Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

RXIDC_0, RXIDC_1, RXIDC_2, RXIDC_3 - Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

27.6 Functional Description

This section provides a complete functional description of the block.

27.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames.

The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see [Message Buffer Structure](#)). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the MB with a range of Identifiers on received CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to [Table 27-4](#)). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to [Table 27-5](#)).

27.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see

Transmission Abort Mechanism). If backwards compatibility is desired (MCR[AEN] bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see [Message Buffer Inactivation](#)).

3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see [Table 27-4](#) and [Table 27-5](#) in [Message Buffer Structure](#))

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

27.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See [Control 2 Register \(FLEXCAN_CTRL2\)](#) for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When ARM write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.

Functional Description

- When CHI is in Idle state and ARM writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO_EN] bits settings.

27.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO_EN] bit has no effect when CTRL1[LBUF] is asserted.

27.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO_EN] bit setting.

27.6.3.2.1 Local Priority disabled

If MCR[LPRIO_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see [Table 27-12](#)) in such a way that the Local Priority is disabled.

Table 27-12. Composition of the arbitration value when Local Priority is disabled

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)

Table continues on the next page...

Table 27-12. Composition of the arbitration value when Local Priority is disabled (continued)

Extended (IDE = 1)	Extended ID[28:18] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)
-----------------------	----------------------------------	----------------	----------------	---------------------------------	----------------

27.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

Table 27-13. Composition of the arbitration value when Local Priority is enabled

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18](11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

Functional Description

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)) to optimize the arbitration start point.
- During CAN Bus Off state from TX_ERR_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER_OF_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)) to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.
- Arbitration winner inactivation or abort during any arbitration process.
- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

27.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see [Message Buffer Inactivation](#)), preferably with a *safe inactivation* (see [Transmission Abort Mechanism](#));
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see [Move-in](#)) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;
4. The received SRR, IDE, RTR and DLC fields are stored;
5. The CODE field in the Control and Status word is updated. (see [Table 27-4](#) and [Table 27-5](#) in Section [Message Buffer Structure](#))
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See [Message Buffer Lock Mechanism](#);
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See [Move-in](#);
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to

workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX_DIS] bit is not asserted. If MCR[SRX_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode (see [Rx FIFO](#)). Upon receiving the Frames Available in Rx FIFO interrupt (see [Interrupt Masks 1 Register \(FLEXCAN_IMASK1\)](#), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

27.6.5 Matching Process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus.

If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Please, refer to the following table for details.

Table 27-14. Matching architecture

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID] ¹	MB[CODE]
Mailbox	0	-	0	cmp ²	no_cmp ³	cmp_msk ⁴	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO ⁵	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to [Message Buffer Structure](#) for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to [Rx FIFO Structure](#) for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no_cmp: The SMB contents are not compared with the MB contents.
4. cmp_msk: Compares the SMB contents with MB contents taking into account the masks.
5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the ARM and unlocked as described in [Message Buffer Lock Mechanism](#));
- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see [Message Buffer Inactivation](#))
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not. If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
 - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
 - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see [Message Buffer Inactivation](#)) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

Table 27-15. Matching Possibilities and Resulting Reception Structures

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
No FIFO, only MB, match is always MB first						
0	0	X ¹	None ²	-. ³	None	Frame lost by no match
0	0	X	Free ⁴	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMB	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None ⁵	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMB	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull ⁶	FIFO	
1	0	0	None	Full ⁷	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirtsMB	Overrun

Table continues on the next page...

**Table 27-15. Matching Possibilities and Resulting Reception Structures
(continued)**

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMB	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMB	Overrun

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for ARM to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. ARM can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to [Rx Mailboxes Global Mask Register \(FLEXCAN_RXMGMASK\)](#). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode, otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

27.6.6 Move Process

There are two types of move process, namely move-in and move-out.

27.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead.

The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see [Matching Process](#)) and all of the following conditions are true:

- the CAN bus has reached or let past either:
 - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
 - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;
- the destination Mailbox is not locked by ARM;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consists of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to [Table 27-4](#).

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see [Message Buffer Inactivation](#)) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that ARM beware that the Message Buffer content is temporarily incoherent.

27.6.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see [Arbitration process](#)).

The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field
- during Wait For Bus Idle field

The move-out process is not atomic. Only ARM has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

27.6.7 Data Coherence

In order to maintain data coherency and FlexCAN proper operation, the ARM must obey the rules described in

Any form of ARM accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

27.6.7.1 Transmission Abort Mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform ARM if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, ARM must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the ARM is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to ARM.

If ARM writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way ARM just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and ARM wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. ARM checks the corresponding IFLAG and clears it, if asserted.
2. ARM writes 0b1001 into the CODE field of the C/S word.
3. ARM waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. ARM reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

27.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing ARM to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See [Transmit Process](#) and [Receive Process](#) for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox ARM must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* ARM must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see [Transmission Abort Mechanism](#));

The inactivation automatically unlocks the Mailbox (see [Message Buffer Lock Mechanism](#)).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. ARM must keep the data coherence into FIFO region when RFEN is asserted.

27.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When ARM reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that ARM wants to read the whole MB in an atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when ARM reads the Free Running Timer (global unlock operation), or when it reads the

Control and Status word of another MB regardless of its code or when ARM writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while ARM is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY¹ (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the ARM decides to read MB number 5 and at the same time another message with the same ID is arriving. When ARM reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If ARM reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If ARM inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox. An MB is unlocked when ARM reads the Free Running Timer Register (see [Free Running Timer Register \(FLEXCAN_TIMER\)](#)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in [Modes of Operation](#) specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

27.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see [Rx FIFO Structure](#)). ARM can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, ARM can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to ARM. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until ARM clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the ARM clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also [Rx FIFO Structure](#)):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to [Control 2 Register \(FLEXCAN_CTRL2\)](#)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

27.6.9 CAN Protocol Related Features

27.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this

mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.

- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the ARM. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

27.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission
- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

27.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in [Control 1 Register \(FLEXCAN_CTRL1\)](#).

27.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRESDIV, PROPSEG, PSEG1, PSEG2 and RJW. See [Control 1 Register \(FLEXCAN_CTRL1\)](#).

The PRESDIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{\text{(Prescaler value)}}$$

A bit time is subdivided into three segments² (reference [Table 27-16](#)):

- SYNC_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long

$$\text{Bit Rate} = \frac{f_{Tq}}{\text{(number of Time Quanta)}}$$

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

Figure 27-2. Segments within the Bit Time

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ_ACK] and MCR[LPM_ACK] in [Module Configuration Register \(FLEXCAN_MCR\)](#)), the number of peripheral clocks in one CAN bit can be calculated as:

$$NCCP = \frac{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)}{f_{CANCLK}}$$

where:

NCCP is the number of peripheral clocks in one CAN bit;

f_{CANCLK} is the Protocol Engine (PE) Clock in Hz;

f_{sys} is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRESDIV is the value in CTRL1[PRESDIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Figure 27-2 gives an overview of the CAN compliant segment settings and the related parameter values.

Table 27-16. Time Segment Syntax

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

Table 27-17. CAN Standard Compliant Bit Time Segment Settings

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

27.6.9.5 Arbitration and Matching Timing

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

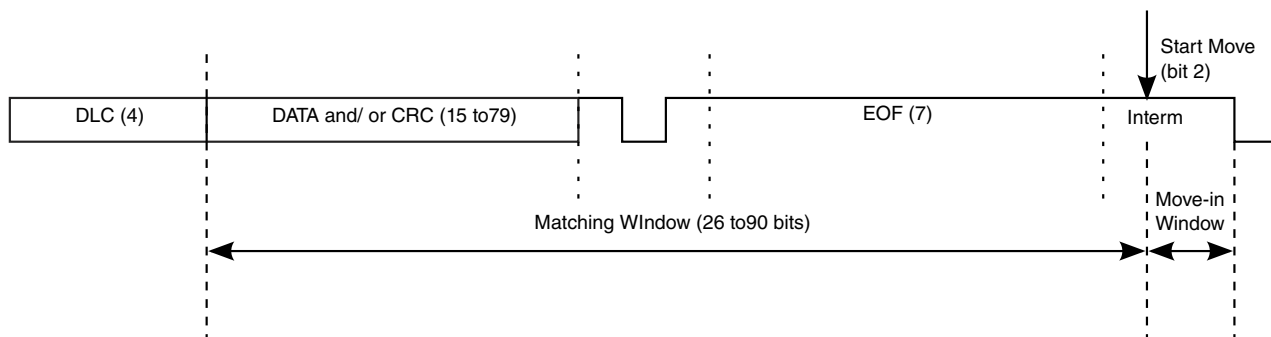

Figure 27-3. Matching and Move-In Time Windows

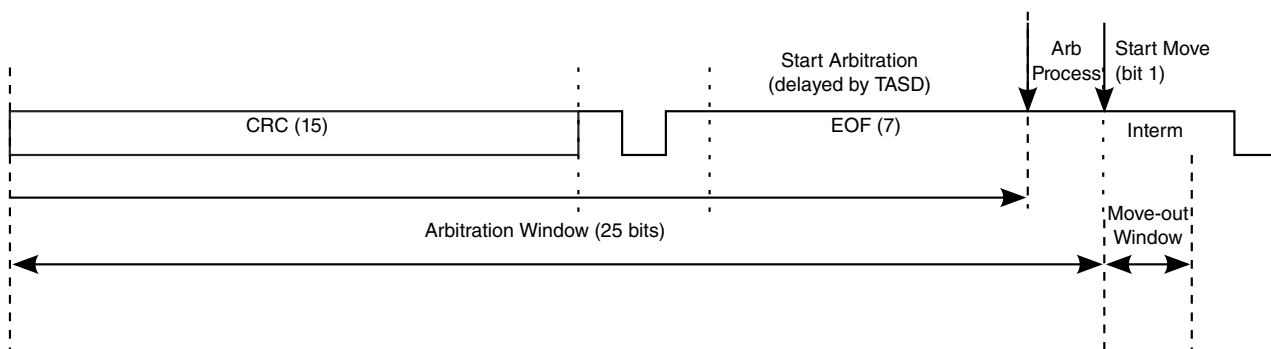

Figure 27-4. Arbitration and Move-Out Time Windows

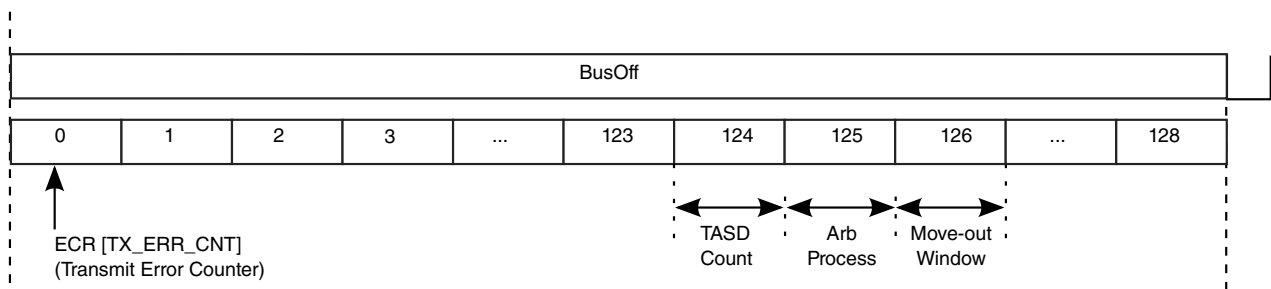

Figure 27-5. Arbitration at the end of Bus Off and Move-Out Time Windows

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in [Table 27-17](#)
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

Table 27-18. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate

Number of Message Buffers	RFEN	Minimum Number of Peripheral Clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in [Table 27-18](#) can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRES DIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRES DIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

27.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode).

See in [Modes of Operation](#) an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

27.6.10.1 Freeze Mode

This mode is requested by ARM through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode . In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ_ACK bit in the same register. The ARM must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN_RX input pin and drives the FLEXCAN_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT_RDY and FRZ_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- ARM negates the FRZ bit in the MCR Register
- The ARM is removed from Debug Mode and the HALT bit is negated

The FRZ_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

27.6.10.2 Module Disable Mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the ARM through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM_ACK bit in the same register. The ARM must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM_ACK bit and negates the FRZ_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive

- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT_RDY and LPM_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the ARM to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the ARM. Exiting from this mode is done by negating the MDIS bit by ARM, which make FlexCAN requests to resume the clocks and negates the LPM_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by ARM.

27.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings.. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1_STOP_REQ and CAN2_STOP_REQ bit in the register IOMUXC_GPR13) and check the acknowledgement asserted by the FlexCAN (see the CAN1_STOP_ARK and CAN2_STOP_ARK in the register IOMUXC_GPR4) . The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM_ACK bit, negates the FRZ_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN_RX input pin and drives its FLEXCAN_TX pin as recessive
- Sets the NOT_RDY and LPM_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- ARM resuming the clocks and removing the Stop Mode request
- ARM resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK_INT bit in the ESR Register and, if enabled by the WAK_MSK bit in MCR, generates a Wake Up interrupt to the ARM. Upon receiving the interrupt, the ARM should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up.

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN_RX input line while in Stop Mode. See the WAK_SRC bit in [Module Configuration Register \(FLEXCAN_MCR\)](#) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments.

27.6.11 Interrupts

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the ARM writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See [Interrupt Flags 1 Register \(FLEXCAN_IFLAG1\)](#) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The ARM must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up) generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

27.7 Initialization/Application Information

This section provides instructions for initializing the FLEXCAN module.

27.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ_ACK and NOT_RDY bits in the MCR Register are set. The FLEXCAN_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
 - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
 - Enable the warning interrupts by setting the WRN_EN bit

- If required, disable frame self reception by setting the SRX_DIS bit
- Enable the FIFO by setting the RFEN bit
- Enable the abort mechanism by setting the AEN bit
- Enable the local priority feature by setting the LPRIO_EN bit
- Initialize the Control Register
 - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
 - Determine the bit rate by programming the PRESDIV field
 - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
 - The Control and Status word of all Message Buffers must be initialized
 - If FIFO was enabled, the 8-entry ID table must be initialized
 - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

27.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

FLEXCAN memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_0000	Module Configuration Register (FLEXCAN1_MCR)	32	R/W	5980_000Fh	27.8.1/1312
209_0004	Control 1 Register (FLEXCAN1_CTRL1)	32	R/W	0000_0000h	27.8.2/1317
209_0008	Free Running Timer Register (FLEXCAN1_TIMER)	32	R/W	0000_0000h	27.8.3/1320

Table continues on the next page...

FLEXCAN memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_0010	Rx Mailboxes Global Mask Register (FLEXCAN1_RXMGMASK)	32	R/W	FFFF_FFFFh	27.8.4/1320
209_0014	Rx Buffer 14 Mask Register (FLEXCAN1_RX14MASK)	32	R/W	FFFF_FFFFh	27.8.5/1321
209_0018	Rx Buffer 15 Mask Register (FLEXCAN1_RX15MASK)	32	R/W	FFFF_FFFFh	27.8.6/1322

FLEXCANx_MCR field descriptions

Field	Description
31 MDIS	<p>This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See Module Disable Mode for more information.</p> <p>1 Disable the FLEXCAN module 0 Enable the FLEXCAN module</p>
30 FRZ	<p>The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at ARM level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode.</p> <p>1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode</p>
29 RFEN	<p>This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 27-18 (see Arbitration and Matching Timing). This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FIFO enabled 0 FIFO not enabled</p>
28 HALT	<p>Assertion of this bit puts the FLEXCAN module into Freeze Mode. The ARM should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes. See Freeze Mode for more information.</p> <p>1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.</p>
27 NOT_RDY	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes.</p> <p>1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode</p>
26 WAK_MSK	<p>This bit enables the Wake Up Interrupt generation.</p> <p>1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled</p>
25 SOFT_RST	<p>When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers</p> <p>The SOFT_RST bit can be asserted directly by the ARM when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.</p> <p>Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.</p>

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

Field	Description
	1 Reset the registers 0 No reset request
24 FRZ_ACK	This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See Freeze Mode for more information 1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running
23 SUPV	This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses
22 SLF_WAK	This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the ARM so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode. 1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled
21 WRN_EN	When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero, independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <96 to ≥ 96. 0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters.
20 LPM_ACK	This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the ARM can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See Module Disable Mode , and Stop Mode for more information 1 FLEXCAN is either in Disable Mode, or Stop mode 0 FLEXCAN not in any of the low power modes
19 WAK_SRC	This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See Stop Mode for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus 0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus.
18 -	This field is reserved. Reserved

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

Field	Description
17 SRX_DIS	<p>This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Self reception disabled 0 Self reception enabled</p>
16 IRMQ	<p>This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Individual Rx masking and queue feature are enabled. 0 Individual Rx masking and queue feature are disabled. For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.</p>
15–14 -	This field is reserved. Reserved
13 LPRIO_EN	<p>This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Local Priority enabled 0 Local Priority disabled</p>
12 AEN	<p>This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted.</p> <p>1 Abort enabled 0 Abort disabled</p>
11–10 -	This field is reserved. Reserved
9–8 IDAM	<p>This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See Rx FIFO Structure. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.</p>
7 -	This field is reserved. Reserved
MAXMB	<p>This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes</p> <p>Number of the last MB = MAXMB.</p>

Table continues on the next page...

FLEXCANx_MCR field descriptions (continued)

Field	Description
	NOTE: Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN] MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 27-18 (see Arbitration and Matching Timing).

27.8.2 Control 1 Register (FLEXCANx_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

Address: Base address + 4h offset

FLEXCANx_CTRL1 field descriptions

Field	Description
31–24 PRESDIV	This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. For more information refer to Protocol Timing . This field can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

Field	Description
	Sclock frequency = CPI clock frequency / (PRESDIV+1)
23–22 RJW	This 2-bit field defines the maximum number of time quanta that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes Resync Jump Width = RJW + 1.
21–19 PSEG1	This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta.
18–16 PSEG2	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time. The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta.
15 BOFF_MSK	This bit provides a mask for the Bus Off Interrupt. 1 Bus Off interrupt enabled 0 Bus Off interrupt disabled
14 ERR_MSK	This bit provides a mask for the Error Interrupt. 1 Error interrupt enabled 0 Error interrupt disabled
13 -	This field is reserved. Reserved
12 LPB	This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Loop Back enabled 0 Loop Back disabled
11 TWRN_MSK	This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled
10 RWRN_MSK	This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled
9–8 -	This field is reserved. Reserved
7 SMP	This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.

Table continues on the next page...

FLEXCANx_CTRL1 field descriptions (continued)

Field	Description
	<p>1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used</p> <p>0 Just one sample is used to determine the bit value</p>
6 BOFF_REC	<p>This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery.</p> <p>1 Automatic recovering from Bus Off state disabled</p> <p>0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B</p>
5 TSYN	<p>This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Timer Sync feature enabled</p> <p>0 Timer Sync feature disabled</p>
4 LBUF	<p>This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Lowest number buffer is transmitted first</p> <p>0 Buffer with highest priority is transmitted first</p>
3 LOM	<p>This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.</p> <p>Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN module operates in Listen Only Mode</p> <p>0 Listen Only Mode is deactivated</p>
PROP_SEG	<p>This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes</p> <p>Propagation Segment Time = (PROPSEG + 1) * Time-Quanta.</p> <p>Time-Quantum = one Sclock period.</p>

1. One time quantum is equal to the Sclock period.

27.8.3 Free Running Timer Register (FLEXCANx_TIMER)

This register represents a 16-bit free running counter that can be read and written by the ARM. The timer starts from \$0000 after Reset, counts linearly to \$FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

ARM can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

Address: Base address + 8h offset

FLEXCANx_TIMER field descriptions

Field	Description
31-16 -	This field is reserved. Reserved
TIMER	TIMER

27.8.4 Rx Mailboxes Global Mask Register (FLEXCANx_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

Table 27-49. Rx Mailboxes Global Mask usage

SMB[RTR] ¹	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note ²	- Note ³	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

Address: Base address + 10h offset

FLEXCANx_RXMGMASK field descriptions

Field	Description
MG31_MG0	<p>These bits mask the Mailbox filter bits as shown in the figure above. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE which are located in the Control and Status word of the Mailbox. Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK) shows in detail which MG bits mask each Mailbox filter field.</p> <p>1 The corresponding bit in the filter is checked against the one received 0 the corresponding bit in the filter is "don't care"</p>

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

27.8.5 Rx Buffer 14 Mask Register (FLEXCANx_RX14MASK)

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 14h offset

FLEXCANx_RX14MASK field descriptions

Field	Description
RX14M31_RX14M0	<p>These bits mask Mailbox 14 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK))</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

27.8.6 Rx Buffer 15 Mask Register (FLEXCANx_RX15MASK)

RX15MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX15MASK Register to have no effect on the module operation.

RX15MASK is used to mask the filter fields of Message Buffer 15.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 18h offset

FLEXCANx_RX15MASK field descriptions

Field	Description
RX15M31_RX15M0	<p>These bits mask Mailbox 15 filter bits in the same fashion as RXMGMASK masks other Mailboxes filters (see Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)).</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

27.8.7 Error Counter Register (FLEXCANx_ECR)

This register has 2 8-bit fields reflecting the value of two FLEXCAN error counters: Transmit Error Counter (Tx_Err_Counter field) and Receive Error Counter (Rx_Err_Counter field). The rules for increasing and decreasing these counters are described in the CAN protocol and are completely implemented in the FLEXCAN module. Both counters are read only except in Freeze Mode, where they can be written by the ARM.

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx_Err_Counter or Rx_Err_Counter increases to be greater than or equal to 128, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx_Err_Counter or Rx_Err_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx_Err_Counter increases to be greater than 255, the FLT_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx_Err_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx_Err_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx_Err_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx_Err_Counter. When Tx_Err_Counter reaches the value of 128, the FLT_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx_Err_Counter value.
- If during system start-up, only one node is operating, then its Tx_Err_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx_Err_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx_Err_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next

FLEXCAN Memory Map/Register Definition

successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

27.8.8 Error and Status 1 Register (FLEXCANx_ESR1)

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the ARM.

The ARM read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the ARM read this register. Bits 9-3 are status bits.

Some bits in this register are read-only and some are not.

Table 27-54. FlexCAN State

SYNCH	IDLE	TX	RX	FlexCAN state
0	0	0	0	Not synchronized to CAN bus
1	1	x	x	Idle
1	0	1	0	Transmitting
1	0	0	1	Receiving
other combinations				Reserved

Address: Base address + 20h offset

FLEXCANx_ESR1 field descriptions

Field	Description
31–19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to Table 27-29 1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode. 1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
16 RWRN_INT	<p>If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.</p> <p>1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence</p>
15 BIT1_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.</p> <p>1 At least one bit sent as recessive is received as dominant 0 No such occurrence</p>
14 BIT0_ERR	<p>This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.</p> <p>1 At least one bit sent as dominant is received as recessive 0 No such occurrence</p>
13 ACK_ERR	<p>This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.</p> <p>1 An ACK error occurred since last read of this register 0 No such occurrence</p>
12 CRC_ERR	<p>This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.</p> <p>1 A CRC error occurred since last read of this register. 0 No such occurrence</p>
11 FRM_ERR	<p>This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.</p> <p>1 A Form Error occurred since last read of this register 0 No such occurrence</p>
10 STF_ERR	<p>This bit indicates that a Stuffing Error has been detected.</p> <p>1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.</p>
9 TX_WRN	<p>This bit indicates when repetitive errors are occurring during message transmission.</p> <p>1 TX_Err_Counter ≥ 96 0 No such occurrence</p>
8 RX_WRN	<p>This bit indicates when repetitive errors are occurring during message reception.</p> <p>1 Rx_Err_Counter ≥ 96 0 No such occurrence</p>
7 IDLE	<p>This bit indicates when CAN bus is in IDLE state. Refer to Table 27-29.</p>

Table continues on the next page...

FLEXCANx_ESR1 field descriptions (continued)

Field	Description
	<p>1 CAN bus is now IDLE</p> <p>0 No such occurrence</p>
6 TX	<p>This bit indicates if FLEXCAN is transmitting a message. Refer to Table 27-29.</p> <p>1 FLEXCAN is transmitting a message</p> <p>0 FLEXCAN is receiving a message</p>
5-4 FLT_CONF	<p>If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the ARM. It may be necessary up to one CAN bit time to get them coherent again.</p> <p>Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted.</p> <p>This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below:</p> <p>00 Error Active</p> <p>01 Error Passive</p> <p>1x Bus off</p>
3 RX	<p>This bit indicates if FlexCAN is receiving a message. Refer to Table 27-29.</p> <p>1 FLEXCAN is transmitting a message</p> <p>0 FLEXCAN is receiving a message</p>
2 BOFF_INT	<p>This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 FLEXCAN module entered 'Bus Off' state</p> <p>0 No such occurrence</p>
1 ERR_INT	<p>This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. Writing '0' has no effect.</p> <p>1 Indicates setting of any Error Bit in the Error and Status Register</p> <p>0 No such occurrence</p>
0 WAK_INT	<p>When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the ARM. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. ARM must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect</p> <p>1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode</p> <p>0 No such occurrence</p>

27.8.9 Interrupt Masks 2 Register (FLEXCANx_IMASK2)

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

FLEXCANx_IMASK2 field descriptions

Field	Description
BUF63M_BUF32M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB32 to MB63) Interrupt. Setting or clearing a bit in the IMASK2 Register can assert or negate an interrupt request, if the corresponding IFLAG2 bit is set. 1 The corresponding buffer Interrupt is enabled 0 The corresponding buffer Interrupt is disabled

27.8.10 Interrupt Masks 1 Register (FLEXCANx_IMASK1)

This register allows to enable or disable any number of a range of 32 Message Buffer Interrupts. It contains one interrupt mask bit per buffer, enabling the ARM to determine which buffer generates an interrupt after a successful transmission or reception (i.e., when the corresponding IFLAG1 bit is set).

Address: Base address + 28h offset

FLEXCANx_IMASK1 field descriptions

Field	Description
BUF31M_BUF0M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt. Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set

FLEXCANx_IMASK1 field descriptions (continued)

Field	Description
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

27.8.11 Interrupt Flags 2 Register (FLEXCANx_IFLAG2)

This register defines the flags for 32 Message Buffer interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG2 bit. If the corresponding IMASK2 bit is set, an interrupt will be generated. The interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect. Before updating MCR[MAXMB] field, ARM must treat the IFLAG2 bits which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 2Ch offset

FLEXCANx_IFLAG2 field descriptions

Field	Description
BUF63I_BUF32I	Each bit flags the respective FLEXCAN Message Buffer (MB32 to MB63) interrupt.
1	The corresponding buffer has successfully completed transmission or reception
0	No such occurrence

27.8.12 Interrupt Flags 1 Register (FLEXCANx_IFLAG1)

This register defines the flags for 32 Message Buffer interrupts and FIFO interrupts. It contains one interrupt flag bit per buffer. Each successful transmission or reception sets the corresponding IFLAG1 bit. If the corresponding IMASK1 bit is set, an interrupt will be generated. The Interrupt flag must be cleared by writing it to '1'. Writing '0' has no effect.

When the RFEN bit in the MCR is set (Rx FIFO enabled), the function of the 8 least significant interrupt flags (BUF7I - BUF0I) is changed to support the FIFO operation. BUF7I, BUF6I and BUF5I indicate operating conditions of the FIFO, while BUF4I to BUF0I are not used. Before enabling the RFEN, ARM must service the IFLAG1 asserted

FLEXCAN Memory Map/Register Definition

in the Rx FIFO region (see [Rx FIFO](#)). Otherwise, these IFLAGS will mistakenly show the related MBs now belonging to FIFO as having contents to be serviced. When the RFEN is negated, the FIFO flags must be cleared. The same care must be taken when a RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, ARM must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

FLEXCANx_IFLAG1 field descriptions

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt. 1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7. If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6. If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes.

Table continues on the next page...

FLEXCANx_IFLAG1 field descriptions (continued)

Field	Description
	1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO. This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4. If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations. These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by ARM writes. 1 Corresponding MB completed transmission/reception 0 No such occurrence

27.8.13 Control 2 Register (FLEXCANx_CTRL2)

This register contains control bits for CAN errors, FIFO features and mode selection.

Table 27-60. Rx FIFO Filters

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes ¹	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks ²	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask ²

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.

2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP_MB} - 6) \times 4$$

where SETUP_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 27-36](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

FLEXCANx_CTRL2 field descriptions

Field	Description
31 -	must be written as 0
30-29 -	This field is reserved. Reserved

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
28 WRMFRZ	<p>Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode.</p> <p>1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory</p>
27–24 RFEN	<p>This 4-bit field defines the number of Rx FIFO filters according to Table 27-35. The maximum selectable number of filters is determined by the ARM. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see Table 27-35) that may not exceed the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see Module Configuration Register (FLEXCAN_MCR)) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in Table 27-18 (see Arbitration and Matching Timing).</p>
23–19 TASD	<p>This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency.</p> <p>The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa.</p> <p>If TASD is 0 then the arbitration start is not delayed, thus ARM has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then ARM can configure a Tx MB later and less time is reserved for arbitration.</p> <p>If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that ARM reconfigure some Tx MBs and the winner MB is not the best to be transmitted.</p> <p>The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate.</p> <p>The optimal configuration for TASD can be calculated as:</p>

Table continues on the next page...

FLEXCANx_CTRL2 field descriptions (continued)

Field	Description
	$TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{SYS} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p>f_{CANCLK} is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. See Clock Root Generator</p> <p>f_{SYS} is the peripheral clock in Hz;</p> <p>MAXMB is the value in CTRL1[MAXMB] field;</p> <p>RFEN is the value in CTRL1[RFEN] bit;</p> <p>RFFN is the value in CTRL2[RFFN] field;</p> <p>PSEG1 is the value in CTRL1[PSEG1] field;</p> <p>PSEG2 is the value in CTRL1[PSEG2] field;</p> <p>PROPSEG is the value in CTRL1[PROPSEG] field;</p> <p>PRES DIV is the value in CTRL1[PRES DIV] field.</p> <p>Please refer to Arbitration process and Protocol Timing for more details.</p>
18 MRP	<p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p>
17 RRS	<p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p>
16 EACEN	<p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p>

Field	Description
	Reserved

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

27.8.14 Error and Status 2 Register (FLEXCANx_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

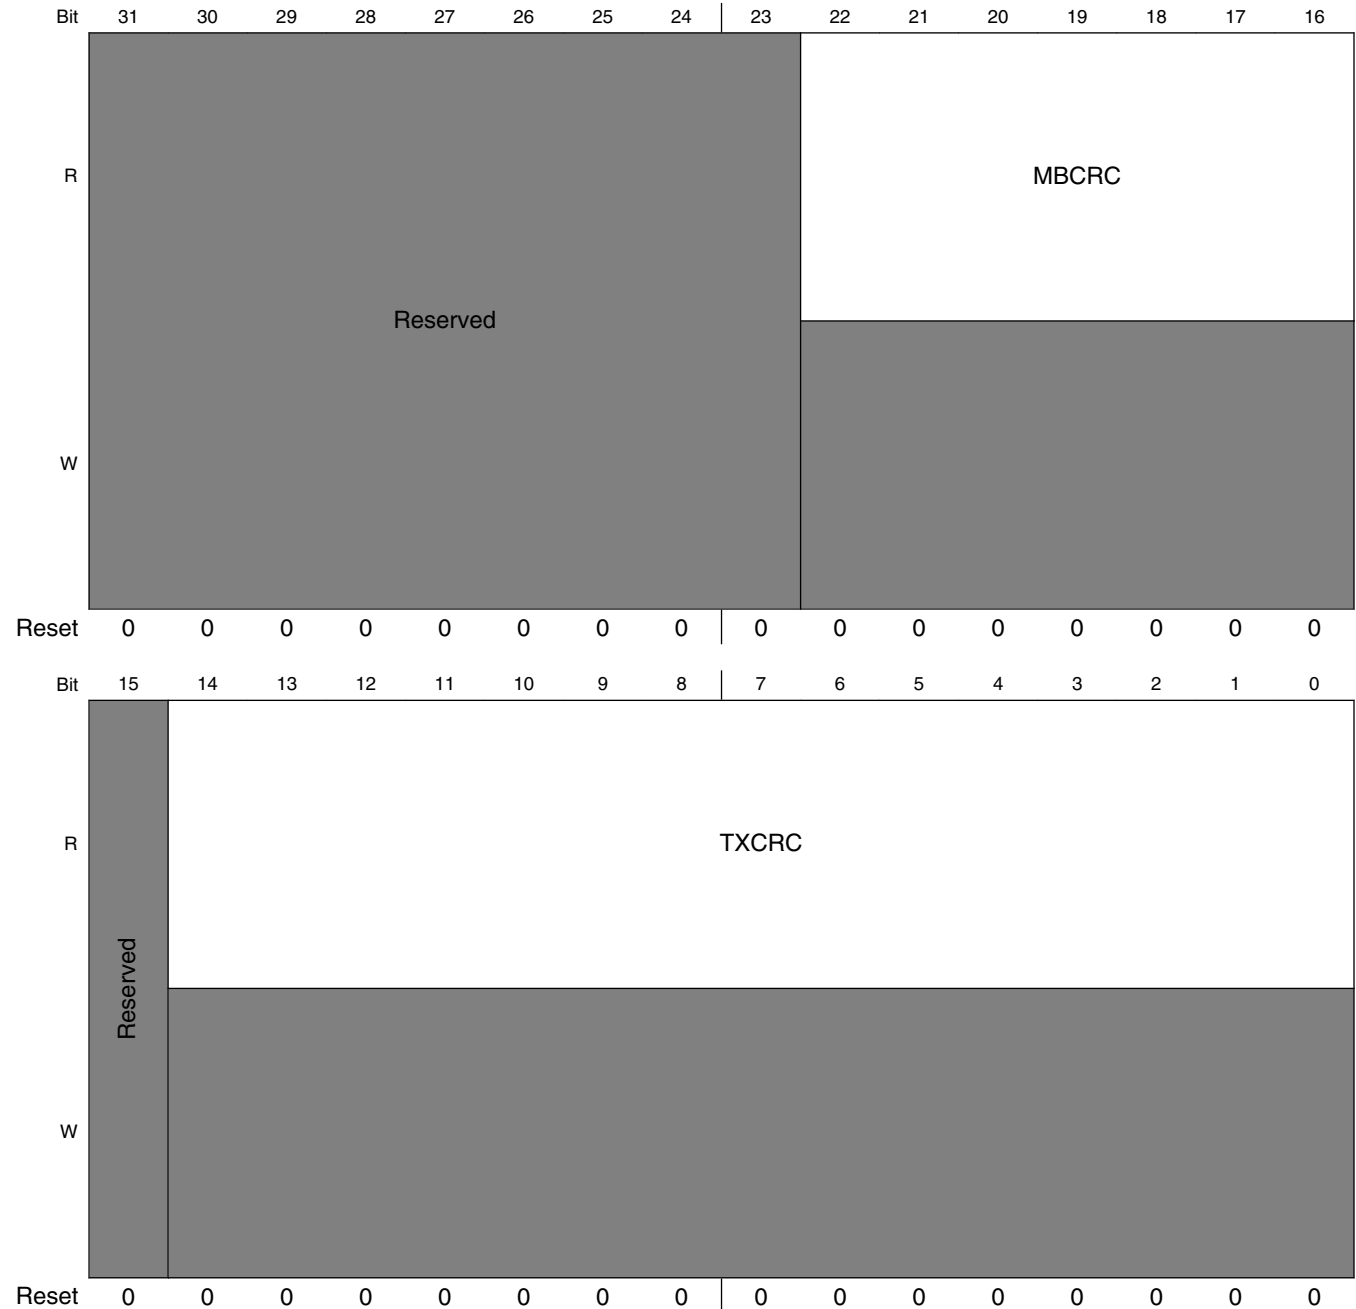

FLEXCANx_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, this 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value. If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see Highest Mailbox priority first). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the ARM writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process. If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox. ESR2[VPS] is not affected by any ARM write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked. 1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000). This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see Arbitration process). LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM]. 1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

27.8.15 CRC Register (FLEXCANx_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

FLEXCANx_CRCR field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

27.8.16 Rx FIFO Global Mask Register (FLEXCANx_RXFGMASK)

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

Table 27-65. Rx FIFO Global Mask usage

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1	-	-
C	-	-	-	-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	-

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

Address: Base address + 48h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

FLEXCANx_RXFGMASK field descriptions

Field	Description
FGM31_FGM0	<p>These bits mask the ID Filter Table elements bits in a perfect alignment. Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK) shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter.</p> <p>1 The corresponding bit in the filter is checked 0 The corresponding bit in the filter is "don't care"</p>

- If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
- If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

27.8.17 Rx FIFO Information Register (FLEXCANx_RXFIR)

RXFIR provides information on Rx FIFO.

This register is the port through which ARM accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																								IDHIT

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

FLEXCANx_RXFIR field descriptions

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see Rx FIFO Structure) was hit by the received message that is in the output of the Rx FIFO. (refer to Rx FIFO for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

27.8.18 Rx Individual Mask Registers (FLEXCANx_RXIMR0_RXIMR63)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO. If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN_CTRL2\)](#) for details.

RXIMR can only be written by the ARM while the module is in Freeze Mode, otherwise they are blocked by hardware.

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset

FLEXCANx_RXIMR0_RXIMR63 field descriptions

Field	Description
MI31_MIO	<p>These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways.</p> <p>For Mailbox filter refer to Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK).</p> <p>For Rx FIFO ID Filter Table element refer to Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK).</p> <p>1 The corresponding bit in the filter is checked 0 the corresponding bit in the filter is "don't care"</p>

27.8.19 Glitch Filter Width Registers (FLEXCANx_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

FLEXCANx_GFWR field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33us when the oscillator is 24MHz.

Chapter 28

General Interrupt Service (GIS)

28.1 Overview

The General Interrupt Service (GIS) block is designed to facilitate the backup camera operation on startup when the cpu is loading the kernal and can't process the required interrupts.

The GIS is responsible for monitoring the framebuffer complete interrupt from the CSI and the frame done interrupt from the PXP. The GIS uses this information to coordinate moving the video frame data from the CSI through the PXP and finally to the LCDIF for display. Software is responsible for programming the GIS, CSI, PXP and LCDIF to work together correctly.

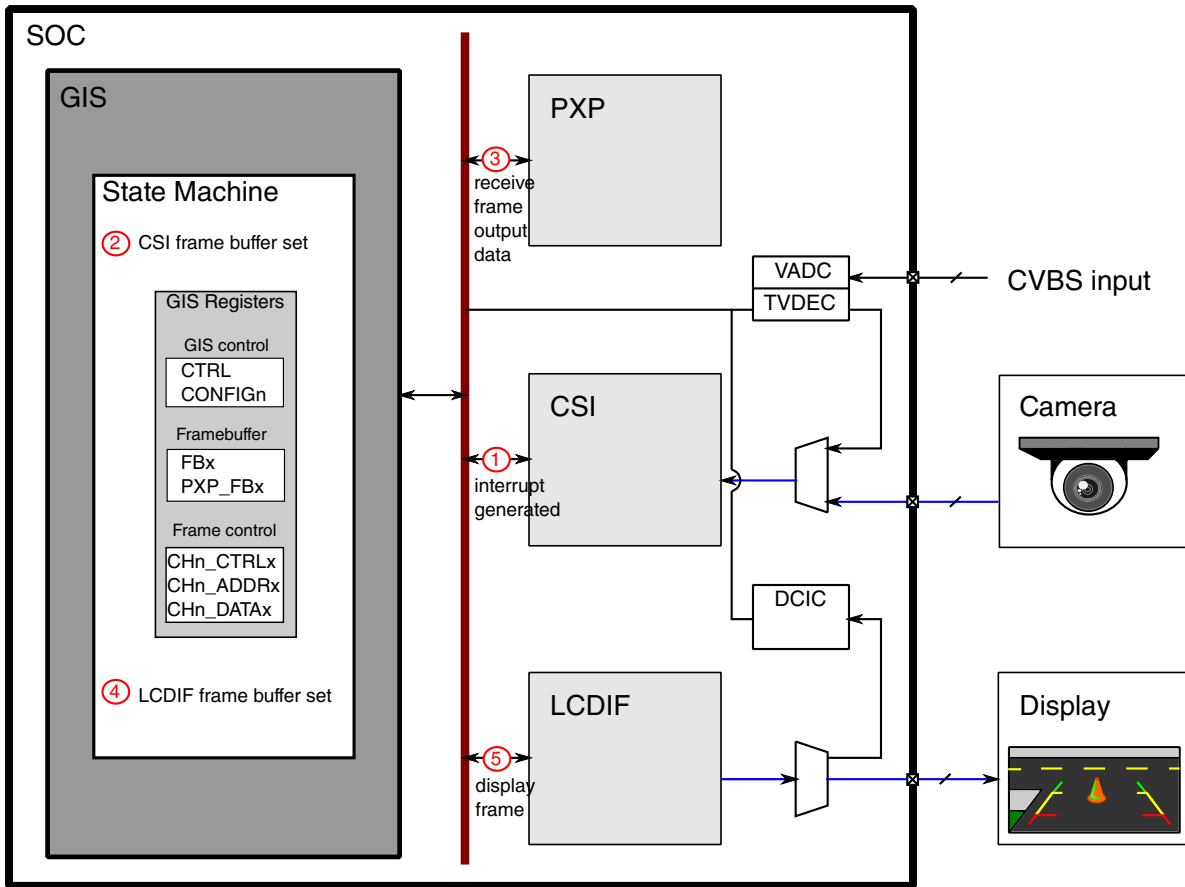

Figure 28-1. GIS Block Diagram

28.2 External Signals

There are no GIS signals directly available at the chip boundary of the SoC.

28.3 Clocks

The following table describes the clock sources for GIS. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 28-1. GIS Clocks

Clock name	Clock Root	Description
clk	display_clk_root	Module clock (APB bus clock)

28.4 Functional Description

The basic function of the GIS is described as follows:

1. When a CSI interrupt is received then clear the interrupt.
2. Program the correct framebuffer pointer into the CSI for storage of the next incoming CSI image.
3. Program the incoming framebuffer pointer from the CSI into the PXP. Also program the output framebuffer pointer for the PXP to dump the output.
4. Kick the PXP to process the frame.
5. When the PXP is finished processing update the input framebuffer pointer in the LCDIF to display the new frame.
6. Wait for new CSI interrupt and go back to step 1.

This process continues and moves data from the CSI to the display. The GIS also handles the case where the PXP might process the frames slower than they are coming in from the CSI and frames must be dropped. Although the GIS receives LCDIF interrupts, they are ignored in this implementation. Only the CSI and PXP interrupts are processed.

The function of the GIS is accomplished by setting up programmable commands into the work channels defined in the register map. These channels are assigned to work tasks (specific sub-tasks) of the above algorithm. For example, a channel is assigned to clear the interrupt from the CSI, that channel is called and its programmable commands are executed at the proper time in the execution of the algorithm. Another work channel would be assigned the responsibility of setting up the PXP framebuffer pointer in preparation of it being kicked off to process another frame. This channel's commands would be executed at the proper time in the algorithm.

28.4.1 Double Buffer

The GIS basic function is implemented by using a double buffer system. In the GIS double buffer system, there are two sets of memory double buffers. One set for the output of the CSI data (input for the PXP) and one set for the output of the PXP data (input for the LCDIF).

The first set of buffers is used between CSI and PXP. When CSI fills camera framebuffer 0, GIS writes the address of framebuffer 1 for CSI to fill and tells PXP to process camera framebuffer 0. When CSI finishes filling camera framebuffer 1, the PXP begins processing it, and CSI starts to fill camera framebuffer 0 again.

The second set of buffers is used to coordinate the image flow between PXP and LCDIF. When the PXP completes the processing of a frame, it writes to PXP framebuffer 0. The GIS programs the LCDIF to display that frame while PXP is filling framebuffer 1 with the next frame. When PXP finishes filling framebuffer 1, GIS tells LCDIF to display PXP framebuffer 1. This process repeats.

28.4.2 Bus Interface

The GIS is an IPS bus master and is capable of reading and writing to CSI, PXP and LCDIF registers. The GIS registers are on the APB bus.

28.4.3 State Machine

The GIS algorithm is implemented using one-hot state machine (SM). The state machine is detailed below.

28.4.3.1 State Machine: main

There are 6 states in this SM. An Idle state and one state for each of the sub-task work units.

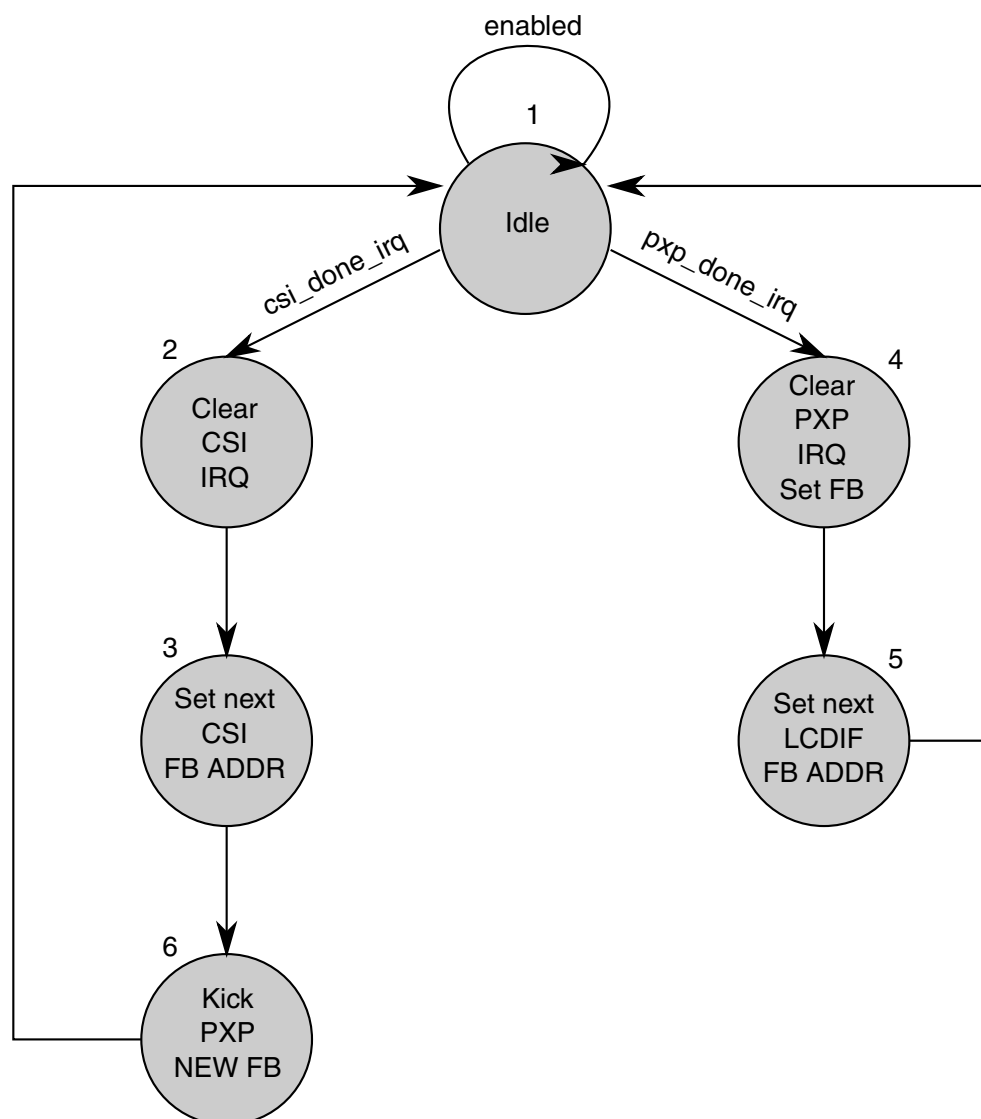

Figure 28-2. State Machine: main

The state transitions depend on the timing of the CSI and PXP interrupts. Frames will be dropped if a CSI interrupt is received while the PXP is busy. The states are detailed below.

1. Idle
2. CSI clear interrupt - This state kicks off the writes to CSI to clear the interrupt (WR_DATA)
3. CSI set next framebuffer address - This state kicks off the writes to CSI FB address register based on PXP clear IRQ when entering the state. This state sets the PXP kick state if a PXP IRQ is pending. (WR_FB_CSI)
4. PXP clear interrupt and set framebuffer - This state kicks off the writes to PXP to clear the interrupt. (WR_DATA, WR_FB_PXP_OUT)
5. LCDIF set framebuffer to display - This state kicks off the writes to LCDIF to set new buffer for display. (WR_FB_LCDIF)

- 6. PXP kick to process next framebuffer - This state kicks off the writes to PXP to start new frame. (WR_FB_PXP_IN, WR_DATA)

28.4.4 Sub-tasks and channel assignments

A command channel is a set of commands (up to 4) that are executed as a unit or set. This set of commands can also be called an algorithm sub-task. This implementation breaks up the GIS work into smaller work units. One command channel can be assigned to execute at each main SM state (except Idle). At each SM state, the commands in the associated channels constitute the sub-task. There are 5 main SM states (not including idle) and therefore 5 algorithm sub-tasks.

Each of these states / sub-tasks must be assigned a command channel through register programming (this is the case already set by register default values). There are 6 command channels available. Any channel can be assigned to any sub-task except channel 5. Channel 5 registers should remain in their default state.

28.4.5 Commands supported

Up to 4 commands can be specified and defined to execute in each channel. For each channel, there is a GIS_CHn_CTRL register that defines an opcode, alu function and an accumulator negation flag for each command. Also there are 4 sets of address and data registers for each channel (GIS_CHn_ADDRx and GIS_CHn_DATAx). These are programmed with address and data values for bus transactions. There is an internal accumulator register that can be the source or destination for data of bus transfers. The commands supported are as follows.

Table 28-2. GIS Commands

Command	Description
SET_ACC	Initialize accumulator value.
WR_DATA	Store data at address.
WR_ACC	Store accumulator value at address.
WR_ALU	Store the result of accumulator combined (ALU operation) with data with at address.
MOV_ACC	Store the result of accumulator combined(ALU operation) with data with at accumulator.
RD_DATA	Read data at address and store in acc.
RD_ALU	Store the result of accumulator combined (ALU operation) with data read from address to accumulator.
WR_FB_CSI	Store calculated next CSI frame buffer pointer at address.

Table continues on the next page...

Table 28-2. GIS Commands (continued)

Command	Description
WR_FB_PXP_IN	Store calculated next PXP input frame buffer pointer at address.
WR_FB_PXP_OUT	Store calculated next PXP output frame buffer pointer at address.
WR_FB_LCDIF	Store calculated next LCDIF frame buffer pointer at address.

There is also an alu function and acc negation flag that is applicable to some of the more complex opcodes.

28.4.6 Backup camera use case

The following is an attempt to specify how the channels might be programmed to implement the backup camera use case.

CHO CSI IRQ - CSI clear interrupt

- Use 1 command with opcode WR_DATA. Write to CSI register with pattern that will clear the CSI interrupt.

CH1 CSI FB - CSI set next framebuffer addr

- Use 1 command with opcode WR_FB_CSI. Put fb0 CSI register address in ADDR register and fb1 CSI register address in the DATA register. The internal logic decides which register to write to. The actual fb pointer values that are the data for the write come from the GIS_CAM_FBx registers. The internal logic decides which value to use.

CH2 PXP_IRQ - PXP clear interrupt and set framebuffer

- Program two commands for this channel with the following opcodes.
 - WR_DATA: Write to PXP register with pattern that will clear PXP interrupt bit.
 - WR_FB_PXP_OUT: Write to PXP framebuffer register. The address of the PXP register must be programmed into the command address register. The pointer value comes from the GIS_CAM_FBx registers. The internal logic makes the choice of which one to write.

CH3 LCDIF_FB - LCDIF set framebuffer to display

- Use 1 command of opcode WR_FB_LCDIF. Put the address of the LCDIF framebuffer update register in the ADDR register. The data is calculated automatically and comes from the GIS_PXP_FBx registers.

CH4 PXP_KICK - PXP kick to process next framebuffer

- Two commands are needed for this sub-task.

- **WR_FB_PXP_IN:** Write to PXP framebuffer register. Write the PXP register address to the ADDR register of the command. The pointer value comes from the GIS_CAM_FBx registers. The internal logic makes the choice of which one to write.
- **WR_DATA:** Write to PXP register with pattern that will kick off another PXP processing operation.

28.5 GIS Memory Map/Register Definition

This section contains the detailed register descriptions for the GIS registers.

GIS memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
220_4000	GIS Control Register (GIS_CTRL)	32	R/W	C000_01F0h	28.5.1/1359
220_4004	GIS Control Register (GIS_CTRL_SET)	32	R/W	C000_01F0h	28.5.1/1359

28.5.1 GIS Control Register (GIS_CTRLn)

The control register provides control for the overall block.

Address: 220_4000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R			Reserved														
W	SFTRST	CLKGATE	Reserved

GIS_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to zero to enable normal GIS operation. Set this bit to one (default) to disable clocking with the GIS and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the GIS block to its default state
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29–9 -	This field is reserved. Reserved
8 LCDIF1_IRQ_ POLARITY	Specifies the polarity of the irq assertion level. 0 Assert low. 1 Assert high.
7 LCDIF0_IRQ_ POLARITY	Specifies the polarity of the irq assertion level. 0 Assert low. 1 Assert high.
6 PXP_IRQ_ POLARITY	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block. 0 Assert low. 1 Assert high.
5 CSI1_IRQ_ POLARITY	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block. 0 Assert low. 1 Assert high.
4 CSI0_IRQ_ POLARITY	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block. 0 Assert low. 1 Assert high.
3 CSI_SEL	Specifies which of the two CSI interfaces to use, which interrupt to monitor. 0 CSI0 1 CSI1
2 LCDIF_SEL	Specifies which of the two LCDIF interfaces to use, which interrupt to monitor. 0 LCDIF0 1 LCDIF1
1 FB_START	Specifies which CSI FB finished and caused the first CSI interrupt. 0 FB0 caused the first interrupt 1 FB1 caused the first interrupt
0 ENABLE	Enable the block to process interrupts.

28.5.2 GIS Configuration 0 Register (GIS_CONFIG0n)

This register provides configuration of the GIS channels.

Address: 220_4000h base + 10h offset + (4d × i), where i=0d to 3d

GIS_CONFIG0n field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29–27 CH3_NUM	Number of valid commands to execute for this channel. Valid values are 0-4. Zero indicates there are no commands to execute from this channel.
26–24 CH3_MAPPING	Command channel3 assignment. Specifies which phase of the processing pipeline these programmed channel commands are used for. More than 1 channel can be mapped to a processing phase and they will be processed in order of ascending channel number. Values 5 and 6 are reserved. 000 CSI_ISR — Service a csi interrupt. 001 CSI_FB_UPDATE — Set the CSU frame buffer address for the next buffer to fill. 010 PXP_ISR — Service the PXP interrupt. 011 LCDIF_FB_UPDATE — Set the LCDIF to display the new frame buffer. 100 PXP_KICK — Start the PXP processing the newly available frame buffer from the camera. 101-110 - — Reserved. 111 CHANNEL_UNUSED — Specifies an unused channel.
23–22 -	This field is reserved. Reserved
21–19 CH2_NUM	Number of valid commands to execute for this channel. Valid values are 0-4. Zero indicates there are no commands to execute from this channel.
18–16 CH2_MAPPING	Command channel2 assignment. Specifies which phase of the processing pipeline these programmed channel commands are used for. More than 1 channel can be mapped to a processing phase and they will be processed in order of ascending channel number. Values 5 and 6 are reserved. 000 CSI_ISR — Service a csi interrupt. 001 CSI_FB_UPDATE — Set the CSU frame buffer address for the next buffer to fill. 010 PXP_ISR — Service the PXP interrupt. 011 LCDIF_FB_UPDATE — Set the LCDIF to display the new frame buffer. 100 PXP_KICK — Start the PXP processing the newly available frame buffer from the camera. 101-110 - — Reserved. 111 CHANNEL_UNUSED — Specifies an unused channel.
15–14 -	This field is reserved. Reserved

GIS_CONFIG1n field descriptions

Field	Description
31–14 -	This field is reserved. Reserved
13–11 CH5_NUM	Number of valid commands to execute for this channel. Valid values are 0-4. Zero indicates there are no commands to execute from this channel.
10–8 CH5_MAPPING	Command channel5 assignment. Specifies which phase of the processing pipeline these programmed channel commands are used for. More than 1 channel can be mapped to a processing phase and they will be processed in order of ascending channel number. Values 5 and 6 are reserved. 000 CSI_ISR — Service a csi interrupt. 001 CSI_FB_UPDATE — Set the CSU frame buffer address for the next buffer to fill. 010 PXP_ISR — Service the PXP interrupt. 011 LCDIF_FB_UPDATE — Set the LCDIF to display the new frame buffer. 100 PXP_KICK — Start the PXP processing the newly available frame buffer from the camera. 101-110 - — Reserved. 111 CHANNEL_UNUSED — Specifies an unused channel.
7–6 -	This field is reserved. Reserved
5–3 CH4_NUM	Number of valid commands to execute for this channel. Valid values are 0-4. Zero indicates there are no commands to execute from this channel.
CH4_MAPPING	Command channel4 assignment. Specifies which phase of the processing pipeline these programmed channel commands are used for. More than 1 channel can be mapped to a processing phase and they will be processed in order of ascending channel number. Values 5 and 6 are reserved. 000 CSI_ISR — Service a csi interrupt. 001 CSI_FB_UPDATE — Set the CSU frame buffer address for the next buffer to fill. 010 PXP_ISR — Service the PXP interrupt. 011 LCDIF_FB_UPDATE — Set the LCDIF to display the new frame buffer. 100 PXP_KICK — Start the PXP processing the newly available frame buffer from the camera. 101-110 - — Reserved. 111 CHANNEL_UNUSED — Specifies an unused channel.

28.5.4 Camera Frame Buffer Address 0 Register (GIS_FB0)

Camera frame buffer address 0.

Address: 220_4000h base + 30h offset = 220_4030h

GIS_FB0 field descriptions

Field	Description
ADDR	32 bit address of command.

28.5.5 Camera Frame Buffer Address 1 Register (GIS_FB1)

Camera frame buffer address 1.

Address: 220_4000h base + 40h offset = 220_4040h

GIS_FB1 field descriptions

Field	Description
ADDR	32 bit address of command.

28.5.6 PXP Frame Buffer Address 0 Register. (GIS_PXP_FB0)

PXP frame buffer address 0.

Address: 220_4000h base + 50h offset = 220_4050h

GIS_PXP_FB0 field descriptions

Field	Description
ADDR	32 bit address of command.

28.5.7 PXP Frame Buffer Address 1 Register (GIS_PXP_FB1)

PXP frame buffer address 1.

Address: 220_4000h base + 60h offset = 220_4060h

GIS_PXP_FB1 field descriptions

Field	Description
ADDR	32 bit address of command.

28.5.8 Control Command Channel 0 Register (GIS_CH0_CTRLn)

Control information for command channel 0.

Address: 220_4000h base + 70h offset + (4d × i), where i=0d to 3d

GIS_CH0_CTRLn field descriptions

Field	Description
31 CMD3_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
30–28 CMD3_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
27–24 CMD3_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator.

Table continues on the next page...

GIS_CH0_CTRLn field descriptions (continued)

Field	Description
	0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
23 CMD2_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
22–20 CMD2_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
19–16 CMD2_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
15 CMD1_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
14–12 CMD1_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation.

Table continues on the next page...

GIS_CH0_CTRLn field descriptions (continued)

Field	Description
	001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
11–8 CMD1_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
7 CMD0_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
6–4 CMD0_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
CMD0_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc.

Table continues on the next page...

GIS_CH0_CTRLn field descriptions (continued)

Field	Description
0110	RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator.
0111	WR_FB_CSI — Store calculated next CSI frame buffer pointer at address.
1000	WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address.
1001	WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address.
1010	WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address.
1011-1111	- — Reserved.

28.5.9 Channel 0 Command 0 Address Register. (GIS_CH0_ADDR0n)

Address register for channel 0 command 0.

Address: 220_4000h base + 80h offset + (4d × i), where i=0d to 3d

GIS_CH0_ADDR0n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.10 Channel 0 Command 0 Data Register (GIS_CH0_DATA0)

Data register for channel 0 command 0.

Address: 220_4000h base + 90h offset = 220_4090h

GIS_CH0_DATA0 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.11 Channel 0 Command 1 Address Register. (GIS_CH0_ADDR1n)

Address register for channel 0 command 1.

Address: 220_4000h base + A0h offset + (4d × i), where i=0d to 3d

GIS_CH0_ADDR1n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.

Table continues on the next page...

GIS_CH0_ADDR1n field descriptions (continued)

Field	Description
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.12 Channel 0 Command 1 Data Register (GIS_CH0_DATA1)

Data register for channel 0 command 1.

Address: 220_4000h base + B0h offset = 220_40B0h

GIS_CH0_DATA1 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.13 Channel 0 Command 2 Address Register. (GIS_CH0_ADDR2n)

Address register for channel 0 command 2.

Address: 220_4000h base + C0h offset + (4d × i), where i=0d to 3d

GIS_CH0_ADDR2n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.14 Channel 0 Command 2 Data Register (GIS_CH0_DATA2)

Data register for channel 0 command 2.

Address: 220_4000h base + D0h offset = 220_40D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GIS_CH0_DATA2 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.15 Channel 0 Command 3 Address Register. (GIS_CH0_ADDR3n)

Address register for channel 0 command 3.

Address: 220_4000h base + E0h offset + (4d × i), where i=0d to 3d

GIS_CH0_ADDR3n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CS11_SEL	This bit selects the CS11 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CS10_SEL	This bit selects the CS10 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.16 Channel 0 Command 3 Data Register (GIS_CH0_DATA3)

Data register for channel 0 command 3.

Address: 220_4000h base + F0h offset = 220_40F0h

GIS_CH0_DATA3 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.17 Control Command Channel 0 Register (GIS_CH1_CTRLn)

Control information for command channel 0.

Address: 220_4000h base + 100h offset + (4d × i), where i=0d to 3d

31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.21 Channel 0 Command 1 Data Register (GIS_CH1_DATA1)

Data register for channel 0 command 1.

Address: 220_4000h base + 140h offset = 220_4140h

GIS_CH1_DATA1 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.22 Channel 0 Command 2 Address Register. (GIS_CH1_ADDR2n)

Address register for channel 0 command 2.

Address: 220_4000h base + 150h offset + (4d × i), where i=0d to 3d

GIS_CH1_ADDR2n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CS11_SEL	This bit selects the CS11 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CS10_SEL	This bit selects the CS10 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.23 Channel 0 Command 2 Data Register (GIS_CH1_DATA2)

Data register for channel 0 command 2.

Address: 220_4000h base + 160h offset = 220_4160h

GIS_CH1_DATA2 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.24 Channel 0 Command 3 Address Register. (GIS_CH1_ADDR3n)

Address register for channel 0 command 3.

Address: 220_4000h base + 170h offset + (4d × i), where i=0d to 3d

GIS_CH1_ADDR3n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.25 Channel 0 Command 3 Data Register (GIS_CH1_DATA3)

Data register for channel 0 command 3.

Address: 220_4000h base + 180h offset = 220_4180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GIS_CH2_CTRL_n field descriptions

Field	Description
31 CMD3_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.

Table continues on the next page...

GIS_CH2_CTRLn field descriptions (continued)

Field	Description
30–28 CMD3_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
27–24 CMD3_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
23 CMD2_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
22–20 CMD2_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
19–16 CMD2_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address.

Table continues on the next page...

GIS_CH2_CTRLn field descriptions (continued)

Field	Description
	0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
15 CMD1_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
14–12 CMD1_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved. 000 AND — AND operation. 001 OR — OR operation. 010 XOR — XOR operation. 011 ADD — ADD operation. 100 SUB — SUBTRACT operation. 101-111 - — Reserved.
11–8 CMD1_OPCODE	This field specifies the opcode to go along with the address and data values for this command. Values 0-7 are defined below. All other values are reserved. 0000 SET_ACC — Initialize accumulator value.. 0001 WR_DATA — Store data to address. 0010 WR_ACC — Store accumulator value to address. 0011 WR_ALU — Store the result of accumulator combined(ALU operation) with data with to address. 0100 MOV_ACC — Store the result of accumulator combined(ALU operation) with data with to accumulator. 0101 RD_DATA — Read data at address and store in acc. 0110 RD_ALU — Store the result of accumulator combined(ALU operation) with data read from address to accumulator. 0111 WR_FB_CSI — Store calculated next CSI frame buffer pointer at address. 1000 WR_FB_PXP_IN — Store calculated next PXP input frame buffer pointer at address. 1001 WR_FB_PXP_OUT — Store calculated next PXP output frame buffer pointer at address. 1010 WR_FB_LCDIC — Store calculated next LCDIF frame buffer pointer at address. 1011-1111 - — Reserved.
7 CMD0_ACC_NEG	If the accumulator is used in the command this bit specifies if the accumulator value should be to negated before it is used in the command. The original value is retained in the internal accumulator register. 0 NO_NEGATE — No negation. 1 NEGATE — Negation specified.
6–4 CMD0_ALU	Specifies the what logical or arithmetic operation for the ALU when combining the accumulator and the data bits. Values 5-7 are reserved.

Table continues on the next page...

28.5.36 Channel 0 Command 0 Address Register. (GIS_CH3_ADDR0n)

Address register for channel 0 command 0.

Address: 220_4000h base + 230h offset + (4d × i), where i=0d to 3d

GIS_CH3_ADDR0n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.37 Channel 0 Command 0 Data Register (GIS_CH3_DATA0)

Data register for channel 0 command 0.

Address: 220_4000h base + 240h offset = 220_4240h

GIS_CH3_DATA0 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.38 Channel 0 Command 1 Address Register. (GIS_CH3_ADDR1n)

Address register for channel 0 command 1.

Address: 220_4000h base + 250h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.39 Channel 0 Command 1 Data Register (GIS_CH3_DATA1)

Data register for channel 0 command 1.

Address: 220_4000h base + 260h offset = 220_4260h

GIS_CH3_DATA1 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.40 Channel 0 Command 2 Address Register. (GIS_CH3_ADDR2n)

Address register for channel 0 command 2.

Address: 220_4000h base + 270h offset + (4d × i), where i=0d to 3d

GIS_CH3_ADDR2n field descriptions

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.

Table continues on the next page...

Field	Description
31 LCDIF1_SEL	This bit selects the LCDIF1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
30 LCDIF0_SEL	This bit selects the LCDIF0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
29 PXP_SEL	This bit selects the PXP block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
28 CSI1_SEL	This bit selects the CSI1 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
27 CSI0_SEL	This bit selects the CSI0 block as the target if this command will access the bus. Only 1 of the select bits in this register should be set.
ADDR	32 bit address of command.

28.5.50 Channel 0 Command 2 Data Register (GIS_CH4_DATA2)

Data register for channel 0 command 2.

Address: 220_4000h base + 310h offset = 220_4310h

GIS_CH4_DATA2 field descriptions

Field	Description
DATA	32 bit address of command.

28.5.51 Channel 0 Command 3 Address Register. (GIS_CH4_ADDR3n)

Address register for channel 0 command 3.

Address: 220_4000h base + 320h offset + (4d × i), where i=0d to 3d

GIS_DEBUG1 field descriptions

Field	Description
31–20 -	This field is reserved. Reserved
19–18 LCDIF_FB	For debug purposes only. Which frame buffer is current.
17–16 PXP_IN_FB	For debug purposes only. Which frame buffer is current.
15–8 PXP_OUT_FB	For debug purposes only. Which frame buffer is current.
CSI_FB	For debug purposes only. Which frame buffer is current.

28.5.64 Version Register (GIS_VERSION)

This register reflects the version number for the GIS.

Address: 220_4000h base + 3F0h offset = 220_43F0h

GIS_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

Chapter 29

General Power Controller (GPC)

29.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- [DVFS - Dynamic Voltage & Frequency Scaling](#) load tracking for CPU
- [CPU Power Gating Control \(PGC\)](#)

Each sub-block has its own IP registers.

GPC determines wake-up irq for exiting STOP mode (with or without CPU power gating).

Figure 29-1. GPC Block Diagram

29.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 29-1. GPC Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

29.3 DVFS overview

The DVFS allows simple dynamic voltage frequency scaling.

The frequency of the core clock domain and the voltage of the core power domain can be changed on the fly while all modules (including the MCU) continue their normal operation. The frequency of the core clock domain can be changed by temporally switching to an alternate PLL clock, or by changing the post dividers division factors.

The DVFS load tracking block allows hardware tracking on the core load and generate an interrupt when a frequency change is requested.

NOTE

DVFS is a monitor that only provides an interrupt when CPU load exceeds the predefined value and does not send any request to make a change of voltage and frequency. This can be done by the user in the CPU interrupt routine or SDMA routine.

Figure 29-2. DVFS_core diagram

29.3.1 Features

The DVFS load tracking block includes the following features:

- Configurable include/exclude of input signals:
 - per-core ARM standby signal (idle / non-idle)
 - 16 general purpose bits (common for all 4 tracking modules)
 - Configurable weight to each bit.
- Configurable generated clocks and averaging time slicing (respond time).
- Configurable panic mode respond logic (for frequency up).
- Programmable buffer for last 4, 8, 12, or 16 load tracking samples of core 0 (only).

29.4 DVFS output event/interrupt configuration

Event/interrupt will be always high as long as LBFL is '1' and is not cleared by SW. Unless DVFEV (always event) is asserted. Then the event/interrupt will be toggled up and down at every toggle of div_3_clk.

29.4.1 Interrupts

DVFS generates an interrupt that indicates that frequency and voltage update is needed. The user has to read the FSVAIM bits in order to know which change needs to be done.

29.4.2 DVFS Change Request Sequence Diagrams

The following figures describe the sequence on DVFS interrupt.

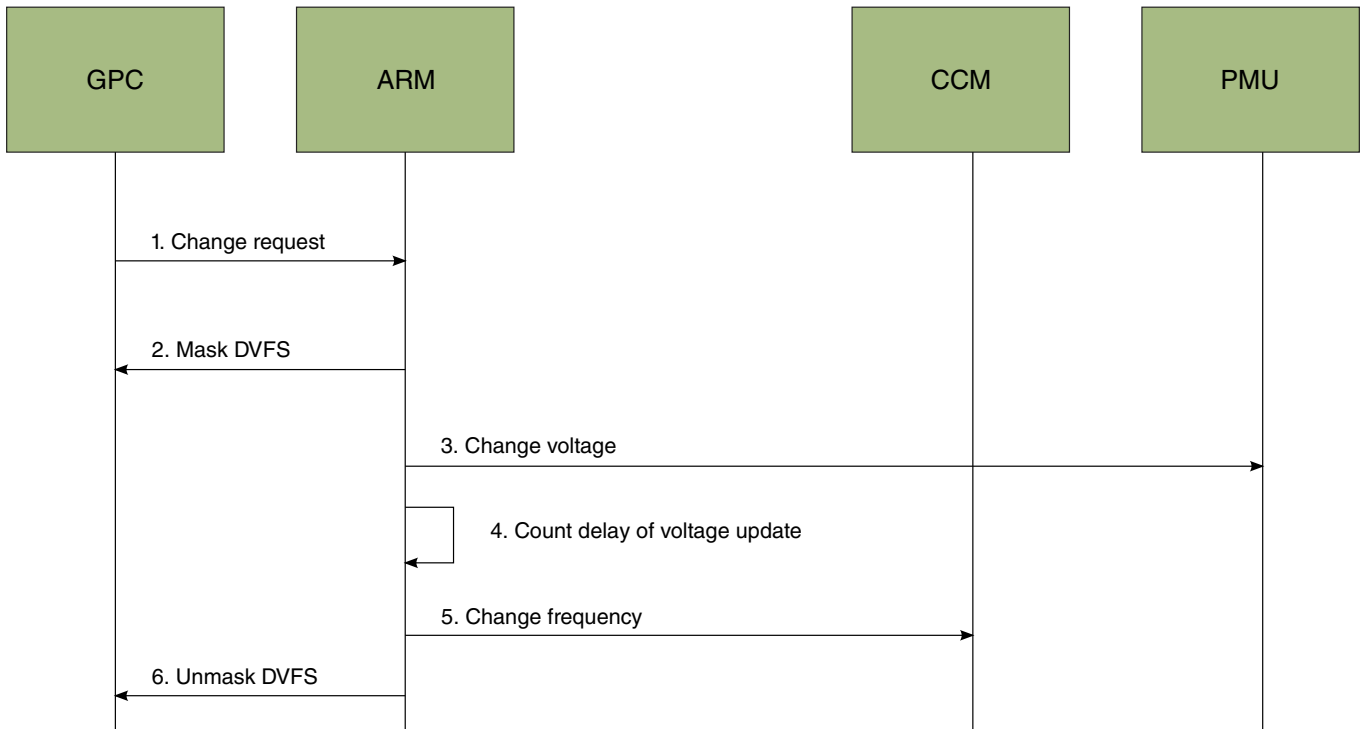

Figure 29-3. DVFS - frequency increase

Figure 29-4. DVFS - frequency decrease

CPU DVFS frequency change can be performed in 2 ways:

- PLL inputs muxing update
- clock dividers update

29.5 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

PGC power up sequence:

- One of the power up irq is asserted.

- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

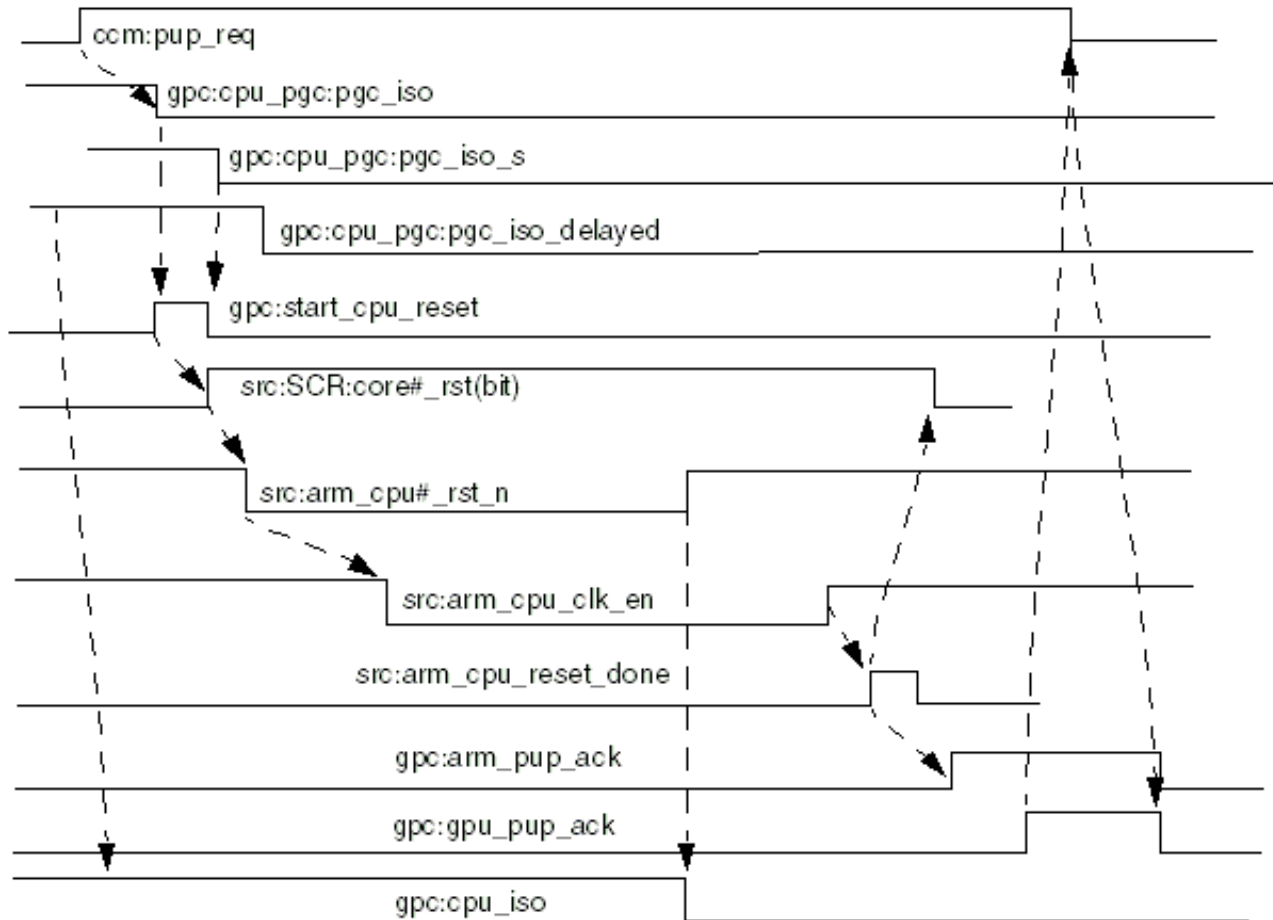

Figure 29-5. GPC-SRC handshake for reset after power gating

29.5.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 29-6](#) shows PGC as part of the SoC's overall power management scheme.

Figure 29-6. PGC Block Diagram

29.5.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

29.6 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 128 interrupts.

29.6.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 128 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

29.7 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

GPC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_C000	GPC Interface control register (GPC_CNTR)	32	R/W	0010_0000h	29.7.1/1423

0 PCIE_PHY_RESET_B	PCIE PHY power switch control signal indication 0 — PCIE PHY power supply is switched on 1 — PCIE PHY power supply is switched off

29.8 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by $[\text{GPC base address}] + [\text{PGC CPU/GPU/DISPLAY Offset}]$.

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	<p>After asserting power toggle on/off signal (switch_b), the PGC waits a number of IPG clocks equal to the value of SW2ISO before negating isolation.</p> <p>NOTE: SW2ISO must not be programmed to zero.</p>
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	<p>After a power-up request (pup_req assertion), the PGC waits a number of IPG clocks equal to the value of SW before asserting power toggle on/off signal (switch_b).</p> <p>NOTE: SW must not be programmed to zero.</p> <p>NOTE: The PGC clock is generated from the IPG_CLK_ROOT. for frequency configuration of the IPG_CLK_ROOT. See Clock Controller Module (CCM).</p>

29.8.3 Pull Down Sequence Control Register (PGCx_PCIE_PHY_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 208h offset

PGCx_PCIE_PHY_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of IPG clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). NOTE: ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of IPG clocks equal to the value of ISO before asserting isolation. NOTE: ISO must not be programmed to zero.

29.8.4 Power Gating Controller Status Register (PGCx_PCIE_PHY_SR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 20Ch offset

PGCx_PCIE_PHY_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down. 0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

29.8.5 PGC Control Register (PGCx_MEGA_CTRL)

The PGCR enables the response to a power-down request.

Address: Base address + 220h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

See Clock Controller Module (CCM).</p>

29.8.15 Pull Down Sequence Control Register (PGCx_GPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 268h offset

PGCx_GPU_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of IPG clocks equal to the value of ISO2SW before negating power toggle on/off signal (switch_b). NOTE: ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of IPG clocks equal to the value of ISO before asserting isolation. NOTE: ISO must not be programmed to zero.

29.8.16 Power Gating Controller Status Register (PGCx_GPU_SR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 26Ch offset

PGCx_GPU_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PSR	Power status. When in functional (or software-controlled debug) mode, PGC hardware sets PSR as soon as any of the power control output changes its state to one. Write one to clear this bit. Software should clear this bit after power up; otherwise, PSR continues to reflect the power status of the initial power down. 0 The target subsystem was not powered down for the previous power-down request. 1 The target subsystem was powered down for the previous power-down request.

29.8.17 PGC Control Register (PGCx_CPU_CTRL)

The PGCR enables the response to a power-down request.

Address: Base address + 2A0h offset

PGCx_CPU_CTRL field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 PCR	Power Control NOTE: PCR must not change from power-down request (pdn_req) assertion until the target subsystem is completely powered up. 0 Do not switch off power even if pdn_req is asserted. 1 Switch off power when pdn_req is asserted.

29.8.18 Power Up Sequence Control Register (PGCx_CPU_PUPSCR)

The PUPSCR contains the power-up timing parameters.

Address: Base address + 2A4h offset

PGCx_CPU_PUPSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SW2ISO	After asserting , the PGC waits a number of 32k clocks equal to the value of SW2ISO before negating isolation. NOTE: SW2ISO must not be programmed to zero. The SW2ISO value should be chosen such that the delay before negating isolation is greater than the LDO ramp-up time.
7–6 Reserved	This read-only field is reserved and always has the value 0.
SW	After a power-up request (pup_req assertion), the PGC waits a number of 32k clocks equal to the value of SW before asserting . NOTE: SW must not be programmed to zero.

29.8.19 Pull Down Sequence Control Register (PGCx_CPU_PDNSCR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 2A8h offset

PGCx_CPU_PDNSCR field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 ISO2SW	After asserting isolation, the PGC waits a number of 32k clocks equal to the value of ISO2SW before negating . NOTE: ISO2SW must not be programmed to zero.
7–6 Reserved	This read-only field is reserved and always has the value 0.
ISO	After a power-down request (pdn_req assertion), the PGC waits a number of 32k clocks equal to the value of ISO before asserting isolation. NOTE: ISO must not be programmed to zero.

29.8.20 Power Gating Controller Status Register (PGCx_CPU_SR)

The PDNSCR contains the power-down timing parameters.

Address: Base address + 2ACh offset

Chapter 30

General Purpose Input/Output (GPIO)

30.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

[Figure 30-1](#) shows the chip multiplexing scheme.

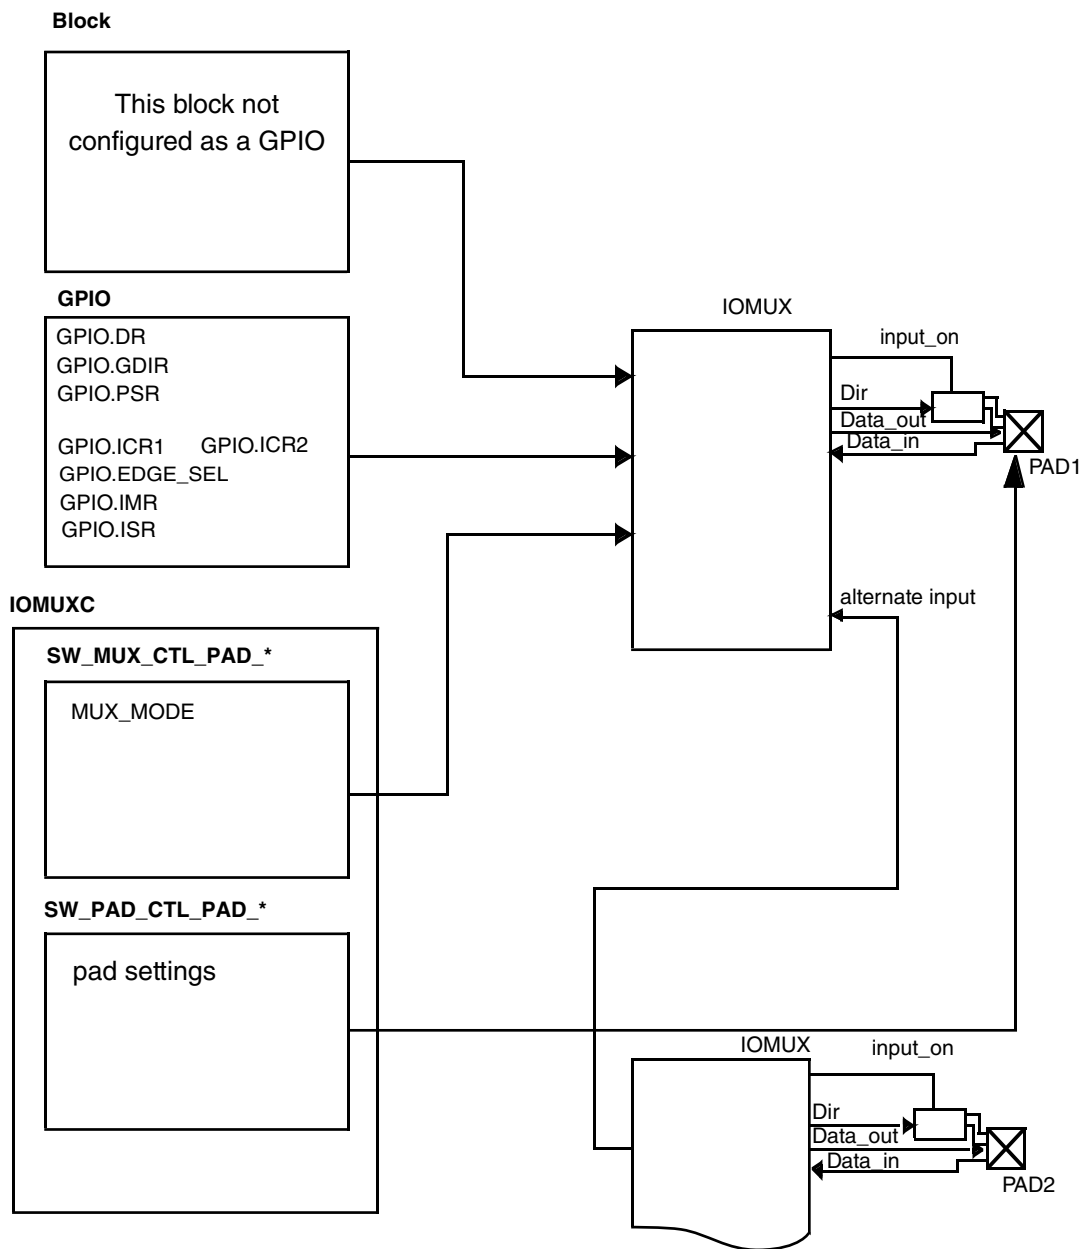

Figure 30-1. Chip IOMUX Scheme

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO_DR)
- GPIO direction register (GPIO_GDIR)
- Pad sample register (GPIO_PSR)
- Interrupt control registers (GPIO_ICR1, GPIO_ICR2)

- Edge select register (GPIO_EDGE_SEL)
- Interrupt mask register (GPIO_IMR)
- Interrupt status register (GPIO_ISR)

These registers are described in detail in [GPIO Memory Map/Register Definition](#).

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

30.1.1 Block Diagram

The GPIO subsystem contains 8 GPIO blocks which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 30-2](#).

Figure 30-2. GPIO Block Diagram

30.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
 - Drives specific data to output using the data register (GPIO_DR)
 - Controls the direction of the signal using the GPIO direction register (GPIO_GDIR)
 - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO_PSR).
- GPIO interrupt capabilities:
 - Supports up to 32 interrupts

- Identifies interrupt edges
- Generates three active-high interrupts to the SoC interrupt controller

30.2 External Signals

The tables found here describe the external signals of GPIO.

Table 30-1. GPIO External Signals

30.3 Clocks

The table found here describes the clock sources for GPIO.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 30-2. GPIO Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

30.4 GPIO Functional Description

This section provides a complete functional description of the block.

30.4.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO_GDIR).

When configured as an output (GPIO_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO_GDIR bit = 0), the state of the input can be read from the corresponding GPIO_PSR bit.

30.4.2 GPIO pad structure

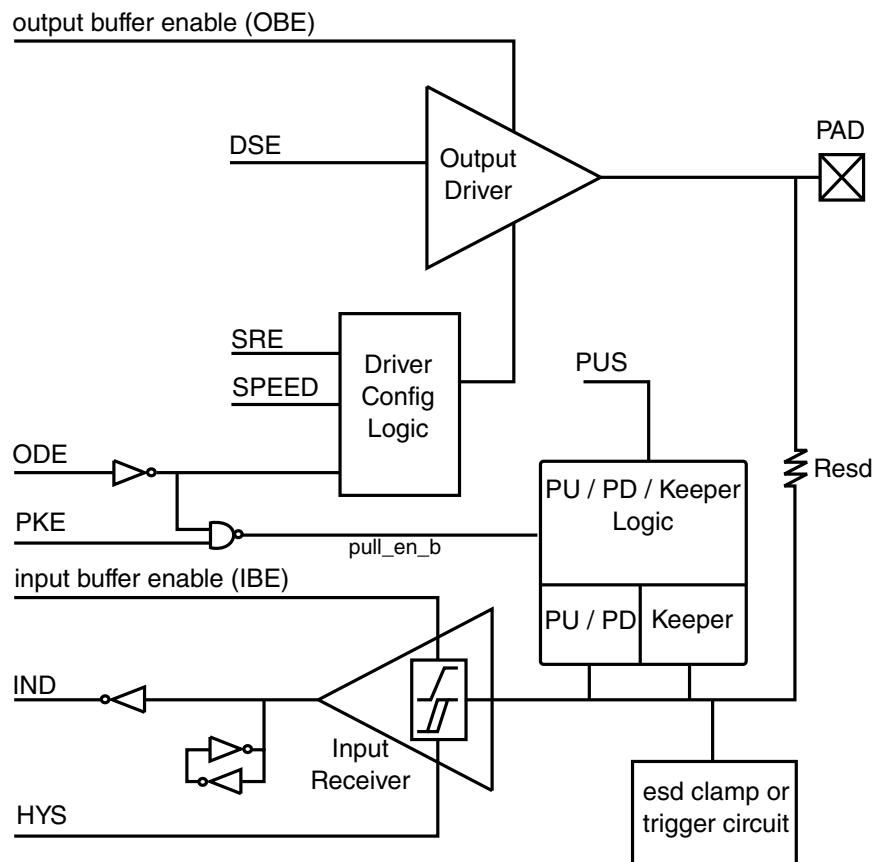

Figure 30-3. GPIO pad functional diagram

30.4.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

30.4.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 30-4. Schmitt trigger transfer characteristic

Figure 30-5. Receiver output in CMOS and hysteresis

30.4.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

30.4.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type
- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

Figure 30-6. Output Driver Functional Diagram

30.4.2.2.1 Drive strength

Drive strength selection can be used to make the impedance matched and get better signal integrity.

30.4.2.2.2 Output keeper

A simple latch to hold the input value.

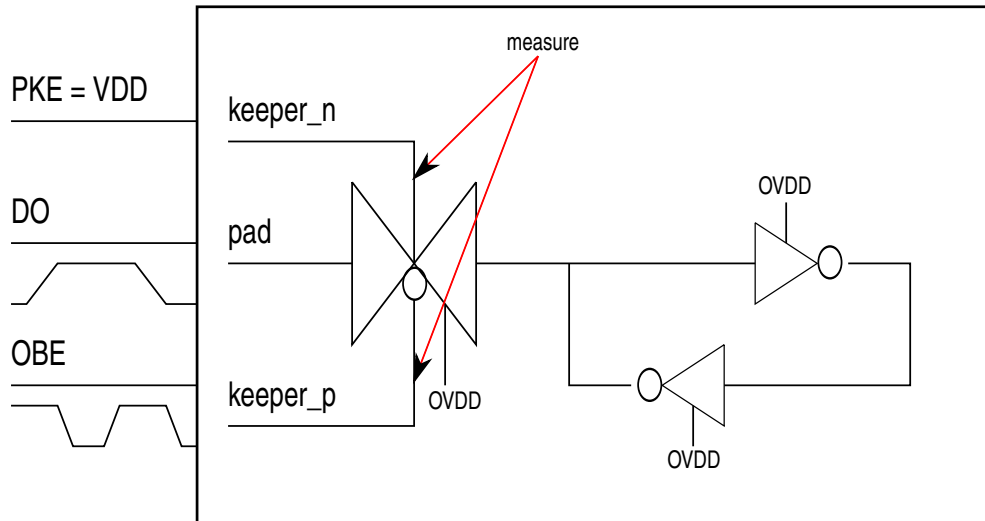

Figure 30-7. Keeper functional diagram

30.4.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

30.4.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

If internal pull-up resistor (Rpu) is used, output level will depend on OVDD1

If external Rpu is used, output level will depend on OVDD2

Figure 30-8. Output buffer in open drain mode

30.4.2.3 Operating Frequency

Table 30-3. IO Operating Frequency

DSE Setting	SRE / SPEED Setting	R_fixture (Ohm)	R_fixture (Ohm)	Operating Frequency (MHz)

30.4.3 GPIO Programming

30.4.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl_<input0>_<input1>_<input2>_<input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

NOTE

While the GPIO direction is set to input (GPIO_GDIR = 0), a read access to GPIO_DR does not return GPIO_DR data. Instead, it returns the GPIO_PSR data, which is the corresponding input signal value.

30.4.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad <output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad <output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxxF
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

30.4.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO_ICR1 and GPIO_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO_ICR1 and GPIO_ICR2 settings, see [GPIO Memory Map/Register Definition](#).

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

30.5 GPIO Memory Map/Register Definition

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

GPIO memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_C000	GPIO data register (GPIO1_DR)	32	R/W	0000_0000h	30.5.1/1491

30.5.1 GPIO data register (GPIOx_DR)

The 32-bit GPIO_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[n] is set and IOMUXC input mode is GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is GPIO, then reading DR[n] returns the corresponding input signal's value.
- If GDIR[n] is set and IOMUXC input mode is not GPIO, then reading DR[n] returns the contents of DR[n].
- If GDIR[n] is cleared and IOMUXC input mode is not GPIO, then reading DR[n] always returns zero.

Address: Base address + 0h offset

GPIOx_DR field descriptions

Field	Description
DR	Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[n]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[n]=1), or the input signal's value if configured as an input (GDIR[n]=0). NOTE: The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.

30.5.2 GPIO direction register (GPIOx_GDIR)

GPIO_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

Address: Base address + 4h offset

GPIOx_GDIR field descriptions

Field	Description
GDIR	GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal. NOTE: GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO. 0 INPUT — GPIO is configured as input. 1 OUTPUT — GPIO is configured as output.

30.5.3 GPIO pad status register (GPIOx_PSR)

GPIO_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the `ipg_clk_s` clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPIOx_ICR2 field descriptions (continued)

Field	Description
	00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.
5–4 ICR18	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 18. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.
3–2 ICR17	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 17. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.
ICR16	Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 16. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00 LOW_LEVEL — Interrupt n is low-level sensitive. 01 HIGH_LEVEL — Interrupt n is high-level sensitive. 10 RISING_EDGE — Interrupt n is rising-edge sensitive. 11 FALLING_EDGE — Interrupt n is falling-edge sensitive.

30.5.6 GPIO interrupt mask register (GPIOx_IMR)

GPIO_IMR contains masking bits for each interrupt line.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
R																		IMR																	
W																																			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			

GPIOx_IMR field descriptions

Field	Description
IMR	<p>Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.</p> <p>Settings:</p> <p>Bit IMR[n] (n=0...31) controls interrupt n as follows:</p> <p>0 UNMASKED — Interrupt n is disabled.</p> <p>1 MASKED — Interrupt n is enabled.</p>

30.5.7 GPIO interrupt status register (GPIOx_ISR)

The GPIO_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ISR																															
W	w1c																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPIOx_ISR field descriptions

Field	Description
ISR	<p>Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.</p> <p>When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.</p>

30.5.8 GPIO edge select register (GPIOx_EDGE_SEL)

GPIO_EDGE_SEL may be used to override the ICR registers' configuration. If the GPIO_EDGE_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

Address: Base address + 1Ch offset

GPIOx_EDGE_SEL field descriptions

Field	Description
GPIO_EDGE_SEL	Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

Chapter 31

General Purpose Media Interface (GPMI)

31.1 Overview

The GPMI controller is a flexible interface to supporting up to four NAND flash chip selects.

- ONFI 2.2, DDR Mode, Samsung / Toshiba Toggle NAND protocol compatible.
- Fully configurable address and command behavior, providing support for future devices not yet specified.

The GPMI resides on the APBH. The GPMI also provides an interface to the BCH module to allow direct parity processing.

Registers are clocked on the HCLK domain. The I/O and pin timing are clocked on a dedicated GPMICLK domain. GPMICLK can be set to maximize I/O performance.

The following figure shows a block diagram of the GPMI controller.

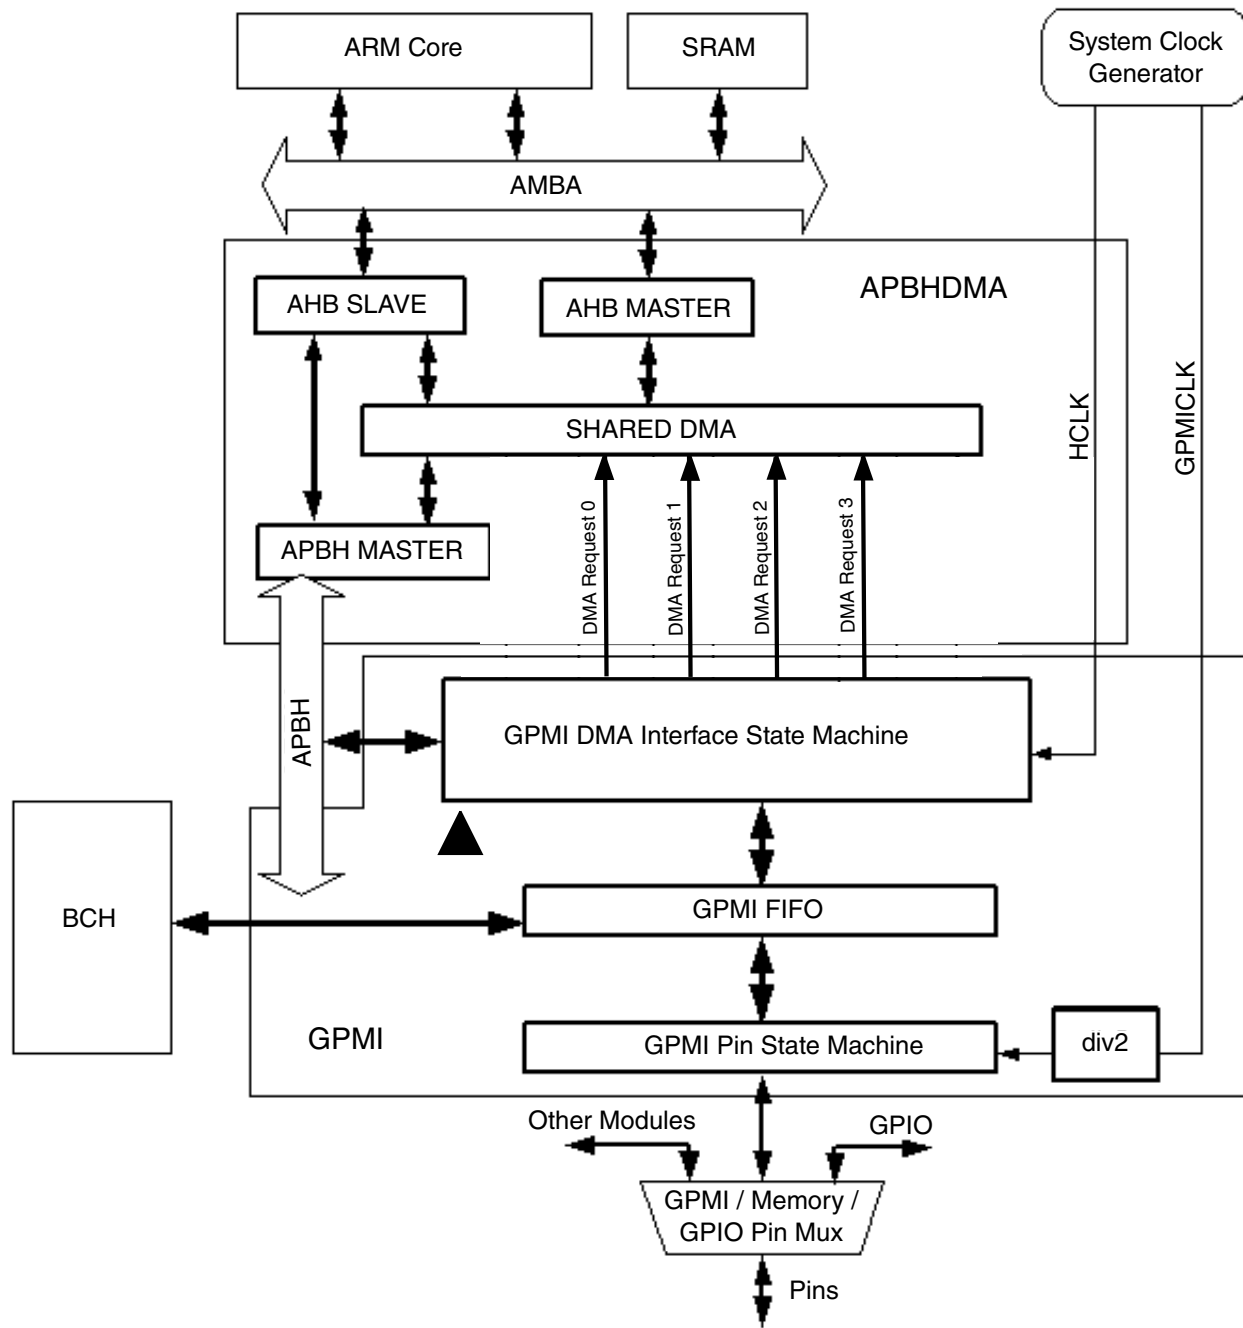

Figure 31-1. General-Purpose Media Interface Controller Block Diagram

31.2 External Signals

The table found here describes the external signals of GPMI.

Table 31-1. GPMI External Signals

Signal	Description	Pad	Mode	Direction
NAND_ALE	Address latch enable signal	NAND_ALE	ALT0	O
NAND_CE0_B	Chip enable signal	NAND_CE0_B	ALT0	O
NAND_CE1_B	Chip enable signal	NAND_CE1_B	ALT0	O
NAND_CE2_B	Chip enable signal	SD4_DATA5	ALT1	O
NAND_CE3_B	Chip enable signal	SD4_DATA6	ALT1	O
NAND_CLE	Command latch enable signal	NAND_CLE	ALT0	O
NAND_DATA00	Data signal	NAND_DATA00	ALT0	IO
NAND_DATA01	Data signal	NAND_DATA01	ALT0	IO
NAND_DATA02	Data signal	NAND_DATA02	ALT0	IO
NAND_DATA03	Data signal	NAND_DATA03	ALT0	IO

NAND_WP_B	Wait polarity signal	NAND_WP_B	ALT0	O

31.3 Clocks

The table found here describes the clock sources for GPMI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 31-2. GPMI Clocks

Clock name	Clock Root	Description
bch_input_apb_clk	usdhc3_clk_root	BCH to APBH input clock
gpmi_bch_input_bch_clk	usdhc4_clk_root	BCH input clock
gpmi_bch_input_gpmi_io_clk	enfc_clk_root	GPMI IO input clock
gpmi_input_apb_clk	usdhc3_clk_root	GPMI to APBH clock

31.4 GPMI NAND Mode

The general-purpose media interface has several features to efficiently support NAND:

- Individual chip select pins and ganged ready/busy pin for up to four NANDs.
- Individual state machine and DMA channel for each chip select.
- Special command modes work with DMA controller to perform all normal NAND functions without CPU intervention.
- Configurable timing based on a dedicated clock allows optimal balance of high NAND performance and low system power.

GPMI and DMA have been designed to handle complex multi-page operations without CPU intervention. The DMA uses a linked descriptor function with branching capability to automatically handle all of the operations needed to read/write multiple pages:

- **Data/Register Read/Write**-The GPMI can be programmed to read or write multiple cycles to the NAND address, command or data registers.
- **Wait for NAND Ready**-The GPMI's Wait-for-Ready mode can monitor the ready/busy signal of a single NAND flash and signal the DMA when the device has become ready. It also has a time-out counter and can indicate to the DMA that a time-out error has occurred. The DMAs can conditionally branch to a different descriptor in the case of an error.
- **Check Status**-The Read-and-Compare mode allows the GPMI to check NAND status against a reference. If an error is found, the GPMI can instruct the DMA to branch to an alternate descriptor, which attempts to fix the problem or asserts a CPU IRQ.

31.4.1 Multiple NAND Support

The GPMI supports up to four NAND chip selects, with ganged ready/busy pins.

Since they share a data bus and control lines, the GPMI can only actively communicate with a single NAND at a time. However, all NANDs can concurrently perform internal read, write, or erase operations. With fast NAND flash and software support for concurrent NAND operations, this architecture allows the total throughput to approach the data bus speed, which can be as high as 50 MB/s (8-bit bus running at 50 MHz single clock edge) in asynchronous mode and 200MB/s (8-bit bus running at 100MHz both clock edges) in Source Synchronous mode.

There are two options for controlling the four NAND chip selects via the DMA interface. The first option is the one to one mapping, where the each DMA channel is tied to its own NAND chip select. For example DMA channel 'n' accesses only NAND attached to chip select 'n'. The second option is the decoupled mode where a DMA channel can access any or all NAND chip selects connected to the GPMI. A DMA channel will signify the NAND chip select it wants to access by writing its chip select value in the GPMI_CTRL0[CS] field and setting the GPMI_CTRL1[DECOUPLE_CS] to 1. This option is useful if software chooses to use only one DMA channel to access all the attached NAND devices.

31.4.2 GPMI NAND Timing and Clocking

The dedicated clock, GPMICK, is used as a timing reference for NAND flash I/O. Since various NANDs have different timing requirements, GPMICK may need to be adjusted for each application.

While the actual pin timings are limited by the NAND chips used and the I/O pad configuration, the GPMI can support data bus speeds of up to 200 MHz x 8 bits. The actual read/write strobe timing parameters are adjusted as indicated in the register descriptions in Memory Map.

31.4.3 Basic NAND Timing

31.4.3.1 NAND Asynchronous Timing

[Figure 31-3](#) and illustrates the operation of the output (from host to device) timing parameters in NAND ONFI asynchronous mode.

GPMI NAND Mode

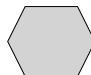

- t_{AS} is configurable by programming HW_GPMI_TIMING0 Address_Setup; in this example, Address_Setup = 4, t_{AS} is equal to 4 dev_clk cycles.
- t_{DS} is configurable by programming HW_GPMI_TIMING0 Data_Setup; in this example, Data_Setup = 3, t_{DS} is equal to 3 dev_clk cycles
- t_{DH} is configurable by programming HW_GPMI_TIMING0 Data_Hold; in this example, Data_Hold = 2, t_{DH} is equal to 2 dev_clk cycles
- $t_{AS}/t_{DS}/t_{DH}$ will extend, if the output data is not ready in device fifo.

Figure 31-2. Asynchronous Mode Basic Write Timing Diagram (command write, address write, or data write)

- t_{AS} is configurable by programming $HW_GPMI_TIMING0$ Address_Setup; in this example, Address_Setup = 4, t_{AS} is equal to 4 dev_clk cycles.
- t_{DS} is configurable by programming $HW_GPMI_TIMING0$ Data_Setup; in this example, Data_Setup = 3, t_{DS} is equal to 3 dev_clk cycles
- t_{DH} is configurable by programming $HW_GPMI_TIMING0$ Data_Hold; in this example, Data_Hold = 2, t_{DH} is equal to 2 dev_clk cycles
- t_{RD} is the delay from RE_B rising edge to the read data sampling edge. If SDR DLL is not enabled, t_{RD} is 0. If SDR DLL enabled, the delay depends on SDR DLL delay.
- $t_{AS}/t_{DS}/t_{DH}$ will extend, if the output data is not ready in device fifo.

 Host controller drives the $DATA[07:00]$ bus
And also don't care if device will drive that or not and what will be driven

ONFI asynchronous mode basic read timing diagram
(data read)

Figure 31-3. ONFI Asynchronous Mode Basic Read Timing Diagram (data read)

31.4.3.2 NAND Asynchronous EDO Mode Timing

In high-speed NANDS, the read data may not be valid until after the read strobe ($NAND_RE_B$) deasserts. This is the case when the minimum t_{DS} is programmed to achieve higher bandwidth.

The GPMI implements a feedback read strobe to sample the read data. The feedback read strobe can be delayed to support fast nand EDO (Extended Data Out) timing where the read strobe may deassert before the read data is valid, and read data is valid for some time after read strobe.

Nand EDO timings is applied typically for read cycle frequency above 33 MHz. See [Figure 31-4](#).

The GPMI provides control over the amount of delay applied to the feedback read strobe. This delay depends on the maximum read access time (t_{REA}) of the nand and the read pulse width (t_{RP}) used to access the nand. t_{RP} is specified by

GPMI_TIMING0[DATA_SETUP] register. When (tREA + 4ns) is less than tRP, no delay is required to sample to nand read data. (The 4ns provides adequate data setup time for the GPMI.) In this case set GPMI_CTRL1[HALF_PERIOD] = 0; GPMI_CTRL1[RDN_DELAY] = 0; GPMI_CTRL1[DLL_ENABLE] = 0.

When (tREA + 4ns) is greater than or equal to tRP, a delay of the feedback read strobe is required to sample to nand read data. This delay is equal to the difference between these two timings:

$$\text{DELAY} = \text{tREA} + 4\text{ns} - \text{tRP}.$$

Since the GPMI delay chain is limited to ns maximum, if DELAY > ns then increase tRP by increasing the value of GPMI_TIMING0[DATA_SETUP] until DELAY is less than or equal to ns.

The GPMI programming for this DELAY depends on the GPMICLK period. The GPMI DLL will not function properly if the GPMICLK period is greater than ns: disable the DLL if this is the case. If the GPMICLK period is greater than ns (and not greater than ns), set the GPMI_CTRL1[HALF_PERIOD]=1; This will cause the DLL reference period (RP) to be one-half of the GPMICLK period. If the GPMICLK period is ns or less then set the GPMI_CTRL1[HALF_PERIOD]=0; This will cause the DLL reference period (RP) to be equal to the GPMICLK period. DELAY is a multiple (0 to 1.875) of RP.

The GPMI_CTRL1[RDN_DELAY] is encoded as a 1-bit integer and 3-bit fraction delay factor. DELAY is a multiple of the delay factor and the reference period. See table below for details.

Table 31-3. RDN DELAY

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
0	0.000
1	0.125
2	0.250
3	0.375
4	0.500
5	0.625
6	0.750
7	0.875
8	1.000
9	1.125
10	1.250
11	1.375
12	1.500

Table continues on the next page...

Table 31-3. RDN DELAY (continued)

HW_GPMI_CTRL1[RDN_DELAY]	Delay Factor
13	1.625
14	1.750
15	1.875

$DELAY = DelayFactor \times RP$ or $DELAY = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times RP$.

Use this equation to calculate the value for GPMI_CTRL1[RDN_DELAY]. Then set GPMI_CTRL1[DLL_ENABLE]=1.

**Figure 31-4. NAND Read Path Timing**

For example, a NAND with $tREAm_{ax} = 20 \text{ ns}$, $tRP_{min} = 12 \text{ ns}$, and $tRC_{min} = 25 \text{ ns}$ (read cycle time) may be programmed as follows:

- GPMICK clock frequency: Consider $480/6 = 80 \text{ MHz}$ which is 12.5 ns clock period. This is too close to the minimum NAND spec if we program the data setup and hold to 1 GPMICK cycle. Consider $480/7 = 68.57 \text{ MHz}$ which is 14.58 ns clock period. With data setup and hold set to 1, we have a tRP of 14.58 ns and a tRC of 29.16 ns (good margins).

- Since $(t_{REA} + 4ns)$ is greater than t_{RP} , required $DELAY = t_{REA} + 4ns - t_{RP} = 20 + 4 - 14.58ns = 9.42 ns$.
- $GPMI_CTRL1[HALF_PERIOD] =$, since $GPMICLK$ period is ns . So $RP = GPMICLK$ period = ns .
- $DELAY = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times RP$. $9.42 ns = GPMI_CTRL1[RDN_DELAY] \times 0.125 \times ns$. $GPMI_CTRL1[RDN_DELAY] =$

NOTE

It is recommended that the drive strength of NAND_RE_B and NAND_WE_B output pins be set to 8 mA. This will reduce the transition time under heavy loads. Low transition times will be important when NAND interface read and write cycle times are below 30 ns. The other GPMI pins may remain at 4 mA, since their frequency is only up to half that of NAND_RE_B and NAND_WE_B.

31.4.3.3 NAND ONFI Source Synchronous Mode Timing

NOTE

In the following figures, CLK shares the same pin as WE_B in Async Mode. And W/R# shares the same pin as RE_B in Async Mode.

Figure 31-5. ONFI Source Synchronous Mode Basic Command Write Timing Diagram

Figure 31-17. Toggle Mode Program Timing Diagram (C)

31.4.4 Hardware BCH Interface

The GPMI provides an interface to the BCH module. This reduces the SOC bus traffic and the software involvement.

The GPMI also provides an interface to the Randomizer module. The Randomizer can generate random data based on BCH ECC encoded / decoded data. It can be employed to reduce the disturbances caused by neighboring cells in the NAND chip, thus reducing bit errors. To enable the Randomizer module, set GPMI_ECCCTRL[RANDOMIZER_ENABLE] to 1, then set GPMI_ECCCOUNT[RANDOMIZER_PAGE] to select randomizer page number needed

to be randomized. All these registers can be programmed by the DMA chain. The randomized data should start from the zero column address and be the size of the whole NAND page. If the randomizer function is enabled, `GPMI_ECCCTRL[ENABLE_ECC]` should also be enabled. To bypass BCH error correction function, set `BCH_FLASHxLAYOUT0[ECC0]` and `BCH_FLASHxLAYOUT1[ECCN]` to 0.

When BCH ECC is enable, parity information is inserted on-the-fly during writes to 8-bit NAND devices. The BCH will supply payload and parity to the GPMI to write to the NAND. During NAND reads, parity is checked and ECC processing is performed after each read block. In this case the GPMI reads the NAND device and redirects the data and parity to the BCH module for ECC processing.

To program the BCH for NAND writes, remove the soft reset and clock gates from `BCH_CTRL[SFTRST]` and `BCH_CTRL[CLKGATE]`. The bulk of BCH programming is actually applied to the GPMI via PIO operations embedded in its DMA command structures. This has a subtle implication when writing to the GPMI ECC registers: access to the these registers must be written in progressive register order. Thus, to write to the `GPMI_ECCECOUNT` register, write first (in order) to registers `GPMI_CTRL0`, `GPMI_COMPARE`, and `GPMI_ECCCTRL` before writing to `GPMI_ECCECOUNT`. These additional register writes need to be accounted for in the `CMDWORDS` field of the respective DMA channel command register.

Note that the `GPMI_PAYLOAD` and `GPMI_AUXILIARY` pointers need to be word-aligned for proper ECC operation. If those pointers are non-word-aligned, then the BCH engine will not operate properly and could possibly corrupt system memory in the adjoining memory regions.

31.5 Behavior During Reset

A soft reset (`SFTRST`) can take multiple clock periods to complete, so do NOT set `CLKGATE` when setting `SFTRST`. The reset process gates the clocks automatically.

31.6 GPMI Memory Map/Register Definition

The following registers provide control for programmable elements of the GPMI module.

NOTE

All ATA or UDMA features are not supported for the chip.

NOTE

GPMI does not support the Set feature command in Toggle mode. The NANDF_DQS output is only enabled in program operation for Toggle mode, but the Set feature command also needs to use the NANDF_DQS signal to write data to Toggle NAND flash. So the Set feature command in Toggle mode is not supported.

GPMI_CTRL0n field descriptions

Field	Description
31 SFTRST	Set to zero for normal operation. When this bit is set to one (default), then the entire block is held in its reset state. This will not work if the CLKGATE bit is already set to '1'. CLKGATE must be cleared to '0' before issuing a soft reset. Also the GPMICK must be running for this to work properly. RUN = 0x0 Allow GPMI to operate normally. RESET = 0x1 Hold GPMI in reset.
30 CLKGATE	Set this bit zero for normal operation. Setting this bit to one (default), gates all of the block level clocks off for minimizing AC energy consumption. RUN = 0x0 Allow GPMI to operate normally. NO_CLKS = 0x1 Do not clock GPMI gates in order to minimize power consumption.
29 RUN	The GPMI is busy running a command whenever this bit is set to '1'. The GPMI is idle whenever this bit set to zero. This can be set to one by a CPU write. In addition, the DMA sets this bit each time a DMA command has finished its PIO transfer phase. IDLE = 0x0 The GPMI is idle. BUSY = 0x1 The GPMI is busy running a command.

Table continues on the next page...

GPMI_CTRL0n field descriptions (continued)

Field	Description
28 DEV_IRQ_EN	When set to '1' and ATA_IRQ pin is asserted, the GPMI_IRQ output will assert.
27 LOCK_CS	For ATA/NAND mode: 0= Deassert chip select (CS) after RUN is complete. 1= Continue to assert chip select (CS) after RUN is complete. For Camera Mode: 0= Dont wait for VSYNC rising edge before capturing data. 1= Wait for VSYNC rising edge before capturing data (Camera mode only). DISABLED = 0x0 Deassert chip select (CS) after RUN is complete. ENABLED = 0x1 Continue to assert chip select (CS) after RUN is complete.
26 UDMA	DISABLED = 0x0 Use ATA-PIO mode on the external bus. ENABLED = 0x1 Use ATA-Ultra DMA mode on the external bus. 0 Use ATA-PIO mode on the external bus. 1 Use ATA-Ultra DMA mode on the external bus.
25–24 COMMAND_ MODE	WRITE = 0x0 Write mode. READ = 0x1 Read mode. READ_AND_COMPARE = 0x2 Read and Compare mode (setting sense flop). WAIT_FOR_READY = 0x3 Wait for Ready mode. For ATA WAIT_FOR_READY command set CS=01. 00 Write mode. 01 Read Mode. 10 Read and Compare Mode (setting sense flop). 11 Wait for Ready.
23 WORD_LENGTH	This bit should only be changed when RUN==0. Reserve = 0x0 Reserved. 8_BIT = 0x1 8-bit Data Bus mode. 0 Reserved. 1 8-bit Data Bus mode.
22–20 CS	Selects which chip select is active for this command. For ATA WAIT_FOR_READY command, this must be set to b01.
19–17 ADDRESS	Specifies the three address lines for ATA mode. In NAND mode, use A0 for CLE and A1 for ALE. NAND_DATA = 0x0 In NAND mode, this address is used to read and write data bytes. NAND_CLE = 0x1 In NAND mode, this address is used to write command bytes. NAND_ALE = 0x2 In NAND mode, this address is used to write address bytes.
16 ADDRESS_ INCREMENT	In ATA mode, the address will increment with each cycle. In NAND mode, the address will increment once, after the first cycle (going from CLE to ALE). DISABLED = 0x0 Address does not increment. ENABLED = 0x1 Increment address. 0 Address does not increment. 1 Increment address.
XFER_COUNT	Number of bytes to transfer for this command. A value of zero will transfer 64K bytes.

31.6.2 GPMI Compare Register Description (GPMI_COMPARE)

The GPMI compare register specifies the expect data and the xor mask for comparing to the status values read from the device. This register is used by the Read and Compare command.

GPMI_COMPARE 0x010

Address: 180_6000h base + 10h offset = 180_6010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	MASK																REFERENCE															
W	MASK																REFERENCE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_COMPARE field descriptions

Field	Description
31–16 MASK	16-bit mask which is applied after the read data is XORed with the REFERENCE bit field.
REFERENCE	16-bit value which is XORed with data read from the NAND device.

31.6.3 GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn)

The GPMI ECC control register handles configuration of the integrated ECC / Randomizer accelerator.

Address: 180_6000h base + 20h offset + (4d × i), where i=0d to 3d

GPMI_ECCCTRLn field descriptions

Field	Description
31–16 HANDLE	This is a register available to software to attach an identifier to a transaction in progress. This handle will be available from the ECC register space when the completion interrupt occurs.
15 RSVD2	Always write zeroes to this bit field.
14–13 ECC_CMD	ECC Command information. DECODE = 0x0 Decode. ENCODE = 0x1 Encode. RESERVE2 = 0x2 Reserved. RESERVE3 = 0x3 Reserved.
12 ENABLE_ECC	Enable ECC processing of GPMI transfers. ENABLE = 0x1 Use integrated ECC for read and write transfers. DISABLE = 0x0 Integrated ECC remains in idle.
11 RANDOMIZER_ENABLE	Enable randomizer function. If this bit is set to enable, ENABLE_ECC should be also enable.

Table continues on the next page...

GPMI_ECCCTRL_n field descriptions (continued)

Field	Description
	0x0 disable 0x1 enable
10–9 -	This field is reserved. Reserved
BUFFER_MASK	ECC buffer information. The BCH error correction only allows two configurations of the buffer mask - software may either read just the first block on the flash page or the entire flash page. Write operations must be for the entire flash page. Invalid buffer mask values will cause the DMA descriptor command to be terminated. BCH_AUXONLY = 0x100 Set to request transfer from only the auxiliary buffer (block 0 on flash). BCH_PAGE = 0x1FF Set to request transfer to/from the entire page.

31.6.4 GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT)

The GPMI ECC Transfer Count Register contains the count of bytes that flow through the ECC / Randomizer subsystem.

GPMI_ECCCOUNT 0x030

Address: 180_6000h base + 30h offset = 180_6030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0									RANDOMIZER_PAGE							COUNT																
W	0																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_ECCCOUNT field descriptions

Field	Description
31–24 -	Always write zeroes to this bit field.
23–16 RANDOMIZER_PAGE	Set NAND page number needed to be randomized. The value is between 0-255
COUNT	Number of bytes to pass through ECC. This is the GPMI transfer count plus the syndrome count that will be inserted into the stream by the ECC. In DMA2ECC_MODE this count must match the GPMI_CTRL0_XFER_COUNT. A value of zero will transfer 64K words.

31.6.5 GPMI Payload Address Register Description (GPMI_PAYLOAD)

The GPMI payload address register specifies the location of the data buffers in system memory. This value must be word aligned.

GPMI Memory Map/Register Definition

GPMI_PAYLOAD 0x040

Address: 180_6000h base + 40h offset = 180_6040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	ADDRESS														RSVD0	
W	ADDRESS														RSVD0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_PAYLOAD field descriptions

Field	Description
31–2 ADDRESS	Pointer to an array of one or more 512 byte payload buffers.
RSVD0	Always write zeroes to this bit field.

31.6.6 GPMI Auxiliary Address Register Description (GPMI_AUXILIARY)

The GPMI auxiliary address register specifies the location of the auxiliary buffers in system memory. This value must be word aligned.

GPMI_AUXILIARY 0x050

Address: 180_6000h base + 50h offset = 180_6050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

GPMI_AUXILIARY field descriptions

Field	Description
31–2 ADDRESS	Pointer to ECC control structure and meta-data storage.
RSVD0	Always write zeroes to this bit field.

31.6.7 GPMI Control Register 1 Description (GPMI_CTRL1n)

The GPMI control register 1 specifies additional control fields that are not used on a per-transaction basis.

Address: 180_6000h base + 60h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W	DEV_CLK_STOP	SSYNC_CLK_STOP	WRITE_CLK_STOP	TOGGLE_MODE	GPMI_CLK_DIV2_EN	UPDATE_CS	SSYNCMODE	DECOUPLE_CS	WRN_DLY_SEL	TEST_TRIGGER	TIMEOUT_IRQ_EN	GANGED_RDYBUSY	BCH_MODE	DLL_ENABLE	HALF_PERIOD	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

GPMI_CTRL1n field descriptions

Field	Description
31 DEV_CLK_STOP	set this bit to 1 will stop gpmi io working clk.
30 SSYNC_CLK_STOP	set this bit to 1 will stop the source synchronous mode clk.
29 WRITE_CLK_STOP	In onfi source synchronous mode, host may save power during the data write cycles by holding the CLK signal high (i.e. stopping the CLK). The host may only stop the CLK during data write, by setting this bit to 1, if the device supports this feature as indicated in the parameter page.
28 TOGGLE_MODE	enable samsung toggle mode.
27 GPMI_CLK_DIV2_EN	This bit should be reset to 0 in asynchronous mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 1). This bit should be set to 1, in source synchronous mode or toggle mode. The frequency ratio of (device clock : ccm gpmi clock) will be (1 : 2). enable the gpmi clk divider. 0x0 internal factor-2 clock divider is disabled 0x1 internal factor-2 clock divider is enabled.

Table continues on the next page...

GPMI_CTRL1n field descriptions (continued)

Field	Description
26 UPDATE_CS	force the CS value is be updated to external chip select pin, even GPMI is idle.
25 SSYNCMODE	source synchronous mode 1 or asynchronous mode 0. ASYNC = 0x0 Asynchronous mode. SSYNC = 0x1 Source Synchronous mode.
24 DECOUPLE_CS	Decouple Chip Select from DMA Channel. Setting this bit to 1 will allow a DMA channel to specify any value in the CTRL0_CS register field. Software can use one DMA channel to access all 8 Nand devices.
23–22 WRN_DLY_SEL	Since the GPMI write strobe (WRN) is a fast clock pin, the delay on this signal can be programmed to match the load on this pin. 0 = ~2ns; 1 = ~4ns; 2 = ~6ns; 3 = no delay.
21 TEST_TRIGGER	Test Trigger Enable 0 Disable 1 Enable
20 TIMEOUT_IRQ_EN	Setting this bit to '1' will enable timeout IRQ for transfers in ATA mode only, and for WAIT_FOR_READY commands in both ATA and Nand mode. The Device_Busy_Timeout value is used for this timeout.
19 GANGED_RDYBUSY	Set this bit to 1 will force all Nand RDY_BUSY inputs to be sourced from (tied to) RDY_BUSY0. This will free up all, except one, RDY_BUSY input pins.
18 BCH_MODE	This bit selects which error correction unit will access GPMI. This bit must always be set to '1', since only the BCH unit is available in this design.
17 DLL_ENABLE	Set this bit to 1 to enable the GPMI DLL. This is required for fast NAND reads (above 30 MHz read strobe). After setting this bit, wait 64 GPMI clock cycles for the DLL to lock before performing a NAND read.
16 HALF_PERIOD	Set this bit to 1 if the GPMI clock period is greater than 16ns for proper DLL operation. DLL_ENABLE must be zero while changing this field.
15–12 RDN_DELAY	This variable is a factor in the calculated delay to apply to the internal read strobe for correct read data sampling. The applied delay (AD) is between 0 and 1.875 times the reference period (RP). RP is one half of the GPMI clock period if HALF_PERIOD=1 otherwise it is the full GPMI clock period. The equation is: $AD = RDN_DELAY \times 0.125 \times RP$. This value must not exceed 16ns. This variable is used to achieve faster NAND access. For example if the Read Strobe is asserted from time 0 to 13ns but the read access time is 20ns, then choose AD=12ns will cause the data to be sampled at time 25ns (13+12) giving a 5ns data setup time. If RP=13ns then $RDN_DELAY = 12 / (0.125 \times 13ns)$ = 7.38 (0111b). DLL_ENABLE must be zero while changing this field.
11 DMA2ECC_MODE	This is mainly for testing HWECC without involving the Nand device. Setting this bit will cause DMA write data to redirected to HWECC module (instead of Nand Device) for encoding or decoding.
10 DEV_IRQ	This bit is set when an Interrupt is received from the ATA device. Write 0 to clear.
9 TIMEOUT_IRQ	This bit is set when a timeout occurs using the Device_Busy_Timeout value. Write 0 to clear.

Table continues on the next page...

GPMI_CTRL1n field descriptions (continued)

Field	Description
8 BURST_EN	When set to 1 each DMA request will generate a 4-transfer burst on the APB bus.
7 ABORT_WAIT_REQUEST	Request to abort "wait for ready" command on channel indicated by ABORT_WAIT_FOR_READY_CHANNEL. Hardware will clear this bit when abort is done.
6-4 ABORT_WAIT_FOR_READY_CHANNEL	Abort a wait for ready command on selected channel. Set the ABORT_WAIT_REQUEST to kick of operation.
3 DEV_RESET	ENABLED = 0x0 NANDF_WP_B(WPN) pin is held low (asserted). DISABLED = 0x1 NANDF_WP_B(WPN) pin is held high (de-asserted). 0 NANDF_WP_B pin is held low (asserted). 1 NANDF_WP_B pin is held high (de-asserted).
2 ATA_IRQRDY_POLARITY	For ATA MODE: Note NAND_RDY_BUSY[3:2] are not affected by this bit. ACTIVELOW = 0x0 ATA IORDY and IRQ are active low, or NAND_RDY_BUSY[1:0] are active low ready. ACTIVEHIGH = 0x1 ATA IORDY and IRQ are active high, or NAND_RDY_BUSY[1:0] are active high ready. 0 External ATA IORDY and IRQ are active low. 1 External ATA IORDY and IRQ are active high. For NAND MODE: 0 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when low and busy when high. 1 External RDY_BUSY[1] and RDY_BUSY[0] pins are ready when high and busy when low.
1 CAMERA_MODE	When set to 1 and ATA UDMA is enabled the UDMA interface becomes a camera interface.
0 GPMI_MODE	ATA mode is only supported on channel zero. If ATA mode is selected, then only channel three is available for NAND use. NAND = 0x0 NAND mode. ATA = 0x1 ATA mode. 0 NAND mode. 1 ATA mode.

31.6.8 GPMI Timing Register 0 Description (GPMI_TIMING0)

The GPMI timing register 0 specifies the timing parameters that are used by the cycle state machine to guarantee the various setup, hold and cycle times for the external media type.

GPMI_TIMING0 0x070

GPMI Memory Map/Register Definition

Address: 180_6000h base + 70h offset = 180_6070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING0 field descriptions

Field	Description
31–24 RSVD1	Always write zeroes to this bit field.
23–16 ADDRESS_SETUP	Number of GPMICLK cycles that the CE/ADDR signals are active before a strobe is asserted. A value of zero is interpreted as 0. For ATA PIO modes this is known in the ATA7 specification as "Address valid to DIOR-/DIOW- setup"
15–8 DATA_HOLD	Data bus hold time in GPMICLK cycles. Also the time that the data strobe is de-asserted in a cycle. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as "DIOR-/DIOW- recovery time"
DATA_SETUP	Data bus setup time in GPMICLK cycles. Also the time that the data strobe is asserted in a cycle. This value must be greater than 2 for ATA devices that use IORDY to extend transfer cycles. A value of zero is interpreted as 256. For ATA PIO modes this is known in the ATA7 specification as ""DIOR-/DIOW-"

31.6.9 GPMI Timing Register 1 Description (GPMI_TIMING1)

The GPMI timing register 1 specifies the timeouts used when monitoring the NAND READY pin or the ATA IRQ and IOWAIT signals.

GPMI_TIMING1 0x080

Address: 180_6000h base + 80h offset = 180_6080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING1 field descriptions

Field	Description
31–16 DEVICE_BUSY_TIMEOUT	Timeout waiting for NAND Ready/Busy or ATA IRQ. Used in WAIT_FOR_READY mode. This value is the number of GPMI_CLK cycles multiplied by 4096.
RSVD1	Always write zeroes to this bit field.

31.6.10 GPMI Timing Register 2 Description (GPMI_TIMING2)

The GPMI timing register 2 specifies the double data rate timing parameters that are used by the cycle state machine to guarantee the various cs delay, pre-amble delay, post-amble delay, command/address delay, data delay, TCR, TRPSTH, and read latency cycle times for the external media type.

GPMI_TIMING2 0x090

Address: 180_6000h base + 90h offset = 180_6090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

GPMI_TIMING2 field descriptions

Field	Description
31–29 TRPSTH	Only for Toggle NAND timing control delay TRPSTH GPMICK cycles for CEn_B high to RE_B high, A value of zero is interpreted as 8
28–27 TCR	Only for Toggle NAND timing control delay (TCR+1) GPMICK cycles for CEn_B low to RE_B low, 0 is less than or equal to TCR, which is less than the PREAMBLE_DELAY
26–24 READ_ LATENCY	This field is for double data rate read latency configuration. others READ LATENCY is 3 000 READ LATENCY is 0 001 READ LATENCY is 1 010 READ LATENCY is 2 011 READ LATENCY is 3 100 READ LATENCY is 4 101 READ LATENCY is 5
23–21 RSVD0	Always write zeroes to this bit field.
20–16 CE_DELAY	GPMI delay from CEn assert to W/Rn changing edge. value of zero is interpreted as 32.
15–12 PREAMBLE_ DELAY	GPMI pre-amble delay in GPMICK cycles. A value of zero is interpreted as 16.
11–8 POSTAMBLE_ DELAY	GPMI post-amble delay in GPMICK cycles. A value of zero is interpreted as 16.
7–4 CMDADD_ PAUSE	GPMI delay time from command or address pause to command or address resume in GPMICK cycles. A value of zero is interpreted as 16.
DATA_PAUSE	GPMI delay time from data pause to data resume in GPMICK cycles. A value of zero is interpreted as 16.

31.6.11 GPMI DMA Data Transfer Register Description (GPMI_DATA)

The GPMI DMA data transfer register is used by the DMA to read or write data to or from the ATA/NAND control state machine.

GPMI_DATA 0x0A0

Address: 180_6000h base + A0h offset = 180_60A0h

GPMI_DATA field descriptions

Field	Description
DATA	In 8-bit mode, one, two, three or four bytes can be accessed to send the same number of bus cycles.

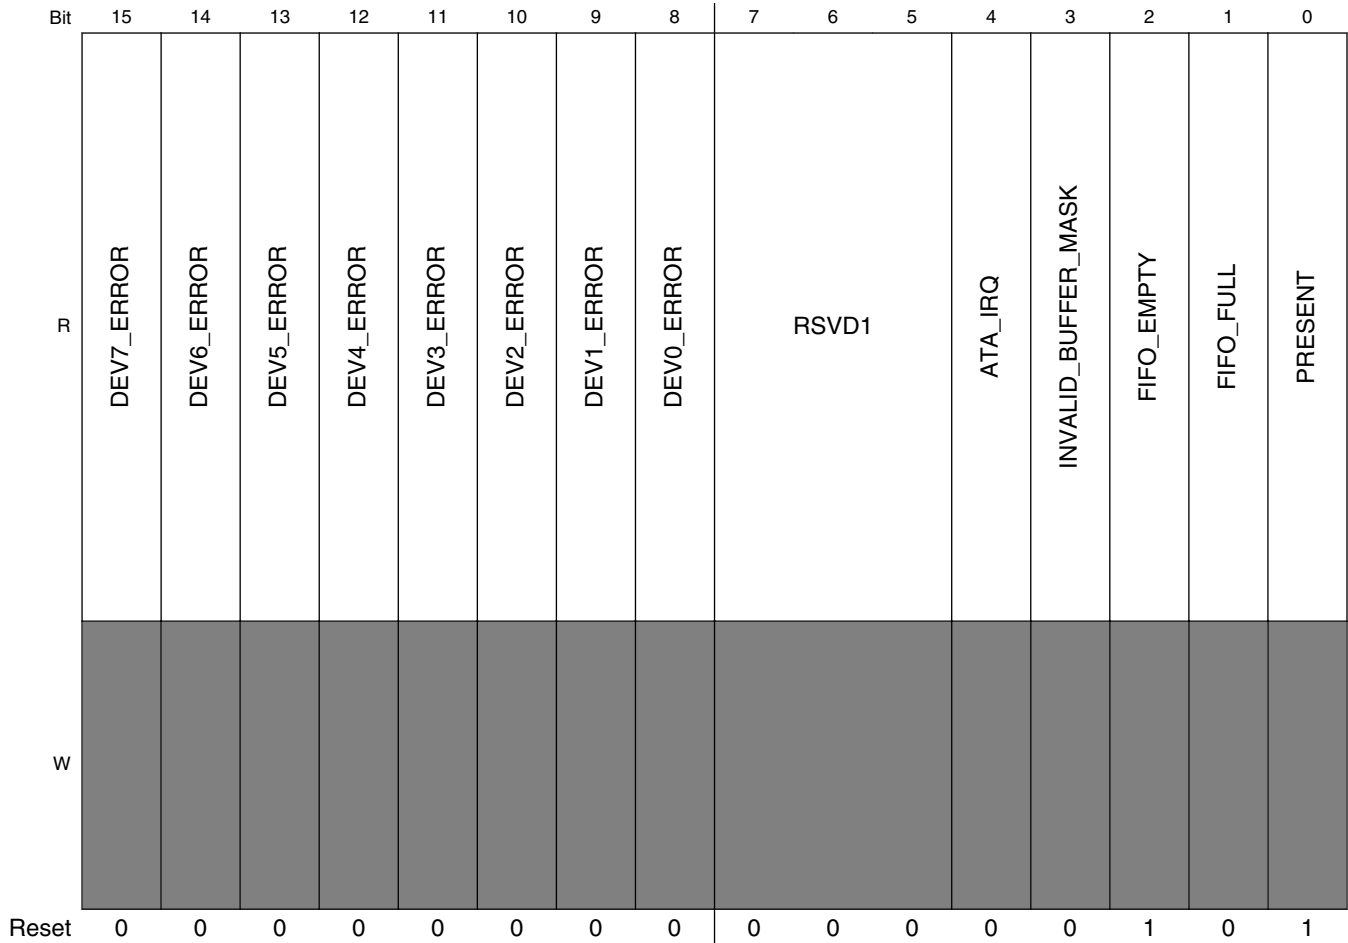

31.6.12 GPMI Status Register Description (GPMI_STAT)

The GPMI control and status register provides a read back path for various operational states of the GPMI controller.

GPMI_STAT 0x0B0

Address: 180_6000h base + B0h offset = 180_60B0h

GPMI_STAT field descriptions

Field	Description
31–24 RDY_BUSY	Read-only view of NAND Ready_Busy Input pins.
23–16 RDY_TIMEOUT	<p>State of the RDY/BUSY Timeout Flags. When any bit is set to '1' in this field, it indicates that a time out has occurred while waiting for the ready state of the requested NAND device. Multiple bits may be set simultaneously.</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 0, RDY_TIMEOUT[n] is associated with the NAND device on chip_select[n].</p> <p>When GPMI_CTRL1_DECOUPLE_CS = 1, these flags become associated to a DMA channel instead of a NAND device.</p> <p>For example if DMA channel 6 sends a WAIT_FOR_READY command for NAND Device 2, and a timeout occurred on RDY_BUSY2, then RDY_TIMEOUT[6] will be set instead of RDY_TIMEOUT[2].</p>
15 DEV7_ERROR	<p>DMA channel 7 (Timeout or compare failure, depending on COMMAND_MODE).</p> <p>0 No error condition present on ATA/NAND Device accessed by DMA channel 7.</p> <p>1 An Error has occurred on ATA/NAND Device accessed by</p>

Table continues on the next page...

GPMI_STAT field descriptions (continued)

Field	Description
14 DEV6_ERROR	DMA channel 6 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 6. 1 An Error has occurred on ATA/NAND Device accessed by
13 DEV5_ERROR	DMA channel 5 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 5. 1 An Error has occurred on ATA/NAND Device accessed by
12 DEV4_ERROR	DMA channel 4 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 4. 1 An Error has occurred on ATA/NAND Device accessed by
11 DEV3_ERROR	DMA channel 3 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 3. 1 An Error has occurred on ATA/NAND Device accessed by
10 DEV2_ERROR	DMA channel 2 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 2. 1 An Error has occurred on ATA/NAND Device accessed by
9 DEV1_ERROR	DMA channel 1 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 1. 1 An Error has occurred on ATA/NAND Device accessed by
8 DEV0_ERROR	DMA channel 0 (Timeout or compare failure, depending on COMMAND_MODE). 0 No error condition present on ATA/NAND Device accessed by DMA channel 0. 1 An Error has occurred on ATA/NAND Device accessed by
7-5 RSVD1	Always write zeroes to this bit field.
4 ATA_IRQ	Status of the ATA_IRQ input pin.
3 INVALID_BUFFER_MASK	Buffer Mask Validity bit. 0 ECC Buffer Mask is not invalid. 1 ECC Buffer Mask is invalid.
2 FIFO_EMPTY	NOT_EMPTY = 0x0 FIFO is not empty. EMPTY = 0x1 FIFO is empty. 0 FIFO is not empty. 1 FIFO is empty.
1 FIFO_FULL	NOT_FULL = 0x0 FIFO is not full. FULL = 0x1 FIFO is full. 0 FIFO is not full. 1 FIFO is full.
0 PRESENT	UNAVAILABLE = 0x0 GPMI is not present in this product. AVAILABLE = 0x1 GPMI is present in this product.

Table continues on the next page...

GPMI_STAT field descriptions (continued)

Field	Description
0	GPMI is not present in this product.
1	GPMI is present is in this product.

31.6.13 GPMI Debug Information Register Description (GPMI_DEBUG)

The GPMI debug information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG 0x0C0

Address: 180_6000h base + C0h offset = 180_60C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																
R	WAIT_FOR_READY_END								DMA_SENSE								DMAREQ								CMD_END																							
W	[Shaded]																																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_DEBUG field descriptions

Field	Description
31–24 WAIT_FOR_READY_END	Read Only view of the Wait_For_Ready End toggle signals to DMA. One per channel
23–16 DMA_SENSE	Read-only view of sense state of the 8 DMA channels. A value of "1" in any bit position indicates that a read and compare command failed or a timeout occurred for the corresponding channel.
15–8 DMAREQ	Read-only view of DMA request line for 8 DMA channels. A toggle on any bit position indicates a DMA request for the corresponding channel.
CMD_END	Read Only view of the Command End toggle signals to DMA. One per channel

31.6.14 GPMI Version Register Description (GPMI_VERSION)

This register reflects the version number for the GPMI.

GPMI_VERSION 0x0D0

Address: 180_6000h base + D0h offset = 180_60D0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0																	
R	MAJOR								MINOR								STEP																																
W	[Shaded]																																																
Reset	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

GPMI_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

31.6.15 GPMI Debug2 Information Register Description (GPMI_DEBUG2)

The GPMI Debug2 information register provides a read back path for diagnostics to determine the current operating state of the GPMI controller.

GPMI_DEBUG2 0x0E0

Address: 180_6000h base + E0h offset = 180_60E0h

GPMI_DEBUG2 field descriptions

Field	Description
31-28 RSVD1	Always write zeroes to this bit field.
27-24 UDMA_STATE	USM_IDLE = 4'h0, idle USM_DMARQ = 4'h1, DMA req USM_ACK = 4'h2, DMA ACK USM_FIFO_E = 4'h3, Fifo empty USM_WPAUSE = 4'h4, WR DMA Paused by device USM_TSTRB = 4'h5, Toggle HSTROBE USM_CAPTUR = 4'h6, Capture Stage, (data sampled with DSTROBE is valid) USM_DATOUT = 4'h7, Change Burst DATAOUT USM_CRC = 4'h8, Source CRC to Device USM_WAIT_R = 4'h9, Waiting for DDMARDY- USM_END = 4'ha; Negate DMAACK (end of DMA) USM_WAIT_S = 4'hb, Waiting for DSTROBE USM_RPAUSE = 4'hc, Rd DMA Paused by Host USM_RSTOP = 4'hd, Rd DMA Stopped by Host USM_WTERM = 4'he, Wr DMA Termination State USM_RTERM = 4'hf, Rd DMA Termination state

GPMI_DEBUG3 field descriptions

Field	Description
31–16 APB_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the APB bus.
DEV_WORD_ CNTR	Reflects the number of bytes remains to be transferred on the ATA/Nand bus.

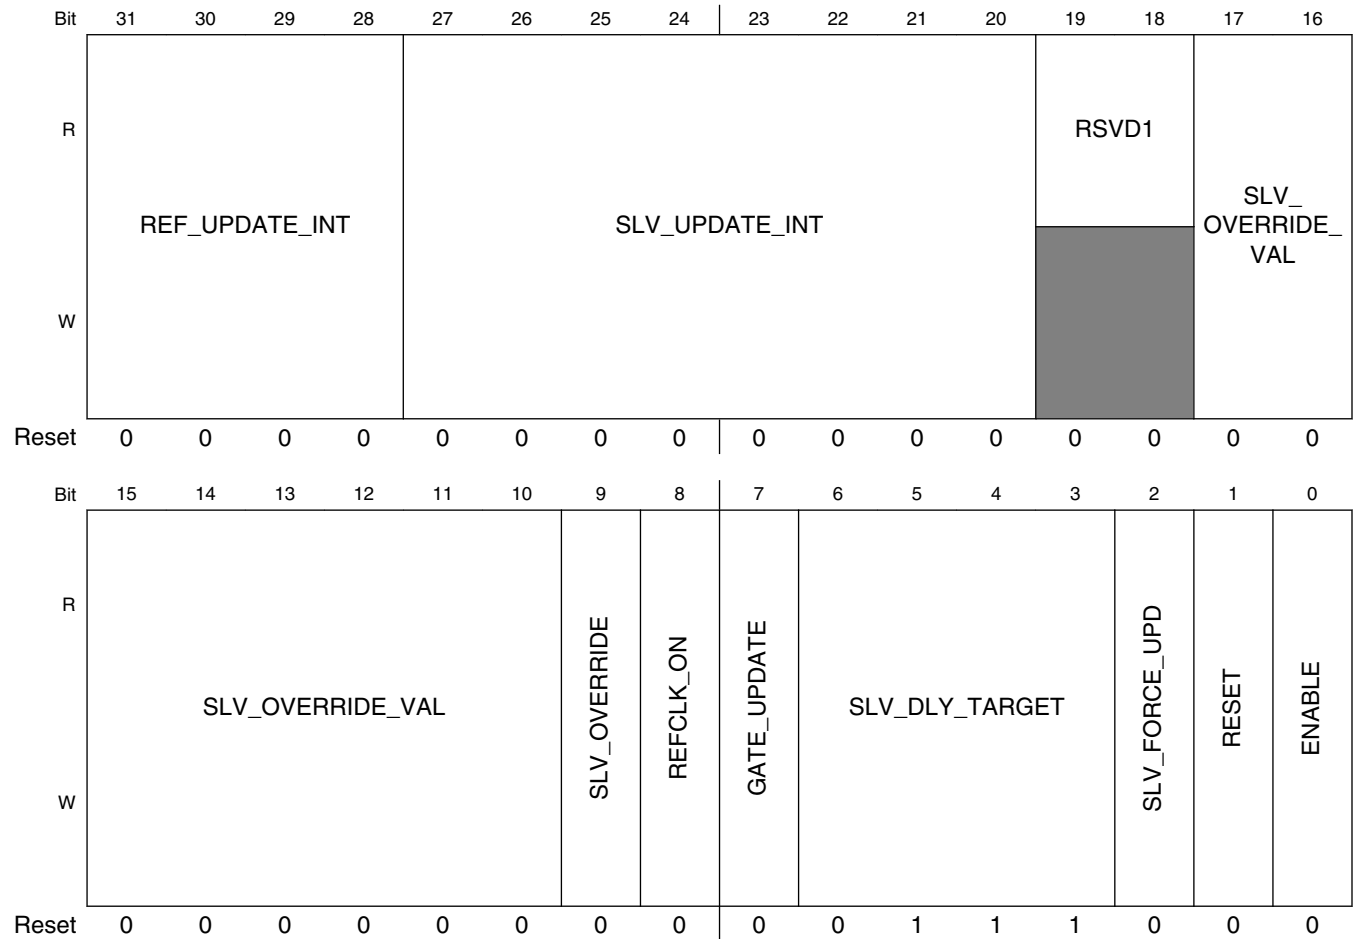

31.6.17 GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL)

GPMI DDR Read Delay Loop Lock Control Register. This register provides programmability in DDR mode for data input timing and data formats.

GPMI_READ_DDR_DLL_CTRL 0x100

GPMI Memory Map/Register Definition

Address: 180_6000h base + 100h offset = 180_6100h

GPMI_READ_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF_UPDATE_INT}) * \text{GPMICLK}$. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

GPMI_READ_DDR_DLL_CTRL field descriptions (continued)

Field	Description
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock is can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from (GPMICLK/2)/16 to GPMICLK/2.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled.

31.6.18 GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL)

GPMI DDR Write Delay Loop Lock Control Register. This register provides programmability in DDR mode for data output timing and data formats.

GPMI_WRITE_DDR_DLL_CTRL 0x110

Address: 180_6000h base + 110h offset = 180_6110h

GPMI Memory Map/Register Definition

GPMI_WRITE_DDR_DLL_CTRL field descriptions

Field	Description
31–28 REF_UPDATE_INT	This field allows the user to add additional delay cycles to the DLL control loop (reference delay line control). By default, the DLL control loop shall update every two GPMICLK cycles. Programming this field results in a DLL control loop update interval of $(2 + \text{REF_UPDATE_INT}) * \text{GPMICLK}$. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–20 SLV_UPDATE_INT	Setting a value greater than 0 in this field, shall over-ride the default slave delay-line update interval of 256 GPMICLK cycles. A value of 0 results in an update interval of 256 GPMICLK cycles (default setting). A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
19–18 RSVD1	Reserved
17–10 SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 256 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 256.
9 SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to tbe enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0
8 REFCLK_ON	set this bit to 1 will turn on the reference clock
7 GATE_UPDATE	Setting this bit to 1, forces the slave delay line not update
6–3 SLV_DLY_TARGET	The delay target for the read clock can be programmed in 1/16th increments of an GPMICLK half-period. So the input read-clock can be delayed relative input data from $(\text{GPMICLK}/2)/16$ to $\text{GPMICLK}/2$.
2 SLV_FORCE_UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered).
1 RESET	Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-calibrate to detect an GPMICLK half period phase shift. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again.
0 ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE VAL, the DLL does not need to be enabled.

31.6.19 GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS)

GPMI Double Rate Read DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_READ_DDR_DLL_STS 0x120

Address: 180_6000h base + 120h offset = 180_6120h

GPMI_READ_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICKLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

31.6.20 GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS)

GPMI Double Rate Write DLL Status Register, Read Only. GPMI DLL status fields are provided in this register.

GPMI_WRITE_DDR_DLL_STS 0x130

Address: 180_6000h base + 130h offset = 180_6130h

GPMI_WRITE_DDR_DLL_STS field descriptions

Field	Description
31–25 RSVD1	Reserved
24–17 REF_SEL	Reference delay line select status.
16 REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to a half-phase GPMICLK shift, allowing the slave delay-line to perform programmed clock delays.
15–9 RSVD0	Reserved
8–1 SLV_SEL	Slave delay line select status
0 SLV_LOCK	Slave delay-line lock status. This signifies that a valid calibration has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value.

Chapter 32

General Purpose Timer (GPT)

32.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming.

The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the DO_CMPOUT n pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

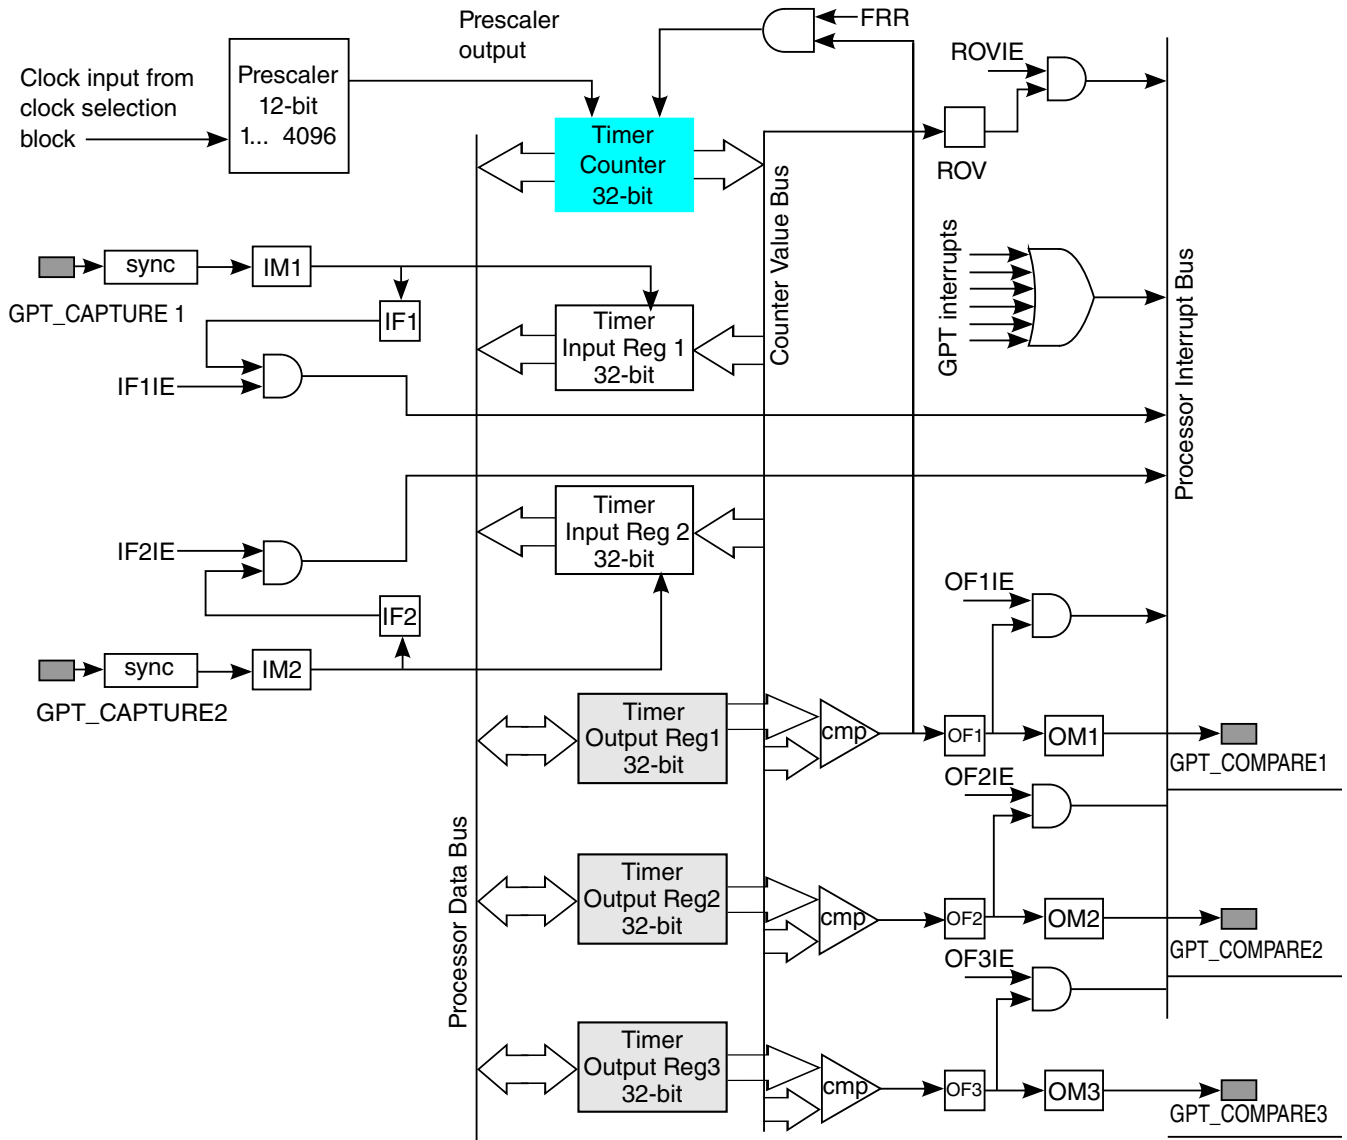

Figure 32-1. GPT Block Diagram

The following figure shows the GPT functional clocking scheme.

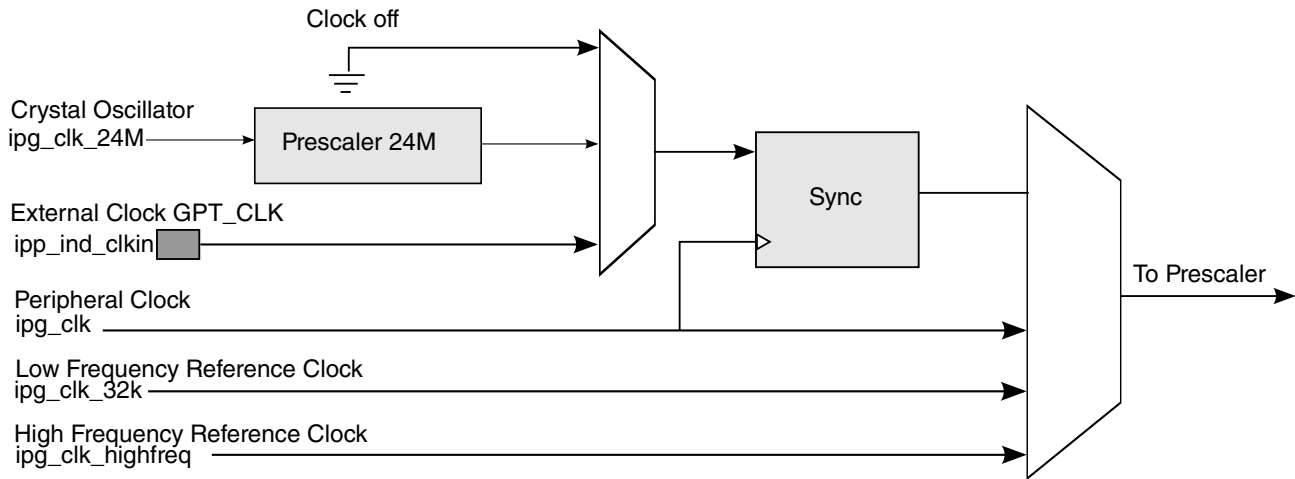

Figure 32-2. GPT Counter Clocks Diagram

32.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

32.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
 - [Restart Mode](#)
 - [Free-Run Mode](#)

32.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

Table 32-1. GPT External Signals

Signal	Description	Pad	Mode	Direction
GPT_CAPTURE1	Input pin for a capture event for Input Capture Channel 1.	SD1_DATA0	ALT3	I
GPT_CAPTURE2	Input pin for a capture event for Input Capture Channel 2.	SD1_DATA1	ALT3	I
GPT_CLK	Input pin for an external clock that the counter can be operated at.	SD1_CLK	ALT3	I
GPT_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1.	SD1_CMD	ALT3	O
GPT_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2.	SD1_DATA2	ALT3	O
GPT_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3.	SD1_DATA3	ALT3	O

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

32.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose.

The external clock input GPT_CLK is treated as asynchronous to the peripheral clock. To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock. Hysteresis characteristics on this pad will be required because this is a clock input.

32.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*.

A positive or/and negative edge on these signals GPT_CAPTURE1 , GPT_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock. Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

32.2.3 Output Compare Signals

The output compare signals: GPT_COMPARE1, GPT_COMPARE2, GPT_COMPARE3, indicate that output compare events have gone through a specified transition.

32.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources:

The following table describes the clock sources for GPT. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 32-2. GPT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg_clk_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg_clk_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg_clk)

If the Peripheral Clock or the External Clock is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock can be switched OFF.

- External Clock

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, and is synchronized to the Peripheral Clock, *inside* the module. Therefore, the External Clock frequency is limited to $< 1/4$ frequency of the Peripheral Clock, for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock

This 24MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24MHz Crystal Oscillator Clock is divided by a 24MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock .

The clock input source is configured using the clock source field (CLKSRC, in the GPT_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

Figure 32-3. Prescaler Value Change Timing Diagram

32.4 Functional Description

This section provides a complete functional description of the GPT.

32.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

32.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

32.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

32.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1).

The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 32-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.
 - If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
 - If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xffffffff.
- The software reset (SWR bit in the GPT_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

32.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

Figure 32-4. Input Capture Event Timing

32.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

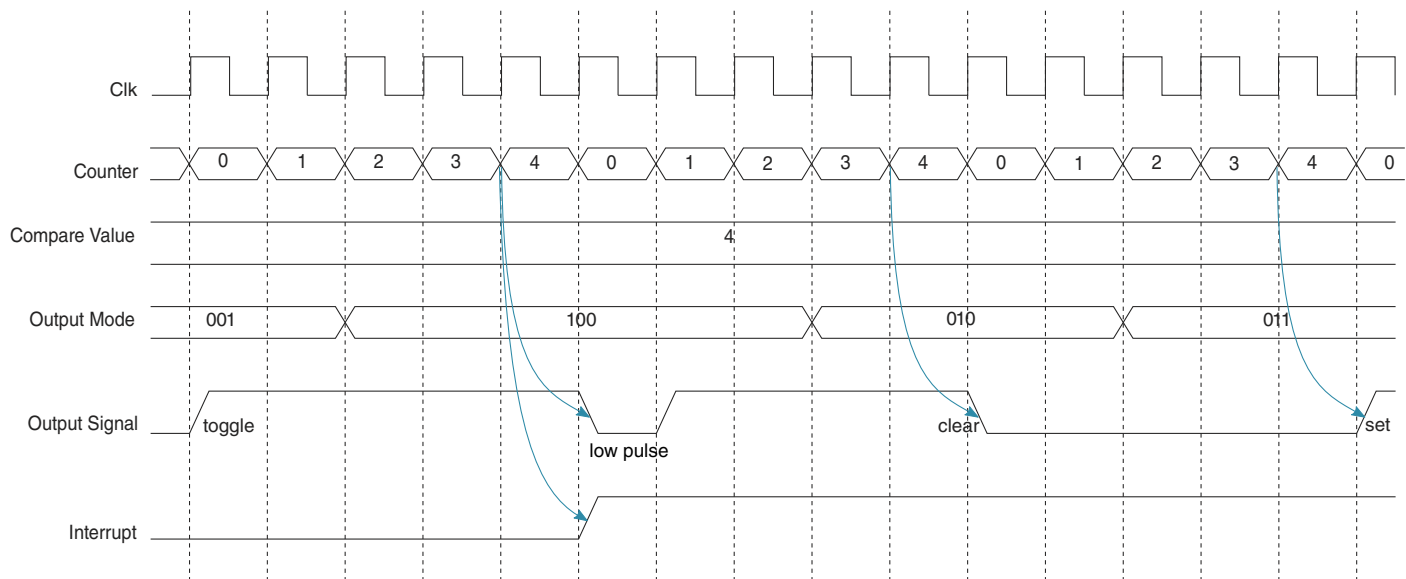

Figure 32-5. Output Compare and Interrupt Timing

32.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes.*

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT_IR register; the associated status bit is the ROV bit in the GPT_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT_IR register); the associated status bits are IF2 and IF1 (in the GPT_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

32.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock, which can be used *only if* the Peripheral Clock is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

32.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGEN bit is not set (in the GPT_CR control register), then the GPT timer is halted.

32.5 Initialization/ Application Information

32.5.1 Selecting the Clock Source

The CLKSRC field in the GPT_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT_CR register.
2. Disable GPT interrupt register (GPT_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT_CR
5. Change clock source CLKSRC to the desired value in GPT_CR register.
6. Assert the SWR bit in GPT_CR register.
7. Clear GPT status register (GPT_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT_CR register.
10. Enable GPT interrupt register (GPT_IR).

32.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT_CR) and the GPT Output Compare Register1 (GPT_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT_ICR1, GPT_ICR2, GPT_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

GPT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
209_8000	GPT Control Register (GPT_CR)	32	R/W	0000_0000h	32.6.1/1567
209_8004	GPT Prescaler Register (GPT_PR)	32	R/W	0000_0000h	32.6.2/1571
209_8008	GPT Status Register (GPT_SR)	32	R/W	0000_0000h	32.6.3/1572
209_800C	GPT Interrupt Register (GPT_IR)	32	R/W	0000_0000h	32.6.4/1573
209_8010	GPT Output Compare Register 1 (GPT_OCR1)	32	R/W	FFFF_FFFFh	32.6.5/1574
209_8014	GPT Output Compare Register 2 (GPT_OCR2)	32	R/W	FFFF_FFFFh	32.6.6/1575

Table continues on the next page...

GPT memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
209_8018	GPT Output Compare Register 3 (GPT_OCR3)	32	R/W	FFFF_FFFFh	32.6.7/1575
209_801C	GPT Input Capture Register 1 (GPT_ICR1)	32	R	0000_0000h	32.6.8/1576
209_8020	GPT Input Capture Register 2 (GPT_ICR2)	32	R	0000_0000h	32.6.9/1576
209_8024	GPT Counter Register (GPT_CNT)	32	R	0000_0000h	32.6.10/1577

32.6.1 GPT Control Register (GPT_CR)

The GPT Control Register (GPT_CR) is used to program and configure GPT operations. An IP Bus Write to the GPT Control Register occurs after one cycle of wait state, while an IP Bus Read occurs after 0 wait states.

Address: 209_8000h base + 0h offset = 209_8000h

GPT_CR field descriptions

Field	Description
31 FO3	FO3 Force Output Compare Channel 3
	FO2 Force Output Compare Channel 2

Table continues on the next page...

GPT_CR field descriptions (continued)

Field	Description
	<p>FO1 Force Output Compare Channel 1</p> <p>The FO_n bit causes the pin action <i>programmed</i> for the timer Output Compare n pin (according to the OM_n bits in this register).</p> <ul style="list-style-type: none"> The OF_n flag (OF_3, OF_2, OF_1) in the status register is not affected. This bit is self-negating and always read as zero. <p>0 Writing a 0 has no effect. 1 Causes the programmed pin action on the timer Output Compare n pin; the OF_n flag is not set.</p>
30 FO2	See F03
29 FO1	See F03
28–26 OM3	<p>OM3 (bits 28-26) controls the Output Compare Channel 3 operating mode. OM2 (bits 25-23) controls the Output Compare Channel 2 operating mode. OM1 (bits 22-20) controls the Output Compare Channel 1 operating mode.</p> <p>The OM_n bits specify the response that a compare event will generate on the output pin of Output Compare Channel n.</p> <ul style="list-style-type: none"> The toggle, clear, and set options cause a change on the output pin <i>only</i> if a compare event occurs. When OM_n is programmed as 1xx (active low pulse), the output pin is set to one immediately on the next input clock; a low pulse (that is an input clock in width) occurs when there is a compare event. Note that here, "input clock" refers to the clock selected by the $CLKSRC$ bits of the GPT Control Register. <p>000 Output disconnected. No response on pin. 001 Toggle output pin 010 Clear output pin 011 Set output pin 1xx Generate an active low pulse (that is one input clock wide) on the output pin.</p>
25–23 OM2	See OM3
22–20 OM1	See OM3

17–16 IM1	See IM2
15 SWR	<p>Software reset.</p> <p>This is the software reset of the GPT module. It is a self-clearing bit.</p> <ul style="list-style-type: none"> The SWR bit is set when the module is in reset state.

Table continues on the next page...

GPT_CR field descriptions (continued)

Field	Description
	<ul style="list-style-type: none"> The SWR bit is cleared when the reset procedure finishes. Setting the SWR bit resets all of the registers to their default reset values, except for the CLKSRC, EN, ENMOD, STOPEN, WAITEN, and DBGEN bits in the GPT Control Register (this control register). <p>0 GPT is not in reset state 1 GPT is in reset state</p>
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 EN_24M	<p>Enable 24MHz clock input from crystal.</p> <ul style="list-style-type: none"> A hardware reset resets the EN_24M bit. A software reset <i>does not affect</i> the EN_24M bit. <p>0 24M clock disabled 1 24M clock enabled</p>
9 FRR	<p>Free-Run or Restart mode.</p> <p>The FRR bit determines the behavior of the GPT when a compare event in channel 1 occurs.</p> <ul style="list-style-type: none"> In Restart mode, after a compare event, the counter resets to 0x00000000 and resumes counting (after the occurrence of a compare event). In Free-Run mode, after a compare event, the counter continues counting until 0xFFFFFFFF and then rolls over to 0. <p>0 Restart mode 1 Free-Run mode</p>
8–6 CLKSRC	<p>Clock Source select.</p> <p>The CLKSRC bits select which clock will go to the prescaler (and subsequently be used to run the GPT counter).</p> <ul style="list-style-type: none"> The CLKSRC bit field value should only be changed after disabling the GPT by clearing the EN bit in this register (GPT_CR). A software reset does not affect the CLKSRC bit. <p>000 No clock 001 Peripheral Clock 010 High Frequency Reference Clock 011 External Clock (CLKIN) 100 Low Frequency Reference Clock 101 Crystal oscillator as Reference Clock others Reserved</p>
5 STOPEN	<p>GPT Stop Mode enable.</p> <p>The STOPEN read/write control bit enables GPT operation <i>during Stop mode</i>.</p> <ul style="list-style-type: none"> A hardware reset resets the STOPEN bit. A software reset <i>does not affect</i> the STOPEN bit. <p>0 GPT is disabled in Stop mode. 1 GPT is enabled in Stop mode.</p>
4 DOZEEN	<p>GPT Doze Mode Enable.</p> <ul style="list-style-type: none"> A hardware reset resets the DOZEEN bit. A software reset <i>does not affect</i> the DOZEEN bit.

Table continues on the next page...

GPT_CR field descriptions (continued)

Field	Description
	0 GPT is disabled in doze mode. 1 GPT is enabled in doze mode.
3 WAITEN	GPT Wait Mode enable. The WAITEN read/write control bit enables GPT operation <i>during Wait mode</i> . <ul style="list-style-type: none"> A hardware reset resets the WAITEN bit. A software reset <i>does not affect</i> the WAITEN bit. 0 GPT is disabled in wait mode. 1 GPT is enabled in wait mode.
2 DBGEN	GPT debug mode enable. The DBGEN read/write control bit enables GPT operation <i>during Debug mode</i> . <ul style="list-style-type: none"> A hardware reset resets the DBGEN bit. A software reset <i>does not affect</i> the DBGEN bit. 0 GPT is disabled in debug mode. 1 GPT is enabled in debug mode.
1 ENMOD	GPT Enable mode. When the GPT is disabled (EN=0), then both the Main Counter and Prescaler Counter <i>freeze their current count values</i> . The ENMOD bit determines the value of the GPT counter when Counter is enabled again (if the EN bit is set). <ul style="list-style-type: none"> If the ENMOD bit is 1, then the Main Counter and Prescaler Counter values are reset to 0 after GPT is enabled (EN=1). If the ENMOD bit is 0, then the Main Counter and Prescaler Counter restart counting <i>from their frozen values</i> after GPT is enabled (EN=1). If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter <i>freeze at their current count values</i> when the GPT enters low power mode. When GPT exits low power mode, the Main Counter and Prescaler Counter start counting from their frozen values, regardless of the ENMOD bit value. Setting the SWR bit will clear the Main Counter and Prescaler Counter values, regardless of the value of EN or ENMOD bits. A hardware reset resets the ENMOD bit. A software reset <i>does not affect</i> the ENMOD bit. 0 GPT counter will retain its value when it is disabled. 1 GPT counter value is reset to 0 when it is disabled.
0 EN	GPT Enable. The EN bit is the GPT module enable bit. Before setting the EN bit , we recommend that <i>all registers be properly programmed</i> . <ul style="list-style-type: none"> A hardware reset resets the EN bit. A software reset <i>does not affect</i> the EN bit. 0 GPT is disabled. 1 GPT is enabled.

32.6.2 GPT Prescaler Register (GPT_PR)

The GPT Prescaler Register (GPT_PR) contains bits that determine the *divide value* of the clock that runs the counter.

Address: 209_8000h base + 4h offset = 209_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0

1 OF2IE	See OF3IE
0 OF1IE	See OF3IE

32.6.5 GPT Output Compare Register 1 (GPT_OCR1)

The GPT Compare Register 1 (GPT_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: 209_8000h base + 10h offset = 209_8010h

GPT_OCR1 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 1.

32.6.6 GPT Output Compare Register 2 (GPT_OCR2)

The GPT Compare Register 2 (GPT_OCR2) holds the value that determines when a compare event will be generated on Output Compare Channel 2.

Address: 209_8000h base + 14h offset = 209_8014h

GPT_OCR2 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 2.

32.6.7 GPT Output Compare Register 3 (GPT_OCR3)

The GPT Compare Register 3 (GPT_OCR3) holds the value that determines when a compare event will be generated on Output Compare Channel 3.

Address: 209_8000h base + 18h offset = 209_8018h

GPT_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

32.6.8 GPT Input Capture Register 1 (GPT_ICR1)

The GPT Input Capture Register 1 (GPT_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: 209_8000h base + 1Ch offset = 209_801Ch

GPT_ICR1 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

32.6.9 GPT Input Capture Register 2 (GPT_ICR2)

The GPT Input capture Register 2 (GPT_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: 209_8000h base + 20h offset = 209_8020h

GPT_ICR2 field descriptions

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

32.6.10 GPT Counter Register (GPT_CNT)

The GPT Counter Register (GPT_CNT) is the main counter's register. GPT_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: 209_8000h base + 24h offset = 209_8024h

GPT_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

Chapter 33

Graphics Processing Unit (GPU)

33.1 Overview

The graphics processing unit (GPU) is designed for high performance, high quality graphics, and low power consumption that delivers hardware acceleration for 2D and 3D graphics displays. Dynamic power consumption is minimized by the extensive use of multi-level hierarchical clock gating. The design also includes a 32-bit AHB interface, a 64-bit AXI interface, and support for virtual memory.

GPU accelerates numerous 2D and 3D graphics applications, including graphical user interfaces (GUI), menu displays, flash animation, and gaming. GPU supports the following graphics APIs:

- OpenGL ES 2.0
- OpenGL ES 1.1
- OpenVG 1.1
- DirectFB
- GDI/DirectDraw

33.1.1 Block Diagram

A block diagram and a description of the functional blocks of the complete graphics pipeline is given below.

- Host Interface - Allows GCCORE to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- Memory Controller - Internal memory management unit that is the block-to-host memory request interface.
- Graphics Pipeline Front End - Inserts high level primitives and commands into the graphics pipeline.

- Ultra-threaded Unified Shader - SIMD processor that performs as both vertex shader and fragment shader. When used as a vertex shader it performs geometry transformations and lighting computations. When used as a fragment shader it computes color and depth values for each pixel.
- 3D Rendering Engine - Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.
- Texture Engine - Retrieves texture information from memory upon request by the fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader.
- Pixel Engine/Resolve - Pixel engine does alpha blending and visible surface determination. Resolve does tiling and de-tiling as well as FSAA filtering.
- 2D Drawing and Scaling Engine - Draws 2D graphics primitives and manipulates 2D images.

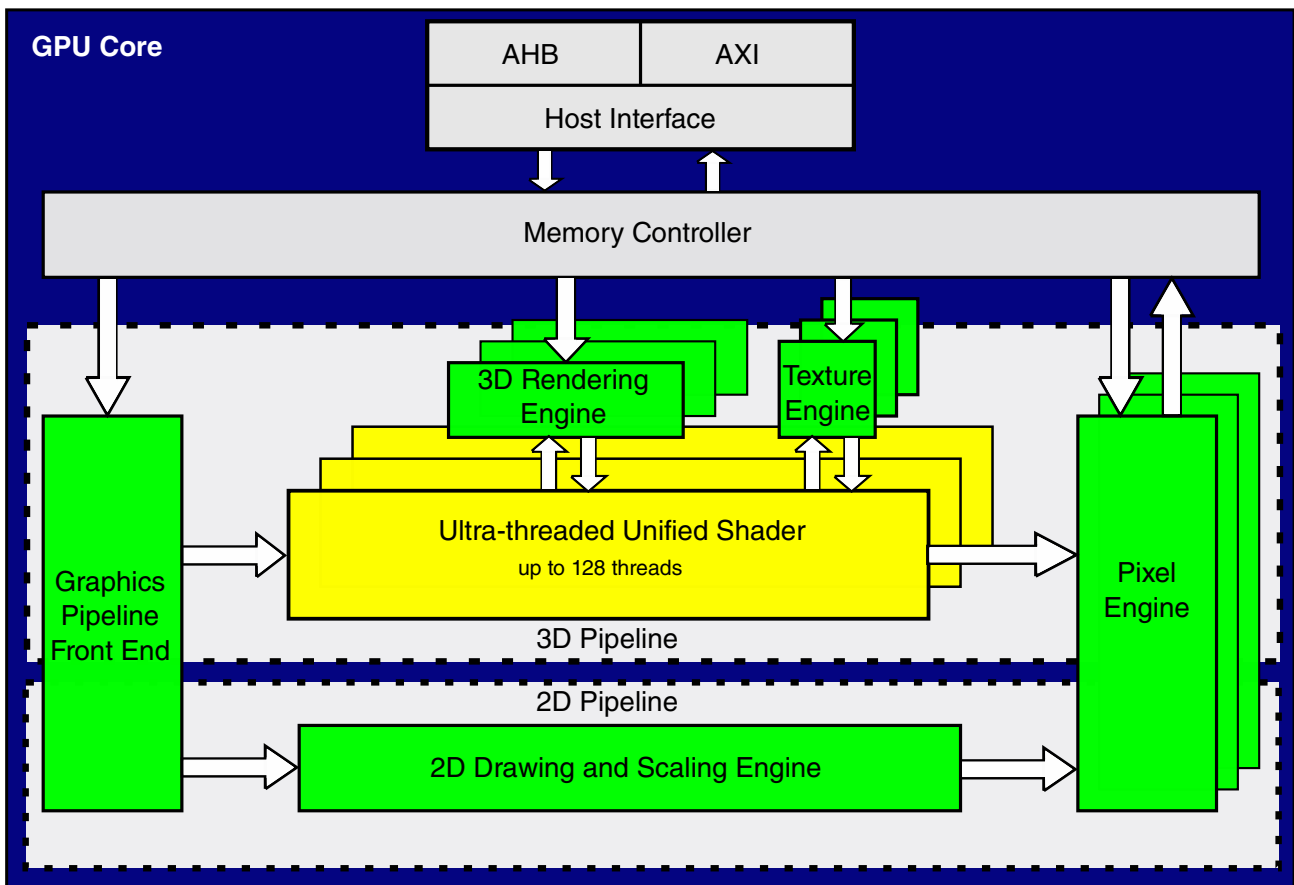

Figure 33-1. GPU Block Diagram

33.2 Clocks

The following table describes the clock sources for GPU. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 33-1. GPU Clocks

Clock name	Clock Root	Description
ACLK	gpu_axi_clk_root	AXI interface clock
HCLK	ahb_clk_root	AHB interface clock
clk2x	gpu_core_clk_root	Functional 2X GPU core clock for the core logic. Also used internally, divided by 2.

33.3 GPU 2D Features

The features of the dedicated 2D-unit include:

- Bit BLT and stretch BLT
- Rectangle fill and clear
- Line drawing
- High-performance stretch and shrink
- Monochrome expansion for text rendering
- ROP2, ROP3, ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- 32k x 32k coordinate system
- 90, 180, and 270 degrees rotation
- Transparency by monochrome mask, chroma key, or pattern mask

Table 33-2. GPU 2D Hardware Features

Feature	GPU Support																								
Programmable Ops	ROP2, ROP3, ROP4 full alpha blending and transparency																								
Fixed function	Line draw, Rectangle fill, Clear, Bit blit, Stretch blit, Filter blit																								
Blit support	Copy (Bit), Filter, Monochrome Mask, Stretch/Shrink, Pattern, Source																								
Source formats	UYVY(4:2:2), YUY2(4:2:2), YV12(4:2:0), 8-bit color index, NV12(4:2:0), NV16(4:2:2)																								
The graphics engine supports 14 source data formats. In addition to these 14 source formats, for RGB source formats, GPU also supports their swizzle formats (ARGB, RGBA, ABGR, BGRA) for RGB formats. For YUV formats, GPU supports their U/V swap formats.	<table border="1"> <thead> <tr> <th>Bits</th> <th>Format</th> <th>Alpha</th> <th>R</th> <th>G</th> <th>B</th> </tr> </thead> <tbody> <tr> <td>8</td> <td>A8</td> <td>8</td> <td>0</td> <td>0</td> <td>0</td> </tr> <tr> <td>16</td> <td>ARGB4444</td> <td>4</td> <td>4</td> <td>4</td> <td>4</td> </tr> <tr> <td>16</td> <td>XRGB4444</td> <td>4 don't care</td> <td>4</td> <td>4</td> <td>4</td> </tr> </tbody> </table>	Bits	Format	Alpha	R	G	B	8	A8	8	0	0	0	16	ARGB4444	4	4	4	4	16	XRGB4444	4 don't care	4	4	4

16	XRGB4444	4 don't care	4	4	4																				

Table continues on the next page...

Table 33-2. GPU 2D Hardware Features (continued)

Feature	GPU Support					
	Bits	Format	Alpha	R	G	B
	16	ARGB1555	1	5	5	5
	16	XRGB1555	1 don't care	5	5	5
	16	RGB565	0	5	6	5
	32	ARGB8888	8	8	8	8
	32	XRGB8888	8 don't care	8	8	8
Destination formats There are 8 destination data formats supported by the graphics engine. In addition to these destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported.	8	A8	8	0	0	0
	16	ARGB4444	4	4	4	4
	16	XRGB4444	4 don't care	4	4	4
	16	ARGB1555	1	5	5	5
	16	XRGB1555	1 don't care	5	5	5
	16	RGB565	0	5	6	5
	32	ARGB8888	8	8	8	8
	32	XRGB8888	8 don't care	8	8	8
Alpha blending modes	Java2 Porter-Duff, Chroma Key, Pattern Mask					
Image scaling	Programmable high quality 9-tap, 32-phase filter					
Rotation	90 / 180 / 270 degrees on every 2D primitive					
Text rendering	Monochrome expansion; support for anti-aliased fonts					
Alpha blend, scale, and rotation operations	Blending, scaling, and rotation are supported in one pass for stretch BLT					
Video	Video scaling and format conversion only					
Power for 2D vs. 3D doing 2D operations	Up to 90% less power required for dedicated 2D functions					
Rendering Size	32K x 32K raster 2D coordinate system					

33.4 GPU 3D Features

The features of the GPU 3D-unit include:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1

- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance

33.4.1 Unified vertex-fragment shader

Table 33-3. Unified Vertex-Fragment Shader

Feature	GPU Support
Shader type and execution units	Unified shader, SIMD4, SFP32 Trans
Swizzle capabilities	Full 32-bit word level swizzle in a 128-bit vector
GPR's per shader	Up to 512 general purpose registers, 128 bits each
Uniform registers	Vertex Shader: 160 registers, 128 bits each Fragment Shader: 64 registers, 128 bits each
FP denorm and rounding options	Denorms are set to zero. Supports rounding to zero.
Maximum number of data input attributes	Maximum of 12 vertex shader input elements; maximum of 8 pixel shader input elements
Maximum number of instructions	256 for vertex shaders; 256 for fragment shaders
Maximum number of vertex streams	1
Maximum number of threads in flight	Up to 256 per shader
Subroutines	4 levels
Conditional branch support	GT, LT, EQ, GE, LE, NE
Shader instruction rate	1-cycle throughput for all shader instructions
Floating-point instruction precision	Transcendental: 22 bits SIMD4 (vector): 23.5 bits
Fragment shader video	Supports video texture

33.4.2 Vertex processing

Table 33-4. Vertex Processing

Feature	GPU Support
Vx D3D, OGL ES formats supported	BYTE, UBYTE, SHORT, USHORT, INT, UINT, DEC, UDEC, FLOAT, FLOAT16, D3DCOLOR, FIXED16DOT16
Vertex data size limits	256 bytes
Pre shader on-die cache	1 KB
Post shader on-die cache	8 vertices

33.4.3 Primitive processing

Table 33-5. Primitive Processing Features

Feature	GPU Support
Primitives supported	triangle strip, fan, and list; line strip and list; point list
Vertex/primitive geometry input index sizes	8-bit ,16-bit and 20-bit indices
Setup parameters available to pixel shader	8 vec4 parameters; all available to fragment shader

33.4.4 Texture processing

Table 33-6. Texture Processing Features

Table 33-6. Texture Processing Features (continued)

Feature	GPU Support
Texture compression	4 bits and 8 bits per texel
Compressed texture formats	DXT1, DXT2, DXT3, DXT4, DXT5, ETC1. All compressed formats are filtered.
Texture size maximum	8k x 8k
Addressing modes	wrap, mirror, clamp
Mipmap support	14 mipmap levels; programmable LOD biasing and replacement
Shadow texture	Depth texture PCF filtering
Texture cache organization	Tiled, 4x4 texels
Texture cache size	32 cache lines, with 64 bytes per cache line; total of 2 KB texture cache
Texture coordinate fraction bits	5 bits
Texture sampler units	12 samples, indexable
Textures per fragment maximum	8; virtualized texture samplers
Dependent texture operation	High performance; unlimited dependent texture reads
Dependent tx per fragment max, relative sampling	No Limit
Texture repeat max	256
Texture types	2D, cube map, 1D, projected, depth, bump map, displacement map
Texture filters	Point sample, bi-linear, tri-linear
Texture component mapping: D3D, OGL ES options	Supports both D3D and OES options
Texture size types	Power-of-2, Non-square texture support

33.4.5 Rasterization

Table 33-7. Rasterization features

Feature	GPU Support
Interpolant attributes limit	8
Render target size	8K x 8K
Clipping window support	Clipping rectangle support
Early Z	Yes

33.4.6 Fragment Processing

Table 33-8. Fragment Processing Features

Feature	GPU Support						
FSAA (anti-aliasing) mechanisms	High quality MSAA 4x						
Fragment color, alpha, Z, stencil precision	Bits	Format	Alpha	R	B	G

Blend modes	Porter-Duff blending modes					
Render target dithering support	Yes					

33.4.8 Z/Stencil Buffer

Table 33-10. Z/Stencil Buffer Features

Feature	GPU Support
Z/stencil formats	16-bit Z; 24-bit Z plus 8-bit stencil
Z/stencil buffer	16 cache lines; 64 bytes per line;
Stencil support	Both stencil and two-sided stencil

33.4.9 Render Target

Table 33-11. Render Target Features

Feature	GPU Support
Formats	16-bit and 32-bit, with lossless compression support
RT buffer cache	16 cache lines; 64 bytes per line; RT caches are fully set associative.

33.5 Usage Mode

The GPU should be programmed through the Freescale provided driver. Freescale does not provide support for software that directly programs the GPU registers. APIs for programming the GPU through the software driver are described in separate driver documentation.

Chapter 34

I2C Controller (I2C)

34.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification, Version 2.1*, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

Four independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

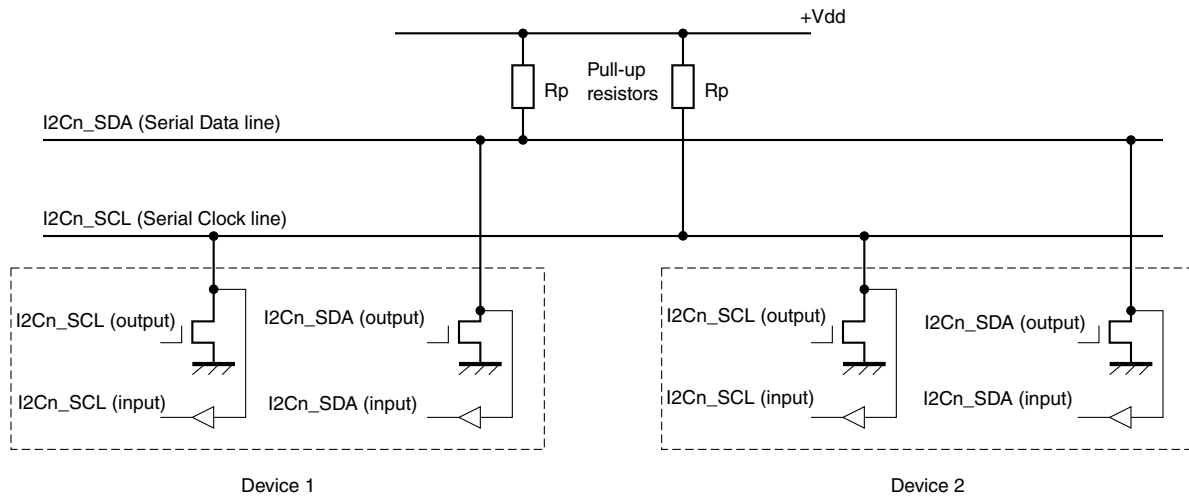

Figure 34-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

Figure 34-2. I2C block diagram

34.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

34.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

34.2 External Signals

This section discusses I2C signals that connect off-chip.

For I2C compliance, all devices connected to the I2Cn_SCL and I2Cn_SDA signals must have open-drain or open-collector outputs. The logic AND function is implemented on both lines with external pull-up resistors.

Inputs of I2Cn_SCL and I2Cn_SDA also need to be manually enabled by setting the SION bit in the IOMUX after the corresponding PADS are selected as I2C function.

The table below describes all I2C signals that connect off-chip.

Table 34-1. I2C External Signals

Signal	Description	Pad	Mode	Direction
I2C1_SCL	Serial Clock	CSI_DATA00	ALT3	IO
		GPIO1_IO00	ALT0	
I2C1_SDA	Serial Data	CSI_DATA01	ALT3	IO
		GPIO1_IO01	ALT0	
I2C2_SCL	Serial Clock	GPIO1_IO02	ALT0	IO
		QSPI1B_DATA3	ALT1	
		SD4_DATA3	ALT2	
I2C2_SDA	Serial Data	GPIO1_IO03	ALT0	IO
		QSPI1B_DATA2	ALT1	
		SD4_DATA2	ALT2	

Table continues on the next page...

Table 34-1. I2C External Signals (continued)

Signal	Description	Pad	Mode	Direction
I2C3_SCL	Serial Clock	ENET2_RX_CLK	ALT2	IO
		KEY_COL4	ALT2	
		NAND_CLE	ALT1	
I2C3_SDA	Serial Data	ENET2_TX_CLK	ALT2	IO
		KEY_ROW4	ALT2	
		NAND_ALE	ALT1	
I2C4_SCL	Serial Clock	CSI_DATA06	ALT2	IO
		SD2_DATA1	ALT4	
		SD3_DATA0	ALT1	
		USB_H_STROBE	ALT3	
I2C4_SDA	Serial Data	CSI_DATA07	ALT2	IO
		SD2_DATA0	ALT4	
		SD3_DATA1	ALT1	
		USB_H_DATA	ALT3	

34.3 Clocks

There are two input clocks for I2C.

The following table describes the clock sources for I2C. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 34-2. I2C Clocks

Clock name	Clock Root	Description
ipg_clk_patref	perclk_clk_root	Module clock
ipg_clk_s		Peripheral access clock

- Peripheral clock (ipg_clk_s): This clock is used for peripheral bus register read/writes.
- Module clock (ipg_clk_patref): This is the functional clock of the I2C. The serial bit clock frequency is derived from the module clock. The module clock and peripheral clocks are synchronous with each other. The minimum frequency of the module clock should be 12.8 MHz for Fast mode to achieve 400-kbps operation.

34.4 Functional description

This section provides a complete functional description of the block.

34.4.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see [Initialization sequence](#).

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

34.4.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

34.4.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see [Figure 34-3](#)). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

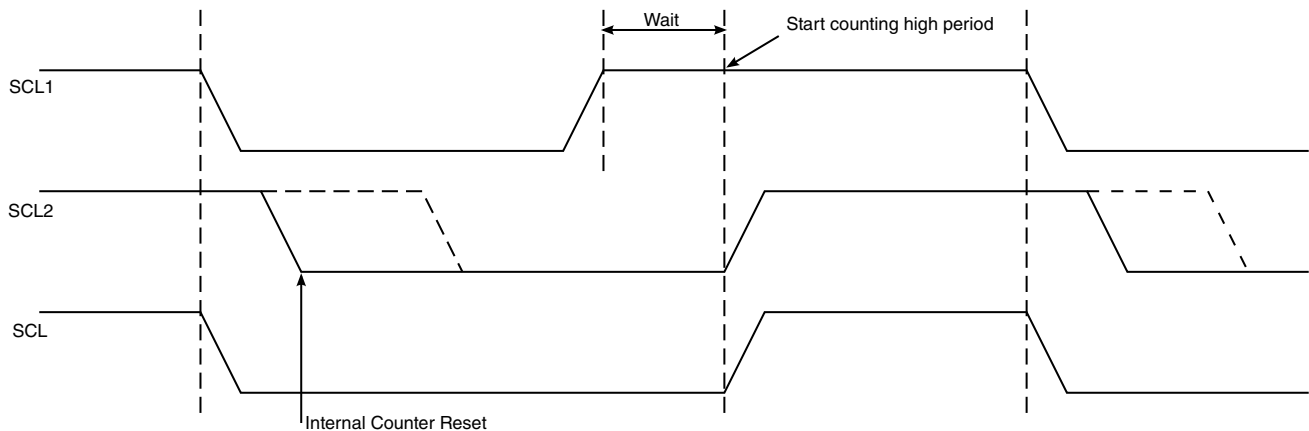

Figure 34-3. Synchronized clock SCL

34.4.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

34.4.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

34.4.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

34.4.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

34.4.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

34.4.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

34.4.10 Byte order

The block only supports the Little-Endian mode.

34.5 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

34.5.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC]) to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

34.5.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

34.5.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in [Figure 34-5](#).

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

34.5.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

34.5.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

34.5.6 Slave mode

In the slave interrupt service routine (see [Figure 34-5](#)), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

34.5.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in [Figure 34-5](#).

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the ARM platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

Figure 34-4. I2C Programming state diagram

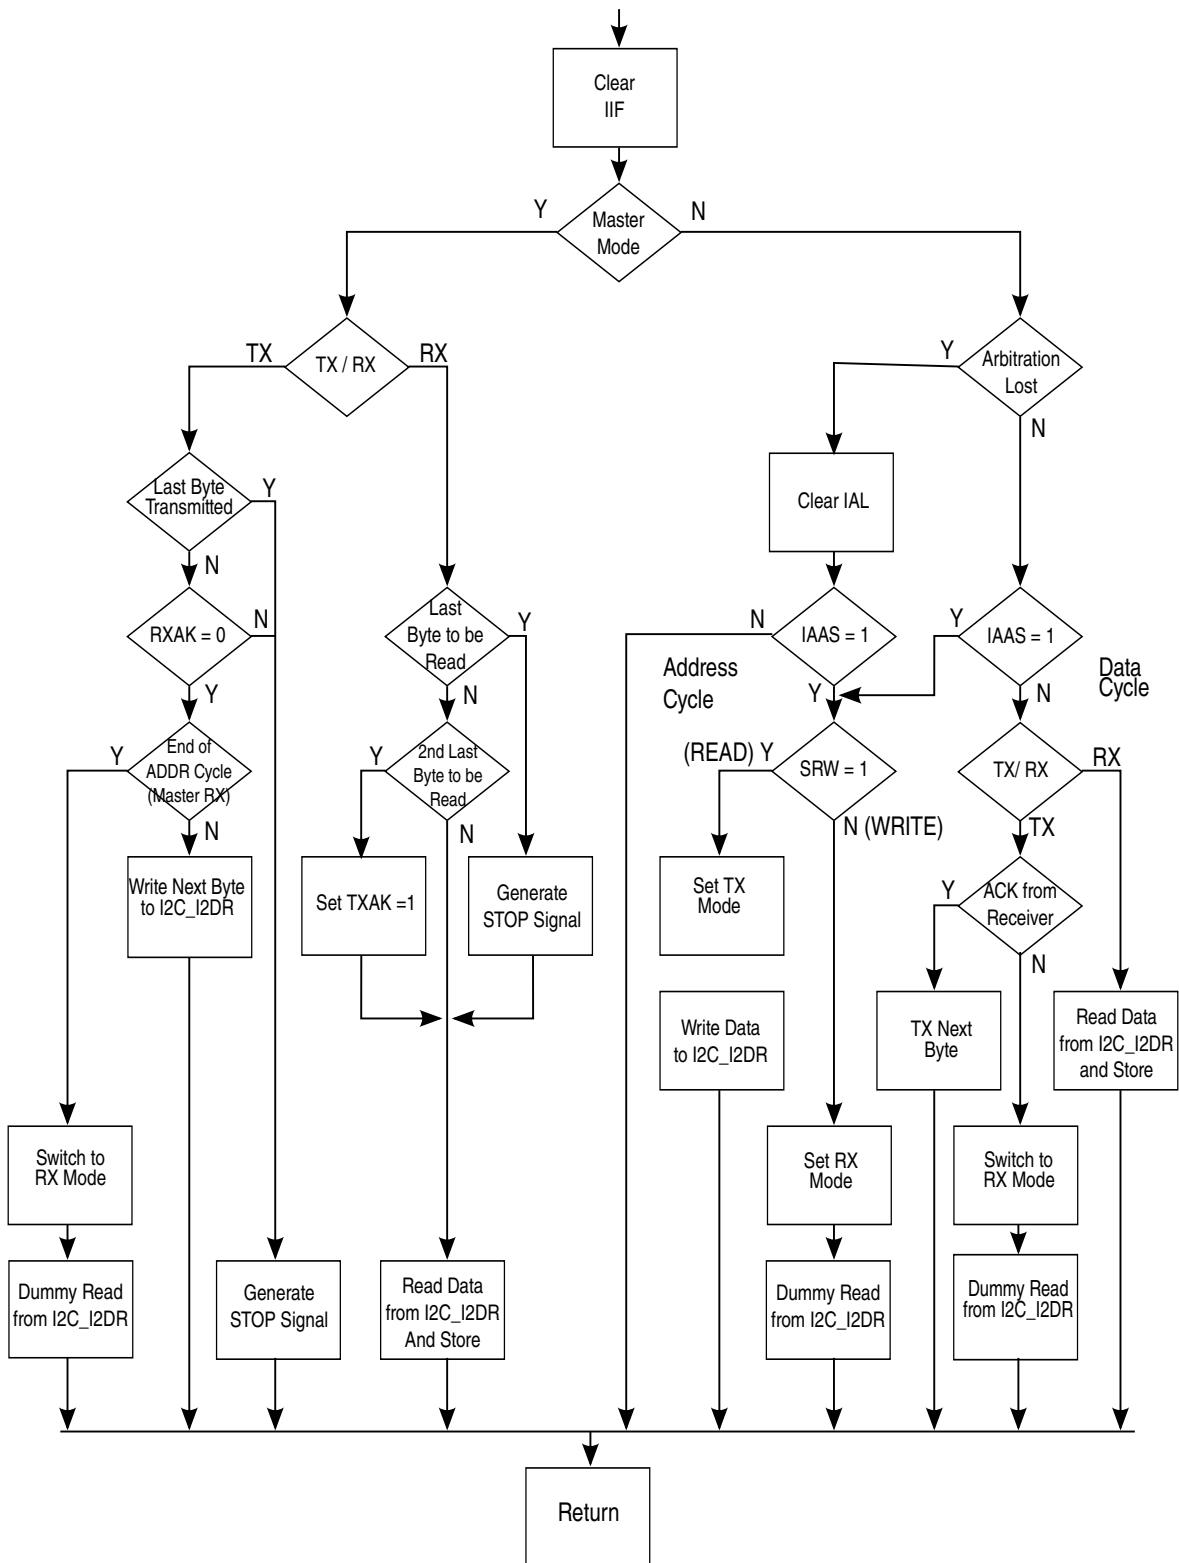

Figure 34-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

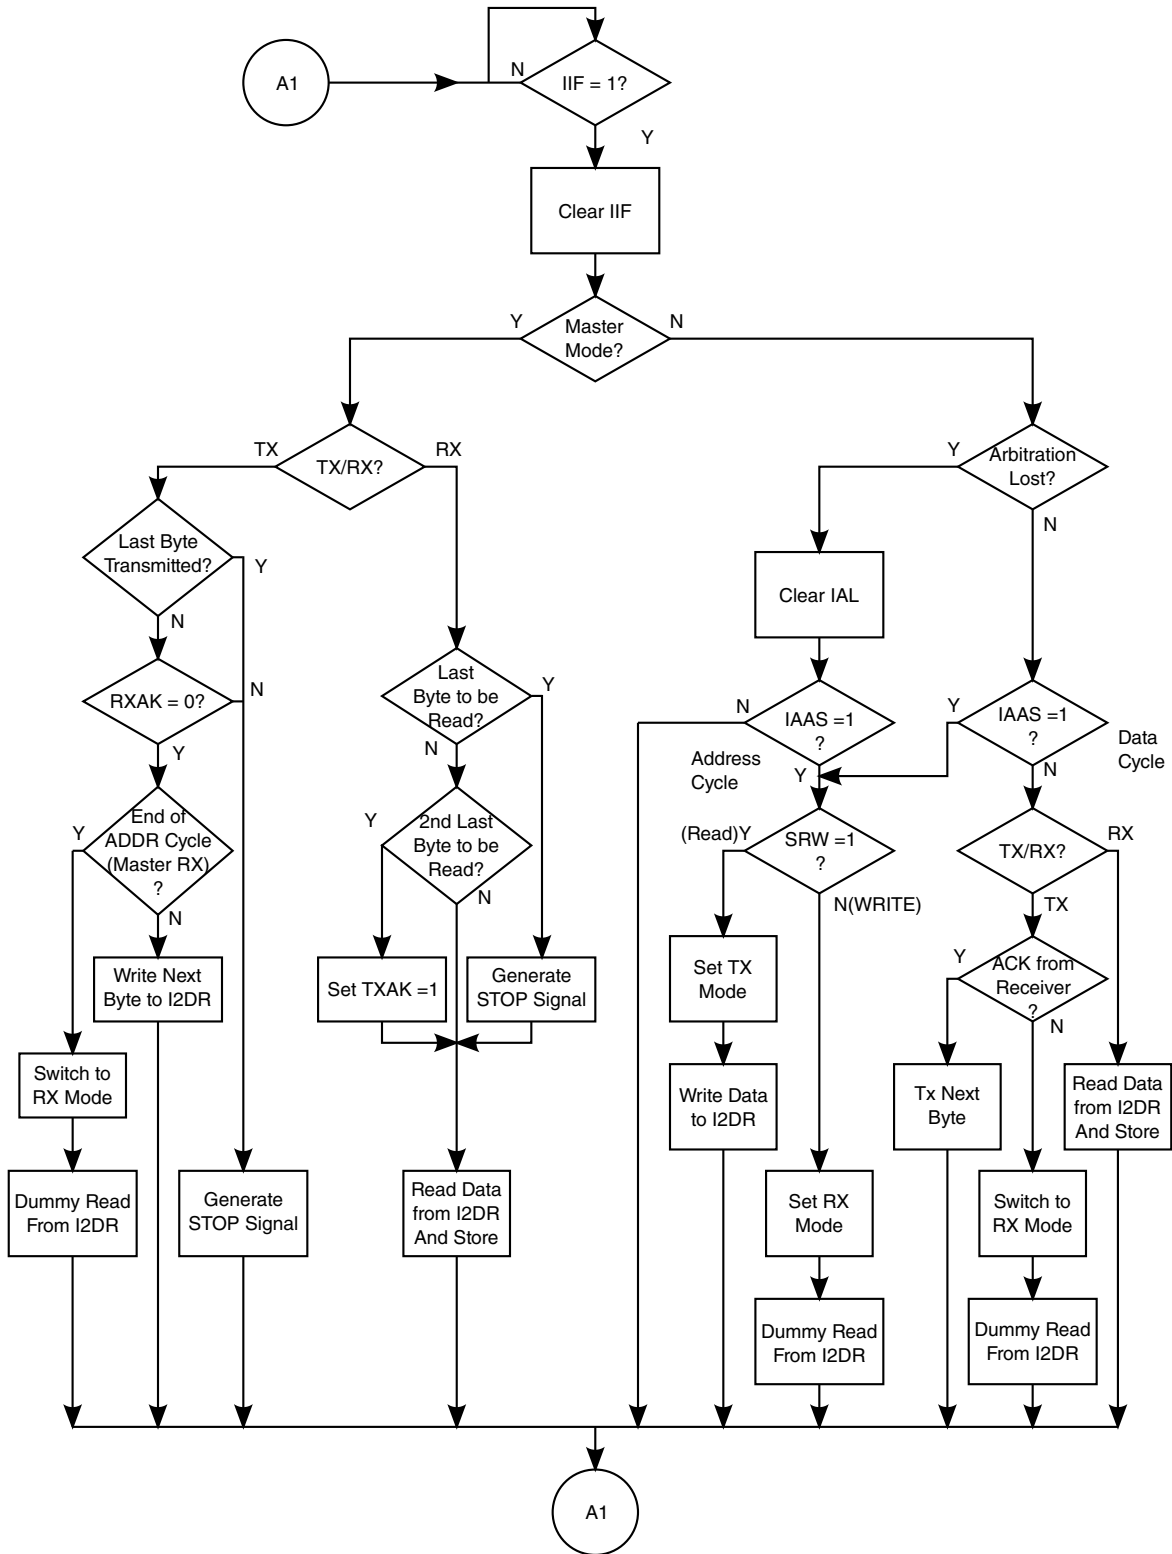

Figure 34-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is $T_{min} = 25 \mu s$ ($= 2.5 \times 10 \mu s$). This value can be calculated for any bus frequency. The formula is $T_{min} = 10/F_{SCL}$, where F_{SCL} is the frequency of the I2C clock (SCL).

Figure 34-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

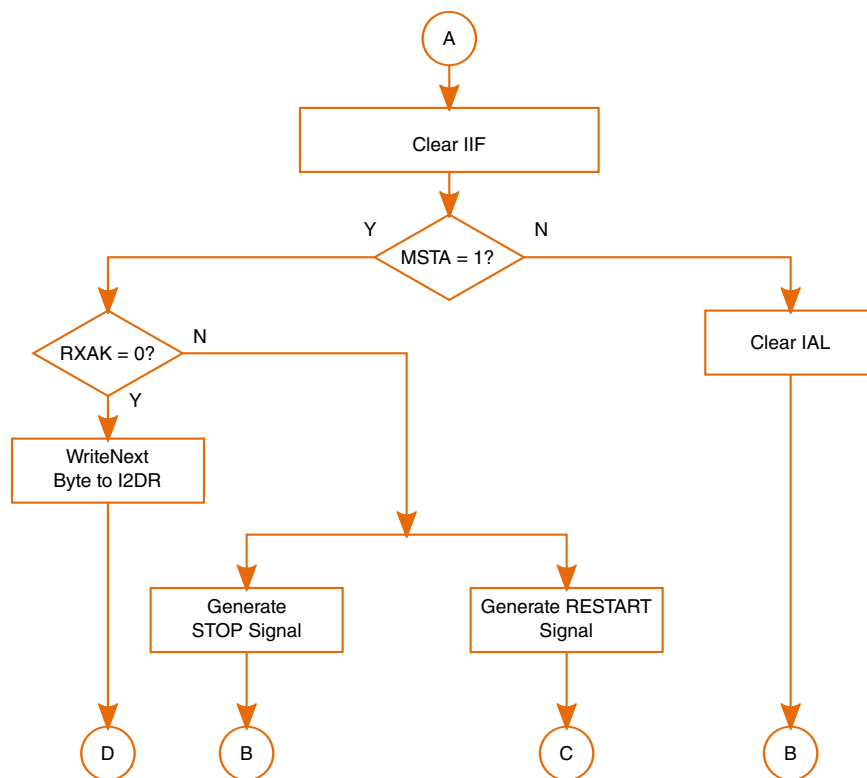

Figure 34-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 34-7 and Figure 34-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

34.6 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

34.7 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

I2C memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

34.7.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
Read	0								ADR								0
Write																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. NOTE: The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

34.7.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

I2C clock is sourced from PERCLK_ROOT which is routed from IPG_CLK_ROOT. I2C clock frequency can easily be obtained by using the following formula:

I2C clock Frequency = (PERCLK_ROOT frequency)/(division factor corresponding to IFDR)

By default, IPG_CLK_ROOT and PERCLK_ROOT frequencies are set to 49.5MHz, where the root clock is sourced from PLL2's PFD2. Obtaining the frequencies can be accomplished by:

$$\text{PLL2} = 528\text{MHz}$$

$$\text{PLL2_PFD2} = 528\text{MHz} * 18 / 24 = 396\text{MHz}$$

$$\text{IPG_CLK_ROOT} = (\text{PLL2_PFD2} / \text{ahb_podf}) / \text{ipg_podf} = (396\text{MHz}/4)/2 = 49.5\text{MHz}$$

$$\text{PER_CLK_ROOT} = \text{IPG_CLK_ROOT}/\text{perclk_podf} = 49.5\text{MHz}/1 = 49.5\text{MHz}$$

NOTE

The above calculation assumes that the default CCM register settings, routing, and division factors are used. If different routing, PFD values, and/or division factors are used, the user must adjust the parameters accordingly to calculate the correct clock frequency.

The following table describes the divider and register values for the register field "IC."

Table 34-13. I2C_IFDR Register Field Values

IC	Divider		IC	Divider		IC	Divider		IC	Divider

I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. NOTE: The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

34.7.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read						0	0	
Write	IEN	IEN	MSTA	MTX	TXAK	RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 I2EN	I2C interrupt enable. NOTE: If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal. NOTE: The module clock should be on for writing to the MSTA bit. NOTE: The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. NOTE: Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

34.7.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write	[Greyed out]							
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write	[Greyed out]	[Greyed out]	[Greyed out]	[Greyed out]	[Greyed out]	[Greyed out]	[Greyed out]	[Greyed out]
Reset	1	0	0	0	0	0	0	1

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The ARM platform is interrupted if the interrupt enable (I2C_I2CR[I IEN]) is set. The ARM platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. NOTE: When I2C is enabled (I2C_I2CR[I IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): <ul style="list-style-type: none"> I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. <ul style="list-style-type: none"> A Start cycle is attempted when the bus is busy. A Repeated Start cycle is requested in Slave mode. A Stop condition is detected when the master did not request it. NOTE: Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. NOTE: The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	<p>This causes a processor interrupt request (if the interrupt enable is asserted [I IEN = 1]). The interrupt is set when one of the following occurs:</p> <ul style="list-style-type: none"> • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	<p>Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle.</p> <p>0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.</p>

34.7.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write	0								0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	<p>Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received.</p> <p>NOTE: The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.</p>

Chapter 35

IOMUX Controller (IOMUXC)

35.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 35-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

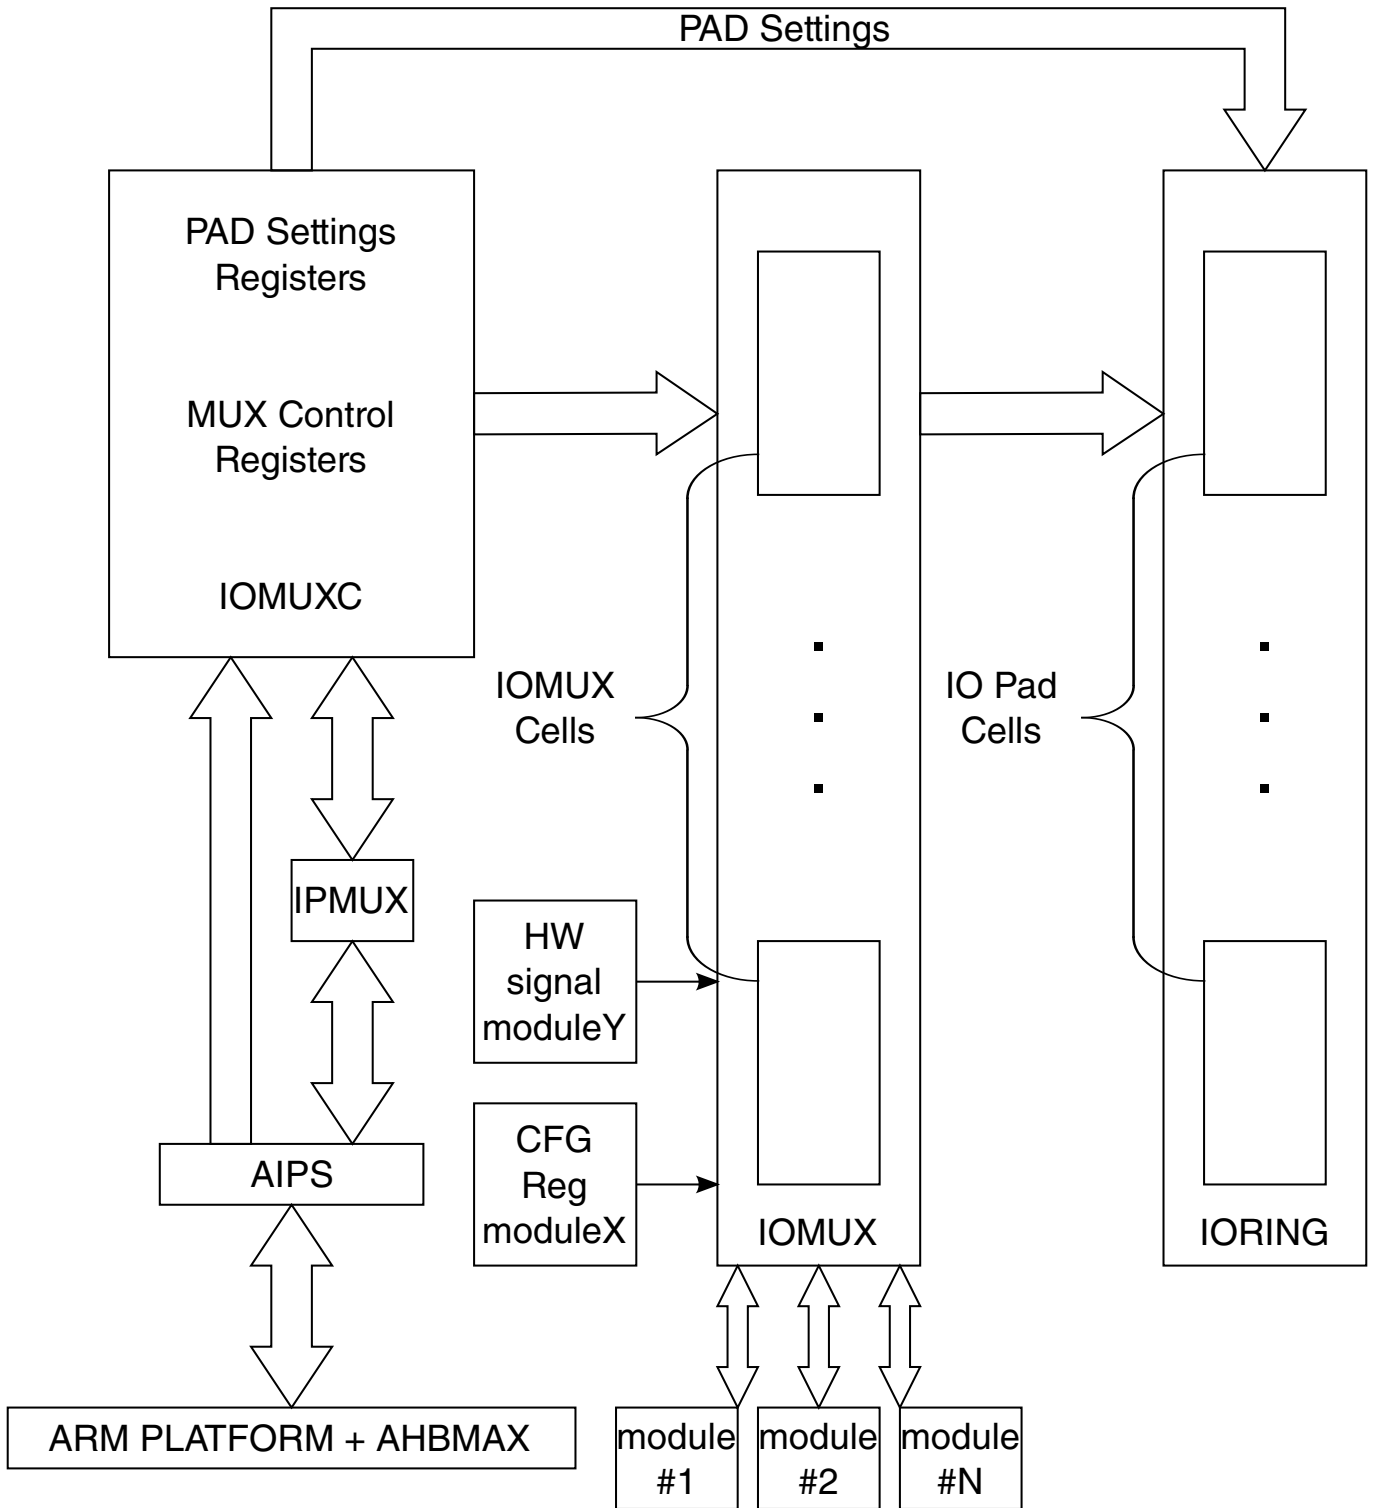

Figure 35-1. IOMUX SoC Level Block Diagram

35.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC_SW_MUX_CTL_PAD_<PAD NAME> or IOMUXC_SW_MUX_CTL_GRP_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC_SW_PAD_CTL_PAD_<PAD_NAME> or IOMUXC_SW_PAD_CTL_GRP_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 14 (GPR0 to GPR13) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

35.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 35-1. IOMUXC Clocks

Clock name	Clock Root	Description
ipt_clk_io		IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

35.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 35-2](#).

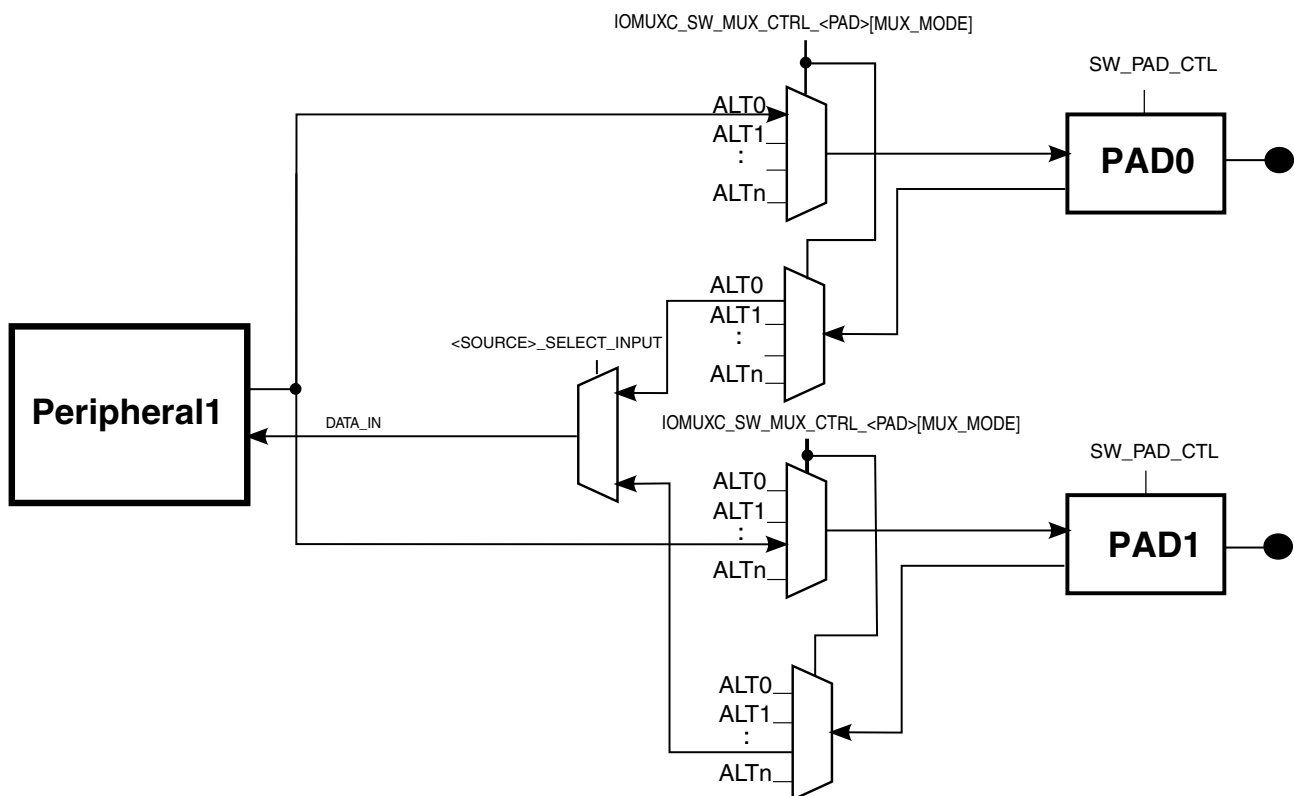

Figure 35-2. IOMUX Cell Block Diagram

35.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

35.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC_SW_MUX_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.
- GPIO Capture - Module x drives the pad and the value is captured by GPIO.

35.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a block port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC_SW_MUX_CTL_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

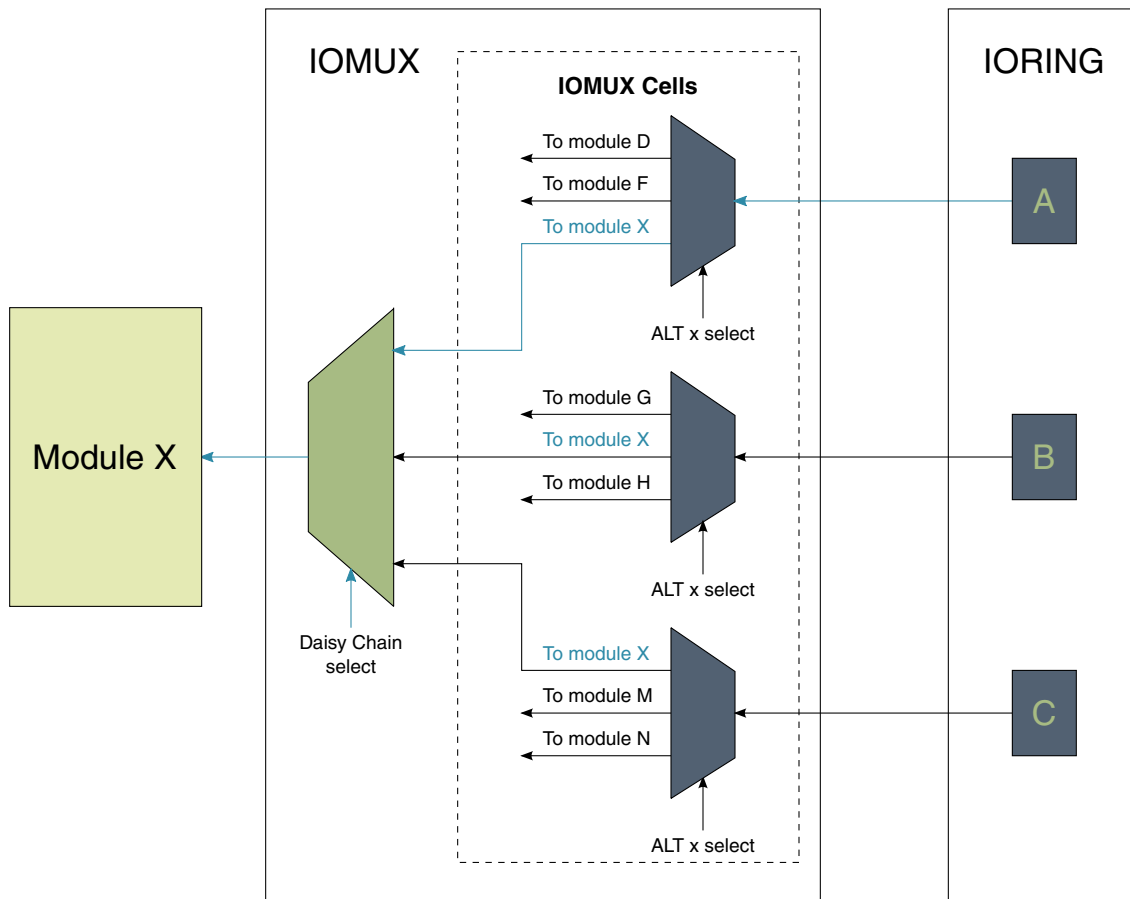

Figure 35-3. Daisy chain illustration

35.4 IOMUXC GPR Memory Map/Register Definition

Field	Description
30 TEST_ POWERDOWN	PCIe_PHY - All Circuits Power-Down Control Function: Powers down all circuitry in the PHY for IDDQ testing. 0 Power down is not requested 1 Power down is requested
29 APP_CLK_REQ_ N	PCIe_CTL (CLK LOGIC CONTROLLER GLUE) - Indicates that application logic is ready to have reference clock removed.
28 APP_READY_ ENTR_L23	PCIe_CTL - Application Ready to Enter L23. Indication from the application that it is ready to enter the L23 state. 0 PCIe application is not ready to enter L23 1 PCIe application is ready to enter L23
27 GPR_PCIE_ CTRL_CFG_L1_ AUX_CLK_ SWITCH_CORE_ CLK_GATE_EN	
26 APP_REQ_ EXIT_L1	PCIe_CTL - Application Request to Exit L1. Request from the application to exit ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set
25 APP_REQ_ ENTR_L1	PCIe_CTL - Application Request to Enter L1. Request from the application to enter ASPM state L1. 0 PCIe application request is not set 1 PCIe application request is set
24 SYS_INT	PCIe_CTL - When SYS_INT goes from low to high, the core generates an Assert_INTx Message. When sys_int goes from high to low, the core generates a Deassert_INTx Message. 0 PCIe system interrupt request is not asserted 1 PCIe system interrupt request is asserted
23–21 PCIe_CTL_7	PCIe control of diagnostic bus select TBD
20–17 DIAG_STATUS_ BUS_SELECT	PCIe_CTL - used for debug to select what part of diag_status_bus will be reflected on the 32 bits of the iomux
16 APPS_PM_XMT_ TURNOFF	PCIe_CTL - Request from the application to generate a PM_Turn_Off Message.
15–12 DEVICE_TYPE	PCIe_CTL - Device/Port Type. Indicates the specific type of this PCI Express Function (EP or RC) DEVICE_TYPE field values 0101-1111 are reserved. 0000 PCIE_EP — EP Mode 0100 PCIE_RC — RC Mode
11 APP_INIT_RST	PCIe_CTL - Request from the application to send a Hot Reset to the downstream device.

Table continues on the next page...

IOMUXC_GPR_GPR12 field descriptions (continued)

Field	Description
10 APP_LTSSM_ENABLE	PCIe_CTL - Driven low by the application after reset to hold the LTSSM in the Detect state until the application is ready. When the application has finished initializing the core configuration registers, it asserts app_ltssm_enable to allow the LTSSM to continue Link establishment. 0 Application is not ready. 1 Application is not ready.
9 APPS_PM_XMT_PME	PCIe_CTL - Wake Up. Used by application logic to wake up the PMC state machine from a D1, D2 or D3 power state. Upon wake-up, the core sends a PM_PME Message
8-4 LOS_LEVEL	PCIe_PHY - Loss-of-Signal Detector Sensitivity Level Control Function: Sets the sensitivity level for the Loss-of-Signal detector. This signal must be set to 0x9
3 -	This field is reserved. Reserved
PCIE_RX0_EQ	control pcie phy's rx0_eq bits

IOMUXC_GPR_GPR13 field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15 GPR_PCIE_ CLK_RST_FIX_ PERST_ DISABLE	
14 GPR_PCIE_ CLK_RST_FIX_ LNKRST_ DISABLE	
13 LCDIF2_RD_ CACHE_SEL	This bit selects the cacheable attribute of LCDIF AXI read transactions) 0 The read transaction cacheable attribute is driven by the LCDIF core 1 The read transaction cacheable attribute is driven by LCDIF_RD_CACHE_VAL.
12 LCDIF1_RD_ CACHE_SEL	This bit selects the cacheable attribute of LCDIF AXI read transactions) 0 The read transaction cacheable attribute is driven by the LCDIF core 1 The read transaction cacheable attribute is driven by LCDIF_RD_CACHE_VAL.
11 PCIE_WR_ CACHE_SEL	This bit selects the cacheable attribute of PCIE AXI write transactions 0 The write transactions cacheable attribute is driven by the PCIE core 1 The write transactions cacheable attribute is driven by PCIE_WR_CACHE_VAL.
10 PCIE_RD_ CACHE_SEL	This bit selects the cacheable attribute of PCIE AXI read transactions) 0 The read transaction cacheable attribute is driven by the PCIE core 1 The read transaction cacheable attribute is driven by PCIE_RD_CACHE_VAL.
9 PXP_WR_ CACHE_SEL	This bit selects the cacheable attribute of PXP AXI write transactions 0 The write transactions cacheable attribute is driven by the PXP core 1 The write transactions cacheable attribute is driven by PXP_WR_CACHE_VAL.
8 PXP_RD_ CACHE_SEL	This bit selects the cacheable attribute of PXP AXI read transactions) 0 The read transaction cacheable attribute is driven by the PXP core 1 The read transaction cacheable attribute is driven by PXP_RD_CACHE_VAL.
7 LCDIF2_RD_ CACHE_VAL	LCDIF block cacheable attribute value of AXI read transactions The value of LCDIF2_RD_CACHE_VAL is affecting the transactions only if LCDIF2_RD_CACHE_SEL is set. 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.
6 LCDIF1_RD_ CACHE_VAL	LCDIF block cacheable attribute value of AXI read transactions The value of LCDIF1_RD_CACHE_VAL is affecting the transactions only if LCDIF1_RD_CACHE_SEL is set. 0 Cacheable attribute is off for read transactions. 1 Cacheable attribute is on for read transactions.

IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO00 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad GPIO1_IO00. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
3 Reserved	This read-only field is reserved and always has the value 0.
MUX_MODE	MUX Mode Select Field. Select 1 of 6 iomux modes to be used for pad: GPIO1_IO00. 000 ALT0 — Select signal I2C1_SCL. 001 ALT1 — Select signal SD1_VSELECT. 010 ALT2 — Select signal SPDIF_LOCK. 100 ALT4 — Select signal WDOG1_ANY. 101 ALT5 — Select signal GPIO1_IO00. 110 ALT6 — Select signal SNVS_VIO_5.

35.5.2 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO01)

IOMUXC_SW_MUX_CTL_PAD_CSI_DATA04 field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 SION	Software Input On Field. Force the selected mux mode input path no matter of MUX_MODE functionality. 1 ENABLED — Force input path of pad CSI_DATA04. 0 DISABLED — Input Path is determined by functionality of the selected mux mode (regular).
MUX_MODE	MUX Mode Select Field. Select 1 of 9 iomux modes to be used for pad: CSI_DATA04. 0000 ALT0 — Select signal CSI1_DATA06. 0001 ALT1 — Select signal ESAI_TX1. 0010 ALT2 — Select signal SPDIF_OUT. 0011 ALT3 — Select signal KPP_COL6. 0100 ALT4 — Select signal UART6_RX_DATA. 0101 ALT5 — Select signal GPIO1_IO18. 0110 ALT6 — Select signal EIM_DATA19. 0111 ALT7 — Select signal PWM5_OUT. 1000 ALT8 — Select signal VADC_DATA08.

35.5.20 Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA05)

Address: 20E_0000h base + 60h offset = 20E_0060h

Field	Description
31–22 -	This field is reserved. Reserved
21–20 DO_TRIM	DO Trim Field Select one of next values for pad: DRAM_CS0_B. 00 MIN_DELAY — Minimum delay. 01 50PS_DELAY — Approx. 50ps ipp_do -> pad delay 10 100PS_DELAY — Approx. 100ps ipp_do -> pad delay 11 150PS_DELAY — Approx. 150ps ipp_do -> pad delay
19–18 DDR_SEL	DDR Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDR_TYPE Note: The value of this field does not reflect the value of the Group Control Register.
17 DDR_INPUT	DDR / CMOS Input Mode Field Select one of next values for pad: DRAM_CS0_B. 0 CMOS — CMOS input mode. 1 DIFFERENTIAL — Differential input mode.
16 HYS	Hysteresis Enable Field Select one of next values for pad: DRAM_CS0_B. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field CANNOT BE CONFIGURED - NO GROUP REGISTER ERROR!
13 PUE	Pull / Keep Select Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRPK Note: The value of this field does not reflect the value of the Group Control Register.
12 PKE	Pull / Keep Enable Field This property can be configured using Group Control Register: IOMUXC_SW_PAD_CTL_GRP_DDRPKE Note: The value of this field does not reflect the value of the Group Control Register.
11 -	This field is reserved. Reserved
10–8 ODT	On Die Termination Field Select one of next values for pad: DRAM_CS0_B. 000 DISABLED — Disabled 001 120_OHM — 120 Ohm ODT 010 60_OHM — 60 Ohm ODT 011 40_OHM — 40 Ohm ODT 100 30_OHM — 30 Ohm ODT 101 24_OHM — 24 Ohm ODT

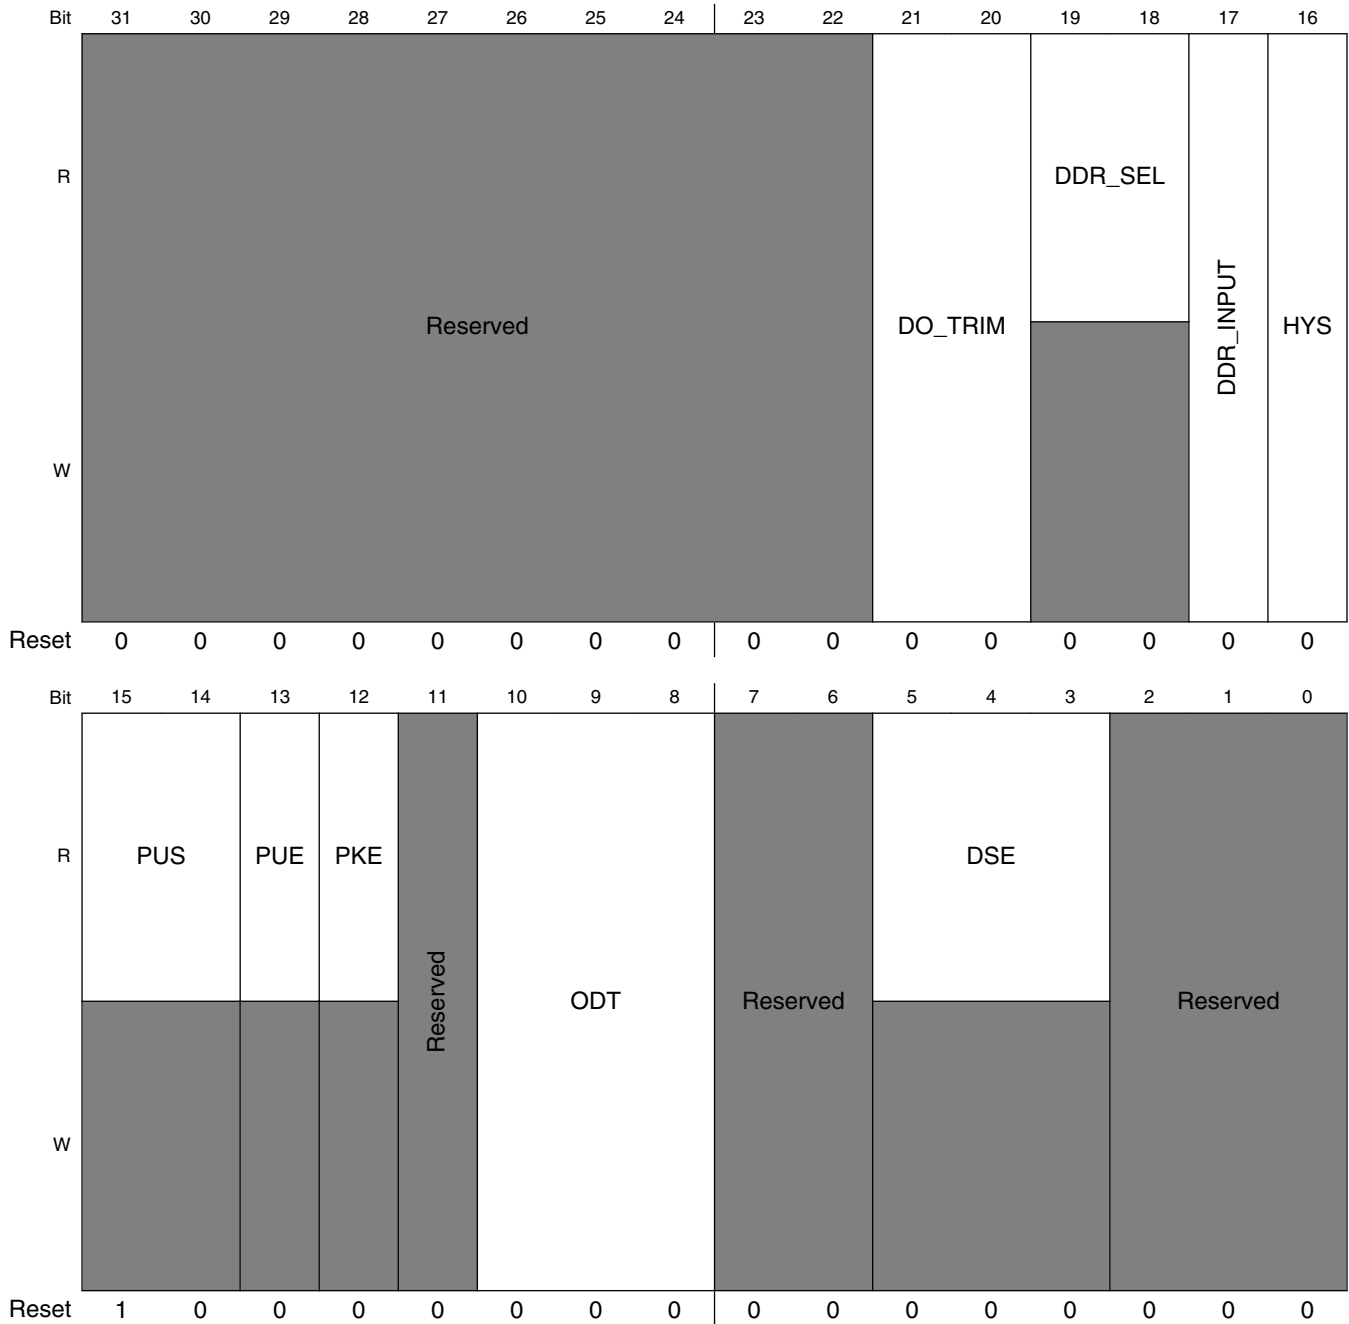

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_RGMII2_RD0 field descriptions

Field	Description
31–17 -	This field is reserved. Reserved
16 HYS	Hysteresis Enable Field Select one of next values for pad: RGMII2_RD0. 0 DISABLED — CMOS input 1 ENABLED — Schmitt trigger input
15–14 PUS	Pull Up / Down Config. Field Select one of next values for pad: RGMII2_RD0. 00 PUS_100KOHM_PD — 100K Ohm Pull Down 01 PUS_47KOHM_PU — 47K Ohm Pull Up 10 PUS_100KOHM_PU — 100K Ohm Pull Up 11 PUS_22KOHM_PU — 22K Ohm Pull Up
13 PUE	Pull / Keep Select Field Select one of next values for pad: RGMII2_RD0. 0 KEEP — Keeper Enabled 1 PULL — Pull Enabled
12 PKE	Pull / Keep Enable Field Select one of next values for pad: RGMII2_RD0. 0 DISABLED — Pull/Keeper Disabled 1 ENABLED — Pull/Keeper Enabled
11 ODE	Open Drain Enable Field Enables open drain of the pin. 0 DISABLED — Output is CMOS. 1 ENABLED — Output is Open Drain.

Table continues on the next page...

IOMUXC_SW_PAD_CTL_PAD_RGMII2_RD0 field descriptions (continued)

Field	Description
10–8 -	This field is reserved. Reserved
7–6 SPEED	Speed Field Select one of next values for pad: RGMII2_RD0. 00 50MHZ — Low(50 MHz) 01 100MHZ — Medium (100 MHz) 10 100MHZ — Medium (100 MHz) 11 200MHZ — Maximum (200 MHz)
5–3 DSE	Drive Strength Field Select one of next values for pad: RGMII2_RD0. 000 HIZ — HI-Z 001 260_OHM — 260 Ohm @ 3.3V, 150 Ohm@1.8V, 240 Ohm for DDR 010 130_OHM — 130 Ohm @ 3.3V, 75 Ohm@1.8V, 120 Ohm for DDR 011 87_OHM — 87 Ohm @ 3.3V, 50 Ohm@1.8V, 80 Ohm for DDR 100 65_OHM — 65 Ohm @ 3.3V, 38 Ohm@1.8V, 60 Ohm for DDR 101 52_OHM — 52 Ohm @ 3.3V, 30 Ohm@1.8V, 48 Ohm for DDR 110 43_OHM — 43 Ohm @ 3.3V, 25 Ohm@1.8V, 40 Ohm for DDR 111 37_OHM — 37 Ohm @ 3.3V, 21 Ohm@1.8V, 34 Ohm for DDR
2–1 -	This field is reserved. Reserved
0 SRE	Slew Rate Field Slew rate control. 0 SLOW — Slow Slew Rate 1 FAST — Fast Slew Rate

35.5.331 Pad Control Register (IOMUXC_SW_PAD_CTL_PAD_RGMII2_RD1)

Address: 20E_0000h base + 53Ch offset = 20E_053Ch

Chapter 36

Keypad Port (KPP)

36.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

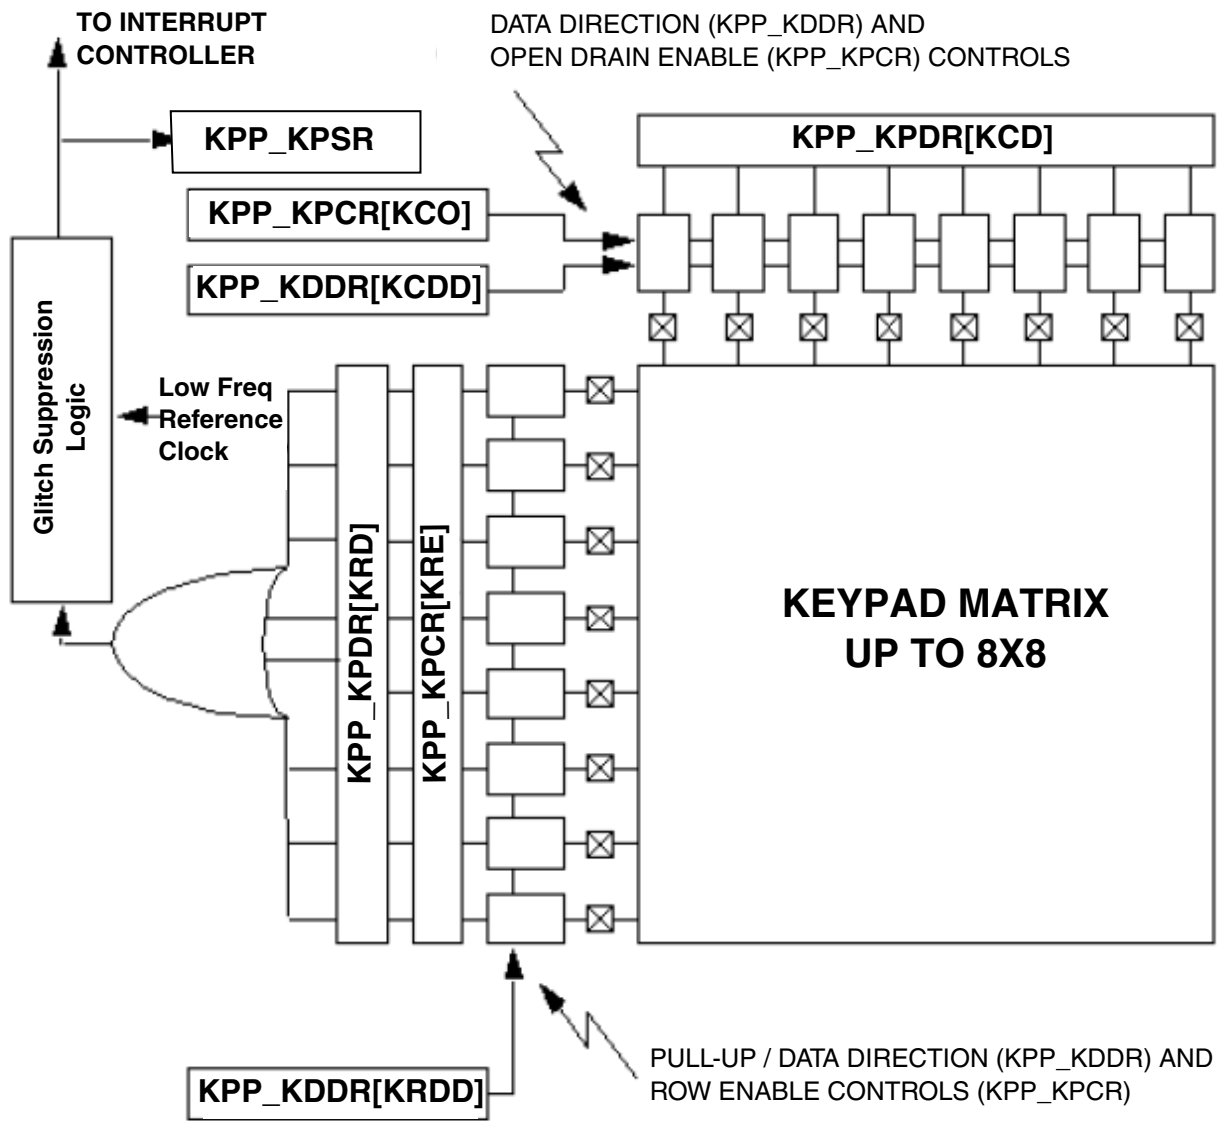

Figure 36-1. KPP Peripheral Block Diagram

36.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

36.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

36.2 Clocks

The table found here describes the clock sources for KPP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 36-1. KPP Clocks

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

36.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

Table 36-2. KPP External Signals

Signal	Description	Pad	Mode	Direction
KPP_COL0	Column input or output pin, from chip	KEY_COL0	ALT0	IO
KPP_COL1	Column input or output pin, from chip	KEY_COL1	ALT0	IO
KPP_COL2	Column input or output pin, from chip	KEY_COL2	ALT0	IO
KPP_COL3	Column input or output pin, from chip	KEY_COL3	ALT0	IO
KPP_COL4	Column input or output pin, from chip	KEY_COL4	ALT0	IO
KPP_COL5	Column input or output pin, from chip	CSI_DATA02	ALT3	IO
		SD2_CLK	ALT2	
KPP_COL6	Column input or output pin, from chip	CSI_DATA04	ALT3	IO
		SD2_DATA3	ALT2	
KPP_COL7	Column input or output pin, from chip	CSI_DATA06	ALT3	IO
		SD2_DATA1	ALT2	
KPP_ROW0	Row input or output pin, from chip	KEY_ROW0	ALT0	IO
KPP_ROW1	Row input or output pin, from chip	KEY_ROW1	ALT0	IO
KPP_ROW2	Row input or output pin, from chip	KEY_ROW2	ALT0	IO
KPP_ROW3	Row input or output pin, from chip	KEY_ROW3	ALT0	IO
KPP_ROW4	Row input or output pin, from chip	KEY_ROW4	ALT0	IO
KPP_ROW5	Row input or output pin, from chip	CSI_DATA03	ALT3	IO
		SD2_CMD	ALT2	
KPP_ROW6	Row input or output pin, from chip	CSI_DATA05	ALT3	IO
		SD2_DATA2	ALT2	
KPP_ROW7	Row input or output pin, from chip	CSI_DATA07	ALT3	IO
		SD2_DATA0	ALT2	

36.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

36.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

Table 36-3. Keypad Port Column Modes

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

36.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

36.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock is on. The KPP may generate an ARM platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

36.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

36.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

36.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

36.4.4 Keypad Standby

There is no need for the ARM platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the ARM platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the ARM platform if any key is pressed.

Upon receiving a keypad interrupt, the ARM platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

36.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the ARM platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock source.

This clock must continue to run in any low power mode where the keypad is a wake-up source, as the ARM platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

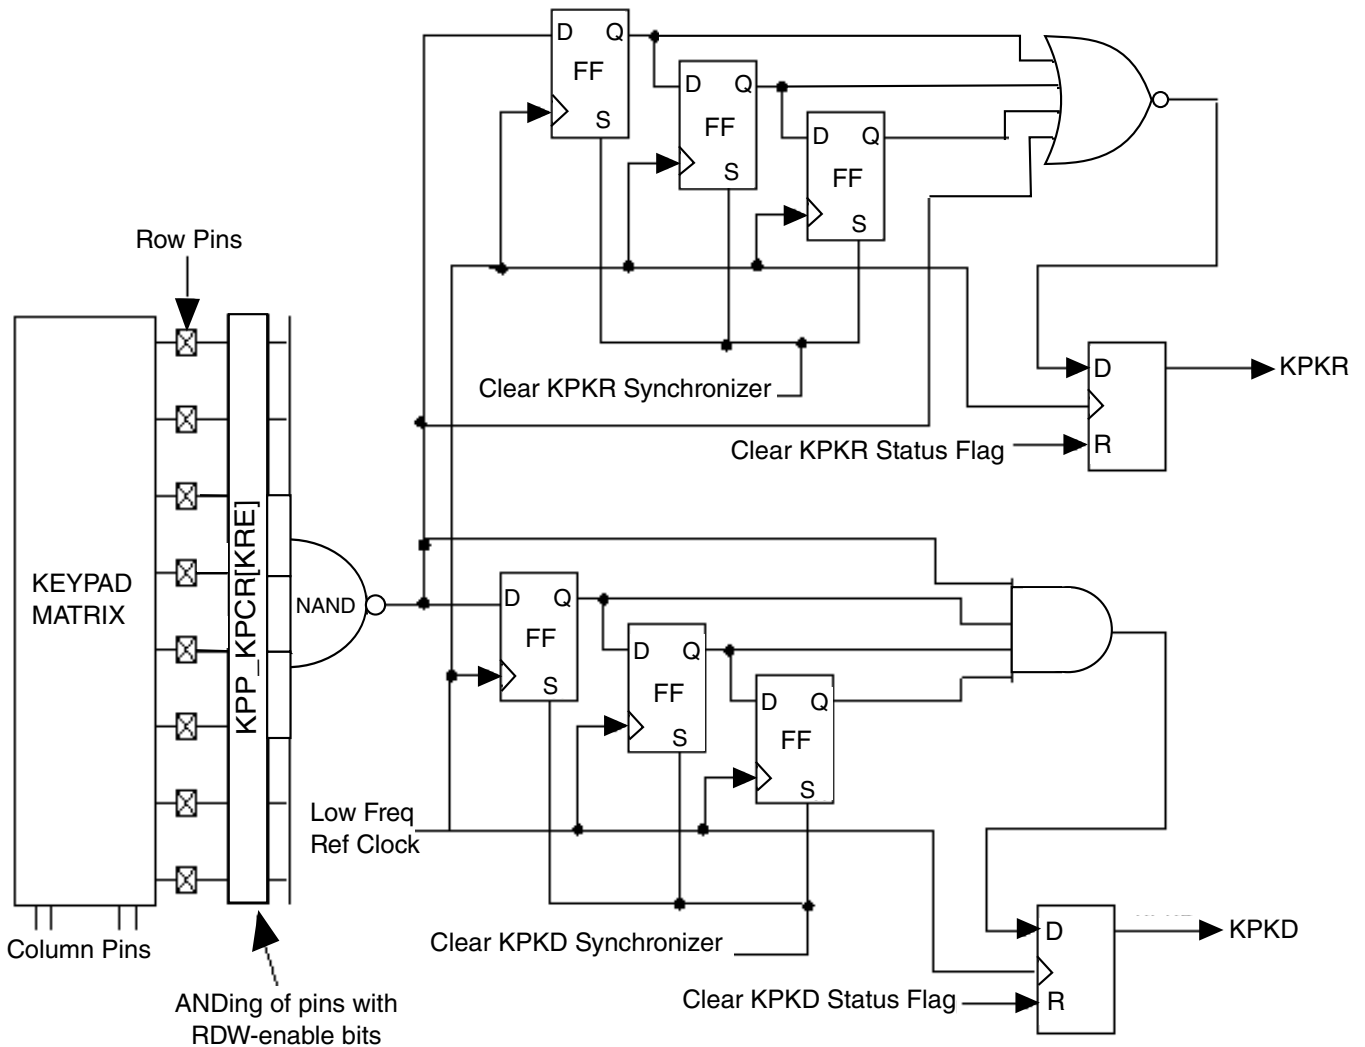

Figure 36-2. Keypad Synchronizer Functional Diagram

36.4.6 Multiple Key Closures

Using the key press and Key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly.

See the following figures for illustrations of the interfacing of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected. Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

Figure 36-3. Multiple Key Presses on Same Column Line (Simplified View)

Figure 36-4. Multiple Key Presses on Same Row Line (Simplified View)

NOTE

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

36.4.6.1 Ghost Key Problem and Correction

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

Functional Description

As can be seen in [Figure 36-5](#), three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see [Figure 36-6](#)).

Figure 36-5. Decoding Wrong Three- Key-Presses

Figure 36-6. Matrix with "Ghost" Key Protections

36.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in Figure 36-7, two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

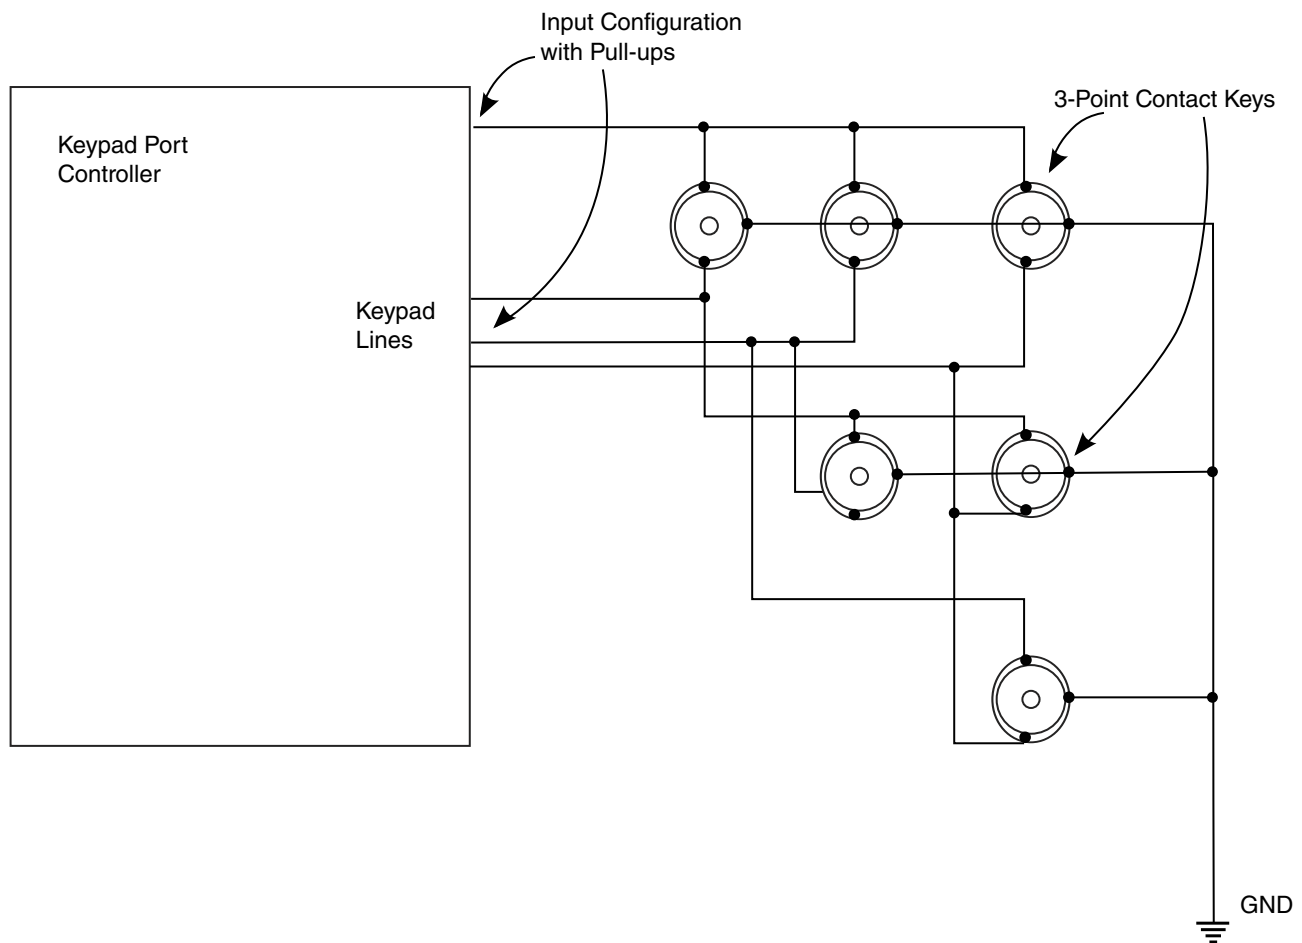

Figure 36-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

36.5 Initialization/Application Information

36.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP_KPCR[KRE]).
2. Write 0s to KPP_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP_KPCR[KCO]).
4. Configure columns as output (KPP_KDDR[KCDD]) and rows as input (KPP_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).
7. (The system is now in standby mode, and awaiting a key press.)

36.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

36.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

36.6 KPP Memory Map/Register Definition

The KPP contains four registers.

KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20B_8000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	36.6.1/2392
20B_8002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	36.6.2/2393
20B_8004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	36.6.3/2395
20B_8006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	36.6.4/2395

36.6.1 Keypad Control Register (KPP_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP_KPCR register is byte- or half-word-addressable.

Address: 20B_8000h base + 0h offset = 20B_8000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCO								KRE							
Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input. NOTE: Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin. 0 TOTEM_POLE — Column strobe output is totem pole drive. 1 OPEN_DRAIN — Column strobe output is open drain.

Table continues on the next page...

KPP_KPCR field descriptions (continued)

Field	Description
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set. 0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

36.6.2 Keypad Status Register (KPP_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP_KPSR register is byte- or half-word-addressable.

Address: 20B_8000h base + 2h offset = 20B_8002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write								
Reset	0	0	0	0	0	1	0	0
Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write					KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

KPP_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain. 0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.

Table continues on the next page...

KPP_KPSR field descriptions (continued)

Field	Description
	<p>0 No interrupt request is generated when KPKD is set.</p> <p>1 An interrupt request is generated when KPKD is set.</p>
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	<p>Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect</p> <p>1 Set bits which sets keypad release synchronizer chain</p>
2 KDSC	<p>Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect</p> <p>1 Set bits that clear the keypad depress synchronizer chain</p>
1 KPKR	<p>Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents.</p> <p>Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1".</p> <p>0 No key release detected</p> <p>1 All keys have been released</p>
0 KPKD	<p>Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys.</p> <p>Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents.</p> <p>0 No key presses detected</p> <p>1 A key has been depressed</p>

36.6.3 Keypad Data Direction Register (KPP_KDDR)

The bits in the KPP_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP_KDDR register is byte- or half-word addressable.

NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

Address: 20B_8000h base + 4h offset = 20B_8004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

KPP_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL n pin as an output (where $n = 7$ through 0). 0 INPUT — COL n pin is configured as an input. 1 OUTPUT — COL n pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW n pin as an output (where $n = 7$ through 0). 0 INPUT — ROW n pin configured as an input. 1 OUTPUT — ROW n pin configured as an output.

36.6.4 Keypad Data Register (KPP_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

KPP Memory Map/Register Definition

The KPP_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 20B_8000h base + 6h offset = 20B_8006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCD								KRD

KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register. 0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports

Chapter 37

Enhanced LCD Interface (eLCDIF)

37.1 Overview

The eLCDIF is a general purpose display controller used to drive a wide range of display devices varying in size and capability.

Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The eLCDIF block supports these interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- PIO interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation.

37.2 External Signals

37.3 Clocks

The following table describes the clock sources for eLCDIF. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 37-2. eLCDIF Clocks

Clock name	Clock Root	Description
------------	------------	-------------

37.4 Functional Description

[Bus Interface Mechanisms](#) through [Initializing the eLCDIF](#), describe the internal pipeline for the MPU write/read interface, VSYNC, DOTCLK, and DVI interfaces. Differences for each mode are then described in separate sections, as follows:

- [MPU Interface](#)
- [VSYNC Interface](#)
- [DOTCLK Interface](#)
- [ITU-R BT.656 Digital Video Interface \(DVI\)](#)

eLCDIF pin usage by interface mode is described in [eLCDIF Pin Usage by Interface Mode](#).

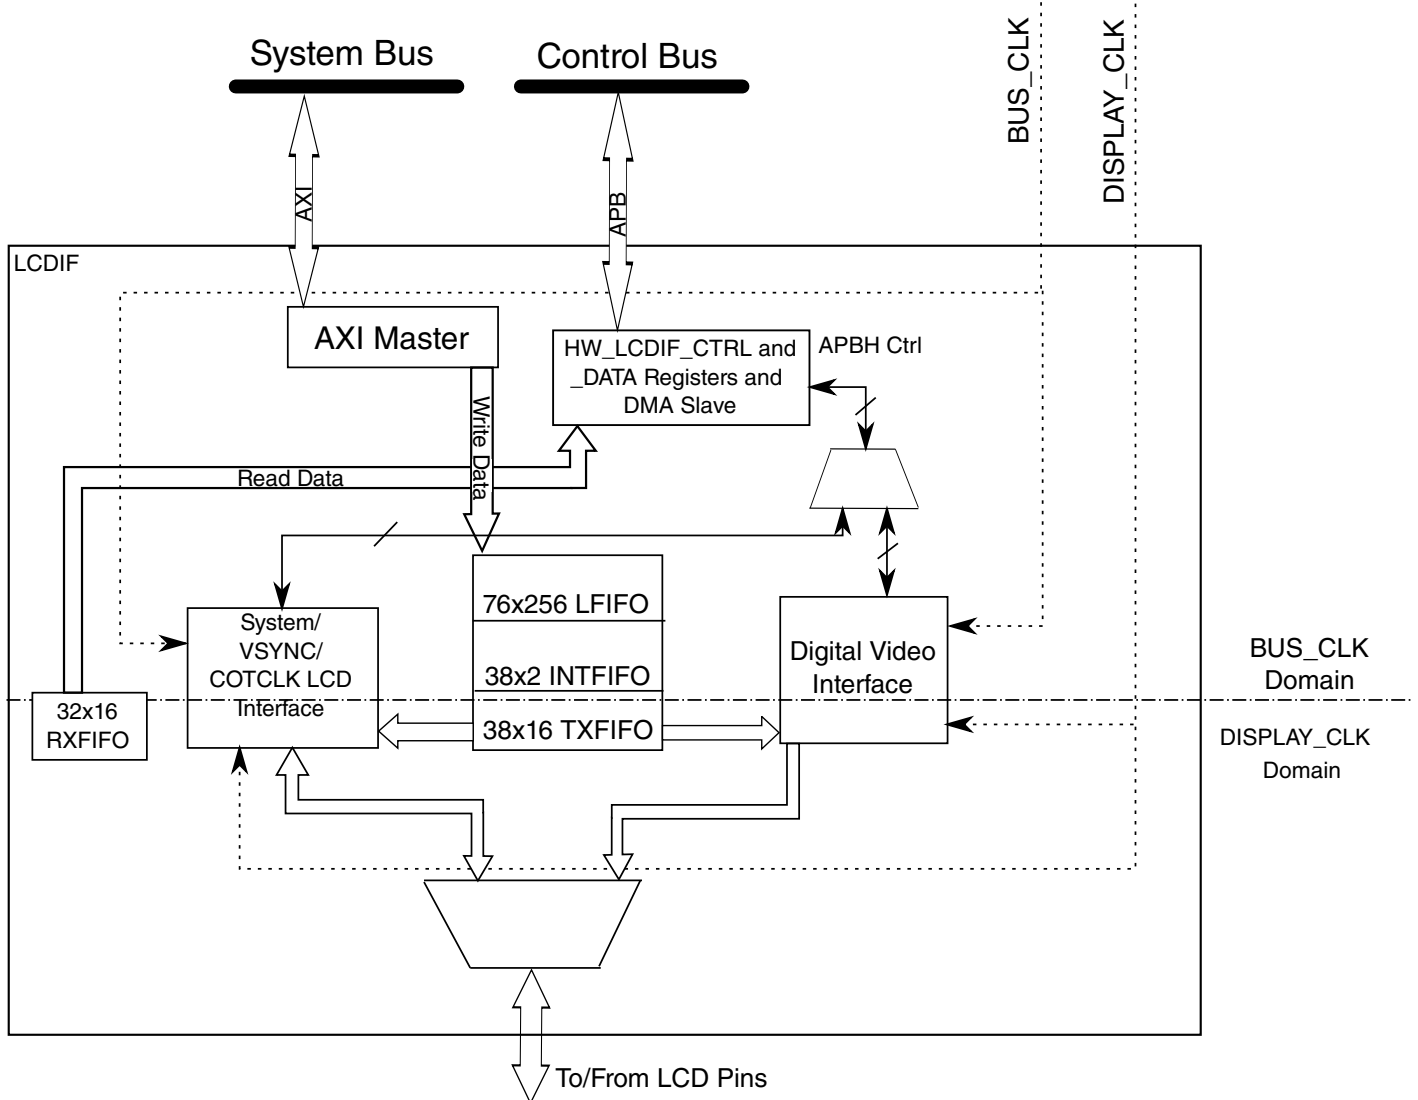

Figure 37-1. Top-Level Block Diagram of eLCDIF subsystem

37.4.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types. Bus mastering can also be used for MPU mode data writes.

The PIO interface is used to interface to "Smart" displays to transfer frame buffer data and control information to/from the external display. The host CPU executes display drivers to manage the display solution.

The following sections describe the system bus interface mechanisms.

37.4.1.1 Bus Master Operation in Write/Display Modes

The eLCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

In the MPU and VSYNC modes, single frames are transferred. When a complete frame is transferred, eLCDIF enters idle and clears the RUN bit in the CTRL register. For subsequent frame transmission, the eLCDIF setup sequence should be repeated.

The DOTCLK and DVI modes are used to refresh the display at the desired refresh rate and resolution. These modes are used to drive displays that do not integrate a display buffer memory. When the display is refreshed, the eLCDIF will automatically update the LCDIF_CUR_BUF_ADDR register with the value in LCDIF_NEXT_BUF_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF_NEXT_BUF_ADDR register was not updated within a frame refresh cycle, eLCDIF will keep transmitting the last frame until a new value is programmed into that register.

eLCDIF also provides the capability of interlacing a progressive frame by fetching odd lines in the first field and then fetching even lines in the second field. This feature can be used in the DVI mode and can be turned on by setting the INTERLACE_FIELDS bit in the LCDIF_CTRL1 register.

37.4.1.2 System Bus Master Performance

The performance of the eLCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF_CTRL2 register will throttle system memory requests. The LCDIF_CTRL2_OUTSTANDING_REQS field will control how many requests the eLCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF_CTRL2_BURST_LEN_8 bit will set the number of 64 bit words requested for each eLCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display resolution. These configuration bits are intended to change the access pattern of the eLCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF_THRES_PANIC value can be used to raise the priority of requests initiated by the eLCDIF to alter how the eLCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF_THRES_PANIC value to $3/4 * 512$, or 128. The panic signal output is used to assess higher priority to eLCDIF system requests to avoid eLCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

37.4.2 Write Data Path

eLCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The INPUT_DATA_SWIZZLE field in the LCDIF_CTRL register provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The WORD_LENGTH field of LCDIF_CTRL register indicates the input data/pixel format. LCDIF_TRANSFER_COUNT register denotes how much data is contained in each frame. The H_COUNT field of this register indicates the number of pixels per line and V_COUNT indicates the total number of lines per frame. A special bit field in the LCDIF_CTRL1 register, called the BYTE_PACKING_FORMAT, can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, BYTE_PACKING_FORMAT should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then BYTE_PACKING_FORMAT should be set to 0x7.

The LCD_DATABUS_WIDTH field in LCDIF_CTRL register suggests the width of the bus going to the external display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. Refer to the system I/O muxing options for support of this feature. If the LCD_DATABUS_WIDTH is not the

same as WORD_LENGTH, eLCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, eLCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, eLCDIF will drop the LSBs of each color channel to convert to the lower color depth. eLCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the ODD_LINE_PATTERN and the EVEN_LINE_PATTERN bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

eLCDIF also supports RGB to YCbCr 4:2:2 color space conversion. This is useful in the DVI mode since the TV encoder requires input in YCbCr 4:2:2 format. The LCDIF_CSC* registers have complete programmability over the CSC coefficients and offsets. The values must be written into these registers in the signed two's complement format.

The following list shows how the different input/output combinations can be obtained:

- WORD_LENGTH=1 indicates that the input is 8-bit data. This is most likely going to be used for sending commands in MPU interface, or maybe a gray scale image. Any combination of BYTE_PACKING_FORMAT [3:0] is permissible.

Limitation: H_COUNT must be a multiple of the sum of BYTE_PACKING_FORMAT [3], BYTE_PACKING_FORMAT [2], BYTE_PACKING_FORMAT [1] and BYTE_PACKING_FORMAT [0]. LCD_DATABUS_WIDTH must be 1, indicating an 8-bit data bus.

- WORD_LENGTH=0 implies the input frame buffer is RGB 16 bits per pixel. DATA_FORMAT_16_BIT field determines the pixels are RGB 555 or RGB 565.

Limitation: BYTE_PACKING_FORMAT [3:0] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and H_COUNT will be restricted to be a multiple of 2 pixels.

- WORD_LENGTH=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the DATA_FORMAT_18_BIT bit.

Limitation: BYTE_PACKING_FORMAT can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case. H_COUNT can be any number.

- WORD_LENGTH=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If BYTE_PACKING_FORMAT [3:0] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on H_COUNT. This is also

the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If `BYTE_PACKING_FORMAT` [3:0] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and `H_COUNT` must be a multiple of 4 pixels.

- `YCBCR422_INPUT=1` implies that the input frame is in YCbCr 4:2:2 format. `BYTE_PACKING_FORMAT` must be 0xF.

Limitation: `LCD_DATABUS_WIDTH` must be 8-bit and `H_COUNT` must be a multiple of 2 pixels.

`ODD_LINE_PATTERN` and `EVEN_LINE_PATTERN` must be 0 when any of `RGB_TO_YCBCR422_CSC` or `INTERLACE_FIELDS` or `YCBCR422_INPUT` bits is 1.

After the RGB to RGB or RGB to YCbCr 4:2:2 color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the `CSC_DATA_SWIZZLE` field in the `LCDIF_CTRL` register, and it provides the same options as the `INPUT_DATA_SWIZZLE` register.

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the `SHIFT_DIR` and `SHIFT_NUM_BITS` fields in `LCDIF_CTRL` register.

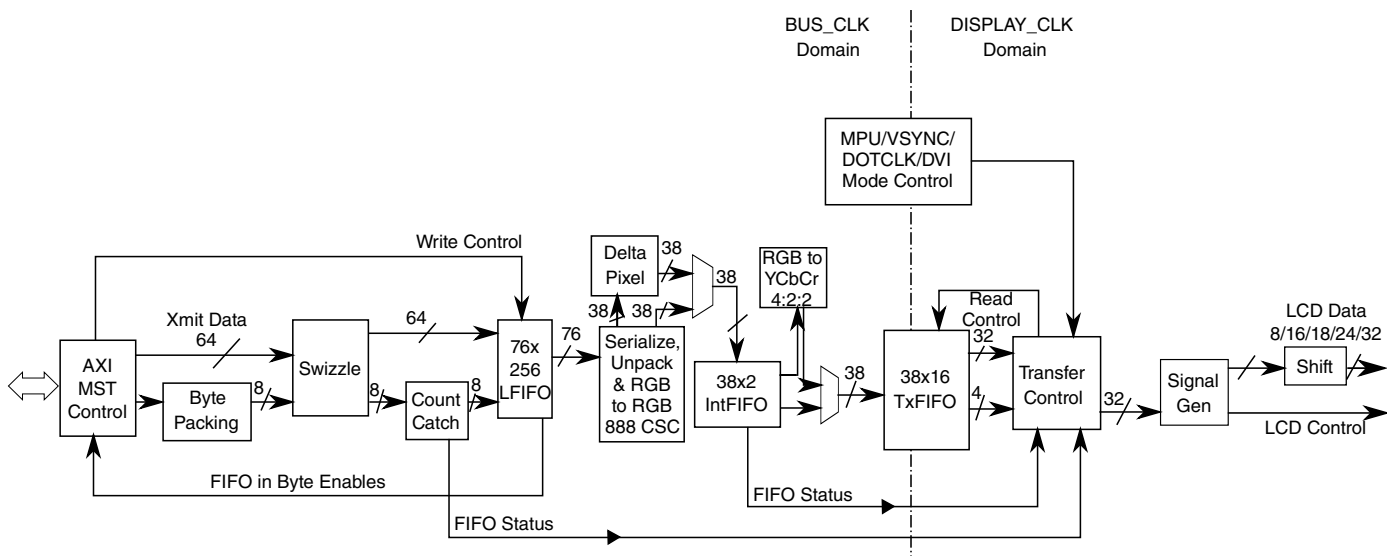

Figure 37-2. General Operations in Write Data Path

Functional Description

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to I/O bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

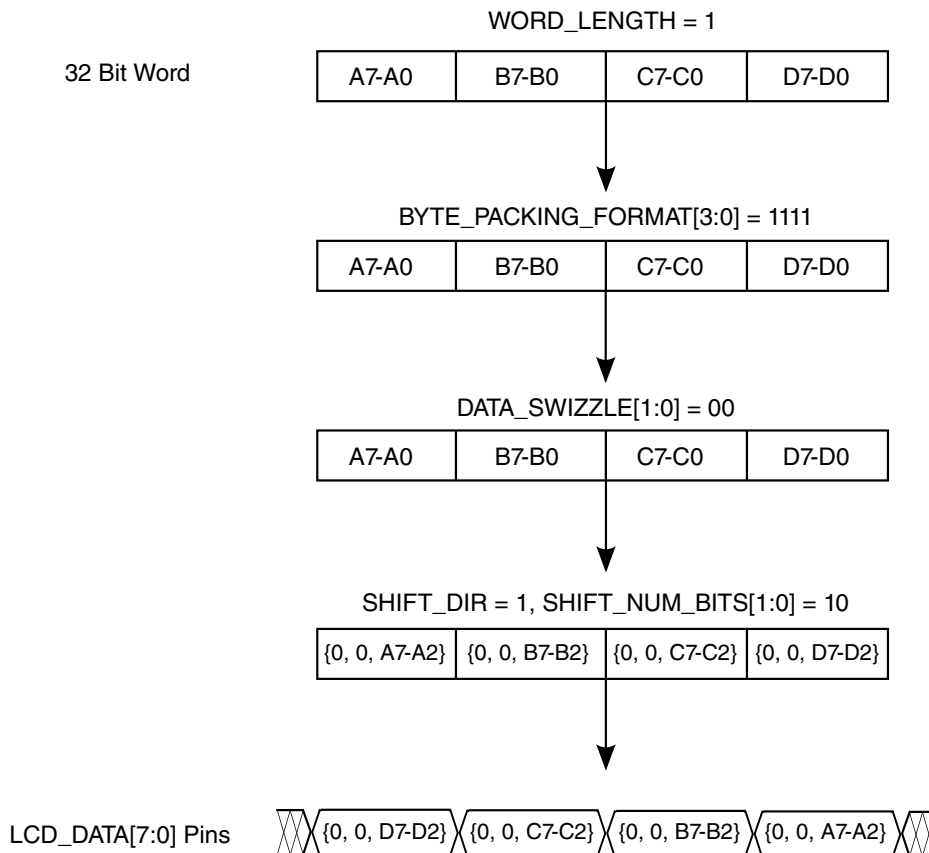

Figure 37-3. Register programming for write mode

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

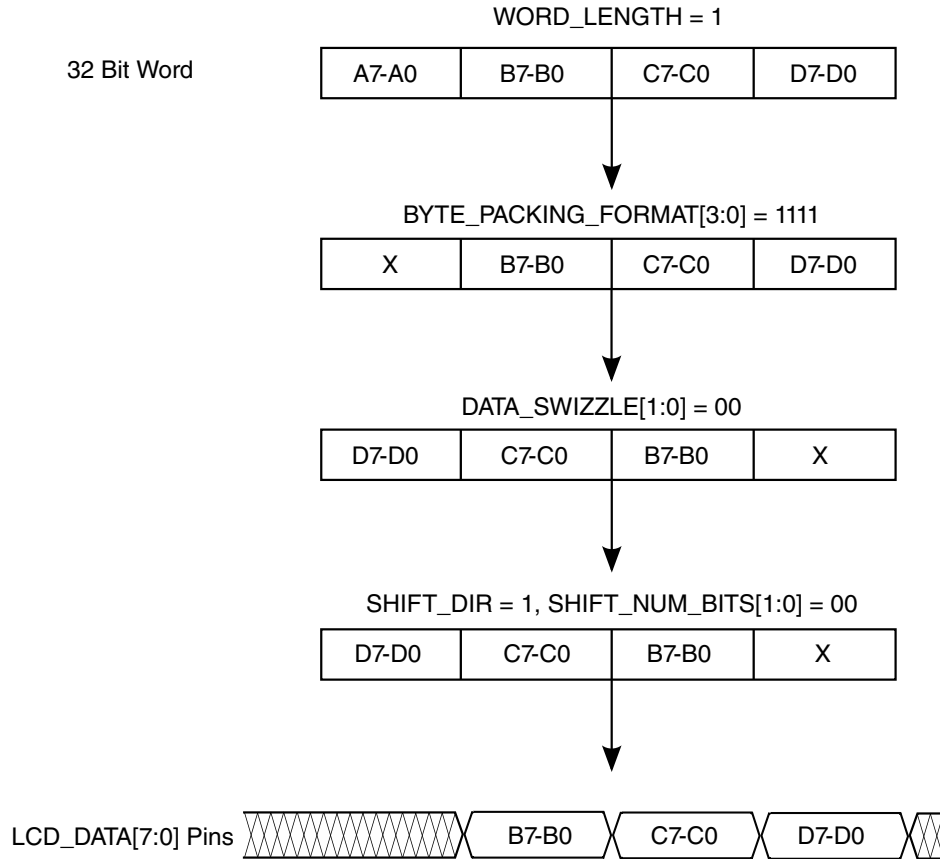

Figure 37-4. Register programming for write mode

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

Figure 37-5. Register programming for write mode

This example indicates how an unpacked frame buffer can be sourced for display. Only a single 16 bit half word within the 32 bit word is transferred out via the 16 display bus.

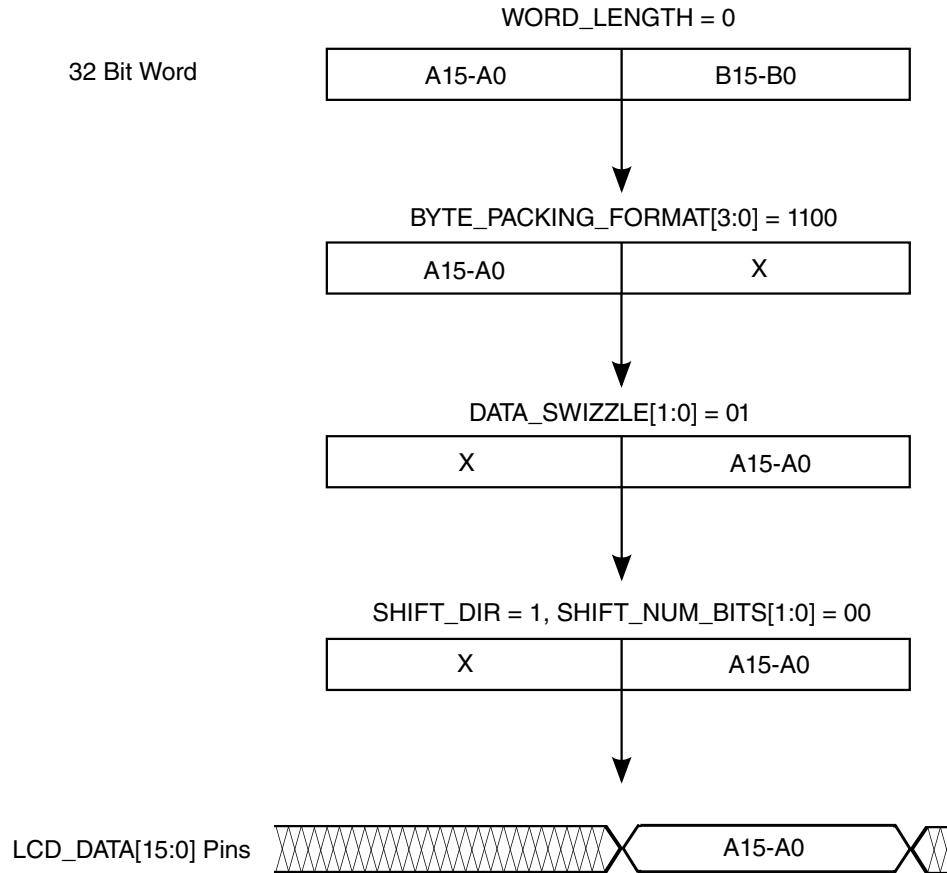

Figure 37-6. Register programming for write mode

37.4.3 Read Data Path

Figure 37-7 shows the MPU read data path in detail.

eLCDIF can read from an external display that follows the 6800/8080 MPU protocol.

The display bus width is determined by the `LCD_DATABUS_WIDTH` bit field. The data sampled at every read strobe is called a subword and the number of subwords that can be packed in a 32-bit word is given by the `READ_MODE_NUM_PACKED_SUBWORDS` bit field. The `INITIAL_DUMMY_READ` bit field directs the eLCDIF to skip the number of programmed subwords before starting to process read data. This feature is useful in the case of an LCD controller that returns the last written data the first time a read is issued, and then sends the correct data thereafter. `SHIFT_DIR` and `SHIFT_NUM_BITS` bit fields indicate whether the data needs to be shifted before getting stored in the internal registers. For example, a value of 2 in `READ_MODE_NUM_PACKED_SUBWORDS` if lcd

Functional Description

databus width is 8 bits indicates two bytes should be packed in a 32-bit word, while if the lcd databus width is 16 bits, it indicates that two half words (or 4 bytes) should be packed.

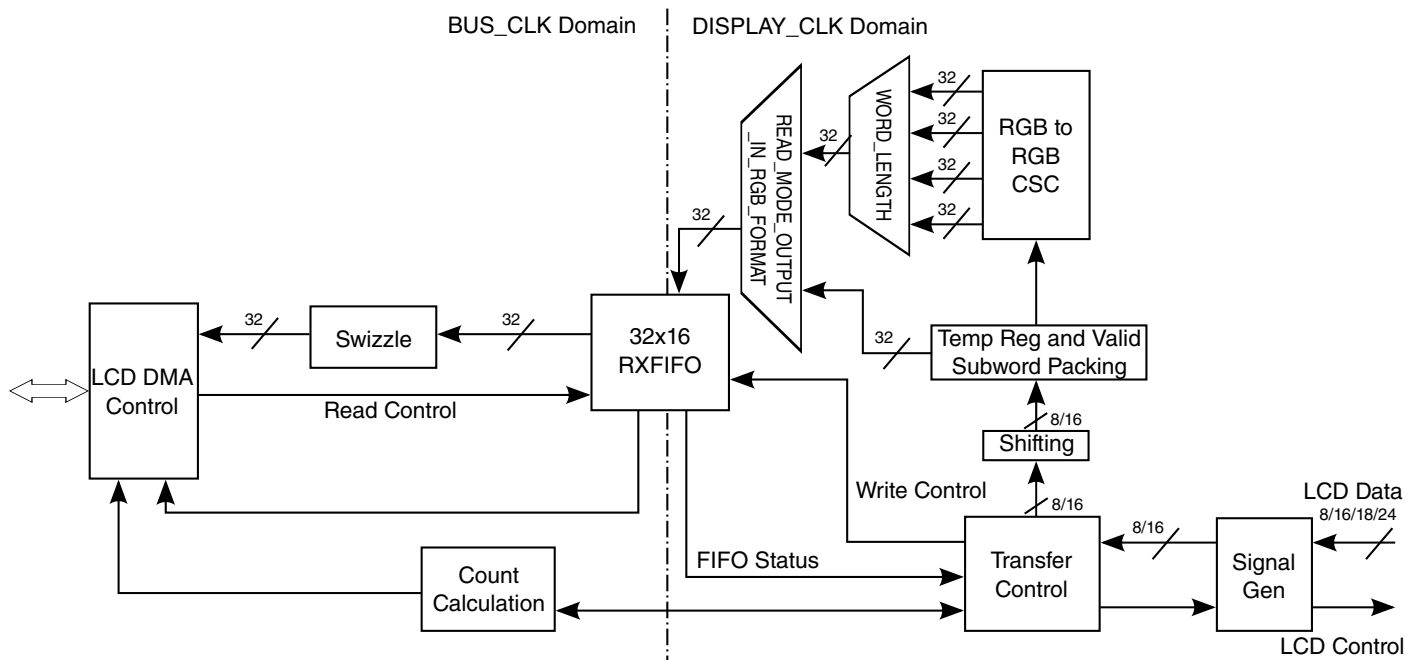

Figure 37-7. MPU Read Data Path

After the last subword within a word is reached, the block looks at the `READ_PACK_DIR` in the `HW_LCDIF_CTRL2` register. If this bit is set, the block will swizzle the data, but only within the valid bytes, unlike in the write mode, where swizzle occurs across all 4 bytes. If the `READ_MODE_OUTPUT_IN_RGB_FORMAT` bit is set, eLCDIF will convert the data obtained from the `READ_PACK_DIR` operation into 24-bit unpacked RGB and then re-convert it into 16/18/24 bpp RGB depending on the `WORD_LENGTH` field. The `DATA_FORMAT_16/18/24_BIT` bit fields are also considered while converting to 24-bit unpacked RGB format. For example, if `DATA_FORMAT_18_BIT` is 1, the RGB666 data will be packed in the upper bits [31:4] of a 32-bit word, and that bit is 0, the data will be packed in the lower bits [17:0]. After all these operations, the data gets written into the RXFIFO.

The following figures show some examples of how data is handled in different MPU read modes.

READ_MODE_NUM_PACKED_SUBWORDS = 2 AND LCD_DATABUS_WIDTH = 8 BITS
 OR
 READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 16 BITS

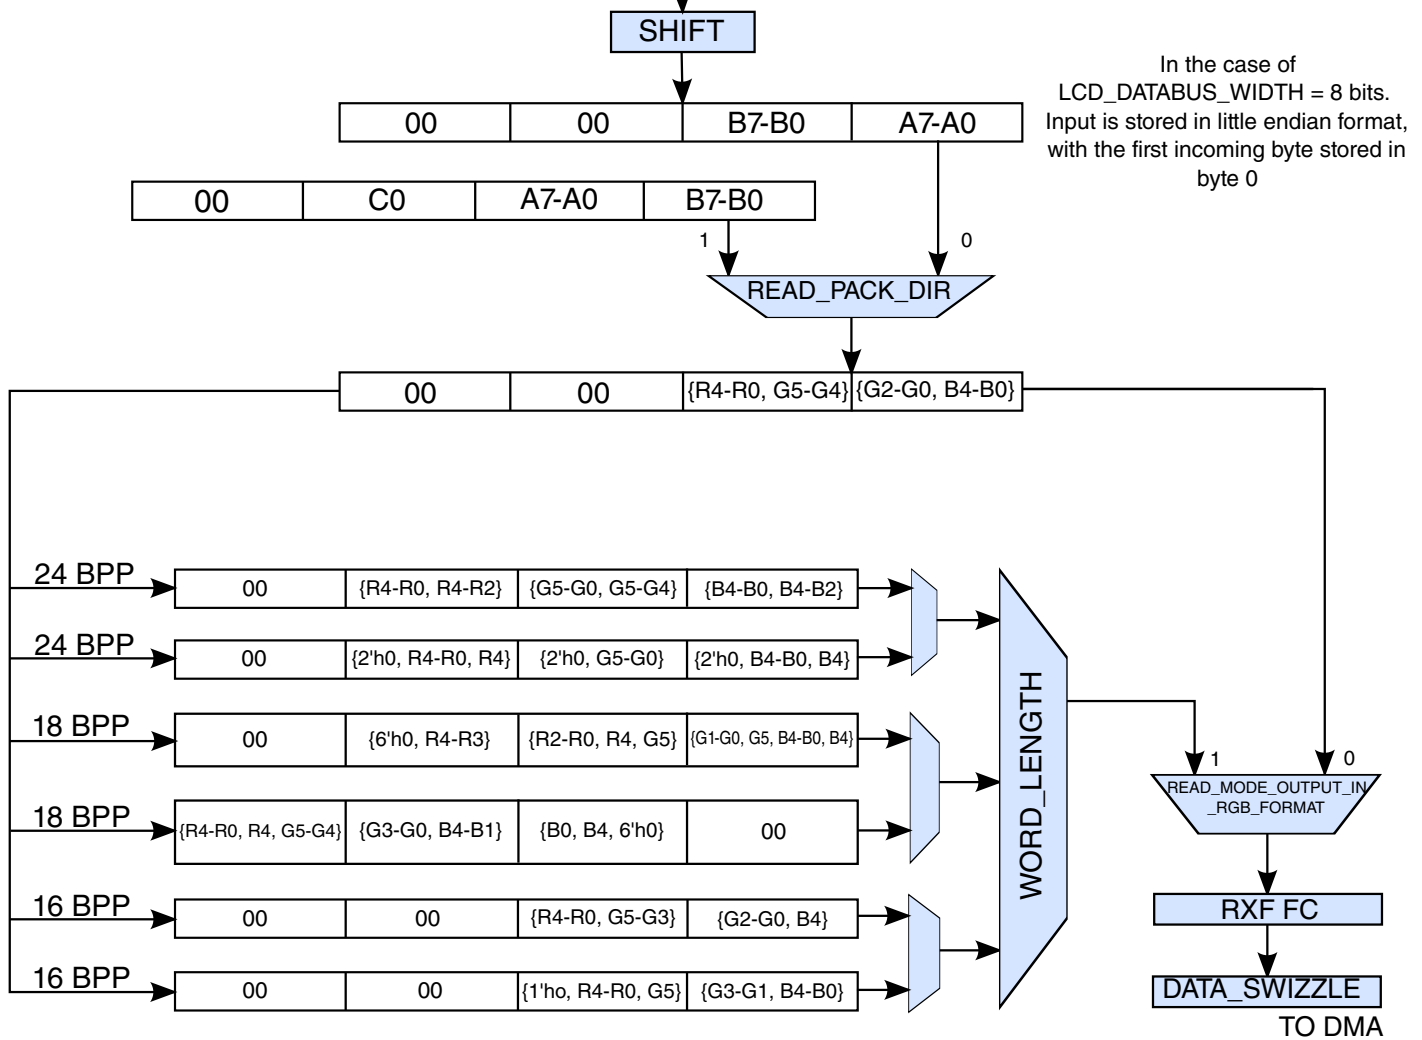

Figure 37-8. Data in MPU read mode

Functional Description

READ_MODE_NUM_PACKED_SUBWORDS = 3 AND LCD_DATABUS_WIDTH = 8 BITS
 OR
 READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 24 BITS

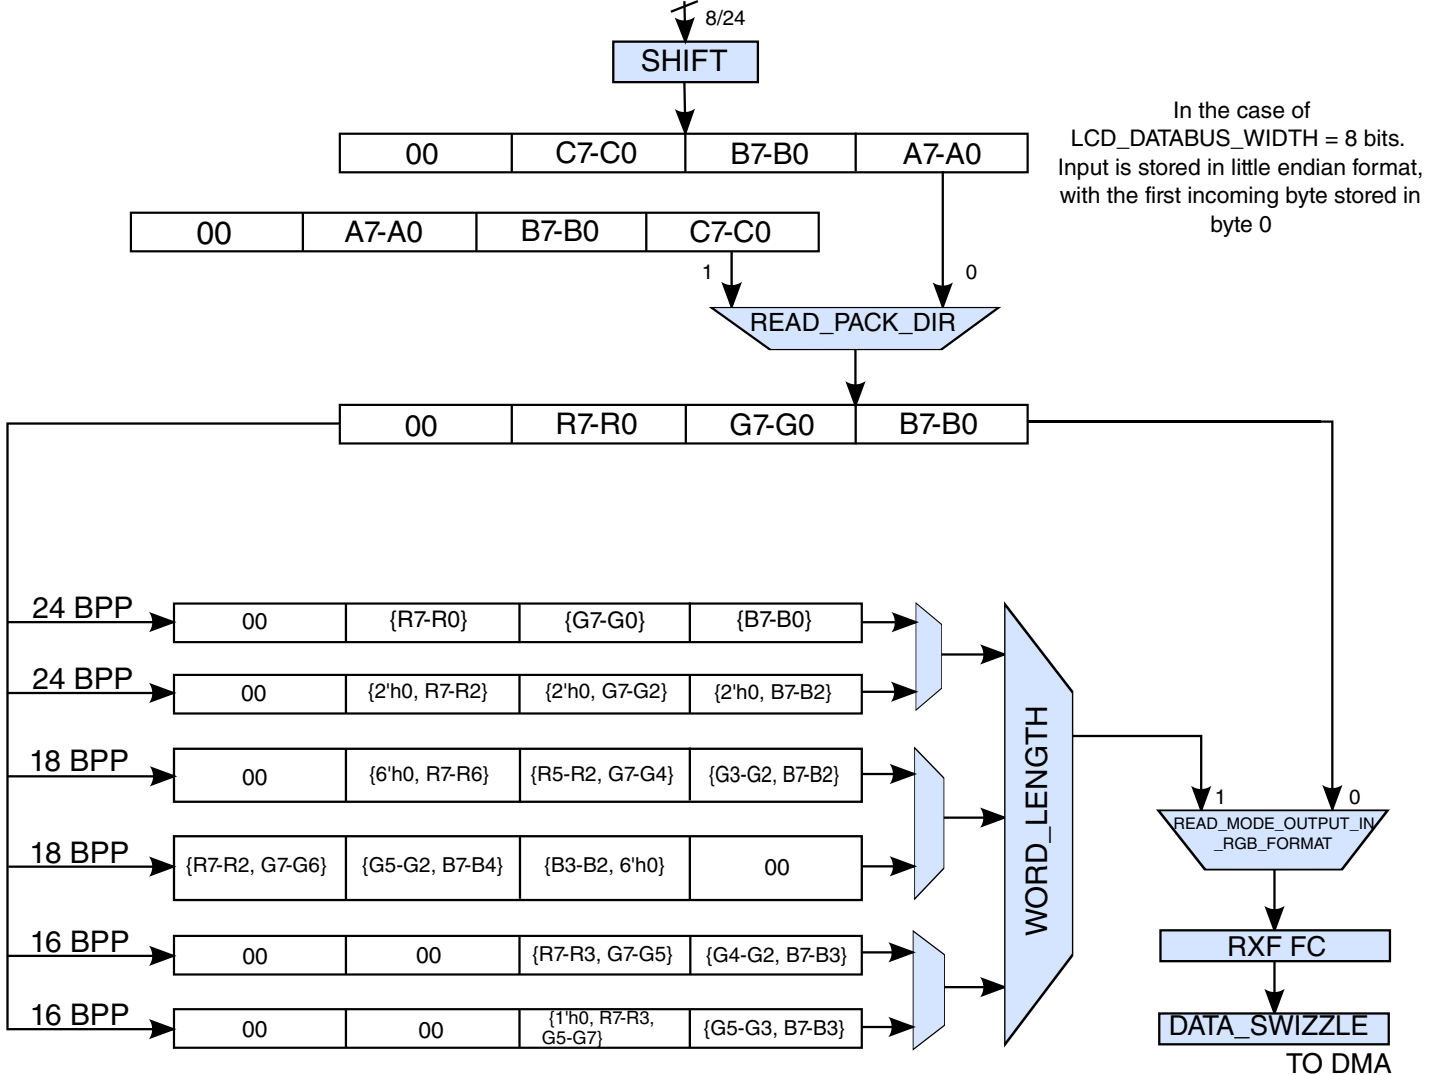

Figure 37-9. Data in MPU read mode

READ_MODE_NUM_PACKED_SUBWORDS = 1 AND LCD_DATABUS_WIDTH = 18 BITS

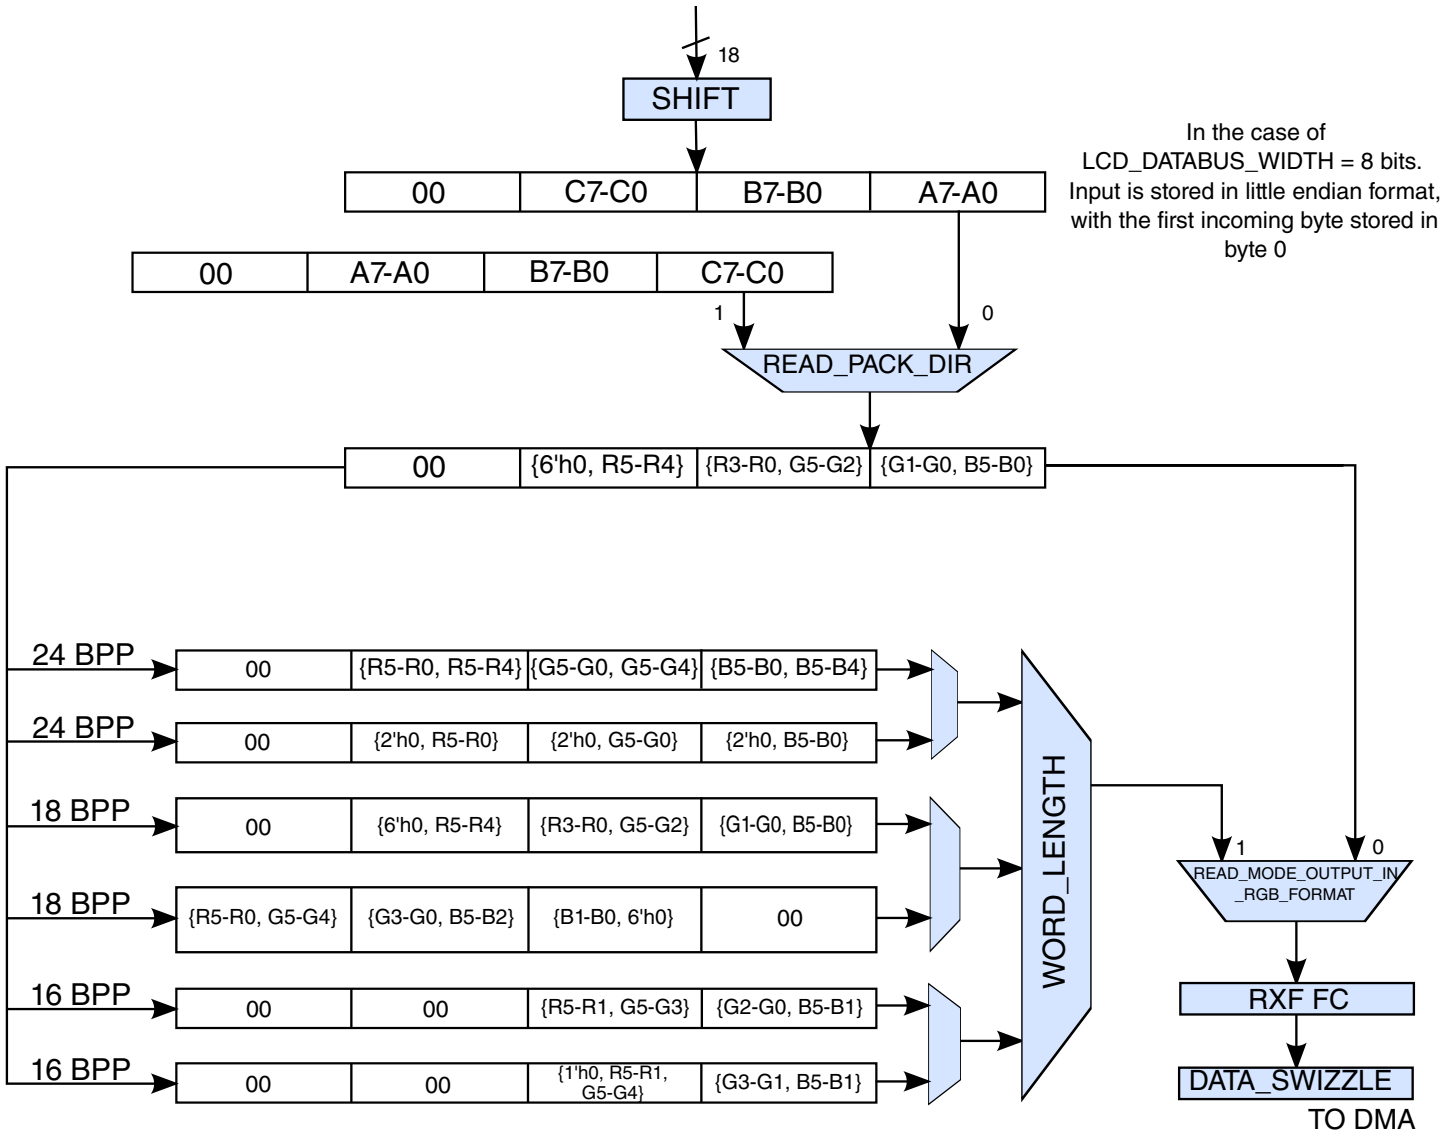

Figure 37-10. Data in MPU read mode

Restrictions:

READ_PACK_DIR should only be used if it is required to swizzle the subwords before doing RGB to RGB CSC, otherwise the DATA_SWIZZLE field should be used to swizzle across bytes.

READ_PACK_DIR must be 0 if LCD_DATABUS_WIDTH is 8 bits and READ_MODE_NUM_PACKED_SUBWORDS = 1

If READ_MODE_OUTPUT_IN_RGB_FORMAT bit is set, the following restrictions should be followed:

- If LCD_DATABUS_WIDTH = 8 bits, then
READ_MODE_NUM_PACKED_SUBWORDS <= 3.
- If LCD_DATABUS_WIDTH = 16/18/24 bits, then
READ_MODE_NUM_PACKED_SUBWORDS = 1.

37.4.4 eLCDIF Interrupts

eLCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by eLCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than its FIFOs could hold. In the read mode, it will be asserted if the RxFIFO becomes full and the block reads more data.
- VSYNC edge interrupt will be asserted every time a leading VSYNC edge occurs.
- Cur_frame_done interrupt occurs at the end of every frame in all modes except DVI. In DVI mode, if IRQ_ON_ALTERNATE_FIELDS bit is set, it will occur at the end of every frame, otherwise it will occur at the end of every field.

37.4.5 Initializing the eLCDIF

This section describes write modes and MPU read mode.

37.4.5.1 Write Modes

The following initialization steps are common to all eLCDIF write modes of operation before entering any particular mode.

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY_CLK clock and set the appropriate frequency by programming the registers in CCM.

3. Start the BUS_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and disable the clock gate bit.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller. See [Behavior During Reset](#) for more information on Reset requirements.
6. Make sure READ_WRITEB bit in HW_LCDIF_CTRL register is 0.
7. Select the transfer mode of operation. The LCDIF_MASTER bit in HW_LCDIF_CTRL register determines the transfer mode selected. Bus master (LCDIF_MASTER =1) or PIO (LCDIF_MASTER =0) mode are the transfer modes to select.
8. Set the INPUT_DATA_SWIZZLE according to the endianness of the LCD controller. Also, set the DATA_SHIFT_DIR and SHIFT_NUM_BITS if it is required to shift the data left or right before it is output.
9. Set the WORD_LENGTH field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in HW_LCDIF_CTRL register.
10. Set the BYTE_PACKING_FORMAT field in HW_LCDIF_CTRL1 according to the input frame.
11. Set the LCD_DATABUS_WIDTH appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
12. Enable the necessary IRQs.

37.4.5.2 MPU Read Mode

The following initialization steps should be done to enter the MPU read mode of operation:

Initialization steps:

1. Configure the external I/Os to correctly interface the external display.
2. Start the DISPLAY_CLK and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS_CLK and set the appropriate frequency by programming the registers in CCM.
4. Bring the eLCDIF out of soft reset and clock gate.
5. Reset the LCD controller by setting LCDIF_CTRL1_RESET bit appropriately, being careful to observe the reset requirements of the controller.
6. Set the READ_WRITEB bit in LCDIF_CTRL register to 1.
7. Set the LCDIF_MASTER bit in LCDIF_CTRL register to 0. Bus master mode is not supported for reading data from the display.

8. Also, set the `DATA_SHIFT_DIR` and `SHIFT_NUM_BITS` if it is required to shift the data left or right before it is output.
9. Indicate if the read data needs to be color-space-converted and stored in a different RGB format by setting the `READ_MODE_OUTPUT_IN_RGB_FORMAT` field accordingly.
10. Set the `WORD_LENGTH` field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24-bit input if `READ_MODE_OUTPUT_IN_RGB_FORMAT` is required. Also, select the correct 16/18/24 bit data format with the corresponding fields in `LCDIF_CTRL` register.
11. Set the `READ_MODE_NUM_PACKED_SUBWORDS` field in `LCDIF_CTRL2` according to the number of subwords per word required to be packed.
12. Set the `READ_PACK_DIR` to 1 if it is required to store the data in big-endian format.
13. Set the `LCD_DATABUS_WIDTH` appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24-bit output.
14. Enable the necessary IRQs.

37.4.6 MPU Interface

The MPU interface is used to transfer data and commands between the SoC via the eLCDIF and the external display at modest data rates.

Bus master or PIO transactions using the `LCDIF_DATA` register can be used for MPU mode write operations. For MPU mode read operations, only PIO can be used. eLCDIF can support the 6800 as well as the 8080 MPU protocol. If `DOTCLK_MODE`, `DVI_MODE` and `VSYNC_MODE` bits in `LCDIF_CTRL` registers are 0, it implies that the block is in MPU interface mode of operation. The LCDIF MPU mode has four basic timing parameters: Setup and Hold for the Command/Data register selection (TCS, TCH) and Setup and Hold for the Data bus (TDS, TDH). These parameters are expressed in `DISPLAY_CLK` cycles. The `LCD_WR` signal is used as the write strobe while `LCD_RS` signal is typically used to switch between command and data modes.

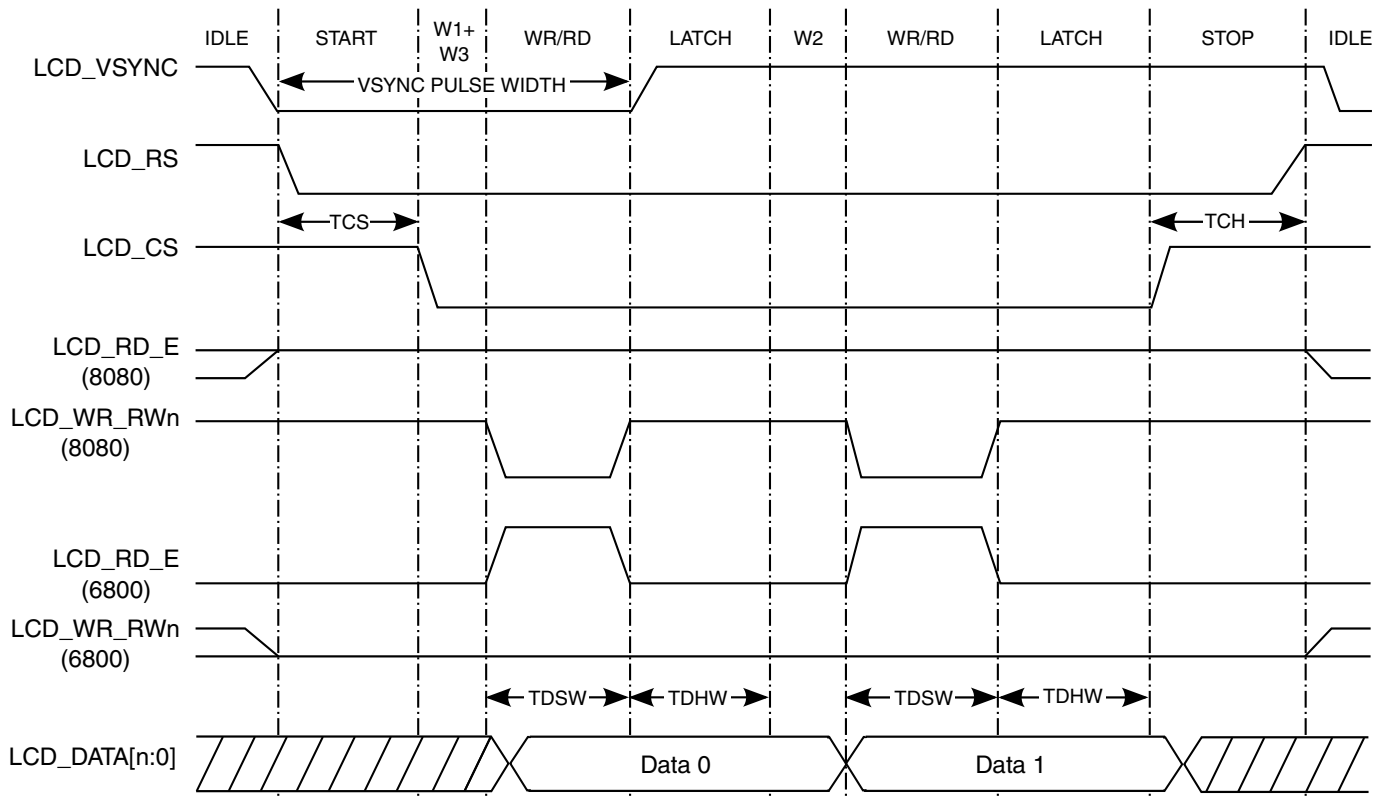

Figure 37-11. Timing in write mode of 6800 and 8080 protocols

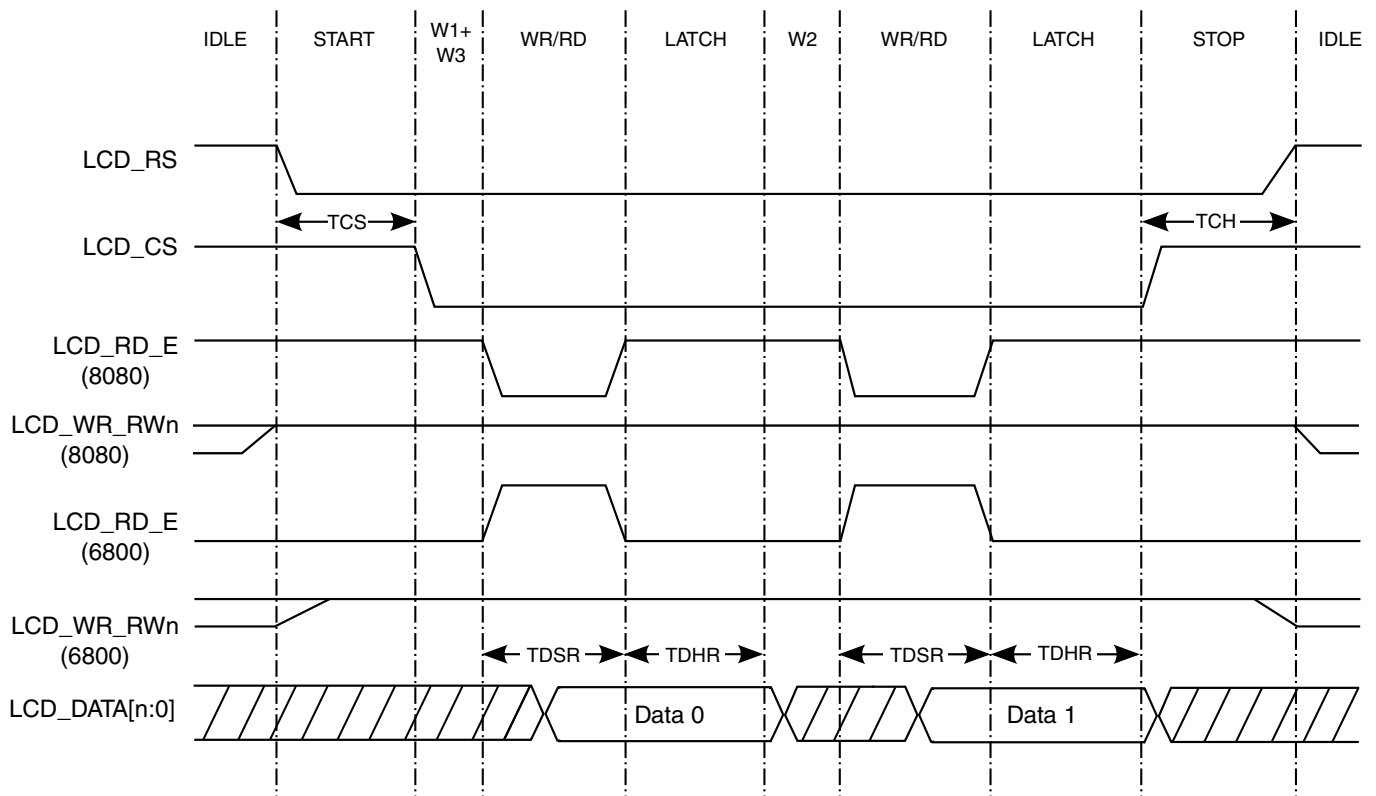

Figure 37-12. Read timing interface in 6800 and 8080 protocols

Functional Description

The eLCDIF has flexible pin and strobe timings which enable it to optimally support a wide range of LCDs. The minimum cycle time is two DISPLAY_CLK cycles (TDS=TDH=1). For example, this results in a maximum LCD data rate of 12 MB/s when DISPLAY_CLK is 24 MHz. TDS and TDH are 8-bit values, so the minimum eLCDIF period is 510 DISPLAY_CLK cycles (47 KHz with a 24 MHz DISPLAY_CLK). The timings are not automatically adjusted if the DISPLAY_CLK frequency changes, so it may be necessary to adjust the timings if DISPLAY_CLK changes.

In the MPU interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

37.4.6.1 Code Example to Initialize the eLCDIF in MPU Write Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1(LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that the
// idle state for LCD_RS signal is high, regardless of the
// programming of the DATA_SELECT register.
BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, READ_WRITEB, 0);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 1); //Only if LCD controller implements a busy line
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
based
// on DISPLAY_CLK frequency and timing requirements of
controller.
// Note that these register must be non-zero for correct
operation.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master PIO write transactions using the LCDIF_DATA register. Note that when using the PIO write operations to the LCDIF_DATA register, the software will need to poll the FIFO STATUS bits to ensure that it does not overflow the eLCDIF data buffers. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

37.4.7 VSYNC Interface

The VSYNC interface uses the same protocol as the MPU interface, with an additional signal VSYNC at the frame rate of the display, as shown in the figure given in MPU Interface section.

It is used in the moving picture display mode where data has to be written to the internal LCD buffer at a speed higher than the display rate and displayed in synchronization with the VSYNC signal. This mode is selected by setting the VSYNC_MODE bit in LCDIF_CTRL register. The VSYNC signal is programmable for period, polarity and direction. Many other programmable parameters are shared with the MPU interface. The VSYNC_OEB bit in LCDIF_VDCTRL0 register indicates whether the display controller will send the VSYNC signal, or whether it should be generated by eLCDIF. The timing of the VSYNC signal is based on the DISPLAY_CLK (make sure VSYNC_PULSE_WIDTH_UNIT = VSYNC_PERIOD_UNIT = 0 and VSYNC_ONLY = 1) and it is determined by the VSYNC_PERIOD, VSYNC_PULSE_WIDTH and VSYNC_POL fields in LCDIF_VDCTRL0-4 registers. The SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set if the target requires the VSYNC signal to be generated by eLCDIF. If the WAIT_FOR_VSYNC_EDGE bit in LCDIF_CTRL register is set, it indicates that the hardware should wait until it sees the leading VSYNC edge before starting the data transfer. The VERTICAL_WAIT_CNT indicates the number of DISPLAY_CLK cycles from the leading VSYNC edge after which data transfer will be started on the interface.

In the VSYNC interface mode, the LCDIF_CTRL_BYPASS_COUNT bit must be 0. The RUN bit is cleared automatically once the eLCDIF has received/transmitted all the data as per the LCDIF_TRANSFER_COUNT register and has completed the transfer to the panel. The current transfer can be cancelled/aborted if the RUN bit is manually made 0.

37.4.7.1 Code Example to Initialize eLCDIF in VSYNC Mode

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DATA_SELECT, 1); // 0 if sending command, 1 if sending data. Note that
//the idle state for LCD_RS signal is high, regardless of the programming of the DATA_SELECT
//register.

BF_CS1 (LCDIF_CTRL, MODE86, 8080_MODE);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 0); //Must be 0 in MPU mode
BF_CS1 (LCDIF_CTRL1, BUSY_ENABLE, 0);
BF_CS4 (LCDIF_TIMING, CMD_HOLD, 2, CMD_SETUP, 2, DATA_HOLD, 2, DATA_SETUP, 2); //Values
//based on DISPLAY_CLK frequency and timing requirements of controller. Note that these
//register must be non-zero for the MPU and VSYNC modes.
BF_CS2 (LCDIF_TRANSFER_COUNT, H_COUNT, 320, V_COUNT, 240); //For a 320 RGB x 240 display
//The following section indicates setting up the VSYNC signal timing when VSYNC is an output
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Making VSYNC signal an output
BF_CS1 (LCDIF_VDCTRL4, VSYNC_ONLY, 1); //Only need to generate VSYNC signal
BF_CS1 (VDCTRL0, VSYNC_POL, 0); //Setting the polarity of VSYNC signal to be low during
//VSYNC_PULSE_WIDTH time
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 0, VSYNC_PULSE_WIDTH_UNIT, 0);
BF_CS2 (LCDIF_VDCTRL1, VSYNC_PERIOD, 400000, VSYNC_PULSE_WIDTH, 100); //Frame display rate in
//terms of number of DISPLAY_CLKs.
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 0, HSYNC_PERIOD, 0);
BF_CS1 (LCDIF_VDCTRL3, VERTICAL_WAIT_CNT, 50);
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
```

Functional Description

```
BF_CS2 (LCDIF_CTRL, VSYNC_MODE, 1, WAIT_FOR_VSYNC_EDGE, 1); //set WAIT_FOR_VSYNC_EDGE if
//software wishes to transfer the next frame after the VSYNC edge occurs.
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

The eLCDIF is now ready to receive data via bus master requests or PIO writes to the LCDIF_DATA register. When eLCDIF is done transmitting H_COUNT x V_COUNT pixels, it will stop, turn off the RUN bit and assert the cur_frame_done interrupt.

37.4.8 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

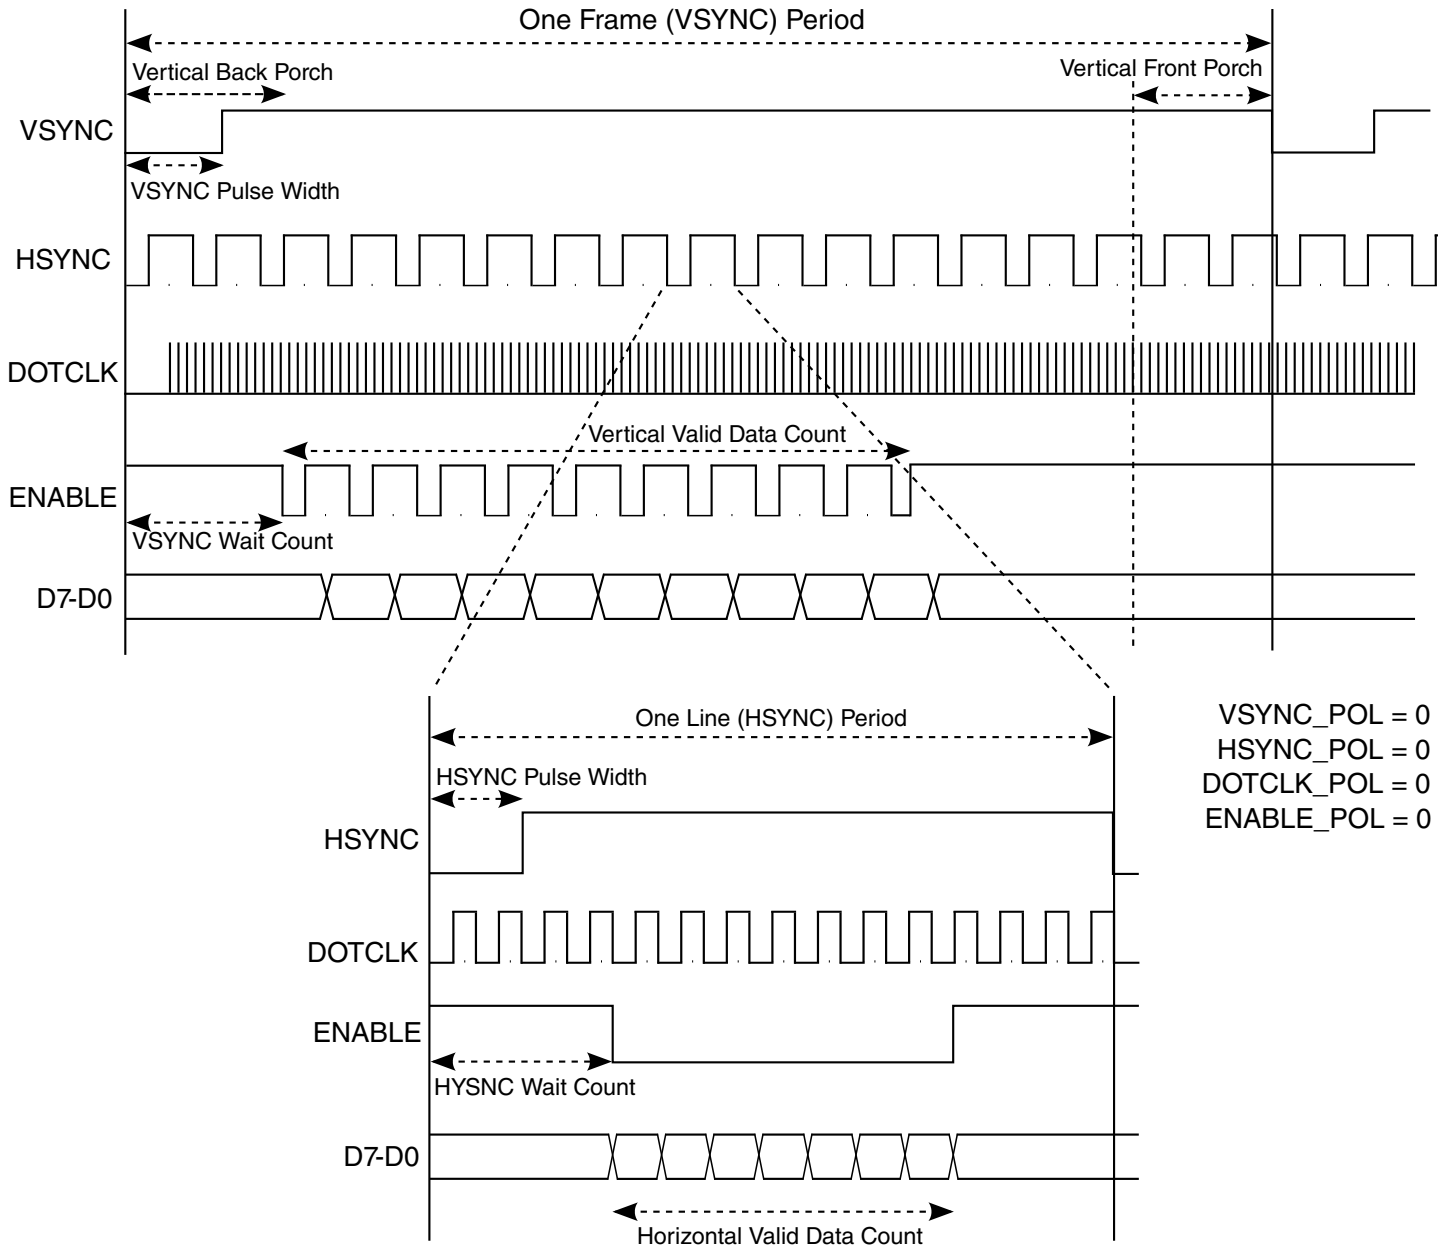

Figure 37-13. DOTCLK protocol with programmable parameters

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC_PULSE_WIDTH_UNIT and VSYNC_PERIOD_UNIT bit fields. The VERTICAL_WAIT_CNT is by default given the same unit as the VSYNC_PERIOD. The DISPLAY_CLK frequency is managed by the CCM.

In DOTCLK mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur_frame_done interrupt.

37.4.8.1 Code Example

The following code shows an example for programming a 320x240 display. Note that setting up the display must be done through the MPU mode or via SPI.

```
// Note: Common initialization steps in Initializing the eLCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
// LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320); //Note that DOTCLK_V_VALID_DATA_CNT is
//implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

37.4.9 CSI HANDSHAKE INTERFACE

The LCDIF and CSI support a pipeline mode to use double buffers inside OGRAM for the video pass through from CSI to LCDIF, the pipeline buffer size can be 8 line or 16 line as configurable. The pipeline will be handle by hardware handshake signals between CSI and LCDIF. The LCDIF will have the capability to synchronize display with CSI based on the VSYNC signal from CSI. When LCDIF is enabled to start display, it can optionally wait for the VSYNC edge from CSI before it starts the display for next frame, The delay from VSYNC input to the start of next frame is programmable by LCDIF_SYNC_DELAY register.

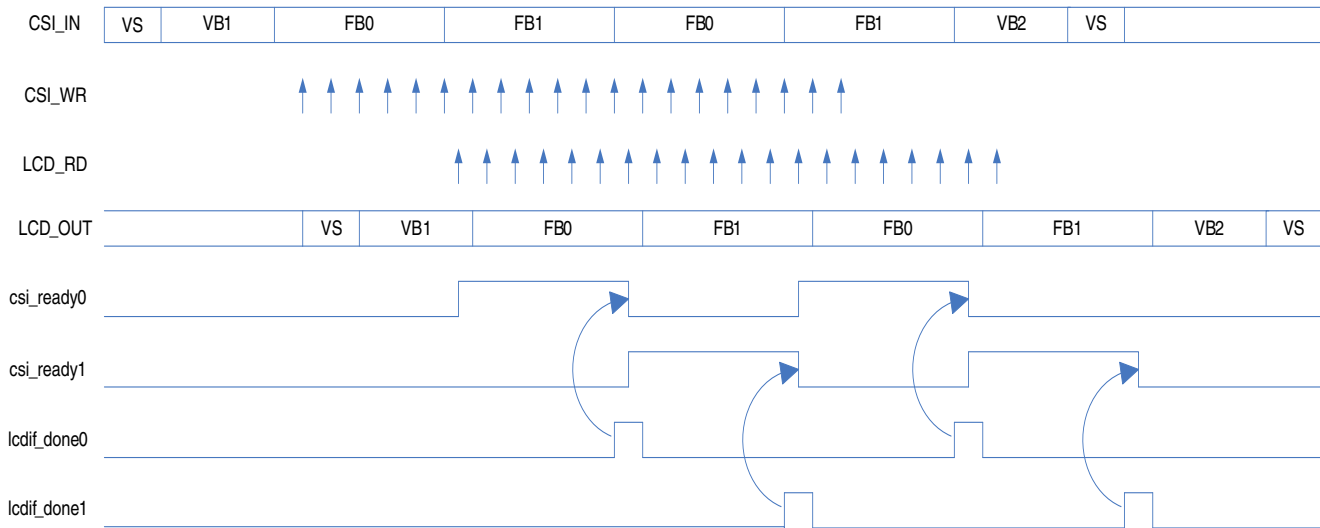

Figure 37-14. CSI HandShake Interface

When this mode is enabled, the hardware handshake protocol will process. At the start of CSI with camera input, the CSI will put the input data to one frame buffer. When the frame buffer is ready for LCDIF display, CSI will assert `csi_ready` signal to indicate LCDIF to read the buffer and LCDIF will display data in this buffer. When one frame buffer reading finished, LCDIF will set the `lcdif_done` signal to indicate CSI this buffer has been displayed and can be written again. With this double buffer handshake mode, the LCDIF can display the video input within very short delay and minimize DRAM bandwidth.

37.4.10 Alpha Blending Interface

The LCDIF has the capability to add an extra overlay on the normal display buffer. LCDIF can fetch data from two buffers and combine them before display, one buffer data can have the alpha value with the RGB pixels. With `LCDIF_AS_CTRL[AS_ENABLE]` is set, the LCDIF will start fetching alpha surface buffer data in bus master mode and combine it with another buffer.

The `LCDIF_AS_CTRL[ALPHA_CTRL]` bits determine how the alpha value is constructed for the alpha surface and alpha blending process is as same as in PXP block, for the alpha blend and color key process refer to the PXP block descriptions.

37.4.11 ITU-R BT.656 Digital Video Interface (DVI)

ITU-R BT.656 Digital Video Interface shown below transmits 4:2:2 YCbCr digital component video to a digital video encoder that can translate it into 525/60 or 625/50 analog TV signal.

Unique timing codes (timing reference signals) are embedded within the video stream to indicate the different timing events that would have been otherwise indicated by VSYNC, HSYNC and BLANK signals. The hardware supports 8-bit data transfers; the pins are shared with the lower 8 bits of LCD data bus. The LCD_RS pin is shared with the clock signal of the interface (called CCIRCLK here for uniqueness). CCIRCLK also can be obtained on the LCD_DOTCK pin. The mode shares the write FIFO with the LCD interface and the associated pipeline. The programmable parameters in registers LCDIF_DVICTRL0-3 allow setting the total number of horizontal lines per frame, vertical and horizontal blanking interval, odd and even field start and end positions, and so on. In short, these parameters are provided to ensure that the hardware has enough flexibility to generate the right 525/60 or 625/50 data streams. Most of the initialization steps in [Initializing the eLCDIF](#) such as data shifting, swizzle, and so on, are applicable to DVI mode also. The register descriptions in the programmable registers section at the end of this chapter include example code for programming the DVICTRL0-3 registers.

In DVI mode, LCDIF_CTRL_BYPASS_COUNT bit must be set to 1. To end the current transfer, the software should make the DVI_MODE bit the value 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and assert the cur_frame_done interrupt.

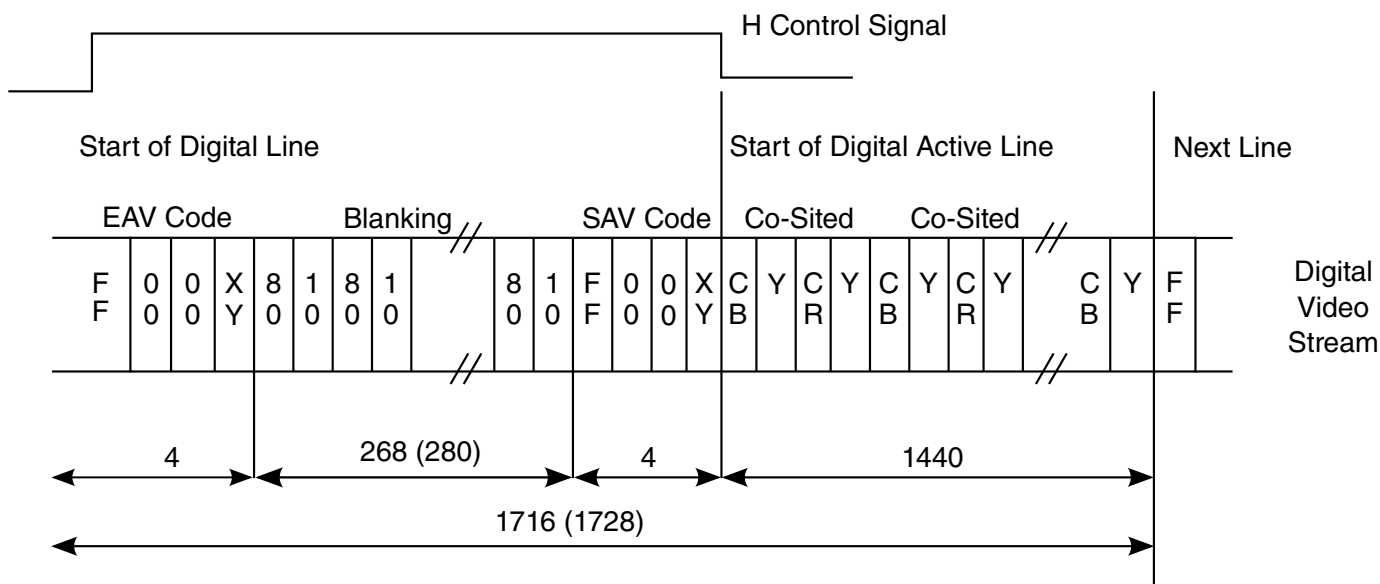

Figure 37-15. Digital Video Interface

37.4.12 eLCDIF Pin Usage by Interface Mode

Table 37-3 and Table 37-4 indicates how the eLCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired eLCDIF operating mode.

The VSYNC signal has been mapped onto two pins, LCD_BUSY and LCD_VSYNC. The pin multiplexing can be programmed to select either of those pins to function as VSYN.

NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX_SYNC_SIGNALS bit in the VDCTRL0 register. There is also an option to internally mux the LCD_WR_RWn and LCD_RD_E pins in the CTRL1 register for backward compatibility.

Table 37-3. Pin use in MPU Mode and VSYNC Mode

PIN NAME	8-bit MPU LCD IF	16-bit MPU LCD IF	18-bit MPU LCD IF	24-bit MPU LCD IF	8-bit VSYNC LCD IF	16-bit VSYNC LCD IF	18-bit VSYNC LCD IF	24-bit VSYNC LCD IF

37.5 Behavior During Reset

BUS_CLK and DISPLAY_CLK must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

37.6 ELCDIF Memory Map/Register Definition

eLCDIF Hardware Register Format Summary

LCDIF memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
222_0000	eLCDIF General Control Register (LCDIF1_RL)	32	R/W	C000_0000h	37.6.1/2433
222_0004	eLCDIF General Control Register (LCDIF1_RL_SET)	32	R/W	C000_0000h	37.6.1/2433
222_0008	eLCDIF General Control Register (LCDIF1_RL_CLR)	32	R/W	C000_0000h	37.6.1/2433
222_000C	eLCDIF General Control Register (LCDIF1_RL_TOG)	32	R/W	C000_0000h	37.6.1/2433
222_0010	eLCDIF General Control1 Register (LCDIF1_CTRL1)	32	R/W	000F_0000h	37.6.2/2436
222_0014	eLCDIF General Control1 Register (LCDIF1_CTRL1_SET)	32	R/W	000F_0000h	37.6.2/2436
222_0018	eLCDIF General Control1 Register (LCDIF1_CTRL1_CLR)	32	R/W	000F_0000h	37.6.2/2436
222_001C	eLCDIF General Control1 Register (LCDIF1_CTRL1_TOG)	32	R/W	000F_0000h	37.6.2/2436
222_0020	eLCDIF General Control2 Register (LCDIF1_CTRL2)	32	R/W	0020_0000h	37.6.3/2438
222_0024	eLCDIF General Control2 Register (LCDIF1_CTRL2_SET)	32	R/W	0020_0000h	37.6.3/2438
222_0028	eLCDIF General Control2 Register (LCDIF1_CTRL2_CLR)	32	R/W	0020_0000h	37.6.3/2438
222_002C	eLCDIF General Control2 Register (LCDIF1_CTRL2_TOG)	32	R/W	0020_0000h	37.6.3/2438
222_0030	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIF1_TRANSFER_COUNT)	32	R/W	0001_0000h	37.6.4/2441
222_0040	LCD Interface Current Buffer Address Register (LCDIF1_CUR_BUF)	32	R/W	0000_0000h	37.6.5/2441
222_0050	LCD Interface Next Buffer Address Register (LCDIF1_NEXT_BUF)	32	R/W	0000_0000h	37.6.6/2442
222_0060	LCD Interface Timing Register (LCDIF1_TIMING)	32	R/W	0000_0000h	37.6.7/2442
222_0070	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF1_VDCTRL0)	32	R/W	0000_0000h	37.6.8/2443

Table continues on the next page...

LCDIF memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
222_0074	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF1_VDCTRL0_SET)	32	R/W	0000_0000h	37.6.8/2443
222_0078	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF1_VDCTRL0_CLR)	32	R/W	0000_0000h	37.6.8/2443
222_007C	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF1_VDCTRL0_TOG)	32	R/W	0000_0000h	37.6.8/2443

37.6.1 eLCDIF General Control Register (LCDIFx_RLn)

The LCD Interface Control Register provides overall control of the eLCDIF block. The eLCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: Base address + 0h offset + (4d × i), where i=0d to 3d

LCDIFx_RLn field descriptions

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the eLCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 YBCR422_INPUT	Zero implies input data is in RGB color space. One implies input data is in YCbCr 4:2:2 format, such that YCbCr are packed in a 32-bit word. It also means that there are 2 pixels in 4 bytes. If this bit is set, software should program the H_COUNT field in the TRANSFER_COUNT register to the total number of pixels that will have to be fetched by the eLCDIF block per line and the BYTE_PACKING_FORMAT should be 0xF. The WORD_LENGTH does not matter in this case.

Table continues on the next page...

LCDIFx_RL_n field descriptions (continued)

Field	Description
28 READ_WRITEB	By default, eLCDIF is in the write mode. Setting this bit to 1 will make the hardware go into 6800/8080 MPU read mode. The LCDIF_MASTER bit must be 0, since bus master mode can only be used for writing the display.
27 WAIT_FOR_VSYNC_EDGE	Setting this bit to 1 will make the hardware wait for the triggering VSYNC edge before starting write transfers to the LCD. Used only in the VSYNC mode of operation.
26 DATA_SHIFT_DIR	Use this bit to determine the direction of shift of transmit data. In the DVI mode, it works only on the active data, not on the timing codes and ancillary data. 0x0 TXDATA_SHIFT_LEFT — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 TXDATA_SHIFT_RIGHT — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_BITS	The data to be transmitted is shifted left or right by this number of bits.
20 DVI_MODE	Set this bit to 1 to get into the ITU-R BT.656 digital video interface mode. Toggle this bit from 1 to 0 to make the hardware go out of DVI mode after completing all data transfer and after the RUN bit has been deasserted.
19 BYPASS_COUNT	When this bit is 0, it means that eLCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 VSYNC_MODE	Setting this bit to 1 will make the eLCDIF hardware go into VSYNC mode. WAIT_FOR_VSYNC_EDGE can be used only if this bit is set. If VSYNC signal is required to be an output from the block, SYNC_SIGNALS_ON bit in LCDIF_VDCTRL4 register must be set.
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 DATA_SELECT	Command Mode polarity bit. This bit should only be changed when RUN is 0. 0x0 CMD_MODE — Command Mode. DC _n signal is Low. 0x1 DATA_MODE — Data Mode. DC _n signal is High.
15–14 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian) 0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
13–12 CSC_DATA_SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 NO_SWAP — No byte swapping.(Little endian)

Table continues on the next page...

LCDIFx_RL_n field descriptions (continued)

Field	Description
	0x0 LITTLE_ENDIAN — Little Endian byte ordering (same as NO_SWAP). 0x1 BIG_ENDIAN_SWAP — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 SWAP_ALL_BYTES — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 HWD_SWAP — Swap half-words. 0x3 HWD_BYTE_SWAP — Swap bytes within each half-word.
11–10 LCD_DATABUS_ WIDTH	LCD Data bus transfer width. 0x0 16_BIT — 16-bit data bus mode. 0x1 8_BIT — 8-bit data bus mode. 0x2 18_BIT — 18-bit data bus mode. 0x3 24_BIT — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 16_BIT — Input data is 16 bits per pixel. 0x1 8_BIT — Input data is 8 bits wide. 0x2 18_BIT — Input data is 18 bits per pixel. 0x3 24_BIT — Input data is 24 bits per pixel.
7 RGB_TO_ YCBCR422_CSC	Set this bit to 1 to enable conversion from RGB to YCbCr colorspace. See the LCDIF_CSC_ registers for further details.
6 ENABLE_PXP_ HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the eLCDIF will act as bus master and the handshake mechanism between eLCDIF and ePXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the eLCDIF act as a bus master. If this bit is reset, the eLCDIF will support or PIO mode.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_ FORMAT_16_ BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_ FORMAT_18_ BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 LOWER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 UPPER_18_BITS_VALID — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_ FORMAT_24_ BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 ALL_24_BITS_VALID — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 DROP_UPPER_2_BITS_PER_BYTE — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the eLCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

37.6.2 eLCDIF General Control1 Register (LCDIFx_CTRL1n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control1 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: Base address + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_CTRL1n field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits. Write as 0.
27 COMBINE_MPU_WR_STRB	If this bit is not set, the write strobe will be driven on LCD_WR_RWn pin in the 8080 mode and on the LCD_RD_E pin in the 6800 mode. If it is set, the write strobe of both the 6800 and 8080 modes will be driven only on the LCD_WR_RWn pin. Note that this does not work for read strobe.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the eLCDIF master mode.
25 BM_ERROR_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the eLCDIF is in master mode and an error response was returned by the slave.

Table continues on the next page...

LCDIFx_CTRL1n field descriptions (continued)

Field	Description
	0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the eLCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the eLCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the eLCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set. This feature is only available in DOTCLK and DVI modes.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have to be transmitted). When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of pixels that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. (Note - YCBCR422_INPUT = 1 implies 2 pixels per 32 bits).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
10 UNDERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.

Table continues on the next page...

LCDIFx_CTRL1n field descriptions (continued)

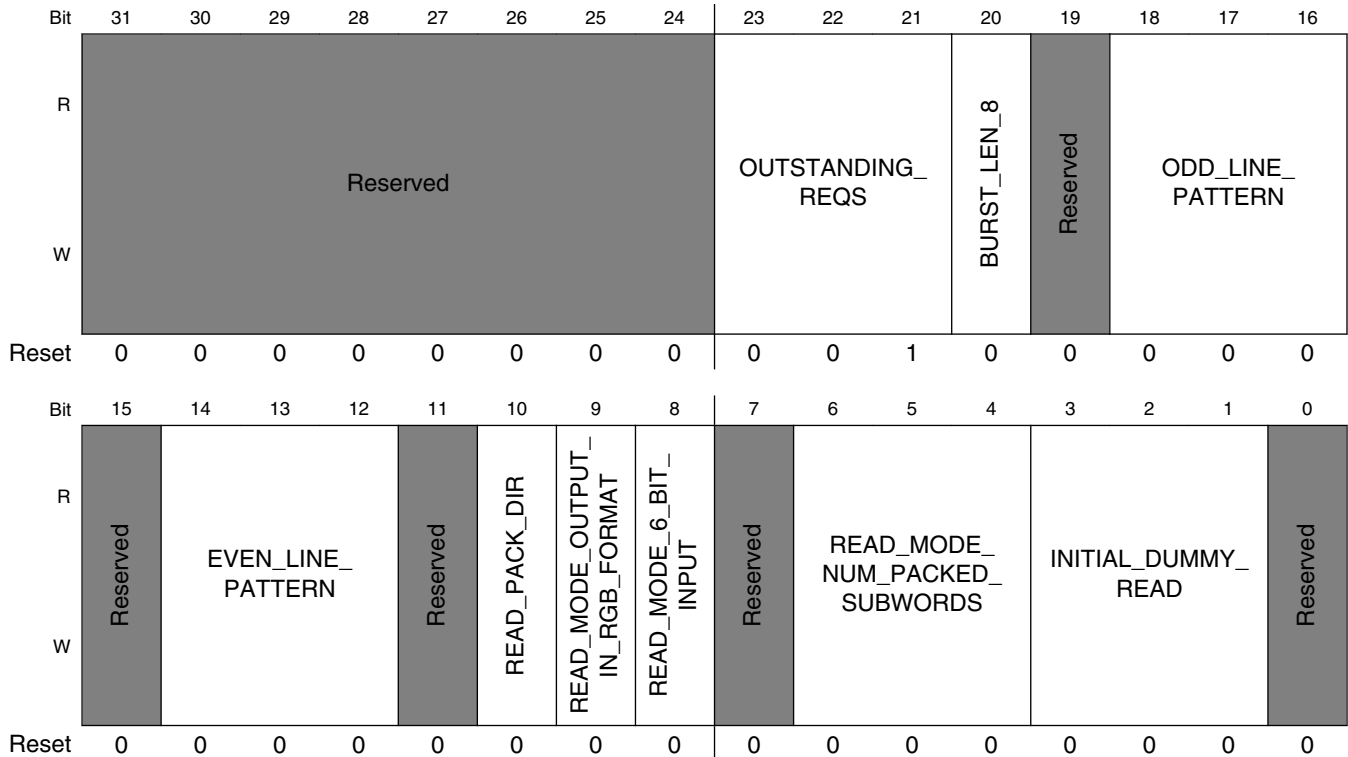

Field	Description
	0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
9 CUR_FRAME_DONE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
8 VSYNC_EDGE_IRQ	This bit is set to indicate that an interrupt is requested by the eLCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field. 0x0 NO_REQUEST — No Interrupt Request Pending. 0x1 REQUEST — Interrupt Request Pending.
7–3 RSRVD0	This field is reserved. Reserved bits. Write as 0.
2 BUSY_ENABLE	This bit enables the use of the interface's busy signal input. This should be enabled for LCD controllers that implement a busy line (to stall the eLCDIF from sending more data until ready). Otherwise this bit should be cleared. 0x0 BUSY_DISABLED — The busy signal from the LCD controller will be ignored. 0x1 BUSY_ENABLED — Enable the use of the busy signal from the LCD controller.
1 MODE86	This bit is used to select between the 8080 and 6800 series of microprocessor modes. This bit should only be changed when RUN is 0. 0x0 8080_MODE — Pins LCD_WR_RWn and LCD_RD_E function as active low WR and active low RD signals respectively. 0x1 6800_MODE — Pins LCD_WR_RWn and LCD_RD_E function as Read/Write and active high Enable signals respectively.
0 RESET	Reset bit for the external LCD controller. This bit can be changed at any time. It CANNOT be reset by SFTRST. 0x0 LCDRESET_LOW — LCD_RESET output signal is low. 0x1 LCDRESET_HIGH — LCD_RESET output signal is high.

37.6.3 eLCDIF General Control2 Register (LCDIFx_CTRL2n)

The eLCDIF Control Register provides overall control of the eLCDIF block.

The eLCDIF Control2 Register provides additional programming to the eLCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: Base address + 20h offset + (4d × i), where i=0d to 3d

LCDIFx_CTRL2n field descriptions

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_ REQS	This bitfield indicates the maximum number of outstanding transactions that eLCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions. 0x0 REQ_1 — 0x1 REQ_2 — 0x2 REQ_4 — 0x3 REQ_8 — 0x4 REQ_16 —
20 BURST_LEN_8	By default, when the eLCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB —

Table continues on the next page...

LCDIFx_CTRL2n field descriptions (continued)

Field	Description
	0x4 BRG — 0x5 BGR —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_ PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,...). This bitfield must be 0 in DVI mode. 0x0 RGB — 0x1 RBG — 0x2 GBR — 0x3 GRB — 0x4 BRG — 0x5 BGR —
11 RSRVD2	This field is reserved. Reserved bits. Write as 0.
10 READ_PACK_DIR	The default value of 0 indicates data is stored in the little endian format. When LCD_DATABUS_WIDTH is 8-bit, this bit provides the option of rearranging the data byte-wise in the big endian format. For example, if READ_MODE_NUM_PACKED_SUBWORDS = 3 and the order of incoming data is 0x11, 0x22 and 0x33, then setting this bit to 1 will cause the data to be stored as 0x00112233 as opposed to the default 0x00332211. This operation occurs after the shifting operation done by SHIFT_NUM_BITS bitfield.
9 READ_MODE_ OUTPUT_IN_ RGB_FORMAT	Setting this bit will enable the eLCDIF to convert the incoming data to the RGB format given by WORD_LENGTH bitfield. This feature is not available when WORD_LENGTH is set to 8 bits. eLCDIF performs this operation of converting to RGB format after the endianness has been determined by the READ_PACK_DIR bitfield.
8 READ_MODE_6_ BIT_INPUT	Setting this bit to 1 indicates to eLCDIF that even though LCD_DATABUS_WIDTH is set to 8 bits, the input data is actually only 6 bits wide and exists on D5-D0.
7 RSRVD1	This field is reserved. Reserved bits. Write as 0.
6–4 READ_MODE_ NUM_PACKED_ SUBWORDS	Indicates the number of valid 8/16/18/24-bit subwords that will be packed into the 32-bit word in read mode. The subword size (8, 16, 18 or 24 bits) is determined by the LCD_DATABUS_WIDTH field. The swizzle operation is performed after READ_MODE_NUM_PACKED_SUBWORDS number of subwords has been received and stored in little-endian format. For example, if LCD_DATABUS_WIDTH is set to 8-bit and data to be read back has to be stored in memory in 24-bit unpacked RGB format, set READ_MODE_NUM_PACKED_SUBWORDS to 0x3 so that each 32-bit word will contain only 3 valid bytes (RGB). Maximum value of READ_MODE_NUM_PACKED_SUBWORDS is 4 for 8-bit databus, 2 for 16-bit databus and 1 for 18/24-bit databus.
3–1 INITIAL_DUMMY_ READ	The value in this field determines the number of dummy 8/16/18/24-bit subwords that have to be read back from the LCD panel/controller. They will then not be stored in the read FIFO.
0 RSRVD0	This field is reserved. Reserved bits. Write as 0.

37.6.4 eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIFx_TRANSFER_COUNT)

This register tells the eLCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V_COUNT and H_COUNT fields. The word size is specified by the WORD_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V_COUNT and H_COUNT should be non-zero.

Address: Base address + 30h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_TRANSFER_COUNT field descriptions

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame. In DVI mode, V_COUNT should be the number of active horizontal lines per frame, and not per field.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. When input data is in YCbCr 4:2:2 format (YCBCR422_INPUT is 1), H_COUNT should be the number of 32-bit words that should be fetched by the block and the BYTE_PACKING_FORMAT should be 0xF. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

37.6.5 LCD Interface Current Buffer Address Register (LCDIFx_CUR_BUF)

This register indicates the address of the current frame being transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur_frame_done interrupt for software to take action. The block will also copy the LCDIF_NEXT_BUF_ADDR into this bitfield so that the software can program the next frame address into the LCDIF_NEXT_BUF_ADDR bitfield. This address must always be double-word aligned.

Address: Base address + 40h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_CUR_BUF field descriptions

Field	Description
ADDR	-

37.6.6 LCD Interface Next Buffer Address Register (LCDIFx_NEXT_BUF)

This register indicates the address of next frame that will be transmitted by eLCDIF.

When the eLCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the eLCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the eLCDIF. This address must always be double-word aligned.

Address: Base address + 50h offset

LCDIFx_NEXT_BUF field descriptions

Field	Description
ADDR	-

37.6.7 LCD Interface Timing Register (LCDIFx_TIMING)

The LCD interface timing register controls the various setup and hold times enforced by the LCD interface in the 6800/8080 MPU and VSYNC modes of operation.

The values used in this register are dependent on the particular LCD controller used, consult the users manual for the particular controller for required timings. Each field of the register must be non-zero, therefore the minimum value is: 0x01010101. NOTE: the timings are not automatically adjusted if the CLK_DIS_LCDIFn frequency changes—it may be necessary to adjust the timings if CLK_DIS_LCDIFn changes. NOTE: Each field in this register must be non-zero for the MPU and VSYNC modes to function. The settings in this register do not affect the DOTCLK and DVI modes.

Address: Base address + 60h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_TIMING field descriptions

Field	Description
31–24 CMD_HOLD	Number of CLK_DIS_LCDIFn cycles that the DCn signal is active after CEn is deasserted.
23–16 CMD_SETUP	Number of CLK_DIS_LCDIFn cycles that the DCn signal is active before CEn is asserted.
15–8 DATA_HOLD	Data bus hold time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is deasserted in a cycle
DATA_SETUP	Data bus setup time in CLK_DIS_LCDIFn cycles. Also the time that the data strobe is asserted in a cycle.

37.6.8 eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIFx_VDCTRL0n)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

Address: Base address + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	Reserved								Reserved								VSYNC_PULSE_WIDTH

R	VSYNC_PULSE_WIDTH																
W	VSYNC_PULSE_WIDTH																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

LCDIFx_VDCTRL0n field descriptions

Field	Description
31–30 RSRVD2	This field is reserved. Reserved bits. Write as 0.
29 VSYNC_OEB	0 means the VSYNC signal is an output, 1 means it is an input. Should be set to 0 in the DOTCLK mode. 0x0 VSYNC_OUTPUT — The VSYNC pin is in the output mode and the VSYNC signal has to be generated by the eLCDIF block. 0x1 VSYNC_INPUT — The VSYNC pin is in the input mode and the LCD controller sends the VSYNC signal to the block.
28 ENABLE_PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines. CLK_DIS_LCDIFn cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of CLK_DIS_LCDIFn cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.
VSYNC_PULSE_WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of CLK_DIS_LCDIFn cycles only.

37.6.9 eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIFx_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: Base address + 80h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

37.6.10 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIFx_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: Base address + 90h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_VDCTRL2 field descriptions

Field	Description
31–18 HSYNC_PULSE_WIDTH	Number of CLK_DIS_LCDIFn cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of CLK_DIS_LCDIFn cycles between two positive or two negative edges of the HSYNC signal.

37.6.11 eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIFx_VDCTRL3)

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

ELCDIF Memory Map/Register Definition

Address: Base address + A0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	VERTICAL_WAIT_CNT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_VDCTRL3 field descriptions

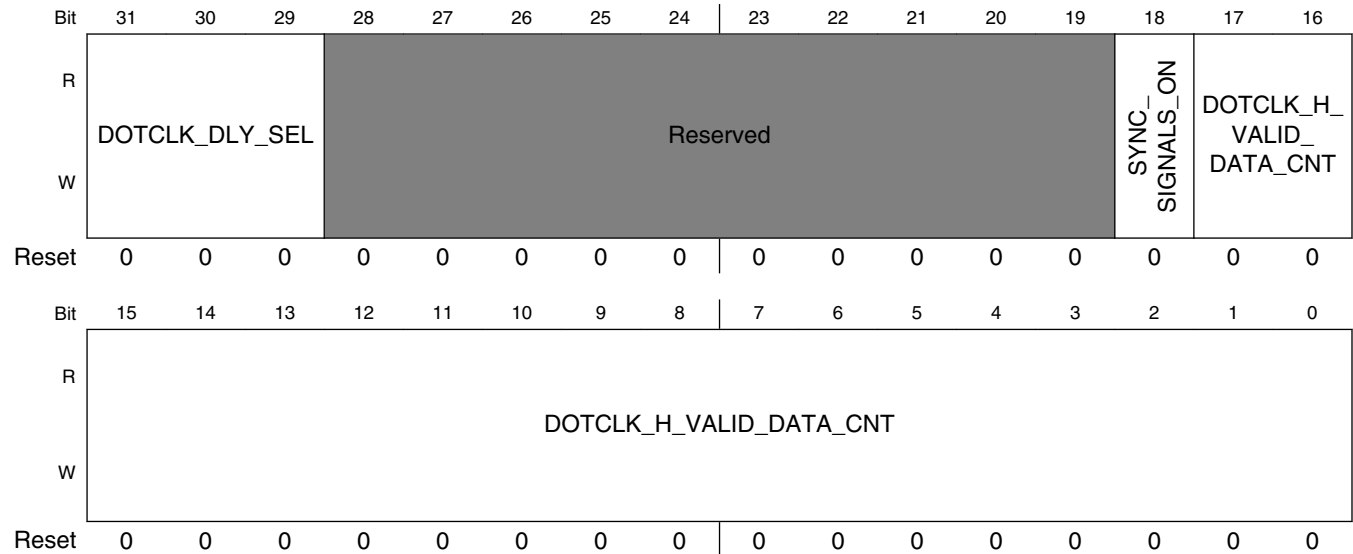

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the eLCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of CLK_DIS_LCDIFn cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

37.6.12 eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIFx_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode. Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V_COUNT bitfield in the LCDIF_TRANSFER_COUNT register.

Address: Base address + B0h offset

**LCDIFx_VDCTRL4 field descriptions**

Field	Description
31–29 DOTCLK_DLY_SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.
18 SYNC_SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_VALID_DATA_CNT	Total number of CLK_DIS_LCDIFn cycles on each horizontal line that carry valid data in DOTCLK mode.

37.6.13 Digital Video Interface Control0 Register (LCDIFx_DVCTRL0)

The Digital Video interface Control0 register provides the overall control of the Digital Video interface.

This register gives information about the horizontal active, horizontal blanking and total number of lines in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
```

ELCDIF Memory Map/Register Definition

```

HW_LCDIF_DVICTRL0_H_ACTIVE_CNT_WR(0x5A0); //1440

LCDIFx_DVICTRL0 field descriptions

Field	Description
31–28 RSRVD1	This field is reserved. Reserved bits, write as 0.
27–16 H_ACTIVE_CNT	Number of active video samples to be transmitted. (Mostly will be 1440 for both PAL and NTSC). Must always be a multiple of 4.
15–12 RSRVD0	This field is reserved. Reserved bits, write as 0.
H_BLANKING_CNT	Number of blanking samples to be inserted between EAV and SAV during horizontal blanking interval.

37.6.14 Digital Video Interface Control1 Register (LCDIFx_DVICTRL1)

The Digital Video interface Control1 register provides the overall control of the Digital Video interface.

This register contains information about the Field1 start and end, and the Field2 start in the ITU-R BT.656 interface.

EXAMPLE

```

//525/60 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x4); //4
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x109); //265
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x10A); //266
//625/50 video system
HW_LCDIF_DVICTRL1_F1_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL1_F1_END_LINE_WR(0x138); //312
HW_LCDIF_DVICTRL1_F2_START_LINE_WR(0x139); //313

LCDIFx_DVICTRL1 field descriptions

Field	Description
31–30 RSRVD0	This field is reserved. Reserved bits, write as 0.
29–20 F1_START_LINE	Vertical line number from which Field 1 begins.
19–10 F1_END_LINE	Vertical line number at which Field1 ends.
F2_START_LINE	Vertical line number from which Field 2 begins.

37.6.15 Digital Video Interface Control2 Register (LCDIFx_DVICTRL2)

The Digital Video interface Control2 register provides the overall control of the Digital Video interface.

This register contains information about the Field2 end, and the Vertical Blanking1 interval in the ITU-R BT.656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL2_F2_END_LINE_WR(0x3); //3
HW_LCDIF_DVICTRL2_V1_BLANK_START_LINE_WR(0x108); //264
HW_LCDIF_DVICTRL2_V1_BLANK_END_LINE_WR(0x11A); //282
//625/50 video system

LCDIFx_DVICTRL2 field descriptions

Field	Description
31–30 RSRVDO	This field is reserved. Reserved bits, write as 0.
29–20 F2_END_LINE	Vertical line number at which Field 2 ends.
19–10 V1_BLANK_START_LINE	Vertical line number towards the end of Field1 where first Vertical Blanking interval starts.
V1_BLANK_END_LINE	Vertical line number in the beginning part of Field2 where first Vertical Blanking interval ends.

37.6.16 Digital Video Interface Control3 Register (LCDIFx_DVICTRL3)

The Digital Video interface Control3 register provides the overall control of the Digital Video interface.

This register contains information about the Vertical Blanking2 interval in the ITU-R BT. 656 interface.

EXAMPLE

```
//525/60 video system
HW_LCDIF_DVICTRL3_V2_BLANK_START_LINE_WR(0x1); //1
HW_LCDIF_DVICTRL3_V2_BLANK_END_LINE_WR(0x13); //19

LCDIFx_DVICTRL3 field descriptions

Field	Description
31–30 RSRVDO	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

LCDIFx_DVICTRL3 field descriptions (continued)

Field	Description
29–20 V2_BLANK_START_LINE	Vertical line number towards the end of Field2 where second Vertical Blanking interval starts.
19–10 V2_BLANK_END_LINE	Vertical line number in the beginning part of Field1 where second Vertical Blanking interval ends.
V_LINES_CNT	Total number of vertical lines per frame (generally 525 or 625)

37.6.17 Digital Video Interface Control4 Register (LCDIFx_DVICTRL4)

The Digital Video interface Control4 register provides the overall control of the Digital Video interface.

This register is used to add side borders to the output if the input frame width is less than 720 pixels.

EXAMPLE

```

//If input frame has only 640 pixels per line, but output is supposed to have
720 pixels per line.
HW_LCDIF_DVICTRL4_H_FILL_CNT_WR(0x50); //80
HW_LCDIF_DVICTRL4_Y_FILL_VALUE_WR(0x10); //16
HW_LCDIF_DVICTRL4_CB_FILL_VALUE_WR(0x80); //128
HW_LCDIF_DVICTRL4_CR_FILL_VALUE_WR(0x80); //128

```

Address: Base address + 100h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	0								0								0								0							
Reset	0								0								0								0							

LCDIFx_DVICTRL4 field descriptions

Field	Description
31–24 Y_FILL_VALUE	Value of Y component of filler data
23–16 CB_FILL_VALUE	Value of CB component of filler data
15–8 CR_FILL_VALUE	Value of CR component of filler data.
H_FILL_CNT	Number of active video samples that have to be filled with the filler data in the front and back portions of the active horizontal interval. Must be a multiple of 4. This field will have to be programmed if the input frame has less than 720 pixels per line.

37.6.18 RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIFx_CSC_COEFF0)

LCDIF_CSC_COEFF0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF0_C0_WR(0x41) ; //0.257x256=65
HW_LCDIF_CSC_COEFF0_CSC_SUBSAMPLE_FILTER_WR(0x3) ;
```

Address: Base address + 110h offset

W	Reserved														E_FILTER	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_CSC_COEFF0 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C0	Two's complement red multiplier coefficient for Y
15–2 RSRVD0	This field is reserved. Reserved bits, write as 0.
CSC_ SUBSAMPLE_ FILTER	This register describes the filtering and subsampling scheme to be performed on the chroma components in order to convert from YCbCr 4:4:4 to YCbCr 4:2:2 space. Note that the following descriptions apply individually to Cb and Cr. 0x0 SAMPLE_AND_HOLD — No filtering, simply keep every chroma value for samples numbered 2n and discard chroma values associated with all samples numbered 2n+1. 0x1 RSRVD — Reserved 0x2 INTERSTITIAL — Chroma samples numbered 2n and 2n+1 are averaged (weights 1/2, 1/2) and that chroma value replaces the two chroma values at 2n and 2n+1. This chroma now exists horizontally halfway between the two luma samples. 0x3 COSITED — Chroma samples numbered 2n-1, 2n, and 2n+1 are averaged (weights 1/4, 1/2, 1/4) and that chroma value exists at the same site as the luma sample numbered 2n and the chroma samples at 2n+1 are discarded.

37.6.19 RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIFx_CSC_COEFF1)

LCDIF_CSC_COEFF1 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

```
HW_LCDIF_CSC_COEFF1_C1_WR(0x81) ; //0.504x256=129
HW_LCDIF_CSC_COEFF1_C2_WR(0x19) ; //0.098x256=25
```

Address: Base address + 120h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_CSC_COEFF1 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C2	Two's complement blue multiplier coefficient for Y
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C1	Two's complement green multiplier coefficient for Y

37.6.20 RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIFx_CSC_COEFF2)

LCDIF_CSC_COEFF2 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0*R + C1*G + C2*B + Y_offset$ $Cb = C3*R + C4*G + C5*B + CbCr_offset$ $Cr = C6*R + C7*G + C8*B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

EXAMPLE

ELCDIF Memory Map/Register Definition

```
HW_LCDIF_CSC_COEFF2_C3_WR(0x3DB) ; //-0.148x256=-37
HW_LCDIF_CSC_COEFF2_C4_WR(0x3B6) ; //-0.291x256=-74
```

Address: Base address + 130h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_CSC_COEFF4 field descriptions

Field	Description
31–26 RSRVD1	This field is reserved. Reserved bits, write as 0.
25–16 C8	Two's complement blue multiplier coefficient for Cr
15–10 RSRVD0	This field is reserved. Reserved bits, write as 0.
C7	Two's complement green multiplier coefficient for Cr

37.6.23 RGB to YCbCr 4:2:2 CSC Offset Register (LCDIFx_CSC_OFFSET)

LCDIF_CSC_ register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC.

Address: Base address + 160h offset

LCDIFx_CSC_OFFSET field descriptions

Field	Description
31–25 RSRVD1	This field is reserved. Reserved bits, write as 0.
24–16 CBCR_OFFSET	Two's complement offset for the Cb and Cr components
15–9 RSRVD0	This field is reserved. Reserved bits, write as 0.
Y_OFFSET	Two's complement offset for the Y component

37.6.24 RGB to YCbCr 4:2:2 CSC Limit Register (LCDIFx_CSC_LIMIT)

LCDIF_CSC_CTRL0 register provides overall control over color space conversion from RGB to 4:2:2 YCbCr. The equations for the conversion are given by: $Y = C0 * R + C1 * G + C2 * B + Y_offset$ $Cb = C3 * R + C4 * G + C5 * B + CbCr_offset$ $Cr = C6 * R + C7 * G + C8 * B + CbCr_offset$

This register carries programming information about RGB to YCbCr 4:2:2 CSC. Note that the values in this register are unsigned.

EXAMPLE

```
HW_LCDIF_CSC_LIMIT_CBCR_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_CBCR_MAX_WR(0xF0); //240
HW_LCDIF_CSC_LIMIT_Y_MIN_WR(0x10); //16
HW_LCDIF_CSC_LIMIT_Y_MAX_WR(0xEB); //235
```

Address: Base address + 170h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_CSC_LIMIT field descriptions

Field	Description
31–24 CBCR_MIN	Lower limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
23–16 CBCR_MAX	Upper limit of Cb and Cr after RGB to 4:2:2 YCbCr conversion
15–8 Y_MIN	Lower limit of Y after RGB to 4:2:2 YCbCr conversion
Y_MAX	Upper limit of Y after RGB to 4:2:2 YCbCr conversion

37.6.25 LCD Interface Data Register (LCDIFx_DATA)

This register is used to transfer data using the PIO interface mode of operation. In MPU mode, data written to this register will be transferred out to the display device. When receiving data from the display, data is read from this register using PIO operations. During write operations, data can be written to this register (from the processor's perspective) as bytes, half-words (16 bits), or words (32 bits) as desired.

This register holds the 32-bit word written by the ARM platform into LCDIF. This data then gets sent out by the block across the interface.

Address: Base address + 180h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	DATA_THREE								DATA_TWO								DATA_ONE								DATA_ZERO								
W																																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_DATA field descriptions

Field	Description
31–24 DATA_THREE	Byte 3 (most significant byte) of data written to LCDIF.
23–16 DATA_TWO	Byte 2 of data written to eLCDIF.
15–8 DATA_ONE	Byte 1 of data written to eLCDIF.
DATA_ZERO	Byte 0 (least significant byte) of data written to eLCDIF.

37.6.26 Bus Master Error Status Register (LCDIFx_BM_ERROR_STAT)

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM_ERROR_IRQ is asserted, the address of the bus error is updated in the register.

Address: Base address + 190h offset

LCDIFx_BM_ERROR_STAT field descriptions

Field	Description
ADDR	Virtual address at which bus master error occurred.

37.6.27 CRC Status Register (LCDIFx_CRC_STAT)

This register reflects the CRC value of each frame sent out by eLCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD_DATABUS_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR_FRAME_DONE_IRQ is asserted. In the case of DVI mode, the CRC is calculated for the entire frame, not separately for each field in the frame.

Address: Base address + 1A0h offset

LCDIFx_CRC_STAT field descriptions

Field	Description
CRC_VALUE	Calculated CRC value.

37.6.28 LCD Interface Status Register (LCDIFx_STAT)

The LCD interface status register can be used to check the current status of the eLCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: Base address + 1B0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ELCDIF Memory Map/Register Definition

LCDIFx_STAT field descriptions

Field	Description
31 PRESENT	0: eLCDIF not present on this product 1: eLCDIF is present.
30 -	This field is reserved. Reserved.
29 LFIFO_FULL	Read only view of the signal that indicates that LCD read datapath FIFO is full, will be generally used in the write mode of the LCD interface.
28 LFIFO_EMPTY	Read only view of the signal that indicates that LCD read datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
27 TXFIFO_FULL	Read only view of the signal that indicates that LCD write datapath FIFO is full, will be generally used in the write mode of the LCD interface.
26 TXFIFO_EMPTY	Read only view of the signal that indicates that LCD write datapath FIFO is empty, will be generally used in the read mode of the LCD interface.
25 BUSY	Read only view of the input busy signal from the external LCD controller.
24 DVI_CURRENT_FIELD	Read only view of the current field being transmitted. DVI_CURRENT_FIELD = 0 means field 1. DVI_CURRENT_FIELD = 1 means field 2.
23-9 RSRVDO	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

37.6.29 LCD Interface Version Register (LCDIFx_VERSION)

The LCD interface version register can be used to read the version of the eLCDIF IP being used in this SoC.

The LCD interface debug register is for diagnostic use only.

Address: Base address + 1C0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_VERSION field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value reflecting the MAJOR field of RTL version.
23–16 MINOR	Fixed read-only value reflecting the MINOR field of RTL version.
STEP	Fixed read-only value reflecting the stepping of RTL version.

37.6.30 LCD Interface Debug0 Register (LCDIFx_DEBUG0)

The LCD interface debug0 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

ELCDIF Memory Map/Register Definition

Address: Base address + 1D0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	1	1	1	0	1	0	0	0	0	0	0	1

LCDIFx_DEBUG0 field descriptions

Field	Description
31 STREAMING_END_DETECTED	Read only view of the DOTCLK_MODE or DVI_MODE bit going from 1 to 0.
30 WAIT_FOR_VSYNC_EDGE_OUT	Read only view of WAIT_FOR_VSYNC_EDGE bit in the VSYNC mode after it comes out of the TXFIFO.
29 SYNC_SIGNALS_ON_REG	Read only view of internal sync_signals_on_reg signal.
28 -	This field is reserved. Reserved.
27 ENABLE	Read only view of ENABLE signal.

Table continues on the next page...

LCDIFx_DEBUG0 field descriptions (continued)

Field	Description
26 HSYNC	Read only view of HSYNC signal.
25 VSYNC	Read only view of VSYNC signal.
24 CUR_FRAME_TX	This bit is 1 for the time the current frame is being transmitted in the VSYNC mode. Useful for VSYNC mode debug.
23 EMPTY_WORD	Indicates that the current word is empty.
22-16 CUR_STATE	Read only view of the current state machine state in the current mode of operation.
15 PXP_LCDIF_B0_READY	Buffer0 ready signal issued by ePXP.
14 PXP_B0_DONE	Buffer0 done signal issued by eLCDIF.
13 PXP_LCDIF_B1_READY	Buffer1 ready signal issued by ePXP.
12 PXP_B1_DONE	Buffer1 done signal issued by eLCDIF.
11-10 CUR_REQ_STATE	Read only view of the request state machine.
9 MST_AVALID	Read only view of the mst_avalid signal issued by the AXI bus master.
8-4 MST_OUTSTANDING_REQS	Read only view of the current outstanding requests issued by the AXI bus master.
MST_WORDS	Read only view of the current bursts issued by the AXI bus master.

37.6.31 LCD Interface Debug1 Register (LCDIFx_DEBUG1)

The LCD interface debug1 register provides a diagnostic view of the state machine and other useful internal signals.

The LCD interface debug register is for diagnostic use only.

Address: Base address + 1E0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

LCDIFx_DEBUG2 field descriptions

Field	Description
MST_ADDRESS	Read only view of the current address issued by the AXI bus master.

37.6.33 eLCDIF Threshold Register (LCDIFx_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

Memory request priority threshold register.

Address: Base address + 200h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	Reserved								FASTCLOCK								Reserved								PANIC								
W	[Reserved]																																
Reset	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	

37.6.34 eLCDIF AS Buffer Control Register (LCDIFx_AS_CTRL)

The Alpha Surface Parameter register provides additional controls for AS.

Address: Base address + 210h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R						RVDS1							ROP			
W	CSI_VSYNC_ENABLE	CSI_VSYNC_POL	CSI_VSYNC_MODE	CSI_SYNC_ON_IRQ_EN	CSI_SYNC_ON_IRQ				PS_DISABLE	INPUT_DATA_SWIZZLE		ALPHA_INVERT

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_AS_CTRL field descriptions

Field	Description
31 CSI_VSYNC_ENABLE	When this bit is set by software, the LCDIF work as sync mode with CSI input.
30 CSI_VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.

Table continues on the next page...

LCDIFx_AS_CTRL field descriptions (continued)

Field	Description
29 CSI_VSYNC_MODE	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
28 CSI_SYNC_ON_IRQ_EN	This bit is set to enable an interrupt when LCDIF lock with CSI vsync input.
27 CSI_SYNC_ON_IRQ	this bit is set by software to decide which vsync generate mode. LCDIF vsync generate by internal counter when set to 0, LCDIF vsync delayed by each csi_vsync_in when set to 1; INT_SYNC_MODE = 0x0 LCDIF vsync generate by internal counter. EXT_SYNC_MODE = 0x1 LCDIF vsync delayed by each csi_vsync_in.
26–24 RVDS1	Reserved, always set to zero.
23 PS_DISABLE	When this bit is set by software, the LCDIF will disable PS buffer data.
22–21 INPUT_DATA_SWIZZLE	This field specifies how to swap the bytes either in the HW_LCDIF_DATA register or those fetched by the AXI master part of LCDIF. The swizzle function is independent of the WORD_LENGTH bit. See the explanation of the HW_LCDIF_DATA below for names and definitions of data register fields. The supported swizzle configurations are: NO_SWAP = 0x0 No byte swapping.(Little endian) LITTLE_ENDIAN = 0x0 Little Endian byte ordering (same as NO_SWAP). BIG_ENDIAN_SWAP = 0x1 Big Endian swap (swap bytes 0, 3 and 1, 2). SWAP_ALL_BYTES = 0x1 Swizzle all bytes, swap bytes 0, 3 and 1, 2 (aka Big Endian). HWD_SWAP = 0x2 Swap half-words. HWD_BYTE_SWAP = 0x3 Swap bytes within each half-word.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field. MASKAS = 0x0 AS AND PS MASKNOTAS = 0x1 nAS AND PS MASKASNOT = 0x2 AS AND nPS MERGEAS = 0x3 AS OR PS MERGENOTAS = 0x4 nAS OR PS MERGEASNOT = 0x5 AS OR nPS NOTCOPYAS = 0x6 nAS NOT = 0x7 nPS NOTMASKAS = 0x8 AS NAND PS NOTMERGEAS = 0x9 AS NOR PS XORAS = 0xA AS XOR PS NOTXORAS = 0xB AS XNOR PS

Table continues on the next page...

LCDIFx_AS_CTRL field descriptions (continued)

Field	Description
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in REG_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS. ARGB8888 = 0x0 32-bit pixels with alpha RGB888 = 0x4 32-bit pixels without alpha (unpacked 24-bit format) ARGB1555 = 0x8 16-bit pixels with alpha ARGB4444 = 0x9 16-bit pixels with alpha RGB555 = 0xC 16-bit pixels without alpha RGB444 = 0xD 16-bit pixels without alpha RGB565 = 0xE 16-bit pixels without alpha
3 ENABLE_ COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Embedded = 0x0 Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. Override = 0x1 Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. Multiply = 0x2 Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. ROPs = 0x3 Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 AS_ENABLE	When this bit is set by software, the LCDIF will start fetching AS buffer data in bus master mode and combine it with another buffer.

37.6.35 Alpha Surface Buffer Pointer (LCDIFx_AS_BUF)

This register is used to indicate the base address of the AS buffer.

Address: Base address + 220h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

LCDIFx_AS_BUF field descriptions

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

37.6.36 LCDIFx_AS_NEXT_BUF

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is upto the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: Base address + 230h offset

LCDIFx_AS_NEXT_BUF field descriptions

Field	Description
ADDR	

37.6.37 eLCDIF Overlay Color Key Low (LCDIFx_AS_CLRKEYLOW)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: Base address + 240h offset

LCDIFx_AS_CLRKEYLOW field descriptions

Field	Description
31-24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer

37.6.38 eLCDIF Overlay Color Key High (LCDIFx_AS_CLRKEYHIGH)

If a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. Colorkey operations are higher priority than alpha or ROP operations.

Address: Base address + 250h offset

LCDIFx_DEBUG4 field descriptions

Field	Description
31–16 H_DATA_COUNT	Read only view of the current AS state of the horizontal data counter.
V_DATA_COUNT	Read only view of the current AS state of the vertical data counter.

37.6.42 LCD Interface Debug5 (LCDIFx_DEBUG5)

The LCD interface debug register is for diagnostic use only.

Address: Base address + 290h offset

LCDIFx_DEBUG5 field descriptions

Field	Description
MST_ADDRESS	Read only view of the AS channel address issued by the AXI bus master.

Chapter 38

LVDS Display Bridge (LDB)

38.1 Overview

The LVDS Display Bridge (LDB) connects to an External LVDS Display Interface.

The purpose of the LDB is to support flow of synchronous RGB data to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

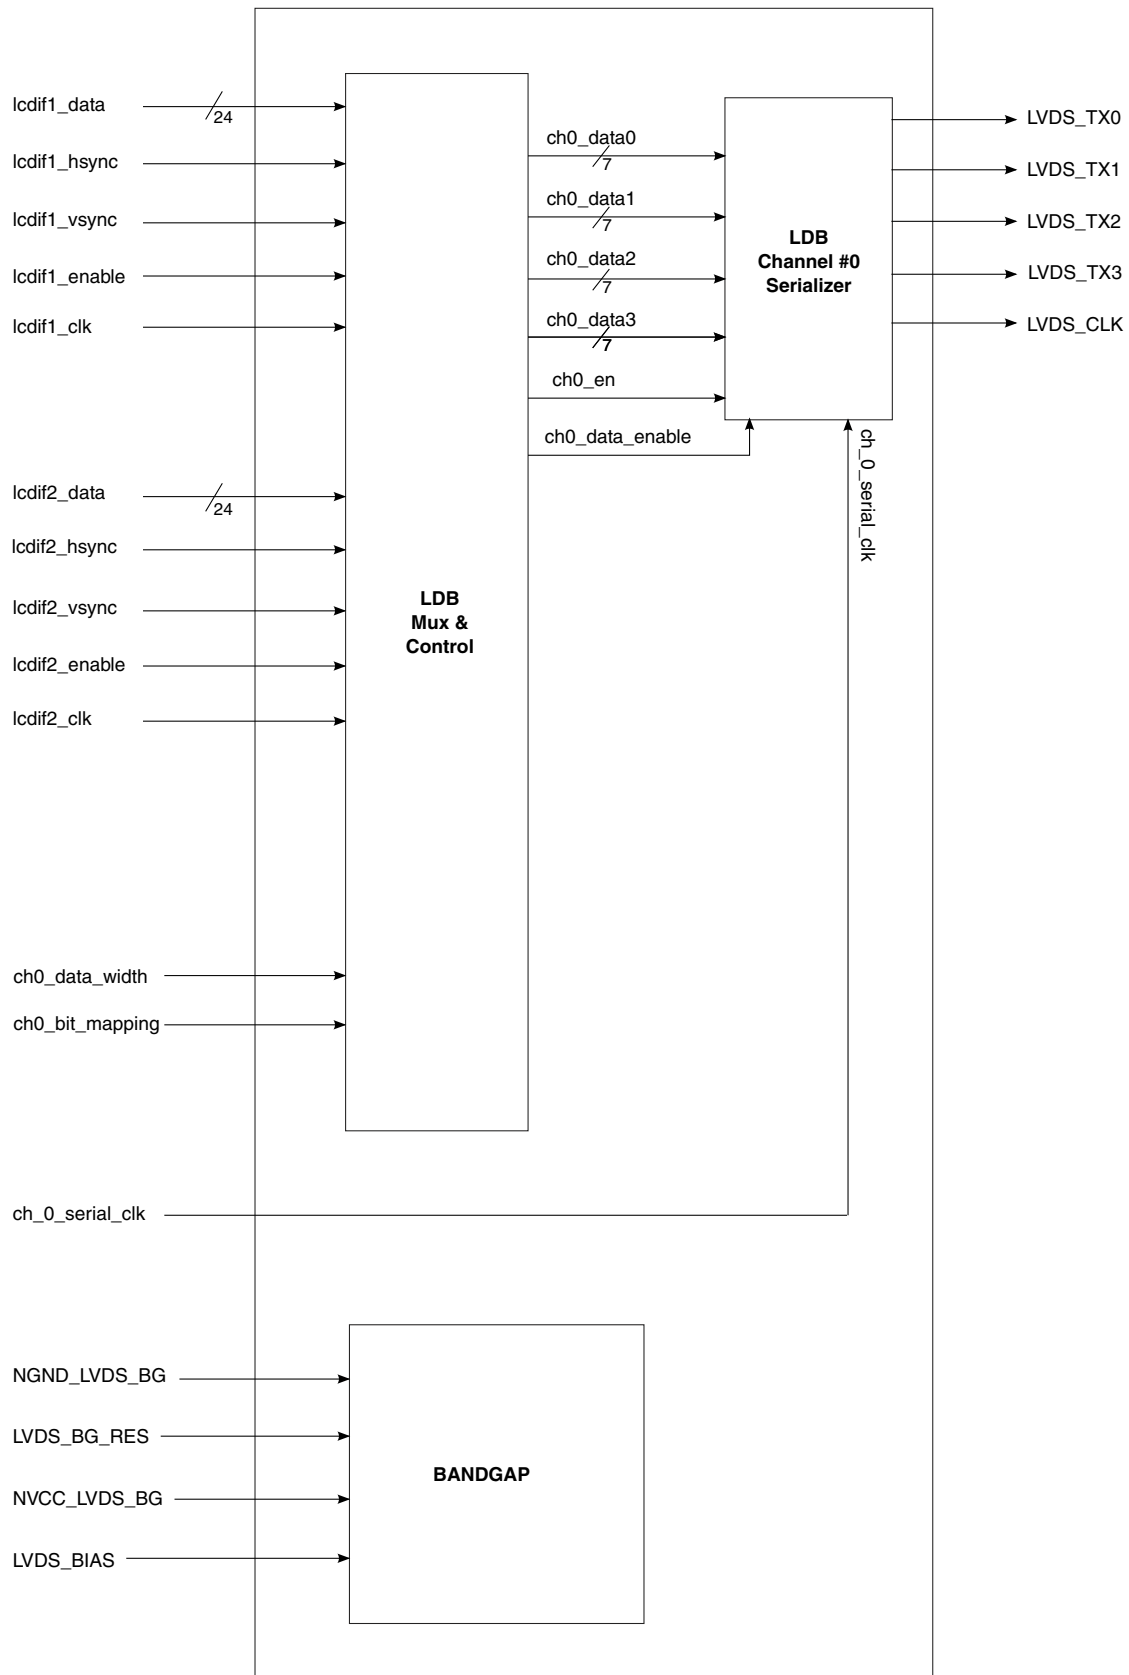

Figure 38-1. LDB Block Diagram

Table 38-1. LDB - Block Description

Block	Description
LDB Mux and Control	Gets control signals from SoC and determines parameters of LDB
Channel Serializers	LDB has 1 channel serializer. The serializer does parallel to serial conversion 7:1 to 3 or 4 data lines
Bandgap	Provides reference current to the LVDS I/O pads.

Table 38-2. LDB IP Parametric Table

Name	Connected to LDB
Function	Connectivity to displays with LVDS interface
External I/O Pins Those are LVDS I/O pads	LVDS Display port: 1 channel, consists of: <ul style="list-style-type: none"> • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 10 I/O pads.
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1

38.1.1 Relevant Standards

Below are the relevant standards to LDB:

1. ANSI EIA-644-A. Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits.
2. SPWG Notebook Panel Specification (V3.8 from 03/2007) <http://www.spwg.org/specifications.htm>.
3. PSWG standards (Panel Standardization Working Group) - set of standards for panels using LVDS. All are available from <http://www.vesa.org>.
4. DISM Standard JEIDA-59-1999

38.2 External Signals

The following table describes the external signals of LDB:

Table 38-3. LDB External Signals

Signal	Description	Pad	Mode	Direction
LVDS_CLK_N	LVDS Negative Clock Signal	LVDS_CLK_N	No muxing	IO
LVDS_CLK_P	LVDS Positive Clock Signal	LVDS_CLK_P	No muxing	IO
LVDS_DATA0_N	LVDS Negative Data0 Signal	LVDS_DATA0_N	No muxing	IO
LVDS_DATA0_P	LVDS Positive Data0 Signal	LVDS_DATA0_P	No muxing	IO
LVDS_DATA1_N	LVDS Negative Data1 Signal	LVDS_DATA1_N	No muxing	IO
LVDS_DATA1_P	LVDS Positive Data1 Signal	LVDS_DATA1_P	No muxing	IO
LVDS_DATA2_N	LVDS Negative Data2 Signal	LVDS_DATA2_N	No muxing	IO
LVDS_DATA2_P	LVDS Positive Data2 Signal	LVDS_DATA2_P	No muxing	IO
LVDS_DATA3_N	LVDS Negative Data3 Signal	LVDS_DATA3_N	No muxing	IO
LVDS_DATA3_P	LVDS Positive Data3 Signal	LVDS_DATA3_P	No muxing	IO

38.3 Clocks

A table with the LDB Clock Sources can be found here.

Table 38-4. LDB Clocks

Clock name	Clock Root	Description
ch_0_serial_clk	lvds_clk_root	Module clock

38.4 Input and Output Ports

38.4.1 Input Parallel Display Ports

One parallel RGB input ports are supported. Only synchronous access mode is supported. Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, ENABLE

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- Up to 85 MHz per interface. (WXGA 1366x768 @ 60 frames per second, 35% blanking).

38.4.2 Output LVDS Ports

There is 1 LVDS channel. The output is used to communicate RGB data and controls to external LCD displays.

The output LVDS port complies to the EIA-644-A standard.

38.5 Processing

LDB data processing stages are as follows:

- Receive input data from parallel input interface. 18/24 RGB data + up to 4 controls and map them to LVDS channels.
 - If needed (dual-channel) split the input bus to two half-rate busses.
- Re-arrange the input data according to channel configuration, and muxing scheme.
- Serialize the 22/28 bit input bus (per channel) on 3-4 output serial data lines (7:1)

38.5.1 Bit Mapping

LDB supports two mapping standards:

- SPWG mapping
- JEIDA mapping

Table 38-5. SPWG/PSWG/VESA 18/24 bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDS_DATA0	G0	R5	R4	R3	R2	R1	R0
LVDS_DATA1	B1	B0	G5	G4	G3	G2	G1
LVDS_DATA2	DE	VS	HS	B5	B4	B3	B2
LVDS_DATA3 (for 24 bpp only)	CTL	B7	B6	G7	G6	R7	R6

Table 38-6. JEIDA 24bpp Data Mapping

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDS_DATA0	G2	R7	R6	R5	R4	R3	R2

Table continues on the next page...

Table 38-6. JEIDA 24bpp Data Mapping (continued)

Serializer input	Slot 0	Slot 1	Slot 2	Slot 3	Slot 4	Slot 5	Slot 6
LVDS_DATA1	B3	B2	G7	G6	G5	G4	G3
LVDS_DATA2	DE	VS	HS	B7	B6	B5	B4
LVDS_DATA3	CTL	B1	B0	G1	G0	R1	R0

NOTE

Several options of control usage can be available. some display devices use only ENABLE, some others use all 3 controls, some use only HS.

38.6 LDB Memory Map/Register Definition**LDB memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20E_0014	LDB Control Register (LDB_CTRL)	32	R/W	0000_0000h	38.6.1/2481

38.6.1 LDB Control Register (LDB_CTRL)

The register is implemented in the IOMUX Controller block (IOMUXC), as the register IOMUXC_GPR6.

Address: 20E_0014h base + 0h offset = 20E_0014h

LDB_CTRL field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 counter_reset_val[1:0]	Reset value for the LDB counter which determines when the shift registers are loaded with data. NOTE: Used for debug purposes only. In normal functional operation must be '00' 00 Reset value is 5 01 Reset value is 3 10 Reset value is 4 11 Reset value is 6
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 lvds_clk_shift[2:0]	Shifts the LVDS output clock in relation to the data.

Table continues on the next page...

LDB_CTRL field descriptions (continued)

Field	Description
	<p>NOTE: Used for debug purposes only. In normal functional operation must be '000'</p> <p>000 Output clock is '1100011' (normal operation) 001 Output clock is '1110001' 010 Output clock is '1111000' 011 Output clock is '1000111' 100 Output clock is '0001111' 101 Output clock is '0011111' 110 Output clock is '0111100' 111 Output clock is '1100011'</p>
15 Reserved	This read-only field is reserved and always has the value 0.
14–11 Reserved	This read-only field is reserved and always has the value 0.
10 -	This field is reserved. Reserved
9 lcdif1_vs_polarity	Vsync polarity for lcdif1 interface. 0 lcdif1_vsync is active high. 1 lcdif1_vsync is active low.
8–7 -	This field is reserved. Reserved
6 bit_mapping_ch0	Data mapping for LVDS channel 0. 0 Use SPWG standard. 1 Use JEIDA standard.
5 data_width_ch0	Data width for LVDS channel 0. NOTE: This bit must be set when using JEIDA standard (bit_mapping_ch0 is set) 0 Data width is 18 bits wide (LVDS_TX3 is not used) 1 Data width is 24 bits wide.
4–2 -	This field is reserved. Reserved
ch0_mode[1:0]	LVDS channel 0 operation mode 00 Channel disabled. 01 Channel enabled, routed to lcdif1 10 Channel disabled. 11 Channel enabled, routed to lcdif2.

Chapter 39

MediaLB (MLB)

39.1 Overview

The MLB50 implements the required functionality of a Media Local Bus (MediaLB) Device. Functionality includes:

- Transmission of commands and data when functioning as the transmitting device associated with a ChannelAddress
- Reception of data and transmission of RxStatus responses when functioning as the receiving device associated with a ChannelAddress
- MediaLB lock detection
- SystemChannel command handling

MediaLB Device functionality is implemented with an MediaLB 3-pin interface . The MediaLB interfaces are capable of exchanging data at speeds up to 1024xFs in 3-pin mode.

A set of physical channels for exchanging data over the MediaLB bus is supported. These physical channels (4 bytes in length, or a quadlet) can be grouped into logical channels, where each logical channel is referenced using a ChannelAddress and represents a unidirectional data path between a specific MediaLB Device transmitting the data and the MediaLB Device(s) receiving the data. The logical channels, configured by system software, can be any combination of channel types (synchronous, asynchronous, isochronous, or control) and direction (transmit or receive).

39.1.1 Block Diagram

The following figure is the top-level block diagram of the MLB50 behavioral models.

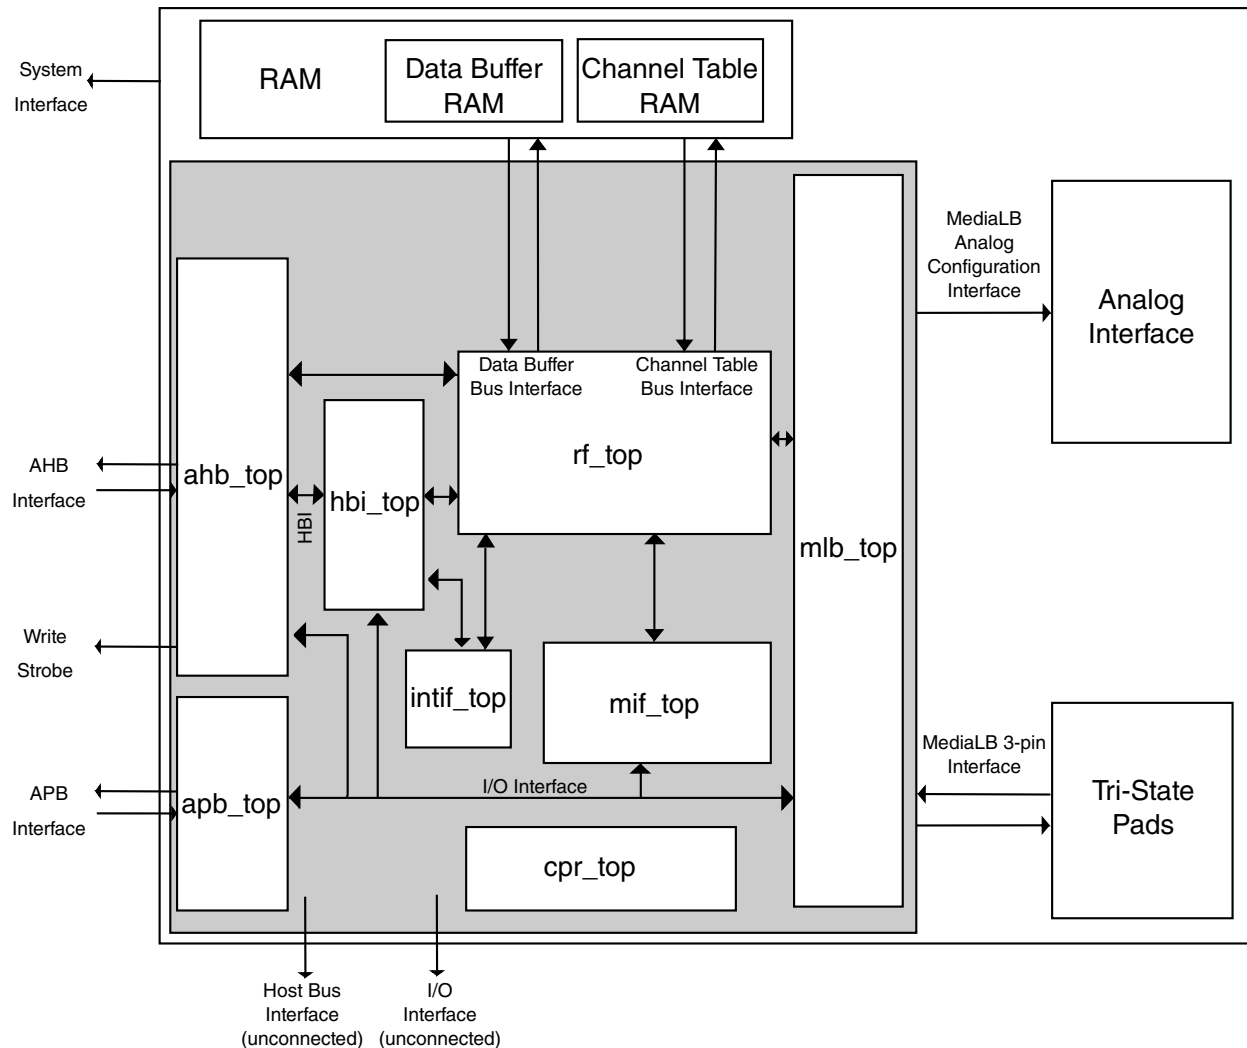

Figure 39-1. Block Diagram of MLB50

39.1.1.1 Bus Interfaces

The external bus interfaces include:

- MediaLB 3-pin Interface
- Channel Table Bus (CTB) Interface
- Data Buffer Bus (DBB) Interface
- System Interface
- AMBA Advanced High-performance Bus (AHB) Interface
- AMBA Advanced Peripheral Bus (APB) Interface

39.2 External Signals

The table found here describes the external signals of MLB50.

Table 39-1. MLB External Signals

Signal	Description	Pad	Mode	Direction
MLB_CLK	Clock signal	ENET2_TX_CLK	ALT4	I
		GPIO1_IO12	ALT4	
		SD2_CMD	ALT4	
MLB_DATA	Data signal	ENET2_RX_CLK	ALT4	IO
		GPIO1_IO11	ALT4	
		SD2_DATA3	ALT4	
MLB_SIG	MLB signal	ENET2_CRS	ALT4	IO
		GPIO1_IO13	ALT4	
		SD2_CLK	ALT4	

39.3 Clocks

The table found here describes the clock sources for MLB50.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 39-2. MLB150 Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	AHB bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
sys_clk		Module clock
mem_ct_CLK		Channel table bus clock
mem_db_CLK		Data buffer bus clock

39.4 Functional Description

This section describes the functional architecture of the MLB50.

The internal functional blocks of the MLB50 include:

- MediaLB Block (mlb_top) - Implements the physical and link-layer requirements of MediaLB 3-pin interface. Serial-to-parallel and parallel-to-serial data transformations are implemented, as well as MediaLB frame synchronization
- Host Bus Interface Block (hbi_top) - Provides 16-bit parallel slave access to all MOST channels and data types for the external Host Controller (HC). The HBI supports up to 64 independent channels with a minimum access latency of 40 ns per word and a maximum bandwidth of 400 Mbps
- Routing Fabric Block (rf_top) - Manages the flow of data between the MediaLB block and the HBI block, implementing a bus arbiter and muxing logic to the Channel Table RAM (CTR) and the Data Buffer RAM (DBR)
- Memory Interface Block (mif_top) - Implements a bridge between the I/O bus and the customer-implemented RAMs (i.e. Channel Table and Data Buffer)
- Interrupt Interface Block (intif_top) - Sends notifications to HBI that there are changes to the channel descriptors
- Clocks, Power, and Reset Block (cpr_top) - Implements clock and reset muxing and synchronization
- AMBA AHB Block (ahb_top) - Implements a bus bridge between the AHB master and the HBI slave interfaces
- AMBA APB Block (apb_top) - Implements a bus bridge that translates the two cycle APB interface signals to the single-cycle I/O interface signals

39.4.1 MediaLB Block

The Media Local Bus (MediaLB) block supports MediaLB 3-pin interface. Both MediaLB interfaces provide real-time access to all network data types including streaming, packet, control, and isochronous data.

- MediaLB 3-pin Interface - Supports the MediaLB protocol for single-ended 3-pin mode, with a maximum data rate of 1024xFs (49.152 MHz at Fs=48 kHz).

39.4.1.1 MediaLB Channel Address to Logical Channel Mapping

The MediaLB channel addresses are mapped to the logical channels as follows.

Table 39-3. MediaLB Channel Address to Logical Channel Mapping

Channel Address	Logical Channel
0x0002	1
0x0004	2
0x0006	3

Table continues on the next page...

Table 39-3. MediaLB Channel Address to Logical Channel Mapping (continued)

Channel Address	Logical Channel
....
0x007C	62
0x007E	63
0x01FE	0*
* Logical Channel 0 is the System Channel and is reserved.	

39.4.2 Host Bus Interface Block

The Host Bus Interface (HBI) block provides a 16-bit parallel slave port that provides an external Host Controller (HC) with access to all MOST channels and data types.

Up to 64 independent HBI channels are available to the HC, each configurable for either transmitting or receiving a particular application data type (synchronous, isochronous, asynchronous, or control). The HBI block provides source and sink access to the full network data bandwidth.

39.4.2.1 HBI Physical Addresses

To access a particular HBI DMA channel, hardware must first translate the HBI channel address to a channel allocation table (CAT) physical address. This physical address is then used to retrieve the channel label (CL), which in turn retrieves the channel descriptor.

See [Table 39-4](#) for more information on the mapping between the HBI channel address and physical address.

Table 39-4. HBI Channel Address to Physical Address Mapping

HBI Channel	CAT Address	CAT Offset
0x0	0x88	000
0x1	0x88	001
0x2	0x88	010
0x3	0x88	011
0x4	0x88	100
0x5	0x88	101
0x6	0x88	110
0x7	0x88	111
0x8	0x89	000

Table continues on the next page...

Table 39-4. HBI Channel Address to Physical Address Mapping (continued)

HBI Channel	CAT Address	CAT Offset
...
0x3E	0x8F	110
0x3F	0x8F	111

39.4.3 Routing Fabric Block

The Routing Fabric (RF) block manages the flow of data between the MediaLB Port and the HBI Port. Bus multiplexers and a bus arbiter are implemented in the RF block for accessing the channel table RAM (CTR) and data buffer RAM (DBR).

Each DMA controller in the routing fabric uses Channel Descriptors (stored in the CTR) to manage access to dynamic buffers in the DBR.

39.4.3.1 Data Buffer RAM

The MLB50 has an external data buffer RAM (DBR) that is 8-bit x 16k entries deep. The DBR provides dynamic circular buffering between the transmit and receive devices.

The size and location of each data buffer is defined by software in the channel descriptor table (CDT), which is located in the CTR.

Receive devices retain the write address pointer to the associated circular data buffer in the DBR, while transmit devices retain the read address pointer. The DMA controllers in the routing fabric are responsible for ensuring that the circular buffers do not overflow or underflow. Each channel type (e.g. synchronous, isochronous, asynchronous and control) has Full and Empty detection.

39.4.3.1.1 Synchronous Channels

For synchronous channels, two mechanisms prevent overflow and underflow of the data buffer:

- Hardware aligns the read pointer (RPTR) to the write pointer (WPTR) to ensure an offset of two sub-buffers.
- RPTR and WPTR are periodically synchronized to the start of the next sub-buffer (e.g. following a FRAMESYNC).

39.4.3.1.2 Isochronous Channels

For isochronous channels, hardware does not read from an empty data buffer or write to a full data buffer. The conditions used by hardware for detection include:

Data buffer Empty condition: $(RPTR = WPTR) \text{ AND } (BF = 0)$, and

Data buffer Full condition: $(WPTR = RPTR) \text{ AND } (BF = 1)$.

39.4.3.1.3 Asynchronous and Control Channels

For asynchronous and control channels, hardware does not read from an empty data buffer or write to a full data buffer. Hardware evaluates the DMA pointers (RPTR, WPTR) and packet count (RPC, WPC) to detect the data buffer condition, where:

- Data buffer Empty condition: $(RPTR = WPTR) \text{ AND } (RPC = WPC)$, and
- Data buffer Full condition: $((WPTR = RPTR) \text{ AND } (WPC \neq RPC)) \text{ OR } (WPC = (RPC - 1))$.

39.4.3.2 Channel Table RAM

The MLB50 has an external Channel Table RAM (CTR) that is 128-bit x 144-entry. The CTR allows system software to dynamically configure channel routing and allocate data buffers in the DBR.

The CTR is logically divided into three sub-tables:

- Channel Descriptor Table (CDT)
- AHB Descriptor Table (ADT)
- Channel Allocation Table (CAT)

39.4.3.2.1 Address Mapping

Table 39-5. CTR Address Mapping

Label	Address	Bits 127...96	Bits 95...64	Bits 63...32	Bits 31...0
Channel Descriptor Table (CDT):					
CDT	0x00	CDT0[127:0], CL = 0			
	0x01	CDT1[127:0], CL = 1			
	0x02	CDT2[127:0], CL = 2			
			
	0x3D	CDT61[127:0], CL = 61			
	0x3E	CDT62[127:0], CL = 62			

Table continues on the next page...

Table 39-5. CTR Address Mapping (continued)

Label	Address	Bits 127...96	Bits 95...64	Bits 63...32	Bits 31...0				
	0x3F	CDT63[127:0], CL = 63							
AHB Descriptor Table (ADT):									
ADT*	0x40	ADT0[127:0]							
	0x41	ADT1[127:0]							
	0x42	ADT2[127:0]							
							
	0x7D	ADT61[127:0]							
	0x7E	ADT62[127:0]							
	0x7F	ADT63[127:0]							
Channel Allocation Table (CAT):									
CAT for MediaLB	0x80	CAT7	CAT6	CAT5	CAT4	CAT3	CAT2	CAT1	CAT0

	0x87	CAT63	CAT62	CAT61	CAT60	CAT59	CAT58	CAT57	CAT56
CAT for HBI*	0x88	CAT71	CAT70	CAT69	CAT68	CAT67	CAT66	CAT65	CAT64

	0x8F	CAT127	CAT126	CAT125	CAT124	CAT123	CAT122	CAT121	CAT120
* A fixed relationship exists between ADT entries and HBI CAT entries. When using HBI channel 0 (CAT64) on should program ADT0. When using HBI channel 1 (CAT65) on should program ADT1, and so on.									

39.4.3.2.2 Channel Allocation Table

The Channel Allocation Table (CAT) is comprised of 16 CTR entries (addresses 0x80 - 0x8F), as shown in [Table 39-5](#). Each 16-bit CAT entry represents a logical connection to or from a transmit/receive device (e.g. MediaLB or HBI channel). All entries are indexed according to a fixed physical address assigned to every Rx/Tx channel (as shown in [Table 39-6](#)). The value stored in a CAT entry includes a 6-bit Connection Label, which provides a pointer to the CDT. To complete a logical channel and form a routing connection, system software must assign the same Connection Label to both the Rx and Tx channels.

Table 39-6. CAT Entry Map

Peripheral	Tx Channels	Rx Channels	CAT Start Index	CAT End Index	Entries
MediaLB	0 to 64	64 - Tx Channels	0	63	64
HBI	0 to 64	64 - Tx Channels	64	127	64

The format of a full CAT entry is shown in [Table 39-7](#), with field descriptions described in [Table 39-8](#). All reserved bits of a CAT entry field should be written as zero.

Table 39-7. CAT Entry Formats

Channel Type	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Synchronous	rsvd	MFE	MT	RN W	CE	CT[2:0] = 0			rsvd	CL[5:0]						

Table 39-8. CAT Field Definitions

Field	Description
CL[5:0]	Connection Label (offset into CDT)
CT[2:0]	Channel Type (Others): 111 = Reserved 110 = Reserved 101 = Reserved 100 = Reserved 011 = Isochronous 010 = Asynchronous 001 = Control 000 = Synchronous
CE	Channel Enable: 1 = Enabled 0 = Disabled
RNW	Read Not Write: 1 = Read 0 = Write
MT	Mute Enable: 1 = Enabled 0 = Disabled
FCE	Flow Control Enable: 2 1 = Enabled 0 = Disabled
MFE	Multi-Frame per Sub-buffer Enable: 3 1 = Enabled 0 = Disabled
rsvd	Reserved. Software writes a zero to all Reserved bits when the entry is initialized. The Reserved bits are Read-only after initialization.
<p>1. When set for synchronous channels, the MT bit forces Rx channels to write zeros into the channel data buffer, and Tx channels to output zeros on the physical interface. When set for asynchronous and control channels, the MT bit causes DMA to halt at a packet boundary. Not valid for isochronous channels.</p> <p>2. The FCE bit is used by MediaLB isochronous Rx channels only.</p> <p>3. The MFE bit is used by MediaLB synchronous channels only.</p>	

39.4.3.2.2.1 Channel Setup

Data direction in the MLB50 is in reference to the DBR. Therefore, the data direction of CAT entries corresponding to the same channel is reversed for the HBI CAT and the MediaLB CAT.

For a Tx channel (from the HC to the MediaLB interface):

- HBI CAT entry: RNW = 0 (write)
- MediaLB CAT entry: RNW = 1 (read)

Conversely, for a Rx channel (data from MediaLB to HC):

Functional Description

- HBI CAT entry: RNW = 1 (read)
- MediaLB CAT entry: RNW = 0 (write)

The figure below illustrates the directional relationship in the MLB50.

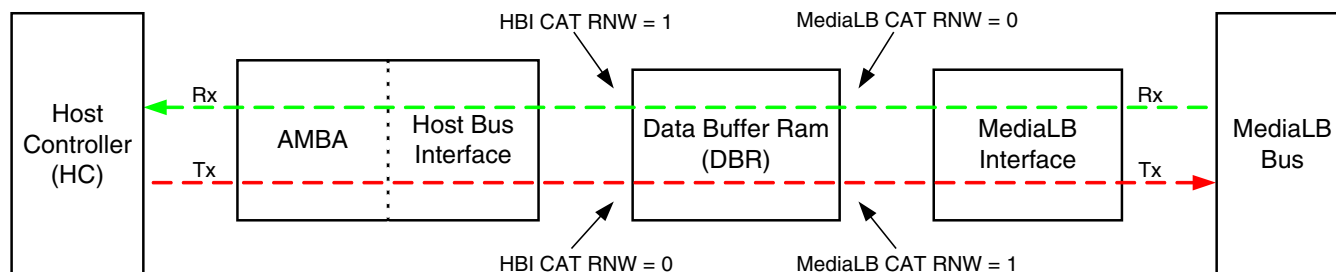

Figure 39-2. MLB DBR Directional Relationship

39.4.3.2.3 Channel Descriptor Table

The *Channel Descriptor Table* (CDT) is comprised of 64 CTR entries (addresses 0x00 - 0x3F), as shown in [Table 39-5](#).

Each 128-bit CDT entry (also referred to as a *Channel Descriptor*) is referenced by a *Connection Label* and contains information about a data buffer in the DBR (e.g. buffer size, address pointers).

The format of each CDT entry (also referred to as a *Channel Descriptor*) is dependent on the channel type (e.g. synchronous, isochronous, asynchronous, or control).

NOTE

All reserved *Channel Descriptor* bits must be written to '0' by software when initialized.

39.4.3.2.3.1 Synchronous Channel Operation

The MLB50 provides two modes of operation (Standard and Multi-Frame per Sub-buffer) to provide flexibility for implementing synchronous channels.

A sample synchronous data buffer is shown in the figure found here.

A sample synchronous data buffer is shown in the figure below. Each data buffer contains four sub-buffers and each sub-buffer contains space for 1 to 64 frames of data, determined by MLBC0.FCNT[2:0].

Figure 39-3. Synchronous Data Buffer Structure

39.4.3.2.3.2 Synchronous Channel Descriptors

The format and field definitions for a synchronous CDT entry are shown in the tables below respectively.

Table 39-9. Synchronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	WSBC		Reserved													
16	RSBC		Reserved													
32	Reserved

64	WSTS[3:0]				WPTR[11:0]											
80	RSTS[3:0]				RPTR[11:0]											
96	Reserved				BD[11:0]											
112	Reserved		BA[13:0]													

Table 39-10. Synchronous CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - BD = 4 x m x bpf - 1, where: m = frames per sub-buffer (for MFE = 0, m = 1) bpf = bytes per frame.	r,w
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA write address = BA + WPTR	r,w,u
RSBC	Read Sub-buffer Counter	- Software initializes to zero, hardware updates - Counts the read sub-buffer offset - DMA uses for pointer management	r,w,u
WSBC	Write Sub-buffer Counter	- Software initializes to zero, hardware updates	r,w,u

Table continues on the next page...

Table 39-10. Synchronous CDT Entry Field Definitions (continued)

Field	Description	Details	Accessibility
		- Counts the write sub-buffer offset - DMA uses for pointer management	
RSTS	Read Status	- Software initializes to zero, hardware updates - RSTS states: xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - WSTS states: xxx0 = normal operation (no mute) xxx1 = normal operation (mute) xx0x = idle 1xxx = command protocol error	r,w,u
Reserved	Reserved	- Software writes a zero to all <i>Reserved</i> bits when the entry is initialized. The <i>Reserved</i> bits are <i>Read-only</i> after initialization.	r,w,u

* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers).

39.4.3.2.3.3 Isochronous Channel Descriptors

The format and field definitions for an isochronous CDT entry are shown in the tables below respectively.

Table 39-11. Isochronous CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	Reserved															
16	Reserved															
32	Reserved							BS[8:0]								
48	Reserved															
64	WSTS[2:0]			WPTR[12:0]												
80	RSTS[2:0]			RPTR[12:0]												
96	Reserved			BD[12:0]												
112	BF	rsvd	BA[13:0]													

Table 39-12. Isochronous CDT Entry Field Definitions

Field	Description	Details	Accessibility
BA	Buffer Base Address	- BA can start at any byte in the 16k DBR	r,w
BD	Buffer Depth	- BD = size of buffer in bytes - 1 - Buffer end address = BA + BD - Isochronous buffers must be large enough to hold at least 3 blocks (packets) of data - Buffer depth must be a integer multiple of blocks	r,w
BF	Buffer Full	- Software initializes to zero, hardware updates - DMA write hardware sets BF when the buffer is full - DMA read hardware clears BF when the buffer is empty - BF is valid only when the buffer is full or empty, otherwise ignore	r,w,u
BS	Block Size	- BS defines when to begin the DMA to the data buffer - BS = buffer block size in bytes - 1 - For Rx channels, the DMA writes start when the number of empty bytes (SPACE) in the data buffer \geq the block size - For Tx channels, the DMA reads start when the number of valid bytes (VALID) in the data buffer \geq the block size	r,w,u
RPTR	Read Pointer	- Software initializes to zero, hardware updates - Counts the read address offset within a buffer - DMA read address = BA + RPTR	r,w,u
WPTR	Write Pointer	- Software initializes to zero, hardware updates - Counts the write address offset within a buffer - DMA write address = BA + WPTR	r,w,u
RSTS	Read Status	- Software initializes to zero, hardware updates - RSTS states: xx1 = active xx0 = idle	r,w,u
WSTS	Write Status	- Software initializes to zero, hardware updates - WSTS states: xx1 = active xx0 = idle x1x = command protocol error 1xx = buffer overflow (FCE = 0 only)	r,w,u
Reserved	Reserved	- Software writes a zero to all <i>Reserved</i> bits when the entry is initialized. The <i>Reserved</i> bits are <i>Read-only</i> after initialization.	r,w,u

* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers).

39.4.3.2.3.4 Asynchronous and Control Channel Descriptors

The format and field definitions for asynchronous and control CDT entries are shown in the tables below respectively.

Table 39-13. Asynchronous/Control CDT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	WPC[4:0]					Reserved

* Only valid for DMA pointers associated with the MediaLB block (Not valid for HBI block related pointers)

39.4.4 Memory Interface Block

The Memory Interface (MIF) block implements a bridge between the I/O and the CTB or DBB interfaces.

The MIF block diagram is shown in the figure below. The targeted RAM (CTR or DBR) is determined by the target location bit in the memory address register (MADR.TB).

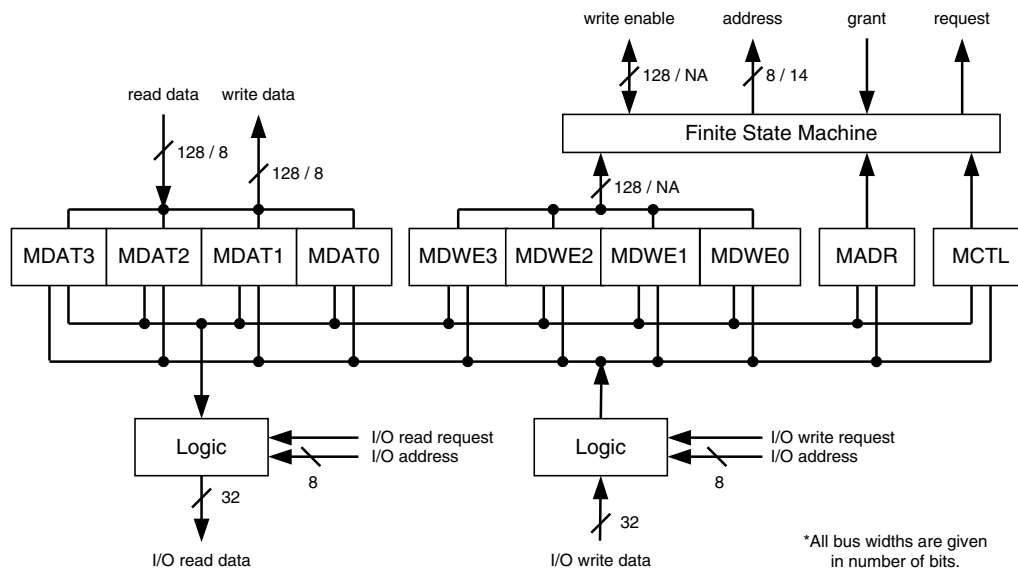

Figure 39-4. MIF Block Diagram

NOTE

The size of the read data, write data, write enable, and address buses are dependent on whether the CTB or DBB interfaces are

used. In the figure above, the first number is for CTR accesses while the second is for DBR accesses (i.e. CTR bus width / DBR bus width).

39.4.4.1 CTR Access

The MIF block allows the HC to directly access the external Channel Table RAM (CTR) when MADR.TB is cleared. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

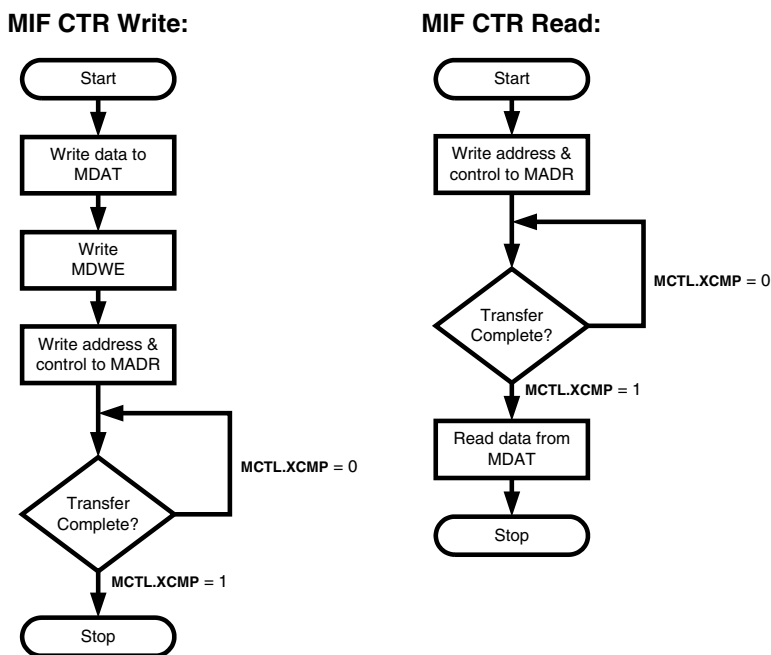

Figure 39-5. MIF CTR Read and Write Flow Diagrams

39.4.4.1.1 Direct CTR Writes

For a direct write of the CTR, the HC first loads the 128-bit data entry into the MDAT0-3 registers. Bitwise write enable control is available via the MDWE0-3 registers.

After the MDATn and MDWEn registers are set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

39.4.4.1.2 Direct CTR Reads

For a direct read of the CTR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0
- MADR.TB = 0
- MADR.ADDR[7:0] = 8-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the read is complete. The HC can then read the 128-bit data entry from the MDAT0-3 registers.

39.4.4.1.3 CTR Addressing

The CTR is addressed as a 128-bit wide value. However, the MIF block can only access 32 bits of the addressed CTR data in a single access. Therefore, four 32-bit accesses through the MIF block are required to access a single 128-bit value (e.g. CDT entry).

To access a 16-bit CAT entry in the CTR, only a single access through the MIF is required. For example, to load a CAT61 entry for an isochronous Tx channel with mute and flow control enabled:

- Write MDAT2 = 7B070000h (assumes Connection Label = 7)
- MDWE2 = FFFF0000h (bitwise write enable for 16 msbs; assumes MDWE0/1/3 = 00000000h)
- MADR = 80000087h (write CTR address 87h)

39.4.4.2 DBR Access

The MIF block allows the HC to access the external Data Buffer RAM (DBR) directly when MADR.TB is set. Any write to the MADR register triggers a single read or write cycle. Reading from the MADR register does not initiate read/write access.

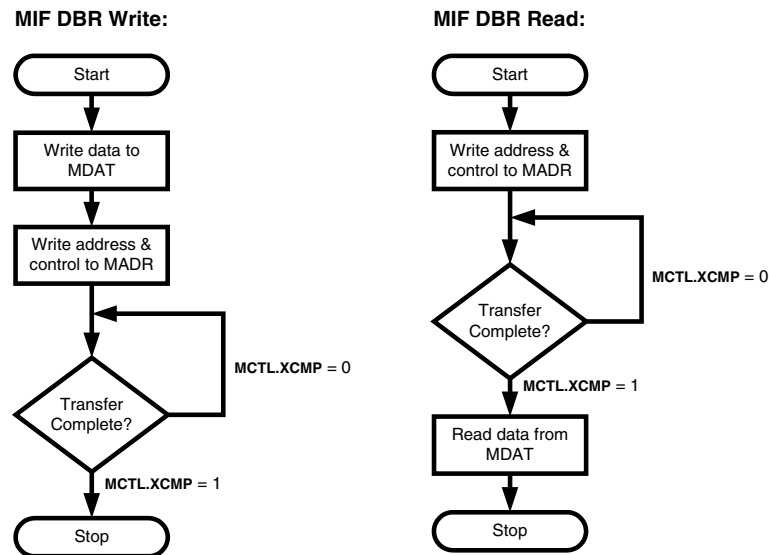

Figure 39-6. MIF DBR Read and Write Flow Diagrams

39.4.4.2.1 Direct DBR Writes

For a direct write of the DBR, the HC first loads the 8-bit data entry into the MDAT0 register at bits[7:0]. MDAT1-3 and MDWE0-3 are not used for DBR access.

After the MDAT0 register is set up, a write cycle is initiated by writing the address and control information to MADR as follows:

- MADR.WNR = 1
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets MCTL.XCMP = 1 to inform the HC when the write is complete.

39.4.4.2.2 Direct DBR Reads

For a direct read of the DBR, the HC initiates a read cycle by writing the address and control information to MADR as follows:

- MADR.WNR = 0
- MADR.TB = 1
- MADR.ADDR[13:0] = 14-bit Target Address

The MIF block sets $MCTL.XCMP = 1$ to inform the HC when the read is complete. The HC can then read the 8-bit data entry from the MDAT0 register at bits[7:0].

39.4.5 Interrupt Interface Block

The Interrupt Interface (INTIF) block performs a low-priority polling algorithm of each of the HBI channel descriptors.

The INTIF alerts the HBI block when specific changes to HBI Channel Descriptors occur.

- For asynchronous and control read/write channels:
 - a packet is available to read in the channel buffer, or
 - sufficient empty space is available in the channel buffer to accept a requested packet write.
- For isochronous read/write channels:
 - the number of valid bytes in the channel buffer exceeds the block size, or
 - the number of empty bytes in the channel buffer exceeds the block size.

39.4.6 AMBA AHB Block

The AMBA AHB block manages data exchange between local channel data buffers within the MLB50 and the system memory buffer.

To support system memory buffering, a ping-pong memory structure is implemented on a per-channel basis using 128-bit descriptors for AHB Descriptor Table (ADT) entries.

NOTE

The 64 ADT entries are directly mapped to the 64 HBI physical channels.

Each logical channel is assigned a separate 128-bit descriptor, defining the data buffers in the system memory used by the DMA interface for that channel. The descriptors are stored at fixed addresses in the external CTR.

39.4.6.1 AHB Descriptor Table

The table below provides an overview of field definitions for ADT entries.

Table 39-15. ADT Field Definitions

Field	No. of Bits	Description	Accessibility
CE	1	Channel enable: 0 = Disabled 1 = Enabled	r,w,u
LE	1	Endianess select: 0 = Big Endian 1 = Little Endian	r,w
PG	1	Page pointer. Software initializes to zero, hardware writes thereafter. 0 = Ping buffer 1 = Pong buffer	r,w,u
RDY1	1	Buffer ready bit for ping buffer page: 0 = Not ready 1 = Ready	r,w
RDY2	1	Buffer ready bit for pong buffer page: 0 = Not ready 1 = Ready	r,w
DNE1	1	Buffer done bit for ping buffer page: 0 = Not done 1 = Done	r,u,c0
DNE2	1	Buffer done bit for pong buffer page: 0 = Not done 1 = Done	r,u,c0
ERR1	1	AHB error response detected for ping buffer page: 0 = No error 1 = Rrror	r,u,c0
ERR2	1	AHB error response detected for pong buffer page: 0 = No error 1 = Error	r,u,c0
PS1	1	Packet start bit for ping buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
PS2	1	Packet start bit for pong buffer page: 0 = No packet start 1 = Packet start Reserved for synchronous and isochronous channels.	r,w,u (both Tx and Rx)
MEP1	1	Most Ethernet Packet (MEP) indicator for ping buffer page: 0 = Not MEP 1 = MEP MEP1 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx
MEP2	1	MEP packet indicator for pong buffer page: 0 = not MEP 1 = MEP MEP2 only valid for the first page of a segmented buffer. Reserved for control, synchronous and isochronous channels.	Rsvd for Tx r,u,c0 for Rx
BD1*	11 to 13	Buffer depth for ping buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BD2*	11 to 13	Buffer depth for pong buffer page: 11 or 12-bits for asynchronous and control channels. 13-bits for synchronous and isochronous channels.	r,w
BA1	32	Buffer base address for ping buffer page	r,w
BA2	32	Buffer base address for pong buffer page	r,w
Reserved	varies	Software writes a zero to all <i>Reserved</i> bits when the entry is initialized. The <i>Reserved</i> bits are <i>Read-only</i> after initialization.	r,w,u

* The buffer depth (BD1 and BD2) for synchronous channels must consider if *Multi-Frame per Sub-buffer* mode is enabled.

Data exchange across the AHB interface can be configured as Little Endian (LE = 1) or Big Endian (LE = 0). The figure below provides an overview of the endian options, chosen by an ADT descriptor field.

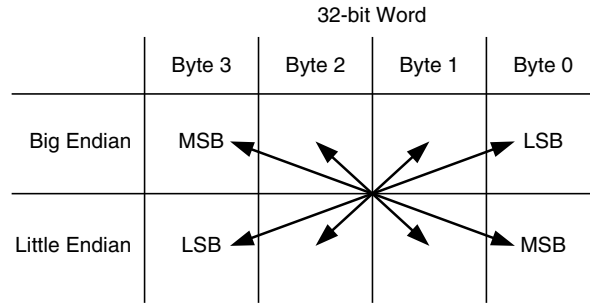

Figure 39-7. Endianness Overview

The figure below shows an example of the ping-pong system memory structure. This system memory structure is similar for all channel types and shows the relationship between the BA_n, BD_n, and PG descriptor fields.

Figure 39-8. Ping-Pong System Memory Structure

Each ADT entry holds a 32-bit BA_n field which defines the start of each ping or pong buffer within system memory. The BD_n field is used to indicate the size for the respective ping or pong page. The maximum size is 2k-entries for asynchronous and control channels; 8k-entries for isochronous and synchronous channels.

39.4.6.2 AHB Synchronous Channel Descriptors

The table below shows the format for a synchronous ADT entry. The field definitions are defined in [Table 39-15](#). Each synchronous channel buffer can be up to 8k-bytes deep.

Table 39-16. Synchronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															

Table continues on the next page...

48	RDY 2	DNE 2	ERR 2	BD2[12:0]												
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

39.4.6.3 AHB Isochronous Channel Descriptors

The isochronous buffering scheme allows each ping or pong buffer to contain a single block or a multiple number of blocks. For this reason, the isochronous buffer depth (BDn) must be defined in terms of an *integer number* (n) and *block size* (BS) (e.g. $BDn = n \times (BS + 1) - 1$).

[Table 39-17](#) shows the format for an isochronous ADT entry. The field definitions are defined in [Table 39-15](#). Each isochronous channel buffer can be up to 8k-bytes deep.

Table 39-17. Isochronous ADT Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	BD1[12:0]

64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

39.4.6.4 AHB Asynchronous and Control Channel Descriptors

Every asynchronous and control packet adheres to the Port Message Protocol (PMP), which designates the first two bytes of each packet as the packet length (PML). Each packet must be no more than 2048 bytes.

Software must set the buffer ready bit (RDYn) for each buffer as it programs the DMA. As hardware processes each buffer, it sets the done bit (DNEn) and generates an interrupt to inform HC. When hardware finishes processing a buffer it can begin processing another buffer if RDYn is set. The application is responsible for setting up and configuring the channel buffer descriptor prior to every DMA access on the channel.

Two packet modes are supported by hardware for programming the DMA, single-packet mode and multiple-packet mode.

39.4.6.4.1 Single-packet Mode

The single-packet mode asynchronous and control buffering scheme supports a maximum of one packet per buffer (e.g. ping or pong). Both non-segmented and segmented data packets are allowed while using single-packet mode.

Non-segmented packets are exchanged when only one buffer (e.g. ping or pong) is needed for packet transfer. Segmented packets are exchanged when a single packet is too long for one buffer and the packet must span multiple buffers. The figure below shows the memory space usage for both non-segmented and segmented asynchronous or control packets along with the packet start bit (PSn). While using single-packet mode, buffer done (DNEn) is set in hardware when a packet is done or the buffer is full.

[Table 39-18](#) shows the format for single-packet mode asynchronous and control ADT entries. The field definitions are defined in [Table 39-15](#).

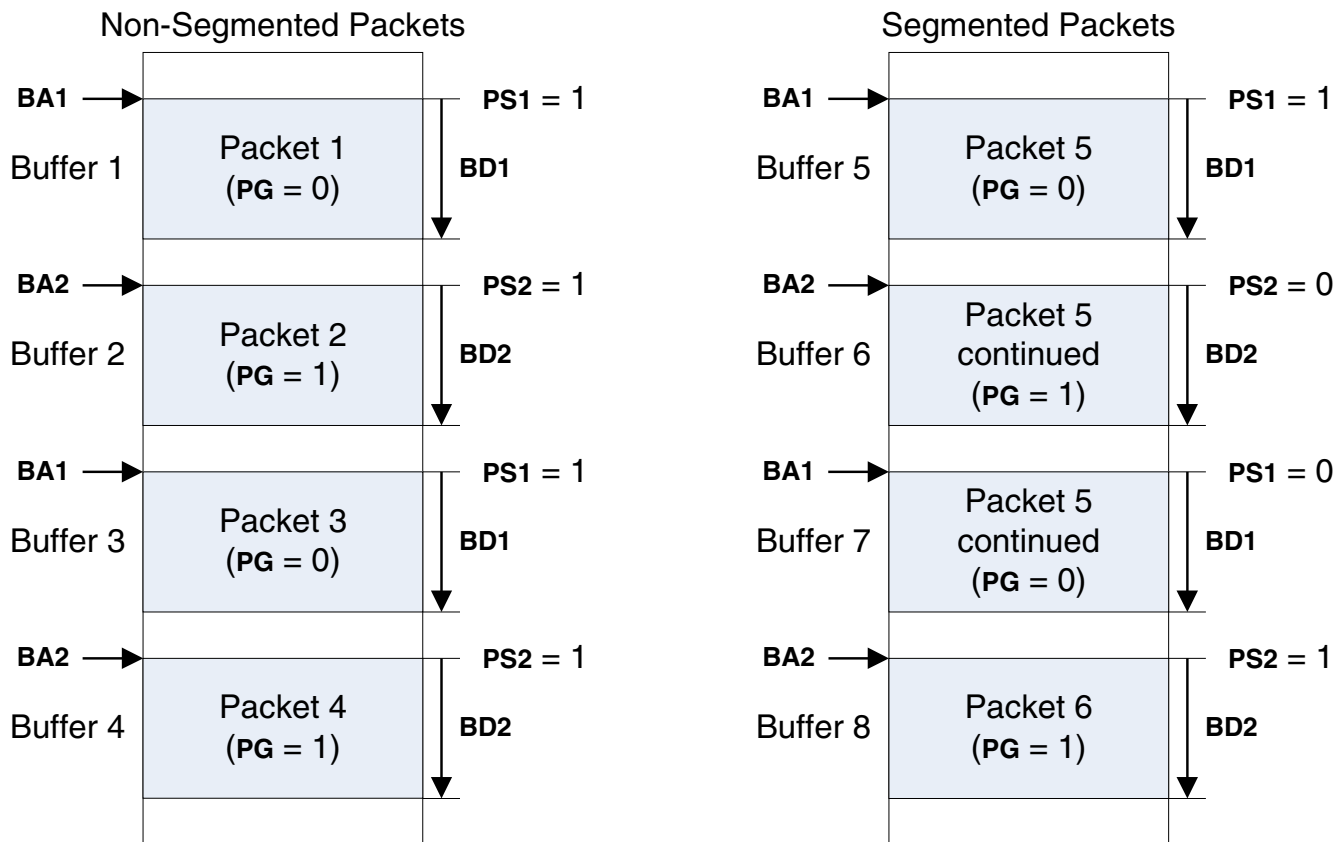

Figure 39-9. Single-packet Asynchronous or Control System Memory Structure

Table 39-18. Single-packet Asynchronous and Control Entry Format

Bit Offset	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	CE	LE	PG	Reserved												
16	Reserved															
32	RDY1	DNE1	ERR1	PS1	MEP1	BD1[10:0]										
48	RDY2	DNE2	ERR2	PS2	MEP2	BD2[10:0]										
64	BA1[15:0]															
80	BA1[31:16]															
96	BA2[15:0]															
112	BA2[31:16]															

39.4.6.4.2 Multiple-packet Mode

The multiple-packet mode asynchronous and control buffering scheme supports more than one packet per system memory buffer, as shown in the figure below. Multiple-packet mode reduces the interrupt rate for packet channels at the cost of increasing buffering and latency.

For Tx packet channels in multiple-packet mode, software sets the packet start bit (PSn) for every buffer. Setting PSn informs hardware that the first two bytes of the buffer contains the port message length (PML) of the first packet. After the first packet, hardware keeps track of where packets start and end within the current buffer. Software should not write to PSn while the buffer is active (RDYn = 1 and DNEn = 0). For Tx packet channels, the buffer is done (DNEn= 1) when the last byte of the last packet in the buffer is read from system memory. Software should set the buffer depth to contain the exact number of complete packets for that buffer. Segmented buffers are not supported for Tx packet channels in multiple-packet mode.

For Rx packet channels in multiple-packet mode, PSn has no meaning and should be ignored. Software is responsible for keeping track of where each packet starts and ends within the multiple-packet buffer via the packet PML. The buffer done bit (DNEn) is set in hardware for Rx channels when a buffer is full (see Buffer 1 in the figure below) or if a packet ends exactly 1-byte before the end of the buffer (see Buffer 2 in the figure below). Multiple-packet mode also supports segmented Rx packets spanning two or more buffers (see Buffers 3 - 6 in the figure below).

Table 39-19 shows the format for multiple-packet mode asynchronous and control ADT entries. The field definitions are defined in Table 39-15.

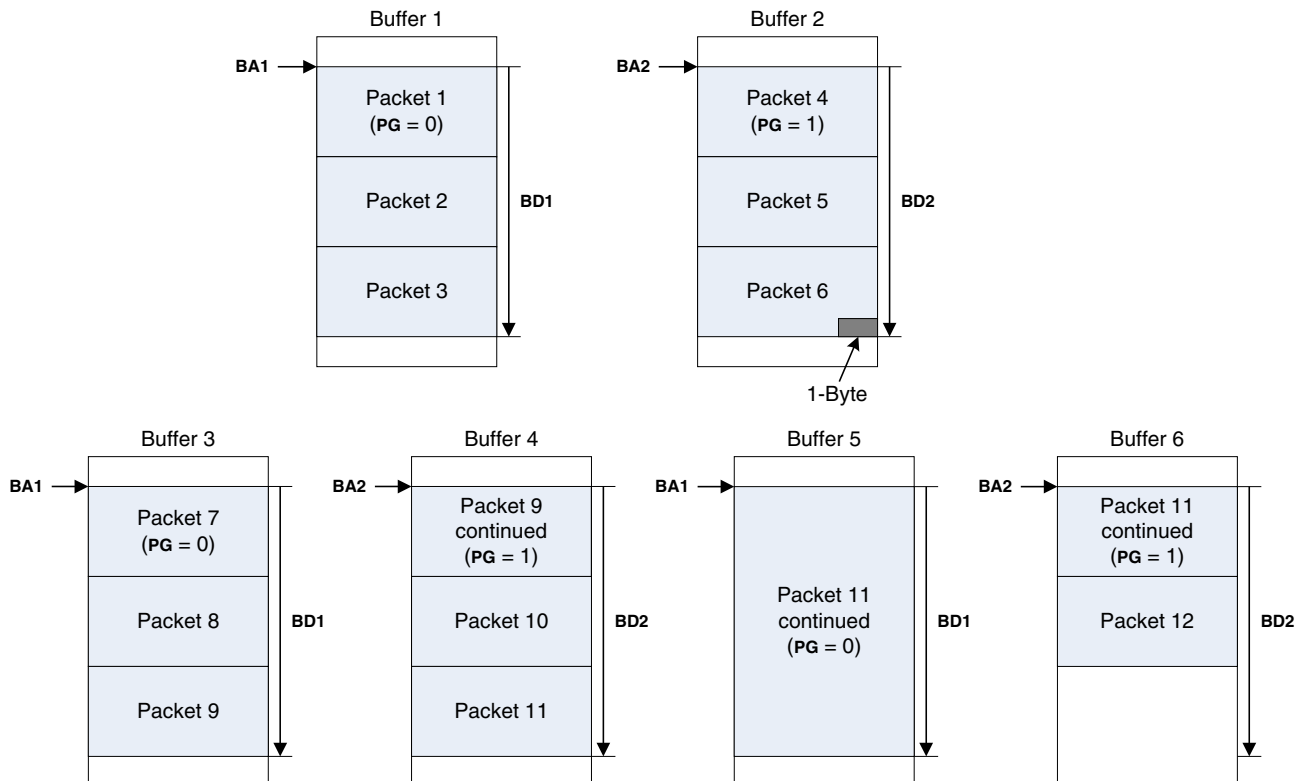

Figure 39-10. Multiple-packet Asynchronous or Control System Memory Structure

Table 39-19. Multiple-packet Asynchronous and Control Entry Format

* PSn is only valid for TX channels. Set PSn = 1 at the start of the buffer.																

39.5 Software Flow

The top-level software tasks the application must perform can be placed in two categories.

- [Channel Initialization](#)
- [Channel Servicing](#)

39.5.1 Channel Initialization

The software flow required to initialize a channel must be performed in order to ensure proper operation.

For clarity, the software flow is grouped as follows:

- [Configure the Hardware](#)
- [Program the Routing Fabric Block](#)
- [Program the AMBA AHB Block DMAs](#)
- [Synchronize and Unmute Synchronous Channel](#)

39.5.1.1 Configure the Hardware

The MLBC0, HMCR0, HMCR1 and HCTL registers are accessible directly via APB reads and writes.

1. Initialize CTR and registers

- a. Set all bit of the CTR (CAT, CDT, and ADT) to '0'.
- b. Set all bits of all registers to '0'.
2. Configure the MediaLB interface
 - a. Select 3-pin MediaLB operation: $MLBC0.MLBPEN = 0$ (3-pin)
 - b. Select MediaLB clock speed via $MLBC0.MLBCLK$
 - c. Set MediaLB enable via $MLBC0.MLBEN$
3. Configure the HBI interface
 - a. Set $HMCR0$ and $HMCR1 = FFFFFFFFh$ to activate all channels
 - b. Set the HBI enable bit: $HCTL.EN = 1$

39.5.1.2 Program the Routing Fabric Block

The CAT and CDT reside in the external CTR and are programmed indirectly via APB or I/O reads and writes to the MIF block.

1. Initialize all bits of the CAT to '0'
2. Select a logical channel: $N = 0 - 63$
3. Program the CDT for channel N
 - a. Set the 14-bit base address (BA)
 - b. Set the 12-bit or 13-bit buffer depth (BD): $BD = \text{buffer depth in bytes} - 1$
 - i. For synchronous channels: $(BD + 1) = 4 \times \text{frames per sub-buffer (m)} \times \text{bytes-per-frame (bpf)}$
 - ii. For isochronous channels: $(BD + 1) \bmod (BS + 1) = 0$
 - iii. For asynchronous channels: $(BD + 1) \geq \text{max packet length}$ (1024 for a MOST Data Packet (MDP); 1536 for a MOST Ethernet Packet (MEP))
 - iv. For control channels: $(BD + 1) \geq \text{max packet length}$ (64)
 - c. For isochronous channels, set the block size (BS): $BS = \text{block size in bytes} - 1$
 - d. Set all other bits of the CDT to '0'
4. Program the CAT for the inbound DMA
 - a. For Tx channels (to MediaLB) HBI is the inbound DMA
 - b. For Rx channels (from MediaLB) MediaLB is the inbound DMA
 - c. Set the channel direction: $RNW = 0$
 - d. Set the channel type: $CT[2:0] = 010$ (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
 - e. Set the connection label: $CL[5:0] = N$
 - f. If $CT[2:0] = 000$ (synchronous), set the mute bit ($MT = 1$).
 - g. Set the channel enable: $CE = 1$
 - h. Set all other bits of the CAT to '0'
5. Program the CAT for the outbound DMA
 - a. For Tx channels (to MediaLB) MediaLB is the outbound DMA
 - b. For Rx channels (from MediaLB) HBI is the outbound DMA

- c. Set the channel direction: $RNW = 1$
 - d. Set the channel type: $CT[2:0] = 010$ (asynchronous), 001 (control), 011 (isochronous), or 000 (synchronous)
 - e. Set the channel label: $CL[5:0] = N$
 - f. If $CT[2:0] = 000$ (synchronous), set the mute bit ($MT = 1$)
 - g. Set the channel enable: $CE = 1$
 - h. Set all other bits of the CAT to '0'
6. Repeat steps 2-5 to initialize all logical channels

39.5.1.3 Program the AMBA AHB Block DMAs

The ADT resides in the external CTR and is programmed indirectly via APB reads and writes to the MIF.

1. Initialize all bits of the ADT to '0'
2. Select a logical channel: $N = 0 - 63$
3. Program the AMBA AHB block ping page for channel N
 - a. Set the 32-bit base address (BA1)
 - b. Set the 11-bit buffer depth (BD1): $BD1 = \text{buffer depth in bytes} - 1$
 - i. For synchronous channels: $(BD1 + 1) = n \times \text{frames per sub-buffer (m)} \times \text{bytes-per-frame (bpf)}$
 - ii. For isochronous channels: $(BD1 + 1) \bmod (BS + 1) = 0$
 - iii. For asynchronous channels: $5 \leq (BD1 + 1) \leq 4096$ (max packet length)
 - iv. For control channels: $5 \leq (BD1 + 1) \leq 4096$ (max packet length)
 - c. For asynchronous and control Tx channels set the packet start bit (PS1) iff the page contains the start of the packet
 - d. Clear the page done bit (DNE1)
 - e. Clear the error bit (ERR1)
 - f. Set the page ready bit (RDY1)
4. Program the AMBA AHB block pong page for channel N
 - a. Set the 32-bit base address (BA2)
 - b. Set the 11-bit buffer depth (BD2): $BD2 = \text{buffer depth in bytes} - 1$
 - i. For synchronous channels: $(BD2 + 1) = n \times \text{frames per sub-buffer (m)} \times \text{bytes-per-frame (bpf)}$
 - ii. For isochronous channels: $(BD2 + 1) \bmod (BS + 1) = 0$
 - iii. For asynchronous channels: $5 \leq (BD2 + 1) \leq 4096$ (max packet length)
 - iv. For control channels: $5 \leq (BD2 + 1) \leq 4096$ (max packet length)
 - c. For asynchronous and control Tx channels set the packet start bit (PS2) if the page contains the start of the packet

- d. Clear the page done bit (DNE2)
 - e. Clear the error bit (ERR2)
 - f. Set the page ready bit (RDY2)
5. Select Big Endian (LE = 0) or Little Endian (LE = 1)
 6. Select the active page: PG = 0 (ping), PG = 1 (pong)
 7. Set the channel enable (CE) bit for all active logical channels
 8. Repeat steps 2-7 for all active logical channels

NOTE

All asynchronous and control packets must start with a PMP header. The first two bytes of the PMP header contains the Port Message Length (PML), which defines the length of the message that follows in bytes (not including PML itself). Hardware uses the PML to determine when a packet is complete. Asynchronous and control packets can also be segmented into two or more pages as well as contain multiple packets per page within system memory.

39.5.1.4 Synchronize and Unmute Synchronous Channel

The MLBC0 and MLBC1 registers are accessible directly via APB reads and writes.

1. Check that MediaLB clock is running (MLBC1.CLKM = 0)
2. If MLBC1.CLKM = 1, clear the register bit, wait one APB or I/O clock cycle and repeat step 1.
3. Poll for MediaLB lock (MLBC0.MLBLK = 1)
4. Wait four frames
5. Unmute synchronous channel(s)

39.5.2 Channel Servicing

After initialization, each channel will require periodic servicing.

The following software flows can be performed concurrently and in any order:

- [Servicing the AMBA AHB Block \(DMA\) Interrupts](#)
- [Servicing the MediaLB Interrupts](#)
- [Polling for MediaLB System Commands](#)

39.5.2.1 Servicing the AMBA AHB Block (DMA) Interrupts

The ACMR0, ACMR1, ACTL, ACSR0, and ACSR1 registers are accessible directly via APB reads and writes.

1. Program the ACMRn registers to enable interrupts from all active DMA channels
2. Select the status clear method: SCTL.SCE = 0 (hardware clears on read), SCTL.SCE = 1 (software writes a '1' to clear)
3. Select 1 or 2 interrupt signals: SCTL.SMX = 0 (one interrupt for channels 0-31 on *ahb_int[0]* and another interrupt for channels 32-63 on *ahb_int[1]*), SCTL.SMX = 1 (single interrupt for all channels on *ahb_int[0]*)
4. Wait for an interrupt from *ahb_int[1:0]*
5. Read the ACSRn registers to determine which channel or channels are causing the interrupt
6. If SCTL.SCE = 1, write the results of step 5 back to ACSR0 and ACSR1 to clear the interrupt
7. Select a logical channel (N = 0-63) with an interrupt to service
8. Read the ADT entry for channel N
 - a. Determine the active page (ping or pong) via the PG bit
 - b. Determine which page(s) are done via the DNEn bits
 - c. Determine which channels encountered an AHB error via the ERRn bit
 - d. Determine which asynchronous and control Rx channel pages contain a packet start via the PSn bit (extract the PML)
9. Reprogram the expired or broken AHB page(s) via steps 3 and 4 in [Program the AMBA AHB Block DMAs](#),
10. Repeat steps 6-9 for all channels with pending interrupts
11. Repeat steps 4-10 while there are active channels

NOTE

Channels that receive an AHB error response are disabled (CE = 0) by hardware.

39.5.2.2 Servicing the MediaLB Interrupts

1. Select the MediaLB Channel Status Register (MSn) to be cleared by software, writing a '0' to the appropriate bits
2. Program MIEN to enable protocol error interrupts for all active MediaLB channels (MIEN.CTX_PE = 1, MIEN.CRX_PE = 1, MIEN.ATX_PE = 1, MIEN.ARX_PE = 1, MIEN.SYNC_PE = 1, and MIEN.ISOC_PE = 1)
3. Wait for an interrupt on the *mlb_int* signal.
4. Read the MSn registers to determine which channel(s) are causing the interrupt

5. Read RSTS/WSTS of the appropriate CDT(s) to determine the interrupt type
6. Clear RSTS/WSTS errors to resume channel operation
 - a. For synchronous channels: $WSTS[3] = 0$
 - b. For isochronous channels: $WSTS[2:1] = 00$
 - c. For asynchronous and control channels: $RSTS[4]/WSTS[4] = 0$ and $RSTS[2]/WSTS[2] = 0$

39.5.2.3 Polling for MediaLB System Commands

The MLB supports the MediaLB System Commands (e.g. MlbScan, MlbReset, MOST_Unlock). The MediaLB System Status (MSS) Register is used to detect a System Command received from the MediaLB Controller. The MLB automatically sends the appropriate system response to the MediaLB Controller.

The procedure for the application is:

1. The application periodically polls the MSS register.
2. Clear by writing a '0' to the appropriate bit in MSS register after the application finishes the service.
3. If $MSS.SWSYSCMD = 1$, read the MSD register to receive the system data sent from MediaLB Controller.

39.5.3 Low Power Mode

MLB doesn't provide dedicated low power mode features.

In case the clocks of digital IP need to shut down to save power, the following operations are recommended before entering low power mode:

- Finish any active MLB transfer
- Disable MLB (clear the MLBEN and MLBPEN bits in MLBC0)
- Disable HBI (clear all bits in HCMR0 and HCMR1, clear EN bit in HCTL)
- Mask AHB interrupts (clear all bits in ACMR0 and ACMR1)

For information on configuring the MLB IP if the clocks are re-enabled, see [Configure the Hardware](#).

39.6 MLB50 Memory Map/Register Definition

The MLB50 registers are divided into 4 sections.

The first section begins at offset 0h00 and describes the MediaLB block registers.

The second section begins at offset 0h80 and it shows the address mapping of the Internal HBI Registers.

The third set begins at offset 0hC0 and implements ten 32-bit I/O registers for CTR transfers, including: data registers (MDATn), write enable registers (MDWEn), a control register (MCTL), and an address register (MADR).

The fourth set, the AMBA AHB registers, begins at offset 0h3C0. They consist of:

- one 32-bit register for control
- two 32-bit registers for interrupt status
- two 32-bit registers for channel interrupt masks

MLB memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

39.6.1 MediaLB Control 0 Register (MLB_MLBC0)

Address: 218_C000h base + 0h offset = 218_C000h

MLB_MLBC0 field descriptions

Field	Description
31-18 -	This field is reserved. Reserved
17-15 FCNT[2:0]	The number of frames per sub-buffer for synchronous channels. 000 1 frame per sub-buffer (Operation is the same as Standard mode.) 001 2 frames per sub-buffer 010 4 frames per sub-buffer 011 8 frames per sub-buffer 100 16 frames per sub-buffer 101 32 frames per sub-buffer 110 64 frames per sub-buffer 111 Reserved
14 CTLRETRY	Control Tx packet retry. When set, a control packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, a control packet that is flagged with a Break or ProtocolError by the receiver is skipped.
13 -	This field is reserved. Reserved

Table continues on the next page...

MLB_MLBC0 field descriptions (continued)

Field	Description
12 ASYRETRY	Asynchronous Tx packet retry. When set, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is retransmitted. When cleared, an asynchronous packet that is flagged with a Break or ProtocolError by the receiver is skipped.
11–8 -	This field is reserved. Reserved
7 MLBLK	MediaLB lock status. When set, indicates that the MediaLB block is synchronized to the incoming MediaLB frame. If MLBLK is clear (unlocked), MLBLK is set after FRAMESYNC is detected at the same position for three consecutive frames. If MLBLK is set (locked), MLBLK is cleared after not receiving FRAMESYNC at the expected time for two consecutive frames. While MLBLK is set, FRAMESYNC patterns occurring at locations other than the expected one are ignored. (read-only)
6 -	This field is reserved. Reserved
5 -	This field is reserved.
4–2 MLBCLK_2_0	MLB_CLK (MediaLB clock) speed select. 000 256xFs (for MLBPEN = 0) 001 512xFs (for MLBPEN = 0) 010 1024xFs (for MLBPEN = 0)
1 -	This field is reserved. Reserved
0 MLBEN	MediaLB enable. When set, MLB_CLK (MediaLB clock), MLB_SIG (signal), and MLB_DATA (data) are received and transmitted on the appropriate MediaLB pins.

39.6.2 MediaLB Channel Status 0 Register (MLB_MS0)

Address: 218_C000h base + Ch offset = 218_C00Ch

MLB_MS0 field descriptions

Field	Description
MCS_31_0	MediaLB channel status. Indicates the channel status for MediaLB channels 31 to 0. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

39.6.3 MediaLB 6-pin Control 2 Register (MLB_MLBPC2)

Address: 218_C000h base + Dh offset = 218_C00Dh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MLB_MLBPC2 field descriptions

Field	Description
31–16 -	Reserved. This field is reserved. Reserved
15 MORCE	Output reference clock (for SPDIF and ASRC) enable. 0 Enable MLB output reference clock. 1 Disable MLB output reference clock.
14–8 MORCD	Divider factor of MLB output reference clock. MLB output reference clock is divided by MLB bus clock, the divider factor can be choose between 1 to 128. 0x00 Divider factor is 1. 0x01 Divider factor is 2. ... 0xff Divider factor is 256.
7–3 -	Reserved. This field is reserved. Reserved.
2–1 -	This field is reserved.
0 SDOPC	MLB 3-pin interface: Signal/Data output phase control. 0 MLB_SIG / MLB_DATA launch at rising edge of MLB_CLK(default) 1 MLB_SIG / MLB_DATA launch at falling edge of MLB_CLK

39.6.4 MediaLB Channel Status1 Register (MLB_MS1)

Address: 218_C000h base + 14h offset = 218_C014h

MLB_MS1 field descriptions

Field	Description
MCS_63_32	MediaLB channel status. Indicates the channel status for MediaLB channels 63 to 32. Channel status bits are set by hardware and cleared by software. Status is only set if the appropriate bits in the MIEN register are set.

39.6.5 MediaLB System Status Register (MLB_MSS)

Address: 218_C000h base + 20h offset = 218_C020h

MLB_MSS field descriptions

Field	Description
31–6 -	This field is reserved. Reserved
5 SERVREQ	Service request enabled. When set, the MediaLB block responds with a "device present, request service" system response if a matching channel scan system command is detected. When cleared, the MediaLB block responds with a "device present" system response.
4 SWSYSCMD	Software system command detected (in the system quadlet). Set by hardware, cleared by software. Data is stored in the MSD register for this command.
3 CSSYSCMD	Channel scan system command detected (in the system quadlet). Set by hardware, cleared by software. If the node address specified in <i>Data</i> quadlet matches the value in MLBC1.NDA , the device responds either "device present" or "device present, request service" system response in the next system quadlet.

Table continues on the next page...

MLB_MSS field descriptions (continued)

Field	Description
2 ULKSYSCMD	Network unlock system command detected (in the system quadlet). Set by hardware, cleared by software.
1 LKSYSCMD	Network lock system command detected (in the system quadlet). Set by hardware, cleared by software.
0 RSTSYSCMD	Reset system command detected (in the system quadlet). Set by hardware, cleared by software.

39.6.6 MediaLB System Data Register (MLB_MSD)

Address: 218_C000h base + 24h offset = 218_C024h

MLB_MSD field descriptions

Field	Description
31–24 SD3_7_0	System data (byte 3). Updated with MediaLB Data[31:24] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD3 is not updated. (read-only)
23–16 SD2_7_0	System data (byte 2). Updated with MediaLB Data[23:16] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD2 is not updated. (read-only)
15–8 SD1_7_0	System data (byte 1). Updated with MediaLB Data[15:8] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD1 is not updated. (read-only)
SD0_7_0	System data (byte 0). Updated with MediaLB Data[7:0] when a MediaLB software system command is received in the system quadlet. If MSS.SWSYSCMD is already set, then SD0 is not updated. (read-only)

39.6.7 MediaLB Interrupt Enable Register (MLB_MIEN)

Address: 218_C000h base + 2Ch offset = 218_C02Ch

MLB_MIEN field descriptions

Field	Description
31–30 -	This field is reserved. Reserved
29 CTX_BREAK	Control Tx break enable. When set, a <i>ReceiverBreak</i> response received from the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
28 CTX_PE	Control Tx protocol error enable. When set, a <i>ProtocolError</i> generated by the receiver on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
27 CTX_DONE	Control Tx packet done enable. When set, a packet transmitted with no errors on a control Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
26 CRX_BREAK	Control Rx break enable. When set, a <i>ControlBreak</i> command received from the transmitter on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
25 CRX_PE	Control Rx protocol error enable. When set, a <i>ProtocolError</i> detected on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
24 CRX_DONE	Control Rx packet done enable. When set, a packet received with no errors on a control Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
23 -	This field is reserved. Reserved
22 ATX_BREAK	Asynchronous Tx break enable. When set, a <i>ReceiverBreak</i> response received from the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

Table continues on the next page...

MLB_MIEN field descriptions (continued)

Field	Description
21 ATX_PE	Asynchronous Tx protocol error enable. When set, a <i>ProtocolError</i> generated by the receiver on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
20 ATX_DONE	Asynchronous Tx packet done enable. When set, a packet transmitted with no errors on an asynchronous Tx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
19 ARX_BREAK	Asynchronous Rx break enable. When set, a <i>AsyncBreak</i> command received from the transmitter on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
18 ARX_PE	Asynchronous Rx protocol error enable. When set, a <i>ProtocolError</i> detected on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
17 ARX_DONE	Asynchronous Rx done enable. When set, a packet received with no errors on an asynchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
16 SYNC_PE	Synchronous protocol error enable. When set, a <i>ProtocolError</i> detected on a synchronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.
15–2 -	This field is reserved. Reserved
1 ISOC_BUFO	Isochronous Rx buffer overflow enable. When set, a buffer overflow on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set. This occurs only when isochronous flow control is disabled.
0 ISOC_PE	Isochronous Rx protocol error enable. When set, a <i>ProtocolError</i> detected on an isochronous Rx channel causes the appropriate channel bit in the MS0 or MS1 registers to be set.

39.6.8 MediaLB Control 1 Register (MLB_MLBC1)

Address: 218_C000h base + 3Ch offset = 218_C03Ch

MLB_MLBC1 field descriptions

Field	Description
31–16 -	This field is reserved. Reserved
15–8 NDA_7_0	Node device address. Used for system commands directed to individual MediaLB nodes.
7 CLKM	MediaLB clock missing status. Set when MLB_CLK (MediaLB clock) is not toggling at the pin; cleared by software.
6 LOCK	MediaLB lock error status. Set when MediaLB is unlocked; cleared by software.
-	This field is reserved. Reserved

39.6.9 HBI Control Register (MLB_HCTL)

The HC can control and monitor general operation of the HBI block by reading and writing the HBI Control Register (HCTL) through the I/O interface. Each bit of HCTL is read/write.

Address: 218_C000h base + 80h offset = 218_C080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

39.6.10 HBI Channel Mask 0 Register (MLB_HCMR0)

The HC can control which channel(s) are able to generate an HBI interrupt by writing the HBI Channel Mask Registers (HCMRn). The HCMRn registers mask the channel interrupt on the *hbi_hintb* signal (i.e. *hbi_hintb* will not become active for any masked channel). Each bit of HCMRn is read/write.

Address: 218_C000h base + 88h offset = 218_C088h

MLB_HCMR0 field descriptions

Field	Description
CHM_31_0_P	Bitwise channel mask bit
	0 masked
	1 unmasked

39.6.11 HBI Channel Mask 1 Register (MLB_HCMR1)

Address: 218_C000h base + 8Ch offset = 218_C08Ch

MLB_HCMR1 field descriptions

Field	Description
CHM_63_32	Bitwise channel mask bit
	0 masked
	1 unmasked

39.6.12 HBI Channel Error 0 Register (MLB_HCER0)

The HBI Channel Error Registers (HCERn) indicate which channel(s) have encountered fatal errors.

Address: 218_C000h base + 90h offset = 218_C090h

MLB_HCER0 field descriptions

Field	Description
CERR_31_0	Bitwise channel error bit

39.6.13 HBI Channel Error 1 Register (MLB_HCER1)

HCERn status bits are set when hardware detects hardware errors on the given logical channel, including:

- Channel opened, but not enabled,
- Channel programmed with invalid channel type, or
- Out-of-range PML for asynchronous or control Tx channels

Address: 218_C000h base + 94h offset = 218_C094h

MLB_HCER1 field descriptions

Field	Description
CERR_63_32	Bitwise channel error bit

39.6.14 HBI Channel Busy 0 Register (MLB_HCBR0)

The HC can determine which channel(s) are busy by reading the HBI Channel Busy Registers (HCBRn). An HBI channel is busy if:

- it is currently loaded into one of the two AGUs
- the channel is enabled, CE = 1 from the Channel Allocation Table ([Table 39-5](#)), and
- the DMA is active

When an HBI channel is busy, hardware may write back its local copy of the channel descriptor at any time. System software should not write a CDT descriptor for a channel that is busy. Only two HBI channels can be busy at any given time. Each bit of HCBRn is read-only.

Address: 218_C000h base + 98h offset = 218_C098h

MLB_HCBR0 field descriptions

Field	Description
CHB_31_0	Bitwise channel busy bit 0 idle 1 busy

39.6.15 HBI Channel Busy 1 Register (MLB_HCBR1)

Address: 218_C000h base + 9Ch offset = 218_C09Ch

0 SCE	Software clear enable: 0 Hardware clears interrupt after a ACSRn register read 1 Software clears interrupt

39.6.27 AHB Channel Status 0 Register (MLB_ACSR0)

The AHB Channel Status (ACSRn) registers contain interrupt bits for each of the 64 physical channels. When an ACSRn register bit is set, it indicates that the corresponding physical channel has an interrupt pending.

An AHB interrupt is triggered when either DNEn or ERRn is set within the AHB Channel Descriptor. The HC is notified of the channel interrupt via *ahb_int[1:0]*. When an interrupt occurs in ACSR0 (for channels 31 to 0) *ahb_int[0]* is set. When an interrupt occurs in ACSR1 (for channels 63 to 32) *ahb_int[1]* is set.

Interrupts in ACSR0 and ACSR1 can be optionally muxed onto a single interrupt signal, *ahb_int[0]*, if ACTL.SMX = 1. If ACTL.SCE = 0, hardware automatically clears the interrupt bit(s) after the HC reads the ACSRn register. Alternatively, if ACTL.SCE = 1, software must write a 1 to the appropriate bit(s) of ACSRn to clear the interrupt(s).

Address: 218_C000h base + 3D0h offset = 218_C3D0h

MLB_ACSR0 field descriptions

Field	Description
CHS	Interrupt status for logical channels 31 to 0: 0 None 1 Interrupt

39.6.28 AHB Channel Status 1 Register (MLB_ACSR1)

Address: 218_C000h base + 3D4h offset = 218_C3D4h

MLB_ACSR1 field descriptions

Field	Description
CHS[63:32]	Interrupt status for logical channels 63 to 32: 0 None 1 Interrupt

39.6.29 AHB Channel Mask 0 Register (MLB_ACMR0)

Using the AHB Channel Mask (ACMRn) register, the HC can control which channel(s) generate interrupts on *ahb_int[1:0]*. All ACMRn register bits default as '0' ("masked"); therefore, the HC must initially write ACMRn to enable interrupts. Each bit of ACMRn is read/write accessible.

Address: 218_C000h base + 3D8h offset = 218_C3D8h

Field	Description
CHM[63:32]	Bitwise channel mask bit: 0 Masked 1 Unmasked

Chapter 40

Multi Mode DDR Controller (MMDC)

40.1 Overview

MMDC is a multi-mode DDR controller that supports DDR3/DDR3L x16/x32 and LPDDR2 x16/x32 memory types. MMDC is configurable, high performance, and optimized.

The following figure shows the MMDC block diagram.

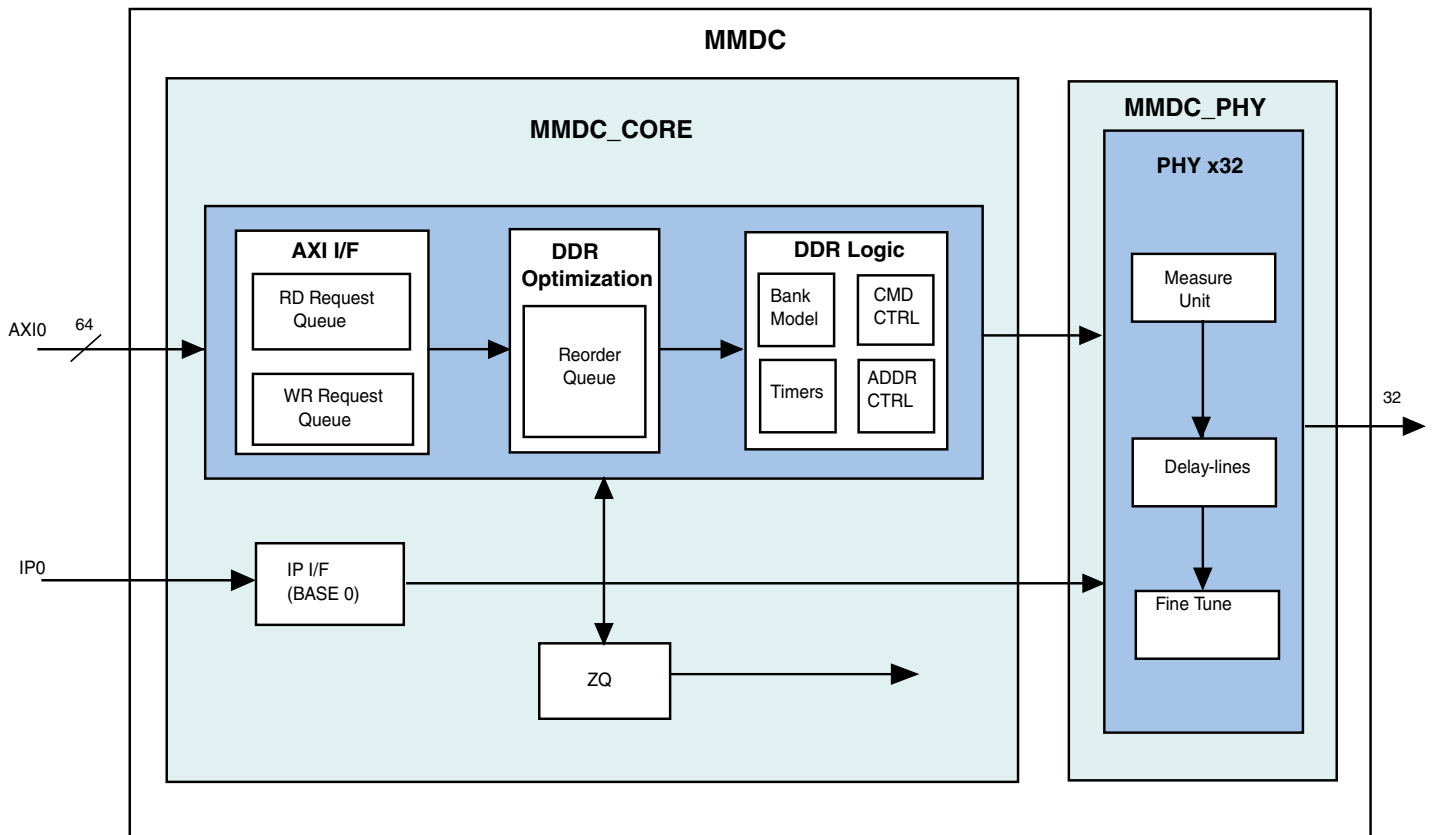

Figure 40-1. MMDC block diagram

MMDC consists of a core (MMDC_CORE) and PHY (MMDC_PHY).

- The core is responsible for communication with the system through an AXI interface, DDR command generation, DDR command optimizations, and a read/write data path.
- The PHY is responsible for the timing adjustment; it uses special calibration mechanisms to ensure data capture margin at a clock rate of up to 400 MHz.

The internal memory map(configuration registers) of the MMDC can be configured through an IP channel (IP0).

40.1.1 MMDC feature summary

The table found here summarizes the MMDC features.

Table 40-1. MMDC feature summary

Feature	Details
DDR standards	<ul style="list-style-type: none"> • LV-DDR3, DDR3 x16, x32 • LPDDR2 x16, x32 • Does not support LPDDR1MDDR or DDR2
DDR interface	<ul style="list-style-type: none"> • x16, x32 data bus width • Density per DDR device of 256 Mbits–8 Gbits with the following column and row combinations: <ul style="list-style-type: none"> • Column size of 8–12 bits • Row size of 11–16 bits • Two chip selects (one chip select for DDR3/LVDDR3, two chip selects for LPDDR2) • Up to 4 Gbytes of address space with configurable partitioning between CS0 and CS1 • Supports burst length of 8 (aligned) for DDR3 • Supports burst length of 4 for LPDDR2
DDR performance	<ul style="list-style-type: none"> • MMDC running at up to 396 MHz (792MT/s), see CCM block for actual clock frequencies supported. • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable various priority levels in the re-ordering mechanism: real-time, latency sensitive, normal priority. • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write request queues to enable bank prediction. • Drives back the critical word in a read transaction as soon as it is received by the DDR device (does not wait until the whole data phase has been completed). • Keeps tracking of open memory pages • Supports bank interleaving • Special optimization in case of non-aligned wrap accesses in DDR3 mode (burst length 8) <p>NOTE: Due to reordering and optimization mechanisms (per different AXI Identifier (ID)), the transactions towards the DDR device may be driven in a different ID order than was received by the AXI master. In a similar fashion, the write response, read response or read data may be driven to the AXI master in a different ID order.</p>
AXI interface	<ul style="list-style-type: none"> • AXI bus compliant • Supports bus transfers of 8, 16, 32, 64 bits (single accesses and bursts) running at 396 MHz.

Table continues on the next page...

Table 40-1. MMDC feature summary (continued)

Feature	Details
	<ul style="list-style-type: none"> • Supports AXI bursts length of up to 16 • Supports burst types of WRAP, INCR and FIXED • Supports 16 bits AXI ID • Write data interleave depth is 1 (no support for Write Data Interleave) • Supports write data before address • Supports buffered/non-buffered accesses (AWCACHE[0] = 0b means a non-bufferable access and AWCACHE[0] = 1b means a bufferable access). The rest of the CACHE options are not supported <ul style="list-style-type: none"> • To keep data access coherency between write and read access of the same master, the response signal is sent as follows: <ul style="list-style-type: none"> • Bufferable write access—BRESP will be sent when last data of the access has entered the MMDC. • Non-bufferable write access—BRESP will be sent when the data was physically written into the external memory device. • Supports four exclusive monitors per configurable ID for only a single access with a size of up to 64 bits • Supports AXI responses as follows: <ul style="list-style-type: none"> • Okay in case the access has been successful or exclusive access failure • Slave error in case of security violation • Exclusive okay in case the read or the write portion of an exclusive access has been successful
DDR calibration and delay-lines.	<ul style="list-style-type: none"> • Supports various calibration processes which can be performed either automatically (hardware) or manually (software) towards either CS0 or CS1. (At the end of the process the delay-lines will work with one set of results.) The following calibration processes are supported: <ul style="list-style-type: none"> • ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2 through MRW command) <ul style="list-style-type: none"> • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh) • Can be handled manually at ZQ INIT • ZQ calibration for i.MX DDR I/O pads for calibrating the DDR driving strength <ul style="list-style-type: none"> • The sequence can be handled automatically by hardware • The sequence can be handled step by step manually by software • Read data calibration. Adjustment of read DQS with read data byte. • Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. • Write data calibration. Adjustment of write DQS with write data byte. • Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). • Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit. • Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit. • Periodic delay-line measurement for keeping its accuracy during refresh interval. • Additional fine tuning delay lines to adjust DDR clock delay, DDR clock duty cycle, DQS duty cycle.
Power saving	<ul style="list-style-type: none"> • Support of dynamic voltage, frequency change and self-refresh mode entry through hardware and software negotiation with the system (request/acknowledge handshake) <ul style="list-style-type: none"> • Upon hardware or software self-refresh request assertion, further AXI requests are blocked (even before the assertion of the acknowledge). • During self-refresh mode the system may deassert the operating clock of the MMDC for power saving. • During self-refresh mode the clock (CK) that is driven to the DDR device will be gated for power saving. • Supports automatic self-refresh and power down entry and exit <ul style="list-style-type: none"> • In automatic self-refresh, the internal operating clock will be gated for power saving.

Table continues on the next page...

Table 40-1. MMDC feature summary (continued)

Feature	Details
	<ul style="list-style-type: none"> • Supports fast and slow precharge power down in DDR3 • Automatic active and precharge power down timer per chip select (one chip select can enter power down while the other is still working) • While CS (chip-select) is inactive (high) the command and address buses are not toggling for power saving. • While DM (data masking) is high the associated DQ bus is not toggling (driven to "0") for power saving.
DDR general	<ul style="list-style-type: none"> • Configurable timing parameters • Configurable refresh scheme • Page boundary crossing support <ul style="list-style-type: none"> • Automatically generates precharge command and activates the next row • Supports various ODT control schemes <ul style="list-style-type: none"> • Assertion or deassertion of ODT control per read or write accesses and for active or passive CS (chip-select) • Supports MRW and MRR commands for LPDDR2 • Software control in LPDDR2 mode for switching to derated timing parameters and/or update the refresh rate according to temperature sensor • Debug and profiling capabilities

40.2 External Signals

40.4 Functional Description

This section provides a complete functional description of the block.

40.4.1 Write/Read data flow

40.4.1.1 Write data flow

1. Write requests are received into an 8 entries request FIFO. Access is received only when there are at least two available entries. Each entry holds all of the AXI attributes.
 - If the burst length is greater than 8, the access splits into two accesses: one with burst length 8 and the other with the remainder.
 - The access can be performed as soon as the entire data phase of the associated write request is completed (all data beats were received).
2. A simple round-robin arbitration between the pending read and write accesses is performed, and the pointer to this stage's winner access is sent to the re-ordering buffer.
3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see [Dynamic scoring mode \(Arbitration Winning Conditions\)](#).
4. The winner write access at the previous stage is received and is held for dispatch to the DDR logic.
5. When the DDR command control unit is ready to accept the write request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The DDR logic drives the associated data to the DDR device through the DDR PHY.

40.4.1.2 Read data flow

1. Read requests are received into a 16 entry request FIFO in MMDC if there are at least two available entries. Each entry holds all of the AXI attributes.

NOTE

If the burst length is greater than 8, the access splits into 2 accesses (one with burst length 8 and the other with the remainder).

2. A simple round-robin arbitration between the pending read and write accesses is performed and the pointer to this phase's winner access is sent to the re-ordering buffer.

3. The reordering mechanism is activated to find the winner access, which is the access that best utilizes the DDR bus, based on its dynamic score. For further information see [Dynamic scoring mode \(Arbitration Winning Conditions\)](#).
4. The winner read access at the previous stage is sampled and is held for dispatch to the DDR logic. This read access will be dispatched when there is at least one free slot in the read data buffer to store the data.
5. When the DDR command control unit is ready to accept the read request, it issues (if needed) a precharge/active command to the DDR device according to the status of the bank model and the parameters of the timers.
6. The MMDC PHY samples the read data, and the DDR logic transfers the data to the associated slot in the read data buffer.
7. MMDC transfers the data back to the master.

40.4.2 MMDC initialization

Because the MMDC is disabled when the chip exits reset, no clock is driven to the DDR device and the whole interface towards the DDR device is inactive. The following steps are required to activate the MMDC properly.

NOTE

To guarantee that the DRAM_RESET and DRAM_SDCKE signals are kept low during the power-up and reset sequences of the chip in DDR3 and LPDDR2 modes (as defined by JEDEC), you must connect those signals to pull-down resistors.

1. Set MDSCR[CON_REQ], which sets the configuration request; note that because the MMDC is disabled, there is no need to poll the configuration acknowledge bit at MDSCR[CON_ACK].
2. Configure the desired timing parameters at the MDCFG0, MDCFG1, MDCFG2, and MDOTC registers.
3. Configure the DDR type and other miscellaneous parameters at the MDMISC register.
4. Configure the required delay while leaving reset, at the MDOR register.
5. Configure the DDR physical parameters (density and burst length) at the MDCTL register.
6. Perform a ZQ calibration of the MMDC module to correctly initialize drive strengths.
7. Enable MMDC with the desired chip select at MDCTL[SDE_0] (for chip select 0) and MDCTL[SDE_1] (for chip select 1). At this point, MMDC starts the reset and initialization sequence related to DRAM_RESET/DRAM_SDCKE as defined by JEDEC.

8. Complete the initialization sequence as defined by JEDEC by issuing MRS/MRW commands for (ZQ, ODT, PRE, and so on). To issue those commands, configure the appropriate command and address at the MDSCR register.
9. Program the DDR mode registers by configuring the appropriate command and address at the MDSCR register.
10. Configure the power down and self-refresh entry and exit parameters at the MDPDC and MAPSR registers.
11. Configure the ZQ scheme at the MPZQHWCTRL and MPZQLP2CTRL registers.
12. Configure and activate the periodic refresh scheme at the MDREF register.
13. Deassert the configuration request by clearing MDSCR[CON_REQ].

NOTE

Steps 1 through 5 are non-blocking and can be done in any order.

Upon completion of these steps, MMDC is ready for work and to process AXI accesses.

NOTE

To achieve better timing and better precision, it is recommended that users configure the MMDC PHY delay parameters by operating either the automatic or manual calibration process. Before starting any calibration process, you must disable the periodic refresh scheme (MDREF[REF_SEL] = 00) and then issue a manual refresh command by configuring MDSCR[CMD] to 2h. For further information, see [Calibration Process](#).

40.4.3 Configuring the MMDC registers

To safely modify MMDC's internal configuration registers, MMDC must be placed into configuration mode.

Use the following steps to enter configuration mode.

1. Issue a configuration request by setting MDSCR[CON_REQ].
2. Poll on configuration acknowledge until it is set at MDSCR[CON_ACK].

At this point, MMDC enters configuration mode and accessing the MMDC registers is permitted.

NOTE

During configuration mode, MMDC prevents further AXI accesses from being acknowledged.

Upon deassertion of MDSCR[CON_REQ], MMDC leaves configuration mode and AXI accesses are processed.

40.4.4 MMDC Address Space

40.4.4.1 Address decoding

MMDC supports up to two consecutive chip selects, each with the same density.

It is optional to configure the partition between the chip selects through MDASP[CS0_END].

The incoming AXI address bus is 32 bits. MMDC decodes each access as follows:

1. chip select
2. bank number
3. row number
4. column number

The following registers in the MMDC define the DDR address space:

- MDMISC[DDR_4_BANK]—Defines either 4 or 8 banks in the DDR device
- MDCTL[DSIZ]—Defines the DDR data bus width of x16, x32 or x64
- MDMISC[BI]—Defines whether bank interleaving is on or off
- MDCTL[COL]—Defines the column size of the DDR device
- MDCTL[ROW]—Defines the row size of the DDR device

The following tables show address decoding examples for x16 and x32 bit DDR devices when bank interleaving is both on and off. It is assumed that the configuration is as follows: 8 banks (3 bits), 15 bit assignment for the row, and 10 bit assignment for the column. The total density is 256 MWords (512 Mbytes for x16 and 1 Gbyte for x32).

NOTE

Chip selection is done by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

A1	COL[0]	—
A0	—	—

NOTE

In cases where this is an access to a non-initialized or disconnected chip select, behavior may be unexpected.

40.4.4.2 Chip select settings

MMDC drives the incoming access to either CS0 or CS1 by comparing the 7 most significant address bits (ARADDR[31:25]/AWADDR[31:25]) with MDASP[CS0_END].

Generally, the total density per chip-select must be the same, and the total density per chip-select must be a power of two.

[Creating 4 Gbyte address space with 2 Gbyte CS density](#) and [Creating 2 Gbyte address spaces with 1 Gbyte CS density](#) show how to create a continuous address space and configure the MMDC accordingly.

40.4.4.2.1 Creating 4 Gbyte address space with 2 Gbyte CS density

If the DDR memory space allocation is 4 Gbytes, only one configuration of chip select partition is allowed.

The register MDASP[CS0_END] should be set to 011_1111 (partition at 2 Gbytes).

The figure below shows the associated memory space. In the case of DDR3 x64, this address space can be achieved by connecting four devices per chip select. Each device is x16 with density of 4 Gbytes.

Figure 40-2. Chip select partition—2 Gbytes per chip select

40.4.4.2.2 Creating 2 Gbyte address spaces with 1 Gbyte CS density

If the DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition: MDASP[CS0_END] to 001_1111 (1 Gbyte), MDASP[CS0_END] to 011_1111 (2 Gbytes), and MDASP[CS0_END] to 101_1111 (3 Gbytes).

If DDR memory space allocation is 2 Gbytes, there are three options for configuring the chip select partition:

- MDASP[CS0_END] to 001_1111 (1 Gbyte)
- MDASP[CS0_END] to 011_1111 (2 Gbytes)
- MDASP[CS0_END] to 101_1111 (3 Gbytes)

The figure below shows the associated memory space:

Functional Description

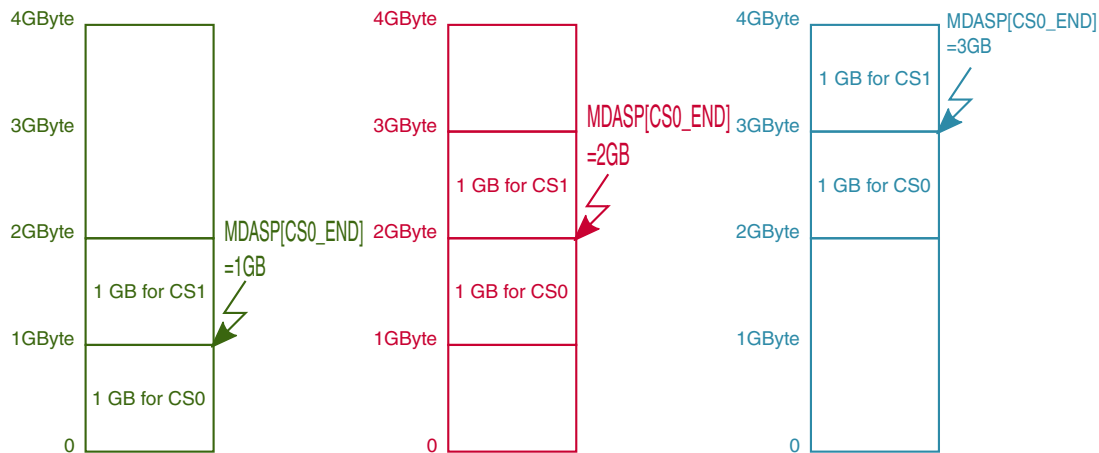

Figure 40-3. Chip select partition—1 Gbyte per chip select

40.4.4.3 Translation of AXI accesses to DDR accesses

40.4.4.3.1 Example

Assume the AXI write access has the following attributes:

- Increment (awburst[1:0]=2'b01)
- AXI size of 64bits (awsize[2:0]=3'b011)
- AXI length of 2 (awlen[3:0]=4'b0001)
- AXI address with suffix 0x5 (non aligned)

Toward DDR3(MDMISC[DDR_TYPE]=2'b00) with the following attributes:

- x32 (MDCTL[DSIZ]=2'b10)
- burst length of 8 (MDCTL[BL]=1'b1)

In this case the AXI alignment is every 8B (0x8) and the DDR boundary is every 4Bx8=32B(0x20).

The master expects to write the data to the following addresses: 0x5 (with WSTRB=0xE0), 0x8 (till 0xF).

The MMDC will issue one access toward the DDR as follows:

Write access toward logic address with suffix 0x0 (DDR boundary is 0x20 and 0x0 is the closest to 0x0) while address 0x0 till 0x4 are masked by DM (data masking signal) and address 0x10 till 0x1F are also masked by DM.

40.4.4.4 Address mirroring

When enabling this feature, address bits DRAM_A3, DRAM_A4, DRAM_A5, DRAM_A6, DRAM_A7, DRAM_A8, DRAM_SDBA0, and DRAM_SDBA1 behave differently according to the associated chip select.

This feature facilitates PCB board routing for devices on chip select 1, which are typically populated on the opposite side of the PCB from the devices on chip select 0.

NOTE

This feature will not be supported for DDR3 since only a single chip select is supported for DDR3

The following table specifies the address mirroring options:

Table 40-6. Address mirroring options

MMDC pin	Chip select 0 pin	Chip select 1 pin
DRAM_A3	DRAM_A3	DRAM_A4
DRAM_A4	DRAM_A4	DRAM_A3
DRAM_A5	DRAM_A5	DRAM_A6
DRAM_A6	DRAM_A6	DRAM_A5

DRAM_SDBA1	DRAM_SDBA1	DRAM_SDBA0

40.4.5 LPDDR2 and DDR3 pin mux mapping

The following table shows the pin mux mapping between LPDDR2 and DDR3. The i.MX DDR I/O pads corresponds with the DDR3 standard.

- In DDR3, all DRAM_DATA, DRAM_SDQS, and DRAM_DQM data lines work with channel 0.
- In LPDDR2, DRAM_DDQS[3:0], DRAM_DATA[31:0] and DRAM_DQM[3:0] work with channel 0. DRAM_SDQS[7:4], DRAM_DATA[63:32], and DRAM_DQM[7:4] work with channel 1.

40.4.6 Power Saving and Clock Frequency Change modes

40.4.6.1 Power saving general

MMDC supports multiple DDR power saving modes.

NOTE

At default, the power saving modes are disabled. These modes may dramatically decrease the power consumption of DDR memories.

1. Self-refresh entry to the entire DDR device (for both chip select 0 and 1) can be activated through two mechanisms:
 - LPMD (Low Power Mode)
 - Hardware handshaking (LPMD/LPACK) with the clock module in the system
 - Software handshaking by setting the field MAPSR[LPMD] and polling MAPSR[LPACK]
 - Automatic entry by configuring the amount of idle cycle for triggering self-refresh entry through MAPSR[PST] and by clearing MAPSR[PSD]
 - DVFS (Dynamic Voltage and Frequency Change)
 - Hardware handshaking (DVFS/DVACK) with the clock module in the system
 - Software handshaking by setting the field MAPSR[DVFS] and polling MAPSR[DVACK]

NOTE

If hardware or software requests for self-refresh entry were detected by the MMDC (even before the assertion of the LPACK), no write or read accesses will be acknowledged until the deassertion of those requests.

2. Automatic active/precharge power down entry to a specific chip select can be activated by configuring the ESDPDC register:
 - PWDT_0/PWDT_1 - define the number of idle cycles before entering power down, can be different value per chip select.
 - SLOW_PD - In case of DDR3 memory is configured to use slow precharge power down then this bit should be set as well.
 - BOTH_CS_PS - The MMDC can either set each chip select independently to power down, according to its idle state, or set both chip selects to power down only if both in idle state for the configured period.
 - Few parameters must be configured in addition:
 - Timing parameters at ESDCFG0[tXP and tXPDLL].
 - ODT timing at ESDOTC[tAOFPD, tAONPD, tANPD and tAXPD]

NOTE

It is possible to enter certain chip selects to low power consumption while the second chip select is activated.

3. Automatic precharge of all DDR banks to a specific chip select. Can be activated by configuring ESDPDC fields: PRCT_0 and PRCT_1. Each field determines a value loaded to a different chip select.

40.4.6.2 Self refresh and Frequency change entry/exit

As described in [Power saving general](#), the MMDC supports two mechanisms that will cause the DDR device to enter self-refresh mode:

- LPMD (Low Power Mode) - For power saving purposes
- DVFS (Dynamic Voltage and Frequency Change) - For clock frequency changes

While the DDR device is in self-refresh mode, there is no need to provide periodic refresh commands.

The MMDC treats hardware/software handshaking of LPMD/DVFS in the same manner:

- Upon the assertion of LPMD/DVFS request, the following is done:
 - The MMDC blocks any further AXI accesses even before the acknowledge is asserted
 - Completes all opened AXI accesses
 - Closes (precharge) all banks in the appropriate timing
 - Drives self-refresh command by deasserting clock enable signal (DRAM_SDCKE is driven to "0") together with a refresh command. This occurs after satisfying tRP/tRPA from the precharge all command.
 - Deasserts the clock (CK) that is driven to the DDR device
 - Asserts LPMD/DVFS acknowledge (LPACK/DVACK)
 - Allows deassertion of the operating clock of the MMDC (AXI clock)
- Upon the deassertion of LPMD/DVFS request, the following is done:
 - Operating clock of the MMDC must be turned on before LPMD/DVFS is deasserted
 - Starts driving the clock (CK) to the DDR device
 - After satisfying tCKSRX from clock renewal the clock enable signal (DRAM_SDCKE) is asserted
 - LPMD/DVFS acknowledge (LPACK/DVACK) is deasserted
 - After satisfying tXS from the assertion of DRAM_SDCKE, a refresh command is driven to the DDR device.
 - If ZQ calibration is enabled then tRFC is satisfied from the refresh command and a long ZQ command is driven.

- tZQoper idle cycles are counted after the ZQ command.
- After satisfying tDLLK from the assertion DRAM_SDCKE, the MMDC returns to normal operation.

The figure below shows the timing diagram of the hardware/software handshaking of LPMD/DVFS:

Figure 40-4. LPMD/DVFS Hardware/Software Handshaking

Note for self-refresh:

- As soon as LPMD or DVFS requests are detected by either hardware or software handshaking, the MMDC will deassert the AXI ARREADY/AWREADY signals immediately to block further requests from the system.
- In case of automatic self-refresh, the internal operating clock will be negated to save power.

40.4.7 Reset

40.4.7.1 Hard reset

When hard reset is asserted (aresetn is driven to "0") while warm reset is deasserted (warm_reset is driven to "0"), the entire MMDC will be initialized, including configuration/status registers and state machines.

In order to access the DDR device, the MMDC will then have to be reconfigured.

40.4.7.2 Warm reset

The MMDC supports warm reset signal. The warm reset signal must envelop the hard reset signal and then the MMDC will reset all the internal registers. The only registers that are not reset are those that are essential for returning it to normal operation without repeating the initialization sequence and without losing data stored in the memory (configuration/status registers won't be initialized).

For the successful operation of warm reset, the following steps must be performed:

- The MMDC must enter self-refresh mode. This can be achieved by either LPMD or DFVS requests
- Wait for LPMD or DVFS acknowledge
- Assert warm reset signal (i.e. drive warm_reset to "1")
- Assert hard reset signal (i.e. drive aresetn to "0")
- Deassert hard reset signal
- Deassert warm reset
- Get out of the LPMD/DVFS mode

Figure 40-5. Warm Reset Diagram

40.4.7.3 Software reset

The MMDC supports software reset. When software reset is configured then the MMDC will reset all the internal registers except those that are essential for returning to normal operation without repeating the initialization sequence or without losing data stored in the memory (configuration/status registers won't be initialized).

The following steps should be performed for successful operation of software reset:

- The MMDC should enter self-refresh mode. This can be achieved by either LPMD or DFVS request.
- Wait for LPMD or DVFS acknowledge
- Assert software reset, by setting MDMISC[RST]
- Get out of the LPMD/DVFS mode

Normal operation can be resumed.

40.4.8 Refresh Scheme

The MMDC supports various automatic refresh options which can be configured via the MDREF register.

The periodic auto refresh can be triggered by the following clocks:

- 32KHz clock
- 64KHz clock
- MMDC operating clock

The refresh scheme of the MMDC is flexible and allows the system to configure the desired AXI accesses delay/latency in each refresh cycle.

The table below shows an example of four configurations of the refresh cycles that will be handled by the MMDC. Each configuration meets a refresh rate of 3.9us (tREFI, refresh command every 3.9us).

Table 40-8. MMDC Refresh Scheme

Option number	Description	REFR	REF_SEL	REF_CNT	DDR hang time
1	Issue 8 refresh commands every 31,250 ns	0x7 (8 refreshes)	0x2 (64KHz)	not needed	tRFC * 8
2	Issue 4 refresh commands every 15,625ns	0x3 (4 refreshes)	0x1(32KHz)	not needed	tRFC * 4
3	Issue 2 refresh commands every 7800ns	0x1(2 refreshes)	0x3 (fast counter)	7800/2.5 = 3120 (0xC30)	tRFC * 2
4	Issue 1 refresh command every 3900 ns	0x0 (1 refresh)	0x3 (fast counter)	3900/2.5 = 1560(0x618)	tRFC

40.4.9 Burst Length options towards DDR

The MMDC supports two kinds of burst lengths which can be configured through MDCTL[BL] as follows:

- In DDR3 mode, only burst length 8 can be used.
- In LPDDR2 mode, only burst length 4 can be used.

In DDR3 mode read/write accesses to the DDR are always 8 words (x16, x32, x64) and aligned in according to JEDEC standards.

In case of AXI INCREMENT, accesses that are not aligned the irrelevant data is masked in write accesses and ignored in read accesses. In case of AXI WRAP accesses, even if the access is not aligned, then the MMDC provides an internal optimization mechanism for better efficiency of the DDR data bus.

40.4.10 Exclusive accesses handling

The MMDC contains four exclusive monitors, each for dedicated ID as configured in MAEXIDR0 and MAEXIDR1.

- If legal read exclusive is received by the MMDC, the associated monitor is turned on.
- While the monitor is turned on upon legal write exclusive, the monitor will be turned off and the write will be completed successfully with EXOKAY.
- The following rules must be met for successful exclusive access:
 - Aligned access (the AXI address is aligned to the AXI size)
 - AXI single access (AXI burst length isn't greater than 1)
 - AXI size of up to 64 bits
 - AXI non-cachable access (i.e. ARCACHE[1]/AWCACHE[1] is equal "0" or ARCACHE[1]/AWCACHE[1] is equal "1" while ARCACHE[3:2]/AWCACHE[3:2] are equal "00")
 - AXI ID that matches one of the four exclusive IDs

Exclusive read behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the read is blocked and is not sent to DDR. There are two options for response:
 - If ARCR_SEC_ERR_EN (MAARCR[30]) is high, SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- If AXI exclusive rules violation occurs (as described above), the read access is not blocked and is sent to DDR. The data will be fetched and be driven to the master, but the type of response may be unpredictable.
- If none of the above occurs, the read is sent to the DDR. The exclusive monitor will be turned on and the response is ExOKAY
- If additional legal AXI read exclusive is received with the same ID before the AXI exclusive write, the monitor will be updated with the latest attributes.

Exclusive write behavior (first bullet also correct for non-exclusive accesses):

- In case of security violation, the write is blocked and is not sent to DDR, but the monitor will be kept on. There are two options for response:
 - If ARCR_SEC_ERR_EN (MAARCR[30]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.

- In case of AXI exclusive rules violation (as described above), the write is blocked and is not sent to DDR. In that case the type of response may be unpredictable.
- In case the exclusive write access has different AXI attributes, but the same ID as the read exclusive access, the write is blocked and is not sent to DDR and the monitor will be turned off. There are two options for response:
 - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.
- In case of regular (non exclusive) write access is received to the same address or overlapping addresses then the write will be sent to the DDR and the monitor will be turned off.
- In case of legal write exclusive access is received with the same attributes as the read exclusive access while the monitor is on (no write accesses occurred to the same address between the read exclusive and write exclusive), then the write is sent to DDR and the response is EXOKAY. But, if the legal write exclusive is received while the monitor is off, the write is blocked and there are two options for response.
 - If ARCR_EXC_ERR_EN (MAARCR[28]) is high then SLV error is issued towards the Master, otherwise OKAY response is sent to the Master.

40.4.11 AXI Error Handling

The MMDC supports the AXI responses listed here.

- In case of AXI exclusive violation there are two options for response:
 - If MAARCR[28] is high then SLVError is issued towards the Master, Otherwise OKAY response is sent to the Master

NOTE

In case of read error MMDC drives zeros on the read data bus

40.5 Performance

40.5.1 Arbitration and reordering mechanism

40.5.1.1 Arbitration General

The following specifies arbitration and reordering flow in MMDC towards the DDR.

- AXI read and write accesses are sampled in the associated queue.
- Read/write arbitration is handled to select the winning access.
- Winning access is sampled in the reordering queue
- Reordering mechanism is handled between valid requests that reside in the reordering queue to select the access that will be dispatched to the DDR.
 - The reordering is held in order to optimize the accesses and to maximize the utilization of the DDR bus
 - As soon as the reordered access is completed (indicated by end of response or data phase) then it is erased from the associated queue and the MMDC is ready to receive the next available access from the master

In general, the reordering/arbitration mechanism is based on dynamic priority mechanism, which compares dynamic priorities between valid entries in the reordering queue and issues the entry with highest dynamic priority towards the DDR Logic.

The selection of the winning access is based on two modes, which can be activated together, as following:

- Real time channel mode:
 - Accesses with QoS='f' (i.e. awqos[3:0]/arqos[3:0] = "f") will bypass all other requests towards the DDR
- Dynamic scoring mode:
 - The arbitration mechanism is based on dynamic priority. Relevant for the accesses with QoS smaller than 'f' or when real time channel mode is disabled.

NOTE

Due to re-ordering and optimization mechanism (per different AXI ID), the transactions towards the DDR may be driven in a different ID order they were received by the AXI master. In similar way, the write response, read response or read data may be driven to the AXI master in a different ID order.

40.5.1.2 Real time channel mode

When real time mode is enabled (i.e MAARCR[ARCR_RCH_EN] = "1") , all requests with QoS='f' (i.e. awqos[3:0]/aqos[3:0] = "f") will bypass all other pending accesses towards the DDR. This mode is enabled by default.

40.5.1.3 Dynamic scoring mode (Arbitration Winning Conditions)

The arbitration between pending accesses in the MMDC is handled according to a dynamic priority of each access.

The dynamic priority (may be also called score) is calculated according to a sum of some factors (final_score[3:0]), where part of them may be updated dynamically. The following will specify each scoring factor:

- MAARCR[ARCR_PAG_HIT] (Page hit score) - A static score which is taken into account in case the pending access has a page hit
- MAARCR[ARCR_ACC_HIT] (Access hit score) - A static score, which is taken into account in case the current access type (read/write) is the same as the access that has been dispatched to the DDR previously
- MAARCR[ARCR_DYN_JMP] (Dynamic jump score) - A dynamic score which is given to any pending access in case it was not chosen in the arbitration. The dynamic jump counter is limited by maximum value which is set in MAARCR[ARCR_DYN_MAX].
- QoS score which is indicated through a sideband 4bits AXI signals (awqos[3:0]/ aqqos[3:0]) and is driven by the AXI master per access

Note: In order to prevent an overflow in the total sum of scores, a clipping is held and selects the maximum score value of 'f' once a total scores sum is greater than 'f'.

The figure below shows the dynamic score calculations

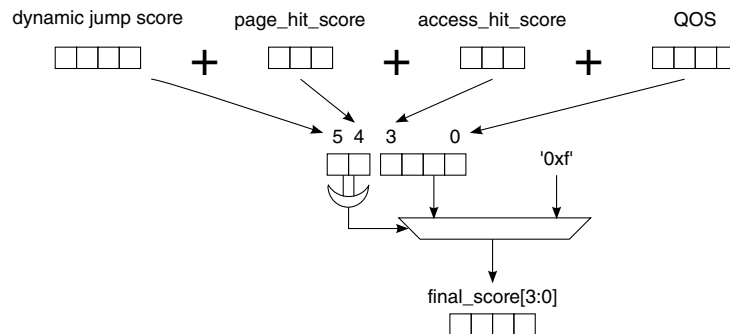

Figure 40-6. Dynamic score/priority calculation

40.5.1.4 Guarding (aging) mechanism

The guarding mechanism (may be also called aging) is used to prevent a starvation of accesses.

As soon as the dynamic jump score reaches its maximum value (MAARCR[ARCR_DYN_MAX]) then each time a pending request was not chosen in the arbitration, the "guarding" counter is incremented by 1. When the "guarding" counter reaches its predefined value, set in MAARCR[ARCR_GUARD], the associated request gets the highest priority and will be chosen in the next arbitration cycle towards the DDR unless a real time channel (i.e access with QoS ="f") is arrived.

Note: In case real time channel has arrived then the dynamic score of the non real time channels won't increment in order to prevent a case where the "guarding" counter of more than one access has reached its limit.

40.5.2 Prediction mechanism

When prediction mechanism is enabled (i.e by configuring MDMISC[MIF3_MODE]) then the MMDC predicts the chip-select, bank address and row address that is going to be issued towards the DDR before the access is physically dispatched towards DDR device.

That mechanism enables to prepare the DDR device with future accesses and improves the overall DDR performance.

This prediction mechanism operates in parallel to the reordering mechanism and may yield a prediction based on 3 levels of pending accesses:

1. Access in first stage of pipeline.
2. Valid access on AXI bus either read channel or write channel.
3. Valid access on special bus from arbitration - this access is chosen by the arbitration as the next miss access in its buffers

40.5.3 Special Optimization for accesses towards DDR3

In case an AXI read/write wrap non-aligned access is acknowledged in DDR3 mode with the same wrap boundary as the DDR wrap boundary then the MMDC will make an optimization and issue only one access towards the DDR, although all the accesses towards the DDR3 must be aligned.

For example: AXI write access with size of 128bits (awsiz[2:0]=3'b100), length of 4 (awlen[3:0]=4'b0011) towards DDR3 x64 (burst length 8). In that case the AXI wrap boundary is 16Bx4=64B (0x40) and the DDR3 wrap boundary is 8Bx8=64B (0x40). If, for example, the AXI access is towards AXI address with suffix of 0x10 (non-aligned to 64B boundary) then the MMDC will get from the AXI master the data that is associated with addresses 0x10, 0x20, 0x30, 0x0. The MMDC will rearrange internally the data so it

will match DDR3 alignment as following: 0x0, 0x10, 0x20, 0x30 and drive it in one access towards the DDR to address 0x0. The alternative was to issue two accesses towards the DDR with address 0x0 with different data masking

NOTE

In read wrap access the same optimization is handled, while as soon as the critical AXI word is fetched from the DDR then it is driven immediately to the AXI master without buffering. Based on the example above, the master expects to fetch first the data that is associated with address 0x10. Therefore the MMDC will issue read access from address 0x0 of the DDR and as soon as the data that is associated with address 0x10 is received then it will be driven back immediately to the master even before fetching the data of the further addresses.

40.6 MMDC Debug

40.6.1 Hardware debug monitor

The MMDC has a hardware debugging mechanism that monitors each access that is driven to the MMDC.

Every time this mechanism is enabled (setting of MADPCR0[DBG_EN] to "1") then each access that will be dispatched to the DDR will be also observed in the I/O pads (i.e. over ipp_do_ddr_debug[50:0]). The content of this bus is described in the table below.

Table 40-9. Hardware monitor debugging

Signal Name	Number of Bits	Description
acc_addr	[31:0]	AXI ADDRESS of the selected access
acc_type	1	access type of the selected access. "0" indicates write. "1" indicates read.
acc_id	[15:0]	AXI transaction ID of the selected access
valid_strobe	1	indication for a valid request . This signal will be asserted for 1 clock cycle

The fields above are organized as following:

MMDC_DEBUG[50:0] = { 1'b0,valid_strobe,acc_id,access_type,addr }

These signals are sent to IOMUX, in IOMUX user can configure it to be output from the chip for debug usage.

40.6.2 Step By Step (SBS) software monitor

The MMDC has a Step By Step (SBS) software debugging mechanism that monitors each access that is driven to the MMDC.

Every time this mechanism is triggered then one AXI access will be dispatched to the DDR and in parallel its attributes will be observed in a status register.

Once the "step by step" is enabled (i.e. MADPCR0[SBS_EN] is "1") then all accesses to the DDR device will be halted.

Setting MADPCR0[SBS] to "1" will dispatch the access that is pending in the head of the MMDC queue (read or write). Upon every setting of MADPCR0[SBS]:

- The AXI attributes of the access will be sampled in the associated MASBS0 and MASBS1 fields
- MADPCR0[SBS] will be cleared automatically.

Setting again MADPCR0[SBS] to "1" will dispatch the next pending access in the MMDC queue.

40.7 MMDC Profiling

The profiling mechanism provides the ability to calculate the DDR utilization together with read and write accesses statistics towards DDR per given period of time.

MMDC supports the following profiling counters:

- MADPSR0 (Total cycles count) - Indicates the total amount of cycles of the profiling period (up to 2^{32} cycles)
- MADPSR1 (Busy cycles count) - Indicates the total busy cycles during the profiling period. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.
- MADPSR2 (Total read accesses count) - Indicates the total read accesses towards MMDC during the profiling period
- MADPSR3 (Total write accesses count) - Indicates the total write accesses towards MMDC during the profiling period
- MADPSR4 (Total read bytes count) - Indicates total bytes that were read from MMDC during the profiling period
- MADPSR5 (Total write bytes count) - Indicates total bytes that were written to MMDC during the profiling period

All profiling items described above are disabled by default. The following describes how to control the profiling mechanism:

- MADPCR0[DBG_EN] enables profiling.
- MADPCR0[PRF_FRZ] stops/freezes the profiling for example in case user wishes to perform DDR profiling per specific task. In order to resume profiling then MADPCR0[PRF_FRZ] should be cleared.
- MADPCR0[DBG_RST] clears all profiling counters
- MADPCR0[CYC_OVF] indicates whether an overflow occurred in the total cycles counter (i.e. total amount of cycles are greater than 2^{32}). This field can only be cleared by writing '0'.

Read/Write statistics can be collected per specific AXI ID (16bits). The following fields in MADPCR1 register determines which AXI-ID or AXI-ID's to monitor:

- PRF_AXI_ID defines which AXI IDs are taken for profiling. Default value is 16'h0.
- PRF_AXI_ID_MASK defines which bits from PRF_AXI_ID will be compared with AXI ID of read/write access. "1" means to monitor the associated bit and "0" means don't care. Default value is 16'h0000, meaning all IDs are not monitored

So the AXI-IDs to be monitored are calculated according to the following equation:

$$(AXI-ID \& PRF_AXI_ID_MASK) \text{ Xnor } (PRF_AXI_ID \& PRF_AXI_ID_MASK)$$

For example if AXI ID's between A100 till A1FF are wished to be monitored then the following should be configured:

- PRF_AXI_ID = A100
- PRF_AXI_ID_MASK = FF00

40.8 LPDDR2 Refresh Rate Update and Timing Derating

LPDDR2 devices may have a temperature sensor that is used to determine an appropriate refresh rate and whether AC timing derating is required. The status of the temperature sensor can be read through MRR command from LPDDR2 MR4 register.

The MMDC supports refresh update and timing derating mechanism on the fly. The following specify how to use that mechanism:

- Perform periodic polling on MR4 LPDDR2 register using MRR command
- Read MDMRR register and analyze the MR4 indication
- In case refresh rate update and/or AC timing derating is required then it is needed to update MDREF and/or MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] parameters

NOTE

MDMR4[tRCD_DE, tRC_DE, tRAS_DE, tRP_DE, tRRD_DE] are referred to the associated values configured at MDCFG3LP[tRC_LP, tRP_LP, tRCD_LP], MDCFG1[tRAS], MDCFG2[tRRD]

- Assert MDMR4[UPDATE_DE_REQ]
- When the MMDC switch to the new values then an acknowledge will be indicated at MDMR4[UPDATE_DE_ACK]

40.9 DLL Off mode

DLL Off mode is supported only in DDR3 and allows operation of the DDR in low frequency (i.e. below 125MHz as defined in JEDEC standard).

For further details refer to DLL-off Mode chapter in the standard.

The following steps should be executed in order to switch from DLL on to DLL off mode:

- Assert CON_REQ signal and wait to CON_ACK assertion.
- Disable power down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
- Execute precharge all banks command (via MDSCR).
- Execute MRW command to MR1 and disable RTT Nom (A9,A6,A2 =0) and DLL ON (A0 =1).
- Execute MRW command to MR2 in order to update CWL to 6.
- Execute MRW command to MR0 in order to update CL to 6.
- De-assert CON_REQ signal.
- Enter self refresh mode. For further information refer to [Self refresh and Frequency change entry/exit](#).
- At self refresh entry acknowledge , change to the desired frequency.
- Exit self refresh mode.
- Assert CON_REQ and wait to CON_ACK assertion.
- Enable Pull Down resistors on DQS (through the I/O-MUX).
- Configure the MMDC register as following:
- Update tCWL =6 and tCL =6 to meet the values configured in the DDR device. (MDCGFG0, MDCFG1)
- Disable ODT resistor (i.e. set MPODTCTRL to "0").
- Disable DQS gating (i.e. set MPDGCTRL0[DG_DIS] to "1").

- Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
- De-assert CON_REQ and wait for de-assertion of CON_ACK.

The following steps should be executed in order to switch from DLL off to DLL on:

- Execute precharge all banks command (via MDSCR).
- Enter self refresh mode. For further information refer to [Self refresh and Frequency change entry/exit](#).
- At self refresh entry acknowledge, change to the desired frequency.
- Exit self refresh mode
- Assert CON_REQ and wait to CON_ACK assertion.
- Disable power down timers that can conflict with this sequence, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
- Execute MRW command to MR1 and enable RTT Nom (A9,A6,A2) and DLL ON (A0 =0).
- Execute MRW command to MR0 to reset the DLL (A8) and update CL value
- Execute MRW command to MR2 in order to update CWL value.
- Execute ZQ commnad.
- Reconfigure MMDC BLOCK
- Update tCWL and tCL to meet the values configured to the memory. (MDCFG0, MDCFG1)
- Enable ODT resistor (i.e. MPODTCTRL register)
- Enable DQS gating (i.e. set MPDGCTRL0[DG_DIS] to "0").
- Disable Pull Down resistors on DQS (through the I/O-MUX).
- Enable required power down timers that were disabled, such as: MAPSR[PSD], MDPDC[PWDT_1], MDPDC[PWDT_0], MDPDC[PRCT_0], MDPDC[PRCT_1].
- De-assert CON_REQ and wait for de-assertion of CON_ACK.

40.10 ODT Configuration

The MMDC supports one DRAM_ODT signal (DRAM_ODT for each DRAM_CS) in DDR3 mode in order to allow the DDR device to turn on/off its termination resistors. The MMDC suggests various configuration for the assertion of the ODT signal as well as configuration of several related timing.

MDOTC register controls the timing for the DRAM_ODT signals assertion.

NOTE

tODTLon determines the delay between DRAM_ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value configured to MDOTC[tODTLon] field should correspond with the value configured to MDCGFG1[tCWL].

In precharge power down mode , when all banks are closed, the assertion of ODT corresponds with tAOFPD and tAONPD which are configured in MDOTC register.

The figure below shows timing diagram of DRAM_ODT and RTT signals while MPODTCTRL[0] is set to "1" (i.e. assertion of DRAM_ODT to the non active DRAM_CS in write access command) and MDOTC[tODTLon] is set to 4.

40.11 Calibration Process

The MMDC offers various calibration processes that are used to obtain better timing accuracy, board skew compensation and I/O pad driving strength adjustment.

Each calibration process can be performed either automatically (hardware) or manually (software), though the manual method is typically reserved for debugging purposes. The following calibration processes are supported:

NOTE

Power saving features should be disabled before the calibration process begin. (Such as: MDPDC[PWDT#], MDPDC[PRCT#], MAPSR[PSD])

- ZQ calibration for external DDR device (in DDR3 through ZQ calibration command and in LPDDR2 through MRW command)
 - Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh)
 - Can be handled manually at ZQ INIT
- ZQ calibration for i.MX DDR I/O pads for calibrating the DDR driving strength
 - The sequence can be handled automatically by hardware
 - The sequence can be handled step by step manually by software
- Read DQS gating calibration for DDR3 only. Adjustment of DQS gate with read preamble window. For further information refer to [Read DQS Gating Calibration](#)
- Read data calibration. Adjustment of read DQS with read data byte. For further information refer to [Read Calibration](#)

- Write data calibration. Adjustment of write DQS with write data byte. For further information refer to [Write Calibration](#)
- Write leveling calibration. Adjustment of write DQS with CK (DDR differential clock). For further information refer to [Write leveling Calibration](#)
- Read fine tuning. Adjustment of up to 7 delay-line units for each read data bit.
- Write fine tuning. Adjustment of up to 3 delay-line units for each read data bit.

NOTE

Before starting any calibration process that involves the DDR3 device MPR mode or write leveling calibration, the following should be done:

- Disable the periodic refresh scheme (i.e. setting MDREF[REF_SEL] = "00") and then issue manual refresh command burst by configuring MDSCR[CMD]= 0x2. At the end of the calibration it is needed to enable the periodic refresh scheme.
- Disable the automatic power saving mode (i.e set MAPSR[PSD] = "1").

40.11.1 Delay-line

Each of the calibration processes controls several delay-lines for aligning data and strobos.

By default the delay-line is configured to generate 1/4 clock cycle of delay. The maximum delay that may be issued by the delay-line, while configured to the value 127, is as following:

- Under best-case conditions, -40C, 1.21V - 1.6ns.
- Under worst-case conditions, 125C, 0.99V - 3.8ns

Moreover, when the operating clock is at the maximum allowed frequency, as appeared in the features list, then the delay-line is capable to issue a configurable delay of up to 1/2 clock cycle.

NOTE

At the beginning of the calibration process the initial value of the delay-line must be a valid value (i.e. the strobos must be somewhere among the associated data window) though it might not be the optimal value. The delay-line calibration should be done after Read DQS gating and write-leveling calibrations.

In order to generate an adequate delay during normal operation of the MMDC the delay-line is going through an automatic measurement process during the refresh period of the DDR device

40.11.2 ZQ calibration

The MMDC supports ZQ calibration process to calibrate the driving strength of the i.MX DDR I/O pads as well as driving ZQ commands to calibrate the external DDR device driving strength.

The first i.MX ZQ calibration (after booting the processor) is performed prior to turning on the MMDC. Subsequent i.MX ZQ calibrations may be executed in parallel to the DDR ZQ calibration. The MMDC supports 2 types of ZQ calibration commands: short and long.

The ZQ long calibration is executed during power up sequence, when existing self-refresh mode or when exiting slow precharge power down (DLL lock can be done in parallel). The ZQ short calibration is executed periodically according to a configurable timer defined by `MPZQHWCTRL[ZQ_HW_PER]`.

The field `MPZQHWCTRL[ZQ_MODE]` determines whether the MMDC will execute ZQ calibration to i.MX DDR I/O pads and/or issue ZQ short/long command to the DDR device.

The MMDC supports both automatic (hardware) and manual (software) ZQ calibration process for the i.MX DDR I/O pads.

It is possible to perform automatic (hardware) ZQ calibration only once (i.e. non-periodical) by asserting `MPZQHWCTRL[ZQ_HW_FOR]`.

Figure 40-7. MMDC ZQ IF with PAD

40.11.2.1 ZQ automatic (hardware) calibration process

The ZQ automatic calibration lasts 11 steps. 5 steps for the pull up resistors calibration and 6 for the pull down resistors calibration.

The calibration control interface with ZQ pin is described below:

The calibration process is as follows:

40.11.2.1.1 ZQ automatic Pull-up calibration

The MMDC automatically performs a handshaking mechanism with the i.MX ZQ calibration pad as follows:

1. The MMDC drives `zq_comparator_en` to "1"
2. The MMDC waits few cycles according to `MPZQHWCTRL[EARLY_COMPARATOR_EN_TIMER]`
3. The MMDC drives `zq_pu_pd_sel` to "1" for indication of pull-up calibration and drives `zq_pu_val[4:0] = 5'b00000`
4. MMDC drives `zq_pu_val[4]` to "1"
5. MMDC asserts `zq_compare_en`
6. MMDC waits few cycles according to `MPZQSWCTRL[ZQ_CMP_OUT_SMP]` before sampling the comparator output (i.e `zq_comp_out`). If `zq_comp_out` is "1" then it means that the output voltage is greater than $V_{dd}/2$ (i.e. internal resistor is less than 240 ohm) and drives bit `zq_pu_val[4]` to "1" else it drives `zq_pu_val[4]` to "0"

7. MMDC deasserts `zq_compare_en`
8. MMDC repeats steps 4- 7 for `zq_pu_val` bits 3 to 0
9. MMDC drives ZQ calibration result to `MPZQHWCTRL[ZQ_HW_PU_RES]`
10. MMDC advances to pull-down calibration

40.11.2.1.2 ZQ automatic Pull-down calibration

1. The MMDC drives `zq_pu_pd_sel` to "0" for indication of pull-down calibration and drives `zq_pd_val[4:0] = 5'b00000`
2. MMDC drives `zq_pd_val[4]` to "1"
3. MMDC asserts `zq_compare_en`
4. MMDC waits few cycles according to `MPZQSWCTRL[ZQ_CMP_OUT_SMP]` before sampling the comparator output (i.e `zq_comp_out`). If `zq_comp_out` is "1" then it means that the output voltage is greater than $V_{dd}/2$ (i.e. internal resistor is less than 240 ohm) and drives bit `zq_pd_val[4]` to "0" else it drives `zq_pd_val[4]` to "1"
5. MMDC deasserts `zq_compare_en`
6. MMDC repeats steps 12- 15 for `zq_pd_val` bits 3 to 0
7. MMDC drives ZQ calibration result to `MPZQHWCTRL[ZQ_HW_PD_RES]`
8. MMDC deassert `zq_comparator_en` to indicate the completion of the ZQ calibration

40.11.2.2 ZQ software calibration process

The ZQ calibration can be done also in software. However since software ZQ calibration is much slower than hardware calibration it should be used mainly for debugging.

Software should configure the ZQ calibration parameters (Pull-up or Pull-down and their value) then assert the `MPZQSWCTRL[ZQ_SW_FOR]` bit. Then software should wait till `ZQ_SW_FOR` is de-asserted and use `ZQ_SW_RES` status bit in order to calculate the next ZQ calibration parameters.

40.11.2.3 ZQ calibration commands

Before the MMDC can issue a ZQCL/ZQCS command to the memory it should precharge all memory banks and wait tRP period. A single ZQ command can be issued to all devices as long as the devices don't share the same ZQ resistor.

When the MMDC issues the ZQ command it should also drive A10 (long or short command) and CS (0, 1 or both).

The MMDC must keep the memory lines quiet (except for CK) for the ZQ calibration time as defined in the Jedec (512 cycles for ZQCL after reset, 256 for other ZQCL and 64 for ZQCS).

40.11.3 Read DQS Gating Calibration

The read DQS gating calibration is used to adjust the read DQS gating with the middle of the read DQS preamble.

The DQS gating includes a delay of up to 7 cycles (The delay is chosen according to two fields MPDGCTRL#[DG_HC_DEL#] and MPDGCTRL#[DG_DL_ABS_OFFSET#]

Each DQS has its own delay-line. The DQS gating process can be done for all DQS in parallel.

NOTE

In LPDDR2 mode hardware Read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected.

In DDR3_x64 mode activation of the calibration is done by setting MPDGCTRL0[HW_DG_EN] at address 0xBASE0_083C

40.11.3.1 Hardware DQS Gating Calibration

- There are two modes of operations:
 - Calibration with the MPR (Multi Purpose Register)
 - Calibration with MMDC pre-defined values

40.11.3.1.1 Hardware DQS Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

40.11.3.1.2 Hardware DQS Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPDGCTRL0[HW_DG_EN]

The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read DQS delay-line is updated with the absolute delay value for all bytes at MPDGCTRL#[DG_HC_DEL#] and MPDGCTRL#[DG_DL_ABS_OFFSET#] and also satisfying the Tmod + 4 requirement
7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then MMDC advances to step 14
9. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
10. MMDC increments the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
11. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
13. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 9-12. If the comparison passes then MMDC stores the value of the temporary low boundary and advances to next step

14. MMDC increments the read DQS gating delay-line of each byte by half cycle (i.e. $\text{MPDGCTRL}\#[\text{DG_HC_DEL}\#] + 1$) and issue measurement process of the read DQS gating delay-line to update itself with the new value
15. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to $\text{MPDGCTRL0}[\text{DG_CMP_CYC}]$ assuming that the data has arrived from the DDR device.
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
17. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 14-16. If the comparison fails then MMDC stores the value of the temporary upper boundary and starts searching the adequate low and high boundaries
18. MMDC returns to the temporary low boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
19. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to $\text{MPDGCTRL0}[\text{DG_CMP_CYC}]$ assuming that the data has arrived from the DDR device.
20. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
21. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-23. If the comparison passes then MMDC stores the value of the adequate low boundary and advances to step 24
22. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting $\text{MPDGCTRL}[\text{RST_RD_FIFO}] = 1$
23. MMDC increments the read DQS gating delay of each byte by 1 (i.e. $\text{MPDGCTRL}\#[\text{DG_DL_ABS_OFFSET}\#] + 1$) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 19
24. MMDC returns to the temporary upper boundary minus half cycle and issue measurement process of the read DQS gating delay-line to update itself with the new value
25. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to $\text{MPDGCTRL0}[\text{DG_CMP_CYC}]$ assuming that the data has arrived from the DDR device.
26. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
27. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 28-29. If the comparison fails then MMDC stores the value minus 1 of the adequate upper boundary and advances to step 30

28. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
29. MMDC increments the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and issue measurement process of the read DQS gating delay-line to update itself with the new value and advances to step 25
30. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated `MPDGCTRL#[DG_DL_ABS_OFFSET#]` and issue measurement process of the read DQS delay-line to update itself with the new value.
31. MMDC indicates that the read DQS gating calibration had finished by setting `MPDGCTRL0[HW_DG_EN] = 0`
32. Exit the DDR device from MPR mode through MRS command
33. Read the upper boundary that was found: `MPDGHWST#[HW_DG_UP#]`. This field is 11 bits, 7 LSB bits correspond to `MPDGCTRL#[DG_DL_ABS_OFFSET#]` upper limit value and 4 MSB bits correspond to `MPDGCTRL#[DG_HC_DEL#]` upper limit value.
34. Set `MPDGHWST#[HW_DG_UP#[6:0]]` to `MPDGCTRL#[DG_DL_ABS_OFFSET#]`.
35. Set `(MPDGHWST#[HW_DG_UP#[10:7]] - 1)` to `MPDGCTRL#[DG_HC_DEL#]`. (We set the DQS gating value to be the upper limit value minus 1 half cycle)

40.11.3.2 SW read DQS gating Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)
- Calibration with MMDC pre-defined values

40.11.3.2.1 SW read Calibration with MPR

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR mode through MRS commands
3. Configure the MMDC to work with MPR mode by asserting `MPPDCMPR2[MPR_CMP]`
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. `MPRDDCTL[RD_DL_ABS_OFFSET#]`) will place the read DQS somewhere inside the read DQ window

40.11.3.2.2 SW read Calibration with pre-defined value

In case pre-defined mode is used, (i.e. MPPDCMPR2[MPR_CMP]) is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

The following steps should be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

5. Configure the read DQS delay-line to issue zero delay by setting MPDGCTRL#[DG_DL_ABS_OFFSET#] = 0 and MPDGCTRL#[DG_HC_DEL#] = 0
6. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
7. Wait 16 DDR cycles till the read DQS delay-line is updated with the absolute delay value for all bytes
8. Issue read command (with the legal DDR address chosen in step 3) from the external DDR device
9. Waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
10. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point. If the comparison passes then advance to step 15
11. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
12. Increment the read DQS gating delay of each byte by half cycle (i.e. MPDGCTRL#[DG_HC_DEL#] + 1)
13. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC]) assuming that the data has arrived from the DDR device.
14. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 11 - 14. If the comparison passes then advance to step 15

15. Store the temporary lower boundary and start searching the temporary upper boundary
16. MMDC resets the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
17. Increment the read DQS gating delay of each byte by half cycle (i.e. `MPDGCTRL#[DG_HC_DEL#] + 1`)
18. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]` assuming that the data has arrived from the DDR device.
19. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8).
20. If the comparison passes then it indicates that the read DQS gating is asserted inside the read preamble window and it is needed to repeat steps 16-19. If the comparison fails then it is needed to store the value of the temporary upper boundary and starts searching the adequate low and high boundaries
21. Load the temporary low boundary minus half cycle into the associated `MPDGCTRL#[DG_HC_DEL#]`
22. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
23. Increment the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and force the delay line to measure itself and to issue the requested read DQS delay by configuring `MPMUR[FRC_MSR] = 1`
24. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to `MPDGCTRL0[DG_CMP_CYC]`) assuming that the data has arrived from the DDR device.
25. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
26. If the comparison fails then it indicates that the read DQS gating is asserted in illegal time point and it is needed to repeat steps 22-26. If the comparisons passes then advance to the next step.
27. Store the adequate lower boundary
28. Load the temporary upper boundary minus half cycle into the associated `MPDGCTRL#[DG_HC_DEL#]`
29. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
30. Increment the read DQS gating delay of each byte by 1 (i.e. `MPDGCTRL#[DG_DL_ABS_OFFSET#] + 1`) and force the delay line to measure itself and to issue the requested read DQS delay by configuring `MPMUR[FRC_MSR] = 1`

31. Issue read command to the external DDR devices and waits 16 or 32 cycles (according to MPDGCTRL0[DG_CMP_CYC] assuming that the data has arrived from the DDR device.
32. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8)
33. If the comparison passes then it is needed to repeat steps 29-32. If the comparisons fails then advance to the next step.
34. Reset the read FIFO (to the inverted pre-defined/MPR value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
35. Store the adequate upper boundary.
36. Keep the MPDGCTRL#[DG_DL_ABS_OFFSET#] value of the upper limit.
37. Set MPDGCTRL#[DG_HC_DEL#] = (MPDGCTRL#[DG_HC_DEL#] - 1). (We set the DQS gating value to be the upper limit value minus 1 half cycle)
38. Issue the requested read DQS delay by configuring MPMUR[FRC_MSR] = 1
39. Exit the DDR device from MPR mode through MRS command

40.11.4 Read Calibration

The read calibration is used to adjust the read DQS with read data byte.

It is assumed that the read DQS gating calibration process is completed prior to the read calibration.

NOTE

In DDR3 mode, the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN] at address 0xBASE0_0860. In LP2_x16, LP2_x32 the activation of the calibration is done by setting MPRDDLHWCTL[HW_RD_DL_EN] at address 0xBASE0_0860 .

40.11.4.1 Hardware (automatic) Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration(LPDDR2)
- Calibration with MMDC pre-defined values

40.11.4.1.1 Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2)

The following steps should be executed:

1. Precharge all active banks (can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands.
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP].
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window.
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN].

40.11.4.1.2 Hardware (automatic) Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access to the external DDR device by setting MPSWDAR0[SW_DUMMY_WR] = 1 (MMDC will generate internally write access without intervention of the system towards bank 0, row 0, column 0)
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window
5. Start the calibration process by asserting MPRDDLHWCTL[HW_RD_DL_EN]

The following steps will be executed automatically by the MMDC for both modes (MPR and Pre-defined value):

6. MMDC waits till the read delay-line is updated with the absolute delay value for all bytes at MPRDDLCTL[RD_DL_ABS_OFFSET#] and also satisfying the Tmod + 4 requirement
7. MMDC drives read command to the external DDR devices and waits 16 or 32 cycles (according to MPRDDLHWCTL[HW_RD_DL_CMP_CYC]) assuming that the data has arrived from the DDR device.
8. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial read DQS isn't inside the read DQ window and the MMDC generates an error for the associated byte at MPRDDLHWCTL[HW_RD_DL_ERR#] . If the comparison passes then MMDC advances to next step.

9. MMDC resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
10. MMDC decrements the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) and issue measurement process of the read delay-line to update itself with the new value.
11. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to `MPRDDLHWCTL[HW_RD_DL_CMP_CYC]`) assuming that the data has arrived from the DDR device
12. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the low read boundary of the associated byte for each byte at `MPRDDLHWST0/1[HW_RD_DL_LOW#]` . If the comparison passes then MMDC repeats steps 9-11. If all read data comparisons fail then the MMDC advances to the next step
13. The MMDC start seeking the upper boundary and sets the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the read delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
15. MMDC drives read command to the DDR external devices and waits 16 or 32 cycles (according to `MPRDDLHWCTL[HW_RD_DL_CMP_CYC]`) assuming that the data has arrived from the DDR device
16. MMDC compares the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper read boundary of the associated byte for each byte at `MPRDDLHWST0/1[HW_RD_DL_UP#]` . If the comparison passes then MMDC increments the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`) and issue measurement process of the read delay-line to update itself with the new value.
17. If all read data comparisons fail then the MMDC advances to the next step. otherwise, MMDC repeats steps 14-16.
18. After the MMDC finds the window boundary (lower and upper) of each read data byte then it stores the average between lower and upper boundaries at the associated `MPRDDLCTL[RD_DL_ABS_OFFSET#]` and issue measurement process of the read delay-line to update itself with the new value.
19. MMDC indicates that the read data calibration had finished by setting `MPRDDLHWCTL[HW_RD_DL_EN] = 0`
20. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands

40.11.4.2 SW Read Calibration

- There are two modes of operations:
- Calibration with the MPR (Multi Purpose Register)/DQ calibration(LPDDR2)
- Calibration with MMDC pre-defined values

40.11.4.2.1 Calibration with MPR(DDR3)/DQ calibration(LPDDR2)

The following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Enter the DDR device into MPR/DQ calibration mode through MRS/MRW commands
3. Configure the MMDC to work with MPR/DQ calibration mode by asserting MPPDCMPR2[MPR_CMP]
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

40.11.4.2.2 Calibration with pre-defined value

In case pre-defined mode is used, i.e. MPPDCMPR2[MPR_CMP] is cleared, then the following steps should be executed:

1. Precharge all active banks (Can be done through MDSCR) as required by the standard.
2. Configure the pre-defined value, which reflects the value that will be written and compared through the read calibration, to MPPDCMPR1[PDV1, PDV2]
3. Issue write access (with any legal DDR address) to external DDR device.
4. Make sure that the initial value that is configured in the read delay line absolute offset of each byte (i.e. MPRDDLCTL[RD_DL_ABS_OFFSET#]) will place the read DQS somewhere inside the read DQ window

The following steps will be executed manually by SW for both modes (MPR/DQ calibration and Pre-defined value):

5. Force the delay line to measure itself and to issue the requested read delay by configuring MPMUR[FRC_MSR] = 1
6. Wait 16 DDR cycles till the read delay-line is updated with the absolute delay value for all bytes
7. Issue read command (with any legal DDR address) from the external DDR device
8. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it

indicates that the initial read DQS isn't inside the read DQ window. If the comparison passes then advance to next step.

9. Reset the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
10. Decrement the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`)
11. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
12. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device and waits 16 or 32 cycles (according to `MPRDDLHWCTL[HW_RD_DL_CMP_CYC]`) assuming that the data has arrived from the DDR device
13. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low read boundary of the associated byte at of each byte . If the comparison passes then repeat steps 9-12. If all read data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the read delay line absolute offset of each byte to the initial value + 1 as determined at step 4
15. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
16. Resets the rd fifo (to the inverted pre-defined/MPR value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
17. Issue read command (with the legal DDR address chosen in step 7) from the external DDR device
18. Compare the read data byte to the associated byte in the pre-defined/MPR value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper read boundary of the associated byte at of each byte. If the comparison passes then increment the read delay line absolute offset of each byte by 1 (i.e. `MPRDDLCTL[RD_DL_ABS_OFFSET#]`)
19. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
20. If all read data comparisons fail then advance to the next step, else repeat steps 16-19
21. After finding the window boundary (lower and upper) of each read data byte then calculate the average between lower and upper boundaries and store the associated average at `MPRDDLCTL[RD_DL_ABS_OFFSET#]`
22. Force the delay line to measure itself and to issue the requested read delay by configuring `MPMUR[FRC_MSR] = 1`
23. Exit the DDR device from MPR/DQ calibration mode through MRS/MRW commands.

40.11.5 Write Calibration

The write calibration is used to adjust the write DQS with write data byte. It is assumed that the read calibration process is completed prior to the write calibration.

40.11.5.1 HW (automatic) Write Calibration

The following steps should be executed:

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) will place the write DQS somewhere inside the write DQ window
2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to `MPPDCMPR1[PDV1, PDV2]`
3. Assert `MPWRDLHWCTL0[HW_WR_DL_EN]`

The following steps will be executed automatically:

4. MMDC waits till the write delay-line is updated with the absolute delay value for all bytes at `MPWRDCTL[WR_DL_ABS_OFFSET#]`
5. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to `MPWRDLHWCTL[HW_WR_DL_CMP_CYC]`) assuming that the data has arrived to the DDR device.
6. MMDC drives read command to the same address from the external DDR
7. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window and the MMDC generates an error for the associated byte at `MPWRDLHWCTL[HW_WR_DL_ERR#]` . If the comparison passes then MMDC advances to next step.
8. MMDC resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting `MPDGCTRL[RST_RD_FIFO] = 1`
9. MMDC decrements the write delay line absolute offset of each byte by 1 (i.e. `MPWRDLCTL[WR_DL_ABS_OFFSET#]`) and issue measurement process of the write delay-line to update itself with the new value.
10. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to `MPWRDLHWCTL[HW_WR_DL_CMP_CYC]`) assuming that the data has arrived to the DDR device
11. MMDC drives read command to the same address from the external DDR
12. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it

stores the low write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_LOW#] . If the comparison passes then MMDC repeats steps 8-11. If all data comparisons fail then the MMDC advances to the next step

13. The MMDC start seeking the upper boundary and sets the write delay line absolute offset of each byte to the initial value + 1 as determined at step 4 and issue measurement process of the write delay-line to update itself with the new value
14. MMDC resets the rd fifo (to the inverted pre-defined value) and its pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
15. MMDC drives write command to the external DDR devices (to bank 0 address 0) and waits 16 or 32 cycles (according to MPWRDLHWCTL[HW_WR_DL_CMP_CYC]) assuming that the data has arrived to the DDR device.
16. MMDC drives read command to the same address from the external DDR
17. MMDC compares the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it stores the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UP#] . If the comparison passes then MMDC increments the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) and issue measurement process of the write delay-line to update itself with the new value.
18. MMDC repeats steps 14-17. If all data comparisons fail then the MMDC advances to the next step
19. .After the MMDC finds the window boundary (lower and upper) of each write data byte then it stores the average between lower and upper boundaries at the associated MPWRDLCTL[WR_DL_ABS_OFFSET#] and issue measurement process of the write delay-line to update itself with the new value.
20. MMDC indicates that the write data calibration had finished by setting MPWRDLHWCTL[HW_WR_DL_EN] = 0

40.11.5.2 SW Write Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Make sure that the initial value that is configured in the write delay line absolute offset of each byte (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#]) will place the write DQS somewhere inside the write DQ window

2. Configure the pre-defined value, which reflects the value that will be written and compared through the write calibration, to MPPDCMPR1[PDV1, PDV2]
3. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
4. Wait 16 DDR cycles till the write delay-line is updated with the absolute delay value for all bytes
5. Issue write command to any legal DDR address of the external DDR device
6. Issue read command, to the address written previously, from the external DDR device
7. Compare the read data byte to the associated byte in the pre-defined value for all bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it indicates that the initial write DQS isn't inside the write DQ window. If the comparison passes then advance to next step.
8. MMDc resets the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
9. Decrement the write delay line absolute offset of each byte by 1 (i.e. MPWRDLCTL[WR_DL_ABS_OFFSET#])
10. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
11. Issue write command to any legal DDR address of the external DDR device
12. Issue read command, to the address written previously, from the external DDR device
13. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the low write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_LOW#] . If the comparison passes then repeat steps 8-12. If all data comparisons fail then advance to the next step.
14. Start seeking the upper boundary and set the write delay line absolute offset of each byte to the initial value + 1
15. Force the delay line to measure itself and to issue the requested write delay by configuring MPMUR[FRC_MSR] = 1
16. Reset the rd fifo (to the inverted pre-defined value) and it's pointers by setting MPDGCTRL[RST_RD_FIFO] = 1
17. Issue write command to any legal DDR address of the external DDR device
18. Issue read command, to the address written previously, from the external DDR device
19. Compare the read data byte to the associated byte in the pre-defined value for all the bytes in the DDR burst (burst length 4 or 8). If the comparison fails then it is needed to store the upper write boundary of the associated byte of each byte at MPWRDLHWST0/1[HW_WR_DL_UP#]. If the comparison passes then increment the write delay line absolute offset of each byte by 1.

20. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`
21. If all read data comparisons fail then advance to the next step else repeat steps 16-20.
22. .After finding the window boundary (lower and upper) of each write data byte then calculate the average between lower and upper boundaries and store the associated average at `MPWRDLCTL[WR_DL_ABS_OFFSET#]`
23. Force the delay line to measure itself and to issue the requested write delay by configuring `MPMUR[FRC_MSR] = 1`

40.11.6 Write leveling Calibration

The write leveling calibration can generate a delay between the clock and the associate DQS of up to 3 cycles as following: $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.

Write leveling calibration can be executed automatically(HW) or manually (SW).

The automatic calibration process can only detect the optimal DQS to clock delay to within 1 cycle. In extreme cases in which the DDR3 memory is placed far from the microcontroller (long address/command/clock trace lengths), the skew between the DQS and clock may exceed 1 cycle. If this is the case, it is the user's responsibility to both understand that their design causes the DQS to clock skew to exceed 1 cycle and to indicate this manually in the `MPWLDECTRL0/1[WL_CYC_DEL#]`. It is highly recommended to keep the DDR3 memory as close to the microcontroller as possible, especially in embedded system designs. When using fly-by topology, the user should calculate the PCB flight time of the clock signal to the furthest placed DDR3 memory to ensure less than 1 cycle skew between DQS and clock.

NOTE

In LPDDR2 mode Write-leveling calibration should be disabled.

In DDR3_x64 mode activation of the calibration is done by setting `MPWLGCR[HW_WL_EN]` at address `0xBASE1_0808`

NOTE

It is essential to route the first bit in each data byte group (D0, D8, D16, D24, D32, D40, D48, D56) from the DDR3 memory to the same data bus bits on the controller. The DDR3 memory outputs the state of the DRAM clock during the write leveling calibration. If any of these are not routed properly, the controller will have no information regarding the state of the DRAM clock during calibration. In previous designs in which

write leveling calibration was not performed, the board designer would often swap data bits within each byte group to make the data bus routing cleaner and less susceptible to noise and impedance mismatch. This can still be done with DDR3 so long as the requirement of properly routing D0, D8, D16, D24, D32, D40, D48, D56 is maintained.

40.11.6.1 Hardware Write Leveling Calibration

The following steps should be executed:

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Active automatic calibration by setting MPWLGCR[HW_WL_EN]

The following steps will be executed automatically by the MMDC:

4. MMDC enters write leveling mode, counts 25 + 15 cycles and drives the DQS pads as output while the DQ pads will remain inputs. In parallel the MMDC configures the write leveling delay line to "0" (i.e. $MPWLDECTRL0[WL_DL_ABS_OFFSET\#] = 0$) and issue measurement process of the writ-leveling delay-line to update itself with the new value
5. MMDC drives one DQS pulse to the DDR external device
6. MMDC waits 16 cycles (to guarantee that the DQ prime data is stable) and samples the associated prime DQ bit (for example for DQS1 the MMDC samples DQ[8])
7. MMDC increments the write leveling delay line by 1/8 cycle and perform measurement process in order to load the updated value to the associated delay-line
8. MMDC repeats steps 5-7 till the write leveling delay is 1 cycle
9. MMDC checks the 8 bit prime DQ results for each DQS and finds the first transition from 0 to 1. If no transition is found then the MMDC indicates an error at $MPWLGCR[HW_WL_ERR\#]$
10. MMDC stores the value that issues the last "0" on the prime DQ before the transition and loads it to the write leveling delay-line. The MMDC initiates a fine-tune process by incrementing the delay-line values by 1 step (which is 1/256 part of a cycle) till detecting the most accurate transition from 0 to 1
11. Upon completion of this process the MMDC de-asserts the $MPWLGCR[HW_WL_EN]$ and update the most accurate value of the delay-line at the associated $MPWLDECTRL\#[WL_DL_ABS_OFFSET\#]$
12. MMDC perform measurement process in order to load the most accurate value to the associated delay-line
13. User should issue MRS command to exit write leveling mode

14. The user should read the results of the associated delay-line at MPWLDECTRL#[WL_DL_ABS_OFFSET#] and in case the user estimates that the reasonable delay may be above 1 cycle then the user should indicate it at MPWLDECTRL#[WL_CYC_DEL#]. Moreover the user should indicate it in MDMISC[WALAT] field. For example, if the result of the write leveling calibration is 100/256 parts of a cycle, but the user estimates that the delay is above 2 cycles then MPWLDECTRL#[WL_CYC_DEL#] should be configured to 2, so the total delay will be 2 and 100/256 parts of a cycle
15. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

40.11.6.2 SW Write Leveling Calibration

The following steps should be executed:

NOTE

It is recommended to perform the write calibration using the HW method. The SW method is provided for debug purposes only.

1. Configure the external DDR device to enter write leveling mode through MRS command
2. Activate the DQS output enable by setting MDSCR[WL_EN]
3. Set the write-leveling delay-line offset to "0" by configuring MPWLDECTRL0[WL_DL_ABS_OFFSET#] = 0
4. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
5. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1 together with MPWLGCR[SW_WL_CNT_EN] = 1
6. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
7. Increment the write leveling delay line by 1/8 cycle (i.e add 0x20 to {MPWLDECTRL0[WL_HC_DEL#],MPWLDECTRL0[WL_DL_ABS_OFFSET#]})
8. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
9. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
10. Repeat steps 6-9 till the edge of CK was detected (i.e the write-leveling result switched from "0" to "1")

11. Store the value that issues the last "0" on the prime DQ before the transition and load it to the write leveling delay-line and start fine tuning process to detect the exact switch from "0" to "1"
12. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
13. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
14. Issue a IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
15. Increment the write leveling delay line by 1 step (i.e add 0x01 to MPWLDECTRL0[WL_DL_ABS_OFFSET#])
16. Force the delay line to measure itself and to issue the requested write-leveling delay by configuring MPMUR[FRC_MSR] = 1
17. Issue an IP read command from MPWLGCR. If MPWLGCR[SW_WL_EN] = 0 then the SW write-leveling result is valid at MPWLGCR[WL_SW_RES#].
18. Activate SW write-leveling calibration and issue one DQS pulse by setting MPWLGCR[SW_WL_EN] = 1
19. Repeats step 15-18 till the exact edge of CK was detected (i.e the write-leveling result switched from "0" to "1")
20. Issue MRS command to exit write leveling mode
21. Return the DQS output enable to functional mode by deasserting MDSCR[WL_EN]

40.11.7 Write fine tuning

Write fine tuning is an additional circuit that provides the ability to fine tune the timing of each dq/dm bits (relative to dqs) by up to +/-100 ps.

This is done by reducing the delay between the wl_dqs by 100 ps and adding a configurable delay of up to 200 ps (6 delay units of around 30-35 ps each) for each DQ/DM output. The delay can be configured independently for each DQ/DM. The calibration of this mechanism can be done only by writing & reading data from the memory. Controlled by register MPWRDQBY#DL.

40.11.8 Read fine tuning

Read fine tuning is an additional circuit that provides the ability to fine tune the timing of each coming dq bits (relative to coming dqs) by up to +/-100 ps.

This is done by reducing the delay between the incoming rd_dqs by 100 ps and adding a configurable delay of up to 200 ps (6 delay units of around 30-35 ps each) for each DQ input. The delay can be configured independently for each DQ. The calibration of this mechanism can be done only by writing & reading data from the memory. Controlled by register MPRDDQBY#DL.

Address: 21B_0000h base + 0h offset = 21B_0000h

MMDC_MDCTL field descriptions

Field	Description
31 SDE_0	MMDC Enable CS0. This bit enables/disables accesses from the MMDC toward Chip Select 0. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
30 SDE_1	MMDC Enable CS1. This bit enables/disables accesses from the MMDC toward Chip Select 1. The reset value of this bit is "0" (i.e No clocks and clock enable will be driven to the memory). At the enabling point the MMDC will perform an initialization process (including a delay on RESET and/or CKE) for both chip selects. The initialization length depends on the configured memory type. 0 Disabled 1 Enabled
29–27 Reserved	This read-only field is reserved and always has the value 0.
26–24 ROW	Row Address Width. This field specifies the number of row addresses used by the memory array. It will affect the way an incoming address will be decoded. Settings 110-111 are reserved 000 11 bits Row 001 12 bits Row 010 13 bits Row 011 14 bits Row 100 15 bits Row 101 16 bits Row

Table continues on the next page...

MMDC_MDCTL field descriptions (continued)

Field	Description
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 COL	Column Address Width. This field specifies the number of column addresses used by the memory array. It will determine how an incoming address will be decoded. 0x0 9 bits column 0x1 10 bits column 0x2 11 bits column 0x3 8 bits column 0x4 12 bits column 0x5-0xF Reserved
19 BL	Burst Length. This field determines the burst length of the DDR device. In LPDDR2 mode the MMDC supports burst length 4. In DDR3 mode the MMDC supports burst length 8. 0 Burst Length 4 is used 1 Burst Length 8 is used
18 Reserved	This read-only field is reserved and always has the value 0.
17–16 DSIZ	DDR data bus size. This field determines the size of the data bus of the DDR memory 0 16-bit data bus 1 32-bit data bus — — — 2-3 Reserved
Reserved	This read-only field is reserved and always has the value 0.

40.12.2 MMDC Core Power Down Control Register (MMDC_MDPDC)**Table 40-13. PRCT field encoding**

PRCT[2:0]	Precharge Timer
000	Disabled (Bit field reset value)
001	2 clocks
010	4 clocks
011	8 clocks
100	16 clocks
101	32 clocks
110	64 clocks
111	128 clocks

Table 40-14. PWDT field encoding

PWDT[3:0]	Power Down Time-out
0000	Disabled (bit field reset value)
0001	16 cycles
0010	32 cycles
0011	64 cycles
0100	128 cycles
0101	256 cycles
0110	512 cycles
0111	1024 cycles
1000	2048 cycles
1001	4096 cycles
1010	8196 cycles
1011	16384 cycles
1100	32768 cycles
1101-1111	Reserved

Address: 21B_0000h base + 4h offset = 21B_0004h

MMDC_MDPDC field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 PRCT_1	Precharge Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically precharged. The amount of cycles are determined according to the PRCT Field Encoding table above.
27 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MDPDC field descriptions (continued)

Field	Description
26–24 PRCT_0	Precharge Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically precharged. The amount of cycles are determined according to the table below.
23–19 Reserved	This read-only field is reserved and always has the value 0.
18–16 tCKE	CKE minimum pulse width. This field determines the minimum pulse width of CKE. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
15–12 PWDT_1	Power Down Timer - Chip Select 1. This field determines the amount of idle cycle for which chip select 1 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
11–8 PWDT_0	Power Down Timer - Chip Select 0. This field determines the amount of idle cycle for which chip select 0 will be automatically get into precharge/active power down. The amount of cycles are determined according to the PWDT Field Encoding table above.
7 SLOW_PD	Slow/fast power down. In DDR3 mode this field is referred to slow precharge power-down. In LPDDR2 mode this field is not relevant. NOTE: Memory should be configured the same. 0 Fast mode. 1 Slow mode.
6 BOTH_CS_PD	Parallel power down entry to both chip selects. When power down timer is used for both chip-selects (i.e PWDT_0 and PWDT1 don't equal "0"), then if this bit is enabled, the MMDC will enter power down only if the amount of idle cycles of both chip selects was obtained. 0 Each chip select can enter power down independently according to its configuration. 1 Chip selects can enter power down only if the amount of idle cycles of both chip selects was obtained.
5–3 tCKSRX	Valid clock cycles before self-refresh exit. This field determines the amount of clock cycles before self-refresh exit 0x0 0 cycle 0x1 1 cycles 0x6 6 cycles 0x7 7 cycles
tCKSRE	Valid clock cycles after self-refresh entry. This field determines the amount of clock cycles after self-refresh entry 0x0 0 cycle 0x1 1 cycles

Table continues on the next page...

MMDC_MDPDC field descriptions (continued)

Field	Description
0x6	6cycles
0x7	7cycles

40.12.3 MMDC Core ODT Timing Control Register (MMDC_MDOTC)

For further information see [ODT Configuration](#).

Address: 21B_0000h base + 8h offset = 21B_0008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MDOTC field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.
29–27 tAOFPD	Asynchronous RTT turn-off delay (power down with DLL frozen). This field determines the time between termination circuit starts to turn off the ODT resistance till termination has reached high impedance. This field is not relevant in LPDDR2 mode. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
26–24 tAONPD	Asynchronous RTT turn-on delay (power down with DLL frozen). This field determines the time between termination circuit gets out of high impedance and begins to turn on till ODT resistance are fully on. This field is not relevant in LPDDR2 mode. 0x0 1 cycle 0x1 2 cycles 0x6 7 cycles 0x7 8 cycles
23–20 tANPD	Asynchronous ODT to power down entry delay. In DDR3 should be set to tCWL-1 This field is not relevant in LPDDR2 mode.

Table continues on the next page...

MMDC_MDOTC field descriptions (continued)

Field	Description
	0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
19–16 tAXPD	Asynchronous ODT to power down exit delay. In DDR3 should be set to tCWL-1 This field is not relevant in LPDDR2 mode. 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF 16 clocks
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 tODTLon	ODT turn on latency. This field determines the delay between ODT signal and the associated RTT, where according to JEDEC standard it equals WL(write latency) - 2. Therefore, the value that is configured to tODTLon field should correspond the value that is configured to MDCGFG1[tCWL] In LPDDR2 this field is not relevant. 0x0 - 0x1 Reserved 0x2 2 cycles 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 Reserved
11–9 Reserved	This read-only field is reserved and always has the value 0.
8–4 tODT_idle_off	ODT turn off latency. This field determines the Idle period before turning memory ODT off. This field is not relevant in LPDDR2 mode. 0x0 0 cycle (turned off at the earliest possible time) 0x1 1 cycle 0x2 2 cycles 0x1E 30 cycles 0x1F 31 cycles
Reserved	This read-only field is reserved and always has the value 0.

40.12.7 MMDC Core Miscellaneous Register (MMDC_MDMISC)

Address: 21B_0000h base + 18h offset = 21B_0018h

MMDC_MDMISC field descriptions

Field	Description
31 CS0_RDY	External status device on CS0. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.
30 CS1_RDY	External status device on CS1. This is a read-only status bit, that indicates whether the external memory is in wake-up period. 0 Device in wake-up period. 1 Device is ready for initialization.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
29–22 Reserved	This read-only field is reserved and always has the value 0.
21 CK1_GATING	Gating the secondary DDR clock. When this bit is asserted then the MMDC will disable the secondary DDR clock 0 MMDC drives two clocks toward the DDR memory 1 MMDC drives only one clock toward the DDR memory (CK0)
20 CALIB_PER_CS	Number of chip-select for calibration process. This bit determines the chip-select index that the associated calibration is targetted to. Relevant for read, write, write leveling and read DQS gating calibrations 0 Calibration is targetted to CS0 1 Calibration is targetted to CS1
19 ADDR_MIRROR	Address mirroring. NOTE: This feature is not supported for LPDDR2 memories. But only for DDR3 memories. For further information see Address mirroring . 0 Address mirroring disabled. 1 Address mirroring enabled.
18 LHD	Latency hiding disable. This is a debug feature. When set to "1" the MMDC will handle one read/write access at a time. Meaning that the MMDC pipe-line will be limited to 1 open access (next AXI address phase will be acknowledged if the current AXI data phase had finished) 0 Latency hiding on. 1 Latency hiding disable.
17–16 WALAT	Write Additional latency. In case the write-leveling calibration process indicates a delay of greater than one-eighth a clock cycle (between CK and any of the DQS strobe lines), then this field must be configured accordingly. This field will add delay on the obe I/O control, which will compensate on the additional write leveling delay on DQS and prevent the DQS from being cropped. NOTE: The purpose of WALAT is to add time delay at the end of a burst write operation to ensure that the JEDEC time specification for Write Post Amble Delay (tWPST) is met (DQS strobe is held low at the end of a write burst for > 30% a clock cycle before it is released). If the value of any of the WL_DL_ABS_OFFSETn register fields are greater than '1F', WALAT should be set to '1' (cycle additional delay). WALAT should be further increased for any full cycle delays added by the WL_CYC_DELn register fields. 0x0 No additional latency required. 0x1 1 cycle additional delay 0x2 2 cycles additional delay 0x3 3 cycles additional delay
15–13 Reserved	This read-only field is reserved and always has the value 0.
12 BI_ON	Bank Interleaving On. This bit controls the organization of the bank, row and column address bits. For further information see Address decoding .

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
	0 Banks are not interleaved, and address will be decoded as bank-row-column 1 Banks are interleaved, and address will be decoded as row-bank-column
11 LPDDR2_S2	LPDDR2 S2 device type indication. In case LPDDR2 device is used (DDR_TYPE = 0x1), this bit will indicate whether S2 or S4 device is used. This bit should be cleared in DDR3 mode 0x0 LPDDR2-S4 device is used. 0x1 LPDDR2-S2 device is used.
10–9 MIF3_MODE	Command prediction working mode. This field determines the level of command prediction that will be used by the MMDC 00 Disable prediction. 01 Enable prediction based on : Valid access on first pipe line stage. 10 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus. 11 Enable prediction based on: Valid access on first pipe line stage, Valid access on axi bus, Next miss access from access queue.
8–6 RALAT	Read Additional Latency. This field determines the additional read latency which is added to CAS latency and internal delays for which the MMDC will retrieve the read data from the internal FIFO. This field is used to compensate on board/chip delays. NOTE: In LPDDR2 mode 2 extra cycles will be added internally in order to compensate tDQSCK delay. 0x0 no additional latency. 0x1 1 cycle additional latency. 0x2 2 cycles additional latency. 0x3 3 cycles additional latency. 0x4 4 cycles additional latency. 0x5 5 cycles additional latency. 0x6 6 cycles additional latency. 0x7 7 cycles additional latency.
5 DDR_4_BANK	Number of banks per DDR device. When this bit is set to "1" then the MMDC will work with DDR device of 4 banks. 0 8 banks device is being used. (Default) 1 4 banks device is being used
4–3 DDR_TYPE	DDR TYPE. This field determines the type of the external DDR device. 0x0 DDR3 device is used. (Default) 0x1 LPDDR2 device is used. — — 0x2 Reserved. 0x3 Reserved.
2 Reserved	This read-only field is reserved and always has the value 0.
1 RST	Software Reset. When this bit is asserted then the internal FSMs and registers of the MMDC will be initialized. NOTE: This bit once asserted gets deasserted automatically.

Table continues on the next page...

MMDC_MDMISC field descriptions (continued)

Field	Description
	0 Do nothing. 1 Assert reset to the MMDC.
0 Reserved	This read-only field is reserved and always has the value 0.

40.12.8 MMDC Core Special Command Register (MMDC_MDSCR)

This register is used to issue special commands manually toward the external DDR device (such as load mode register, manual self refresh, manual precharge and so on). Every write to this register will be interpreted as a command, and a read from this register will show the last command that was executed.

Every write to this register will result in one special command, and the IP bus will assert `ips_xfr_wait` as long as the special command is being carried out.

Address: 21B_0000h base + 1Ch offset = 21B_001Ch

MMDR_MDSR field descriptions

Field	Description
31–24 CMD_ADDR_ MSB_MR_OP	Command/Address MSB. This field indicates the MSB of the command/Address. In LPDDR2 this field indicates the MRW operand
23–16 CMD_ADDR_ LSB_MR_ADDR	Command/Address LSB. This field indicates the LSB of the command/Address In LPDDR2 this field indicates the MRR/MRW address
15 CON_REQ	Configuration request. When this bit is set then the MMDC will clean the pending AXI accesses and will prevent from further AXI accesses to be acknowledged. This field guarantee safe configuration (or change configuration) of the MMDC while no access is in process and prevents an unexpected behaviour. After setting this bit, it is needed to poll on CON_ACK until it is set to "1". When CON_ACK is asserted then configuration is permitted. After configuration is completed then this bit must be deasserted in order to process further AXI accesses. NOTE: This bit is asserted at the end of the reset sequence, meaning that the MMDC is waiting to configure and initialize the external memory before accepting any AXI accesses. Configuration request/acknowledge mechanism should be used for the following procedures: changing of timing parameters , during calibration process or driving commands via MDSR[CMD]

Table continues on the next page...

MMDC_MDSCR field descriptions (continued)

Field	Description
	0 No request to configure MMDC. 1 A request to configure MMDC is valid
14 CON_ACK	Configuration acknowledge. Whenever this bit is set, it is permitted to configure MMDC IP registers. 0 Configuration of MMDC registers is forbidden. 1 Configuration of MMDC registers is permitted.
13–11 Reserved	This read-only field is reserved and always has the value 0.
10 MRR_READ_DATA_VALID	MRR read data valid. This field indicates that read data is valid at MDMRR register This field is relevant only for LPDDR2 mode 0 Cleared upon the assertion of MRR command 1 Set after MRR data is valid and stored at MDMRR register.
9 WL_EN	DQS pads direction. This bit controls the DQS pads direction during write-leveling calibration process. Before starting the write-leveling calibration process this bit should be set to "1". It should be set to "0" when sending write leveling exit command. For further information see Write leveling Calibration . 0 Exit write leveling mode or stay in normal mode. 1 Write leveling entry command was sent.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–4 CMD	Command. This field contains the command to be executed. This field will be automatically cleared after the command will be send to the DDR memory. 0x0 Normal operation 0x1 Precharge all, command is sent independently of bank status (set correct CMD_CS). Will be issued even if banks are closed. Mainly used for init sequence purpose. 0x2 Auto-Refresh Command (set correct CMD_CS). 0x3 Load Mode Register Command (DDR3, set correct CMD_CS, CMD_BA, CMD_ADDR_LSB, CMD_ADDR_MSB), MRW Command (LPDDR2, set correct CMD_CS, MR_OP, MR_ADDR) 0x4 ZQ calibration (DDR3, set correct CMD_CS, {CMD_ADDR_MSB,CMD_ADDR_LSB} = 0x400 or 0x0) 0x5 Precharge all, only if banks open (set correct CMD_CS). 0x6 MRR command (LPDDR2, set correct CMD_CS, MR_ADDR) 0x7 Reserved
3 CMD_CS	Chip Select. This field determines which chip select the command is targeted to 0 to Chip-select 0 1 to Chip-select 1
CMD_BA	Bank Address. This field determines the address of the bank within the selected chip-select where the command is targetted to. 0x0 bank address 0 0x1 bank address 1

Table continues on the next page...

MMDC_MDSCR field descriptions (continued)

Field	Description
0x2	bank address 2
0x7	bank address 7

40.12.9 MMDC Core Refresh Control Register (MMDC_MDREF)

This register determines the refresh scheme that will be executed toward the DDR device. It specifies how often a refresh cycle occurs and how many refresh commands will be executed every refresh cycle.

For further information see [Refresh Scheme](#).

The following tables show examples of possible refresh schemes.

Table 40-22. Refresh rate example for REF_SEL = 0

REFR[2:0]	Number of refresh commands every 64KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	15.6 μ s	tRFC
0x1	2	7.8 μ s	2*tRFC
0x3	4	3.9 μ s	4*tRFC
0x7	8	1.95 μ s	8*tRFC

Table 40-23. Refresh rate example for REF_SEL = 1

REFR[2:0]	Number of refresh commands every 32KHz	Average periodic refresh rate (tREFI)	System Refresh period
0x1	2	15.6 μ s	2*tRFC
0x3	4	7.8 μ s	4*tRFC
0x7	8	3.9 μ s	8*tRFC

Table 40-24. Refresh rate example for REF_SEL = 2@ 400MHz

REFR[2:0]	Number of refresh commands every refresh cycle	REF_CNT	Average periodic refresh rate (tREFI)	System Refresh period
0x0	1	0x618	3.9 μ s	tRFC
0x1	2	0xC30	3.9 μ s	2*tRFC
0x2	3	0x1248	3.9 μ s	3*tRFC
0x3	4	0x1860	3.9 μ s	4*tRFC

Other refresh configurations are also allowed; the configuration values in the tables above are only examples for obtaining the desired average periodic refresh rate.

If the required average periodic refresh rate (tREFI) is kept, all of the rows will be refreshed in every refresh window. Because the memory device issues additional refresh commands for every refresh it receives, the tREFI remains the same across the device, regardless of its number of rows. This is particularly relevant in the tRFC parameter, which becomes bigger as the density increases.

Address: 21B_0000h base + 20h offset = 21B_0020h

MMDC_MDREF field descriptions

Field	Description
31–16 REF_CNT	Refresh Counter at DDR clock period If REF_SEL equals '2' a refresh cycle will begin every amount of DDR cycles configured in this field. 0x0 Reserved. 0x1 1 cycle. 0xFFFFE 65534 cycles. 0xFFFF 65535 cycles.
15–14 REF_SEL	Refresh Selector. This bit selects the source of the clock that will trigger each refresh cycle: 0 Periodic refresh cycles will be triggered in frequency of 64KHz. 1 Periodic refresh cycles will be triggered in frequency of 32KHz. 2 Periodic refresh cycles will be triggered every amount of cycles that are configured in REF_CNT field. 3 No refresh cycles will be triggered.
13–11 REFR	Refresh Rate. This field determines how many refresh commands will be issued every refresh cycle. After every refresh command the MMDC won't drive any command to the DDR device until satisfying tRFC period

Table continues on the next page...

MMDC_MDREF field descriptions (continued)

Field	Description
	0x0 1 refresh 0x1 2 refreshes 0x2 3 refreshes 0x3 4 refreshes 0x4 5 refreshes 0x5 6 refreshes 0x6 7 refreshes 0x7 8 refreshes
10–1 Reserved	This read-only field is reserved and always has the value 0.
0 START_REF	Manual start of refresh cycle. When this field is set to '1' the MMDC will start a refresh cycle immediately according to number of refresh commands that are configured in 'REFR' field. This bit returns to zero automatically. 0 Do nothing. 1 Start a refresh cycle.

40.12.10 MMDC Core Read/Write Command Delay Register (MMDC_MDRWD)

This register determines the delay between back to back read and write accesses. The register reset values are set to the minimum required value. As the default values are set to achieve optimal results, changing them is discouraged.

Address: 21B_0000h base + 2Ch offset = 21B_002Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MDRWD field descriptions

Field	Description
31–29 Reserved	This read-only field is reserved and always has the value 0.
28–16 tDAI	Device auto initialization period.(maximum) This field is relevant only to LPDDR2 mode

Table continues on the next page...

MMDC_MDRWD field descriptions (continued)

Field	Description
	0x0 1 cycle 0xF9F 4000 cycles (Default, JEDEC value for LPDDR2, gives 10us at 400MHz clock). 0x1FFF 8192 cycles
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 RTW_SAME	Read to write delay for the same chip-select. This field controls the delay between read to write commands toward the same chip select. The total delay is calculated according to: $BL/2 + RTW_SAME + (tCL-tCWL) + RALAT$ 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
11–9 WTR_DIFF	Write to read delay for different chip-select. This field controls the delay between write to read commands toward different chip select. The total delay is calculated according to: $BL/2 + WTR_DIFF + (tCL-tCWL) + RALAT$ 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
8–6 WTW_DIFF	Write to write delay for different chip-select. This field controls the delay between write to write commands toward different chip select. The total delay is calculated according to: $BL/2 + WTW_DIFF$ 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles 0x3 3 cycles (Default) 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
5–3 RTW_DIFF	Read to write delay for different chip-select. This field controls the delay between read to write commands toward different chip select. The total delay is calculated according to: $BL/2 + RTW_DIFF + (tCL - tCWL) + RALAT$ 0x0 0 cycle 0x1 1 cycle

Table continues on the next page...

MMDC_MDRWD field descriptions (continued)

Field	Description
	0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles
RTR_DIFF	Read to read delay for different chip-select. This field controls the delay between read to read commands toward different chip select. The total delay is calculated according to: $BL/2 + RTR_DIFF$ 0x0 0 cycle 0x1 1 cycle 0x2 2 cycles (Default) 0x3 3 cycles 0x4 4 cycles 0x5 5 cycles 0x6 6 cycles 0x7 7 cycles

40.12.11 MMDC Core Out of Reset Delays Register (MMDC_MDOR)

This register defines delays that must be kept when MMDC exits reset.

Address: 21B_0000h base + 30h offset = 21B_0030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	0								tXPR								0	SDE_to_RST				0	RST_to_CKE											
W	0								0								0				0													
Reset	0	0	0	0	0	0	0	0	1	0	0	1	1	1	1	1	1	0	0	0	0	1	1	1	0	0	0	0	0	0	1	1	1	0

MMDC_MDOR field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
23–16 tXPR	DDR3: CKE HIGH to a valid command. This field is not relevant in LPDDR2 mode. DDR3: As defined in timing parameter table. 0x0 Reserved 0x1 2 cycles

Table continues on the next page...

MMDC_MDOR field descriptions (continued)

Field	Description
	0x2 3 cycles 0xFE 255 cycles 0xFF 256 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–8 SDE_to_RST	DDR3: Time from SDE enable until DDR reset# is high. In LPDDR2 mode this field is not relevant . NOTE: Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x4 2 cycles 0x10 14 cycles (Jedec value for DDR3) - total of 200 us 0x3E 60 cycles 0x3F 61 cycles
7–6 Reserved	This read-only field is reserved and always has the value 0.
RST_to_CKE	DDR3: Time from SDE enable to CKE rise. In case that DDR reset# is low, will wait until it's high and thenwait this period until rising CKE. (JEDEC value is 500 us) LPDDR2: Idle time ater first CKE assertion. (JEDEC value is 200 us) NOTE: Each cycle in this field is 15.258 us. 0x0 Reserved 0x1 Reserved 0x2 Reserved 0x3 1 cycles 0x10 14 cycles (JEDEC value for LPDDR2) - total of 200 us 0x23 33 cycles (JEDEC value for DDR3) - total of 500 us 0x3E 60 cycles 0x3F 61 cycles

40.12.12 MMDC Core MRR Data Register (MMDC_MDMRR)

This register contains data that was collected after issuing MRR command. The data in this register is valid only when MDSCR[MRR_READ_DATA_VALID] is set to "1".

This register is relevant only in LPDDR2 mode. For further information see [LPDDR2 Refresh Rate Update and Timing Derating](#) .

Address: 21B_0000h base + 34h offset = 21B_0034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MDCFG3LP field descriptions

Field	Description
31–22 Reserved	This read-only field is reserved and always has the value 0.
21–16 RC_LP	Active to Active or Refresh command period (same bank). (This field is valid only for LPDDR2 memories) 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0x3E 63 clocks 0x3F Reserved

Table continues on the next page...

MMDC_MDCFG3LP field descriptions (continued)

Field	Description
15–12 Reserved	This read-only field is reserved and always has the value 0.
11–8 tRCD_LP	Active command to internal read or write delay time (same bank). (This field is valid only for LPDDR2 memories) 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
7–4 tRPpb_LP	Precharge (per bank) command period (same bank). (This field is valid only for LPDDR2 memories) 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved
tRPab_LP	Precharge (all banks) command period. (This field is valid only for LPDDR2 memories) 0x0 1 clock 0x1 2 clocks 0x2 3 clocks 0xE 15 clocks 0xF Reserved

40.12.14 MMDC Core MR4 Derating Register (MMDC_MDMR4)

This register is relevant only for LPDDR2 mode. It is used to dynamically change certain values depending on MR4 read result, which is based on memory temperature sensor result.

Address: 21B_0000h base + 3Ch offset = 21B_003Ch

MMDC_MDMR4 field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 tRRD_DE	tRRD derating value. 0 Original tRRD is used. 1 tRRD is derated in 1 cycle.
7 tRP_DE	tRP derating value. 0 Original tRP is used. 1 tRP is derated in 1 cycle.
6 tRAS_DE	tRAS derating value. 0 Original tRAS is used. 1 tRAS is derated in 1 cycle.
5 tRC_DE	tRC derating value. 0 Original tRC is used. 1 tRC is derated in 1 cycle.
4 tRCD_DE	tRCD derating value. 0 Original tRCD is used. 1 tRCD is derated in 1 cycle.
3–2 Reserved	This read-only field is reserved and always has the value 0.
1 UPDATE_DE_ACK	Update Derated Values Acknowledge. This read only bit will be cleared upon UPDATE_DE_REQ assertion and will be set after the new values are taken.
0 UPDATE_DE_REQ	Update Derated Values Request. This read modify write field is automatically cleared after the request is issued. 0 Do nothing. 1 Request to update the following values: tRRD, tRCD, tRP, tRC, tRAS and refresh related fields(MDREF register): REF_CNT, REF_SEL, REFR

40.12.15 MMDC Core Address Space Partition Register (MMDC_MDASP)

This register defines the partitioning between chip select 0 and chip select 1. For further information see [Chip select settings](#).

Address: 21B_0000h base + 40h offset = 21B_0040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	0																CS0_END																
W	0																0																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	1

MMDC_MDASP field descriptions

Field	Description
31–7 Reserved	This read-only field is reserved and always has the value 0.
CS0_END	CS0_END. Defines the absolute last address associated with CS0 with increments of 256Mb. CS0_END=AXI_ADDRESS[31:25] bits.

40.12.16 MMDC Core AXI Reordering Control Register (MMDC_MAARCR)

This register determines the values of the weights used for the re-ordering arbitration engine. For further information see [Performance](#) .

Address: 21B_0000h base + 400h offset = 21B_0400h

MMDC_MAARCR field descriptions

Field	Description
31 ARCR_SEC_ERR_LOCK	Once set, this bit locks ARCR_SEC_ERR_EN and prevents from its updating. This bit can be only cleared by reset Default value is 0x0 - encoding 0 (unlocked) 0 ARCR_SEC_ERR_EN is unlocked, so can be updated any moment 1 ARCR_SEC_ERR_EN is locked, so it can't be updated
30 ARCR_SEC_ERR_EN	This bit defines whether security read/write access violation result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error, rresp/bresp=2'b10) 0 security violation results in OKAY response (rresp/bresp=2'b00) 1 security violation results in SLAVE Error response (rresp/bresp=2'b10)

Table continues on the next page...

MMDC_MAARCR field descriptions (continued)

Field	Description
29 -	This field is reserved. Reserved
28 ARCR_EXC_ERR_EN	This bit defines whether exclusive read/write access violation of AXI 6.2.4 rule result in SLV Error response or in OKAY response Default value is 0x1 - encoding 1(response is SLV Error) 0 violation of AXI exclusive rules (6.2.4) result in OKAY response (rresp/bresp=2'b00) 1 violation of AXI exclusive rules (6.2.4) result in SLAVE Error response (rresp/bresp=2'b10)
27–25 -	This field is reserved. Reserved
24 ARCR_RCH_EN	This bit defines whether Real time channel is activated and bypassed all other pending accesses, So accesses with QoS=='F' will be granted the highest priority in the optimization/reordering mechanism Default value is 0x1 - encoding 1 (Enabled) 0 normal prioritization, no bypassing 1 accesses with QoS=='F' bypass the arbitration
23 -	This field is reserved. Reserved
22–20 ARCR_PAG_HIT	ARCR Page Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that is targeted to an open DDR row. Default value of ARCR_PAG_HIT is 0x00100 - encoding 4.
19 -	This field is reserved. Reserved
18–16 ARCR_ACC_HIT	ARCR Access Hit Rate. This value will be added by the optimization/reordering mechanism to any pending access that has the same access type (read/write) as the previous access. Default value of is ARCR_ACC_HIT 0x0010 - encoding 2.
15–12 -	This field is reserved. Reserved
11–8 ARCR_DYN_JMP	ARCR Dynamic Jump. Each time an access wan't chosen by the optimization/reordering mechanism then its dynamic score will be incremented by ARCR_DYN_JMP value. NOTE: Setting ARCR_DYN_JMP may cause starvation of low priority accesses NOTE: ARCR_DYN_JMP must be smaller than ARCR_DYN_MAX Default ARCR_DYN_JMP value is 0x0001 - encoding 1
7–4 ARCR_DYN_MAX	ARCR Dynamic Maximum. ARCR_DYN_MAX is the maximum dynamic score value that each access inside the optimization/reordering mechanism can get. 0000 0 0001 1 1111 15 (default)
ARCR_GUARD	ARCR Guard. After an access reached the maximum dynamic score value, it will wait additional ARCR_GUARD arbitration cycles and then will gain the highest priority in the optimization/reordering mechanism. 0000 15 (default) 0001 16 1111 30

40.12.17 MMDC Core Power Saving Control and Status Register (MMDC_MAPSR)

The MAPSR determines the power saving features of MMDC. For further information see [Power Saving and Clock Frequency Change modes](#).

Address: 21B_0000h base + 404h offset = 21B_0404h

MMDC_MAPSR field descriptions

Field	Description
31–26 -	This field is reserved. Reserved
25 DVACK	General DVFS acknowledge. This read only bit indicates whether a dvfs acknowledge was asserted and that MMDC is in self-refresh mode
24 LPACK	General low-power acknowledge. This read only bit indicates whether a low-power acknowledge was asserted and that MMDC is in self-refresh mode
23–22 -	This field is reserved. Reserved
21 DVFS	General DVFS request. SW request for DVFS. Assertion of this bit will yield in self-refresh entry sequence 0 no dvfs request 1 dvfs request
20 LPMD	General LPMD request. SW request for LPMD. Assertion of this bit will yield in self-refresh entry sequence 0 no lpmd request 1 lpmd request
19–16 -	This field is reserved. Reserved
15–8 PST	Automatic Power saving timer. Valid only when PSD is set to "0". When the MMDC is idle for amount of cycles specified in that field then the DDR device will be entered automatically into self-refresh mode. The real value which is used is register-value multiplied by 64. 00000000 Reserved - this value is forbidden. 00000001 timer is configured to 64 clock cycles. 00000010 timer is configured to 128 clock cycles.

Table continues on the next page...

MMDC_MAPSR field descriptions (continued)

Field	Description
	00010000 (Default)- 1024 clock cycles. 11111111 timer clock is configured to 16320 clock cycles.
7 -	This field is reserved. Reserved.
6 WIS	Write Idle Status. This read only bit indicates whether write request buffer is idle (empty) or not. 0 idle 1 not idle
5 RIS	Read Idle Status. This read only bit indicates whether read request buffer is idle (empty) or not. 0 idle 1 not idle
4 PSS	Power Saving Status. This read only bit indicates whether the MMDC is in automatic power saving mode. 0 not in power saving 1 power saving
3-1 -	This field is reserved. Reserved.
0 PSD	Automatic Power Saving Disable. When the value of PSD is "0" (i.e automatic power saving is enabled) then the PST is activated and MMDC will enter automatically to self-refresh while the number of idle cycle reached. NOTE: This bit must be disabled (i.e set to "1") during calibration process 0 power saving enabled 1 power saving disabled (default)

40.12.18 MMDC Core Exclusive ID Monitor Register0 (MMDC_MAEXIDR0)

This register defines the ID to be monitored for exclusive accesses of monitor0 and monitor1. For further information see [Exclusive accesses handling](#) .

Address: 21B_0000h base + 408h offset = 21B_0408h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset	0	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	

MMDC_MAEXIDR1 field descriptions

Field	Description
31–16 EXC_ID_ MONITOR3	This feild defines ID for Exclusive monitor#3. Default value is 0x0060
EXC_ID_ MONITOR2	This feild defines ID for Exclusive monitor#2. Default value is 0x0040

40.12.20 MMDC Core Debug and Profiling Control Register 0 (MMDC_MADPCR0)

Address: 21B_0000h base + 410h offset = 21B_0410h

MMDC_MADPCR0 field descriptions

Field	Description
31–10 Reserved	This read-only field is reserved and always has the value 0.
9 SBS	Step By Step trigger. If SBS_EN is set to "1" then dispatching AXI pending access toward the DDR will done only if this bit is set to "1", otherwise no access will be dispatched toward the DDR. This bit is cleared when the pending access has been issued toward the DDR device. 1 Launch AXI pending access toward the DDR 0 No access will be launched toward the DDR
8 SBS_EN	Step By Step debug Enable. Enable step by step mode. Every time this mechanism is enabled then setting SBS to "1" will dispatch one pending AXI access to the DDR and in parallel its attributes will be observed in the status registes (MASBS0 and MASBS1). For further information see Step By Step (SBS) software monitor . 0 disable 1 enable
7–4 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MADPCR0 field descriptions (continued)

Field	Description
3 CYC_OVF	Total Profiling Cycles Count Overflow. When profiling mechanism is enabled (DBG_EN is set to "1") then this bit is asserted when overflow of CYC_COUNT occurred. Cleared by writing 1 to it. 0 no overflow 1 overflow
2 PRF_FRZ	Profiling freeze. When this bit is asserted then the profiling mechanism will be frozen and the associated status registers (MADPSR0-MADPSR5) will hold the the current profiling values. 0 profiling counters are not frozen 1 profiling counters are frozen
1 DBG_RST	Debug and Profiling Reset. Reset all debug and profiling counters and components. 0 no reset 1 reset
0 DBG_EN	Debug and Profiling Enable. Enable debug and profiling mechanism. When this bit is asserted then the MMDC will perform a profiling based on the ID that is configured to MADPCR1. Upon assertion of PRF_FRZ the profiling will be frozen and the profiling results will be sampled to the status registers (MADPSR0-MADPSR5). For further information see MMDC Profiling . default is "disable" 0 disable 1 enable

40.12.21 MMDC Core Debug and Profiling Control Register 1 (MMDC_MADPCR1)

Address: 21B_0000h base + 414h offset = 21B_0414h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		

MMDC_MADPCR1 field descriptions

Field	Description
31-16 PRF_AXI_ID_MASK	Profiling AXI ID Mask. AXI ID bits which masked by this value are chosen for profiling. 1 AXI ID specific bit is chosen for profiling 0 AXI ID specific bit is ignored (don't care)
PRF_AXI_ID	Profiling AXI ID. AXI IDs that matches a bit-wise AND logic operation between PRF_AXI_ID and PRF_AXI_ID_MASK are chosen for profiling. Default value is 0x0, to choose any ID-s for profiling

40.12.22 MMDC Core Debug and Profiling Status Register 0 (MMDC_MADPSR0)

Address: 21B_0000h base + 418h offset = 21B_0418h

MMDC_MADPSR0 field descriptions

Field	Description
CYC_COUNT	Total Profiling cycle Count. This field reflects the total cycle count in case the profiling mechanism is enabled from assertion of DBG_EN and until PRF_FRZ is asserted

40.12.23 MMDC Core Debug and Profiling Status Register 1 (MMDC_MADPSR1)

The register reflects the total cycles during which the MMDC state machines were busy (both writes and reads). This information can be used for DDR Utilization calculation.

Address: 21B_0000h base + 41Ch offset = 21B_041Ch

MMDC_MADPSR1 field descriptions

Field	Description
BUSY_COUNT	Profiling Busy Cycles Count. This field reflects the total number of cycles where the MMDC read and write state machines were busy during the profiling period. Can be used for DDR utilization calculations. Busy cycles are any MMDC clock cycles where the internal state machine is not idle. If any read or write requests are pending in the FIFOs, the MMDC is not idle.

40.12.24 MMDC Core Debug and Profiling Status Register 2 (MMDC_MADPSR2)

This register reflects the total number of read accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 420h offset = 21B_0420h

MMDC_MADPSR2 field descriptions

Field	Description
RD_ACC_COUNT	Profiling Read Access Count. This register reflects the total number of read accesses (per AXI ID) toward MMDC.

40.12.25 MMDC Core Debug and Profiling Status Register 3 (MMDC_MADPSR3)

This register reflects the total number of write accesses (per AXI ID) toward MMDC.

Address: 21B_0000h base + 424h offset = 21B_0424h

MMDC_MADPSR3 field descriptions

Field	Description
WR_ACC_COUNT	Profiling Write Access Count. This register reflects the total number of write accesses (per AXI ID) toward MMDC.

40.12.26 MMDC Core Debug and Profiling Status Register 4 (MMDC_MADPSR4)

This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 428h offset = 21B_0428h

MMDC_MADPSR4 field descriptions

Field	Description
RD_BYTES_COUNT	Profiling Read Bytes Count. This register reflects the total number of bytes that were transferred during read access (per AXI ID) toward MMDC.

40.12.27 MMDC Core Debug and Profiling Status Register 5 (MMDC_MADPSR5)

This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

Address: 21B_0000h base + 42Ch offset = 21B_042Ch

MMDC_MADPSR5 field descriptions

Field	Description
WR_BYTES_COUNT	Profiling Write Bytes Count. This register reflects the total number of bytes that were transferred during write access (per AXI ID) toward MMDC.

40.12.28 MMDC Core Step By Step Address Register (MMDC_MASBS0)

Address: 21B_0000h base + 430h offset = 21B_0430h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

MMDC_MASBS1 field descriptions

Field	Description
31–16 SBS_AXI_ID	Step By Step AXI ID. These bits reflect the AXI ID of the pending request in case of step by step mode.
15–13 SBS_LEN	Step By Step Length. These bits reflect the AXI LENGTH of the pending request in case of step by step mode. 000 burst of length 1 001 burst of length 2 111 burst of length 8
12 SBS_BUFF	Step By Step Buffered. This bit reflect the AXI CACHE[0] of the pending request in case of step by step mode. Relevant only for write requests

Table continues on the next page...

MMDC_MASBS1 field descriptions (continued)

Field	Description
11-10 SBS_BURST	Step By Step Burst. These bits reflect the AXI BURST of the pending request in case of step by step mode. 00 FIXED 01 INCR burst 10 WRAP burst 11 reserved
9-7 SBS_SIZE	Step By Step Size. These bits reflect the AXI SIZE of the pending request in case of step by step mode. 000 8 bits 001 16 bits 010 32 bits 011 64 bits 100 128bits 101-111 Reserved
6-4 SBS_PROT	Step By Step Protection. These bits reflect the AXI PROT of the pending request in case of step by step mode.
3-2 SBS_LOCK	Step By Step Lock. These bits reflect the AXI LOCK of the pending request in case of step by step mode.
1 SBS_TYPE	Step By Step Request Type. These bits reflect the type (read/write) of the pending request in case of step by step mode. 0 write 1 read
0 SBS_VLD	Step By Step Valid. This bit reflects whether there is a pending request in case of step by step mode. 0 not valid 1 valid

40.12.30 MMDC Core General Purpose Register (MMDC_MAGENP)

This register is a general 32 bit read/write register.

Address: 21B_0000h base + 440h offset = 21B_0440h

MMDC_MAGENP field descriptions

Field	Description
GP31_GP0	General purpose read/write bits.

40.12.31 MMDC PHY ZQ HW control register (MMDC_MPZQHWCTRL)

Address: 21B_0000h base + 800h offset = 21B_0800h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPZQHWCTRL field descriptions

Field	Description
31–27 ZQ_EARLY_COMPARATOR_EN_TIMER	ZQ early comparator enable timer. This timer defines the interval between the warming up of the comparator of the i.MX ZQ calibration pad and the beginning of the ZQ calibration process with the pad 0x0 - 0x6 Reserved 0x7 8 cycles 0x14 21 cycles (Default) 0x1E 31 cycles 0x1F 32 cycles
26 Reserved	This read-only field is reserved and always has the value 0.
25–23 TZQ_CS	Device ZQ short time. This field holds the number of cycles that are required by the external DDR device to perform ZQ short calibration. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. NOTE: In LPDDR2 the ZQ short time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCS] NOTE: This field should not be update during ZQ calibration. 000 Reserved 001 Reserved 010 128 cycles (Default) 011 256 cycles 100 512 cycles 101 1024 cycles 110- 111 Resreved
22–20 TZQ_OPER	Device ZQ long/oper time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration except the first ZQ long command that is issued after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time. NOTE: In LPDDR2 the ZQ oper time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQCL]

Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	<p>NOTE: This field should not be update during ZQ calibration.</p> <p>000 Reserved 001 Reserved 010 128 cycles 011 256 cycles - Default (JEDEC value for DDR3) 100 512 cycles 101 1024 cycles 110- 111 Resreved</p>
19–17 TZQ_INIT	<p>Device ZQ long/init time. This field holds the number of cycles that are required by the external DDR device to perform ZQ long calibration right after reset. Upon driving the command to the DDR device then no further accesses will be issued to the DDR device till satisfying that time.</p> <p>NOTE: In LPDDR2 the ZQ init time is taken from MPZQLP2CTL[ZQ_LP2_HW_ZQINIT]</p> <p>NOTE: This field should not be update during ZQ calibration.</p> <p>000 Reserved 001 Reserved 010 128 cycles 011 256 cycles 100 512 cycles - Default (JEDEC value for DDR3) 101 1024 cycles 110- 111 Resreved</p>
16 ZQ_HW_FOR	<p>Force ZQ automatic calibration process with the i.MX ZQ calibration pad. When this bit is asserted then the MMDC will issue one ZQ automatic calibration process with the i.MX ZQ calibration pad. It is the user responsibility to make sure that all the accesses to DDR will be finished before asserting this bit using CON_REQ/CON_ACK mechanism. HW will negate this bit upon completion of the ZQ calibration process. Upon negation of this bit the ZQ HW calibration pull-up and pull-down results (ZQ_HW_PU_RES and ZQ_HW_PD_RES respectively) are valid</p> <p>NOTE: In order to enable this bit ZQ_MODE must be set to either "1" or "3"</p>
15–11 ZQ_HW_PD_RES	<p>ZQ HW calibration pull-down result. This field holds the pull-down resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad.</p> <p>00000 Max. resistance. 11111 Min. resistance.</p>
10–6 ZQ_HW_PU_RES	<p>ZQ automatic calibration pull-up result. This field holds the pull-up resistor value calculated at the end of the ZQ automatic calibration process with the i.MX ZQ calibration pad.</p> <p>00000 Min. resistance. 11111 Max. resistance.</p>
5–2 ZQ_HW_PER	<p>ZQ periodic calibration time. This field determines how often the periodic ZQ calibration is performed.</p> <p>This field is applied for both ZQ short calibration and ZQ automatic calibration process with i.MX ZQ calibration pad. Whenever this timer is expired then according to ZQ_MODE the ZQ automatic calibration process with the i.MX ZQ calibration pad will be issued and/or short/long command will be issued to the external DDR device.</p> <p>This field is ignored if ZQ_MODE equals "00"</p> <p>0000 ZQ calibration is performed every 1 ms. 0001 ZQ calibration is performed every 2 ms.</p>

Table continues on the next page...

MMDC_MPZQHWCTRL field descriptions (continued)

Field	Description
	0010 ZQ calibration is performed every 4 ms. 1010 ZQ calibration is performed every 1 sec. 1110 ZQ calibration is performed every 16 sec. 1111 ZQ calibration is performed every 32 sec.
ZQ_MODE	ZQ calibration mode: 0x0 No ZQ calibration is issued. (Default) 0x1 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ long command to the external DDR device only when exiting self refresh. 0x2 ZQ calibration command long/short is issued only to the external DDR device periodically and when exiting self refresh 0x3 ZQ calibration is issued to i.MX ZQ calibration pad together with ZQ calibration command long/short to the external DDR device periodically and when exiting self refresh

40.12.32 MMDC PHY ZQ SW control register (MMDC_MPZQSWCTRL)

Address: 21B_0000h base + 804h offset = 21B_0804h

MMDC_MPZQSWCTRL field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 ZQ_CMP_OUT_SMP	Defines the amount of cycles between driving the ZQ signals to the ZQ pad and till sampling the comparator enable output while performing ZQ calibration process with the i.MX ZQ calibration pad 00 7 cycles 01 15 cycles

Table continues on the next page...

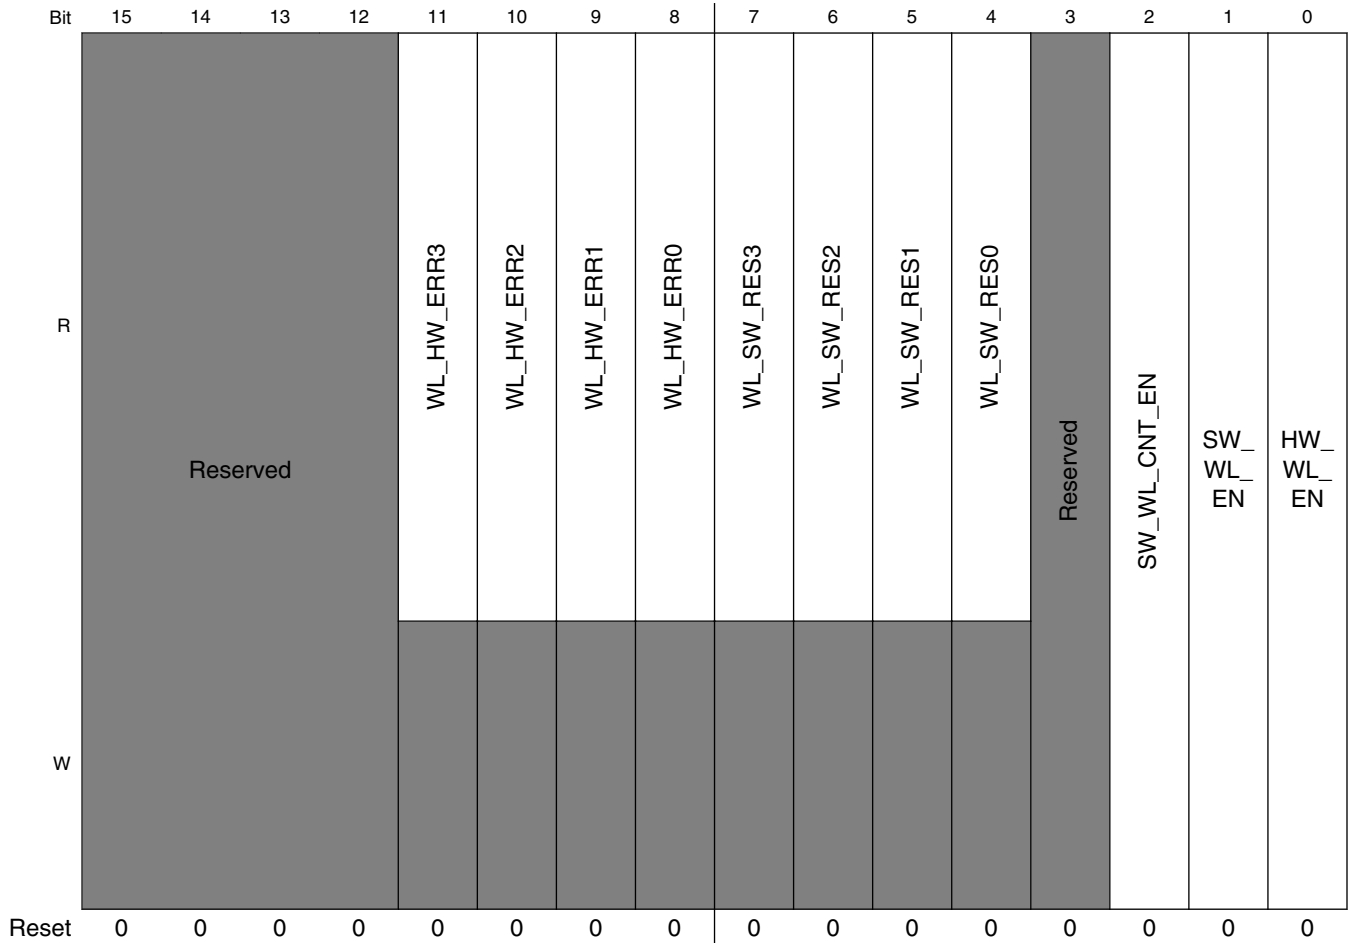

MMDC_MPZQSWCTRL field descriptions (continued)

Field	Description
	10 23 cycles 11 31 cycles
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 USE_ZQ_SW_VAL	Use SW ZQ configured value for I/O pads resistor controls. This bit selects whether ZQ SW value or ZQ HW value will be driven to the I/O pads resistor controls. By default this bit is cleared and MMDC drives the HW ZQ status bits on the resistor controls of the I/O pads. NOTE: This bit should not be updated during ZQ calibration. 0 Fields ZQ_HW_PD_VAL & ZQ_HW_PU_VAL will be driven to I/O pads resistor controls. 1 Fields ZQ_SW_PD_VAL & ZQ_SW_PU_VAL will be driven to I/O pads resistor controls.
12 ZQ_SW_PD	ZQ software PU/PD calibration. This bit determines the calibration stage (PU or PD). 0 PU resistor calibration 1 PD resistor calibration
11–7 ZQ_SW_PD_VAL	ZQ software pull-down resistance. This field determines the value of the PD resistor during SW ZQ calibration. 00000 Max. resistance. 11111 Min. resistance.
6–2 ZQ_SW_PU_VAL	ZQ software pull-up resistance. This field determines the value of the PU resistor during SW ZQ calibration. 00000 Min. resistance. 11111 Max. resistance.
1 ZQ_SW_RES	ZQ software calibration result. This bit reflects the ZQ calibration voltage comparator value. 0 Current ZQ calibration voltage is less than VDD/2. 1 Current ZQ calibration voltage is more than VDD/2
0 ZQ_SW_FOR	ZQ SW calibration enable. This bit when asserted enables ZQ SW calibration. HW negates this bit upon completion of the ZQ SW calibration. Upon negation of this bit the ZQ SW calibration result (i.e ZQ_SW_RES) is valid

40.12.33 MMDC PHY Write Leveling Configuration and Error Status Register (MMDC_MPWLGCR)

Address: 21B_0000h base + 808h offset = 21B_0808h

MMDC_MPWLGCRCR field descriptions

Field	Description
31-12 -	This field is reserved. Reserved
11 WL_HW_ERR3	Byte3 write-leveling HW calibration error. This bit is asserted when an error was found on byte3 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e HW_WL_EN bit is de-asserted) 0 No error was found on byte3 during write-leveling HW calibration. 1 An error was found on byte3 during write-leveling HW calibration.
10 WL_HW_ERR2	Byte2 write-leveling HW calibration error. This bit is asserted when an error was found on byte2 during write-leveling HW calibration. This bit is valid only upon completion of the write-leveling HW calibration (i.e HW_WL_EN bit is de-asserted) 0 No error was found on byte2 during write-leveling HW calibration. 1 An error was found on byte2 during write-leveling HW calibration.
9 WL_HW_ERR1	Byte1 write-leveling HW calibration error. This bit is asserted when an error was found on byte1 during write-leveling HW calibration.

Table continues on the next page...

MMDC_MPWLGCR field descriptions (continued)

Field	Description
	<p>This bit is valid only upon completion of the write-leveling HW calibration (i.e HW_WL_EN bit is de-asserted)</p> <p>0 No error was found on byte1 during write-leveling HW calibration. 1 An error was found on byte1 during write-leveling HW calibration.</p>
8 WL_HW_ERR0	<p>Byte0 write-leveling HW calibration error. This bit is asserted when an error was found on byte0 during write-leveling HW calibration.</p> <p>This bit is valid only upon completion of the write-leveling HW calibration (i.e HW_WL_EN bit is de-asserted)</p> <p>0 No error was found on byte0 during write-leveling HW calibration. 1 An error was found on byte0 during write-leveling HW calibration.</p>
7 WL_SW_RES3	<p>Byte3 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ24 during SW write-leveling.</p> <p>0 DQS3 sampled low CK during SW write-leveling. 1 DQS3 sampled high CK during SW write-leveling.</p>
6 WL_SW_RES2	<p>Byte2 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ16 during SW write-leveling.</p> <p>0 DQS2 sampled low CK during SW write-leveling. 1 DQS2 sampled high CK during SW write-leveling.</p>
5 WL_SW_RES1	<p>Byte1 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ8 during SW write-leveling.</p> <p>0 DQS1 sampled low CK during SW write-leveling. 1 DQS1 sampled high CK during SW write-leveling.</p>
4 WL_SW_RES0	<p>Byte0 write-leveling software result. This bit reflects the value that is driven by the DDR device on DQ0 during SW write-leveling.</p> <p>0 DQS0 sampled low CK during SW write-leveling. 1 DQS0 sampled high CK during SW write-leveling.</p>
3 -	<p>This field is reserved. Reserved</p>
2 SW_WL_CNT_EN	<p>SW write-leveling count down enable. This bit when asserted set a certain delay of (25+15) cycles from the setting of SW_WL_EN and before driving the DQS to the DDR device. This bit should be asserted before the first SW write-leveling request and after issuing the write leveling MRS command</p> <p>0 MMDC doesn't count 25+15 cycles before issuing write-leveling DQS. 1 MMDC counts 25+15 cycles before issuing write-leveling DQS.</p>
1 SW_WL_EN	<p>Write-Leveling SW enable. If this bit is asserted then the MMDC will perform one write-leveling iteration with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negate this bit upon completion of the SW write-leveling. Negation of this bit also points that the write-leveling SW calibration result is valid</p> <p>NOTE: If this bit and the SW_WL_CNT_EN are enabled the MMDC counts 25 + 15 cycles before issuing the SW write-leveling DQS.</p>
0 HW_WL_EN	<p>Write-Leveling HW (automatic) enable. If this bit is asserted then the MMDC will perform the whole Write-Leveling sequence with the DDR device (assuming that Write-Leveling procedure is already enabled in the DDR device through MRS command). HW negates this bit upon completion of the HW write-leveling. Negation of this bit also points that the write-leveling HW calibration results are valid</p>

Table continues on the next page...

MMDC_MPWLGCR field descriptions (continued)

Field	Description
	NOTE: Before issuing the first DQS the MMDC counts 25 + 15 cycles automatically as required by the standard.

40.12.34 MMDC PHY Write Leveling Delay Control Register 0 (MMDC_MPWLDECTRL0)

Address: 21B_0000h base + 80Ch offset = 21B_080Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0					WL_CYC_DEL1		WL_HC_DEL1	0	WL_DL_ABS_OFFSET1						
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MPWLDECTRL0 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–25 WL_CYC_DEL1	Write leveling cycle delay for Byte 1. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 \times \text{cycle}) + (WL_HC_DEL \times \text{half cycle}) + (WL_CYC_DEL \times \text{cycle})$. When both SW write-leveling is enabled (i.e SW_WL_EN = 1) or HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL. Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration. 0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.
24 WL_HC_DEL1	Write leveling half cycle delay for Byte 1. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and

Table continues on the next page...

MMDC_MPWLDECTRL0 field descriptions (continued)

Field	Description
	<p>WL_CYC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p> <p>0 No delay is added. 1 Half cycle delay is added.</p>
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WL_DL_ABS_OFFSET1	<p>Absolute write-leveling delay offset for Byte 1. This field indicates the absolute delay between CK and write DQS of Byte1 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WR_DL_ABS_OFFSET1 / 256) * clock\ period$</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>
15–11 Reserved	This read-only field is reserved and always has the value 0.
10–9 WL_CYC_DELO	<p>Write leveling cycle delay for Byte 0. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When both SW write-leveling is enabled (i.e SW_WL_EN = 1) or HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL.</p> <p>Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration.</p> <p>0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.</p>
8 WL_HC_DELO	<p>Write leveling half cycle delay for Byte 0. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p> <p>0 No delay is added. 1 Half cycle delay is added.</p>

Table continues on the next page...

MMDC_MPWLDECTRL0 field descriptions (continued)

Field	Description
7 Reserved	This read-only field is reserved and always has the value 0.
WL_DL_ABS_OFFSET0	<p>Absolute write-leveling delay offset for Byte 0. This field indicates the absolute delay between CK and write DQS of Byte0 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WR_DL_ABS_OFFSET1 / 256) * \text{clock period}$</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>

40.12.35 MMDC PHY Write Leveling Delay Control Register 1 (MMDC_MPWLDECTRL1)

Address: 21B_0000h base + 810h offset = 21B_0810h

MMDC_MPWLDECTRL1 field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26–25 WL_CYC_DEL3	Write leveling cycle delay for Byte 3. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WL_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * \text{cycle}) + (WL_HC_DEL * \text{half cycle}) + (WL_CYC_DEL * \text{cycle})$.

Table continues on the next page...

MMDC_MPWLDECTRL1 field descriptions (continued)

Field	Description
	<p>When both SW write-leveling is enabled (i.e SW_WL_EN = 1) or HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL.</p> <p>Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration.</p> <p>0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.</p>
24 WL_HC_DEL3	<p>Write leveling half cycle delay for Byte 3. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WL_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p> <p>0 No delay is added. 1 Half cycle delay is added.</p>
23 Reserved	<p>This read-only field is reserved and always has the value 0.</p>
22–16 WL_DL_ABS_OFFSET3	<p>Absolute write-leveling delay offset for Byte 3. This field indicates the absolute delay between CK and write DQS of Byte3 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WL_DL_ABS_OFFSET3 / 256) * clock\ period$</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>
15–11 Reserved	<p>This read-only field is reserved and always has the value 0.</p>
10–9 WL_CYC_DEL2	<p>Write leveling cycle delay for Byte 2. This field indicates whether a delay of 1 or 2 cycles between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_HC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When both SW write-leveling is enabled (i.e SW_WL_EN = 1) or HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_HC_DEL.</p> <p>Note that in HW write-leveling this field is not used for indication, as in WL_DL_OFFSET and WL_HC_DEL, but for configuration.</p> <p>0 No delay is added. 1 1 cycle delay is added. 2 2 cycles delay is added. 3 Reserved.</p>

Table continues on the next page...

MMDC_MPWLDECTRL1 field descriptions (continued)

Field	Description
8 WL_HC_DEL2	<p>Write leveling half cycle delay for Byte 2. This field indicates whether a delay of half cycle between CK and write DQS is added to the delay that is indicated in the associated WR_DL_ABS_OFFSET and WL_CYC_DEL. So the total delay is the sum of $(WL_DL_ABS_OFFSET/256 * cycle) + (WL_HC_DEL * half\ cycle) + (WL_CYC_DEL * cycle)$.</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is and will be added to the associated delay that is configured in WL_DL_OFFSET and WL_CYC_DEL. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) whether a delay of half cycle was added or not to the associated WL_DL_OFFSET and WL_CYC_DEL.</p> <p>0 No delay is added. 1 Half cycle delay is added.</p>
7 Reserved	This read-only field is reserved and always has the value 0.
WL_DL_ABS_OFFSET2	<p>Absolute write-leveling delay offset for Byte 2. This field indicates the absolute delay between CK and write DQS of Byte1 with fractions of a clock period and up to half cycle. This value is process and frequency independent. The value of the delay can be calculated using the following equation $(WR_DL_ABS_OFFSET2 / 256) * clock\ period$</p> <p>When SW write-leveling is enabled (i.e SW_WL_EN = 1) then this value will be taken as is to the associated delay-line. When HW write-leveling is enabled (i.e HW_WL_EN = 1) then this value will indicate (status) the value that is taken to the associated delay-line at the end of the write-leveling calibration.</p> <p>NOTE: The delay-line has a resolution that may vary between device to device, therefore in some cases an increment of the delay by 1 step may be smaller than the delay-line resolution.</p>

40.12.36 MMDC PHY Write Leveling delay-line Status Register (MMDC_MPWLDLST)

This register holds the status of the four write leveling delay-lines.

Address: 21B_0000h base + 814h offset = 21B_0814h

MMDC_MPWLDLST field descriptions

Field	Description
31 -	This field is reserved. Reserved
30–24 WL_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by write leveling delay-line 3.
23 -	This field is reserved. Reserved
22–16 WL_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by write leveling delay-line 2.
15 -	This field is reserved. Reserved
14–8 WL_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by write leveling delay-line 1.
7 -	This field is reserved. Reserved
WL_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by write leveling delay-line 0.

40.12.37 MMDC PHY ODT control register (MMDC_MPODTCTRL)

NOTE

In LPDDR2 mode this register should be cleared, so no termination will be activated

MMDC_MPODTCTRL field descriptions (continued)

Field	Description
	100 Rtt_Nom 30 Ohm 101 Rtt_Nom 24 Ohm 110 Rtt_Nom 20 Ohm 111 Rtt_Nom 17 Ohm
3 ODT_RD_ACT_EN	Active read CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during read accesses. 0 Active CS ODT pin is disabled during read access. 1 Active CS ODT pin is enabled during read access.
2 ODT_RD_PAS_EN	Inactive read CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during read accesses. 0 Inactive CS ODT pin is disabled during read accesses to other CS. 1 Inactive CS ODT pin is enabled during read accesses to other CS.
1 ODT_WR_ACT_EN	Active write CS ODT enable. The bit determines if ODT pin of the active CS will be asserted during write accesses. 0 Active CS ODT pin is disabled during write access. 1 Active CS ODT pin is enabled during write access.
0 ODT_WR_PAS_EN	Inactive write CS ODT enable. The bit determines if ODT pin of the inactive CS will be asserted during write accesses. 0 Inactive CS ODT pin is disabled during write accesses to other CS. 1 Inactive CS ODT pin is enabled during write accesses to other CS.

40.12.38 MMDC PHY Read DQ Byte0 Delay Register (MMDC_MPRDDQBY0DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte0 relative to the read DQS. This delay is in addition to the read data calibration. If operating in 64-bit mode, there is an identical register that is mapped at the second base address.

Address: 21B_0000h base + 81Ch offset = 21B_081Ch

MMDC_MPRDDQBY2DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq23_del	Read dqs2 to dq23 delay fine-tuning. This field holds the number of delay units that are added to dq23 relative to dqs2. 000 No change in dq23 delay 001 Add dq23 delay of 1 delay unit 010 Add dq23 delay of 2 delay units. 011 Add dq23 delay of 3 delay units. 100 Add dq23 delay of 4 delay units. 101 Add dq23 delay of 5 delay units. 110 Add dq23 delay of 6 delay units. 111 Add dq23 delay of 7 delay units.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq22_del	Read dqs2 to dq22 delay fine-tuning. This field holds the number of delay units that are added to dq22 relative to dqs2. 000 No change in dq22 delay 001 Add dq22 delay of 1 delay unit 010 Add dq22 delay of 2 delay units. 011 Add dq22 delay of 3 delay units. 100 Add dq22 delay of 4 delay units. 101 Add dq22 delay of 5 delay units. 110 Add dq22 delay of 6 delay units. 111 Add dq22 delay of 7 delay units.

Table continues on the next page...

MMDC_MPRDDQBY2DL field descriptions (continued)

Field	Description
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq21_del	Read dqs2 to dq21 delay fine-tuning. This field holds the number of delay units that are added to dq21 relative to dqs2. 000 No change in dq21 delay 001 Add dq21 delay of 1 delay unit 010 Add dq21 delay of 2 delay units. 011 Add dq21 delay of 3 delay units. 100 Add dq21 delay of 4 delay units. 101 Add dq21 delay of 5 delay units. 110 Add dq21 delay of 6 delay units. 111 Add dq21 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.
18–16 rd_dq20_del	Read dqs2 to dq20 delay fine-tuning. This field holds the number of delay units that are added to dq20 relative to dqs2. 000 No change in dq20 delay 001 Add dq20 delay of 1 delay unit 010 Add dq20 delay of 2 delay units. 011 Add dq20 delay of 3 delay units. 100 Add dq20 delay of 4 delay units. 101 Add dq20 delay of 5 delay units. 110 Add dq20 delay of 6 delay units. 111 Add dq20 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq19_del	Read dqs2 to dq19 delay fine-tuning. This field holds the number of delay units that are added to dq19 relative to dqs2. 000 No change in dq19 delay 001 Add dq19 delay of 1 delay unit 010 Add dq19 delay of 2 delay units. 011 Add dq19 delay of 3 delay units. 100 Add dq19 delay of 4 delay units. 101 Add dq19 delay of 5 delay units. 110 Add dq19 delay of 6 delay units. 111 Add dq19 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq18_del	Read dqs2 to dq18 delay fine-tuning. This field holds the number of delay units that are added to dq18 relative to dqs2. 000 No change in dq18 delay 001 Add dq18 delay of 1 delay unit 010 Add dq18 delay of 2 delay units. 011 Add dq18 delay of 3 delay units.

Table continues on the next page...

MMDC_MPRDDQBY2DL field descriptions (continued)

Field	Description
	100 Add dq18 delay of 4 delay units. 101 Add dq18 delay of 5 delay units. 110 Add dq18 delay of 6 delay units. 111 Add dq18 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6-4 rd_dq17_del	Read dqs2 to dq17 delay fine-tuning. This field holds the number of delay units that are added to dq17 relative to dqs2. 000 No change in dq17 delay 001 Add dq17 delay of 1 delay unit 010 Add dq17 delay of 2 delay units. 011 Add dq17 delay of 3 delay units. 100 Add dq17 delay of 4 delay units. 101 Add dq17 delay of 5 delay units. 110 Add dq17 delay of 6 delay units. 111 Add dq17 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq16_del	Read dqs2 to dq16 delay fine-tuning. This field holds the number of delay units that are added to dq16 relative to dqs2. 000 No change in dq16 delay 001 Add dq16 delay of 1 delay unit 010 Add dq16 delay of 2 delay units. 011 Add dq16 delay of 3 delay units. 100 Add dq16 delay of 4 delay units. 101 Add dq16 delay of 5 delay units. 110 Add dq16 delay of 6 delay units. 111 Add dq16 delay of 7 delay units.

40.12.41 MMDC PHY Read DQ Byte3 Delay Register (MMDC_MPRDDQBY3DL)

This register is used to add fine-tuning adjustment to every bit in the read DQ byte3 relative to the read DQS.

The bit assignments and the bit field descriptions for the register are shown below.

Address: 21B_0000h base + 828h offset = 21B_0828h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPRDDQBY3DL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–28 rd_dq31_del	Read dqs3 to dq31 delay fine-tuning. This field holds the number of delay units that are added to dq31 relative to dqs3. 000 No change in dq31 delay 001 Add dq31 delay of 1 delay unit 010 Add dq31 delay of 2 delay units. 011 Add dq31 delay of 3 delay units. 100 Add dq31 delay of 4 delay units. 101 Add dq31 delay of 5 delay units. 110 Add dq31 delay of 6 delay units. 111 Add dq31 delay of 7 delay units.
27 Reserved	This read-only field is reserved and always has the value 0.
26–24 rd_dq30_del	Read dqs3 to dq30 delay fine-tuning. This field holds the number of delay units that are added to dq30 relative to dqs3. 000 No change in dq30 delay 001 Add dq30 delay of 1 delay unit 010 Add dq30 delay of 2 delay units. 011 Add dq30 delay of 3 delay units. 100 Add dq30 delay of 4 delay units. 101 Add dq30 delay of 5 delay units. 110 Add dq30 delay of 6 delay units. 111 Add dq30 delay of 7 delay units.
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 rd_dq29_del	Read dqs3 to dq29 delay fine-tuning. This field holds the number of delay units that are added to dq29 relative to dqs3. 000 No change in dq29 delay 001 Add dq29 delay of 1 delay unit 010 Add dq29 delay of 2 delay units. 011 Add dq29 delay of 3 delay units. 100 Add dq29 delay of 4 delay units. 101 Add dq29 delay of 5 delay units. 110 Add dq29 delay of 6 delay units. 111 Add dq29 delay of 7 delay units.
19 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPRDDQBY3DL field descriptions (continued)

Field	Description
18–16 rd_dq28_del	Read dqs3 to dq28 delay fine-tuning. This field holds the number of delay units that are added to dq28 relative to dqs3. 000 No change in dq28 delay 001 Add dq28 delay of 1 delay unit 010 Add dq28 delay of 2 delay units. 011 Add dq28 delay of 3 delay units. 100 Add dq28 delay of 4 delay units. 101 Add dq28 delay of 5 delay units. 110 Add dq28 delay of 6 delay units. 111 Add dq28 delay of 7 delay units.
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 rd_dq27_del	Read dqs3 to dq27 delay fine-tuning. This field holds the number of delay units that are added to dq27 relative to dqs3. 000 No change in dq27 delay 001 Add dq27 delay of 1 delay unit 010 Add dq27 delay of 2 delay units. 011 Add dq27 delay of 3 delay units. 100 Add dq27 delay of 4 delay units. 101 Add dq27 delay of 5 delay units. 110 Add dq27 delay of 6 delay units. 111 Add dq27 delay of 7 delay units.
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 rd_dq26_del	Read dqs3 to dq26 delay fine-tuning. This field holds the number of delay units that are added to dq26 relative to dqs3. 000 No change in dq26 delay 001 Add dq26 delay of 1 delay unit 010 Add dq26 delay of 2 delay units. 011 Add dq26 delay of 3 delay units. 100 Add dq26 delay of 4 delay units. 101 Add dq26 delay of 5 delay units. 110 Add dq26 delay of 6 delay units. 111 Add dq26 delay of 7 delay units.
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 rd_dq25_del	Read dqs3 to dq25 delay fine-tuning. This field holds the number of delay units that are added to dq25 relative to dqs3. 000 No change in dq25 delay 001 Add dq25 delay of 1 delay unit 010 Add dq25 delay of 2 delay units. 011 Add dq25 delay of 3 delay units. 100 Add dq25 delay of 4 delay units. 101 Add dq25 delay of 5 delay units.

Table continues on the next page...

MMDC_MPRDDQBY3DL field descriptions (continued)

Field	Description
	110 Add dq25 delay of 6 delay units. 111 Add dq25 delay of 7 delay units.
3 Reserved	This read-only field is reserved and always has the value 0.
rd_dq24_del	Read dqs3 to dq24 delay fine-tuning. This field holds the number of delay units that are added to dq24 relative to dqs3. 000 No change in dq24 delay 001 Add dq24 delay of 1 delay unit 010 Add dq24 delay of 2 delay units. 011 Add dq24 delay of 3 delay units. 100 Add dq24 delay of 4 delay units. 101 Add dq24 delay of 5 delay units. 110 Add dq24 delay of 6 delay units. 111 Add dq24 delay of 7 delay units.

40.12.42 MMDC PHY Write DQ Byte0 Delay Register (MMDC_MPWRDQBY0DL)

This register is used to add fine-tuning adjustment to every bit in the write DQ byte0 relative to the write DQS

Address: 21B_0000h base + 82Ch offset = 21B_082Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPWRDQBY0DL field descriptions

Field	Description
31–30 wr_dm0_del	Write dm0 delay fine-tuning. This field holds the number of delay units that are added to dm0 relative to dqs0. 00 No change in dm0 delay 01 Add dm0 delay of 1 delay unit. 10 Add dm0 delay of 2 delay units. 11 Add dm0 delay of 3 delay units.

Table continues on the next page...

MMDC_MPWRDQBY0DL field descriptions (continued)

Field	Description
29–28 wr_dq7_del	Write dq7 delay fine-tuning. This field holds the number of delay units that are added to dq7 relative to dqs0. 00 No change in dq7 delay 01 Add dq7 delay of 1 delay unit. 10 Add dq7 delay of 2 delay units. 11 Add dq7 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq6_del	Write dq6 delay fine-tuning. This field holds the number of delay units that are added to dq6 relative to dqs0. 00 No change in dq6 delay 01 Add dq6 delay of 1 delay unit. 10 Add dq6 delay of 2 delay units. 11 Add dq6 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq5_del	Write dq5 delay fine-tuning. This field holds the number of delay units that are added to dq5 relative to dqs0. 00 No change in dq5 delay 01 Add dq5 delay of 1 delay unit. 10 Add dq5 delay of 2 delay units. 11 Add dq5 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq4_del	Write dq4 delay fine-tuning. This field holds the number of delay units that are added to dq4 relative to dqs0. 00 No change in dq4 delay 01 Add dq4 delay of 1 delay unit.. 10 Add dq4 delay of 2 delay units. 11 Add dq4 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq3_del	Write dq3 delay fine-tuning. This field holds the number of delay units that are added to dq3 relative to dqs0. 00 No change in dq3 delay 01 Add dq3 delay of 1 delay unit. 10 Add dq3 delay of 2 delay units. 11 Add dq3 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq2_del	Write dq2 delay fine-tuning. This field holds the number of delay units that are added to dq2 relative to dqs0. 00 No change in dq2 delay

Table continues on the next page...

MMDC_MPWRDQBY0DL field descriptions (continued)

Field	Description
	01 Add dq2 delay of 1 delay unit. 10 Add dq2 delay of 2 delay units. 11 Add dq2 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq1_del	Write dq1 delay fine-tuning. This field holds the number of delay units that are added to dq1 relative to dqs0. 00 No change in dq1 delay 01 Add dq1 delay of 1 delay unit. 10 Add dq1 delay of 2 delay units. 11 Add dq1 delay of 3 delay units.
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq0_del	Write dq0 delay fine-tuning. This field holds the number of delay units that are added to dq0 relative to dqs0. 00 No change in dq0 delay 01 Add dq0 delay of 1 delay unit. 10 Add dq0 delay of 2 delay units. 11 Add dq0 delay of 3 delay units.

40.12.43 MMDC PHY Write DQ Byte1 Delay Register (MMDC_MPWRDQBY1DL)

This register is used to add fine-tuning adjustment to every bit in the write DQ byte1 relative to the write DQS

Address: 21B_0000h base + 830h offset = 21B_0830h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

MMDC_MPWRDQBY3DL field descriptions

Field	Description
31–30 wr_dm3_del	Write dm3 delay fine tuning. This field holds the number of delay units that are added to dm3 relative to dqs3. 00 No change in dm3 delay 01 Add dm3 delay of 1 delay unit. 10 Add dm3 delay of 2 delay units. 11 Add dm3 delay of 3 delay units.
29–28 wr_dq31_del	Write dq31 delay fine tuning. This field holds the number of delay units that are added to dq31 relative to dqs3. 00 No change in dq31 delay 01 Add dq31 delay of 1 delay unit. 10 Add dq31 delay of 2 delay units. 11 Add dq31 delay of 3 delay units.
27–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 wr_dq30_del	Write dq30 delay fine tuning. This field holds the number of delay units that are added to dq30 relative to dqs3. 00 No change in dq30 delay 01 Add dq30 delay of 1 delay unit. 10 Add dq30 delay of 2 delay units. 11 Add dq30 delay of 3 delay units.
23–22 Reserved	This read-only field is reserved and always has the value 0.
21–20 wr_dq29_del	Write dq29 delay fine tuning. This field holds the number of delay units that are added to dq29 relative to dqs3.

Table continues on the next page...

MMDC_MPWRDQBY3DL field descriptions (continued)

Field	Description
	00 No change in dq29 delay 01 Add dq29 delay of 1 delay unit. 10 Add dq29 delay of 2 delay units. 11 Add dq29 delay of 3 delay units.
19–18 Reserved	This read-only field is reserved and always has the value 0.
17–16 wr_dq28_del	Write dq28 delay fine tuning. This field holds the number of delay units that are added to dq28 relative to dqs3. 00 No change in dq28 delay 01 Add dq28 delay of 1 delay unit. 10 Add dq28 delay of 2 delay units. 11 Add dq28 delay of 3 delay units.
15–14 Reserved	This read-only field is reserved and always has the value 0.
13–12 wr_dq27_del	Write dq27 delay fine tuning. This field holds the number of delay units that are added to dq27 relative to dqs3. 00 No change in dq27 delay 01 Add dq27 delay of 1 delay unit. 10 Add dq27 delay of 2 delay units. 11 Add dq27 delay of 3 delay units.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 wr_dq26_del	Write dq26 delay fine tuning. This field holds the number of delay units that are added to dq26 relative to dqs3. 00 No change in dq26 delay 01 Add dq26 delay of 1 delay unit. 10 Add dq26 delay of 2 delay units. 11 Add dq26 delay of 3 delay units.
7–6 Reserved	This read-only field is reserved and always has the value 0.
5–4 wr_dq25_del	Write dq25 delay fine tuning. This field holds the number of delay units that are added to dq25 relative to dqs3. 00 No change in dq25 delay 01 Add dq25 delay of 1 delay unit. 10 Add dq25 delay of 2 delay units. 11 Add dq25 delay of 3 delay units.
3–2 Reserved	This read-only field is reserved and always has the value 0.
wr_dq24_del	Write dq24 delay fine tuning. This field holds the number of delay units that are added to dq24 relative to dqs3. 00 No change in dq24 delay 01 Add dq24 delay of 1 delay unit.

Table continues on the next page...

MMDC_MPWRDQBY3DL field descriptions (continued)

Field	Description
10	Add dq24 delay of 2 delay units.
11	Add dq24 delay of 3 delay units.

40.12.46 MMDC PHY Read DQS Gating Control Register 0 (MMDC_MPDGCTRL0)

Address: 21B_0000h base + 83Ch offset = 21B_083Ch

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Field	0		HW_DG_ERR	DG_HC_DELO				0	DG_DL_ABS_OFFSET0							

MMDC_MPDGCTRL0 field descriptions

Field	Description
31 RST_RD_FIFO	Reset Read Data FIFO and associated pointers. If this bit is asserted then the MMDC resets the read data FIFO and the associated pointers. This bit is self cleared after the FIFO reset is done.
30 DG_CMP_CYC	Read DQS gating sample cycle. If this bit is asserted then the MMDC waits 32 cycles before comparing the read data, Otherwise it waits 16 DDR cycles. 0 MMDC waits 16 DDR cycles 1 MMDC waits 32 DDR cycles
29 DG_DIS	Read DQS gating disable. If this bit is asserted then the MMDC disables the read DQS gating mechanism.

Table continues on the next page...

MMDC_MPDGCTRL0 field descriptions (continued)

Field	Description
	<p>If this bits is asserted (read DQS gating is disabled) then pull-up and pull-down resistors suppose to be used on DQS and DQS# respectively</p> <p>0 Read DQS gating mechanism is enbled 1 Read DQS gating mechanism is disabled</p>
28 HW_DG_EN	<p>Enable automatic read DQS gating calibration. If this bit is asserted then the MMDC performs automatic read DQS gating calibration. HW negates this bit upon completion of the automatic read DQS gating.</p> <p>Note: Before issuing the first read command the MMDC counts 12 cycles. In LPDDR2 mode automatic (HW) read DQS gating should be disabled and Pull-up/pull-down resistors on DQS/DQS# should be enabled while ODT resistors must be disconnected.</p> <p>0 Disable automatic read DQS gating calibration 1 Start automatic read DQS gating calibration</p>
27–24 DG_HC_DEL1	<p>Read DQS gating half cycles delay for Byte1</p> <p>. This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte1. This delay is added to the delay that is genearted by the read DQS1 gating delay-line, So the total read DQS gating delay is $(DG_HC_DEL\#)*0.5*\text{cycle} + (DG_DL_ABS_OFFSET\#)*1/256*\text{cycle}$</p> <p>Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved</p>
23 DG_EXT_UP	<p>DG extend upper boundary. By default the upper boundary of DQS gating HW calibration is set according to first failing comparison after at least one passing comparison. If this bit is asserted then the upper boundary is set accroding to the last passing comparison.</p>
22–16 DG_DL_ABS_OFFSET1	<p>Absolute read DQS gating delay offset for Byte1. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte1 with fractions of a clock period and up to half cycle.The fraction is process and frequency independent. The delay of the delay-line would be $(DG_DL_ABS_OFFSET1 / 256)*\text{MMDC AXI clock (fast clock)}$.</p> <p>This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.</p>
15–13 Reserved	<p>This read-only field is reserved and always has the value 0.</p>
12 HW_DG_ERR	<p>HW DQS gating error. This bit valid is asserted when an error was found during the read DQS gating HW calibration process. Error can occur when no valid value was found during HW calibration.</p> <p>This bit is valid only after HW_DG_EN is de-asserted.</p> <p>0 No error was found during the DQS gating HW calibration process. 1 An error was found during the DQS gating HW calibration process.</p>

Table continues on the next page...

MMDC_MPDGCTRL0 field descriptions (continued)

Field	Description
11–8 DG_HC_DELO	<p>Read DQS gating half cycles delay for Byte0</p> <p>. This field indicates the delay in half cycles between read DQS gate and the middle of the read DQS preamble of Byte0/4. This delay is added to the delay that is generated by the read DQS1 gating delay-line, So the total read DQS gating delay is $(DG_HC_DEL\#)*0.5*\text{cycle} + (DG_DL_ABS_OFFSET\#)*1/256*\text{cycle}$</p> <p>Upon completion of the automatic read DQS gating calibration this field gets the value of the 4 MSB of $((HW_DG_LOW1 + HW_DG_UP1) / 2)$.</p> <p>0000 0 cycles delay. 0001 Half cycle delay. 0010 1 cycle delay 1101 6.5 cycles delay 1110 Reserved 1111 Reserved</p>
7 Reserved	This read-only field is reserved and always has the value 0.
DG_DL_ABS_OFFSET0	<p>Absolute read DQS gating delay offset for Byte0. This field indicates the absolute delay between read DQS gate and the middle of the read DQS preamble of Byte0 with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be $(DG_DL_ABS_OFFSET0 / 256)*\text{MMDC AXI clock (fast clock)}$.</p> <p>This field can also bit written by HW. Upon completion of the automatic read DQS gating calibration this field gets the value of the 7 LSB of $((HW_DG_LOW0 + HW_DG_UP0) / 2)$.</p> <p>Note that not all changes will have effect on the actual delay. If the requested change is smaller than the delay-line resolution, then no change will occur.</p>

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 WR_DL_UNIT_NUM3	This field reflects the number of delay units that are actually used by write delay-line 3.

Table continues on the next page...

MMDC_MPWRDLST field descriptions (continued)

Field	Description
23 Reserved	This read-only field is reserved and always has the value 0.
22–16 WR_DL_UNIT_NUM2	This field reflects the number of delay units that are actually used by write delay-line 2.
15 Reserved	This read-only field is reserved and always has the value 0.
14–8 WR_DL_UNIT_NUM1	This field reflects the number of delay units that are actually used by write delay-line 1.
7 Reserved	This read-only field is reserved and always has the value 0.
WR_DL_UNIT_NUM0	This field reflects the number of delay units that are actually used by write delay-line 0.

40.12.53 MMDC PHY CK Control Register (MMDC_MPSDCTRL)

This register controls the fine tuning of the primary clock (CK0).

Address: 21B_0000h base + 858h offset = 21B_0858h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0				SDCLK1_del				SDclk0_del				0			
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

MMDC_MPSDCTRL field descriptions

Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
11–10 SDCLK1_del	DDR clock1 delay fine tuning. This field holds the number of delay units that are added to DDR clock1 (CK1). 00 No change in DDR clock delay 01 Add DDR clock delay of 1 delay unit. 10 Add DDR clock delay of 2 delay units. 11 Add DDR clock delay of 3 delay units.

Table continues on the next page...

MMDC_MPSPCTRL field descriptions (continued)

Field	Description
9–8 SDclk0_del	DDR clock0 delay fine tuning. This field holds the number of delay units that are added to DDR clock (CK0). 00 No change in DDR clock0 delay 01 Add DDR clock0 delay of 1 delay unit. 10 Add DDR clock0 delay of 2 delay units. 11 Add DDR clock0 delay of 3 delay units.
Reserved	This read-only field is reserved and always has the value 0.

40.12.54 MMDC ZQ LPDDR2 HW Control Register (MMDC_MPZQLP2CTL)

This register controls the idle time that takes the LPDDR2 device to perform ZQ calibration

Address: 21B_0000h base + 85Ch offset = 21B_085Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0	ZQ_LP2_HW_ZQCS							ZQ_LP2_HW_ZQCL							
W																
Reset	0	0	0	1	1	0	1	1	0	1	0	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0							ZQ_LP2_HW_ZQINIT								
W																
Reset	0	0	0	0	0	0	0	1	0	0	0	0	1	0	0	1

MMDC_MPZQLP2CTL field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30–24 ZQ_LP2_HW_ZQCS	This register defines the period in cycles that it takes the memory device to perform a Short ZQ calibration. This is the period of time that the MMDC has to wait after sending a long ZQ calibration and before sending other commands. This delay will also be used if ZQ reset is sent. 0x0-0x1A Reserved 0x1B 112 cycles (default) 0x1C 116 cycles 0x7E 508 cycles 0x7F 512 cycles

Table continues on the next page...

MMDC_MPZQLP2CTL field descriptions (continued)

Field	Description
23–16 ZQ_LP2_HW_ ZQCL	<p>This register defines the period in cycles that it takes the memory device to perform a long ZQ calibration. This is the period of time that the MMDC has to wait after sending a Short ZQ calibration and before sending other commands.</p> <p>0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x5F 192 cycles (Default, JEDEC value, tZQCL, for LPDDR2, 360ns @ clock frequency 533MHz) 0xFE 510 cycles 0xFF 512 cycles</p>
15–9 Reserved	This read-only field is reserved and always has the value 0.
ZQ_LP2_HW_ ZQINIT	<p>This register defines the period in cycles that it takes the memory device to perform a Init ZQ calibration. This is the period of time that the MMDC has to wait after sending a init ZQ calibration and before sending other commands.</p> <p>0x0-0x36 Reserved 0x37 112 cycles 0x38 114 cycles 0x109 532 cycles (Default, JEDEC value, tZQINIT, for LPDDR2, 1us @ clock frequency 533MHz) 0x1FE 1022 cycles 0x1FF 1024 cycles</p>

40.12.55 MMDC PHY Read Delay HW Calibration Control Register (MMDC_MPRDDLHWCTL)

Address: 21B_0000h base + 860h offset = 21B_0860h

MMDC_MPRDDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPRDDLHWCTL field descriptions (continued)

Field	Description
5 HW_RD_DL_CMP_CYC	Automatic (HW) read sample cycle. If this bit is asserted then the MMDC will compare the read data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_RD_DL_EN	Enable automatic (HW) read calibration. If this bit is asserted then the MMDC will perform an automatic read calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also points that the read calibration results are valid Note: Before issuing the first read command MMDC counts 12 cycles.
3 HW_RD_DL_ERR3	Automatic (HW) read calibration error of Byte3. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 3. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST1 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 3 during the automatic (HW) read calibration process of read delay-line 3. 1 An error was found in read delay-line 3 during the automatic (HW) read calibration process of read delay-line 3.
2 HW_RD_DL_ERR2	Automatic (HW) read calibration error of Byte2. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 2. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST1 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 2 during the automatic (HW) read calibration process of read delay-line 2. 1 An error was found in read delay-line 2 during the automatic (HW) read calibration process of read delay-line 2.
1 HW_RD_DL_ERR1	Automatic (HW) read calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1. 1 An error was found in read delay-line 1 during the automatic (HW) read calibration process of read delay-line 1.
0 HW_RD_DL_ERR0	Automatic (HW) read calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of read delay-line 0. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPRDDLHWST0 register. This bit is valid only after HW_RD_DL_EN is de-asserted. 0 No error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0. 1 An error was found in read delay-line 0 during the automatic (HW) read calibration process of read delay-line 0.

40.12.56 MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL)

Address: 21B_0000h base + 864h offset = 21B_0864h

MMDC_MPWRDLHWCTL field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 HW_WR_DL_CMP_CYC	Write sample cycle. If this bit is asserted then the MMDC will compare the data 32 cycles after the MMDC sent the read command enable pulse else it compares the data after 16 cycles.
4 HW_WR_DL_EN	Enable automatic (HW) write calibration. If this bit is asserted then the MMDC will perform an automatic write calibration. HW should negate this bit upon completion of the calibration. Negation of this bit also indicates that the write calibration results are valid Note: Before issuing the first read command MMDC counts 12 cycles.

Table continues on the next page...

MMDC_MPWRDLHWCTL field descriptions (continued)

Field	Description
3 HW_WR_DL_ERR3	Automatic (HW) write calibration error of Byte3. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 3. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST1 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 3. 1 An error was found during the automatic (HW) write calibration process of write delay-line 3.
2 HW_WR_DL_ERR2	Automatic (HW) write calibration error of Byte2. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 2. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST1 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 2. 1 An error was found during the automatic (HW) write calibration process of write delay-line 2.
1 HW_WR_DL_ERR1	Automatic (HW) write calibration error of Byte1. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 1. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST0 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 1. 1 An error was found during the automatic (HW) write calibration process of write delay-line 1.
0 HW_WR_DL_ERR0	Automatic (HW) write calibration error of Byte0. If this bit is asserted then it indicates that an error was found during the HW calibration process of write delay-line 0. In case this bit is zero at the end of the calibration process then the boundary results can be found at MPWRDLHWST0 register. This bit is valid only after HW_WR_DL_EN is de-asserted. 0 No error was found during the automatic (HW) write calibration process of write delay-line 0. 1 An error was found during the automatic (HW) write calibration process of write delay-line 0.

40.12.57 MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0)

MMDC_MPDGHWST2 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP2	HW DQS gating calibration result of the upper boundary of Byte2. This field holds the HW DQS gating calibration result of the upper boundary of Byte2.
15–11 -	This field is reserved. Reserved
HW_DG_LOW2	HW DQS gating calibration result of the lower boundary of Byte2. This field holds the HW DQS gating calibration result of the lower boundary of Byte2.

40.12.65 MMDC PHY Read DQS Gating HW Status Register 3 (MMDC_MPDGHWST3)

Address: 21B_0000h base + 888h offset = 21B_0888h

MMDC_MPDGHWST3 field descriptions

Field	Description
31–27 -	This field is reserved. Reserved
26–16 HW_DG_UP3	HW DQS gating calibration result of the upper boundary of Byte3. This field holds the HW DQS gating calibration result of the upper boundary of Byte3.
15–11 -	This field is reserved. Reserved
HW_DG_LOW3	HW DQS gating calibration result of the lower boundary of Byte3. This field holds the HW DQS gating calibration result of the lower boundary of Byte3.

40.12.66 MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1)

This register holds the MMDC pre-defined compare value that will be used during automatic read, read DQS gating and write calibration process. The compare value can be the MPR value (as defined in the JEDEC) or can be programmed by the PDV1 and PDV2 fields. In case of DDR3 (BL=8) the MMDC will duplicate PDV1,PDV2 and drive that data on Beat4-7 of the same byte

MMDC_MPPDCMPR1 field descriptions

Field	Description
31–16 PDV2	<p>MMDC Pre defined compare value2. This field holds the 2 MSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field.</p> <p>Note : Before issue the read access the MMDC will invert the value of this field and drive it to the associate entry in the read comparison FIFO. For further information see Section 19.14.3.1.2, "Calibration with pre-defined value , Section 19.14.4.1.2, "Calibration with pre-defined value and Section 19.14.5.1, "HW (automatic) Write Calibraion</p>
PDV1	<p>MMDC Pre defined compare value2. This field holds the 2 LSB of the data that will be driven to the DDR device during automatic read, read DQS gating and write calibrations in case MPR(DDR3)/ DQ calibration (LPDDR2) mode are disabled (MPR_CMP is disabled). Upon read access during the calibration the MMDC will compare the read data with the data that is stored in this field.</p> <p>NOTE: Before issuing the read access, the MMDC will invert the value of this field and drive it to the associated entry in the read comparison FIFO.</p>

40.12.67 MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2)

Address: 21B_0000h base + 890h offset = 21B_0890h

MMDC_MPPDCMPR2 field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 0.
30-24 PHY_CA_DL_UNIT	This field reflects the number of delay units that are actually used by CA (Command/Address of LPDDR2) delay-line
23 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPPDCMPR2 field descriptions (continued)

Field	Description
22–16 CA_DL_ABS_ OFFSET	Absolute CA (Command/Address of LPDDR2) offset. This field indicates the absolute delay between CA (Command/Address) bus and the DDR clock (CK) with fractions of a clock period and up to half cycle. The fraction is process and frequency independent. The delay of the delay-line would be $(CA_DL_ABS_OFFSET / 256) * MMDC\ AXI\ clock\ (fast\ clock)$. So for the default value of 64 we get a quarter cycle delay.
15–3 Reserved	This read-only field is reserved and always has the value 0.
2 READ_LEVEL_ PATTERN	MPR(DDR3)/DQ calibration(LPDDR2) read compare pattern. In case MPR(DDR3)/DQ calibration(LPDDR2) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates the read pattern for the comparison. 0 Compare with read pattern 1010 1 Compare with read pattern 0011 (Used only in LPDDR2 mode)
1 MPR_FULL_ CMP	MPR(DDR3)/DQ calibration (LPDDR2) full compare enable. In case MPR(DDR3)/DQ calibration(LPDDR2) modes are used during the calibration process (MPR_CMP is asserted) then this field indicates whether the MMDC will compare all the bits of the data that is read from the DDR device to the MPR pre-defined pattern. When this bit is de-asserted only LSB of each byte is compared.
0 MPR_CMP	MPR(DDR3)/DQ calibration (LPDDR2) compare enable. This bit indicates whether the MMDC will compare the read data during automatic read and read DQS calibration processes to the pre-defined patterns that are driven by the DDR device (READ_LEVEL_PATTERN as defined by JEDEC) or general pre-defined value that are stored in PDV1 and PDV2. When this bit is disabled data is compared to the data of the pre defined compare value field For further information see Read DQS Gating Calibration and Read Calibration .

40.12.68 MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0)

Address: 21B_0000h base + 894h offset = 21B_0894h

MMDC_MPSWDAR0 field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

MMDC_MPSWDAR0 field descriptions (continued)

Field	Description
5 SW_DUM_CMP3	SW dummy read byte3 compare results. This bit indicates the result of the read data comparison of Byte3 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
4 SW_DUM_CMP2	SW dummy read byte2 compare results. This bit indicates the result of the read data comparison of Byte2 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
3 SW_DUM_CMP1	SW dummy read byte1 compare results. This bit indicates the result of the read data comparison of Byte1 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
2 SW_DUM_CMP0	SW dummy read byte0 compare results. This bit indicates the result of the read data comparison of Byte0 at the completion of SW_DUMMY_RD. This bit is valid only when SW_DUMMY_RD is de-asserted. 0 Dummy read fail 1 Dummy read pass
1 SW_DUMMY_RD	SW dummy read. When this bit is asserted the MMDC will generate internally read access without intervention of the system toward bank 0, row 0, column 0. If MPR_CMP = 1 then the read data will be compared to MPPDCMPR2[READ_LEVEL_PATTERN] . If MPR_CMP =0 then the read data will be compared to MPPDCMPR1[PDV1], MPPDCMPR1[PDV2]. Upon completion of the access this bit is de-asserted automatically and the read data and comparison results are valid at MPSWDAR0[SW_DUM_CMP#] and MPSWDRDR0-MPSWDRDR7 respectively.
0 SW_DUMMY_WR	SW dummy write. When this bit is asserted the MMDC will generate internally write access without intervention of the system toward bank 0, row 0, column 0, while the data is driven from MPPDCMPR1[PDV1] and MPPDCMPR1[PDV2]. The bit is de-asserted automatically upon completion of the access.

40.12.69 MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0)

MMDC_MPMUR0 field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–16 MU_UNIT_DEL_NUM	Number of delay units measured per cycle. This field is used in debug mode and holds the number of delay units that were measured by the measure unit per DDR clock cycle. The delay-lines that are used in every calibration process use that number for generating the desired delay.
15–12 Reserved	This read-only field is reserved and always has the value 0.
11 FRC_MSR	Force measurement on delay-lines. When this bit is asserted then a measurement process will be performed, where at the completion of the process the delay-lines will issue the desired delay. Upon completion of the measurement process the measure unit and the delay-lines will return to functional mode. This bit is self cleared. NOTE: This bit should be used only during manual (SW) calibration and not while the DDR is functional (being accessed). After initial calibration is done the hardware performs periodic measurements to track any operating conditions changes. Hence, force measurements (FRC_MSR) should not be used. See Calibration Process for more information. NOTE: User should make sure that there is no active accesses to/from DDR before asserting this bit. 0 No measurement is performed 1 Perform measurement process
10 MU_BYP_EN	Measure unit bypass enable. This field is used in debug mode and when it is asserted then the delay-lines will use the number of delay units that are indicated at MU_BYP_VAL, otherwise the delay-lines will use the number of delay units that was measured by the measurement unit and are indicated at MU_UNIT_DEL_NUM 0 The delay-lines use delay units as indicated at MU_UNIT_DEL_NUM. 1 The delay-lines use delay units as indicated at MU_BYPASS_VAL.
MU_BYP_VAL	Number of delay units for measurement bypass. This field is used in debug mode and holds the number of delay units that will be used by the delay-lines when MU_BYP_EN is asserted.

40.12.78 MMDC Write CA delay-line controller (MMDC_MPWRCADL)

This register is used to add fine-tuning adjustment to the CA (command/Address of LPDDR2 bus) relative to the DDR clock

Address: 21B_0000h base + 8BCh offset = 21B_08BCh

7–6 WR_CA3_DEL	CA (Command/Address LPDDR2 bus) bit 3 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 3 relative to the clock. 00 No change in CA3 delay 01 Add CA3 delay of 1 delay unit 10 Add CA3 delay of 2 delay units. 11 Add CA3 delay of 3 delay units.
5–4 WR_CA2_DEL	CA (Command/Address LPDDR2 bus) bit 2 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 2 relative to the clock. 00 No change in CA2 delay 01 Add CA2 delay of 1 delay unit 10 Add CA2 delay of 2 delay units. 11 Add CA2 delay of 3 delay units.
3–2 WR_CA1_DEL	CA (Command/Address LPDDR2 bus) bit 1 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 1 relative to the clock. 00 No change in CA1 delay 01 Add CA1 delay of 1 delay unit 10 Add CA1 delay of 2 delay units. 11 Add CA1 delay of 3 delay units.
WR_CA0_DEL	CA (Command/Address LPDDR2 bus) bit 0 delay fine tuning. This field holds the number of delay units that are added to CA (Command/Address bus) bit 0 relative to the clock. 00 No change in CA0 delay 01 Add CA0 delay of 1 delay unit 10 Add CA0 delay of 2 delay units. 11 Add CA0 delay of 3 delay units.

40.12.79 MMDC Duty Cycle Control Register (MMDC_MPDCCR)

This register is used to control the duty cycle of the DQS and the primary clock (CK0) . Programming of that register is permitted by entering the DDR device into self-refresh mode through LPMD/DVFS mechanism

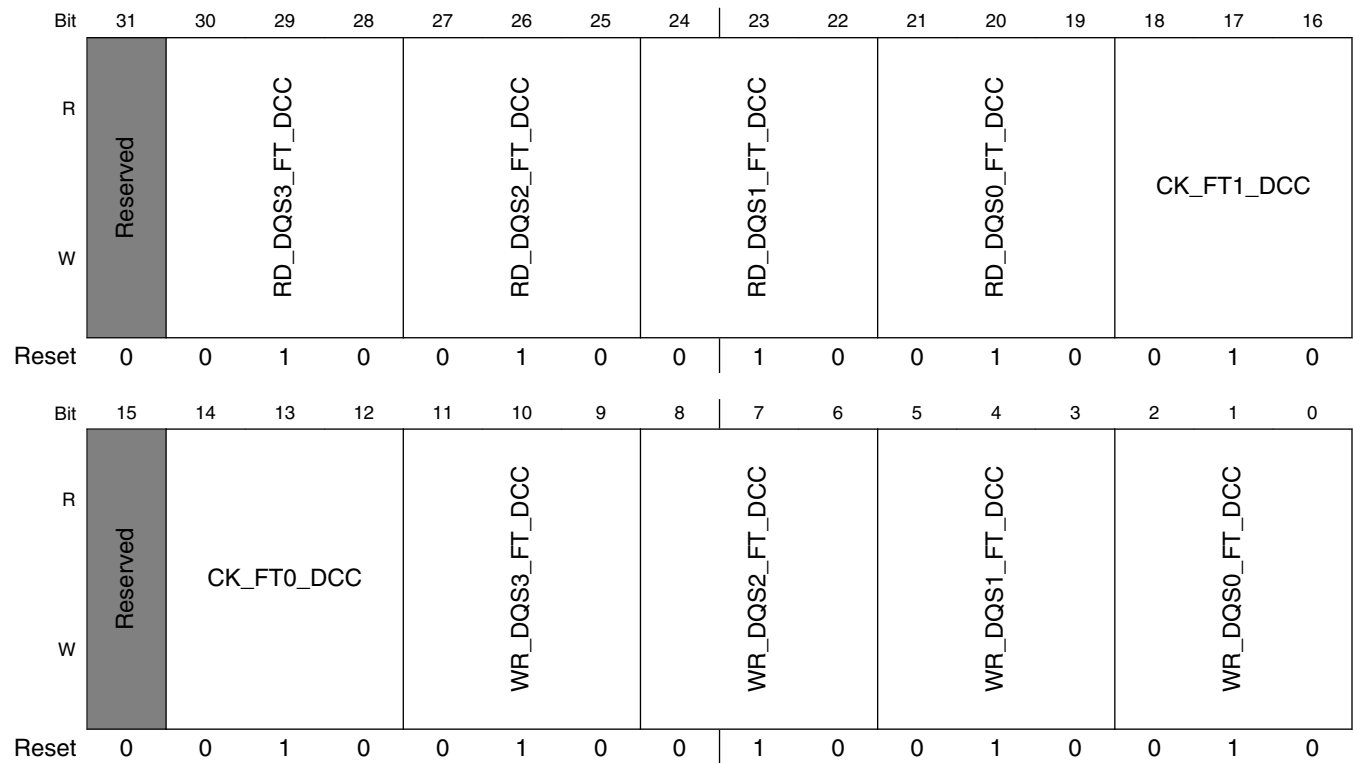

NOTE

If the duty cycle is modified after DDR initialization, the DDR will have to be placed in self-refresh mode.

NOTE

The duty cycle may be changed during initial DDR initialization without having to be placed in self-refresh mode.

Chapter 41

Medium Quality Sound (MQS)

41.1 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

MQS is 2-channel, MSB-valid 16bit, MSB first; frame sync aligned with the left channel data, 44.1 kHz or 48 kHz I2S signals from SAI1; and it provides the SNR target as no more than 20dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

41.2 Block Diagram

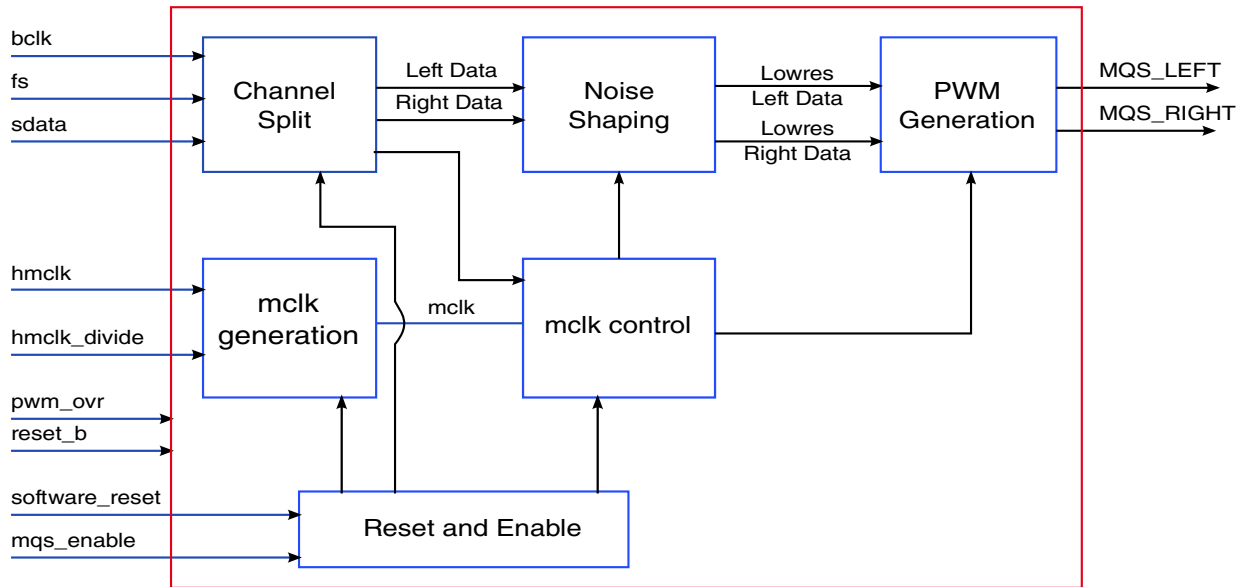

Figure 41-1. Block Diagram

MQS has the following sub-modules:

1. Channel Split: Splits the I2S signals into separate left channel and right channel audio data.
2. Noise Shaping: Uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.
3. PWM generation: Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.
4. mclk generation: Used to generate the master clock (mclk). The frequency of mclk is determined by the final bit duration of PWM generation module.
5. mclk control: Used as a metronome to co-ordinate the different functional blocks working synchronously.
6. Reset and Enable: Used to generate the reset and enable logic to different clock domains.

41.3 External Signals

The following table describes the external signals of MQS:

Table 41-1. MQS External Signals

Signal	Description	Pad	Mode	Direction
MQS_LEFT	Left signal output	CSI_HSYNC	ALT4	O
		SD2_CMD	ALT6	

Table continues on the next page...

Table 41-1. MQS External Signals (continued)

Signal	Description	Pad	Mode	Direction
MQS_RIGHT	Right signal output	CSI_VSYNC	ALT4	O
		SD2_CLK	ALT6	

41.4 Interface Signals

MQS module has the following interface signals.

Signal Name	In/Out	BitWidth	Description	Comments
reset_b	In	1	asynchronous reset	
software_reset	In	1	Software reset	From GPR
mqs_enable	In	1	module enable	From GPR
pwm_ovr	In	1	PWM oversampling ratio1—64, 0--32	From GPR
hmclk	In	1	Maximum bit clock, used to generate the mclk, divider ratio is controlled by mqs_hmclk_divide	Max 66.5MHzTypical 24.576MHz
hmclk_divide	In	8	Divider ration control for mclk from hmclk	From GPR
bclk	In	1	bit clock from I2S signal	
fs	In	1	frame sync clock from I2S signal	
sdata	In	1	serial audio data from I2S signal	

41.5 Programmability

MQS has no internal programmable registers. But it does have some programmability from IOMUXC_GPR2.

Register Bits	Name	Description
IOMUXC_GPR2[26]	MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64, 0—32.
IOMUXC_GPR2[25]	MQS_EN	MQS enable.

Table continues on the next page...

Usage Model

Register Bits	Name	Description
		1—Enable MQS, 0—Disable MQS
IOMUXC_GPR2[24]	MQS_SW_RST	MQS software reset. 1—Enable software reset for mqs, 0—Exit software reset for MQS
IOMUXC_GPR2[23:16]	MQS_CLK_DIV[7:0]	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = $\frac{1}{2}$ *hmclk frequency; 2—mclk frequency = $\frac{1}{3}$ *hmclk frequency; ...; n—mclk frequency = $\frac{1}{(n+1)}$ *hmclk frequency

41.6 Usage Model

The user needs to program SAI1 to output 2-channel MSB-16bit active I2S signal, and then to program the related IOMUXC_GPR2 bits.

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, customer need choose the appropriate MQS_CLK_DIV and MQS_OVERSAMPLE values for the best audible effects.

Chapter 42

Messaging Unit (MU)

42.1 Overview

The Messaging Unit module enables two processors within the SoC to communicate and coordinate by passing messages (e.g. data, status and control) through the MU interface. The MU also provides the ability for one processor to signal the other processor using interrupts. The MU interfaces two processors inside the i.MX6SX chip, the ARM Cortex-A9 and the ARM Cortex-M4 processors.

Because the MU manages the messaging between processors, the MU uses different clocks (from each side of the different peripheral buses). Therefore, the MU must synchronize the accesses from one side to the other. The MU accomplishes synchronization using two sets of matching registers (Processor A-facing, Processor B-facing).

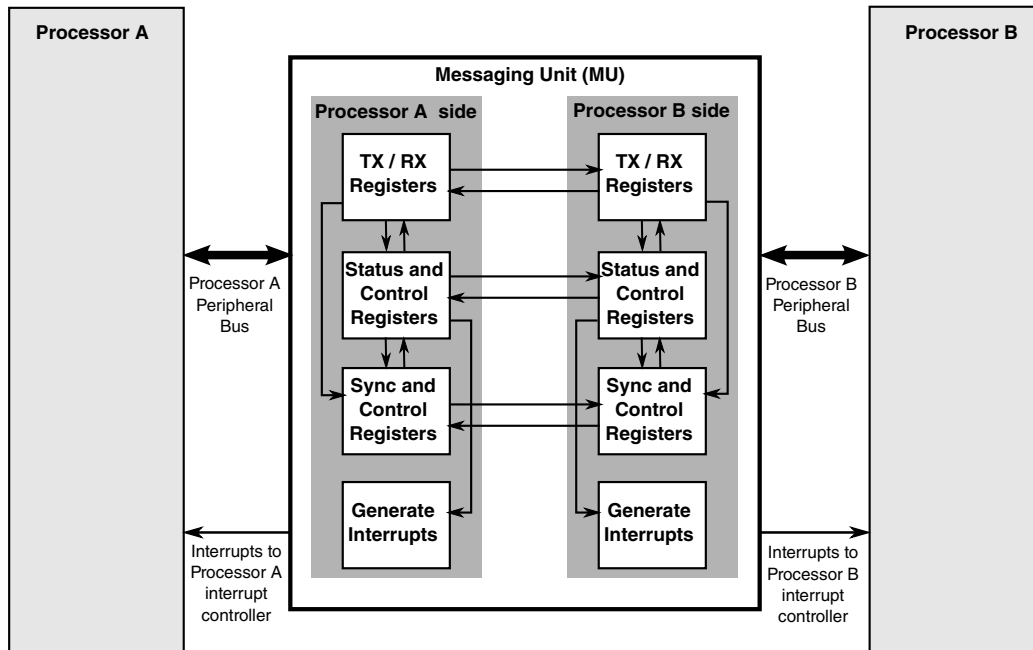

Figure 42-1. MU Block Diagram

42.1.1 Features

The MU includes the following features:

- Messaging control by interrupts or by polling
- The Processor B can take the Processor A out of low-power modes by asserting one of the above twelve interrupts to the Processor A and vice versa
- Symmetrical processor interfaces with each side supporting the following:
 - Four general-purpose interrupt requests reflected to the other side
 - Three general-purpose flags reflected to the other side
 - Four receive registers with maskable interrupt
 - Four transmit registers with maskable interrupt

42.1.2 Modes of Operation

The MU supports the modes described in the indicated sections:

- [Operating Modes](#)
- [Low Power Modes](#)

42.2 External Signals

There are no Messaging Unit signals directly available at the chip boundary of the SoC.

42.3 Functional Description

Table 42-1. Major Features of the MU

Major Feature	Description
Interprocessor Interrupts	<ul style="list-style-type: none"> The MU has 12 interrupt sources on each side (Processor A-side, Processor B-side) that are used for signaling the other processor. The interrupts can be used for notification of RX/TX events and general-purpose signaling between the processors.
MU Reset	<ul style="list-style-type: none"> The Processor A can issue a reset to the entire MU, using a control bit (MUR) in the Processor A Control Register (ACR). The MUR bit is a self-clearing bit.
Processor B Boot Configuration	<ul style="list-style-type: none"> The Boot Source for Processor B can be configured with the BBOOT bits in the ACR register. Boot Source Options are: <ul style="list-style-type: none"> DMEM Base Address IMEM Base Address Address 0x00 The value at reset is loaded from Flash IFR
Processor B Reset Hold	<ul style="list-style-type: none"> Processor B can be held in reset following any reset event. This is done by setting the BRSTH bit in the ACR register. Processor B will be released from reset when this bit is cleared. The value at reset is loaded from Flash IFR.
Processor A/B Clock Enable	<ul style="list-style-type: none"> The Processor A/B platform clock can be enabled to continue running when Processor A/B enters Stop Mode, until Processor B/A also enters Stop Mode. This allows Processor B/A to continue accessing peripherals on Processor A/B's AIPS bus even when it has entered a Stop Mode.
Status and Control Communications between Cores	<ul style="list-style-type: none"> The MU provides a way for the two cores to communicate using the status and control registers present on both the Processor B and Processor A sides of the MU. The status register of one MU side reflects the status of the other MU side. The control register is used for control operations, such as enabling an interrupt and sending an interrupt to the other processor.
Synchronized Message Transfers between Cores	<ul style="list-style-type: none"> The transfer of data messages between cores uses transmit empty and receive full flags provided on both sides of the MU. The update of these transmit and receive flags is accomplished using a synchronization mechanism. There is inherent latency between updating the flag on one side and reflecting its status on other side. For more about latency, see Event Update Timing
Accessing Shared Memory Directly and Avoiding Collisions	<ul style="list-style-type: none"> For sending data or messages from one MU-side to the other MU-side, the MU provides 4 transmit registers and 4 receive registers on each side of the MU. The Processor A or Processor B can access shared memory resources of the SoC directly. However, to avoid simultaneous access to shared memory by both cores, the MU provides a method (to prevent simultaneous access) using interrupts and transmit-receive registers for both processors.

Table continues on the next page...

Table 42-1. Major Features of the MU (continued)

Major Feature	Description
Support for Different Clocks in the Two Cores	<ul style="list-style-type: none"> • The heart of the MU module is the event control mechanism, which synchronizes the access of one MU-side to the other MU-side, because these two MU-sides can operate using different clocks. • Formulated event update latency.
Memory-Mapped Registers	<ul style="list-style-type: none"> • The MU is connected as a peripheral under the Peripheral bus on both sides—on the Processor A-side, the Processor A Peripheral Bus, and on the Processor B-side, the Processor B Peripheral Bus.

42.3.1 Processor A Side Memory-Mapping

The messaging, control, and status registers of the Processor A-side for the MU are mapped to the Processor A memory as a regular peripheral. The Peripheral bus data bus is 32 bits wide inside the MU module.

42.3.2 Processor B Side Memory-Mapping

The messaging, control, and status registers of the Processor B-side for the MU are mapped to the Processor B memory as a regular peripheral. The Peripheral bus data bus is 32 bits wide inside the MU module.

42.3.3 MU Messaging

The MU provides 32-bit status and control registers to the Processor B and Processor A sides for control operations (such as interrupts and reset), and for status checking of the other MU-side.

For messaging, the MU has four, 32-bit write-only transmit registers and four, 32-bit read-only receive registers on the Processor B and Processor A-sides. These registers are used for sending messages to each other. These messages can be also be controlled using the 3 general purpose flags provided in the control and status registers of either MU-side.

42.3.3.1 Programmer Model

The messaging logic is used in conjunction with external memory. You have various messaging methods, which you can use to implement a messaging protocol. Some of these messages could mean “I have just written a message of N words, starting at offset X

in the memory,” or “I have just finished reading the previous data block that was sent.” Having the messaging logic independent from the memory array does not restrict you to a predefined hardware protocol. On the other hand, the software needed to manage the messaging is short and straightforward.

Most of the messaging mechanisms are symmetric; they are duplicated and are available on both the Processor B-side and the Processor A-side. The messaging mechanisms are:

- Four, 32-bit write-only transmit registers, which are each reflected in four, read-only receive registers in the other processor’s side. You can use these registers to transfer 32-bit word messages or frame information of messages written to the shared memory (number of words, initial address, and message type code).
- A write to a transmit register on the transmitter side clears a “transmitter empty” bit in the Status Register on the transmitter side, and sets a “receiver full” bit in the Status Register on the receiver side. The setting of the bit at the receiver side can optionally trigger an interrupt at the receiver side (maskable receive interrupt).
- A read of one of the receive registers at the receiver side clears the “receiver full” bit in the Status Register at the receiver side, and sets the “transmitter empty” bit in the Status Register on the transmitter side. The setting of the “transmitter empty” bit can optionally trigger an interrupt at the transmitter side (maskable transmit interrupt).
- Four general purpose flags are reflected in the Status Register on the receiver side
- A read/write access to any reserved location and a write to a read-only register on the Processor A-side of the MU will generate a module transfer error acknowledge to the Processor A.
- A read/write access to any reserved location and write to a read-only register on the Processor B-side of the MU will generate a module transfer error acknowledge to the Processor B.

42.3.3.2 Messaging Examples

The following are messaging examples:

- **Passing short messages:** Transmit register(s) can be used to pass short messages from one to four words in length. For example, when a four-word message is desired, only one of the registers needs to have its corresponding interrupt enable bit set at the receiver side; the message’s first three words are written to the registers whose interrupt is masked, and the fourth word is written to the other register (which triggers an interrupt at the receiver side).
- **Passing frame information:** Transmit registers can be used to pass frame information for long messages written to the shared system (SDRAM and SyncFLASH). Such frame information normally includes a start address, number of words, and perhaps a message type code.

- **Passing event notices and requests:** Events and requests that do not include data words can be signaled from the Processor B to the Processor A using the general interrupts, such as acknowledging that a long message was read from the shared system memory.
- **Passing fixed length data:** Formatted data with a fixed length can be written in predetermined locations in the shared memory. A processor can use a general interrupt (Processor A or Processor B) to signal the other processor that the data is ready.
- **Passing announcements:** The three flags can be used by a processor to announce its current program state or other billboard messages to the other processor.

Figure 42-2 shows the MU registers schematic.

Figure 42-2. MU Registers

42.3.4 Operating Modes

This section describes all functional operation modes of the module.

42.3.5 Low Power Modes

This section describes the low power operating modes of the MU module.

42.3.5.1 Low Power Clocks and Synchronization

The Processor B and the Processor A clocks operate at different frequencies and from different sources. The MU design does not assume any frequency relationship between the Processor A and the Processor B clocks. Be aware, however, that the frequency relationship affects the MU's throughput performance.

- The data buffers and control logic of each MU-side operate with its corresponding clock.

42.3.5.2 Processor Low Power Modes

The Processors have four power modes:

- Run
- WAIT
- STOP
- DSM

The Processor can be awakened from a low-power mode by any enabled Processor side MU interrupt, as reflected in the xSR “status” register (RF0–3, TE0–3, GIP0–3 bits are set) and enabled in the xCR control register. Using these bits, the Processor can actively control when to wake the other Processor.

While the Processor is in STOP mode (such that the xSR register bits cannot be updated with events), special logic drives the enabled Processor interrupts directly from the other Processor-side (instead of from the xSR register).

While the Processor is in STOP mode, the asynchronous Processor interrupt will be asserted to wake the Processor:

- If any transmit data register of the other Processor-side is full, because of a write to it (transmit data register); that is, its “empty” bit in the xSR register is cleared while its corresponding receive interrupt is enabled on the Processor-side.
- If any receive data register of the other Processor-side is empty, because of a read on the other Processor -side; that is, its “full” bit in the xSR register is cleared while its corresponding transmit interrupt is enabled on the Processor-side.
- If any general purpose interrupt is set in the xCR register while the corresponding interrupt is enabled on the Processor-side.
- If the other Processor issues a non-maskable interrupt to the Processor.

The logic enables the other Processor to operate independently while the Processor is in any power mode (including STOP). However, the Processor power mode change protocol should be handled with care regarding:

- The interrupts that are enabled on the Processor-side

- The events that could be triggered by the other Processor-side
- The compatibility with the other Processor protocol of entering STOP mode

If the Processor is in STOP mode and an event on the other Processor is triggered, the EP bit (in the xSR register) will remain high until the Processor wakes up.
