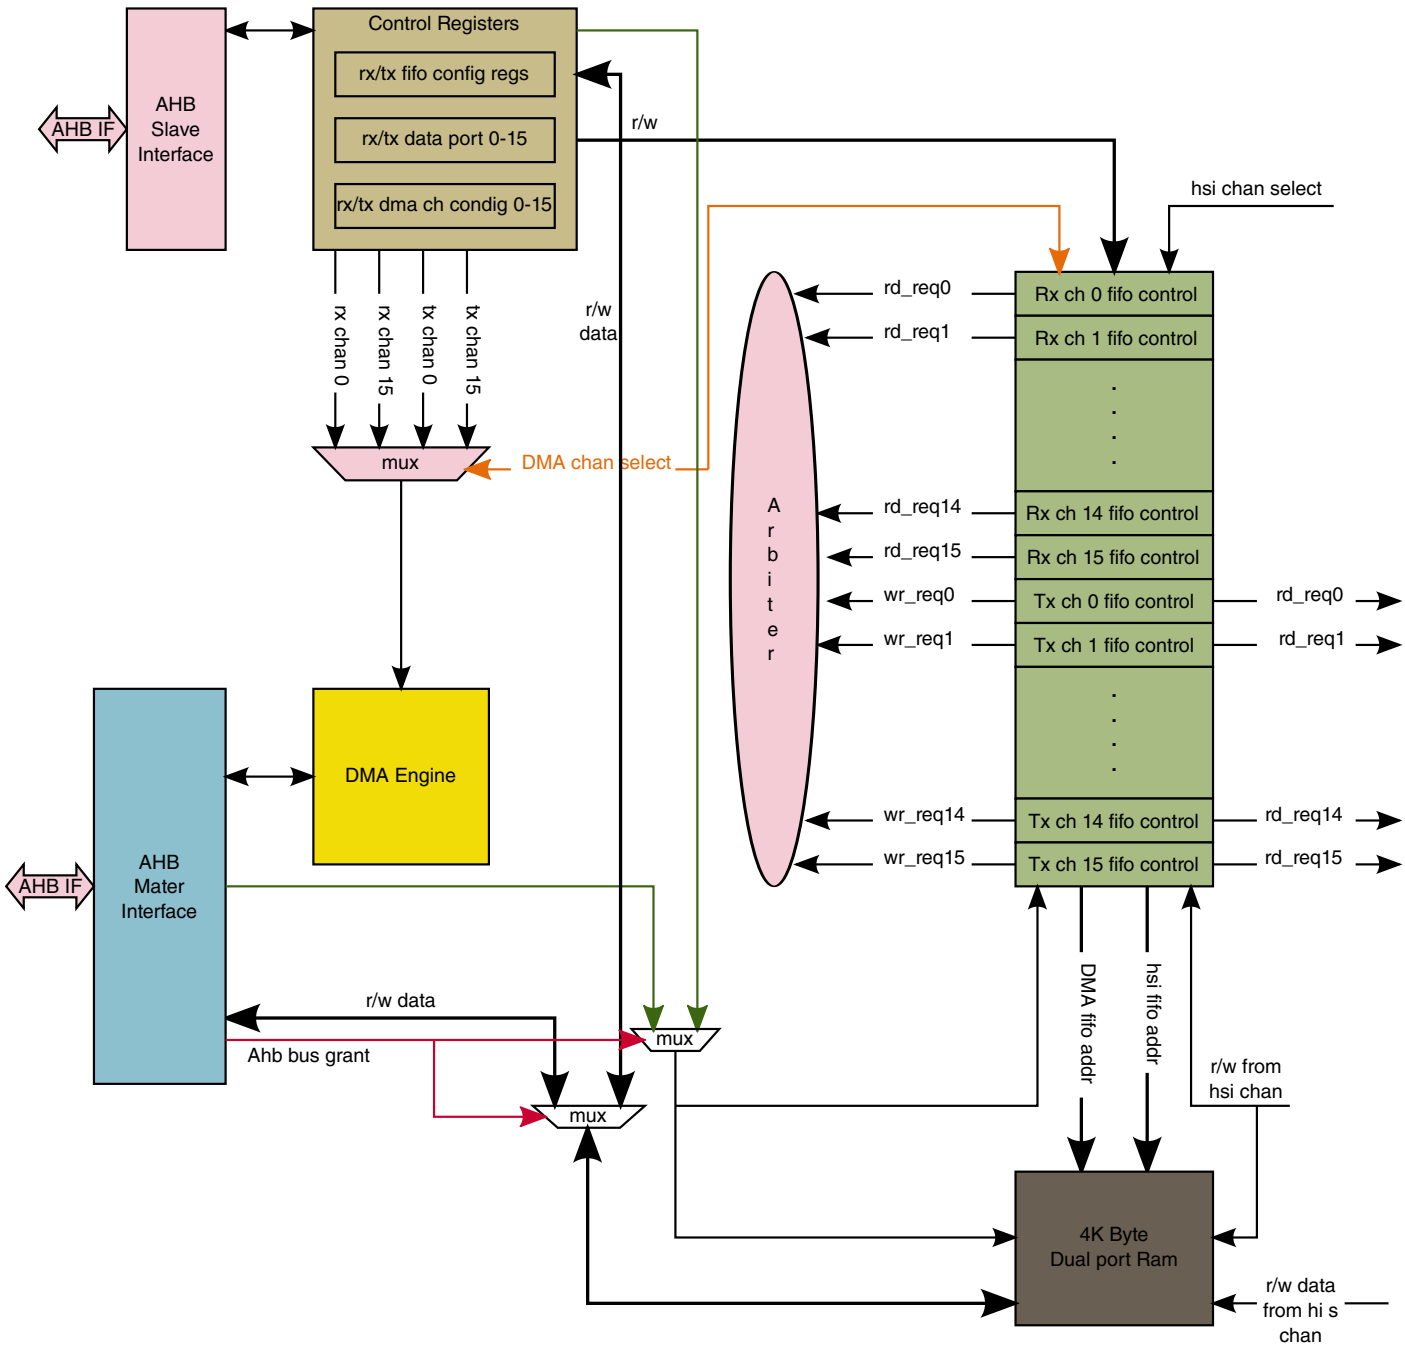

Figure 42-2. HSI DMA AHB/PIO AHB slave and data channel Buffer Scheme

42.4.1.1 AHB Slave Interface

This interface is compatible with AMBA AHB2.0 interface.

42.4.1.2 AHB Master Interface

This block access bus data by burst 8, burst 4 or single. AHB bus error is support.

42.4.1.3 Control Registers

This block has all the control registers of HSI Controller.

42.4.1.4 DMA Engine

This block generate DMA commands and send it to AHB master interface. These DMA commands are generated according current DMA channel configuration registers. AHB Master Interface should access AHB bus according the commands.

42.4.1.5 Rx/Tx FIFO controller

There are 32 sets of Rx/Tx FIFO Controller. Each FIFO Controller is corresponding to a Rx/Tx channel and a DMA channel. The depth for Each FIFO Controller is configurable. Once the number of data in the FIFO is less (for Tx) or more (for Rx) than the burst length of the corresponding DMA channel, it will send wr_req/rd_req signal to the Arbiter.

42.4.1.6 Arbiter

The arbiter arbitrates the requests from all 32 FIFO controllers according round robin priority.

42.4.1.7 4K Bytes Dual Port RAM

This block is used to save all FIFO data.

42.4.1.8 Typical Software Operation Flow for DMA

1. Configure Tx/Rx FIFO Size Configuration Registers. The total size of the FIFOs should not more than 1K DWords.

2. Enable RDMA/TDMA channel Complete Irq and Error Irq.

3. Configure RDMA/TDMA Start Address, Burst Size and Trans_length for each DMA channel. After that, set the RDMA/TDMA Enable bit. Once the Enable bit is set, the DMA channel will start to work right away.

4. Wait HSI Controller Irq and check RDMA/TDMA Complete Irq Stat bit.

42.4.1.9 Typical Software Operation Flow 1 for Data Port

1. Read corresponding Tx/Rx FIFO Status Register to make sure FIFO isn't empty/full.

2. Read/write Tx/Rx channel Data Port registers to access channel FIFO data.

42.4.1.10 Typical Software Operation Flow 2 for Data Port

1. Configure corresponding Tx/Rx FIFO Threshold Register.

2. Enable Tx/Rx FIFO Threshold interrupt.

3. Wait Tx/Rx FIFO Threshold interrupt.

4. Read/write Tx/Rx channel Data Port registers to access channel FIFO data.

42.4.2 HSI Reset

There are two kinds of reset signals within HSI:

1. Hardware reset
2. Software reset for all

These signals are fed into this module and stable signals are generated inside the module to reset all other modules. The module also gates off all the inside signals.

This module controls all the reset signals within the HSI.

42.5 HSI Memory Map/Register Definition

This section includes the module memory map and detailed descriptions of all registers.

NOTE

The HSI registers are 32 bits wide and only support 32-bit access.

NOTE

The term reset refers to power-on-reset. It will be specified whenever the software reset value differs from the power-on-reset.

MIPI_HSI_CTRL field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal HSI operation. Set this bit to one (default) to disable clocking with the HSI and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the HSI block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.

Table continues on the next page...

MIPI_HSI_CTRL field descriptions (continued)

Field	Description
29–28 Reserved	This field is reserved. Reserved, always set to zero.
27 DMA_DISABLE	This bit must be set to zero for any DMA operation. When set to one it disabel all the DMA channels.
26–24 RX_DLY_SEL	These values denote the tap delay values for reception of data and flag. 000 0ns ; 001 1ns ; 010 2ns ; 011 3ns ; 100 4ns ; 101 5ns ; 110 6ns ; 111 7ns ;
23–16 RX_FRAME_ BRST_CNT	This value is to limit the continous Frame transmission count in Pipelined Data flow. The Receiver Frame Burst counter shall be able to support upto 256 frames of continous transfer. 7'h00 256 frames transmission count is set. 7'h01 1 frames transmission count is set. 7'h02 2 frames transmission count is set. 7'hff 255 frames transmission count is set.
15–14 Reserved	This field is reserved. Reserved.
13–12 RX_TAIL_BIT_ CNT	The value determines the length of the Tailing bit counter. The receiver shall start Receiver Tailing bit counter after the nth frame programmed in Rx Frame Burst counter is received. The receiver shall then drive ready to logic one if the receiver Tailing-bit counter has completed with no errors detected, and the receiver has enough room for at least one new frame. 00 800-> tx_refclk 01 400-> tx_refclk 10 200-> tx_refclk 11 100-> tx_refclk
11–8 DATA_ TIMEOUT_CNT	This value determines the interval by which DATA timeouts are detected. This data timeout counter logic is used only for Receive operations. The counter should start counting when data in any of the RX channel fifo is less than the threshold value and resets to zero when there is a threshold reached interrupt from any of the RX buffers. The counter value should be zero, when RX fifo is empty. An interrupt will be asserted to the host driver, when the counter value reaches the data timeout counter value. 1110 HSI Tx Clock x 2 ^ 27 0001 HSI Tx Clock x 2 ^ 14 0000 HSI Tx Clock x 2 ^ 13

Table continues on the next page...

MIPI_HSI_CTRL field descriptions (continued)

Field	Description
7–5 Reserved	This field is reserved. Reserved.
4 TX_BREAK	Seeting this bit to one trigger a transmission break at HSI Tx. Once this bit is set to one, the HSI controller will send a serise zeros on HSI_TX_DATA port according to the tx break co unt. It will be automatically cleared, when the send is finished.
TX_CLK_ DIVISOR	This register holds the divisor of the base clock (tx_refclk) frequency for HSI Tx clock (internal clock used to drive Transmitter interface). 1000 tx_refclk divided by 256 0111 tx_refclk divided by 128 0110 tx_refclk divided by 64 0101 tx_refclkdivided by 32 0100 tx_refclk divided by 16 0011 tx_refclk divided by 8 0010 tx_refclk divided by 4 0001 tx_refclk divided by 2 0000 tx_refclk divided by 1

42.5.2 HSI Tx Config Register (MIPI_HSI_TX_CONF)

This register contains the configurations of tx channel enable/disable, tx wakup and tx trans mode.

Address: 220_8000h base + 4h offset = 220_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MIPI_HSI_CH_SFTRST field descriptions

Field	Description
31 TX_CH15	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 15 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
30 TX_CH14	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 14 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
29 TX_CH13	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 13 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
28 TX_CH12	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 12 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
27 TX_CH11	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 11 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
26 TX_CH10	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 10 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
25 TX_CH9	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 9 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

Table continues on the next page...

MIPI_HSI_CH_SFTRST field descriptions (continued)

Field	Description
24 TX_CH8	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 8 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
23 TX_CH7	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 7 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
22 TX_CH6	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 6 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
21 TX_CH5	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 5 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
20 TX_CH4	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 4 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
19 TX_CH3	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 3 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
18 TX_CH2	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 2 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
17 TX_CH1	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 1 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
16 TX_CH0	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Tx Channel 0 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
15 RX_CH15	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 15 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
14 RX_CH14	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 14 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
13 RX_CH13	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 13 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
12 RX_CH12	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 12 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
11 RX_CH11	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 11 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
10 RX_CH10	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 10 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
9 RX_CH9	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 9 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
8 RX_CH8	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 8 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
7 RX_CH7	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 7 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
6 RX_CH6	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 6 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
5 RX_CH5	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 5 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
4 RX_CH4	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 4 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
3 RX_CH3	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 3 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
2 RX_CH2	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 2 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

Table continues on the next page...

MIPI_HSI_CH_SFTRST field descriptions (continued)

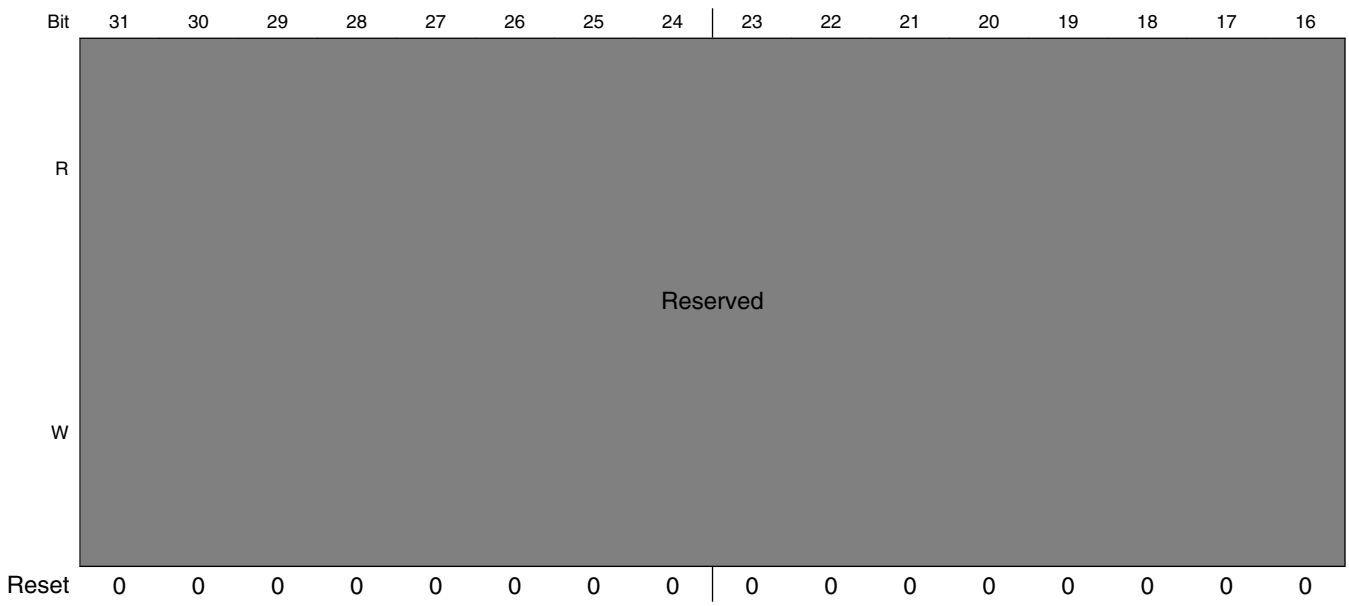
Field	Description
1 RX_CH1	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 1 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.
0 RX_CH0	Set this bit to zero to enable normal HSI operation. Set this bit to one to reset Rx Channel 0 (DMA and Fifo). When the reset operation complete, this bit will turn to zero automatically.

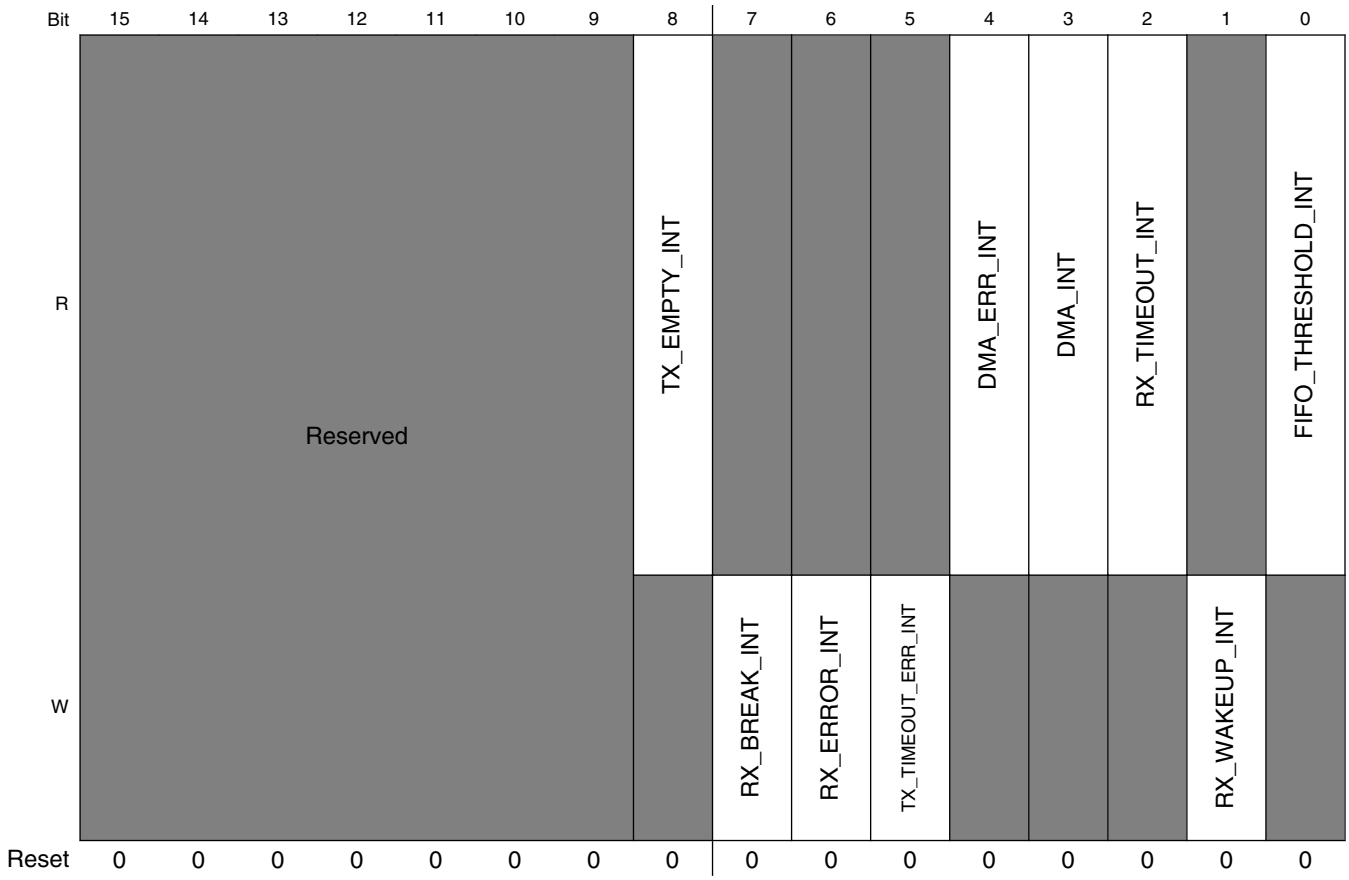
42.5.13 HSI Interrupt Status Register (MIPI_HSI_IRQSTAT)

This is HSI controller Interrupt Status Register.

This register contains the HSI controller Interrupt Status.

Address: 220_8000h base + 30h offset = 220_8030h





MIPI_HSI_IRQSTAT field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.
8 TX_EMPTY_INT	1 All tx channel empty and tx state IDLE Interrupt Status 0 not All tx channel empty and tx state IDLE Interrupt Status
7 RX_BREAK_INT	0 No Error. 1 Error.
6 RX_ERROR_INT	0 No Error. 1 Error.
5 TX_TIMEOUT_ERR_INT	0 No Error. 1 Error.
4 DMA_ERR_INT	If any bit in the DMA Error Interrupt Status Register is set, then this bit is set. on seeing this bit set, the ocp driver will read the Error Interrupt Staus Register. 0 No Error. 1 Error.
3 DMA_INT	This bit is set when a Transmit or Receive Operation is completed for DMA.

Table continues on the next page...

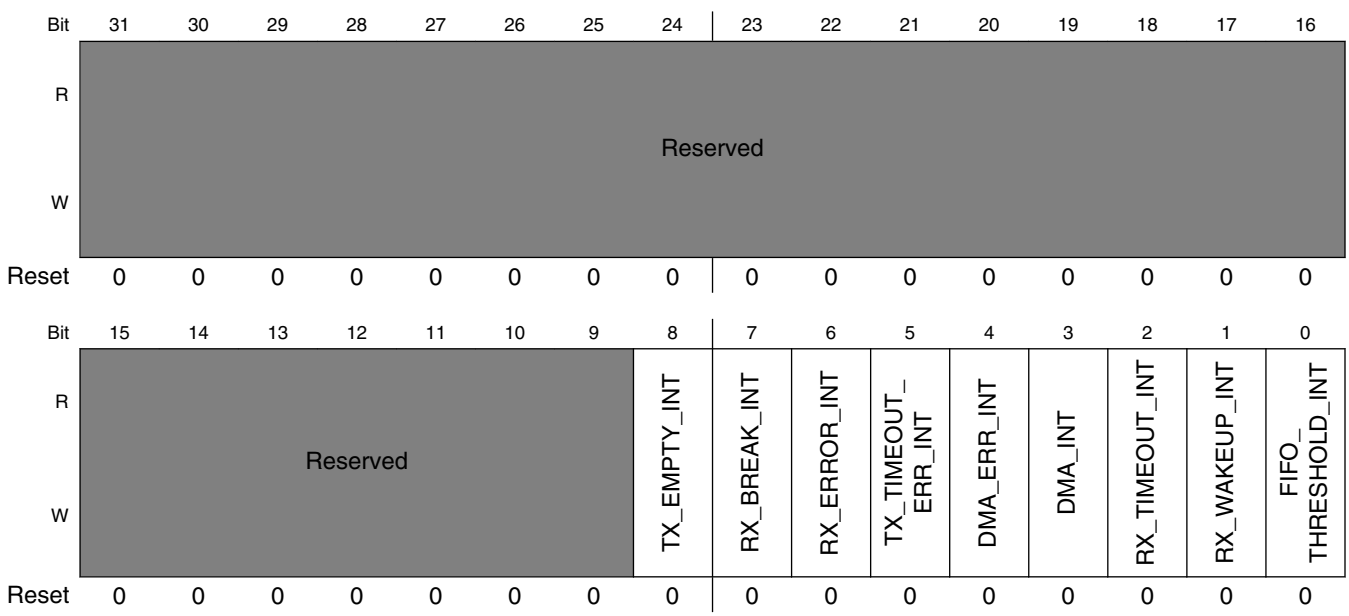
MIPI_HSI_IRQSTAT field descriptions (continued)

Field	Description
2 RX_TIMEOUT_INT	If any bit in the HSI Error Interrupt Status Register is set, then this bit is set. on seeing this bit set, the ocp driver will read the Error Interrupt Staus Register. 0 No Error. 1 Error.
1 RX_WAKEUP_INT	1 Receiver Wakeup event is occurred 0 Receiver Wakeup event is not occurred
0 FIFO_THRESHOLD_INT	1 Threshold amount of data reached in TX/Rx FIFO Interrupt Status 0 Threshold amount of data not reached in TX/Rx FIFO Interrupt Status

42.5.14 HSI Interrupt Status Enable Register (MIPI_HSI_IRQSTAT_EN)

This register contains the HSI controller Interrupt Status Enable.

Address: 220_8000h base + 34h offset = 220_8034h



MIPI_HSI_IRQSTAT_EN field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.

Table continues on the next page...

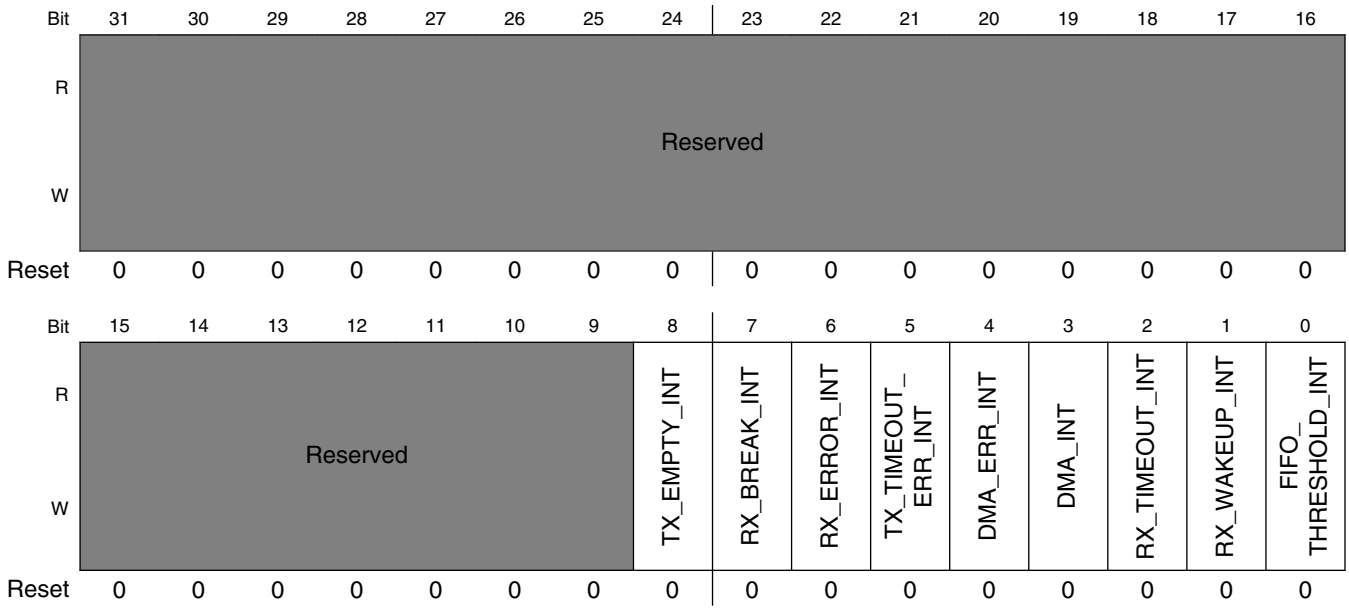
MIPI_HSI_IRQSTAT_EN field descriptions (continued)

Field	Description
8 TX_EMPTY_INT	1 Interrupt status enabled for TX_EMPTY_INT_STATUS interrupt. 0 Interrupt status masked TX_EMPTY_INT_STATUS interrupt.
7 RX_BREAK_INT	1 Interrupt status enabled for RX_BREAK status interrupt. 0 Interrupt status masked RX_BREAK status interrupt.
6 RX_ERROR_INT	1 Interrupt status enabled for RX_ERROR status interrupt. 0 Interrupt status masked RX_ERROR status interrupt.
5 TX_TIMEOUT_ERR_INT	1 Interrupt status enabled for TX_TIMEOUT_ERR status interrupt. 0 Interrupt status masked TX_TIMEOUT_ERR status interrupt.
4 DMA_ERR_INT	1 Interrupt status enabled for DMA_ERROR_INT_STATUS interrupt. 0 Interrupt status masked DMA_ERROR_INT_STATUS interrupt.
3 DMA_INT	1 Interrupt status enabled for DMA_INT_STATUS interrupt. 0 Interrupt status masked DMA_INT_STATUS interrupt.
2 RX_TIMEOUT_INT	1 Interrupt status enabled for RX_TIMEOUT_INT_STATUS interrupt. 0 Interrupt status masked RX_TIMEOUT_INT_STATUS interrupt.
1 RX_WAKEUP_INT	1 Interrupt status enabled for RX_WAKEUP_INT_STATUS interrupt. 0 Interrupt status masked RX_WAKEUP_INT_STATUS interrupt.
0 FIFO_THRESHOLD_INT	1 Interrupt status enabled for FIFO_THRESHOLD_INT_STATUS interrupt. 0 Interrupt status masked FIFO_THRESHOLD_INT_STATUS interrupt.

42.5.15 HSI Interrupt Signal Enable Register (MIPI_HSI_IRQSIG_EN)

This register contains the HSI controller Interrupt Signal Enable.

Address: 220_8000h base + 38h offset = 220_8038h



MIPI_HSI_IRQSIG_EN field descriptions

Field	Description
31–9 Reserved	This field is reserved. Reserved, always set to zero.
8 TX_EMPTY_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI TX_EMPTY interrupt. 0 Interrupt signal masked for HSI TX_EMPTY interrupt.
7 RX_BREAK_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX_BREAK interrupt. 0 Interrupt signal masked for RX_BREAK interrupt.
6 RX_ERROR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX Error interrupt. 0 Interrupt signal masked for RX Error interrupt.
5 TX_TIMEOUT_ERR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for TX Timeout Error interrupt. 0 Interrupt signal masked for TX Timeout Error interrupt.

Table continues on the next page...

MIPI_HSI_IRQSIG_EN field descriptions (continued)

Field	Description
4 DMA_ERR_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for DMA Error interrupt. 0 Interrupt signal masked for DMA Error interrupt.
3 DMA_INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for DMA Completed interrupt. 0 Interrupt signal masked for DMA Completed interrupt.
2 RX_TIMEOUT_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for RX TIMEOUT interrupt. 0 Interrupt signal masked for RX TIMEOUT interrupt.
1 RX_WAKEUP_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI RX Wakeup interrupt. 0 Interrupt signal masked for HSI RX Wakeup interrupt.
0 FIFO_ THRESHOLD_ INT	Setting this bit will enable interrupt generation on interrupt line. 1 Interrupt signal enabled for HSI FIFO_THRESHOLD interrupt. 0 Interrupt signal masked for HSI FIFO_THRESHOLD interrupt.

42.5.16 HSI FIFO Threshold Interrupt Status Register (MIPI_HSI_FIFO_THR_IRQSTAT)

This register contains the HSI controller FIFO Threshold Interrupt Status.

Address: 220_8000h base + 3Ch offset = 220_803Ch

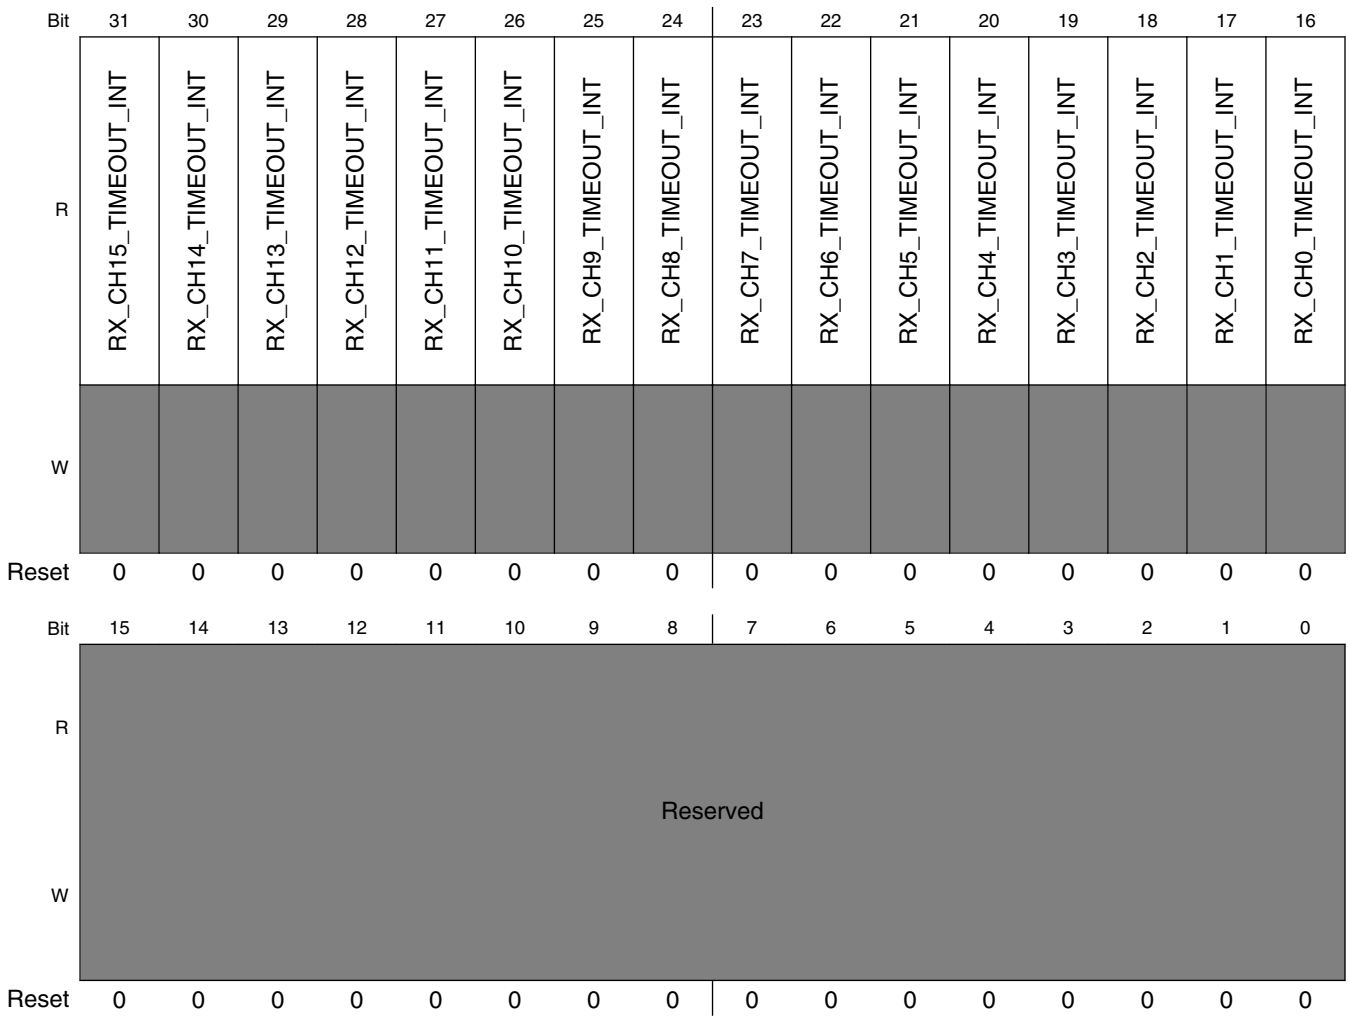
MIPI_HSI_RX_CH*n*_DP field descriptions

Field	Description
DATA	Software could Write/Read this bits to access Rx Channel n.

42.5.21 HSI Error Interrupt Status Register (MIPI_HSI_ERR_IRQSTAT)

This register contains the HSI controller Error Interrupt Status.

Address: 220_8000h base + D0h offset = 220_80D0h



MIPI_HSI_ERR_IRQSTAT field descriptions

Field	Description
31 RX_CH15_ TIMEOUT_INT	This status bit is set when data timeout counter for ch15 reaches thedata timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch15 buffer and then read HSI Status register to find the further status of the Rx ch15 Buffer. The host driver has to read the Rx ch15 fifo on Dword basis, till the fifo is completely empty.

Table continues on the next page...

MIPI_HSI_ERR_IRQSTAT field descriptions (continued)

Field	Description
30 RX_CH14_ TIMEOUT_INT	This status bit is set when data timeout counter for ch14 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch14 buffer and then read HSI Status register to find the further status of the Rx ch14 Buffer. The host driver has to read the Rx ch14 fifo on Dword basis, till the fifo is completely empty.
29 RX_CH13_ TIMEOUT_INT	This status bit is set when data timeout counter for ch13 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch13 buffer and then read HSI Status register to find the further status of the Rx ch13 Buffer. The host driver has to read the Rx ch13 fifo on Dword basis, till thefifo is completely empty.
28 RX_CH12_ TIMEOUT_INT	This status bit is set when data timeout counter for ch12 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch12 buffer and then read HSI Status register to find the further status of the Rx ch12 Buffer. The host driver has to read the Rx ch12 fifo on Dword basis, till the fifo is completely empty.
27 RX_CH11_ TIMEOUT_INT	This status bit is set when data timeout counter for ch11 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch11 buffer and then read HSI Status register to find the further status of the Rx ch11 Buffer. The host driver has to read the Rx ch11 fifo on Dword basis, till the fifo is completely empty.
26 RX_CH10_ TIMEOUT_INT	This status bit is set when data timeout counter for ch10 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch10 buffer and then read HSI Status register to find the further status of the Rx ch10 Buffer. The host driver has to read the Rx ch10 fifo on Dword basis, till the fifo is completely empty.
25 RX_CH9_ TIMEOUT_INT	This status bit is set when data timeout counter for ch9 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch9 buffer and then read HSI Status register to find the further status of the Rx ch9 Buffer. The host driver has to read the Rx ch9 fifo on Dword basis, till the fifo is completely empty.
24 RX_CH8_ TIMEOUT_INT	This status bit is set when data timeout counter for ch8 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch8 buffer and then read HSI Status register to find the further status of the Rx ch8 Buffer. The host driver has to read the Rx ch8 fifo on Dword basis, till the fifo is completely empty.
23 RX_CH7_ TIMEOUT_INT	This status bit is set when data timeout counter for ch7 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch7 buffer and then read HSI Status register to find the further status of the Rx ch7 Buffer. The host driver has to read the Rx ch7 fifo on Dword basis, till the fifo is completely empty.
22 RX_CH6_ TIMEOUT_INT	This status bit is set when data timeout counter for ch6 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch6 buffer and then read HSI Status register to find the further status of the Rx ch6 Buffer. The host driver has to read the Rx ch6 fifo on Dword basis, till the fifo is completely empty.
21 RX_CH5_ TIMEOUT_INT	This status bit is set when data timeout counter for ch5 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch5 buffer and then read HSI Status register to find the further status of the Rx ch5 Buffer. The host driver has to read the Rx ch5 fifo on Dword basis, till the fifo is completely empty.
20 RX_CH4_ TIMEOUT_INT	This status bit is set when data timeout counter for ch4 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch4 buffer and then read HSI Status register to find the further status of the Rx ch4 Buffer. The host driver has to read the Rx ch4 fifo on Dword basis, till the fifo is completely empty.

Table continues on the next page...

MIPI_HSI_ERR_IRQSTAT field descriptions (continued)

Field	Description
19 RX_CH3_ TIMEOUT_INT	This status bit is set when data timeout counter for ch3 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch3 buffer and then read HSI Status register to find the further status of the Rx ch3 Buffer. The host driver has to read the Rx ch3 fifo on Dword basis, till the fifo is completely empty.
18 RX_CH2_ TIMEOUT_INT	This status bit is set when data timeout counter for ch2 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch2 buffer and then read HSI Status register to find the further status of the Rx ch2 Buffer. The host driver has to read the Rx ch2 fifo on Dword basis, till the fifo is completely empty.
17 RX_CH1_ TIMEOUT_INT	This status bit is set when data timeout counter for ch1 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch1 buffer and then read HSI Status register to find the further status of the Rx ch1 Buffer. The host driver has to read the Rx ch1 fifo on Dword basis, till the fifo is completely empty.
16 RX_CH0_ TIMEOUT_INT	This status bit is set when data timeout counter for ch0 reaches the data timeout counter value. On receiving the interrupt the host driver should read 1Dword of data from Rx ch0 buffer and then read HSI Status register to find the further status of the Rx ch0 Buffer. The host driver has to read the Rx ch0 fifo on Dword basis, till the fifo is completely empty.

Field	Description
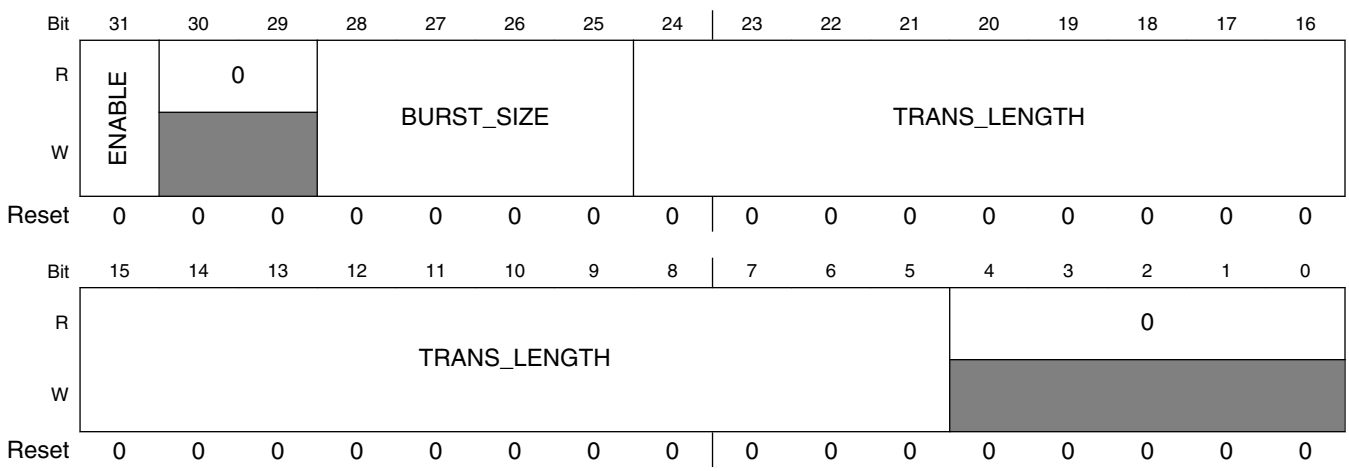
	hffffff 1048575Dwords to transfer
Reserved	This read-only field is reserved and always has the value 0.

42.5.25 Rx DMA Channel n Configuration Register (MIPI_HSI_RDMA*n*_CONF)

This register contains the configurations of enable/disable, burst size and transfer count for Rx DMA channel n.

Address: 220_8000h base + 11Ch offset + (4d × i), where i=0d to 15d



MIPI_HSI_RDMA*n*_CONF field descriptions

Field	Description
31 ENABLE	Setting this bit enables the inernal Rx DMA channel n.
30–29 Reserved	This read-only field is reserved and always has the value 0.
28–25 BURST_SIZE	Burst size for Rx DMA channel n. The unit is Dword. The burst size should not be larger than relevant TRANS_LENGTH and FIFO_SIZE. h0 1Dword to transfer for each burst h1 2Dword to transfer for each burst h2 4Dword to transfer for each burst h10 1024Dword to transfer for each burst
24–5 TRANS_ LENGTH	Transfer data length for Rx DMA channel 0. The unit is Dword. h1 1Dword to transfer

Table continues on the next page...

MIPI_HSI_RDMA*n*_CONF field descriptions (continued)

Field	Description
	h2 2Dwords to transfer hffffff 1048575Dwords to transfer
Reserved	This read-only field is reserved and always has the value 0.

42.5.26 Tx DMA Channel n Start Address Register (MIPI_HSI_TDMA*n*_STA_ADDR)

This Register containts the physical Start Address HSI for Tx DMA Channel n.

Address: 220_8000h base + 15Ch offset + (4d × i), where i=0d to 15d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MIPI_HSI_AHB_MASTER_CONF field descriptions

Field	Description
31–10 Reserved	This field is reserved. Reserved, always set to zero.
9–6 DP_HOLD_ CYCLE	These bits used to set the number of cycles for DP access fifo.
5–4 DMA_MODE	00 Once AHB master get hgrant from bus, it will set htrans "IDLE" for serval ahb cycles.In the serval cycles, once it found dataport is accessing fifo, it will release bus. 01 Once AHB master get hgrant from bus, it will set htrans "IDLE" for serval ahb cycles.After the serval cycles, once it found dataport is accessing fifo, it will keep on sending "IDLE" out untill dataport finish accessing fifo. 1x Once AHB master get hgrant from bus, dataport can not access fifo untill a dma operation done.

Table continues on the next page...

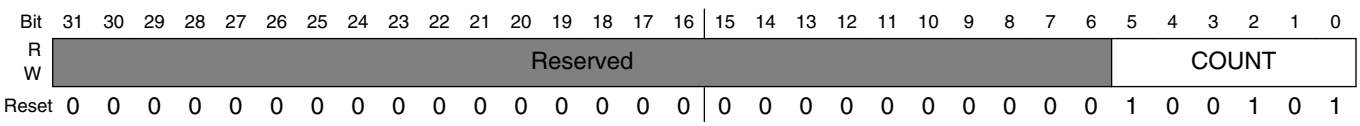
MIPI_HSI_AHB_MASTER_CONF field descriptions (continued)

Field	Description
DMA_INSERT_IDLE_NUM	These bits used to set the number of "IDLE" cycles when DMA_MODE == 2'b0x.

42.5.42 TX Break Length Register (MIPI_HSI_TX_BREAK_LEN)

This register used to set tx break length

Address: 220_8000h base + 22Ch offset = 220_822Ch



MIPI_HSI_TX_BREAK_LEN field descriptions

Field	Description
31–6 Reserved	This field is reserved. Reserved, always set to zero.
COUNT	The tx break length count. 6'h00 64 6'h01 1 6'h3f 63

Chapter 43
MediaLB (MLB)

43.1 Overview

The MLB implements the required functionality of a Media Local Bus (MediaLB) Device. Functionality includes:

- Transmission of commands and data when functioning as the transmitting device associated with a ChannelAddress
- Reception of data and transmission of RxStatus responses when functioning as the receiving device associated with a ChannelAddress
- MediaLB lock detection
- SystemChannel command handling

MediaLB Device functionality is implemented with an MediaLB 3-pin interface . The MediaLB interfaces are capable of exchanging data at speeds up to 1024xFs in 3-pin mode.

A set of physical channels for exchanging data over the MediaLB bus is supported. These physical channels (4 bytes in length, or a quadlet) can be grouped into logical channels, where each logical channel is referenced using a ChannelAddress and represents a unidirectional data path between a specific MediaLB Device transmitting the data and the MediaLB Device(s) receiving the data. The logical channels, configured by system software, can be any combination of channel types (synchronous, asynchronous, isochronous, or control) and direction (transmit or receive).

43.1.1 Block Diagram

The following figure is the top-level block diagram of the MLB behavioral models.

43.1.1.1 Bus Interfaces

The external bus interfaces include:

- MediaLB 3-pin Interface
- MediaLB 6-pin Interface
- MediaLB Analog Configuration Interface
- Channel Table Bus (CTB) Interface
- Data Buffer Bus (DBB) Interface
- System Interface
- AMBA Advanced High-performance Bus (AHB) Interface
- AMBA Advanced Peripheral Bus (APB) Interface

43.2 External Signals

The table found here describes the external signals of MLB.

Table 43-1. MLB External Signals

Signal	Description	Pad	Mode	Direction
MLB_CLK	3-Wire clock signal	ENET_TXD1	ALT0	I
		GPIO_3	ALT7	
MLB_CLK_N	Negative clock signal	MLB_CN	No Muxing	I
MLB_CLK_P	Positive clock signal	MLB_CP	No Muxing	I
MLB_DATA	3-Wire data signal	ENET_MDC	ALT0	I/O
		GPIO_2	ALT7	
MLB_DATA_N	Negative data signal	MLB_DN	No Muxing	I/O
MLB_DATA_P	Positive data signal	MLB_DP	No Muxing	I/O
MLB_SIG	3-Wire signal	ENET_RXD1	ALT0	I/O
		GPIO_6	ALT7	
MLB_SIG_N	Negative signal	MLB_SIG_N	No Muxing	I/O
MLB_SIG_P	Positive signal	MLB_SIG_P	No Muxing	I/O

43.3 Clocks

The table found here describes the clock sources for MLB.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

Table 43-2. MLB150 Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	AHB bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
sys_clk	axi_clk_root	Module clock
mem_ct_CLK	axi_clk_root	Channel table bus clock
mem_db_CLK	axi_clk_root	Data buffer bus clock

43.4 Functional Description

This section describes the functional architecture of the MLB.

The internal functional blocks of the MLB include:

- MediaLB Block (mlb_top) - Implements the physical and link-layer requirements of MediaLB 3-pin interface. Serial-to-parallel and parallel-to-serial data transformations are implemented, as well as MediaLB frame synchronization
- Host Bus Interface Block (hbi_top) - Provides 16-bit parallel slave access to all MOST channels and data types for the external Host Controller (HC). The HBI supports up to 64 independent channels with a minimum access latency of 40 ns per word and a maximum bandwidth of 400 Mbps
- Routing Fabric Block (rf_top) - Manages the flow of data between the MediaLB block and the HBI block, implementing a bus arbiter and muxing logic to the Channel Table RAM (CTR) and the Data Buffer RAM (DBR)
- Memory Interface Block (mif_top) - Implements a bridge between the I/O bus and the customer-implemented RAMs (i.e. Channel Table and Data Buffer)
- Interrupt Interface Block (intif_top) - Sends notifications to HBI that there are changes to the channel descriptors
- Clocks, Power, and Reset Block (cpr_top) - Implements clock and reset muxing and synchronization
- AMBA AHB Block (ahb_top) - Implements a bus bridge between the AHB master and the HBI slave interfaces
- AMBA APB Block (apb_top) - Implements a bus bridge that translates the two cycle APB interface signals to the single-cycle I/O interface signals

43.4.1 MediaLB Block

The Media Local Bus (MediaLB) block supports MediaLB 3-pin interface. Both MediaLB interfaces provide real-time access to all network data types including streaming, packet, control, and isochronous data.

- MediaLB 3-pin Interface - Supports the MediaLB protocol for single-ended 3-pin mode, with a maximum data rate of 1024xFs (49.152 MHz at Fs=48 kHz).

43.4.1.1 MediaLB Channel Address to Logical Channel Mapping

The MediaLB channel addresses are mapped to the logical channels as follows.

Table 43-3. MediaLB Channel Address to Logical Channel Mapping

Channel Address	Logical Channel
0x0002	1
0x0004	2
0x0006	3
....	....
0x007C	62
0x007E	63
0x01FE	0*
* Logical Channel 0 is the System Channel and is reserved.	

43.4.2 Host Bus Interface Block

The Host Bus Interface (HBI) block provides a 16-bit parallel slave port that provides an external Host Controller (HC) with access to all MOST channels and data types.

Up to 64 independent HBI channels are available to the HC, each configurable for either transmitting or receiving a particular application data type (synchronous, isochronous, asynchronous, or control). The HBI block provides source and sink access to the full network data bandwidth.

43.4.2.1 HBI Physical Addresses

To access a particular HBI DMA channel, hardware must first translate the HBI channel address to a channel allocation table (CAT) physical address. This physical address is then used to retrieve the channel label (CL), which in turn retrieves the channel descriptor.

See Table 43-4 for more information on the mapping between the HBI channel address and physical address.

Table 43-4. HBI Channel Address to Physical Address Mapping

HBI Channel	CAT Address	CAT Offset
0x0	0x88	000
0x1	0x88	001
0x2	0x88	010
0x3	0x88	011
0x4	0x88	100
0x5	0x88	101
0x6	0x88	110
0x7	0x88	111
0x8	0x89	000
...	...	...
0x3E	0x8F	110
0x3F	0x8F	111

43.4.3 Routing Fabric Block

The Routing Fabric (RF) block manages the flow of data between the MediaLB Port and the HBI Port. Bus multiplexers and a bus arbiter are implemented in the RF block for accessing the channel table RAM (CTR) and data buffer RAM (DBR).

Each DMA controller in the routing fabric uses Channel Descriptors (stored in the CTR) to manage access to dynamic buffers in the DBR.

43.4.3.1 Data Buffer RAM

The MLB has an external data buffer RAM (DBR) that is 8-bit x 16k entries deep. The DBR provides dynamic circular buffering between the transmit and receive devices.

The size and location of each data buffer is defined by software in the channel descriptor table (CDT), which is located in the CTR.

Receive devices retain the write address pointer to the associated circular data buffer in the DBR, while transmit devices retain the read address pointer. The DMA controllers in the routing fabric are responsible for ensuring that the circular buffers do not overflow or underflow. Each channel type (e.g. synchronous, isochronous, asynchronous and control) has Full and Empty detection.

43.4.3.1.1 Synchronous Channels

For synchronous channels, two mechanisms prevent overflow and underflow of the data buffer:

- Hardware aligns the read pointer (RPTR) to the write pointer (WPTR) to ensure an offset of two sub-buffers.
- RPTR and WPTR are periodically synchronized to the start of the next sub-buffer (e.g. following a FRAMESYNC).

43.4.3.1.2 Isochronous Channels

For isochronous channels, hardware does not read from an empty data buffer or write to a full data buffer. The conditions used by hardware for detection include:

Data buffer Empty condition: (RPTR = WPTR) AND (BF = 0), and

Data buffer Full condition: (WPTR = RPTR) AND (BF = 1).

43.4.3.1.3 Asynchronous and Control Channels

For asynchronous and control channels, hardware does not read from an empty data buffer or write to a full data buffer. Hardware evaluates the DMA pointers (RPTR, WPTR) and packet count (RPC, WPC) to detect the data buffer condition, where:

- Data buffer Empty condition: (RPTR = WPTR) AND (RPC = WPC), and
- Data buffer Full condition: ((WPTR = RPTR) AND (WPC != RPC)) OR (WPC = (RPC - 1)).

43.4.3.2 Channel Table RAM

The MLB has an external Channel Table RAM (CTR) that is 128-bit x 144-entry. The CTR allows system software to dynamically configure channel routing and allocate data buffers in the DBR.

The CTR is logically divided into three sub-tables:

- Channel Descriptor Table (CDT)
- AHB Descriptor Table (ADT)
- Channel Allocation Table (CAT)

43.4.3.2.1 Address Mapping

Table 43-5. CTR Address Mapping

Label	Address	Bits 127…96	Bits 95…64	Bits 63…32	Bits 31…0
Channel Descriptor Table (CDT):					
CDT	0x00	CDT0[127:0], CL = 0			
	0x01	CDT1[127:0], CL = 1			
	0x02	CDT2[127:0], CL = 2			
	...	...			
	0x3D	CDT61[127:0], CL = 61			
	0x3E	CDT62[127:0], CL = 62			
	0x3F	CDT63[127:0], CL = 63			
AHB Descriptor Table (ADT):					
ADT*	0x40	ADT0[127:0]			
	0x41	ADT1[127:0]			
	0x42	ADT2[127:0]			
	...	...			
	0x7D	ADT61[127:0]			
	0x7E	ADT62[127:0]			
	0x7F	ADT63[127:0]			
Channel Allocation Table (CAT):					
CAT for MediaLB	0x80	CAT7	CAT6	CAT5	CAT4	CAT3	CAT2	CAT1	CAT0
	...	...	...	...	...	...	...	...	...
	0x87	CAT63	CAT62	CAT61	CAT60	CAT59	CAT58	CAT57	CAT56

	...	...	...	...	...	...	...	...	...
	0x8F	CAT127	CAT126	CAT125	CAT124	CAT123	CAT122	CAT121	CAT120
* A fixed relationship exists between ADT entries and HBI CAT entries. When using HBI channel 0 (CAT64) on should program ADT0. When using HBI channel 1 (CAT65) on should program ADT1, and so on.									

43.4.3.2.2 Channel Allocation Table

The Channel Allocation Table (CAT) is comprised of 16 CTR entries (addresses 0x80 - 0x8F), as shown in Table 43-5. Each 16-bit CAT entry represents a logical connection to or from a transmit/receive device (e.g. MediaLB or HBI channel). All entries are indexed according to a fixed physical address assigned to every Rx/Tx channel (as shown in Table 43-6). The value stored in a CAT entry includes a 6-bit Connection Label, which

provides a pointer to the CDT. To complete a logical channel and form a routing connection, system software must assign the same Connection Label to both the Rx and Tx channels.

Table 43-6. CAT Entry Map

Peripheral	Tx Channels	Rx Channels	CAT Start Index	CAT End Index	Entries
MediaLB	0 to 64	64 - Tx Channels	0	63	64
HBI	0 to 64	64 - Tx Channels	64	127	64

The format of a full CAT entry is shown in Table 43-7, with field descriptions described in Table 43-8. All reserved bits of a CAT entry field should be written as zero.

Table 43-7. CAT Entry Formats

Channel Type	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Isochronous	rsvd	FCE	rsvd	RNW	CE	CT[2:0] = 3			rsvd		CL[5:0]

Field	Description
CL[5:0]	Connection Label (offset into CDT)
CT[2:0]	Channel Type (Others): 111 = Reserved 110 = Reserved 101 = Reserved 100 = Reserved 011 = Isochronous 010 = Asynchronous 001 = Control 000 = Synchronous
CE	Channel Enable: 1 = Enabled 0 = Disabled
RNW	Read Not Write: 1 = Read 0 = Write
MT	Mute Enable: 1 1 = Enabled 0 = Disabled
FCE	Flow Control Enable: 2 1 = Enabled 0 = Disabled
MFE	Multi-Frame per Sub-buffer Enable: 3 1 = Enabled 0 = Disabled
rsvd	Reserved. Software writes a zero to all Reserved bits when the entry is initialized. The Reserved bits are Read-only after initialization.
1. When set for synchronous channels, the MT bit forces Rx channels to write zeros into the channel data buffer, and Tx channels to output zeros on the physical interface. When set for asynchronous and control channels, the MT bit causes DMA to halt at a packet boundary. Not valid for isochronous channels. 2. The FCE bit is used by MediaLB isochronous Rx channels only. 3. The MFE bit is used by MediaLB synchronous channels only.	

43.4.3.2.2.1 Channel Setup

Data direction in the MLB is in reference to the DBR. Therefore, the data direction of CAT entries corresponding to the same channel is reversed for the HBI CAT and the MediaLB CAT.

For a Tx channel (from the HC to the MediaLB interface):

- HBI CAT entry: RNW = 0 (write)
- MediaLB CAT entry: RNW = 1 (read)

Conversely, for a Rx channel (data from MediaLB to HC):

- HBI CAT entry: RNW = 1 (read)
- MediaLB CAT entry: RNW = 0 (write)

The figure below illustrates the directional relationship in the MLB.

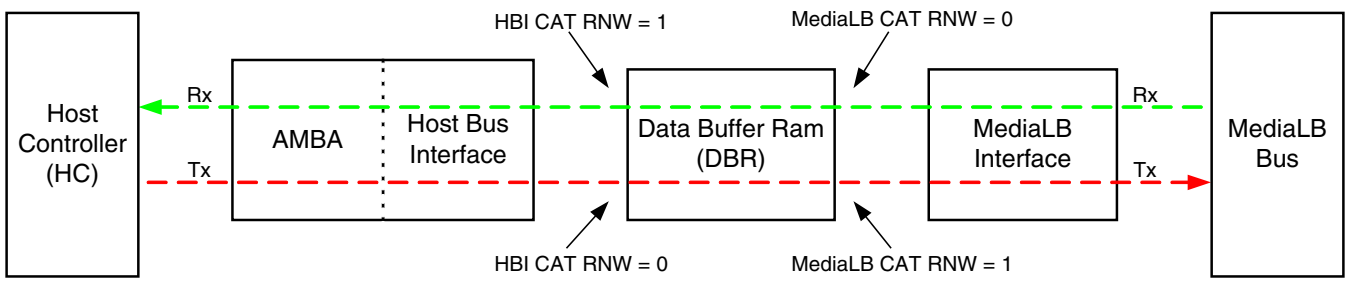

Figure 43-1. MLB DBR Directional Relationship

43.4.3.2.3 Channel Descriptor Table

The *Channel Descriptor Table* (CDT) is comprised of 64 CTR entries (addresses 0x00 - 0x3F), as shown in Table 43-5.

Each 128-bit CDT entry (also referred to as a *Channel Descriptor*) is referenced by a *Connection Label* and contains information about a data buffer in the DBR (e.g. buffer size, address pointers).

The format of each CDT entry (also referred to as a *Channel Descriptor*) is dependent on the channel type (e.g. synchronous, isochronous, asynchronous, or control).

NOTE

All reserved *Channel Descriptor* bits must be written to '0' by software when initialized.

43.4.3.2.3.1 Synchronous Channel Operation

A sample synchronous data buffer is shown in the figure found here.

A sample synchronous data buffer is shown in the figure below. Each data buffer contains four sub-buffers and each sub-buffer contains space for 1 to 64 frames of data, determined by MLBC0.FCNT[2:0].

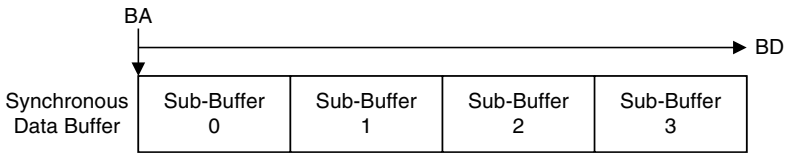

Figure 43-2. Synchronous Data Buffer Structure

43.4.3.2.3.2 Synchronous Channel Descriptors

The format and field definitions for a synchronous CDT entry are shown in the tables below respectively.

Table 43-9. Synchronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	WSBC		Reserved													
16	RSBC		Reserved													
32	Reserved															
48	Reserved															
64	WSTS[3:0]				WPTR[11:0]											
80	RSTS[3:0]				RPTR[11:0]											
96	Reserved				BD[11:0]											
112	Reserved		BA[13:0]													

Table 43-10. Synchronous CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - BD = 4 x m x bpf - 1, where: m = frames per sub-buffer (for MFE = 0, m = 1) bpf = bytes per frame.	r,w
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates	r,w,u

Table continues on the next page...

Table 43-10. Synchronous CDT Entry Field Definitions (continued)

Field	Description	Details	Accessibility
		- Counts the write address offset within a buffer - DMA write address = BA + WPTR	
RSBC	Read Sub-buffer Counter	- Software initializes to zero, hardware updates - Counts the read sub-buffer offset - DMA uses for pointer management	r,w,u
WSBC	Write Sub-buffer Counter	- Software initializes to zero, hardware updates - Counts the write sub-buffer offset - DMA uses for pointer management	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - RSTS states:* xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - WSTS states:* xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle 1xxx = command protocol error	r,w,u
Reserved	Reserved	- Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers).			

43.4.3.2.3.3 Isochronous Channel Descriptors

The format and field definitions for an isochronous CDT entry are shown in the tables below respectively.

Table 43-11. Isochronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Reserved															
16	Reserved															
32	Reserved							BS[8:0]								
48	Reserved															
64	WSTS[2:0]			WPTR[12:0]												

Table continues on the next page...

48	rsvd	RPC[7:5]			Reserved											
64	WSTS[3:0]				WPTR[11:0]											
80	RSTS[3:0]				RPTR[11:0]											
96	RSTS[4]	WSTS[4]	rsvd		BD[11:0]											
112	Reserved		BA[13:0]													

Table 43-14. Asynchronous/Control CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - BD >= max packet length - 1	r,w
RPC	Read Packet Count	- Software initializes to zero, hardware updates - Used in conjunction with WPC, RPTR and WPTR to determine if the buffer is empty or full	r,w,u
WPC	Write Packet Count	- Software initializes to zero, hardware updates - Used in conjunction with RPC, RPTR and WPTR to determine if the buffer is empty or full	r,w,u
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u

Table continues on the next page...

Table 43-14. Asynchronous/Control CDT Entry Field Definitions (continued)

Field	Description	Details	Accessibility
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA read address = BA + WPTR	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - Status states:* x0x00 = idle xx1xx = *ReceiverProtocolError* response received from Rx Device 1xxxx = *ReceiverBreak* command received from Rx Device	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - Status states:* x0x00 = idle xx1xx = command protocol error detected 1xxxx = *AsyncBreak*/*ControlBreak* command received from Tx Device	r,w,u
Reserved	Reserved	Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers)			

43.4.4 Memory Interface Block

The Memory Interface (MIF) block implements a bridge between the I/O and the CTB or DBB interfaces.

The MIF block diagram is shown in the figure below. The targeted RAM (CTR or DBR) is determined by the target location bit in the memory address register (MADR.TB).

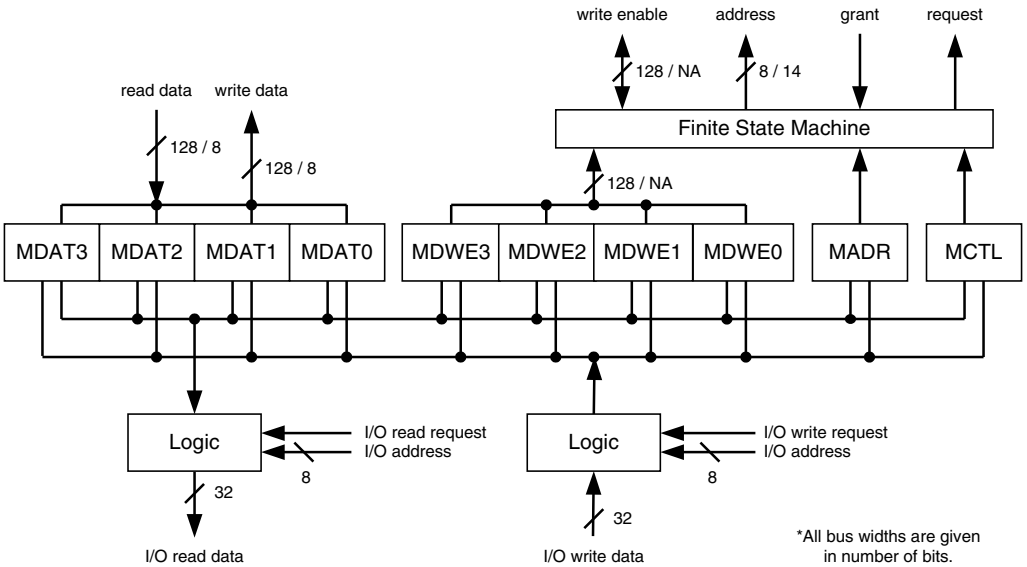

Figure 43-3. MIF Block Diagram

NOTE

The size of the read data, write data, write enable, and address buses are dependent on whether the CTB or DBB interfaces are used. In the figure above, the first number is for CTR accesses while the second is for DBR accesses (i.e. CTR bus width / DBR bus width).

43.4.4.1 CTR Access

The MIF block allows the HC to directly access the external Channel Table RAM (CTR) when MADR.TB is cleared. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

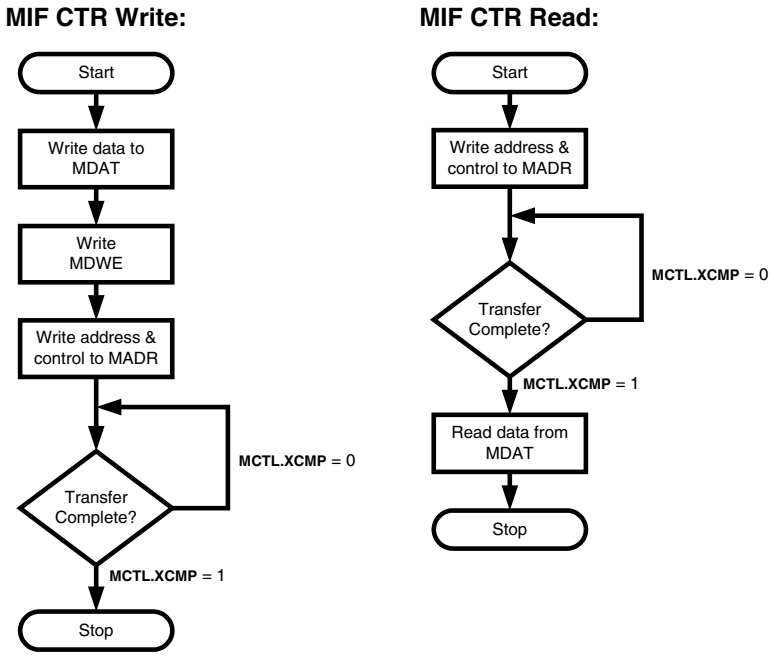

Figure 43-4. MIF CTR Read and Write Flow Diagrams

43.4.4.1.1 Direct CTR Writes

For a direct write of the CTR, the HC first loads the 128-bit data entry into the MDAT0-3 registers. Bitwise write enable control is available via the MDWE0-3 registers.

After the MDATn and MDWEn registers are set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

43.4.4.1.2 Direct CTR Reads

For a direct read of the CTR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0

- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the read is complete. The HC can then read the 128-bit data entry from the MDAT0-3 registers.

43.4.4.1.3 CTR Addressing

The CTR is addressed as a 128-bit wide value. However, the MIF block can only access 32 bits of the addressed CTR data in a single access. Therefore, four 32-bit accesses through the MIF block are required to access a single 128-bit value (e.g. CDT entry).

To access a 16-bit CAT entry in the CTR, only a single access through the MIF is required. For example, to load a CAT61 entry for an isochronous Tx channel with mute and flow control enabled:

- Write MDAT2 = 7B070000h (assumes Connection Label = 7)
- MDWE2 = FFFF0000h (bitwise write enable for 16 msbs; assumes MDWE0/1/3 = 00000000h)
- MADR = 80000087h (write CTR address 87h)

43.4.4.2 DBR Access

The MIF block allows the HC to access the external Data Buffer RAM (DBR) directly when MADR.TB is set. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

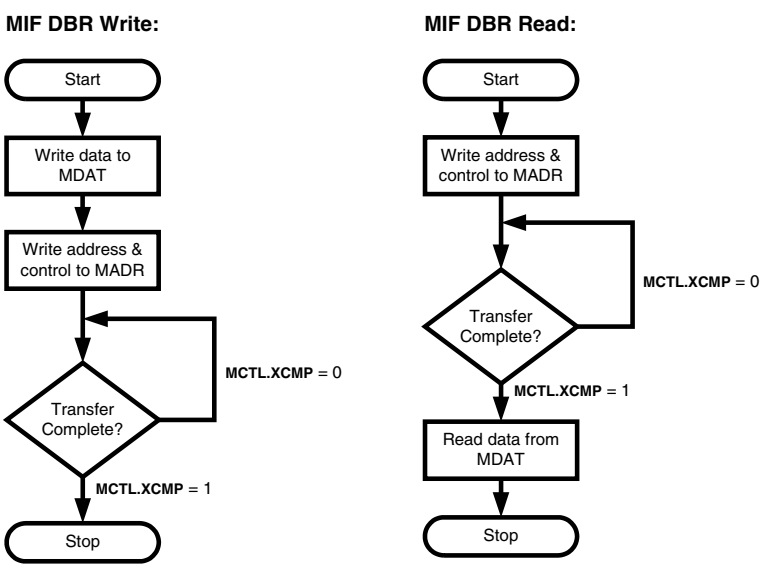

Figure 43-5. MIF DBR Read and Write Flow Diagrams

43.4.4.2.1 Direct DBR Writes

For a direct write of the DBR, the HC first loads the 8-bit data entry into the MDAT0 register at bits[7:0]. MDAT1-3 and MDWE0-3 are not used for DBR access.

After the MDAT0 register is set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

43.4.4.2.2 Direct DBR Reads

For a direct read of the DBR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the read is complete. The HC can then read the 8-bit data entry from the MDAT0 register at bits[7:0].

43.4.5 Interrupt Interface Block

The Interrupt Interface (INTIF) block performs a low-priority polling algorithm of each of the HBI channel descriptors.

The INTIF alerts the HBI block when specific changes to HBI Channel Descriptors occur.

- For asynchronous and control read/write channels:
  - a packet is available to read in the channel buffer, or
  - sufficient empty space is available in the channel buffer to accept a requested packet write.
- For isochronous read/write channels:
  - the number of valid bytes in the channel buffer exceeds the block size, or
  - the number of empty bytes in the channel buffer exceeds the block size.

43.4.6 AMBA AHB Block

The AMBA AHB block manages data exchange between local channel data buffers within the MLB and the system memory buffer.

To support system memory buffering, a ping-pong memory structure is implemented on a per-channel basis using 128-bit descriptors for AHB Descriptor Table (ADT) entries.

NOTE

The 64 ADT entries are directly mapped to the 64 HBI physical channels.

Each logical channel is assigned a separate 128-bit descriptor, defining the data buffers in the system memory used by the DMA interface for that channel. The descriptors are stored at fixed addresses in the external CTR.

43.4.6.1 AHB Descriptor Table

The table below provides an overview of field definitions for ADT entries.

Table 43-15. ADT Field Definitions

Field	No. of Bits	Description	Accessibility
CE	1	Channel enable: 0 = Disabled 1 = Enabled	r,w,u
LE	1	Endianess select: 0 = Big Endian 1 = Little Endian	r,w
PG	1	Page pointer. Software initializes to zero, hardware writes thereafter. 0 = Ping buffer 1 = Pong buffer	r,w,u
RDY1	1	Buffer ready bit for ping buffer page: 0 = Not ready 1 = Ready	r,w
RDY2	1	Buffer ready bit for pong buffer page: 0 = Not ready 1 = Ready	r,w
DNE1	1	Buffer done bit for ping buffer page: 0 = Not done 1 = Done	r,u,c0
DNE2	1	Buffer done bit for pong buffer page: 0 = Not done 1 = Done	r,u,c0
ERR1	1	AHB error response detected for ping buffer page: 0 = No error 1 = Rrror	r,u,c0
ERR2	1	AHB error response detected for pong buffer page: 0 = No error 1 = Error	r,u,c0
PS1	1	Packet start bit for ping buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
PS2	1	Packet start bit for pong buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
MEP1	1	Most Ethernet Packet (MEP) indicator for ping buffer page: 0 = Not MEP 1 = MEP MEP1 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx

Table continues on the next page...

Table 43-15. ADT Field Definitions (continued)

Field	No. of Bits	Description	Accessibility
MEP2	1	MEP packet indicator for pong buffer page: 0 = not MEP 1 = MEP MEP2 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx
BD1*	11 to 13	Buffer depth for ping buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BD2*	11 to 13	Buffer depth for pong buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BA1	32	Buffer base address for ping buffer page	r,w
BA2	32	Buffer base address for pong buffer page	r,w
Reserved	varies	Software writes a zero to all *Reserved* bits when the entry is initialized. The *Reserved* bits are *Read-only* after initialization.	r,w,u
* The buffer depth (BD1 and BD2) for synchronous channels must consider if *Multi-Frame per Sub-buffer* mode is enabled.			

Data exchange across the AHB interface can be configured as Little Endian (LE = 1) or Big Endian (LE = 0). The figure below provides an overview of the endian options, chosen by an ADT descriptor field.

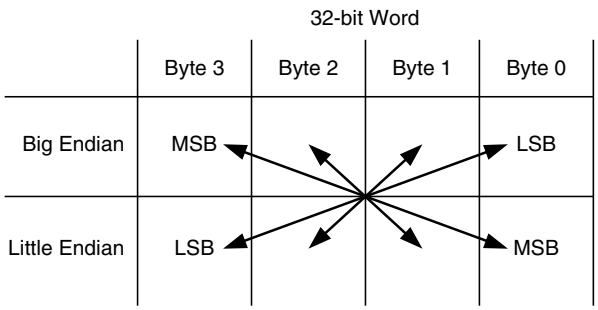

Figure 43-6. Endianness Overview

The figure below shows an example of the ping-pong system memory structure. This system memory structure is similar for all channel types and shows the relationship between the BAn, BDn, and PG descriptor fields.

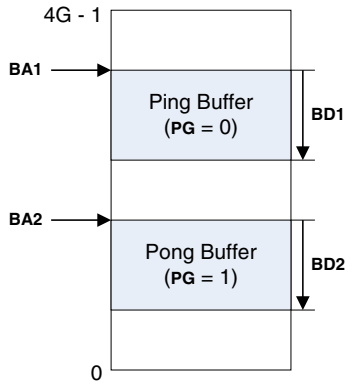

Figure 43-7. Ping-Pong System Memory Structure

Each ADT entry holds a 32-bit BAn field which defines the start of each ping or pong buffer within system memory. The BDn field is used to indicate the size for the respective ping or pong page. The maximum size is 2k-entries for asynchronous and control channels; 8k-entries for isochronous and synchronous channels.

43.4.6.2 AHB Synchronous Channel Descriptors

The table below shows the format for a synchronous ADT entry. The field definitions are defined in Table 43-15. Each synchronous channel buffer can be up to 8k-bytes deep.

Table 43-16. Synchronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY 1	DNE 1	ERR 1	BD1[12:0]												
48	RDY 2	DNE 2	ERR 2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

43.4.6.3 AHB Isochronous Channel Descriptors

The isochronous buffering scheme allows each ping or pong buffer to contain a single block or a multiple number of blocks. For this reason, the isochronous buffer depth (BDn) must be defined in terms of an *integer number* (n) and *block size* (BS) (e.g. BDn = n x (BS + 1) - 1).

Table 43-17 shows the format for an isochronous ADT entry. The field definitions are defined in Table 43-15. Each isochronous channel buffer can be up to 8k-bytes deep.

Table 43-17. Isochronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	BD1[12:0]												
48	RDY2	DNE2	ERR2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

43.4.6.4 AHB Asynchronous and Control Channel Descriptors

Every asynchronous and control packet adheres to the Port Message Protocol (PMP), which designates the first two bytes of each packet as the packet length (PML). Each packet must be no more than 2048 bytes.

Software must set the buffer ready bit (RDYn) for each buffer as it programs the DMA. As hardware processes each buffer, it sets the done bit (DNEn) and generates an interrupt to inform HC. When hardware finishes processing a buffer it can begin processing another buffer if RDYn is set. The application is responsible for setting up and configuring the channel buffer descriptor prior to every DMA access on the channel.

Two packet modes are supported by hardware for programming the DMA, single-packet mode and multiple-packet mode.

43.4.6.4.1 Single-packet Mode

The single-packet mode asynchronous and control buffering scheme supports a maximum of one packet per buffer (e.g. ping or pong). Both non-segmented and segmented data packets are allowed while using single-packet mode.

Non-segmented packets are exchanged when only one buffer (e.g. ping or pong) is needed for packet transfer. Segmented packets are exchanged when a single packet is too long for one buffer and the packet must span multiple buffers. The figure below shows the memory space usage for both non-segmented and segmented asynchronous or control packets along with the packet start bit (PSn). While using single-packet mode, buffer done (DNEn) is set in hardware when a packet is done or the buffer is full.

Table 43-18 shows the format for single-packet mode asynchronous and control ADT entries. The field definitions are defined in Table 43-15.

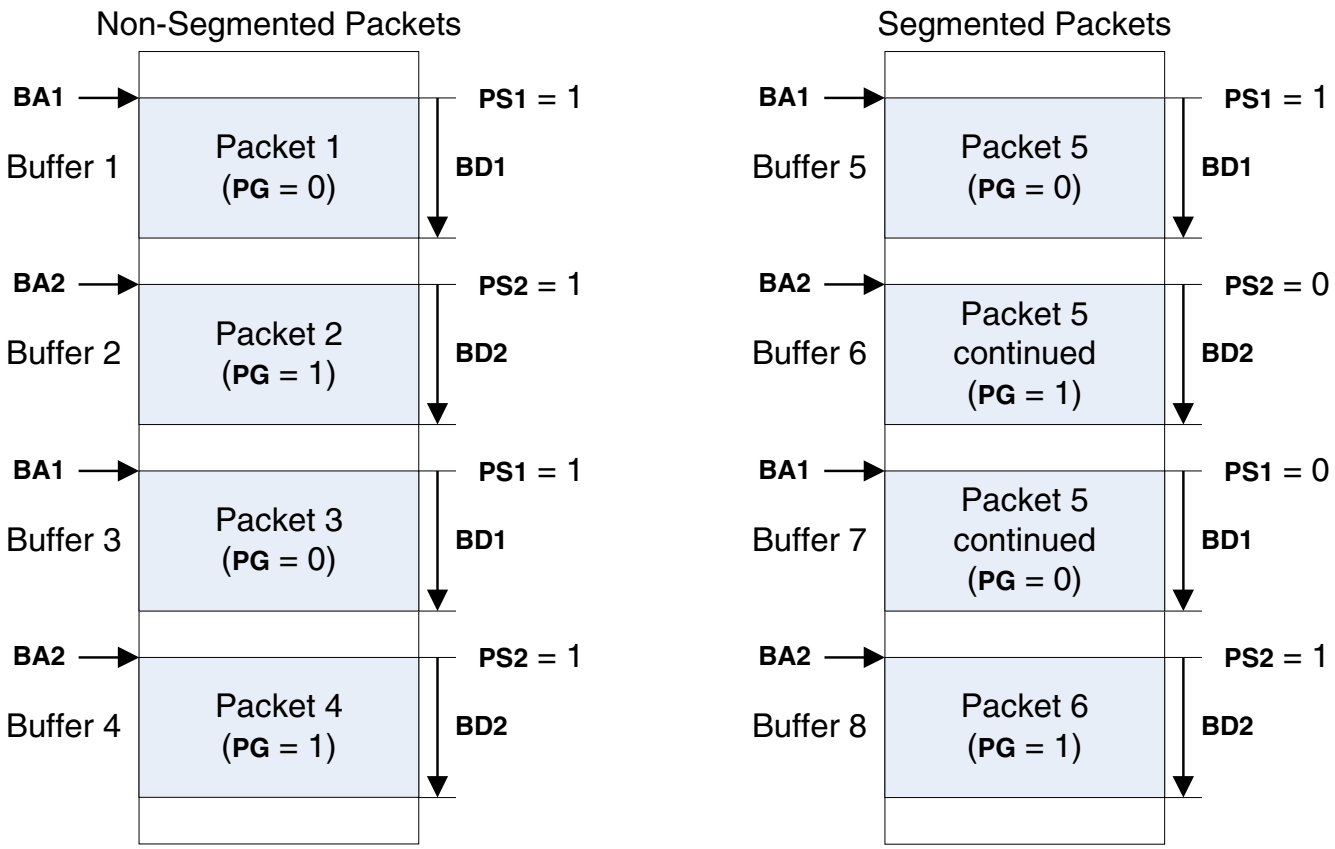

Figure 43-8. Single-packet Asynchronous or Control System Memory Structure

Table 43-18. Single-packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	PS1	MEP1	BD1[10:0]										
48	RDY2	DNE2	ERR2	PS2	MEP2	BD2[10:0]										
64	BA1[15:0]															
80	BA1[31:16]															

Table continues on the next page...

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
96	BA2[15:0]															
112	BA2[31:16]															

43.4.6.4.2 Multiple-packet Mode

The multiple-packet mode asynchronous and control buffering scheme supports more than one packet per system memory buffer, as shown in the figure below. Multiple-packet mode reduces the interrupt rate for packet channels at the cost of increasing buffering and latency.

For Tx packet channels in multiple-packet mode, software sets the packet start bit (PSn) for every buffer. Setting PSn informs hardware that the first two bytes of the buffer contains the port message length (PML) of the first packet. After the first packet, hardware keeps track of where packets start and end within the current buffer. Software should not write to PSn while the buffer is active (RDYn = 1 and DNEn = 0). For Tx packet channels, the buffer is done (DNEn= 1) when the last byte of the last packet in the buffer is read from system memory. Software should set the buffer depth to contain the exact number of complete packets for that buffer. Segmented buffers are not supported for Tx packet channels in multiple-packet mode.

For Rx packet channels in multiple-packet mode, PSn has no meaning and should be ignored. Software is responsible for keeping track of where each packet starts and ends within the multiple-packet buffer via the packet PML. The buffer done bit (DNEn) is set in hardware for Rx channels when a buffer is full (see Buffer 1 in the figure below) or if a packet ends exactly 1-byte before the end of the buffer (see Buffer 2 in the figure below). Multiple-packet mode also supports segmented Rx packets spanning two or more buffers (see Buffers 3 - 6in the figure below).

Table 43-19 shows the format for multiple-packet mode asynchronous and control ADT entries. The field definitions are defined in Table 43-15.

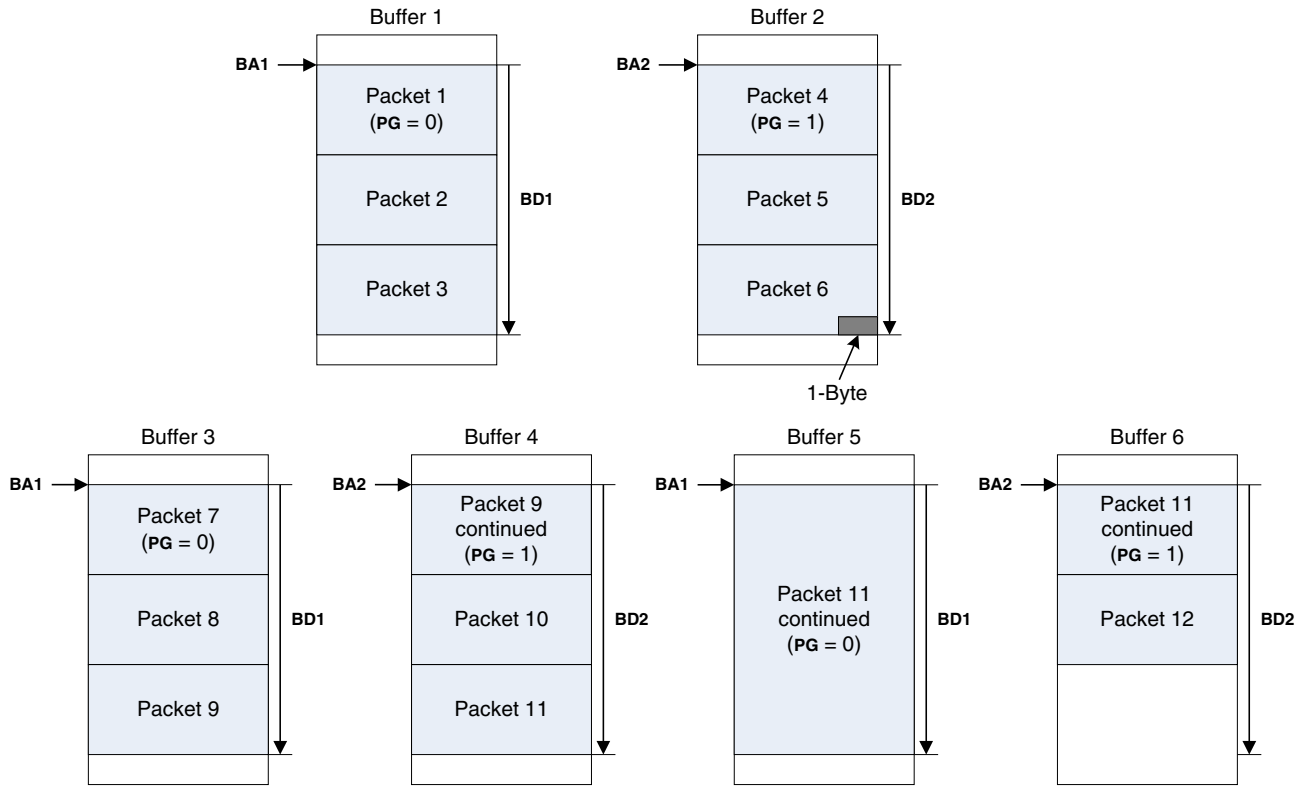

Figure 43-9. Multiple-packet Asynchronous or Control System Memory Structure

Table 43-19. Multiple-packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

* PSn is only valid for TX channels. Set PSn = 1 at the start of the buffer.																

43.5 Software Flow

The top-level software tasks the application must perform can be placed in two categories.

- Channel Initialization
- Channel Servicing

43.5.1 Channel Initialization

The software flow required to initialize a channel must be performed in order to ensure proper operation.

For clarity, the software flow is grouped as follows:

- Configure the Hardware
- Program the Routing Fabric Block
- Program the AMBA AHB Block DMAs
- Synchronize and Unmute Synchronous Channel

43.5.1.1 Configure the Hardware

The MLBC0, HMCR0, HMCR1 and HCTL registers are accessible directly via APB reads and writes.

1. Initialize CTR and registers
   a. Set all bit of the CTR (CAT, CDT, and ADT) to'0'.
   b. Set all bits of all registers to'0'.
2. Configure the MediaLB interface
   a. Select 3-pin MediaLB operation: MLBC0.MLBPEN = 0 (3-pin)
   b. Select MediaLB clock speed via MLBC0.MLBCLK
   c. Set MediaLB enable via MLBC0.MLBEN
3. Configure the HBI interface
   a. Set HMCR0 and HMCR1 = FFFFFFFFh to activate all channels
   b. Set the HBI enable bit: HCTL.EN = 1

43.5.1.2 Program the Routing Fabric Block

The CAT and CDT reside in the external CTR and are programmed indirectly via APB or I/O reads and writes to the MIF block.

1. Initialize all bits of the CAT to '0'
2. Select a logical channel: N = 0 - 63
3. Program the CDT for channel N
   a. Set the 14-bit base address (BA)

b. Set the 12-bit or 13-bit buffer depth (BD): BD = buffer depth in bytes -1
   - i. For synchronous channels: (BD + 1) = 4 x frames per sub-buffer (m) x bytes-per-frame (bpf)
   - ii. For isochronous channels: (BD + 1) mod (BS + 1) = 0
   - iii. For asynchronous channels: (BD + 1) >= max packet length (1024 for a MOST Data Packet (MDP); 1536 for a MOST Ethernet Packet (MEP))
   - iv. For control channels: (BD + 1) >= max packet length (64)

c. For isochronous channels, set the block size (BS): BS = block size in bytes - 1
d. Set all other bits of the CDT to '0'

4. Program the CAT for the inbound DMA
   a. For Tx channels (to MediaLB) HBI is the inbound DMA
   b. For Rx channels (from MediaLB) MediaLB is the inbound DMA
   c. Set the channel direction: RNW = 0
   d. Set the channel type: CT[2:0] = 010 (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
   e. Set the connection label: CL[5:0] = N
   f. If CT[2:0] = 000 (synchronous), set the mute bit (MT = 1).
   g. Set the channel enable: CE = 1
   h. Set all other bits of the CAT to '0'
5. Program the CAT for the outbound DMA
   a. For Tx channels (to MediaLB) MediaLB is the outbound DMA
   b. For Rx channels (from MediaLB) HBI is the outbound DMA
   c. Set the channel direction: RNW = 1
   d. Set the channel type: CT[2:0] = 010 (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
   e. Set the channel label: CL[5:0] = N
   f. If CT[2:0] = 000 (synchronous), set the mute bit (MT = 1)
   g. Set the channel enable: CE = 1
   h. Set all other bits of the CAT to '0'
6. Repeat steps 2-5 to initialize all logical channels

43.5.1.3 Program the AMBA AHB Block DMAs

The ADT resides in the external CTR and is programmed indirectly via APB reads and writes to the MIF.

1. Initialize all bits of the ADT to '0'
2. Select a logical channel: N = 0 - 63
3. Program the AMBA AHB block ping page for channel N
   a. Set the 32-bit base address (BA1)
   b. Set the 11-bit buffer depth (BD1): BD1 = buffer depth in bytes - 1

- i. For synchronous channels: (BD1 + 1) = n x frames per sub-buffer (m) x bytes-per-frame (bpf)
- ii. For isochronous channels: (BD1 + 1) mod (BS + 1) = 0
- iii. For asynchronous channels: 5 <= (BD1 + 1) <= 4096 (max packet length)
- iv. For control channels: 5 <= (BD1 + 1) <= 4096 (max packet length)

c. For asynchronous and control Tx channels set the packet start bit (PS1) iff the page contains the start of the packet
d. Clear the page done bit (DNE1)
e. Clear the error bit (ERR1)
f. Set the page ready bit (RDY1)

4. Program the AMBA AHB block pong page for channel N
   a. Set the 32-bit base address (BA2)
   b. Set the 11-bit buffer depth (BD2): BD2 = buffer depth in bytes - 1
      - i. For synchronous channels: (BD2 +1) = n x frames per sub-buffer (m) x bytes-per-frame (bpf)
      - ii. For isochronous channels: (BD2 + 1) mod (BS + 1) = 0
      - iii. For asynchronous channels: 5 <= (BD2 + 1) <= 4096 (max packet length)
      - iv. For control channels: 5 <= (BD2 + 1) <= 4096 (max packet length)

   c. For asynchronous and control Tx channels set the packet start bit (PS2) if the page contains the start of the packet
   d. Clear the page done bit (DNE2)
   e. Clear the error bit (ERR2)
   f. Set the page ready bit (RDY2)
5. Select Big Endian (LE = 0) or Little Endian (LE = 1)
6. Select the active page: PG = 0 (ping), PG = 1 (pong)
7. Set the channel enable (CE) bit for all active logical channels
8. Repeat steps 2-7 for all active logical channels

NOTE

All asynchronous and control packets must start with a PMP header. The first two bytes of the PMP header contains the Port Message Length (PML), which defines the length of the message that follows in bytes (not including PML itself). Hardware uses the PML to determine when a packet is complete. Asynchronous and control packets can also be segmented into two or more pages as well as contain multiple packets per page within system memory.

43.5.1.4 Synchronize and Unmute Synchronous Channel

The MLBC0 and MLBC1 registers are accessible directly via APB reads and writes.

1. Check that MediaLB clock is running (MLBC1.CLKM = 0)
2. If MLBC1.CLKM = 1, clear the register bit, wait one APB or I/O clock cycle and repeat step 1.
3. Poll for MediaLB lock (MLBC0.MLBLK = 1)
4. Wait four frames
5. Unmute synchronous channel(s)

43.5.2 Channel Servicing

After initialization, each channel will require periodic servicing.

The following software flows can be performed concurrently and in any order:

- Servicing the AMBA AHB Block (DMA) Interrupts
- Servicing the MediaLB Interrupts
- Polling for MediaLB System Commands

43.5.2.1 Servicing the AMBA AHB Block (DMA) Interrupts

The ACMR0, ACMR1, ACTL, ACSR0, and ACSR1 registers are accessible directly via APB reads and writes.

1. Program the ACMRn registers to enable interrupts from all active DMA channels
2. Select the status clear method: SCTL.SCE = 0 (hardware clears on read), SCTL.SCE = 1 (software writes a '1' to clear)
3. Select 1 or 2 interrupt signals: SCTL.SMX = 0 (one interrupt for channels 0-31 on *ahb_int[0]* and another interrupt for channels 32-63 on *ahb_int[1]*), SCTL.SMX = 1 (single interrupt for all channels on *ahb_int[0]*)
4. Wait for an interrupt from *ahb_int[1:0]*
5. Read the ACSRn registers to determine which channel or channels are causing the interrupt
6. If SCTL.SCE = 1, write the results of step 5 back to ACSR0 and ACSR1 to clear the interrupt
7. Select a logical channel (N = 0-63) with an interrupt to service
8. Read the ADT entry for channel N
    a. Determine the active page (ping or pong) via the PG bit

b. Determine which page(s) are done via the DNEn bits
c. Determine which channels encountered an AHB error via the ERRn bit
d. Determine which asynchronous and control Rx channel pages contain a packet start via the PSn bit (extract the PML)

9. Reprogram the expired or broken AHB page(s) via steps 3 and 4 in Program the AMBA AHB Block DMAs,
10. Repeat steps 6-9 for all channels with pending interrupts
11. Repeat steps 4-10 while there are active channels

NOTE

Channels that receive an AHB error response are disabled (CE = 0) by hardware.

43.5.2.2 Servicing the MediaLB Interrupts

1. Select the MediaLB Channel Status Register (MSn) to be cleared by software, writing a '0' to the appropriate bits
2. Program MIEN to enable protocol error interrupts for all active MediaLB channels (MIEN.CTX_PE = 1, MIEN.CRX_PE = 1, MIEN.ATX_PE = 1, MIEN.ARX_PE = 1, MIEN.SYNC_PE = 1, and MIEN.ISOC_PE = 1)
3. Wait for an interrupt on the *mlb_int* signal.
4. Read the MSn registers to determine which channel(s) are causing the interrupt
5. Read RSTS/WSTS of the appropriate CDT(s) to determine the interrupt type
6. Clear RSTS/WSTS errors to resume channel operation
   a. For synchronous channels: WSTS[3] = 0
   b. For isochronous channels: WSTS[2:1] = 00
   c. For asynchronous and control channels: RSTS[4]/WSTS[4] = 0 and RSTS[2]/WSTS[2] = 0

43.5.2.3 Polling for MediaLB System Commands

The MLB supports the MediaLB System Commands (e.g. MlbScan, MlbReset, MOST_Unlock). The MediaLB System Status (MSS) Register is used to detect a System Command received from the MediaLB Controller. The MLB automatically sends the appropriate system response to the MediaLB Controller.

The procedure for the application is:

1. The application periodically polls the MSS register.
2. Clear by writing a '0' to the appropriate bit in MSS register after the application finishes the service.

3. If MSS.SWSYSCMD = 1, read the MSD register to receive the system data sent from MediaLB Controller.

43.5.3 Low Power Mode

MLB doesn't provide dedicated low power mode features.

In case the clocks of digital IP need to shut down to save power, the following operations are recommended before entering low power mode:

- Finish any active MLB transfer
- Disable MLB (clear the MLBEN and MLBPEN bits in MLBC0)
- Disable HBI (clear all bits in HCMR0 and HCMR1, clear EN bit in HCTL)
- Mask AHB interrupts (clear all bits in ACMR0 and ACMR1)

For information on configuring the MLB IP if the clocks are re-enabled, see Configure the Hardware.

43.6 MLB Memory Map/Register Definition

The MLB registers are divided into 4 sections.

The first section begins at offset 0h00 and describes the MediaLB block registers.

The second section begins at offset 0h80 and it shows the address mapping of the Internal HBI Registers.

The third set begins at offset 0hC0 and implements ten 32-bit I/O registers for CTR transfers, including: data registers (MDATn), write enable registers (MDWEn), a control register (MCTL), and an address register (MADR).

The fourth set, the AMBA AHB registers, begins at offset 0h3C0. They consist of:

- one 32-bit register for control
- two 32-bit registers for interrupt status
- two 32-bit registers for channel interrupt masks

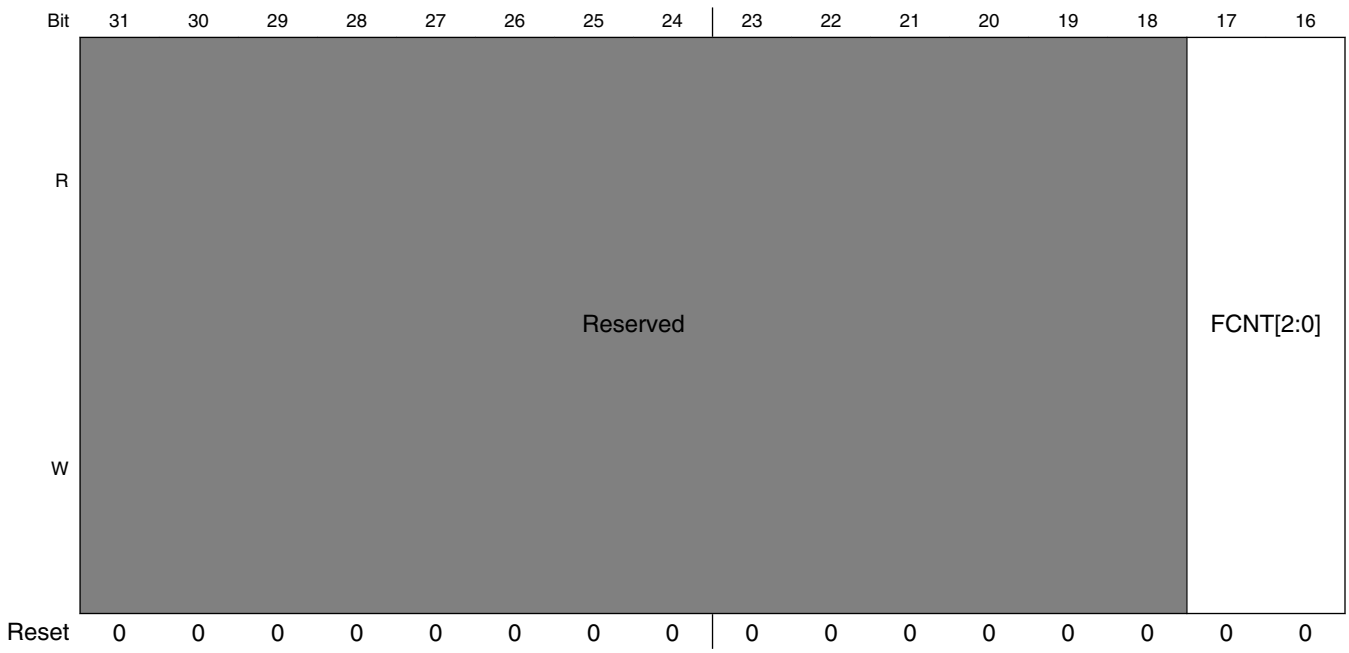
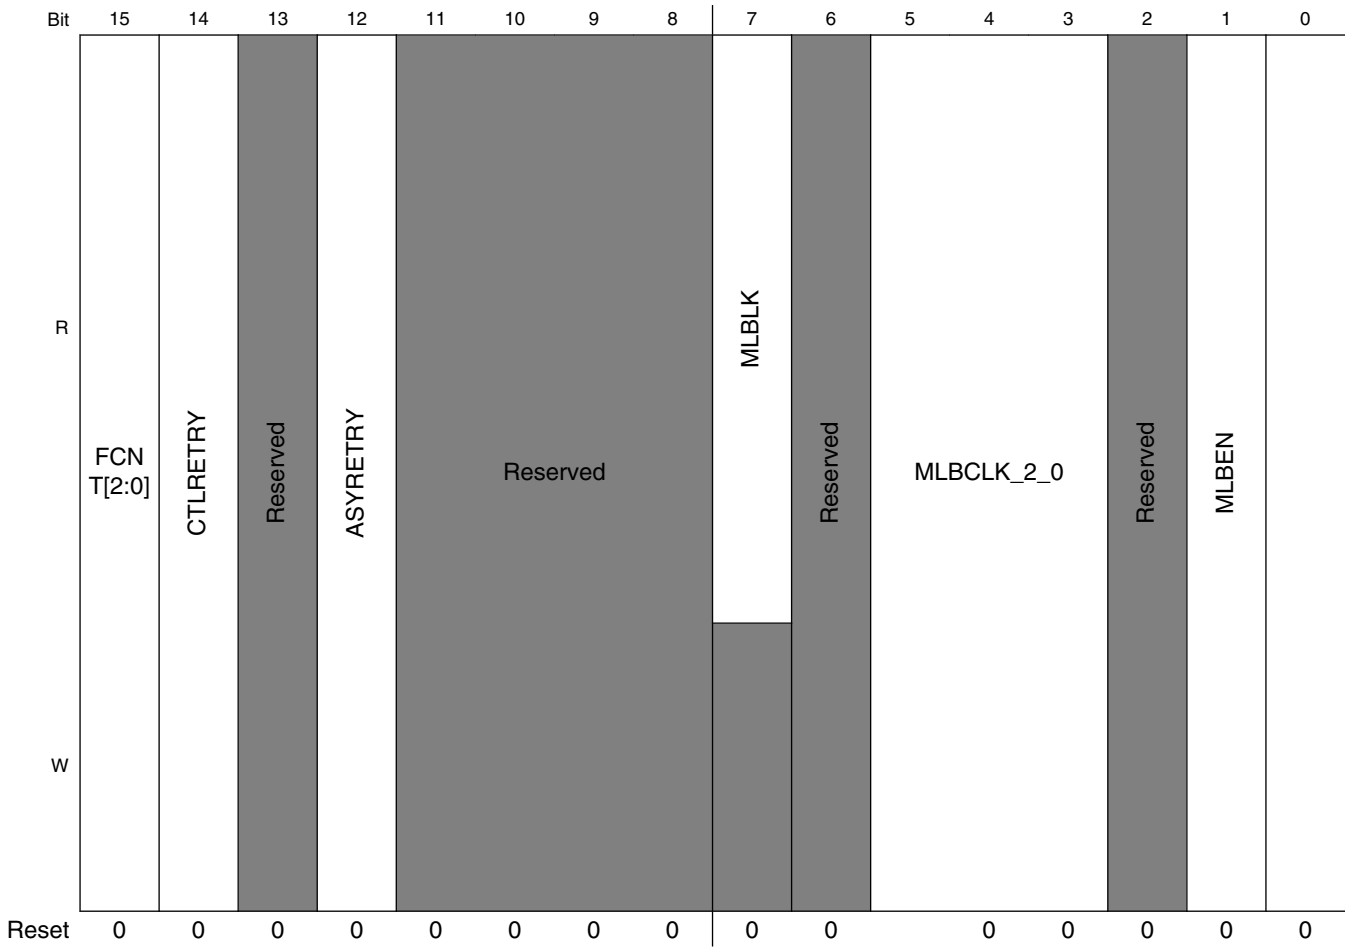
43.6.1 MediaLB Control 0 Register (MLB_MLBC0)

Address: 218_C000h base + 0h offset = 218_C000h





MLB_MLBC0 field descriptions

Field	Description
31–18 -	This field is reserved. Reserved
17–15 FCNT[2:0]	The number of frames per sub-buffer for synchronous channels. 000 1 frame per sub-buffer (Operation is the same as Standard mode.) 001 2 frames per sub-buffer 010 4 frames per sub-buffer 011 8 frames per sub-buffer 100 16 frames per sub-buffer 101 32 frames per sub-buffer 110 64 frames per sub-buffer 111 Reserved
14 CTLRETRY	Control Tx packet retry. When set, a control packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, a control packet that is flagged with a Break or ProtocolError by the receiver is skipped.
13 -	This field is reserved. Reserved

Table continues on the next page...

MLB_MLBC0 field descriptions (continued)

Field	Description
12 ASYRETRY	Asynchronous Tx packet retry. When set, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is skipped.
11–8 -	This field is reserved. Reserved
7 MLBLK	MediaLB lock status. When set, indicates that the MediaLB block is synchronized to the incoming MediaLB frame. If **MLBLK** is clear (unlocked), **MLBLK** is set after FRAMESYNC is detected at the same position for three consecutive frames. If **MLBLK** is set (locked), **MLBLK** is cleared after not receiving FRAMESYNC at the expected time for two consecutive frames. While **MLBLK** is set, FRAMESYNC patterns occurring at locations other than the expected one are ignored. (read-only)
6 -	This field is reserved. Reserved
4–2 MLBCLK_2_0	MLB_CLK (MediaLB clock) speed select. 000 256xFs (for **MLBPEN** = 0) 001 512xFs (for **MLBPEN** = 0) 010 1024xFs (for **MLBPEN** = 0)
1 -	This field is reserved. Reserved
0 MLBEN	MediaLB enable. When set, MLB_CLK (MediaLB clock), MLB_SIG (signal), and MLB_DATA (data) are received and transmitted on the appropriate MediaLB pins.

43.6.2 MediaLB Channel Status 0 Register (MLB_MS0)

Address: 218_C000h base + Ch offset = 218_C00Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

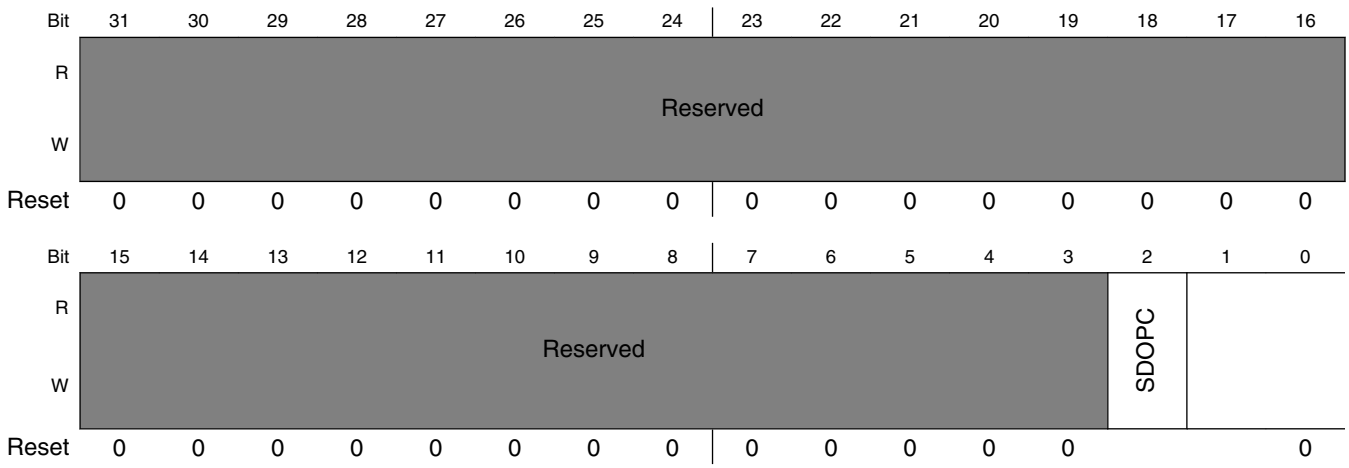
MLB_MS0 field descriptions

Field	Description
MCS_31_0	MediaLB channel status. Indicates the channel status for MediaLB channels 31 to 0. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

43.6.3 MediaLB 6-pin Control 2 Register (MLB_MLBPC2)

Address: 218_C000h base + Dh offset = 218_C00Dh

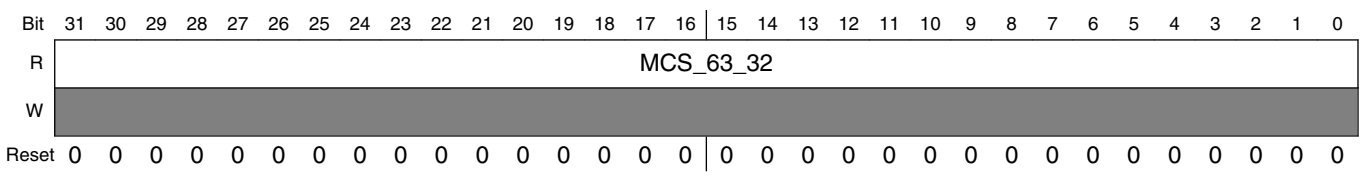


MLB_MLBPC2 field descriptions

Field	Description
31–3 -	This field is reserved. Reserved.
0 SDOPC	MLB 3-pin interface: Signal/Data output phase control. 0 MLB_SIG / MLB_DATA launch at rising edge of MLB_CLK(default) 1 MLB_SIG / MLB_DATA launch at falling edge of MLB_CLK

43.6.4 MediaLB Channel Status1 Register (MLB_MS1)

Address: 218_C000h base + 14h offset = 218_C014h

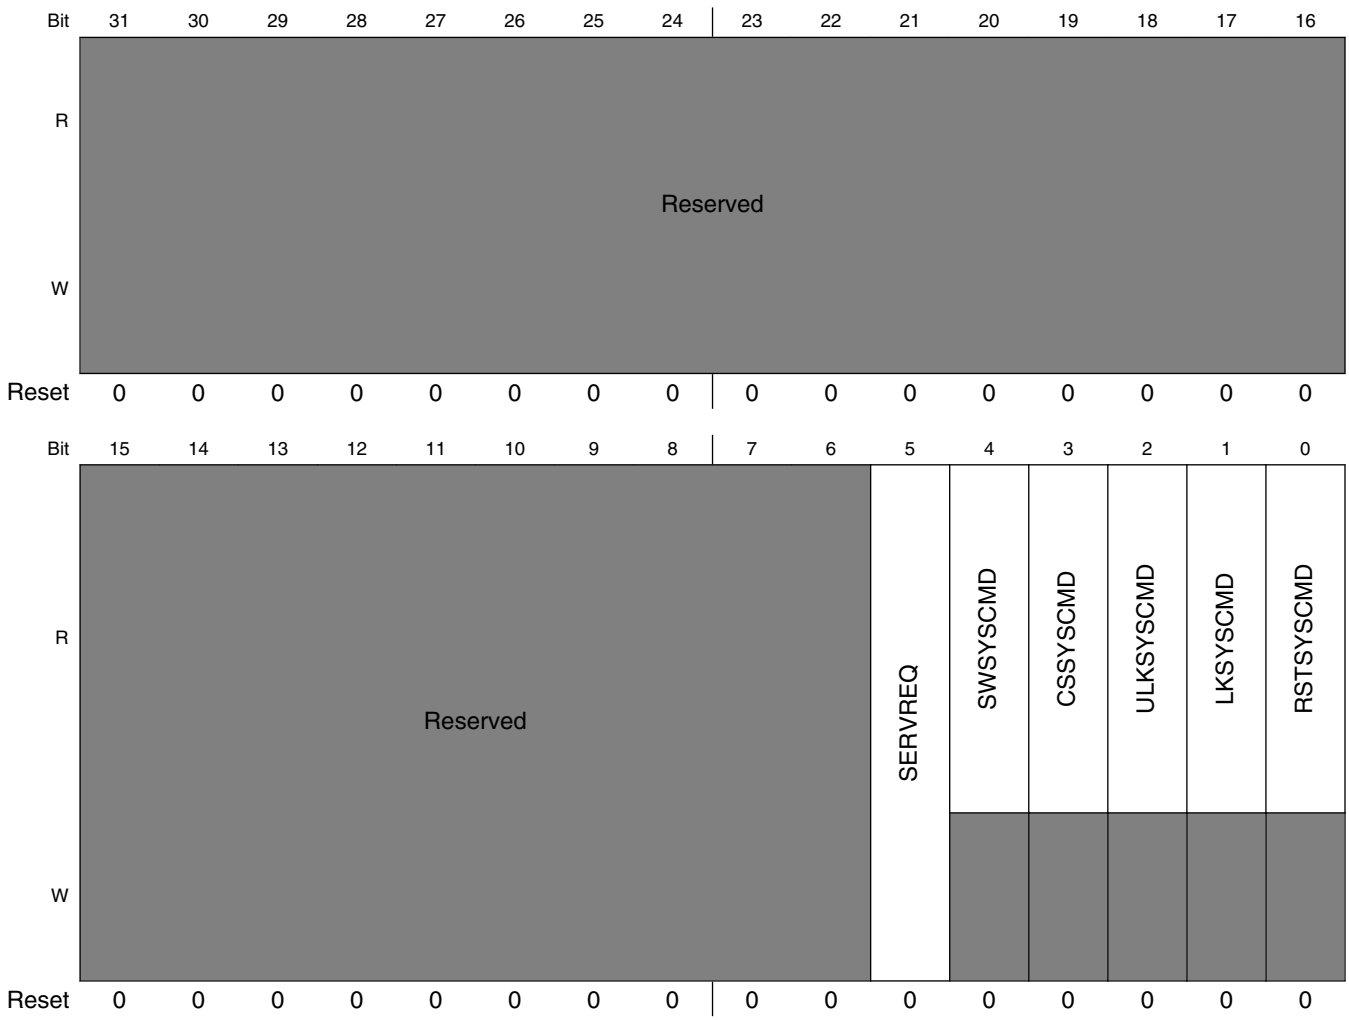


MLB_MS1 field descriptions

Field	Description
MCS_63_32	MediaLB channel status. Indicates the channel status for MediaLB channels 63 to 32. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

43.6.5 MediaLB System Status Register (MLB_MSS)

Address: 218_C000h base + 20h offset = 218_C020h



MLB_MSS field descriptions

Field	Description
31–6 -	This field is reserved. Reserved
5 SERVREQ	Service request enabled. When set, the MediaLB block responds with a "device present, request service" system response if a matching channel scan system command is detected. When cleared, the MediaLB block responds with a "device present" system response.
4 SWSYSCMD	Software system command detected (in the system quadlet). Set by hardware, cleared by software. Data is stored in the MSD register for this command.
3 CSSYSCMD	Channel scan system command detected (in the system quadlet). Set by hardware, cleared by software. If the node address specified in *Data* quadlet matches the value in **MLBC1.NDA**, the device responds either "device present" or "device present, request service" system response in the next system quadlet.

Table continues on the next page...

MLB_MSS field descriptions (continued)

Field	Description
2 ULKSYSCMD	Network unlock system command detected (in the system quadlet). Set by hardware, cleared by software.
1 LKSYSCMD	Network lock system command detected (in the system quadlet). Set by hardware, cleared by software.
0 RSTSYSCMD	Reset system command detected (in the system quadlet). Set by hardware, cleared by software.

43.6.6 MediaLB System Data Register (MLB_MSD)

Address: 218_C000h base + 24h offset = 218_C024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

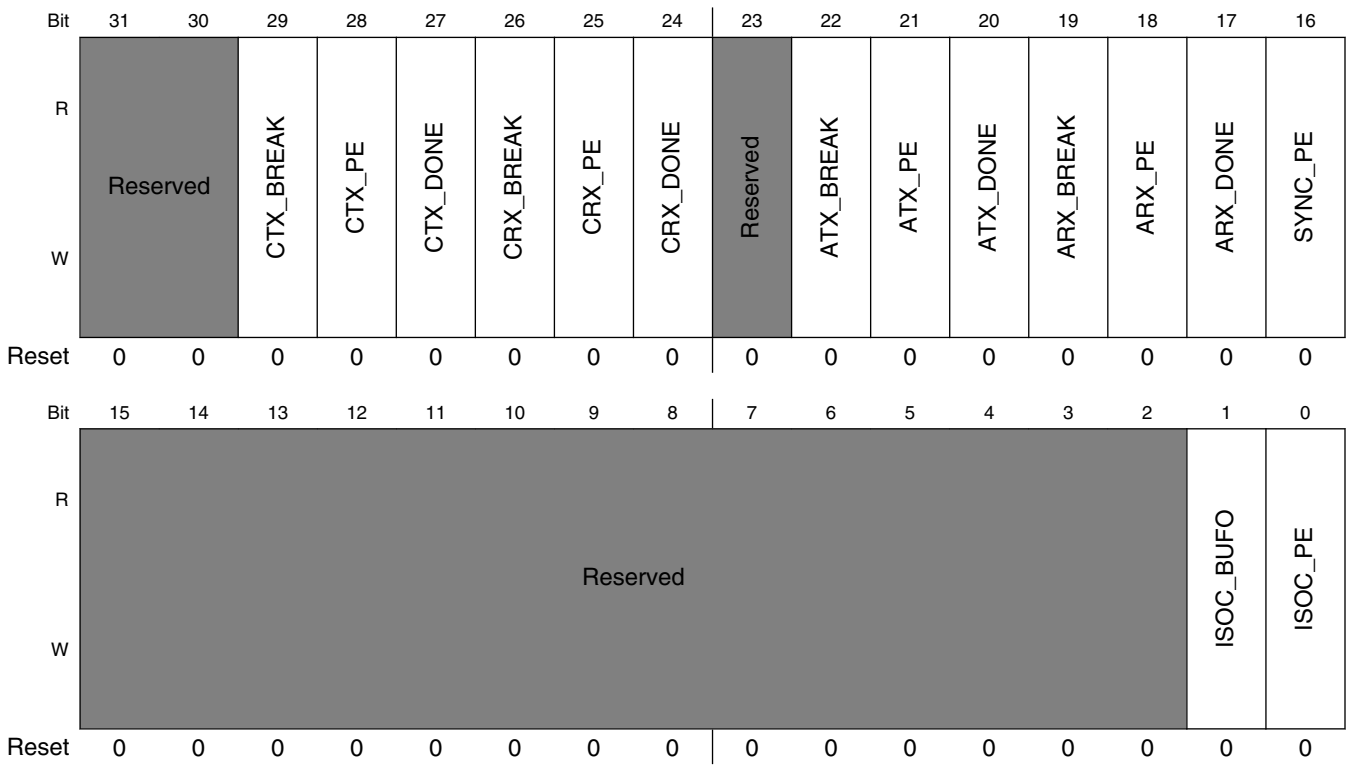
MLB_MSD field descriptions

Field	Description
31–24 SD3_7_0	System data (byte 3). Updated with MediaLB Data[31:24] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD3 is not updated. (read-only)
23–16 SD2_7_0	System data (byte 2). Updated with MediaLB Data[23:16] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD2 is not updated. (read-only)
15–8 SD1_7_0	System data (byte 1). Updated with MediaLB Data[15:8] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD1 is not updated. (read-only)
SD0_7_0	System data (byte 0). Updated with MediaLB Data[7:0] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD0 is not updated. (read-only)

43.6.7 MediaLB Interrupt Enable Register (MLB_MIEN)

Address: 218_C000h base + 2Ch offset = 218_C02Ch



MLB_MIEN field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29 CTX_BREAK	Control Tx break enable. When set, a *ReceiverBreak* response received from the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
28 CTX_PE	Control Tx protocol error enable. When set, a *ProtocolError* generated by the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
27 CTX_DONE	Control Tx packet done enable. When set, a packet transmitted with no errors on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
26 CRX_BREAK	Control Rx break enable. When set, a *ControlBreak* command received from the transmitter on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
25 CRX_PE	Control Rx protocol error enable. When set, a *ProtocolError* detected on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
24 CRX_DONE	Control Rx packet done enable. When set, a packet received with no errors on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
23 -	This field is reserved. Reserved
22 ATX_BREAK	Asynchronous Tx break enable. When set, a *ReceiverBreak* response received from the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

Table continues on the next page...

MLB_MIEN field descriptions (continued)

Field	Description
21 ATX_PE	Asynchronous Tx protocol error enable. When set, a *ProtocolError* generated by the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
20 ATX_DONE	Asynchronous Tx packet done enable. When set, a packet transmitted with no errors on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
19 ARX_BREAK	Asynchronous Rx break enable. When set, a *AsyncBreak* command received from the transmitter on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
18 ARX_PE	Asynchronous Rx protocol error enable. When set, a *ProtocolError* detected on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
17 ARX_DONE	Asynchronous Rx done enable. When set, a packet received with no errors on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
16 SYNC_PE	Synchronous protocol error enable. When set, a *ProtocolError* detected on a synchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
15–2 -	This field is reserved. Reserved
1 ISOC_BUFO	Isochronous Rx buffer overflow enable. When set, a buffer overflow on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set. This occurs only when isochronous flow control is disabled.
0 ISOC_PE	Isochronous Rx protocol error enable. When set, a *ProtocolError* detected on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

43.6.8 MediaLB Control 1 Register (MLB_MLBC1)

Address: 218_C000h base + 3Ch offset = 218_C03Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

43.6.10 HBI Channel Mask 0 Register (MLB_HCMR0)

The HC can control which channel(s) are able to generate an HBI interrupt by writing the HBI Channel Mask Registers (HCMRn). The HCMRn registers mask the channel interrupt on the *hbi_hintb* signal (i.e. *hbi_hintb* will not become active for any masked channel). Each bit of HCMRn is read/write.

Address: 218_C000h base + 88h offset = 218_C088h

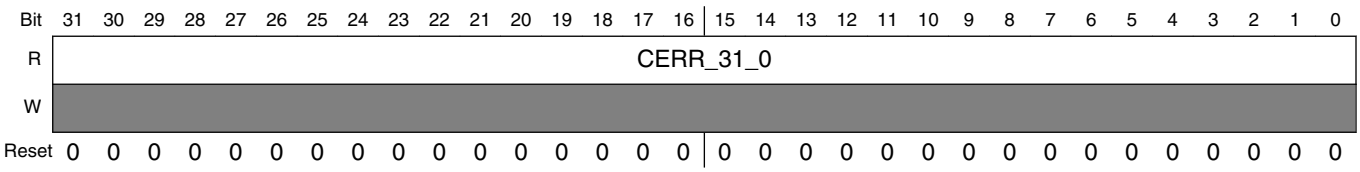
43.6.12 HBI Channel Error 0 Register (MLB_HCER0)

The HBI Channel Error Registers (HCERn) indicate which channel(s) have encountered fatal errors.

Address: 218_C000h base + 90h offset = 218_C090h



MLB_HCER0 field descriptions

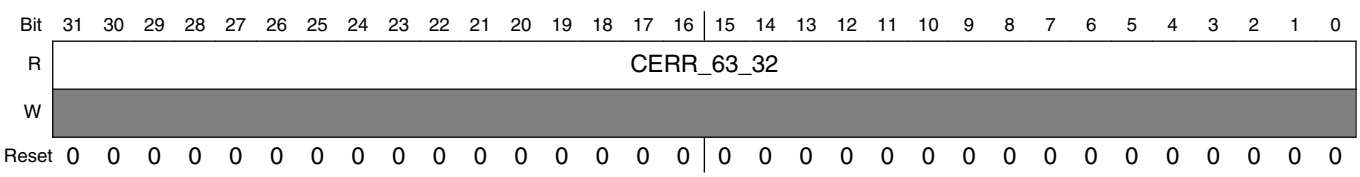
Field	Description
CERR_31_0	Bitwise channel error bit

43.6.13 HBI Channel Error 1 Register (MLB_HCER1)

HCERn status bits are set when hardware detects hardware errors on the given logical channel, including:

- Channel opened, but not enabled,
- Channel programmed with invalid channel type, or
- Out-of-range PML for asynchronous or control Tx channels

Address: 218_C000h base + 94h offset = 218_C094h



MLB_HCER1 field descriptions

Field	Description
CERR_63_32	Bitwise channel error bit

43.6.14 HBI Channel Busy 0 Register (MLB_HCBR0)

The HC can determine which channel(s) are busy by reading the HBI Channel Busy Registers (HCBRn). An HBI channel is busy if:

- it is currently loaded into one of the two AGUs
- the channel is enabled, CE = 1 from the Channel Allocation Table (Table 43-5), and
- the DMA is active

When an HBI channel is busy, hardware may write back its local copy of the channel descriptor at any time. System software should not write a CDT descriptor for a channel that is busy. Only two HBI channels can be busy at any given time. Each bit of HCBRn is read-only.

Address: 218_C000h base + 98h offset = 218_C098h

43.6.26 AHB Control Register (MLB_ACTL)

The AHB Control (ACTL) register is written by the HC to configure the AMBA AHB block for channel interrupts. ACTL contains three configuration fields, one is used to select the DMA mode, one is used to mux channel interrupts onto a single interrupt signal, and the last selects the method of clearing channel interrupts (either software or hardware).

Address: 218_C000h base + 3C0h offset = 218_C3C0h

0 SCE	Software clear enable: 0 Hardware clears interrupt after a ACSRn register read 1 Software clears interrupt

43.6.27 AHB Channel Status 0 Register (MLB_ACSR0)

The AHB Channel Status (ACSRn) registers contain interrupt bits for each of the 64 physical channels. When an ACSRn register bit is set, it indicates that the corresponding physical channel has an interrupt pending.

An AHB interrupt is triggered when either DNEn or ERRn is set within the AHB Channel Descriptor. The HC is notified of the channel interrupt via *ahb_int[1:0]*. When an interrupt occurs in ACSR0 (for channels 31 to 0) *ahb_int[0]* is set. When an interrupt occurs in ACSR1 (for channels 63 to 32) *ahb_int[1]* is set.

Interrupts in ACSR0 and ACSR1 can be optionally muxed onto a single interrupt signal, *ahb_int[0]*, if ACTL.SMX = 1. If ACTL.SCE = 0, hardware automatically clears the interrupt bit(s) after the HC reads the ACSRn register. Alternatively, if ACTL.SCE = 1, software must write a 1 to the appropriate bit(s) of ACSRn to clear the interrupt(s).
