

# u-boot runtime modify Linux device tree(dtb)

Biyong SUN  
20, OCT 2021

EXTERNAL USE

SECURE CONNECTIONS  
FOR A SMARTER WORLD

# Case Description

In some cases, i.MX board connect to different module. It has very tiny changes, such as just one gpio different driver strength.

We can build an entire new software to handle this requirement.

Here we introduce another way, using u-boot to modify the device tree(dtb) at runtime.

# Demo environment

HW: i.MX8MM EVK

Pad/Pin NAND\_READY\_B to do demo

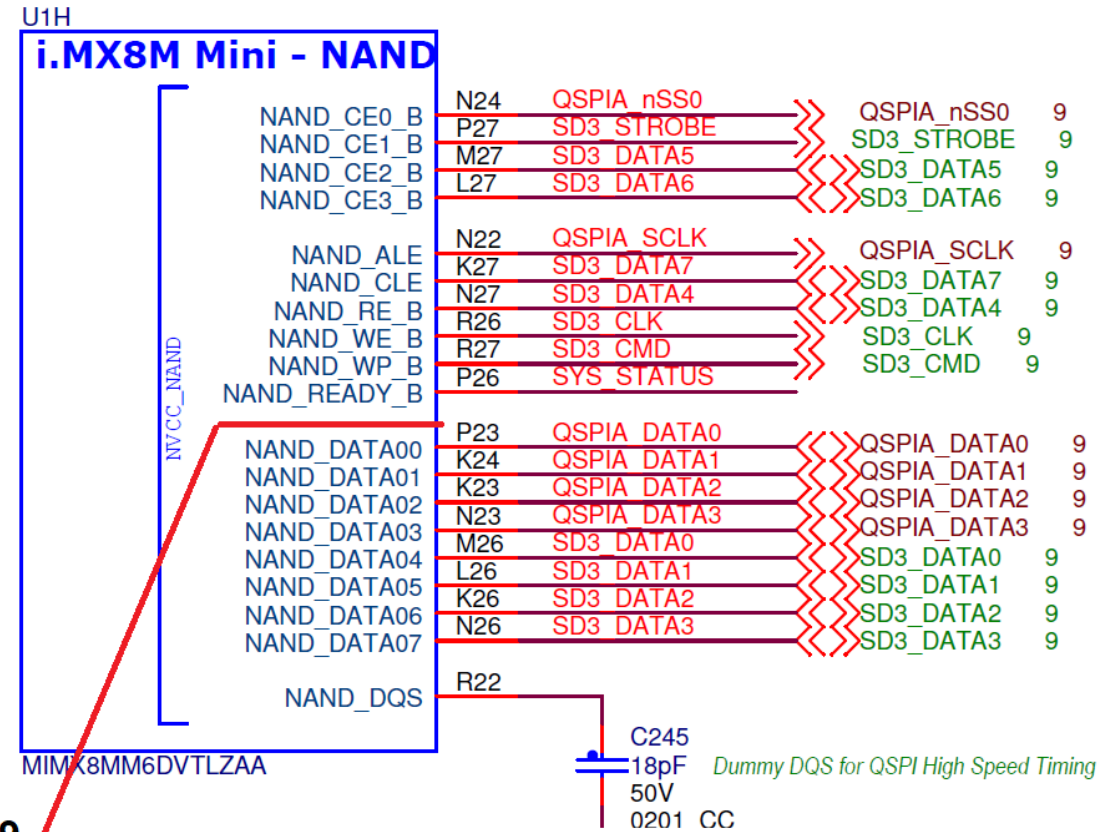

SW: LF\_v5.10.35\_2.0.0

linux/arch/arm64/boot/dts/freescale/imx8mm-evk.dtsi

```
leds {
    compatible = "gpio-leds";
    pinctrl-names = "default";
    pinctrl-0 = <&pinctrl_gpio_led>;

    status {
        label = "status";
        gpios = <&gpio3 16 GPIO_ACTIVE_HIGH>;
        default-state = "on";
    };
};

pinctrl_gpio_led: gpioledgrp {
    fsl,pins = <
        MX8MM_IOMUXC_NAND_READY_B_GPIO3_IO16 0x19
    >;
};
```

# Demo

First, we check the original settings of NAND\_READY\_B in [Linux](#)

```
root@imx8mmevk:~# cat /sys/kernel/debug/pinctrl/pinctrl-maps|grep -B 4 -A 1
MX8MM_IOMUXC_NAND_READY_B
device leds
state default
type CONFIGS_PIN (3)
controlling device 30330000.pinctrl
pin MX8MM_IOMUXC_NAND_READY_B
config 00000019
```

The we reboot the board and get into u-boot

# Demo(cont.)

The we reboot the board and get into **u-boot**

```
run loadfdt
fdt addr ${fdt_addr_r}
fdt print /soc/bus/pinctrl/gpioledgrp
```

```
u-boot=> fdt print /soc/bus/pinctrl/gpioledgrp
gpioledgrp {
    fsl,pins = <0x00000134 0x0000039c 0x00000000 0x00000005 0x00000000 0x00000019>;
    phandle = <0x00000072>;
};
```

Modify to 0x000000**1b** from 0x000000**19**

```
fdt set /soc/bus/pinctrl/gpioledgrp/ fsl,pins <0x00000134 0x0000039c 0x00000000 0x00000005 0x00000000 0x0000001b>
```

```
u-boot=> fdt print /soc/bus/pinctrl/gpioledgrp
gpioledgrp {
    fsl,pins = <0x00000134 0x0000039c 0x00000000 0x00000005 0x00000000 0x0000001b>;
    phandle = <0x00000072>;
```

```
}; EXTERNAL USE
```

# Demo(cont.)

Boot into **Linux** and check the result

Before we already run “run loadfdt”, please do not run again.

Because we have modified the dtb. If you run again, the dtb will load from eMMC, again.

```
run mmcargs
```

```
run loadimage
```

```
booti ${loadaddr} - ${fdt_addr_r}
```

```
root@imx8mmevk:~# cat /sys/kernel/debug/pinctrl/pinctrl-maps|grep -B 4 -A 1 MX8MM_IOMUXC_NAND_READY_B
```

```
device leds
```

```
state default
```

```
type CONFIGS_PIN (3)
```

```
controlling device 30330000.pinctrl
```

```
pin MX8MM_IOMUXC_NAND_READY_B
```

```
config 0000001b
```

## Demo(cont.)

Make it persistent

```
setenv modify_dtb 'echo modify device tree - doing;fdt addr ${fdt_addr_r};fdt set  
/soc/bus/pinctrl/gpioledgrp/ fsl,pins <0x00000134 0x0000039c 0x00000000 0x00000005 0x00000000  
0x00000001b>'
```

```
setenv loadfdt 'fatload mmc ${mmcdev}:${mmcpart} ${fdt_addr_r} ${fdtfile};run modify_dtb'
```

savee

# Demo modify the mmc2

Check in Linux before modification

```
root@imx8mmevk:~# cat /sys/kernel/debug/mmc2/ios
```

```

# How to get the path

In this demo, we need to know the path `/soc/bus/pinctrl/gpioledgrp`. There are two ways to get it.

1. By u-boot at runtime

```
run loadfdt
fdt addr ${fdt_addr_r}
fdt print
```

2. By u-boot at compile time

```
./u-boot/tools/fdtgrep imx8mm-evk.dtb
```

# Host device-tree-compiler approach

```
sudo apt-get install device-tree-compiler
```

We also can use the fdtput of device-tree-compiler to modify the dtb(not dts) without compile it.

```
fdtput -t s imx8mm-evk.dtb mmc2 no-1-8-v
```

```
fdtdump imx8mm-evk.dtb |grep -C 3 no-1-8-v
```

```
vmmc-supply = <0x00000044>;
};
mmc@30b60000 {
    no-1-8-v;
    compatible = "fsl,imx8mm-usdhc", "fsl,imx7d-usdhc";
    reg = <0x30b60000 0x00010000>;
    interrupts = <0x00000000 0x00000018 0x00000004>;
```
