
i.MX 6SoloX Applications Processor Reference Manual

Document Number: IMX6SXRM
Rev 0, 2/2015

Contents

Section number	Title	Page
Chapter 1		
Introduction		
1.1	About This Document.....	167
1.1.1	Audience.....	167
1.1.2	Organization.....	167
1.1.3	Suggested Reading.....	168
1.1.3.1	General Information.....	168
1.1.3.2	Related Documentation.....	168
1.1.4	Conventions.....	168
1.1.5	Register Access.....	170
1.1.5.1	Register Diagram Field Access Type Legend.....	170
1.1.5.2	Register Macro Usage.....	170
1.1.6	Signal Conventions.....	171
1.1.7	Acronyms and Abbreviations.....	172
1.2	Introduction.....	173
1.3	Target Applications.....	174
1.4	features.....	174
1.5	Architectural Overview.....	178
1.5.1	Block Diagram.....	178
1.5.1.1	Simplified Block Diagram.....	178
1.5.2	Architectural Partitioning.....	179
1.5.3	Endianness Support.....	181
1.5.4	Memory Interfaces.....	181
Chapter 2		
Memory Maps		
2.1	Memory system overview.....	183
2.2	ARM Platform Memory Map.....	183
2.3	DMA memory map.....	194

Section number	Title	Page
Chapter 3		
Interrupts and DMA Events		
3.1	Overview.....	197
3.2	A9 interrupts.....	197
3.3	CM4 interrupts.....	201
3.4	SDMA event mapping.....	205
Chapter 4		
External Signals and Pin Multiplexing		
4.1	Overview.....	209
4.1.1	Muxing Options.....	209
Chapter 5		
Fusemap		
5.1	Boot Fusemap.....	257
5.2	Lock Fusemap.....	265
5.3	Fusemap Descriptions Table.....	266
Chapter 6		
External Memory Controllers		
6.1	Overview.....	277
6.2	Multi-mode DDR controller (MMDC) overview and feature summary.....	277
6.3	Raw NAND Flash controller overview.....	279
6.3.1	NAND interface features.....	280
6.3.2	NAND control features.....	281
6.3.3	Internal interface features.....	281
6.3.4	APBH-DMA overview.....	281
6.3.5	ECC-BCH features.....	281
6.4	EIM-PSRAM/NOR Flash controller overview.....	282
6.4.1	EIM features.....	282
6.4.2	EIM boot scenarios.....	283
6.4.3	EIM boot configuration.....	283
6.4.4	OneNAND requirements.....	284

Section number	Title	Page
Chapter 7		
System Debug		
7.1	Overview.....	285
7.2	Chip and ARM Platform Debug Architecture.....	285
7.2.1	Debug Features.....	286
7.2.2	Debug System components.....	286
7.2.2.1	AMBA trace bus (ATB).....	287
7.2.2.2	ATB replicator.....	287
7.2.2.3	Embedded Cross Triggering.....	287
7.2.2.3.1	Cross-Trigger Matrix (CTM).....	288
7.2.2.3.2	Cross-Trigger Interface (CTI).....	289
7.2.2.4	Debug Access Port (DAP).....	289
7.2.2.5	CoreSight trace port interface (TPIU).....	290
7.2.2.6	Coresight Embedded Trace Buffer (ETB).....	291
7.2.2.6.1	Performance Profiling with the ETB.....	292
7.2.2.6.2	ETB Counter Control.....	292
7.2.2.7	Embedded Trace Macrocell v3.5 (ETM).....	293
7.2.2.8	ITM.....	293
7.2.3	i.MX6SoloX-Specific SJC Features.....	294
7.2.3.1	JTAG Disable Mode.....	294
7.2.3.2	JTAG ID.....	294
7.2.4	System JTAG Controller - SJC.....	295
7.2.5	System JTAG controller main features.....	295
7.2.6	SJC TAP Port.....	295
7.2.7	SJC main blocks.....	295
7.3	Smart DMA (SDMA) core.....	296
7.3.1	SDMA On Chip Emulation Module (OnCE) Feature Summary.....	296
7.3.1.1	Other SDMA Debug Functionality.....	297
7.3.1.2	SDMA ROM Patching.....	298

Section number	Title	Page
7.4	Miscellaneous.....	298
7.4.1	Clock/Reset/Power.....	298
7.5	Supported tools.....	298

Chapter 8 System Boot

8.1	Overview.....	301
8.2	Boot modes.....	302
8.2.1	Boot mode pin settings.....	303
8.2.2	High level boot sequence.....	303
8.2.3	Boot From Fuses Mode (BOOT_MODE[1:0] = 00b).....	304
8.2.4	Serial Downloader.....	305
8.2.5	Internal Boot Mode (BOOT_MODE[1:0] = 0b10).....	306
8.2.6	Boot security settings.....	307
8.3	Device Configuration.....	307
8.3.1	Boot eFUSE Descriptions.....	308
8.3.2	GPIO Boot Overrides.....	310
8.3.3	Device Configuration Data.....	312
8.4	Device Initialization.....	312
8.4.1	Internal ROM /RAM memory map.....	312
8.4.2	Boot Block Activation	313
8.4.3	Clocks at Boot Time.....	314
8.4.4	Enabling MMU and Caches.....	316
8.4.5	Exception Handling.....	317
8.4.6	Interrupt Handling During Boot.....	317
8.4.7	Persistent Bits.....	317
8.5	Boot Devices (Internal Boot).....	318
8.5.1	NOR Flash/OneNAND using EIM Interface.....	319
8.5.1.1	NOR Flash Boot Operation.....	319
8.5.1.2	OneNAND Flash Boot Operation.....	319

Section number	Title	Page
8.5.1.3	IOMUX Configuration for EIM Devices.....	320
8.5.2	NAND Flash.....	322
8.5.2.1	NAND eFUSE Configuration.....	322
8.5.2.2	NAND Flash Boot Flow and Boot Control Blocks (BCB).....	324
8.5.2.3	Firmware Configuration Block.....	327
8.5.2.4	Discovered Bad Block Table.....	331
8.5.2.5	Bad Block Handling in the ROM.....	331
8.5.2.6	Read Retry Handling in the ROM.....	332
8.5.2.7	Toggle Mode DDR NAND Boot.....	334
8.5.2.7.1	GPMI and BCH Clocks Configuration.....	334
8.5.2.7.2	Setup DMA for DDR Transfers.....	335
8.5.2.7.3	Reconfigure Timing and Speed Using Values in FCB.....	335
8.5.2.8	Typical NAND Page Organization.....	335
8.5.2.8.1	BCH ECC Page Organization.....	335
8.5.2.8.2	Metadata.....	337
8.5.2.9	IOMUX Configuration for NAND.....	337
8.5.3	Expansion Device.....	338
8.5.3.1	Expansion Device eFUSE Configuration.....	338
8.5.3.2	MMC and eMMC Boot.....	341
8.5.3.3	SD, eSD and SDXC.....	349
8.5.3.4	IOMUX Configuration for SD/MMC.....	349
8.5.3.5	Redundant Boot Support for Expansion Device.....	350
8.5.4	Serial ROM through SPI and I2C.....	351
8.5.4.1	Serial ROM eFUSE Configuration.....	352
8.5.4.2	I2C Boot.....	353
8.5.4.2.1	I2C IOMUX Pin Configuration.....	354
8.5.4.3	ECSPI Boot.....	354
8.5.4.3.1	ECSPI IOMUX Pin Configuration.....	356

Section number	Title	Page
8.6	QuadSPI Serial Flash Memory Boot.....	357
8.6.1	QuadSPI eFUSE Configuration.....	357
8.6.2	QuadSPI Serial Flash BOOT Operation.....	357
8.6.3	QuadSPI Configuration Parameters.....	358
8.6.4	IOMUX Configuration for QSPI Devices.....	361
8.6.5	QuadSPI boot flow chart.....	361
8.7	Program image.....	363
8.7.1	Image Vector Table and Boot Data.....	363
8.7.1.1	Image Vector Table Structure.....	364
8.7.1.2	Boot Data Structure.....	365
8.7.2	Device Configuration Data (DCD).....	365
8.7.2.1	Write Data Command.....	366
8.7.2.2	Check Data Command.....	368
8.7.2.3	NOP Command.....	369
8.7.2.4	Unlock Command.....	369
8.8	Plugin Image.....	370
8.9	Serial Downloader.....	371
8.9.1	USB.....	372
8.9.1.1	USB Configuration Details.....	373
8.9.1.2	IOMUX Configuration for USB.....	373
8.9.2	Serial Download protocol.....	374
8.9.2.1	SDP Command.....	374
8.9.2.1.1	READ REGISTER.....	374
8.9.2.1.2	WRITE REGISTER.....	375
8.9.2.1.3	WRITE_FILE.....	376
8.9.2.1.4	ERROR_STATUS.....	377
8.9.2.1.5	DCD WRITE.....	378
8.9.2.1.6	JUMP ADDRESS.....	379
8.10	Recovery Devices.....	379

Section number	Title	Page
8.11	USB Low Power Boot.....	380
8.12	SD/MMC Manufacture Mode.....	382
8.13	High Assurance Boot (HAB).....	383
8.13.1	HAB API Vector Table Addresses.....	384

Chapter 9 Multimedia

9.1	Display and graphics subsystem.....	387
9.1.1	PiXel Pipeline.....	388
9.1.2	LCD Interface.....	389
9.1.3	CMOS Sensor Interface.....	389
9.1.4	Video ADC features.....	390
9.1.5	TV Decoder.....	390
9.2	2D/3D Graphics Processing Unit.....	390
9.2.1	2D feature summary.....	391
9.2.2	2D Performance.....	392
9.2.3	2D Software.....	392
9.2.4	OpenGL Features.....	392
9.2.5	OpenGL Performance.....	393
9.2.6	OpenGL Software.....	393
9.3	LVDS Display Bridge (LDB).....	393
9.3.1	LDB Overview.....	393
9.3.2	LDB External Ports.....	394
9.3.3	Input Parallel Display Ports.....	394
9.3.3.1	Output LVDS Ports.....	395
9.4	Display Content Integrity Checker (DCIC).....	395
9.5	Audio subsystem.....	395
9.5.1	Audio subsystem module overview.....	395
9.5.2	Synchronous Serial Interface (SSI).....	397
9.5.3	Digital Audio MUX (AUDMUX).....	397

Section number	Title	Page
9.5.4	Synchronous Audio Interface (SAI).....	399
9.5.5	Enhanced Serial Audio Interface (ESAI).....	399
9.5.6	Sony/Philips Digital Interface (SPDIF).....	399

Chapter 10 Clock and Power Management

10.1	Introduction.....	403
10.2	Device Power Management Architecture Components.....	403
10.2.1	Centralized components of clock generation and management.....	404
10.2.2	Centralized components of power generation, distribution and management.....	405
10.2.3	Reset generation and distribution system.....	405
10.2.4	Power and clock management framework.....	405
10.3	Clock Management.....	406
10.3.1	Centralized components of clock management system.....	406
10.3.2	Clock generation.....	409
10.3.2.1	Crystal Oscillator (XTALOSC)	409
10.3.2.2	LVDS I/O ports.....	409
10.3.2.3	PLLs.....	409
10.3.2.3.1	General PLL Control and Status Functions.....	411
10.3.2.4	CCM	412
10.3.2.5	Low Power Clock Gating unit (LPCG).....	412
10.3.3	Peripheral components of clock management system.....	413
10.3.3.1	Interface and functional clock.....	413
10.3.3.2	Block level clock management.....	414
10.3.3.2.1	Master clock protocol.....	415
10.3.3.2.2	Slave clock protocol.....	415
10.3.3.3	Clock Domain(s).....	415
10.3.3.4	Domain level clock management.....	416
10.3.3.5	Domain dependencies.....	416

Section number	Title	Page
10.4	Power management.....	416
10.4.1	Centralized Components of Power Management System.....	416
10.4.1.1	Integrated PMU.....	417
	10.4.1.1.1 Digital LDO Regulators.....	419
	10.4.1.1.2 Analog LDO regulators.....	420
	10.4.1.1.3 USB LDO.....	420
	10.4.1.1.4 SNVS regulator.....	420
10.4.1.2	GPC - General Power Controller.....	421
10.4.1.3	SRC - System reset Controller.....	421
10.4.1.4	Power domain(s).....	422
	10.4.1.4.1 Power distribution	423
	10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating.....	424
	10.4.1.4.3 Power Gating Domain Management.....	425
	10.4.1.4.3.1 Cortex-A9 Core Platform.....	425
	10.4.1.4.3.2 GPU/Display/MEGA.....	426
	10.4.1.4.3.3 SoC.....	426
	10.4.1.4.4 Power Gating domain dependencies.....	426
10.4.1.5	Voltage domains.....	427
10.4.1.6	Voltage domain management.....	427
	10.4.1.6.1 Dynamic.....	428
	10.4.1.6.1.1 DVFS.....	428
	10.4.1.6.1.2 Voltage Scaling.....	429
	10.4.1.6.2 Static	429
	10.4.1.6.2.1 Standby Leakage reduction (SLR).....	429
	10.4.1.6.2.2 ANALOG PHYs IPs -.....	430
	10.4.1.6.3 Voltage domain dependencies.....	430
	10.4.1.6.4 IO voltage	430
10.4.1.7	System domains layout.....	430

Section number	Title	Page
10.4.2	Power management techniques.....	432
10.4.2.1	Power saving techniques.....	433
10.4.2.2	Thermal-aware power management.....	433
10.4.2.3	Peripheral Power management.....	434
10.4.2.3.1	Main memory power management.....	434
10.4.2.3.2	Video-Graphics system power management.....	435
10.4.2.3.3	IO power reduction.....	435
10.4.3	Examples of External Power Supply Interfacing in the i.MX based systems	435
10.5	ONOFF (Button).....	438

Chapter 11 System Security

11.1	Overview.....	441
11.2	Central Security Unit (CSU).....	442
11.2.1	CSU Overview.....	442
11.2.2	CSU Features.....	442
11.2.3	CSU Functional Description.....	443
11.2.3.1	CSU Peripheral Access Policy.....	443
11.3	Secure Non-Volatile Storage (SNVS).....	444
11.3.1	SNVS Overview.....	444
11.3.2	Tamper Detection.....	445
11.4	High Assurance Boot (HAB).....	445
11.5	RDC Overview.....	445
11.6	System JTAG Controller (SJC).....	446

Chapter 12 ARM Cortex A9 MPCore Platform (ARM)

12.1	Overview.....	447
12.2	External Signals.....	447
12.3	Platform configuration.....	448
12.3.1	Platform and SCU configuration.....	448

Section number	Title	Page
12.3.2	Core configuration.....	449
12.3.3	PL310 L2 Cache configuration.....	449
12.3.4	Endian Modes.....	450
12.3.5	Memory Parity error support	450
12.4	Performance and Power.....	450
12.4.1	Low-Power design.....	450
12.4.1.1	SRPG (State Retention Power Gating).....	451
12.4.1.2	Dynamic Voltage and Frequency Scaling (DVFS).....	451
12.4.2	Clocks, frequency goals.....	451
12.4.2.1	ARM Clock.....	451
12.4.2.2	Bus Clocks.....	452
12.4.2.3	Debug Clocks.....	452
12.5	Core Platform Sub-Blocks details.....	452
12.5.1	ARM Cortex A9 MPCore Processor.....	452
12.5.2	Media Processing Engine (MPE - NEON).....	453
12.5.3	Generic Interrupt Controller (GIC).....	453
12.5.3.1	Interrupt Controller Features.....	453
12.5.3.2	About the Interrupt Controller.....	453
12.5.3.3	Interrupt Controller Clock frequency.....	454
12.5.3.4	TrustZone support.....	454
12.5.4	Instruction and data caches (L1).....	454
12.5.4.1	L1 features.....	454
12.5.5	L2 Cache and controller (PL310).....	454
12.6	Debug and Trace Sub-blocks (CoreSight components).....	455
12.6.1	Debug Access Port (DAP)	455
12.6.2	Program Trace Macrocell (PTM).....	456
12.6.2.1	Program Flow Trace (PFT).....	456
12.6.3	Cross Trigger Interface (CTI).....	457

Section number	Title	Page
12.6.4	Embedded Trace Buffer (ETB).....	457
12.6.4.1	AMBA Trace Bus (ATB) Replicator	458

Chapter 13 ARM Cortex M4 Platform (CM4)

13.1	Overview.....	459
13.1.1	Cortex-M4 Block Diagram.....	459
13.1.2	Integration Layer Block Diagram.....	461
13.2	Cortex-M4 Platform Features.....	463
13.2.1	Core Module Features.....	463
13.2.2	Network Interconnect Features.....	463
13.3	Cortex-M4 Instruction Fetches on the System Bus.....	463
13.4	Major Platform Bus Interfaces.....	464
13.5	Cortex-M4 Boot Requirements.....	465
13.6	Clocks and Resets.....	465
13.7	Debug Configuration.....	466
13.8	Platform JTAG Requirements.....	468
13.9	Local Memory Controller (LMEM).....	468
13.9.1	LMEM Block Diagram.....	468
13.9.2	Cache features.....	469
13.9.3	LMEM Function.....	471
13.9.3.1	Processor Code accesses.....	471
13.9.3.2	Processor Space accesses.....	471
13.9.3.3	Backdoor port accesses.....	472
13.9.3.4	SRAM Function.....	472
13.9.3.4.1	SRAM Configuration.....	472
13.9.3.4.2	SRAM Arrays.....	472
13.9.3.4.3	SRAM accesses.....	472
13.9.3.5	Cache Function.....	473

Section number	Title	Page
13.9.3.6	Cache Control.....	474
13.9.3.6.1	Cache set commands.....	474
13.9.3.6.2	Cache line commands.....	475
13.9.3.6.2.1	Executing a series of line commands using cache addresses.	476
13.9.3.6.2.2	Executing a series of line commands using physical addresses.....	477
13.9.3.6.2.3	Line command results.....	477
13.10	Miscellaneous Control Module (MCM).....	478
13.10.1	MCM features.....	478
13.10.2	MCM Interrupts.....	478
13.10.2.1	Non-maskable interrupt.....	479
13.10.2.2	Normal interrupt.....	479
13.11	LMEM Memory Map/Register Definition.....	479
13.11.1	Cache control register (LMEM_PCCCR).....	480
13.11.2	Cache line control register (LMEM_PCCLCR).....	481
13.11.3	Cache search address register (LMEM_PCCSAR).....	484
13.11.4	Cache read/write value register (LMEM_PCCVVR).....	485
13.11.5	Cache control register (LMEM_PSCCR).....	485
13.11.6	Cache line control register (LMEM_PSCLCR).....	487
13.11.7	Cache search address register (LMEM_PSCSAR).....	489
13.11.8	Cache read/write value register (LMEM_PSCCVVR).....	490
13.12	MCM Memory Map/Register Definition.....	490
13.12.1	Crossbar Switch (AXBS) Slave Configuration (MCM_PLASC).....	491
13.12.2	Crossbar Switch (AXBS) Master Configuration (MCM_PLAMC).....	491
13.12.3	Fault address register (MCM_FADR).....	492
13.12.4	Fault attributes register (MCM_FATR).....	492
13.12.5	Fault data register (MCM_FDR).....	494

Chapter 14

Analog-to-Digital Converter (ADC)

14.1	Overview.....	497
14.1.1	Features.....	497
14.1.2	ADC-Digital I/F block diagram.....	498
14.1.3	ADC-Digital block diagram.....	498
14.1.4	ADC module interface.....	500
14.1.5	Modes of Operation.....	500
14.2	External Signals.....	500
14.3	Functional Description.....	501
14.3.1	Clock Select and Divide Control.....	502
14.3.2	Voltage Reference Selection	503
14.3.3	Hardware Triggering and Channel Selection.....	503
14.3.4	Conversion Control.....	504
14.3.4.1	Initiating Conversions.....	504
14.3.4.2	Completing Conversions.....	505
14.3.4.3	Aborting Conversions.....	506
14.3.4.4	Power Control.....	507
14.3.4.5	Sample Time and Total Conversion Time.....	507
14.3.4.6	Conversion Time Examples.....	510
14.3.4.6.1	Typical conversion time configuration.....	510
14.3.4.6.2	Long conversion time configuration.....	510
14.3.4.6.3	Short conversion time configuration.....	511
14.3.4.7	Hardware Average Function.....	511
14.3.5	Automatic Compare Function.....	512
14.3.6	Calibration Function.....	513
14.3.7	User Defined Offset Function	514
14.3.8	Temperature Sensor.....	515
14.3.9	MCU Wait Mode Operation.....	516

Section number	Title	Page
14.3.10	MCU Stop Mode Operation.....	516
14.3.10.1	Stop Mode With ADACK Disabled.....	516
14.3.10.2	Stop Mode With ADACK Enabled.....	517
14.4	Initialization Information.....	517
14.4.1	ADC Module Initialization Example.....	517
14.4.1.1	Initialization Sequence.....	517
14.4.1.2	Pseudo-Code Example.....	518
14.5	Application Information.....	519
14.5.1	Sources of Error.....	519
14.5.1.1	Sampling Error.....	519
14.5.1.2	Pin Leakage Error.....	520
14.5.1.3	Noise-Induced Errors.....	520
14.5.1.4	Code Width and Quantization Error.....	521
14.5.1.5	Linearity Errors.....	522
14.5.1.6	Code Jitter, Non-Monotonicity, and Missing Codes.....	522
14.6	Memory map and register definition.....	523
14.6.1	Control register for hardware triggers (ADCx_HC0).....	525
14.6.2	Control register for hardware triggers (ADCx_HC1).....	526
14.6.3	Status register for HW triggers (ADCx_HS).....	528
14.6.4	Data result register for HW triggers (ADCx_R0).....	529
14.6.5	Data result register for HW triggers (ADCx_R1).....	530
14.6.6	Configuration register (ADCx_CFG).....	531
14.6.7	General control register (ADCx_GC).....	533
14.6.8	General status register (ADCx_GS).....	535
14.6.9	Compare value register (ADCx_CV).....	536
14.6.10	Offset correction value register (ADCx_OFS).....	537
14.6.11	Calibration value register (ADCx_CAL).....	538

Section number	Title	Page
Chapter 15		
AHB to IP Bridge (AIPSTZ)		
15.1	Overview.....	539
15.1.1	Features.....	539
15.2	Clocks.....	539
15.3	General Operation.....	540
15.4	Functional Description.....	541
15.5	Access Protections.....	541
15.6	Access Support.....	541
15.7	Initialization Information.....	542
15.7.1	Security Block.....	542
15.8	AIPSTZ Memory Map/Register Definition.....	543
15.8.1	Master Privilege Registers (AIPSTZ_MPR).....	544
15.8.2	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR).....	547
15.8.3	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1).....	550
15.8.4	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2).....	553
15.8.5	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3).....	556
15.8.6	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4).....	559
Chapter 16		
Asynchronous Sample Rate Converter (ASRC)		
16.1	Overview.....	561
16.1.1	Features.....	563
16.1.2	Modes of Operation.....	564
16.1.2.1	Data Transfer Schemes.....	564
16.1.2.1.1	Data Input Modes.....	564
16.1.2.1.2	Data Output Modes.....	565
16.1.2.2	Word Alignment Supported.....	566
16.1.2.2.1	Input Data Alignment Modes.....	567
16.1.2.2.2	Output Data Alignment Modes.....	567

Section number	Title	Page
16.2	External Signals.....	568
16.3	Clocks.....	568
16.4	Interrupts.....	568
16.5	DMA requests.....	569
16.6	Functional Description.....	569
16.6.1	Algorithm Description.....	569
16.6.1.1	Signal processing flow.....	569
16.6.1.2	Operation of the Filter.....	573
16.6.1.2.1	Support of Physical Clocks.....	573
16.7	Startup Procedure.....	575
16.8	ASRC Memory Map/Register Definition.....	579
16.8.1	ASRC Control Register (ASRC_ASRCCTR).....	582
16.8.2	ASRC Interrupt Enable Register (ASRC_ASRIER).....	585
16.8.3	ASRC Channel Number Configuration Register (ASRC_ASRCNCR).....	586
16.8.4	ASRC Filter Configuration Status Register (ASRC_ASRCFG).....	588
16.8.5	ASRC Clock Source Register (ASRC_ASRCSTR).....	590
16.8.6	ASRC Clock Divider Register 1 (ASRC_ASRCDR1).....	593
16.8.7	ASRC Clock Divider Register 2 (ASRC_ASRCDR2).....	594
16.8.8	ASRC Status Register (ASRC_ASRSTR).....	596
16.8.9	ASRC Parameter Register n (ASRC_ASRPMn).....	599
16.8.10	ASRC ASRC Task Queue FIFO Register 1 (ASRC_ASRTFR1).....	600
16.8.11	ASRC Channel Counter Register (ASRC_ASRCR).....	601
16.8.12	ASRC Data Input Register for Pair x (ASRC_ASRDIn).....	602
16.8.13	ASRC Data Output Register for Pair x (ASRC_ASRDOx).....	602
16.8.14	ASRC Ideal Ratio for Pair A-High Part (ASRC_ASRIDRHA).....	603
16.8.15	ASRC Ideal Ratio for Pair A -Low Part (ASRC_ASRIDRLA).....	604
16.8.16	ASRC Ideal Ratio for Pair B-High Part (ASRC_ASRIDRHB).....	604
16.8.17	ASRC Ideal Ratio for Pair B-Low Part (ASRC_ASRIDRLB).....	605
16.8.18	ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC).....	605

Section number	Title	Page
16.8.19	ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC).....	606
16.8.20	ASRC 76kHz Period in terms of ASRC processing clock (ASRC_ASR76K).....	607
16.8.21	ASRC 56kHz Period in terms of ASRC processing clock (ASRC_ASR56K).....	608
16.8.22	ASRC Misc Control Register for Pair A (ASRC_ASRMCRA).....	609
16.8.23	ASRC FIFO Status Register for Pair A (ASRC_ASRFSTA).....	611
16.8.24	ASRC Misc Control Register for Pair B (ASRC_ASRMCRB).....	612
16.8.25	ASRC FIFO Status Register for Pair B (ASRC_ASRFSTB).....	614
16.8.26	ASRC Misc Control Register for Pair C (ASRC_ASRMCRC).....	615
16.8.27	ASRC FIFO Status Register for Pair C (ASRC_ASRFSTC).....	617
16.8.28	ASRC Misc Control Register 1 for Pair X (ASRC_ASRMCR1 <i>n</i>).....	618

Chapter 17 Digital Audio Multiplexer (AUDMUX)

17.1	Overview.....	621
17.1.1	Features.....	623
17.1.2	Modes and Operations.....	623
17.2	External Signals.....	623
17.3	Clocks.....	625
17.3.1	Clock Inputs.....	625
17.3.2	Clock Diagram.....	625
17.3.3	Clocking Restrictions.....	626
17.4	Default Register Configuration.....	626
17.4.1	Default Port Configuration.....	627
17.5	Functional Description.....	627
17.5.1	Operating Modes.....	627
17.5.1.1	Port Receive Data Modes.....	628
17.5.1.1.1	Normal Mode.....	629
17.5.1.1.2	Internal Network Mode.....	630
17.5.1.1.3	Transmit Data Output Enable Assertion.....	636
17.5.1.2	Tx/Rx Switch and External Network Mode.....	637

Section number	Title	Page
17.5.1.3	Timing Modes.....	638
17.5.1.3.1	Synchronous Mode (4-Wire Interface).....	638
17.5.1.3.2	Asynchronous Mode (6-Wire Interface).....	640
17.5.2	Connectivity Between Ports.....	643
17.5.2.1	Internal Port to External Port Connectivity.....	644
17.5.2.2	External Port to External Port Connectivity.....	645
17.5.2.3	Internal Port to Internal Port Connectivity.....	645
17.5.2.4	Loopback Connectivity.....	646
17.6	AUDMUX Memory Map/Register Definition.....	646
17.6.1	Port Timing Control Register 1 (AUDMUX_PTCR1).....	647
17.6.2	Port Data Control Register 1 (AUDMUX_PDCR1).....	649
17.6.3	Port Timing Control Register 2 (AUDMUX_PTCR2).....	650
17.6.4	Port Data Control Register 2 (AUDMUX_PDCR2).....	652
17.6.5	Port Timing Control Register 3 (AUDMUX_PTCR3).....	653
17.6.6	Port Data Control Register 3 (AUDMUX_PDCR3).....	655
17.6.7	Port Timing Control Register 4 (AUDMUX_PTCR4).....	656
17.6.8	Port Data Control Register 4 (AUDMUX_PDCR4).....	658
17.6.9	Port Timing Control Register 5 (AUDMUX_PTCR5).....	659
17.6.10	Port Data Control Register 5 (AUDMUX_PDCR5).....	661
17.6.11	Port Timing Control Register 6 (AUDMUX_PTCR6).....	662
17.6.12	Port Data Control Register 6 (AUDMUX_PDCR6).....	664
17.6.13	Port Timing Control Register 7 (AUDMUX_PTCR7).....	665
17.6.14	Port Data Control Register 7 (AUDMUX_PDCR7).....	667

Chapter 18 62-BIT Correcting ECC Accelerator (BCH)

18.1	Overview.....	669
18.2	Operation.....	671
18.2.1	BCH Limitations and Assumptions.....	672
18.2.2	Flash Page Layout.....	673

Section number	Title	Page
18.2.3	Determining the ECC layout for a device.....	675
18.2.3.1	4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(213).....	675
18.2.3.2	4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(213) for data and GF(214) for metadata.....	676
18.2.4	Data Buffers in System Memory.....	676
18.3	Memory to Memory (Loopback) Operation.....	679
18.4	Programming the BCH/GPMI Interfaces.....	680
18.4.1	BCH Encoding for NAND Writes.....	681
18.4.1.1	DMA Structure Code Example.....	683
18.4.1.2	Using the BCH Encoder.....	688
18.4.2	BCH Decoding for NAND Reads.....	689
18.4.2.1	DMA Structure Code Example.....	693
18.4.2.2	Using the Decoder.....	696
18.4.3	Interrupts.....	698
18.4.4	Randomizer.....	699
18.5	Behavior During Reset.....	700
18.6	BCH Memory Map/Register Definition.....	700
18.6.1	Hardware BCH ECC Accelerator Control Register (BCH_CTRL <i>n</i>).....	705
18.6.2	Hardware ECC Accelerator Status Register 0 (BCH_STATUS0 <i>n</i>).....	707
18.6.3	Hardware ECC Accelerator Mode Register (BCH_MODE <i>n</i>).....	709
18.6.4	Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTR <i>n</i>).....	709
18.6.5	Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTR <i>n</i>).....	710
18.6.6	Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTR <i>n</i>).....	710
18.6.7	Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT <i>n</i>).....	711
18.6.8	Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0 <i>n</i>).....	712
18.6.9	Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1 <i>n</i>).....	714
18.6.10	Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0 <i>n</i>).....	715
18.6.11	Hardware BCH ECC Flash 1 Layout 1 Register (BCH_FLASH1LAYOUT1 <i>n</i>).....	716

Section number	Title	Page
18.6.12	Hardware BCH ECC Flash 2 Layout 0 Register (BCH_FLASH2LAYOUT0n).....	717
18.6.13	Hardware BCH ECC Flash 2 Layout 1 Register (BCH_FLASH2LAYOUT1n).....	719
18.6.14	Hardware BCH ECC Flash 3 Layout 0 Register (BCH_FLASH3LAYOUT0n).....	720
18.6.15	Hardware BCH ECC Flash 3 Layout 1 Register (BCH_FLASH3LAYOUT1n).....	721
18.6.16	Hardware BCH ECC Debug Register0 (BCH_DEBUG0n).....	722
18.6.17	KES Debug Read Register (BCH_DBGKESREADn).....	724
18.6.18	Chien Search Debug Read Register (BCH_DBGCSFEREADn).....	724
18.6.19	Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREADn).....	725
18.6.20	Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREADn).....	725
18.6.21	Block Name Register (BCH_BLOCKNAMEn).....	726
18.6.22	BCH Version Register (BCH_VERSIONn).....	726
18.6.23	Hardware BCH ECC Debug Register 1 (BCH_DEBUG1n).....	727

Chapter 19 Clock Controller Module (CCM)

19.1	Overview.....	729
19.1.1	Features.....	729
19.1.2	CCM Block Diagram.....	730
19.2	External Signals.....	732
19.3	CCM Clock Tree.....	732
19.4	System Clocks.....	735
19.5	Functional Description.....	747
19.5.1	Clock Generation.....	747
19.5.1.1	External Low Frequency Clock - CKIL	747
19.5.1.1.1	CKIL synchronizing to IPG_CLK.....	747
19.5.1.2	External High Frequency Clock - CKIH and internal oscillator.....	747
19.5.1.3	PLL reference clock.....	747
19.5.1.3.1	ARM PLL.....	748
19.5.1.3.2	USB PLLs.....	748
19.5.1.3.3	System PLL.....	748

Section number	Title	Page
19.5.1.3.4	Audio / Video PLL.....	749
19.5.1.3.5	Ethernet PLL.....	749
19.5.1.4	Phase Fractional Dividers (PFD).....	750
19.5.1.5	CCM internal clock generation.....	750
19.5.1.5.1	Clock Switcher.....	750
19.5.1.5.2	PLL bypass procedure.....	752
19.5.1.5.3	PLL clock change.....	752
19.5.1.5.4	Clock Root Generator.....	752
19.5.1.5.5	Initial values controlled by the System JTAG Controller (SJC).....	754
19.5.1.5.6	Divider change handshake.....	754
19.5.1.6	Disabling / Enabling PLLs.....	754
19.5.1.7	Clock Switching Multiplexers.....	755
19.5.1.8	Low Power Clock Gating module (LPCG).....	756
19.5.1.8.1	MMDC handshake.....	757
19.5.2	DVFS support.....	758
19.5.3	Power modes.....	758
19.5.3.1	RUN mode.....	758
19.5.3.2	WAIT mode.....	758
19.5.3.2.1	Entering WAIT mode	758
19.5.3.2.2	Exiting WAIT mode	759
19.5.3.3	STOP mode.....	759
19.5.3.3.1	Entering STOP mode	759
19.5.3.3.2	Exiting STOP mode.....	760
19.6	CCM Memory Map/Register Definition.....	761
19.6.1	CCM Control Register (CCM_CCR).....	762
19.6.2	CCM Control Divider Register (CCM_CCDR).....	764
19.6.3	CCM Status Register (CCM_CSR).....	765
19.6.4	CCM Clock Switcher Register (CCM_CCSR).....	766
19.6.5	CCM Arm Clock Root Register (CCM_CACRR).....	767

Section number	Title	Page
19.6.6	CCM Bus Clock Divider Register (CCM_CBCDR).....	768
19.6.7	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	771
19.6.8	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	773
19.6.9	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	776
19.6.10	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	778
19.6.11	CCM SSI1 Clock Divider Register (CCM_CS1CDR).....	780
19.6.12	CCM SSI2 Clock Divider Register (CCM_CS2CDR).....	782
19.6.13	CCM D1 Clock Divider Register (CCM_CDCDR).....	784
19.6.14	CCM HSC Clock Divider Register (CCM_CHSCDDR).....	786
19.6.15	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	788
19.6.16	CCM Serial Clock Divider Register 3 (CCM_CSCDR3).....	790
19.6.17	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	792
19.6.18	CCM Low Power Control Register (CCM_CLPCR).....	795
19.6.19	CCM Interrupt Status Register (CCM_CISR).....	797
19.6.20	CCM Interrupt Mask Register (CCM_CIMR).....	800
19.6.21	CCM Clock Output Source Register (CCM_CCOSR).....	802
19.6.22	CCM General Purpose Register (CCM_CGPR).....	804
19.6.23	CCM Clock Gating Register 0 (CCM_CCGR0).....	805
19.6.24	CCM Clock Gating Register 1 (CCM_CCGR1).....	807
19.6.25	CCM Clock Gating Register 2 (CCM_CCGR2).....	808
19.6.26	CCM Clock Gating Register 3 (CCM_CCGR3).....	810
19.6.27	CCM Clock Gating Register 4 (CCM_CCGR4).....	811
19.6.28	CCM Clock Gating Register 5 (CCM_CCGR5).....	812
19.6.29	CCM Clock Gating Register 6 (CCM_CCGR6).....	814
19.6.30	CCM Module Enable Override Register (CCM_CMEOR).....	815
19.7	CCM Analog Memory Map/Register Definition.....	816
19.7.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM n).....	820
19.7.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1 n).....	822
19.7.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2 n).....	824

Section number	Title	Page
19.7.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYS <i>n</i>).....	826
19.7.5	528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).....	828
19.7.6	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO <i>n</i>).....	829
19.7.7	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)..	831
19.7.8	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	832
19.7.9	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO <i>n</i>).....	833
19.7.10	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)..	835
19.7.11	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	836
19.7.12	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET <i>n</i>).....	837
19.7.13	480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 <i>n</i>).....	839
19.7.14	528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528 <i>n</i>).....	841
19.7.15	Miscellaneous Register 0 (CCM_ANALOG_MISC0 <i>n</i>).....	844
19.7.16	Miscellaneous Register 1 (CCM_ANALOG_MISC1 <i>n</i>).....	848
19.7.17	Miscellaneous Register 2 (CCM_ANALOG_MISC2 <i>n</i>).....	851

Chapter 20 CMOS Sensor Interface (CSI)

20.1	Overview.....	857
20.2	External Signals.....	858
20.3	Clocks.....	860
20.4	Principles of Operation.....	861
20.4.1	Data Transfer with the Embedded DMA Controllers.....	863
20.4.2	Gated Clock Mode.....	864
20.4.3	Non-Gated Clock Mode.....	864
20.4.4	CCIR656 Interlace Mode.....	865
20.4.5	CCIR656 Progressive Mode.....	867
20.4.6	Error Correction for CCIR656 Coding.....	868
20.4.7	Deinterlacer.....	868

Section number	Title	Page
20.5	Interrupt Generation.....	869
20.5.1	Start Of Frame Interrupt (SOF_INT).....	869
20.5.2	End Of Frame Interrupt (EOF_INT).....	869
20.5.3	Change Of Field Interrupt (COF_INT).....	869
20.5.4	CCIR Error Interrupt (ECC_INT).....	870
20.5.5	RxFIFO Full Interrupt (RxFF_INT).....	870
20.5.6	Statistic FIFO Full Interrupt (STATFF_INT).....	870
20.5.7	RxFIFO Overrun Interrupt (RFF_OR_INT).....	870
20.5.8	Statistic FIFO Overrun Interrupt (SFF_OR_INT).....	870
20.5.9	Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1).....	870
20.5.10	Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2).....	871
20.5.11	Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF).....	871
20.5.12	AHB Bus Response Error Interrupt (HRESP_ERR_INT).....	871
20.5.13	DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE).....	871
20.5.14	DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE).....	871
20.5.15	Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR).....	872
20.6	Data Packing Style.....	872
20.6.1	RX FIFO Path.....	872
20.6.1.1	Bayer Data.....	872
20.6.1.2	RGB565 Data.....	873
20.6.1.3	RGB888 Data.....	873
20.6.2	STAT FIFO Path.....	876
20.7	CSI Memory Map/Register Definition.....	876
20.7.1	CSI Control Register 1 (CSIx_CSICR1).....	878
20.7.2	CSI Control Register 2 (CSIx_CSICR2).....	882
20.7.3	CSI Control Register 3 (CSIx_CSICR3).....	884
20.7.4	CSI Statistic FIFO Register (CSIx_CSISTATFIFO).....	886
20.7.5	CSI RX FIFO Register (CSIx_CSIRFIFO).....	886
20.7.6	CSI RX Count Register (CSIx_CSIRXCNT).....	887

Section number	Title	Page
20.7.7	CSI Status Register (CSLx_CSISR).....	888
20.7.8	CSI DMA Start Address Register - for STATFIFO (CSLx_CSIDMASA_STATFIFO).....	891
20.7.9	CSI DMA Transfer Size Register - for STATFIFO (CSLx_CSIDMATS_STATFIFO).....	891
20.7.10	CSI DMA Start Address Register - for Frame Buffer1 (CSLx_CSIDMASA_FB1).....	892
20.7.11	CSI DMA Transfer Size Register - for Frame Buffer2 (CSLx_CSIDMASA_FB2).....	893
20.7.12	CSI Frame Buffer Parameter Register (CSLx_CSIFBUF_PARA).....	894
20.7.13	CSI Image Parameter Register (CSLx_CSIMAG_PARA).....	894
20.7.14	CSI Control Register 18 (CSLx_CSICR18).....	895
20.7.15	CSI Control Register 19 (CSLx_CSICR19).....	897

Chapter 21 Display Content Integrity Checker (DCIC)

21.1	Overview.....	899
21.1.1	Block Diagram.....	900
21.1.2	Features.....	901
21.2	External Signals.....	901
21.3	Functional Description.....	902
21.3.1	Generic synchronous parallel display interface.....	902
21.3.2	CRC Polynomial.....	903
21.3.3	Mode of operation.....	903
21.3.4	Interrupts.....	904
21.3.5	Software reset.....	904
21.3.6	Clock domains.....	904
21.3.7	External controller mismatch indication signal.....	905
21.3.8	Power saving.....	905
21.3.9	System Considerations.....	905
21.4	DCIC Memory Map/Register Definition.....	906
21.4.1	DCIC Control Register (DCICx_DCICC).....	907
21.4.2	DCIC Interrupt Control Register (DCICx_DCICIC).....	908
21.4.3	DCIC Status Register (DCICx_DCICS).....	909

Section number	Title	Page
21.4.4	DCIC ROI Config Register m (DCICx_DCICRC).....	910
21.4.5	DCIC ROI Size Register m (DCICx_DCICRS).....	911
21.4.6	DCIC ROI Reference Signature Register m (DCICx_DCICRRS).....	911
21.4.7	DCIC ROI Calculated Signature m (DCICx_DCICRCS).....	911

Chapter 22 Enhanced Configurable SPI (ECSPI)

22.1	Overview.....	913
22.1.1	Features.....	914
22.1.2	Modes and Operations.....	914
22.2	External Signals.....	915
22.3	Clocks.....	918
22.4	Functional Description.....	918
22.4.1	Master Mode.....	919
22.4.2	Slave Mode.....	919
22.4.3	Low Power Modes.....	920
22.4.4	Operations.....	920
22.4.4.1	Typical Master Mode.....	920
22.4.4.1.1	Master Mode with SPI_RDY.....	921
22.4.4.1.2	Master Mode with Wait States.....	923
22.4.4.1.3	Master Mode with SS_CTL[3:0] Control.....	923
22.4.4.1.4	Master Mode with Phase Control.....	924
22.4.4.2	Typical Slave Mode.....	925
22.4.5	Reset.....	926
22.4.6	Interrupts.....	926
22.4.7	DMA	927
22.4.8	Byte Order.....	928
22.5	Initialization.....	929
22.6	Applications.....	929

Section number	Title	Page
22.7	ECSPI Memory Map/Register Definition.....	930
22.7.1	Receive Data Register (ECSPiX_RXDATA).....	932
22.7.2	Transmit Data Register (ECSPiX_TXDATA).....	933
22.7.3	Control Register (ECSPiX_CONREG).....	933
22.7.4	Config Register (ECSPiX_CONFIGREG).....	936
22.7.5	Interrupt Control Register (ECSPiX_INTREG).....	938

Chapter 23 External Interface Module (EIM)

23.1	Overview.....	945
23.1.1	Features.....	947
23.1.2	Modes of Operation.....	947
23.1.2.1	Asynchronous Mode.....	948
23.1.2.2	Asynchronous Page Read Mode.....	948
23.1.2.3	Multiplexed Address/Data Mode.....	948
23.1.2.4	Burst Clock Mode.....	949
23.1.2.5	Low Power Modes.....	950
23.1.2.6	Boot Mode.....	950
23.2	External Signals.....	950
23.2.1	Other Important Block I/O Signals Internal to the SoC.....	955
23.3	Clocks.....	956
23.4	Chip Select Memory Map.....	956
23.5	Functional Description.....	957
23.5.1	Continuous BCLK.....	957

Section number	Title	Page
23.5.2	Bus Sizing Configuration.....	958
23.5.2.1	8 BIT PORT SUPPORT.....	958
23.5.2.1.1	MOTOROLA 68000.....	958
23.5.2.1.2	INTEL 386.....	959
23.5.3	EIM Operational Modes.....	959
23.5.4	Burst Mode (Synchronous) Memory Operation.....	960
23.5.5	Burst Clock Divisor (BCD).....	960
23.5.6	Burst Clock Start (BCS).....	961
23.5.7	Multiplexed Address/Data Mode Support.....	961
23.5.8	Mixed Master/Memory Burst Modes Support.....	962
23.5.9	AXI (Master) Bus Cycles Support.....	962
23.5.10	WAIT_B Signal, RWSC and WWSC bit fields Usage.....	964
23.5.11	IPS Register Interface.....	965
23.5.12	MRS Set for PSRAM.....	965
23.5.13	EIM Access Termination	965
23.5.14	Error Conditions.....	966
23.5.15	DTACK Mode.....	966
23.5.16	RDY_INT Signal as Interrupt.....	967
23.5.17	RDY_INT Signal as Ready After Reset Indication.....	967
23.5.18	EIM_GRANT / EIM_BUSY Handshake Description.....	967
23.5.19	LPMD / LPACK Handshake Description.....	968
23.5.20	Endianness.....	968
23.5.21	Strobe Signal Use.....	969
23.6	Initialization Information.....	970
23.6.1	Booting from EIM.....	970
23.7	Typical Application.....	970
23.7.1	Access to Intel Sibley Flash.....	971
23.7.1.1	Intel Sibley Flash Asynchronous Mode Configuration.....	971
23.7.1.2	Intel Sibley Flash Synchronous Mode Configuration.....	971

Section number	Title	Page
23.7.1.3	Intel Sibley Flash Utility.....	971
23.7.2	Access to MDOC Device.....	972
23.7.2.1	MDOC Device Boot.....	972
23.7.2.2	MDOC Device Asynchronous Mode Configuration.....	972
23.7.2.3	MDOC Device Utility.....	972
23.7.3	Access to Micron PSRAM	972
23.7.3.1	Micron PSRAM Asynchronous Mode Configuration.....	972
23.7.3.2	Micron PSRAM Synchronous Mode Configuration.....	973
23.7.4	Access to Samsung OneNAND	973
23.7.4.1	Samsung OneNAND Boot.....	973
23.7.4.2	Samsung OneNAND Asynchronous Mode Configuration.....	974
23.7.4.3	Samsung OneNAND Synchronous Mode Configuration.....	974
23.7.4.4	Samsung OneNAND Utility.....	974
23.7.5	Access to Samsung UtRAM	975
23.7.5.1	Samsung UtRAM Asynchronous Mode Configuration.....	975
23.7.5.2	Samsung UtRAM Synchronous Mode Configuration.....	975
23.7.6	Access to Spansion Flash	975
23.7.6.1	Spansion Flash Asynchronous Mode Configuration.....	975
23.7.6.2	Spansion Flash Synchronous Mode Configuration.....	976
23.7.6.3	Spansion Flash Utility.....	976
23.7.7	8 bit support.....	977
23.8	External Bus Timing Diagrams.....	978
23.8.1	Asynchronous Read Memory Accesses Timing Diagram.....	978
23.8.2	Asynchronous Write Memory Accesses Timing Diagram.....	979
23.8.3	Asynchronous Read/Write Memory Accesses Timing Diagram.....	980
23.8.4	Asynchronous Read/Write Using RAL, WAL and CSREC.....	982
23.8.5	Consecutive Asynchronous Write Memory Accesses Timing Diagram.....	983
23.8.6	Consecutive Asynchronous Read Memory Accesses Timing Diagram.....	986
23.8.7	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=0.....	988

Section number	Title	Page
23.8.8	Burst (Synchronous Mode) Read Memory Accesses Timing Diagram - BCD=1.....	989
23.8.9	Burst (Synchronous Mode) Write Memory Access Timing - BCD=1.....	990
23.8.10	Asynchronous Page Mode Access.....	992
23.8.11	DTACK Mode - AXI Single Access.....	992
23.8.12	DTACK Mode - AXI Single Write Access.....	995
23.8.13	DTACK Mode - AXI Burst Access.....	996
23.9	EIM Memory Map/Register Definition.....	997
23.9.1	Chip Select n General Configuration Register 1 (EIM_CSnGCR1).....	1000
23.9.2	Chip Select n General Configuration Register 2 (EIM_CSnGCR2).....	1005
23.9.3	Chip Select n Read Configuration Register 1 (EIM_CSnRCR1).....	1006
23.9.4	Chip Select n Read Configuration Register 2 (EIM_CSnRCR2).....	1009
23.9.5	Chip Select n Write Configuration Register 1 (EIM_CSnWCR1).....	1010
23.9.6	Chip Select n Write Configuration Register 2 (EIM_CSnWCR2).....	1013
23.9.7	EIM Configuration Register (EIM_WCR).....	1014
23.9.8	DLL Control Register (EIM_DCR).....	1016
23.9.9	DLL Status Register (EIM_DSR).....	1017
23.9.10	EIM IP Access Register (EIM_WIAR).....	1018
23.9.11	Error Address Register (EIM_EAR).....	1019

Chapter 24 10/100/1000-Mbps Ethernet MAC (ENET)

24.1	Introduction.....	1021
24.2	Overview.....	1021
24.2.1	Features.....	1022
24.2.1.1	Ethernet MAC features.....	1022
24.2.1.2	IP protocol performance optimization features.....	1023
24.2.1.3	IEEE 1588 features.....	1024
24.2.2	Block diagram.....	1025
24.3	External Signals.....	1025
24.4	Clocks.....	1034

Section number	Title	Page
24.5	Memory map/register definition.....	1035
24.5.1	Interrupt Event Register (ENETx_EIR).....	1047
24.5.2	Interrupt Mask Register (ENETx_EIMR).....	1050
24.5.3	Receive Descriptor Active Register - Ring 0 (ENETx_RDAR).....	1054
24.5.4	Transmit Descriptor Active Register - Ring 0 (ENETx_TDAR).....	1054
24.5.5	Ethernet Control Register (ENETx_ECR).....	1056
24.5.6	MII Management Frame Register (ENETx_MMFR).....	1058
24.5.7	MII Speed Control Register (ENETx_MSCR).....	1059
24.5.8	MIB Control Register (ENETx_MIBC).....	1061
24.5.9	Receive Control Register (ENETx_RCR).....	1062
24.5.10	Transmit Control Register (ENETx_TCR).....	1065
24.5.11	Physical Address Lower Register (ENETx_PALR).....	1067
24.5.12	Physical Address Upper Register (ENETx_PAUR).....	1067
24.5.13	Opcode/Pause Duration Register (ENETx_OPD).....	1068
24.5.14	Transmit Interrupt Coalescing Register (ENETx_TXICn).....	1068
24.5.15	Receive Interrupt Coalescing Register (ENETx_RXICn).....	1069
24.5.16	Descriptor Individual Upper Address Register (ENETx_IAUR).....	1070
24.5.17	Descriptor Individual Lower Address Register (ENETx_IALR).....	1071
24.5.18	Descriptor Group Upper Address Register (ENETx_GAUR).....	1071
24.5.19	Descriptor Group Lower Address Register (ENETx_GALR).....	1072
24.5.20	Transmit FIFO Watermark Register (ENETx_TFWR).....	1072
24.5.21	Receive Descriptor Ring 1 Start Register (ENETx_RDSR1).....	1073
24.5.22	Transmit Buffer Descriptor Ring 1 Start Register (ENETx_TDSR1).....	1074
24.5.23	Maximum Receive Buffer Size Register - Ring 1 (ENETx_MRBR1).....	1075
24.5.24	Receive Descriptor Ring 2 Start Register (ENETx_RDSR2).....	1076
24.5.25	Transmit Buffer Descriptor Ring 2 Start Register (ENETx_TDSR2).....	1076
24.5.26	Maximum Receive Buffer Size Register - Ring 2 (ENETx_MRBR2).....	1077
24.5.27	Receive Descriptor Ring 0 Start Register (ENETx_RDSR).....	1078
24.5.28	Transmit Buffer Descriptor Ring 0 Start Register (ENETx_TDSR).....	1079

Section number	Title	Page
24.5.29	Maximum Receive Buffer Size Register - Ring 0 (ENETx_MRBR).....	1079
24.5.30	Receive FIFO Section Full Threshold (ENETx_RSFL).....	1080
24.5.31	Receive FIFO Section Empty Threshold (ENETx_RSEM).....	1081
24.5.32	Receive FIFO Almost Empty Threshold (ENETx_RAEM).....	1081
24.5.33	Receive FIFO Almost Full Threshold (ENETx_RAFL).....	1082
24.5.34	Transmit FIFO Section Empty Threshold (ENETx_TSEM).....	1082
24.5.35	Transmit FIFO Almost Empty Threshold (ENETx_TAEM).....	1083
24.5.36	Transmit FIFO Almost Full Threshold (ENETx_TAFL).....	1083
24.5.37	Transmit Inter-Packet Gap (ENETx_TIPG).....	1084
24.5.38	Frame Truncation Length (ENETx_FTRL).....	1084
24.5.39	Transmit Accelerator Function Configuration (ENETx_TACC).....	1085
24.5.40	Receive Accelerator Function Configuration (ENETx_RACC).....	1086
24.5.41	Receive Classification Match Register for Class n (ENETx_RCMRn).....	1087
24.5.42	DMA Class Based Configuration (ENETx_DMA n CFG).....	1088
24.5.43	Receive Descriptor Active Register - Ring 1 (ENETx_RDAR1).....	1090
24.5.44	Transmit Descriptor Active Register - Ring 1 (ENETx_TDAR1).....	1091
24.5.45	Receive Descriptor Active Register - Ring 2 (ENETx_RDAR2).....	1092
24.5.46	Transmit Descriptor Active Register - Ring 2 (ENETx_TDAR2).....	1093
24.5.47	QOS Scheme (ENETx_QOS).....	1093
24.5.48	Reserved Statistic Register (ENETx_RMON_T_DROP).....	1095
24.5.49	Tx Packet Count Statistic Register (ENETx_RMON_T_PACKETS).....	1095
24.5.50	Tx Broadcast Packets Statistic Register (ENETx_RMON_T_BC_PKT).....	1096
24.5.51	Tx Multicast Packets Statistic Register (ENETx_RMON_T_MC_PKT).....	1096
24.5.52	Tx Packets with CRC/Align Error Statistic Register (ENETx_RMON_T_CRC_ALIGN).....	1097
24.5.53	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENETx_RMON_T_UNDERSIZE).....	1097
24.5.54	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENETx_RMON_T_OVERSIZE)....	1098
24.5.55	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_T_FRAG).....	1098
24.5.56	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENETx_RMON_T_JAB)...	1099
24.5.57	Tx Collision Count Statistic Register (ENETx_RMON_T_COL).....	1099

Section number	Title	Page
24.5.58	Tx 64-Byte Packets Statistic Register (ENETx_RMON_T_P64).....	1100
24.5.59	Tx 65- to 127-byte Packets Statistic Register (ENETx_RMON_T_P65TO127).....	1100
24.5.60	Tx 128- to 255-byte Packets Statistic Register (ENETx_RMON_T_P128TO255).....	1101
24.5.61	Tx 256- to 511-byte Packets Statistic Register (ENETx_RMON_T_P256TO511).....	1101
24.5.62	Tx 512- to 1023-byte Packets Statistic Register (ENETx_RMON_T_P512TO1023).....	1102
24.5.63	Tx 1024- to 2047-byte Packets Statistic Register (ENETx_RMON_T_P1024TO2047).....	1102
24.5.64	Tx Packets Greater Than 2048 Bytes Statistic Register (ENETx_RMON_T_P_GTE2048).....	1103
24.5.65	Tx Octets Statistic Register (ENETx_RMON_T_OCTETS).....	1103
24.5.66	IEEE_T_DROP Reserved Statistic Register (ENETx_IEEE_T_DROP).....	1103
24.5.67	Frames Transmitted OK Statistic Register (ENETx_IEEE_T_FRAME_OK).....	1104
24.5.68	Frames Transmitted with Single Collision Statistic Register (ENETx_IEEE_T_1COL).....	1104
24.5.69	Frames Transmitted with Multiple Collisions Statistic Register (ENETx_IEEE_T_MCOL).....	1105
24.5.70	Frames Transmitted after Deferral Delay Statistic Register (ENETx_IEEE_T_DEF).....	1105
24.5.71	Frames Transmitted with Late Collision Statistic Register (ENETx_IEEE_T_LCOL).....	1106
24.5.72	Frames Transmitted with Excessive Collisions Statistic Register (ENETx_IEEE_T_EXCOL).....	1106
24.5.73	Frames Transmitted with Tx FIFO Underrun Statistic Register (ENETx_IEEE_T_MACERR).....	1107
24.5.74	Frames Transmitted with Carrier Sense Error Statistic Register (ENETx_IEEE_T_CSERR).....	1107
24.5.75	ENETx_IEEE_T_SQE.....	1107
24.5.76	Flow Control Pause Frames Transmitted Statistic Register (ENETx_IEEE_T_FDXFC).....	1108
24.5.77	Octet Count for Frames Transmitted w/o Error Statistic Register (ENETx_IEEE_T_OCTETS_OK).....	1108
24.5.78	Rx Packet Count Statistic Register (ENETx_RMON_R_PACKETS).....	1109
24.5.79	Rx Broadcast Packets Statistic Register (ENETx_RMON_R_BC_PKT).....	1109
24.5.80	Rx Multicast Packets Statistic Register (ENETx_RMON_R_MC_PKT).....	1110
24.5.81	Rx Packets with CRC/Align Error Statistic Register (ENETx_RMON_R_CRC_ALIGN).....	1110
24.5.82	Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENETx_RMON_R_UNDERSIZE).....	1111
24.5.83	Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENETx_RMON_R_OVERSIZE).....	1111
24.5.84	Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_R_FRAG).....	1112

Section number	Title	Page
24.5.85	Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENETx_RMON_R_JAB).....	1112
24.5.86	Reserved Statistic Register (ENETx_RMON_R_RESVD_0).....	1112
24.5.87	Rx 64-Byte Packets Statistic Register (ENETx_RMON_R_P64).....	1113
24.5.88	Rx 65- to 127-Byte Packets Statistic Register (ENETx_RMON_R_P65TO127).....	1113
24.5.89	Rx 128- to 255-Byte Packets Statistic Register (ENETx_RMON_R_P128TO255).....	1114
24.5.90	Rx 256- to 511-Byte Packets Statistic Register (ENETx_RMON_R_P256TO511).....	1114
24.5.91	Rx 512- to 1023-Byte Packets Statistic Register (ENETx_RMON_R_P512TO1023).....	1115
24.5.92	Rx 1024- to 2047-Byte Packets Statistic Register (ENETx_RMON_R_P1024TO2047).....	1115
24.5.93	Rx Packets Greater than 2048 Bytes Statistic Register (ENETx_RMON_R_P_GTE2048).....	1116
24.5.94	Rx Octets Statistic Register (ENETx_RMON_R_OCTETS).....	1116
24.5.95	Frames not Counted Correctly Statistic Register (ENETx_IEEE_R_DROP).....	1117
24.5.96	Frames Received OK Statistic Register (ENETx_IEEE_R_FRAME_OK).....	1117
24.5.97	Frames Received with CRC Error Statistic Register (ENETx_IEEE_R_CRC).....	1118
24.5.98	Frames Received with Alignment Error Statistic Register (ENETx_IEEE_R_ALIGN).....	1118
24.5.99	Receive FIFO Overflow Count Statistic Register (ENETx_IEEE_R_MACERR).....	1119
24.5.100	Flow Control Pause Frames Received Statistic Register (ENETx_IEEE_R_FDXFC).....	1119
24.5.101	Octet Count for Frames Received without Error Statistic Register (ENETx_IEEE_R_OCTETS_OK)...	1120
24.5.102	Adjustable Timer Control Register (ENETx_ATCR).....	1120
24.5.103	Timer Value Register (ENETx_ATVR).....	1122
24.5.104	Timer Offset Register (ENETx_ATOFF).....	1122
24.5.105	Timer Period Register (ENETx_ATPER).....	1123
24.5.106	Timer Correction Register (ENETx_ATCOR).....	1123
24.5.107	Time-Stamping Clock Period Register (ENETx_ATINC).....	1124
24.5.108	Timestamp of Last Transmitted Frame (ENETx_ATSTMP).....	1124
24.5.109	Timer Global Status Register (ENETx_TGSR).....	1125
24.5.110	Timer Control Status Register (ENETx_TCSR _n).....	1126
24.5.111	Timer Compare Capture Register (ENETx_TCCR _n).....	1127

24.6.8.6.2	Transmit processing.....	1158
24.6.9	Resets and stop controls.....	1158
24.6.9.1	Hardware reset.....	1158
24.6.9.2	Soft reset.....	1158
24.6.9.3	Hardware freeze.....	1159
24.6.9.4	Graceful stop.....	1159
24.6.9.4.1	Graceful transmit stop (GTS).....	1160
24.6.9.4.2	Graceful receive stop (GRS).....	1160
24.6.9.4.3	Graceful stop interrupt (GRA).....	1161
24.6.10	IEEE 1588 functions.....	1161
24.6.10.1	Adjustable timer module.....	1162
24.6.10.1.1	Adjustable timer implementation.....	1162
24.6.10.2	Transmit timestamping.....	1164
24.6.10.3	Receive timestamping.....	1164
24.6.10.4	Time synchronization.....	1164
24.6.10.5	Input Capture and Output Compare.....	1165
24.6.10.5.1	Input capture.....	1165
24.6.10.5.2	Output compare.....	1165
24.6.10.5.3	DMA requests.....	1165
24.6.11	FIFO thresholds.....	1165
24.6.11.1	Receive FIFO.....	1166
24.6.11.2	Transmit FIFO.....	1167
24.6.12	Loopback options.....	1168
24.6.13	Legacy buffer descriptors.....	1169
24.6.13.1	Legacy receive buffer descriptor.....	1169

Section number	Title	Page
	24.6.13.2 Legacy transmit buffer descriptor.....	1170
24.6.14	Enhanced buffer descriptors.....	1170
	24.6.14.1 Enhanced receive buffer descriptor.....	1170
	24.6.14.2 Enhanced transmit buffer descriptor.....	1174
24.6.15	Client FIFO application interface.....	1177
	24.6.15.1 Data structure description.....	1177
	24.6.15.2 Data structure examples.....	1179
	24.6.15.3 Frame status.....	1179
24.6.16	FIFO protection.....	1180
	24.6.16.1 Transmit FIFO underflow.....	1180
	24.6.16.2 Transmit FIFO overflow.....	1181
	24.6.16.3 Receive FIFO overflow.....	1181
24.6.17	PHY management interface.....	1182
	24.6.17.1 MDIO clause 22 frame format.....	1182
	24.6.17.2 MDIO clause 45 frame format.....	1183
	24.6.17.3 MDIO clock generation.....	1184
	24.6.17.4 MDIO operation.....	1185
24.6.18	Ethernet interfaces.....	1185
	24.6.18.1 RMII interface.....	1186
	24.6.18.2 RGMII interface.....	1187
	24.6.18.3 MII Interface — transmit.....	1187
	24.6.18.3.1 Transmit with collision — half-duplex.....	1188
	24.6.18.4 MII interface — receive.....	1189
24.6.19	AVB configuration.....	1190
24.6.20	Interrupt coalescence.....	1191
	24.6.20.1 Interrupt coalescence setup.....	1191
	24.6.20.2 Updating the frame count threshold on-the-fly.....	1192
	24.6.20.3 Updating the timer threshold on-the-fly.....	1192

Chapter 25
Enhanced Periodic Interrupt Timer (EPIT)

25.1	Overview.....	1193
25.1.1	EPIT features.....	1193
25.1.2	EPIT modes and operations.....	1194
25.2	External signals.....	1194
25.3	Clocks.....	1194
25.4	Functional Description.....	1196
25.4.1	Operating modes.....	1196
25.4.1.1	Operating in set-and-forget mode.....	1196
25.4.1.2	Operating in free-running mode.....	1196
25.4.2	Operations.....	1197
25.4.3	Compare Event.....	1197
25.4.3.1	Counter Value Overwrite.....	1198
25.4.3.2	Low-Power Mode Behavior.....	1199
25.4.3.3	Debug Mode Behavior.....	1199
25.5	Initialization/ Application Information.....	1199
25.5.1	Change of Clock Source.....	1199
25.6	EPIT Memory Map/Register Definition.....	1200
25.6.1	Control register (EPITx_CR).....	1200
25.6.2	Status register (EPITx_SR).....	1203
25.6.3	Load register (EPITx_LR).....	1203
25.6.4	Compare register (EPITx_CMPR).....	1204
25.6.5	Counter register (EPITx_CNR).....	1204

Chapter 26
Enhanced Serial Audio Interface (ESAI)

26.1	Overview.....	1205
26.1.1	Features.....	1207

Section number	Title	Page
26.1.2	Modes of Operation.....	1207
26.1.2.1	Normal/Network/On-Demand Mode Selection.....	1207
26.1.2.2	Synchronous/Asynchronous Operating Modes.....	1208
26.1.2.3	Frame Sync Selection.....	1208
26.1.2.4	Shift Direction Selection.....	1209
26.2	External Signals.....	1210
26.2.1	Serial Transmit 0 Data Pin.....	1211
26.2.2	Serial Transmit 1 Data Pin.....	1212
26.2.3	Serial Transmit 2/Receive 3 Data Pin.....	1212
26.2.4	Serial Transmit 3/Receive 2 Data Pin.....	1212
26.2.5	Serial Transmit 4/Receive 1 Data Pin.....	1213
26.2.6	Serial Transmit 5/Receive 0 Data Pin.....	1213
26.2.7	Receiver Serial Clock.....	1214
26.2.8	Transmitter Serial Clock.....	1215
26.2.9	Frame Sync for Receiver.....	1216
26.2.10	Frame Sync for Transmitter.....	1217
26.2.11	High Frequency Clock for Transmitter.....	1217
26.2.12	High Frequency Clock for Receiver.....	1218
26.2.13	Serial I/O Flags.....	1218
26.3	Clocks.....	1219
26.4	Functional Description.....	1220
26.4.1	ESAI After Reset.....	1220
26.4.2	ESAI Interrupt Requests.....	1220
26.4.3	ESAI DMA Requests from the FIFOs.....	1221
26.4.4	ESAI Transmit and Receive Shift Registers.....	1222
26.4.4.1	ESAI Transmit Shift Registers.....	1222
26.4.4.2	ESAI Receive Shift Registers.....	1225
26.5	Initialization Information.....	1225
26.5.1	ESAI Initialization.....	1225

Section number	Title	Page
26.5.2	ESAI Initialization Examples.....	1226
26.5.2.1	Initializing the ESAI using Personal Reset.....	1226
26.5.2.2	Initializing the ESAI Transmitter Section.....	1227
26.5.2.3	Initializing the ESAI Receiver Section.....	1227
26.6	ESAI Memory Map/Register Definition.....	1228
26.6.1	ESAI Transmit Data Register (ESAI_ETDR).....	1229
26.6.2	ESAI Receive Data Register (ESAI_ERDR).....	1230
26.6.3	ESAI Control Register (ESAI_ECR).....	1230
26.6.4	ESAI Status Register (ESAI_ESR).....	1231
26.6.5	Transmit FIFO Configuration Register (ESAI_TFCR).....	1233
26.6.6	Transmit FIFO Status Register (ESAI_TFSR).....	1235
26.6.7	Receive FIFO Configuration Register (ESAI_RFCR).....	1236
26.6.8	Receive FIFO Status Register (ESAI_RFSR).....	1237
26.6.9	Transmit Data Register n (ESAI_TXn).....	1238
26.6.10	ESAI Transmit Slot Register (ESAI_TSR).....	1239
26.6.11	Receive Data Register n (ESAI_RXn).....	1239
26.6.12	Serial Audio Interface Status Register (ESAI_SAISR).....	1240
26.6.13	Serial Audio Interface Control Register (ESAI_SAICR).....	1242
26.6.14	Transmit Control Register (ESAI_TCR).....	1245
26.6.15	Transmit Clock Control Register (ESAI_TCCR).....	1252
26.6.16	Receive Control Register (ESAI_RCR).....	1256
26.6.17	Receive Clock Control Register (ESAI_RCCR).....	1260
26.6.18	Transmit Slot Mask Register A (ESAI_TSMA).....	1263
26.6.19	Transmit Slot Mask Register B (ESAI_TSMB).....	1264
26.6.20	Receive Slot Mask Register A (ESAI_RSMA).....	1265
26.6.21	Receive Slot Mask Register B (ESAI_RSMB).....	1266
26.6.22	Port C Direction Register (ESAI_PPRC).....	1267
26.6.23	Port C Control Register (ESAI_PCRC).....	1267

Section number	Title	Page
Chapter 27		
Flexible Controller Area Network (FLEXCAN)		
27.1	Overview.....	1269
27.1.1	Block Diagram.....	1269
27.1.2	FLEXCAN Module Features.....	1271
27.1.3	Modes of Operation.....	1272
27.2	External Signals.....	1273
27.3	Clocks.....	1274
27.4	Message Buffer Structure.....	1274
27.5	Rx FIFO Structure.....	1278
27.6	Functional Description.....	1282
27.6.1	Functional Overview.....	1282
27.6.2	Transmit Process.....	1282
27.6.3	Arbitration process.....	1283
27.6.3.1	Lowest Mailbox number first.....	1284
27.6.3.2	Highest Mailbox priority first.....	1284
27.6.3.2.1	Local Priority disabled.....	1284
27.6.3.2.2	Local Priority enabled.....	1285
27.6.4	Receive Process.....	1287
27.6.5	Matching Process.....	1288
27.6.6	Move Process.....	1292
27.6.6.1	Move-in.....	1293
27.6.6.2	Move-out.....	1294
27.6.7	Data Coherence.....	1294
27.6.7.1	Transmission Abort Mechanism.....	1294
27.6.7.2	Message Buffer Inactivation.....	1296
27.6.7.3	Message Buffer Lock Mechanism.....	1296
27.6.8	Rx FIFO.....	1298

Section number	Title	Page
27.6.9	CAN Protocol Related Features.....	1299
27.6.9.1	Remote Frames	1299
27.6.9.2	Overload Frames.....	1300
27.6.9.3	Time Stamp.....	1300
27.6.9.4	Protocol Timing.....	1300
27.6.9.5	Arbitration and Matching Timing.....	1303
27.6.10	Modes of Operation Details.....	1305
27.6.10.1	Freeze Mode.....	1305
27.6.10.2	Module Disable Mode.....	1306
27.6.10.3	Stop Mode.....	1307
27.6.11	Interrupts.....	1308
27.7	Initialization/Application Information.....	1309
27.7.1	FLEXCAN Initialization Sequence.....	1309
27.8	FLEXCAN Memory Map/Register Definition.....	1310
27.8.1	Module Configuration Register (FLEXCAN _x _MCR).....	1312
27.8.2	Control 1 Register (FLEXCAN _x _CTRL1).....	1317
27.8.3	Free Running Timer Register (FLEXCAN _x _TIMER).....	1320
27.8.4	Rx Mailboxes Global Mask Register (FLEXCAN _x _RXMGMASK).....	1320
27.8.5	Rx Buffer 14 Mask Register (FLEXCAN _x _RX14MASK).....	1321
27.8.6	Rx Buffer 15 Mask Register (FLEXCAN _x _RX15MASK).....	1322
27.8.7	Error Counter Register (FLEXCAN _x _ECR).....	1323
27.8.8	Error and Status 1 Register (FLEXCAN _x _ESR1).....	1324
27.8.9	Interrupt Masks 2 Register (FLEXCAN _x _IMASK2).....	1328
27.8.10	Interrupt Masks 1 Register (FLEXCAN _x _IMASK1).....	1328
27.8.11	Interrupt Flags 2 Register (FLEXCAN _x _IFLAG2).....	1329
27.8.12	Interrupt Flags 1 Register (FLEXCAN _x _IFLAG1).....	1329
27.8.13	Control 2 Register (FLEXCAN _x _CTRL2).....	1331
27.8.14	Error and Status 2 Register (FLEXCAN _x _ESR2).....	1337
27.8.15	CRC Register (FLEXCAN _x _CRCR).....	1339

Section number	Title	Page
27.8.16	Rx FIFO Global Mask Register (FLEXCAN _x _RXFGMASK).....	1340
27.8.17	Rx FIFO Information Register (FLEXCAN _x _RXFIR).....	1341
27.8.18	Rx Individual Mask Registers (FLEXCAN _x _RXIMR0_RXIMR63).....	1342
27.8.19	Glitch Filter Width Registers (FLEXCAN _x _GFWR).....	1342

Chapter 28 General Interrupt Service (GIS)

28.1	Overview.....	1345
28.2	External Signals.....	1346
28.3	Clocks.....	1346
28.4	Functional Description.....	1347
28.4.1	Double Buffer.....	1347
28.4.2	Bus Interface.....	1348
28.4.3	State Machine.....	1348
28.4.3.1	State Machine: main.....	1348
28.4.4	Sub-tasks and channel assignments.....	1350
28.4.5	Commands supported.....	1350
28.4.6	Backup camera use case.....	1351
28.5	GIS Memory Map/Register Definition.....	1352
28.5.1	GIS Control Register (GIS_CTRL _n).....	1359
28.5.2	GIS Configuration 0 Register (GIS_CONFIG0 _n).....	1361
28.5.3	GIS Configuration 1 Register (GIS_CONFIG1 _n).....	1362
28.5.4	Camera Frame Buffer Address 0 Register (GIS_FB0).....	1363
28.5.5	Camera Frame Buffer Address 1 Register (GIS_FB1).....	1364
28.5.6	PXP Frame Buffer Address 0 Register. (GIS_PXP_FB0).....	1364
28.5.7	PXP Frame Buffer Address 1 Register (GIS_PXP_FB1).....	1364
28.5.8	Control Command Channel 0 Register (GIS_CH0_CTRL _n).....	1365
28.5.9	Channel 0 Command 0 Address Register. (GIS_CH0_ADDR0 _n).....	1368
28.5.10	Channel 0 Command 0 Data Register (GIS_CH0_DATA0).....	1369
28.5.11	Channel 0 Command 1 Address Register. (GIS_CH0_ADDR1 _n).....	1369

Section number	Title	Page
28.5.12	Channel 0 Command 1 Data Register (GIS_CH0_DATA1).....	1370
28.5.13	Channel 0 Command 2 Address Register. (GIS_CH0_ADDR2n).....	1370
28.5.14	Channel 0 Command 2 Data Register (GIS_CH0_DATA2).....	1371
28.5.15	Channel 0 Command 3 Address Register. (GIS_CH0_ADDR3n).....	1372
28.5.16	Channel 0 Command 3 Data Register (GIS_CH0_DATA3).....	1372
28.5.17	Control Command Channel 0 Register (GIS_CH1_CTRLn).....	1373
28.5.18	Channel 0 Command 0 Address Register. (GIS_CH1_ADDR0n).....	1376
28.5.19	Channel 0 Command 0 Data Register (GIS_CH1_DATA0).....	1377
28.5.20	Channel 0 Command 1 Address Register. (GIS_CH1_ADDR1n).....	1377
28.5.21	Channel 0 Command 1 Data Register (GIS_CH1_DATA1).....	1378
28.5.22	Channel 0 Command 2 Address Register. (GIS_CH1_ADDR2n).....	1379
28.5.23	Channel 0 Command 2 Data Register (GIS_CH1_DATA2).....	1379
28.5.24	Channel 0 Command 3 Address Register. (GIS_CH1_ADDR3n).....	1380
28.5.25	Channel 0 Command 3 Data Register (GIS_CH1_DATA3).....	1381
28.5.26	Control Command Channel 0 Register (GIS_CH2_CTRLn).....	1381
28.5.27	Channel 0 Command 0 Address Register. (GIS_CH2_ADDR0n).....	1384
28.5.28	Channel 0 Command 0 Data Register (GIS_CH2_DATA0).....	1385
28.5.29	Channel 0 Command 1 Address Register. (GIS_CH2_ADDR1n).....	1386
28.5.30	Channel 0 Command 1 Data Register (GIS_CH2_DATA1).....	1386
28.5.31	Channel 0 Command 2 Address Register. (GIS_CH2_ADDR2n).....	1387
28.5.32	Channel 0 Command 2 Data Register (GIS_CH2_DATA2).....	1388
28.5.33	Channel 0 Command 3 Address Register. (GIS_CH2_ADDR3n).....	1388
28.5.34	Channel 0 Command 3 Data Register (GIS_CH2_DATA3).....	1389
28.5.35	Control Command Channel 0 Register (GIS_CH3_CTRLn).....	1389
28.5.36	Channel 0 Command 0 Address Register. (GIS_CH3_ADDR0n).....	1393
28.5.37	Channel 0 Command 0 Data Register (GIS_CH3_DATA0).....	1393
28.5.38	Channel 0 Command 1 Address Register. (GIS_CH3_ADDR1n).....	1394
28.5.39	Channel 0 Command 1 Data Register (GIS_CH3_DATA1).....	1395
28.5.40	Channel 0 Command 2 Address Register. (GIS_CH3_ADDR2n).....	1395

Section number	Title	Page
28.5.41	Channel 0 Command 2 Data Register (GIS_CH3_DATA2).....	1396
28.5.42	Channel 0 Command 3 Address Register. (GIS_CH3_ADDR3n).....	1396
28.5.43	Channel 0 Command 3 Data Register (GIS_CH3_DATA3).....	1397
28.5.44	Control Command Channel 0 Register (GIS_CH4_CTRLn).....	1398
28.5.45	Channel 0 Command 0 Address Register. (GIS_CH4_ADDR0n).....	1401
28.5.46	Channel 0 Command 0 Data Register (GIS_CH4_DATA0).....	1402
28.5.47	Channel 0 Command 1 Address Register. (GIS_CH4_ADDR1n).....	1402
28.5.48	Channel 0 Command 1 Data Register (GIS_CH4_DATA1).....	1403
28.5.49	Channel 0 Command 2 Address Register. (GIS_CH4_ADDR2n).....	1403
28.5.50	Channel 0 Command 2 Data Register (GIS_CH4_DATA2).....	1404
28.5.51	Channel 0 Command 3 Address Register. (GIS_CH4_ADDR3n).....	1405
28.5.52	Channel 0 Command 3 Data Register (GIS_CH4_DATA3).....	1405
28.5.53	Control Command Channel 0 Register (GIS_CH5_CTRLn).....	1406
28.5.54	Channel 0 Command 0 Address Register. (GIS_CH5_ADDR0n).....	1409
28.5.55	Channel 0 Command 0 Data Register (GIS_CH5_DATA0).....	1410
28.5.56	Channel 0 Command 1 Address Register. (GIS_CH5_ADDR1n).....	1410
28.5.57	Channel 0 Command 1 Data Register (GIS_CH5_DATA1).....	1411
28.5.58	Channel 0 Command 2 Address Register. (GIS_CH5_ADDR2n).....	1412
28.5.59	Channel 0 Command 2 Data Register (GIS_CH5_DATA2).....	1412
28.5.60	Channel 0 Command 3 Address Register. (GIS_CH5_ADDR3n).....	1413
28.5.61	Channel 0 Command 3 Data Register (GIS_CH5_DATA3).....	1414
28.5.62	Debug 0 Register (GIS_DEBUG0).....	1414
28.5.63	Debug 1 Register (GIS_DEBUG1).....	1415
28.5.64	Version Register (GIS_VERSION).....	1416

Chapter 29 General Power Controller (GPC)

29.1	Overview.....	1417
29.2	Clocks.....	1417

Section number	Title	Page
29.3	DVFS overview.....	1417
29.3.1	Features.....	1418
29.4	DVFS output event/interrupt configuration.....	1418
29.4.1	Interrupts.....	1418
29.4.2	DVFS Change Request Sequence Diagrams.....	1419
29.5	Power Gating Control (PGC).....	1420
29.5.1	Overview.....	1421
29.5.1.1	Features.....	1422
29.6	GPC Interrupt Controller (INTC).....	1422
29.6.1	Interrupt Controller features.....	1422
29.7	GPC Memory Map/Register Definition.....	1423
29.7.1	GPC Interface control register (GPC_CNTR).....	1423
29.7.2	GPC Power Gating Register (GPC_PGR).....	1426
29.7.3	IRQ masking register 1 (GPC_IMR1).....	1427
29.7.4	IRQ masking register 2 (GPC_IMR2).....	1427
29.7.5	IRQ masking register 3 (GPC_IMR3).....	1428
29.7.6	IRQ masking register 4 (GPC_IMR4).....	1428
29.7.7	IRQ status resister 1 (GPC_ISR1).....	1429
29.7.8	IRQ status resister 2 (GPC_ISR2).....	1429
29.7.9	IRQ status resister 3 (GPC_ISR3).....	1430
29.7.10	IRQ status resister 4 (GPC_ISR4).....	1430
29.7.11	A9 Low Power Status Register (GPC_A9_LPSR).....	1431
29.7.12	M4 Low Power Status Register (GPC_M4_LPSR).....	1434
29.7.13	GPC Debug Register (GPC_DR).....	1437
29.8	PGC Memory Map/Register Definition.....	1440
29.8.1	PGC Control Register (PGCx_PCIE_PHY_CTRL).....	1442
29.8.2	Power Up Sequence Control Register (PGCx_PCIE_PHY_PUPSCR).....	1443
29.8.3	Pull Down Sequence Control Register (PGCx_PCIE_PHY_PDNSCR).....	1444
29.8.4	Power Gating Controller Status Register (PGCx_PCIE_PHY_SR).....	1444

Section number	Title	Page
29.8.5	PGC Control Register (PGCx_MEGA_CTRL).....	1445
29.8.6	Power Up Sequence Control Register (PGCx_MEGA_PUPSCR).....	1446
29.8.7	Pull Down Sequence Control Register (PGCx_MEGA_PDNSCR).....	1446
29.8.8	Power Gating Controller Status Register (PGCx_MEGA_SR).....	1447
29.8.9	PGC Control Register (PGCx_DISPLAY_CTRL).....	1448
29.8.10	Power Up Sequence Control Register (PGCx_DISPLAY_PUPSCR).....	1448
29.8.11	Pull Down Sequence Control Register (PGCx_DISPLAY_PDNSCR).....	1449
29.8.12	Power Gating Controller Status Register (PGCx_DISPLAY_SR).....	1450
29.8.13	PGC Control Register (PGCx_GPU_CTRL).....	1450
29.8.14	Power Up Sequence Control Register (PGCx_GPU_PUPSCR).....	1451
29.8.15	Pull Down Sequence Control Register (PGCx_GPU_PDNSCR).....	1452
29.8.16	Power Gating Controller Status Register (PGCx_GPU_SR).....	1452
29.8.17	PGC Control Register (PGCx_CPU_CTRL).....	1453
29.8.18	Power Up Sequence Control Register (PGCx_CPU_PUPSCR).....	1454
29.8.19	Pull Down Sequence Control Register (PGCx_CPU_PDNSCR).....	1454
29.8.20	Power Gating Controller Status Register (PGCx_CPU_SR).....	1455
29.9	DVFS Memory Map/Register Definition.....	1455
29.9.1	DVFS Thresholds (DVFS_THRS).....	1456
29.9.2	DVFS Counters thresholds (DVFS_COUN).....	1457
29.9.3	DVFS general purpose bits weight (DVFS_SIG1).....	1457
29.9.4	DVFS general purpose bits weight (DVFS_DVFSIG0).....	1458
29.9.5	DVFS general purpose bit 0 weight counter (DVFS_DVFSGPC0).....	1459
29.9.6	DVFS general purpose bit 1 weight counter (DVFS_DVFSGPC1).....	1460
29.9.7	DVFS general purpose bits enables (DVFS_DVFSGPBT).....	1461
29.9.8	DVFS EMAC settings (DVFS_DVFSSEMAC).....	1463
29.9.9	DVFS Control (DVFS_CNTR).....	1464
29.9.10	DVFS Load Tracking Register 0, portion 0 (DVFS_DVFSLTR0_0).....	1467

29.9.17	DVFS pattern 3 length (DVFSC_DVFSPT3).....	1472

Chapter 30 General Purpose Input/Output (GPIO)

30.1	Overview.....	1473
30.1.1	Block Diagram.....	1475
30.1.2	Features.....	1476
30.2	External Signals.....	1477
30.3	Clocks.....	1481
30.4	GPIO Functional Description.....	1481
30.4.1	GPIO Function.....	1481
30.4.2	GPIO pad structure.....	1482
30.4.2.1	Input Driver.....	1482
30.4.2.1.1	Schmitt trigger.....	1483
30.4.2.1.2	Input keeper.....	1483
30.4.2.2	Output Driver.....	1484
30.4.2.2.1	Drive strength.....	1484
30.4.2.2.2	Output keeper.....	1485
30.4.2.2.3	PU / PD / Keeper Logic.....	1485
30.4.2.2.4	Open drain.....	1485
30.4.2.3	Operating Frequency.....	1486
30.4.3	GPIO Programming.....	1488
30.4.3.1	GPIO Read Mode.....	1488
30.4.3.2	GPIO Write Mode.....	1488
30.4.4	Interrupt Control Unit.....	1489

Section number	Title	Page
30.5	GPIO Memory Map/Register Definition.....	1489
30.5.1	GPIO data register (GPIOx_DR).....	1491
30.5.2	GPIO direction register (GPIOx_GDIR).....	1492
30.5.3	GPIO pad status register (GPIOx_PSR).....	1493
30.5.4	GPIO interrupt configuration register1 (GPIOx_ICR1).....	1493
30.5.5	GPIO interrupt configuration register2 (GPIOx_ICR2).....	1497
30.5.6	GPIO interrupt mask register (GPIOx_IMR).....	1500
30.5.7	GPIO interrupt status register (GPIOx_ISR).....	1501
30.5.8	GPIO edge select register (GPIOx_EDGE_SEL).....	1502

Chapter 31 General Purpose Media Interface (GPMI)

31.1	Overview.....	1503
31.2	External Signals.....	1504
31.3	Clocks.....	1505
31.4	GPMI NAND Mode.....	1506
31.4.1	Multiple NAND Support.....	1506
31.4.2	GPMI NAND Timing and Clocking.....	1507
31.4.3	Basic NAND Timing.....	1507
31.4.3.1	NAND Asynchronous Timing.....	1507
31.4.3.2	NAND Asynchronous EDO Mode Timing.....	1509
31.4.3.3	NAND ONFI Source Synchronous Mode Timing.....	1512
31.4.3.4	NAND Toggle Mode Timing.....	1517
31.4.4	Hardware BCH Interface.....	1525
31.5	Behavior During Reset.....	1526
31.6	GPMI Memory Map/Register Definition.....	1526
31.6.1	GPMI Control Register 0 Description (GPMI_CTRL0n).....	1529
31.6.2	GPMI Compare Register Description (GPMI_COMPARE).....	1531
31.6.3	GPMI Integrated ECC Control Register Description (GPMI_ECCCTRLn).....	1532
31.6.4	GPMI Integrated ECC Transfer Count Register Description (GPMI_ECCCOUNT).....	1533

Section number	Title	Page
31.6.5	GPMI Payload Address Register Description (GPMI_PAYLOAD).....	1533
31.6.6	GPMI Auxiliary Address Register Description (GPMI_AUXILIARY).....	1534
31.6.7	GPMI Control Register 1 Description (GPMI_CTRL1n).....	1535
31.6.8	GPMI Timing Register 0 Description (GPMI_TIMING0).....	1537
31.6.9	GPMI Timing Register 1 Description (GPMI_TIMING1).....	1538
31.6.10	GPMI Timing Register 2 Description (GPMI_TIMING2).....	1539
31.6.11	GPMI DMA Data Transfer Register Description (GPMI_DATA).....	1540
31.6.12	GPMI Status Register Description (GPMI_STAT).....	1540
31.6.13	GPMI Debug Information Register Description (GPMI_DEBUG).....	1543
31.6.14	GPMI Version Register Description (GPMI_VERSION).....	1543
31.6.15	GPMI Debug2 Information Register Description (GPMI_DEBUG2).....	1544
31.6.16	GPMI Debug3 Information Register Description (GPMI_DEBUG3).....	1547
31.6.17	GPMI Double Rate Read DLL Control Register Description (GPMI_READ_DDR_DLL_CTRL).....	1547
31.6.18	GPMI Double Rate Write DLL Control Register Description (GPMI_WRITE_DDR_DLL_CTRL).....	1549
31.6.19	GPMI Double Rate Read DLL Status Register Description (GPMI_READ_DDR_DLL_STS).....	1551
31.6.20	GPMI Double Rate Write DLL Status Register Description (GPMI_WRITE_DDR_DLL_STS).....	1552

Chapter 32 General Purpose Timer (GPT)

32.1	Overview.....	1555
32.1.1	Features.....	1557
32.1.2	Modes and Operation.....	1557
32.2	External Signals.....	1557
32.2.1	External Clock Input	1558
32.2.2	Input Capture Trigger Signals	1558
32.2.3	Output Compare Signals.....	1559
32.3	Clocks.....	1559
32.4	Functional Description.....	1561
32.4.1	Operating Modes.....	1561
32.4.1.1	Restart Mode.....	1561

Section number	Title	Page
32.4.1.2	Free-Run Mode.....	1561
32.4.2	Operation.....	1562
32.4.2.1	Input Capture.....	1562
32.4.2.2	Output Compare.....	1563
32.4.2.3	Interrupts.....	1564
32.4.2.4	Low Power Mode Behavior.....	1565
32.4.2.5	Debug Mode Behavior.....	1565
32.5	Initialization/ Application Information	1565
32.5.1	Selecting the Clock Source	1565
32.6	GPT Memory Map/Register Definition.....	1566
32.6.1	GPT Control Register (GPT_CR).....	1567
32.6.2	GPT Prescaler Register (GPT_PR).....	1571
32.6.3	GPT Status Register (GPT_SR).....	1572
32.6.4	GPT Interrupt Register (GPT_IR).....	1573
32.6.5	GPT Output Compare Register 1 (GPT_OCR1).....	1574
32.6.6	GPT Output Compare Register 2 (GPT_OCR2).....	1575
32.6.7	GPT Output Compare Register 3 (GPT_OCR3).....	1575
32.6.8	GPT Input Capture Register 1 (GPT_ICR1).....	1576
32.6.9	GPT Input Capture Register 2 (GPT_ICR2).....	1576
32.6.10	GPT Counter Register (GPT_CNT).....	1577

Chapter 33 Graphics Processing Unit (GPU)

33.1	Overview.....	1579
33.1.1	Block Diagram.....	1579
33.2	Clocks.....	1580
33.3	GPU 2D Features.....	1581
33.4	GPU 3D Features.....	1582
33.4.1	Unified vertex-fragment shader.....	1583
33.4.2	Vertex processing.....	1583

Section number	Title	Page
33.4.3	Primitive processing.....	1584
33.4.4	Texture processing.....	1584
33.4.5	Rasterization.....	1585
33.4.6	Fragment Processing.....	1585
33.4.7	Dest/Alpha Blending.....	1586
33.4.8	Z/Stencil Buffer.....	1587
33.4.9	Render Target.....	1587
33.5	Usage Mode.....	1587

Chapter 34 I2C Controller (I2C)

34.1	Overview.....	1589
34.1.1	Features.....	1591
34.1.2	Modes and operations.....	1592
34.2	External Signals.....	1592
34.3	Clocks.....	1593
34.4	Functional description.....	1593
34.4.1	I2C system configuration.....	1594
34.4.2	Arbitration procedure.....	1594
34.4.3	Clock synchronization.....	1594
34.4.4	Handshaking.....	1595
34.4.5	Clock stretching.....	1595
34.4.6	Peripheral bus accesses.....	1596
34.4.7	Generation of transfer error on IP bus.....	1596
34.4.8	Reset.....	1596
34.4.9	Interrupts.....	1596
34.4.10	Byte order.....	1596
34.5	Initialization.....	1597
34.5.1	Initialization sequence.....	1597
34.5.2	Generation of Start.....	1597

Section number	Title	Page
34.5.3	Post-transfer software response.....	1597
34.5.4	Generation of Stop.....	1598
34.5.5	Generation of Repeated Start.....	1598
34.5.6	Slave mode.....	1599
34.5.7	Arbitration lost.....	1599
34.6	Software restriction.....	1605
34.7	I2C Memory Map/Register Definition.....	1606
34.7.1	I2C Address Register (I2Cx_IADR).....	1607
34.7.2	I2C Frequency Divider Register (I2Cx_IFDR).....	1607
34.7.3	I2C Control Register (I2Cx_I2CR).....	1609
34.7.4	I2C Status Register (I2Cx_I2SR).....	1610
34.7.5	I2C Data I/O Register (I2Cx_I2DR).....	1612

Chapter 35 IOMUX Controller (IOMUXC)

35.1	Overview.....	1613
35.1.1	Features.....	1614
35.2	Clocks.....	1615
35.3	Functional description.....	1615
35.3.1	ALT6 and ALT7 extended muxing modes.....	1616
35.3.2	SW Loopback through SION bit.....	1617
35.3.3	Daisy chain - multi pads driving same module input pin.....	1617
35.4	IOMUXC GPR Memory Map/Register Definition.....	1618
35.4.1	GPR0 General Purpose Register (IOMUXC_GPR_GPR0).....	1620
35.4.2	GPR1 General Purpose Register (IOMUXC_GPR_GPR1).....	1623
35.4.3	GPR2 General Purpose Register (IOMUXC_GPR_GPR2).....	1626
35.4.4	GPR3 General Purpose Register (IOMUXC_GPR_GPR3).....	1629
35.4.5	GPR4 General Purpose Register (IOMUXC_GPR_GPR4).....	1634
35.4.6	GPR5 General Purpose Register (IOMUXC_GPR_GPR5).....	1637
35.4.7	GPR6 General Purpose Register (IOMUXC_GPR_GPR6).....	1640

Section number	Title	Page
35.4.8	GPR7 General Purpose Register (IOMUXC_GPR_GPR7).....	1642
35.4.9	GPR8 General Purpose Register (IOMUXC_GPR_GPR8).....	1644
35.4.10	GPR9 General Purpose Register (IOMUXC_GPR_GPR9).....	1645
35.4.11	GPR10 General Purpose Register (IOMUXC_GPR_GPR10).....	1646
35.4.12	GPR11 General Purpose Register (IOMUXC_GPR_GPR11).....	1647
35.4.13	GPR12 General Purpose Register (IOMUXC_GPR_GPR12).....	1649
35.4.14	GPR13 General Purpose Register (IOMUXC_GPR_GPR13).....	1651
35.5	IOMUXC Memory Map/Register Definition.....	1653
35.5.1	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO00).....	1679
35.5.2	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO01).....	1680
35.5.3	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO02).....	1681
35.5.4	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO03).....	1682
35.5.5	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO04).....	1683
35.5.6	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO05).....	1684
35.5.7	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO06).....	1685
35.5.8	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO07).....	1686
35.5.9	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO08).....	1687
35.5.10	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO09).....	1688
35.5.11	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO10).....	1689
35.5.12	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO11).....	1690
35.5.13	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO12).....	1691
35.5.14	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO13).....	1692
35.5.15	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA00).....	1693
35.5.16	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA01).....	1694
35.5.17	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA02).....	1695
35.5.18	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA03).....	1696
35.5.19	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA04).....	1697
35.5.20	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA05).....	1698
35.5.21	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA06).....	1699

Section number	Title	Page
35.5.22	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_DATA07).....	1700
35.5.23	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_HSYNC).....	1701
35.5.24	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_MCLK).....	1702
35.5.25	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_PIXCLK).....	1703
35.5.26	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_CSI_VSYNC).....	1704
35.5.27	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_COL).....	1705
35.5.28	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_CRS).....	1706
35.5.29	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_MDC).....	1707
35.5.30	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_MDIO).....	1708
35.5.31	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_RX_CLK).....	1709
35.5.32	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET1_TX_CLK).....	1710
35.5.33	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_COL).....	1711
35.5.34	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_CRS).....	1712
35.5.35	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_RX_CLK).....	1713
35.5.36	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_ENET2_TX_CLK).....	1714
35.5.37	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL0).....	1715
35.5.38	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL1).....	1716
35.5.39	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL2).....	1717
35.5.40	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL3).....	1718
35.5.41	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_COL4).....	1719
35.5.42	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW0).....	1720
35.5.43	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW1).....	1721
35.5.44	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW2).....	1722
35.5.45	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW3).....	1723
35.5.46	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_KEY_ROW4).....	1724
35.5.47	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_CLK).....	1725
35.5.48	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA00).....	1726
35.5.49	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA01).....	1727
35.5.50	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA02).....	1728

Section number	Title	Page
35.5.51	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA03).....	1729
35.5.52	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA04).....	1730
35.5.53	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA05).....	1731
35.5.54	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA06).....	1732
35.5.55	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA07).....	1733
35.5.56	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA08).....	1734
35.5.57	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA09).....	1735
35.5.58	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA10).....	1736
35.5.59	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA11).....	1737
35.5.60	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA12).....	1738
35.5.61	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA13).....	1739
35.5.62	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA14).....	1740
35.5.63	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA15).....	1741
35.5.64	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA16).....	1742
35.5.65	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA17).....	1743
35.5.66	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA18).....	1744
35.5.67	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA19).....	1745
35.5.68	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA20).....	1746
35.5.69	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA21).....	1747
35.5.70	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA22).....	1748
35.5.71	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA23).....	1749
35.5.72	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_ENABLE).....	1750
35.5.73	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_HSYNC).....	1751
35.5.74	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_RESET).....	1752
35.5.75	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_LCD1_VSYNC).....	1753
35.5.76	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_ALE).....	1754
35.5.77	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CE0_B).....	1755
35.5.78	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CE1_B).....	1756
35.5.79	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_CLE).....	1757

Section number	Title	Page
35.5.80	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA00).....	1758
35.5.81	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA01).....	1759
35.5.82	Pad Mux Register (IOMUXC_SW_MUX_CTL_PAD_NAND_DATA02).....	1760

Chapter 36 Keypad Port (KPP)

36.1	Overview	2377
36.1.1	Features.....	2379
36.1.2	Modes and Operations.....	2379
36.2	Clocks.....	2379

Section number	Title	Page
36.3	External Signals.....	2379
36.3.1	Input Pins.....	2380
36.3.2	Output Pins.....	2381
36.3.3	Generation of Transfer Error Signal on Peripheral Bus.....	2381
36.4	Functional Description.....	2381
36.4.1	Keypad Matrix Construction.....	2382
36.4.2	Keypad Port Configuration.....	2382
36.4.3	Keypad Matrix Scanning.....	2382
36.4.4	Keypad Standby.....	2383
36.4.5	Glitch Suppression on Keypad Inputs.....	2383
36.4.6	Multiple Key Closures.....	2385
36.4.6.1	Ghost Key Problem and Correction.....	2387
36.4.7	3-Point Contact Keys Support.....	2389
36.5	Initialization/Application Information.....	2390
36.5.1	Typical Keypad Configuration and Scanning Sequence.....	2391
36.5.2	Key Press Interrupt Scanning Sequence.....	2391
36.5.3	Additional Comments.....	2391
36.6	KPP Memory Map/Register Definition.....	2392
36.6.1	Keypad Control Register (KPP_KPCR).....	2392
36.6.2	Keypad Status Register (KPP_KPSR).....	2393
36.6.3	Keypad Data Direction Register (KPP_KDDR).....	2395
36.6.4	Keypad Data Register (KPP_KPDR).....	2395

Chapter 37

Enhanced LCD Interface (eLCDIF)

37.1	Overview.....	2397
37.2	External Signals.....	2397
37.3	Clocks.....	2399

Section number	Title	Page
37.4	Functional Description.....	2400
37.4.1	Bus Interface Mechanisms.....	2401
37.4.1.1	Bus Master Operation in Write/Display Modes.....	2402
37.4.1.2	System Bus Master Performance.....	2402
37.4.2	Write Data Path.....	2403
37.4.3	Read Data Path.....	2409
37.4.4	eLCDIF Interrupts.....	2414
37.4.5	Initializing the eLCDIF.....	2414
37.4.5.1	Write Modes.....	2414
37.4.5.2	MPU Read Mode.....	2415
37.4.6	MPU Interface.....	2416
37.4.6.1	Code Example to Initialize the eLCDIF in MPU Write Mode.....	2418
37.4.7	VSYNC Interface.....	2418
37.4.7.1	Code Example to Initialize eLCDIF in VSYNC Mode.....	2419
37.4.8	DOTCLK Interface.....	2420
37.4.8.1	Code Example.....	2422
37.4.9	CSI HANDSHAKE INTERFACE.....	2422
37.4.10	Alpha Blending Interface.....	2423
37.4.11	ITU-R BT.656 Digital Video Interface (DVI).....	2423
37.4.12	eLCDIF Pin Usage by Interface Mode.....	2425
37.5	Behavior During Reset.....	2428
37.6	ELCDIF Memory Map/Register Definition.....	2428
37.6.1	eLCDIF General Control Register (LCDIFx_RLn).....	2433
37.6.2	eLCDIF General Control1 Register (LCDIFx_CTRL1n).....	2436
37.6.3	eLCDIF General Control2 Register (LCDIFx_CTRL2n).....	2438
37.6.4	eLCDIF Horizontal and Vertical Valid Data Count Register (LCDIFx_TRANSFER_COUNT).....	2441
37.6.5	LCD Interface Current Buffer Address Register (LCDIFx_CUR_BUF).....	2441
37.6.6	LCD Interface Next Buffer Address Register (LCDIFx_NEXT_BUF).....	2442
37.6.7	LCD Interface Timing Register (LCDIFx_TIMING).....	2442

Section number	Title	Page
37.6.8	eLCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIFx_VDCTRL0n).....	2443
37.6.9	eLCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIFx_VDCTRL1).....	2444
37.6.10	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIFx_VDCTRL2).....	2445
37.6.11	eLCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIFx_VDCTRL3).....	2445
37.6.12	eLCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIFx_VDCTRL4).....	2446
37.6.13	Digital Video Interface Control0 Register (LCDIFx_DVICTRL0).....	2447
37.6.14	Digital Video Interface Control1 Register (LCDIFx_DVICTRL1).....	2448
37.6.15	Digital Video Interface Control2 Register (LCDIFx_DVICTRL2).....	2449
37.6.16	Digital Video Interface Control3 Register (LCDIFx_DVICTRL3).....	2450
37.6.17	Digital Video Interface Control4 Register (LCDIFx_DVICTRL4).....	2451
37.6.18	RGB to YCbCr 4:2:2 CSC Coefficient0 Register (LCDIFx_CSC_COEFF0).....	2452
37.6.19	RGB to YCbCr 4:2:2 CSC Coefficient1 Register (LCDIFx_CSC_COEFF1).....	2453
37.6.20	RGB to YCbCr 4:2:2 CSC Coefficient2 Register (LCDIFx_CSC_COEFF2).....	2453
37.6.21	RGB to YCbCr 4:2:2 CSC Coefficient3 Register (LCDIFx_CSC_COEFF3).....	2454
37.6.22	RGB to YCbCr 4:2:2 CSC Coefficient4 Register (LCDIFx_CSC_COEFF4).....	2455
37.6.23	RGB to YCbCr 4:2:2 CSC Offset Register (LCDIFx_CSC_OFFSET).....	2456
37.6.24	RGB to YCbCr 4:2:2 CSC Limit Register (LCDIFx_CSC_LIMIT).....	2456
37.6.25	LCD Interface Data Register (LCDIFx_DATA).....	2457
37.6.26	Bus Master Error Status Register (LCDIFx_BM_ERROR_STAT).....	2458
37.6.27	CRC Status Register (LCDIFx_CRC_STAT).....	2458
37.6.28	LCD Interface Status Register (LCDIFx_STAT).....	2459
37.6.29	LCD Interface Version Register (LCDIFx_VERSION).....	2461
37.6.30	LCD Interface Debug0 Register (LCDIFx_DEBUG0).....	2461
37.6.31	LCD Interface Debug1 Register (LCDIFx_DEBUG1).....	2464
37.6.32	LCD Interface Debug2 Register (LCDIFx_DEBUG2).....	2465
37.6.33	eLCDIF Threshold Register (LCDIFx_THRES).....	2465
37.6.34	eLCDIF AS Buffer Control Register (LCDIFx_AS_CTRL).....	2467
37.6.35	Alpha Surface Buffer Pointer (LCDIFx_AS_BUF).....	2469
37.6.36	LCDIFx_AS_NEXT_BUF.....	2470

Section number	Title	Page
37.6.37	eLCDIF Overlay Color Key Low (LCDIFx_AS_CLRKEYLOW).....	2470
37.6.38	eLCDIF Overlay Color Key High (LCDIFx_AS_CLRKEYHIGH).....	2471
37.6.39	LCD working insync mode with CSI for VSYNC delay (LCDIFx_SYNC_DELAY).....	2471
37.6.40	eLCDIF Interface Debug3 Register (LCDIFx_DEBUG3).....	2472
37.6.41	LCD Interface Debug4 (LCDIFx_DEBUG4).....	2473
37.6.42	LCD Interface Debug5 (LCDIFx_DEBUG5).....	2474

Chapter 38 LVDS Display Bridge (LDB)

38.1	Overview.....	2475
38.1.1	Relevant Standards.....	2477
38.2	External Signals.....	2477
38.3	Clocks.....	2478
38.4	Input and Output Ports.....	2478
38.4.1	Input Parallel Display Ports.....	2478
38.4.2	Output LVDS Ports.....	2479
38.5	Processing.....	2479
38.5.1	Bit Mapping.....	2479
38.6	LDB Memory Map/Register Definition.....	2480
38.6.1	LDB Control Register (LDB_CTRL).....	2481

Chapter 39 MediaLB (MLB)

39.1	Overview.....	2483
39.1.1	Block Diagram.....	2483
39.1.1.1	Bus Interfaces.....	2484
39.2	External Signals.....	2485
39.3	Clocks.....	2485
39.4	Functional Description.....	2485
39.4.1	MediaLB Block.....	2486
39.4.1.1	MediaLB Channel Address to Logical Channel Mapping.....	2486

Section number	Title	Page
39.4.2	Host Bus Interface Block.....	2487
39.4.2.1	HBI Physical Addresses.....	2487
39.4.3	Routing Fabric Block.....	2488
39.4.3.1	Data Buffer RAM.....	2488
39.4.3.1.1	Synchronous Channels.....	2488
39.4.3.1.2	Isochronous Channels.....	2488
39.4.3.1.3	Asynchronous and Control Channels.....	2489
39.4.3.2	Channel Table RAM.....	2489
39.4.3.2.1	Address Mapping.....	2489
39.4.3.2.2	Channel Allocation Table.....	2490
39.4.3.2.2.1	Channel Setup.....	2491
39.4.3.2.3	Channel Descriptor Table.....	2492
39.4.3.2.3.1	Synchronous Channel Operation.....	2492
39.4.3.2.3.2	Synchronous Channel Descriptors.....	2493
39.4.3.2.3.3	Isochronous Channel Descriptors.....	2494
39.4.3.2.3.4	Asynchronous and Control Channel Descriptors.....	2495
39.4.4	Memory Interface Block.....	2497
39.4.4.1	CTR Access.....	2498
39.4.4.1.1	Direct CTR Writes.....	2498
39.4.4.1.2	Direct CTR Reads.....	2498
39.4.4.1.3	CTR Addressing.....	2499
39.4.4.2	DBR Access.....	2499
39.4.4.2.1	Direct DBR Writes.....	2500
39.4.4.2.2	Direct DBR Reads.....	2500
39.4.5	Interrupt Interface Block.....	2501
39.4.6	AMBA AHB Block.....	2501
39.4.6.1	AHB Descriptor Table.....	2501
39.4.6.2	AHB Synchronous Channel Descriptors.....	2503
39.4.6.3	AHB Isochronous Channel Descriptors.....	2504

Section number	Title	Page
39.4.6.4	AHB Asynchronous and Control Channel Descriptors.....	2504
39.4.6.4.1	Single-packet Mode.....	2505
39.4.6.4.2	Multiple-packet Mode.....	2506
39.5	Software Flow.....	2508
39.5.1	Channel Initialization.....	2508
39.5.1.1	Configure the Hardware.....	2508
39.5.1.2	Program the Routing Fabric Block.....	2509
39.5.1.3	Program the AMBA AHB Block DMAs.....	2510
39.5.1.4	Synchronize and Unmute Synchronous Channel.....	2511
39.5.2	Channel Servicing.....	2511
39.5.2.1	Servicing the AMBA AHB Block (DMA) Interrupts.....	2512
39.5.2.2	Servicing the MediaLB Interrupts.....	2512
39.5.2.3	Polling for MediaLB System Commands.....	2513
39.5.3	Low Power Mode.....	2513
39.6	MLB50 Memory Map/Register Definition.....	2513
39.6.1	MediaLB Control 0 Register (MLB_MLBC0).....	2516
39.6.2	MediaLB Channel Status 0 Register (MLB_MS0).....	2518
39.6.3	MediaLB 6-pin Control 2 Register (MLB_MLBC2).....	2519
39.6.4	MediaLB Channel Status1 Register (MLB_MS1).....	2520
39.6.5	MediaLB System Status Register (MLB_MSS).....	2521
39.6.6	MediaLB System Data Register (MLB_MSD).....	2522
39.6.7	MediaLB Interrupt Enable Register (MLB_MIEN).....	2523
39.6.8	MediaLB Control 1 Register (MLB_MLBC1).....	2524
39.6.9	HBI Control Register (MLB_HCTL).....	2525
39.6.10	HBI Channel Mask 0 Register (MLB_HCMR0).....	2526
39.6.11	HBI Channel Mask 1 Register (MLB_HCMR1).....	2526
39.6.12	HBI Channel Error 0 Register (MLB_HCER0).....	2527
39.6.13	HBI Channel Error 1 Register (MLB_HCER1).....	2527
39.6.14	HBI Channel Busy 0 Register (MLB_HCBR0).....	2528

Section number	Title	Page
39.6.15	HBI Channel Busy 1 Register (MLB_HCBR1).....	2528
39.6.16	MIF Data 0 Register (MLB_MDAT0).....	2529
39.6.17	MIF Data 1 Register (MLB_MDAT1).....	2529
39.6.18	MIF Data 2 Register (MLB_MDAT2).....	2529
39.6.19	MIF Data 3 Register (MLB_MDAT3).....	2530
39.6.20	MIF Data Write Enable 0 Register (MLB_MDWE0).....	2530
39.6.21	MIF Data Write Enable 1 Register (MLB_MDWE1).....	2530
39.6.22	MIF Data Write Enable 2 Register (MLB_MDWE2).....	2531
39.6.23	MIF Data Write Enable 3 Register (MLB_MDWE3).....	2531
39.6.24	MIF Control Register (MLB_MCTL).....	2532
39.6.25	MIF Address Register (MLB_MADR).....	2532
39.6.26	AHB Control Register (MLB_ACTL).....	2533
39.6.27	AHB Channel Status 0 Register (MLB_ACSR0).....	2534
39.6.28	AHB Channel Status 1 Register (MLB_ACSR1).....	2535
39.6.29	AHB Channel Mask 0 Register (MLB_ACMR0).....	2535
39.6.30	AHB Channel Mask 1 Register (MLB_ACMR1).....	2536

Chapter 40

Multi Mode DDR Controller (MMDC)

40.1	Overview.....	2537
40.1.1	MMDC feature summary.....	2538
40.2	External Signals.....	2540
40.3	Clocks.....	2542
40.4	Functional Description.....	2542
40.4.1	Write/Read data flow.....	2543
40.4.1.1	Write data flow.....	2543
40.4.1.2	Read data flow.....	2543
40.4.2	MMDC initialization	2544
40.4.3	Configuring the MMDC registers.....	2545

Section number	Title	Page
40.4.4	MMDC Address Space.....	2546
40.4.4.1	Address decoding	2546
40.4.4.2	Chip select settings.....	2548
40.4.4.2.1	Creating 4 Gbyte address space with 2 Gbyte CS density.....	2548
40.4.4.2.2	Creating 2 Gbyte address spaces with 1 Gbyte CS density.....	2549
40.4.4.3	Translation of AXI accesses to DDR accesses.....	2550
40.4.4.3.1	Example	2550
40.4.4.4	Address mirroring	2550
40.4.5	LPDDR2 and DDR3 pin mux mapping.....	2551
40.4.6	Power Saving and Clock Frequency Change modes.....	2552
40.4.6.1	Power saving general.....	2552
40.4.6.2	Self refresh and Frequency change entry/exit.....	2554
40.4.7	Reset	2555
40.4.7.1	Hard reset.....	2555
40.4.7.2	Warm reset.....	2555
40.4.7.3	Software reset	2556
40.4.8	Refresh Scheme.....	2556
40.4.9	Burst Length options towards DDR	2557
40.4.10	Exclusive accesses handling.....	2558
40.4.11	AXI Error Handling.....	2559
40.5	Performance.....	2559
40.5.1	Arbitration and reordering mechanism.....	2559
40.5.1.1	Arbitration General.....	2559
40.5.1.2	Real time channel mode.....	2560
40.5.1.3	Dynamic scoring mode (Arbitration Winning Conditions).....	2560
40.5.1.4	Guarding (aging) mechanism.....	2561
40.5.2	Prediction mechanism.....	2562
40.5.3	Special Optimization for accesses towards DDR3.....	2562

Section number	Title	Page
40.6	MMDC Debug	2563
40.6.1	Hardware debug monitor.....	2563
40.6.2	Step By Step (SBS) software monitor.....	2564
40.7	MMDC Profiling.....	2564
40.8	LPDDR2 Refresh Rate Update and Timing Derating.....	2565
40.9	DLL Off mode.....	2566
40.10	ODT Configuration	2567
40.11	Calibration Process.....	2568
40.11.1	Delay-line.....	2569
40.11.2	ZQ calibration	2570
40.11.2.1	ZQ automatic (hardware) calibration process.....	2571
40.11.2.1.1	ZQ automatic Pull-up calibration.....	2571
40.11.2.1.2	ZQ automatic Pull-down calibration.....	2572
40.11.2.2	ZQ software calibration process.....	2572
40.11.2.3	ZQ calibration commands	2572
40.11.3	Read DQS Gating Calibration.....	2573
40.11.3.1	Hardware DQS Gating Calibration.....	2573
40.11.3.1.1	Hardware DQS Calibration with MPR.....	2573
40.11.3.1.2	Hardware DQS Calibration with pre-defined value.....	2573
40.11.3.2	SW read DQS gating Calibration.....	2576
40.11.3.2.1	SW read Calibration with MPR.....	2576
40.11.3.2.2	SW read Calibration with pre-defined value.....	2576
40.11.4	Read Calibration.....	2579
40.11.4.1	Hardware (automatic) Read Calibration.....	2579
40.11.4.1.1	Hardware (automatic) Calibration with MPR (DDR3) /DQ Calibration (LPDDR2).....	2579
40.11.4.1.2	Hardware (automatic) Calibration with pre-defined value.....	2580
40.11.4.2	SW Read Calibration.....	2581
40.11.4.2.1	Calibration with MPR(DDR3)/DQ calibration(LPDDR2).....	2582

Section number	Title	Page
	40.11.4.2.2 Calibration with pre-defined value.....	2582
40.11.5	Write Calibration.....	2584
	40.11.5.1 HW (automatic) Write Calibration.....	2584
	40.11.5.2 SW Write Calibration.....	2585
40.11.6	Write leveling Calibration.....	2587
	40.11.6.1 Hardware Write Leveling Calibration.....	2588
	40.11.6.2 SW Write Leveling Calibration.....	2589
40.11.7	Write fine tuning.....	2590
40.11.8	Read fine tuning.....	2590
40.12	MMDC Memory Map/Register Definition.....	2591

40.12.56	MMDC PHY Write Delay HW Calibration Control Register (MMDC_MPWRDLHWCTL).....	2689
40.12.57	MMDC PHY Read Delay HW Calibration Status Register 0 (MMDC_MPRDDLHWST0).....	2690
40.12.58	MMDC PHY Read Delay HW Calibration Status Register 1 (MMDC_MPRDDLHWST1).....	2691
40.12.59	MMDC PHY Write Delay HW Calibration Status Register 0 (MMDC_MPWRDLHWST0).....	2692
40.12.60	MMDC PHY Write Delay HW Calibration Status Register 1 (MMDC_MPWRDLHWST1).....	2693
40.12.61	MMDC PHY Write Leveling HW Error Register (MMDC_MPWLHWERR).....	2694
40.12.62	MMDC PHY Read DQS Gating HW Status Register 0 (MMDC_MPDGHWST0).....	2694
40.12.63	MMDC PHY Read DQS Gating HW Status Register 1 (MMDC_MPDGHWST1).....	2695
40.12.64	MMDC PHY Read DQS Gating HW Status Register 2 (MMDC_MPDGHWST2).....	2695
40.12.65	MMDC PHY Read DQS Gating HW Status Register 3 (MMDC_MPDGHWST3).....	2696
40.12.66	MMDC PHY Pre-defined Compare Register 1 (MMDC_MPPDCMPR1).....	2697
40.12.67	MMDC PHY Pre-defined Compare and CA delay-line Configuration Register (MMDC_MPPDCMPR2).....	2698
40.12.68	MMDC PHY SW Dummy Access Register (MMDC_MPSWDAR0).....	2700
40.12.69	MMDC PHY SW Dummy Read Data Register 0 (MMDC_MPSWDRDR0).....	2701
40.12.70	MMDC PHY SW Dummy Read Data Register 1 (MMDC_MPSWDRDR1).....	2702
40.12.71	MMDC PHY SW Dummy Read Data Register 2 (MMDC_MPSWDRDR2).....	2702
40.12.72	MMDC PHY SW Dummy Read Data Register 3 (MMDC_MPSWDRDR3).....	2702
40.12.73	MMDC PHY SW Dummy Read Data Register 4 (MMDC_MPSWDRDR4).....	2703
40.12.74	MMDC PHY SW Dummy Read Data Register 5 (MMDC_MPSWDRDR5).....	2703
40.12.75	MMDC PHY SW Dummy Read Data Register 6 (MMDC_MPSWDRDR6).....	2704
40.12.76	MMDC PHY SW Dummy Read Data Register 7 (MMDC_MPSWDRDR7).....	2704

Section number	Title	Page
40.12.77	MMDC PHY Measure Unit Register (MMDC_MPMUR0).....	2705
40.12.78	MMDC Write CA delay-line controller (MMDC_MPWRCADL).....	2706
40.12.79	MMDC Duty Cycle Control Register (MMDC_MPDCCR).....	2708

Chapter 41 Medium Quality Sound (MQS)

41.1	Overview.....	2711
41.2	Block Diagram.....	2711
41.3	External Signals.....	2712
41.4	Interface Signals.....	2713
41.5	Programmability.....	2713
41.6	Usage Model.....	2714

Chapter 42 Messaging Unit (MU)

42.1	Overview.....	2715
42.1.1	Features.....	2716
42.1.2	Modes of Operation.....	2716
42.2	External Signals.....	2717
42.3	Functional Description.....	2717
42.3.1	Processor A Side Memory-Mapping.....	2718
42.3.2	Processor B Side Memory-Mapping.....	2718
42.3.3	MU Messaging.....	2718
42.3.3.1	Programmer Model.....	2718
42.3.3.2	Messaging Examples.....	2719
42.3.4	Operating Modes.....	2720
42.3.5	Low Power Modes.....	2720
42.3.5.1	Low Power Clocks and Synchronization.....	2721
42.3.5.2	Processor Low Power Modes.....	2721
42.3.6	Event Update Timing.....	2722

Section number	Title	Page
42.3.7	Interrupts.....	2722
42.3.7.1	Interrupts to the Processors.....	2722
42.3.7.2	General Purpose Interrupt Clearing Sequence.....	2723
42.3.8	Interrupt Messaging Protocols.....	2723
42.3.8.1	Messaging Protocols using Interrupts.....	2723
42.3.8.2	Messaging Protocols using Event Interrupts.....	2725
42.3.9	Exclusive Access to Shared Memory.....	2726
42.3.10	Packet Data Transfers.....	2728
42.3.11	MU Resets.....	2728
42.4	Software Restrictions.....	2729
42.4.1	General Restrictions.....	2729
42.4.1.1	Write-After-Write to a Transmit Register.....	2729
42.4.1.2	Read-After-Read from a Receive Register.....	2730
42.4.2	Processor Restrictions.....	2730
42.4.2.1	Before Entering Low Power Mode.....	2730
42.4.2.2	Before Setting a General Interrupt Request Bit (GIR0–3).....	2731
42.4.2.3	Reset Bit Restrictions.....	2731
42.5	MU Processor A-side Memory Map/Register Definition.....	2731
42.5.1	Processor A Transmit Register 0 (MU_ATR0).....	2732
42.5.2	Processor A Transmit Register 1 (MU_ATR1).....	2733
42.5.3	Processor A Transmit Register 2 (MU_ATR2).....	2733
42.5.4	Processor A Transmit Register 3 (MU_ATR3).....	2734
42.5.5	Processor A Receive Register 0 (MU_ARR0).....	2735
42.5.6	Processor A Receive Register 1 (MU_ARR1).....	2735
42.5.7	Processor A Receive Register 2 (MU_ARR2).....	2736
42.5.8	Processor A Receive Register 3 (MU_ARR3).....	2737
42.5.9	Processor A Status Register (MU_ASR).....	2738
42.5.10	Processor A Control Register (MU_ACR).....	2741

Section number	Title	Page
42.6	MU Processor B-side Memory Map/Register Definition.....	2743
42.6.1	Processor B Transmit Register 0 (MU_BTR0).....	2744
42.6.2	Processor B Transmit Register 1 (MU_BTR1).....	2744
42.6.3	Processor B Transmit Register 2 (MU_BTR2).....	2745
42.6.4	Processor B Transmit Register 3 (MU_BTR3).....	2746
42.6.5	Processor B Receive Register 0 (MU_BRR0).....	2746
42.6.6	Processor B Receive Register 1 (MU_BRR1).....	2747
42.6.7	Processor B Receive Register 2 (MU_BRR2).....	2748
42.6.8	Processor B Receive Register 3 (MU_BRR3).....	2748
42.6.9	Processor B Status Register (MU_BSR).....	2749
42.6.10	Processor B Control Register (MU_BCR).....	2752

Chapter 43

Network Interconnect Bus System (NIC-301)

43.1	Overview	2755
43.1.1	Block diagram.....	2755
43.1.2	NIC-301 Main Features.....	2757
43.1.3	Modes and Operations.....	2757
43.2	External Signals.....	2757
43.3	Memory Map and Register Definition.....	2757
43.3.1	Memory Map.....	2758
43.3.2	Configuration programmers model.....	2758
43.3.2.1	Address control and ID registers.....	2759
43.3.2.2	AMBA master interface block (AMIB) configuration registers.....	2759
43.3.2.3	ASIB (AMBA slave interface block) configuration registers.....	2759
43.3.3	Register Descriptions.....	2760
43.3.3.1	QoS registers' address look-up example.....	2760
43.3.4	NIC-specific parameters.....	2761

Section number	Title	Page
Chapter 44		
On-Chip OTP Controller (OCOTP_CTRL)		
44.1	Overview.....	2765
44.1.1	Features.....	2765
44.2	Clocks.....	2765
44.3	Top-Level Symbol and Functional Overview.....	2766
44.3.1	Operation.....	2766
44.3.1.1	Shadow Register Reload.....	2767
44.3.1.2	Fuse and Shadow register read.....	2767
44.3.1.3	Fuse and Shadow Register Writes.....	2768
44.3.1.4	Write Postamble.....	2769
44.3.2	Fuse Shadow Memory Footprint.....	2770
44.3.3	OTP Read/Write Timing Parameters.....	2772
44.3.4	Hardware Visible Fuses.....	2773
44.3.5	Behavior During Reset.....	2773
44.3.6	Secure JTAG control.....	2773
44.4	Fuse Map.....	2774
44.5	OCOTP Memory Map/Register Definition.....	2774
44.5.1	OTP Controller Control Register (OCOTP_CTRL n).....	2776
44.5.2	OTP Controller Timing Register (OCOTP_TIMING).....	2779
44.5.3	OTP Controller Write Data Register (OCOTP_DATA).....	2779
44.5.4	OTP Controller Write Data Register (OCOTP_READ_CTRL).....	2780
44.5.5	OTP Controller Read Data Register (OCOTP_READ_FUSE_DATA).....	2781
44.5.6	Sticky bit Register (OCOTP_SW_STICKY).....	2781
44.5.7	Software Controllable Signals Register (OCOTP_SCS n).....	2782
44.5.8	OTP Controller Version Register (OCOTP_VERSION).....	2783
44.5.9	Value of OTP Bank0 Word0 (Lock controls) (OCOTP_LOCK).....	2784
44.5.10	Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (OCOTP_CFG0).....	2787
44.5.11	Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (OCOTP_CFG1).....	2788

Section number	Title	Page
44.5.12	Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (OCOTP_CFG2).....	2788
44.5.13	Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (OCOTP_CFG3).....	2789
44.5.14	Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (OCOTP_CFG4).....	2789
44.5.15	Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (OCOTP_CFG5).....	2790
44.5.16	Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (OCOTP_CFG6).....	2790
44.5.17	Value of OTP Bank1 Word0 (Memory Related Info.) (OCOTP_MEM0).....	2791
44.5.18	Value of OTP Bank1 Word1 (Memory Related Info.) (OCOTP_MEM1).....	2791
44.5.19	Value of OTP Bank1 Word2 (Memory Related Info.) (OCOTP_MEM2).....	2792
44.5.20	Value of OTP Bank1 Word3 (Memory Related Info.) (OCOTP_MEM3).....	2792
44.5.21	Value of OTP Bank1 Word4 (Memory Related Info.) (OCOTP_MEM4).....	2793
44.5.22	Value of OTP Bank1 Word5 (Memory Related Info.) (OCOTP_ANA0).....	2793
44.5.23	Value of OTP Bank1 Word6 (General Purpose Customer Defined Info.) (OCOTP_ANA1).....	2794
44.5.24	Value of OTP Bank1 Word7 (General Purpose Customer Defined Info.) (OCOTP_ANA2).....	2794
44.5.25	Shadow Register for OTP Bank3 Word0 (SRK Hash) (OCOTP_SRK0).....	2795
44.5.26	Shadow Register for OTP Bank3 Word1 (SRK Hash) (OCOTP_SRK1).....	2795
44.5.27	Shadow Register for OTP Bank3 Word2 (SRK Hash) (OCOTP_SRK2).....	2796
44.5.28	Shadow Register for OTP Bank3 Word3 (SRK Hash) (OCOTP_SRK3).....	2796
44.5.29	Shadow Register for OTP Bank3 Word4 (SRK Hash) (OCOTP_SRK4).....	2797
44.5.30	Shadow Register for OTP Bank3 Word5 (SRK Hash) (OCOTP_SRK5).....	2797
44.5.31	Shadow Register for OTP Bank3 Word6 (SRK Hash) (OCOTP_SRK6).....	2798
44.5.32	Shadow Register for OTP Bank3 Word7 (SRK Hash) (OCOTP_SRK7).....	2798
44.5.33	Value of OTP Bank4 Word0 (Secure JTAG Response Field) (OCOTP_RESP0).....	2799
44.5.34	Value of OTP Bank4 Word1 (Secure JTAG Response Field) (OCOTP_HSJC_RESP1).....	2799
44.5.35	Value of OTP Bank4 Word2 (MAC Address) (OCOTP_MAC0).....	2800
44.5.36	Value of OTP Bank4 Word3 (MAC Address) (OCOTP_MAC1).....	2800
44.5.37	Value of OTP Bank4 Word4 (MAC Address) (OCOTP_MAC2).....	2801
44.5.38	Value of OTP Bank4 Word6 (HW Capabilities) (OCOTP_GP1).....	2801
44.5.39	Value of OTP Bank4 Word7 (HW Capabilities) (OCOTP_GP2).....	2802
44.5.40	Value of OTP Bank5 Word5 (HW Capabilities) (OCOTP_MISC_CONF).....	2802

Section number	Title	Page
44.5.41	Value of OTP Bank5 Word6 (HW Capabilities) (OCOTP_FIELD_RETURN).....	2803
44.5.42	Value of OTP Bank5 Word7 (HW Capabilities) (OCOTP_SRK_REVOKE).....	2803
44.5.43	Value of OTP Bank10 Word1 (General Purpose Customer Defined Info) (OCOTP_GP30).....	2804
44.5.44	Value of OTP Bank10 Word2 (General Purpose Customer Defined Info) (OCOTP_GP31).....	2804
44.5.45	Value of OTP Bank10 Word3 (General Purpose Customer Defined Info) (OCOTP_GP32).....	2805
44.5.46	Value of OTP Bank10 Word4 (General Purpose Customer Defined Info) (OCOTP_GP33).....	2805
44.5.47	Value of OTP Bank10 Word5 (General Purpose Customer Defined Info) (OCOTP_GP34).....	2806
44.5.48	Value of OTP Bank10 Word6 (General Purpose Customer Defined Info) (OCOTP_GP35).....	2806
44.5.49	Value of OTP Bank10 Word7 (General Purpose Customer Defined Info) (OCOTP_GP36).....	2807

Chapter 45 On-Chip RAM Memory Controller (OCRAM)

45.1	Overview.....	2809
45.2	Basic Functions.....	2810
45.2.1	Read/Write Arbitration.....	2810
45.2.2	TrustZone.....	2811
45.3	Advanced Features.....	2811
45.3.1	Read Data Wait State.....	2811
45.3.2	Read Address Pipeline.....	2812
45.3.3	Write Data Pipeline.....	2812
45.3.4	Write Address Pipeline.....	2813
45.4	Programmable Registers.....	2813

Chapter 46 PCI Express (PCIe)

46.1	Overview.....	2815
46.1.1	Terms and Abbreviations.....	2815
46.2	Architecture.....	2817
46.2.1	Common Xpress Port Logic (CXPL).....	2819
46.2.2	Transmit Application-Dependent Module (XADM).....	2820
46.2.2.1	Arbitration.....	2821

Section number	Title	Page
46.2.2.2	Credit Checking.....	2822
46.2.3	Receive Application-Dependent Module (RADM).....	2822
46.2.3.1	Posted and Non-Posted Request and Completion TLP Processing.....	2823
46.2.3.1.1	TLP Routing.....	2824
46.2.3.2	Received Completion TLP Processing.....	2824
46.2.3.3	Message Processing.....	2825
46.2.4	Configuration-Dependent Module (CDM).....	2825
46.2.5	Local Bus Controller (LBC) and Data bus Interface (DBI).....	2826
46.2.5.1	Overview (LBC).....	2826
46.2.5.1.1	Simultaneous Transactions.....	2828
46.2.5.2	ELBI.....	2828
46.2.5.3	CDM Register Space Layout.....	2828
46.2.5.3.1	PCI Configuration Header and Capability Registers (in CDM).....	2830
46.2.5.3.2	Port Logic (PL) Registers (in CDM).....	2830
46.2.5.3.3	Memory Mapping PL Registers.....	2830
46.2.5.4	PCIe Wire Access (EP mode).....	2831
46.2.5.5	PCIe Wire Access (RC mode).....	2832
46.3	Core Operations.....	2833
46.3.1	Initialization.....	2833
46.3.2	Link Establishment.....	2835
46.3.3	Transmit TLP Processing.....	2836
46.3.3.1	Transmit Overview.....	2837
46.3.3.2	Transmit TLP Arbitration.....	2837
46.3.3.2.1	Client-Based Arbitration.....	2838
46.3.3.3	Transmit Retry.....	2838
46.3.3.4	Transmit DLLP Priorities.....	2839
46.3.4	Receive TLP Processing.....	2839
46.3.4.1	Receive Overview.....	2839

Section number	Title	Page
46.3.4.2	Receive Filtering.....	2840
46.3.4.2.1	Filtering Rules Applicable for all TLPs Received.....	2841
46.3.4.2.2	Filtering Rules Based on TLP Type Defined in PCIe Specification.....	2842
46.3.4.2.2.1	EP MODE FILTERING RULES.....	2843
46.3.4.2.2.2	RC MODE FILTERING RULES.....	2844
46.3.4.2.3	Filtering Rules Not Defined in PCIe Specification.....	2845
46.3.4.3	Receive Routing.....	2846
46.3.4.3.1	EP Mode.....	2846
46.3.4.3.2	RC mode.....	2848
46.3.4.3.3	ECRC Handling.....	2849
46.3.4.3.4	Request TLP Routing Rules.....	2849
46.3.4.3.5	Completion TLP Routing Rules.....	2851
46.3.4.4	Receive Queuing.....	2852
46.3.4.4.1	Queuing Architecture.....	2853
46.3.4.4.1.1	SEGMENTED-BUFFER RECEIVE QUEUE CONFIGURATION (CX_RADMQ_MODE=2).....	2853
46.3.4.4.2	Queue Modes.....	2854
46.3.4.4.3	Order Enforcement.....	2855
46.3.4.4.4	Queue to Port Mapping.....	2855
46.3.5	Error Handling.....	2856
46.3.5.1	Error Handling Overview.....	2856
46.3.5.2	PCIe Baseline Capability.....	2857
46.3.5.3	Advanced Error Reporting (AER).....	2858
46.3.5.3.1	Advisory Non-Fatal Error Messages.....	2858
46.3.5.4	Error Source Classification.....	2859
46.3.5.5	Error Detection.....	2860

Chapter 48 Power Management Unit (PMU)

48.1	Overview.....	3215
48.2	Digital LDO Regulators.....	3217
48.3	Analog LDO Regulators.....	3218
48.3.1	LDO 1P1.....	3218
48.3.2	LDO 2P5.....	3219
48.3.3	Low Power Operation.....	3219
48.4	USB LDO Regulator.....	3220
48.5	SNVS Regulator.....	3220
48.6	PMU Memory Map/Register Definition.....	3220
48.6.1	Regulator 1P1 Register (PMU_REG_1P1).....	3222
48.6.2	Regulator 3P0 Register (PMU_REG_3P0).....	3225
48.6.3	Regulator 2P5 Register (PMU_REG_2P5).....	3227

Section number	Title	Page
48.6.4	Digital Regulator Core Register (PMU_REG_CORE).....	3229
48.6.5	Miscellaneous Register 0 (PMU_MISC0).....	3232
48.6.6	Miscellaneous Register 1 (PMU_MISC1 n).....	3235
48.6.7	Miscellaneous Control Register (PMU_MISC2 n).....	3238
48.6.8	Low Power Control Register (PMU_LOWPWR_CTRL n).....	3242

Chapter 49 Pulse Width Modulation (PWM)

49.1	Overview.....	3245
49.2	External Signals.....	3246
49.3	Clocks.....	3248
49.4	Functional Description.....	3249
49.4.1	Operation.....	3249
49.4.1.1	FIFO.....	3250
49.4.1.2	Rollover and Compare Event.....	3250
49.4.1.3	Low Power Mode Behavior.....	3251
49.4.1.4	Debug Mode Behavior.....	3251
49.5	Enable Sequence for the PWM.....	3251
49.6	Disable Sequence for the PWM.....	3251
49.7	PWM Memory Map/Register Definition.....	3252
49.7.1	PWM Control Register (PWM x _PWMCR).....	3254
49.7.2	PWM Status Register (PWM x _PWMSR).....	3256
49.7.3	PWM Interrupt Register (PWM x _PWMIR).....	3257
49.7.4	PWM Sample Register (PWM x _PWMSAR).....	3258
49.7.5	PWM Period Register (PWM x _PWMPR).....	3259
49.7.6	PWM Counter Register (PWM x _PWMCNR).....	3260

Chapter 50 Pixel Pipeline (PXP)

50.1	Overview.....	3261
50.2	Clocks.....	3262

Section number	Title	Page
50.3	Top-level architecture.....	3262
50.3.1	Processing Details.....	3264
50.3.2	Scaling Operation.....	3265
50.3.3	Decimation Image Scaling.....	3266
50.3.4	Bilinear Image Scaling Filter	3268
50.3.5	YUV 4:2:2 Image Scaling.....	3270
50.3.6	YUV 4:2:0 Image Scaling.....	3271
50.3.7	RGB/YUV444 Image Scaling.....	3273
50.3.8	Color Space Conversion (CSC).....	3273
50.3.9	CSC1 Operation.....	3274
50.3.10	YUV versus YCbCr Support.....	3275
50.3.11	CSC2 operation.....	3275
50.3.12	Alpha Blending/Color Key	3275
50.3.13	Alpha Blend.....	3276
50.3.14	Color Key.....	3277
50.3.15	LUT.....	3277
50.3.16	Lookup Modes.....	3278
50.3.17	DIRECT_Y8.....	3278
50.3.18	DIRECT_RGB444.....	3278
50.3.19	DIRECT_RGB454.....	3278
50.3.20	CACHE_RGB565.....	3279
50.3.21	Output Modes.....	3280
50.3.22	Y8	3280
50.3.23	RGBW4444CFA.....	3281
	50.3.23.1 CFA Correction.....	3281
50.3.24	RGB888.....	3282
50.3.25	Rotation.....	3282
50.3.26	Output Buffer.....	3285
50.3.27	Address calculator.....	3285

Section number	Title	Page
50.3.28	Block size selection.....	3285
50.3.29	Interlaced Video Support.....	3285
50.3.30	LCDIF Handshake.....	3286
50.3.31	LCDIF Abort.....	3289
50.3.32	Theory of Operation.....	3289
50.3.33	Pixel Handling.....	3290
50.3.34	Output Buffer Composition.....	3291
50.3.35	PS Image Processing.....	3291
50.3.36	Letterboxing.....	3292
50.3.37	Clipping source images.....	3292
50.3.38	Color Key Processing.....	3294
50.3.39	In Place Processing (PS buffer is destination buffer).....	3296
50.3.40	Alpha Surface (AS) Processing.....	3296
50.3.41	Alpha Handling.....	3296
50.3.42	Color Key Processing (AS_CTRL).....	3296
50.4	Output Image Processing.....	3297
50.4.1	Output Image Size.....	3297
50.4.2	Output Format.....	3297
50.4.3	Rotation/Flip operations.....	3297
50.5	Queuing PXP transactions.....	3298
50.6	Error Handling.....	3298
50.6.1	Known PXP Limitations/Issues.....	3299
50.7	PXP Memory Map/Register Definition.....	3299
50.7.1	Control Register 0 (PXP_CTRL).....	3302
50.7.2	Status Register (PXP_STAT).....	3304
50.7.3	Output Buffer Control Register (PXP_OUT_CTRL).....	3306
50.7.4	Output Frame Buffer Pointer (PXP_OUT_BUF).....	3308
50.7.5	Output Frame Buffer Pointer #2 (PXP_OUT_BUF2).....	3309
50.7.6	Output Buffer Pitch (PXP_OUT_PITCH).....	3309

Section number	Title	Page
50.7.7	Output Surface Lower Right Coordinate (PXP_OUT_LRC).....	3310
50.7.8	Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC).....	3311
50.7.9	Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC).....	3312
50.7.10	Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC).....	3313
50.7.11	Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC).....	3314
50.7.12	Processed Surface (PS) Control Register (PXP_PS_CTRL).....	3315
50.7.13	PS Input Buffer Address (PXP_PS_BUF).....	3316
50.7.14	PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF).....	3317
50.7.15	PS V/Cr Input Buffer Address (PXP_PS_VBUF).....	3318
50.7.16	Processed Surface Pitch (PXP_PS_PITCH).....	3318
50.7.17	PS Background Color (PXP_PS_BACKGROUND).....	3319
50.7.18	PS Scale Factor Register (PXP_PS_SCALE).....	3320
50.7.19	PS Scale Offset Register (PXP_PS_OFFSET).....	3321
50.7.20	PS Color Key Low (PXP_PS_CLRKEYLOW).....	3322
50.7.21	PS Color Key High (PXP_PS_CLRKEYHIGH).....	3323
50.7.22	Alpha Surface Control (PXP_AS_CTRL).....	3323
50.7.23	Alpha Surface Buffer Pointer (PXP_AS_BUF).....	3326
50.7.24	Alpha Surface Pitch (PXP_AS_PITCH).....	3326
50.7.25	Overlay Color Key Low (PXP_AS_CLRKEYLOW).....	3327
50.7.26	Overlay Color Key High (PXP_AS_CLRKEYHIGH).....	3327
50.7.27	Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0).....	3328
50.7.28	Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1).....	3330
50.7.29	Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2).....	3330
50.7.30	Color Space Conversion Control Register. (PXP_CSC2_CTRL).....	3331
50.7.31	Color Space Conversion Coefficient Register 0 (PXP_CSC2_COEF0).....	3333
50.7.32	Color Space Conversion Coefficient Register 1 (PXP_CSC2_COEF1).....	3333
50.7.33	Color Space Conversion Coefficient Register 2 (PXP_CSC2_COEF2).....	3334
50.7.34	Color Space Conversion Coefficient Register 3 (PXP_CSC2_COEF3).....	3334
50.7.35	Color Space Conversion Coefficient Register 4 (PXP_CSC2_COEF4).....	3335

Section number	Title	Page
50.7.36	Color Space Conversion Coefficient Register 5 (PXP_CSC2_COEF5).....	3336
50.7.37	Lookup Table Control Register. (PXP_LUT_CTRL).....	3336
50.7.38	Lookup Table Control Register. (PXP_LUT_ADDR).....	3338
50.7.39	Lookup Table Data Register. (PXP_LUT_DATA).....	3340
50.7.40	Lookup Table External Memory Address Register. (PXP_LUT_EXTMEM).....	3340
50.7.41	Color Filter Array Register. (PXP_CFA).....	3341
50.7.42	Histogram Control Register. (PXP_HIST_CTRL).....	3341
50.7.43	2-level Histogram Parameter Register. (PXP_HIST2_PARAM).....	3342
50.7.44	4-level Histogram Parameter Register. (PXP_HIST4_PARAM).....	3343
50.7.45	8-level Histogram Parameter 0 Register. (PXP_HIST8_PARAM0).....	3344
50.7.46	8-level Histogram Parameter 1 Register. (PXP_HIST8_PARAM1).....	3345
50.7.47	16-level Histogram Parameter 0 Register. (PXP_HIST16_PARAM0).....	3346
50.7.48	16-level Histogram Parameter 1 Register. (PXP_HIST16_PARAM1).....	3347
50.7.49	16-level Histogram Parameter 2 Register. (PXP_HIST16_PARAM2).....	3348
50.7.50	16-level Histogram Parameter 3 Register. (PXP_HIST16_PARAM3).....	3349
50.7.51	PXP Power Control Register. (PXP_POWER).....	3349
50.7.52	Next Frame Pointer (PXP_NEXT).....	3350

Chapter 51 Quad Serial Peripheral Interface (QuadSPI)

51.1	Overview.....	3353
51.1.1	Features.....	3355
51.1.2	QuadSPI Modes of Operation.....	3356
51.1.2.1	Normal Mode.....	3356
51.1.2.2	Module Disable Mode.....	3356
51.1.3	Acronyms and Abbreviations.....	3356
51.1.4	Glossary for QuadSPI module.....	3357
51.2	External Signals.....	3358
51.2.1	Driving External Signals.....	3360

Section number	Title	Page
51.3	Memory Map and Register Definition.....	3362
51.3.1	Register Write Access.....	3362
51.3.2	Serial Flash Address Assignment.....	3363
51.3.3	AMBA Bus Register Memory Map.....	3363
51.3.4	AHB Bus Register Memory Map Descriptions.....	3365
51.3.4.1	AHB Bus Access Considerations.....	3365
51.3.4.2	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash A.....	3366
51.3.4.3	Memory Mapped Serial Flash Data - Individual Flash Mode on Flash B.....	3367
51.3.4.4	Parallel Flash Mode.....	3368
51.4	Interrupt Signals.....	3369
51.5	Functional Description.....	3369
51.5.1	Serial Flash Access Schemes.....	3369
51.5.2	Modes of Operation.....	3370
51.5.3	Normal Mode.....	3371
51.5.3.1	Programmable Sequence Engine.....	3371
51.5.3.2	Flexible AHB buffers.....	3373
51.5.3.3	Suspend-Abort Mechanism.....	3375
51.5.3.4	Look-up Table.....	3376
51.5.3.5	Issuing SFM Commands.....	3377
51.5.3.6	Flash Programming.....	3378
51.5.3.7	Flash Read.....	3379
51.5.3.8	Byte Ordering of Serial Flash Read Data.....	3383
51.5.3.9	Normal Mode Interrupt and DMA Requests.....	3386
51.5.3.10	TX Buffer Operation.....	3388
51.5.3.11	Address scheme.....	3389
51.6	Initialization/Application Information.....	3390
51.6.1	Power Up and Reset.....	3390
51.6.2	Available Status/Flag Information.....	3390
51.6.2.1	IP Commands.....	3390

Section number	Title	Page
51.6.2.2	AHB Commands.....	3390
51.6.2.3	Overview of Error Flags.....	3391
51.6.2.4	IP Bus and AHB Access Command Collisions.....	3392
51.6.3	Exclusive Access to Serial Flash for AHB Commands.....	3392
51.6.3.1	RX Buffer Read via QSPI_ARDB Registers.....	3393
51.6.3.2	RX Buffer Read via QSPI_RBDR Registers.....	3393
51.6.4	Command Arbitration	3394
51.6.5	Flash Device Selection.....	3395
51.6.6	DMA Usage.....	3395
51.6.6.1	DMA Usage in Normal Mode.....	3395
51.6.6.1.1	Bandwidth considerations.....	3395
51.6.7	Parallel mode.....	3397
51.7	Serial Flash Devices.....	3399
51.7.1	Example Sequences.....	3399
51.7.1.1	Fast Read Sequence (Macronix/Numonyx/Spansion/Winbond).....	3400
51.7.1.2	Fast Dual I/O DT Read Sequence (Macronix).....	3400
51.7.1.3	Fast Read Quad Output (Winbond).....	3401
51.7.1.4	4 x I/O Read Enhance Performance Mode (XIP) (Macronix).....	3401
51.7.1.5	Dual Command Page Program (Numonyx).....	3402
51.7.1.6	Sector Erase (Macronix/Spansion/Numonyx).....	3402
51.7.1.7	Read Status Register (Macronix/Spansion/Numonyx/Winbond).....	3402
51.7.2	Dual Die Flashes.....	3403
51.7.3	Boot initialization sequence.....	3403
51.8	Internal Sampling of Serial Flash Input Data.....	3404
51.8.1	Internal Sampling of Serial Flash Input Data.....	3404
51.8.2	DDR Mode.....	3407
51.9	Serial Flash Data Input Timing.....	3408
51.9.1	Input timing in SDR mode with internal sampling.....	3410
51.9.2	Input timing in DDR mode with internal sampling.....	3410

Section number	Title	Page
51.9.3	Input timing in SDR mode with loopback DQS sampling.....	3411
51.9.4	Input timing in DDR mode with loopback DQS sampling.....	3412
51.9.5	Input timing in SDR mode with flash DQS sampling.....	3413
51.9.6	Input timing in DDR mode with flash DQS sampling.....	3414
51.9.7	Data Strobe Signal functionality.....	3415
51.10	Output timing in SDR mode.....	3415
51.11	Output timing in DDR mode.....	3416
51.12	AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31).....	3417
51.12.1	AHB RX Data Buffer (QSPI_ARDB0 to QSPI_ARDB31).....	3417
51.12.1.1	AHB RX Data Buffer register (ARDB <i>n</i>).....	3417
51.13	Peripheral Bus Register Descriptions.....	3419
51.13.1	Module Configuration Register (QuadSPIx_MCR).....	3431
51.13.2	IP Configuration Register (QuadSPIx_IPCR).....	3433
51.13.3	Flash Configuration Register (QuadSPIx_FLSHCR).....	3434
51.13.4	Buffer0 Configuration Register (QuadSPIx_BUF0CR).....	3435
51.13.5	Buffer1 Configuration Register (QuadSPIx_BUF1CR).....	3435
51.13.6	Buffer2 Configuration Register (QuadSPIx_BUF2CR).....	3436
51.13.7	Buffer3 Configuration Register (QuadSPIx_BUF3CR).....	3437
51.13.8	Buffer Generic Configuration Register (QuadSPIx_BFGENCR).....	3438
51.13.9	Buffer0 Top Index Register (QuadSPIx_BUF0IND).....	3439
51.13.10	Buffer1 Top Index Register (QuadSPIx_BUF1IND).....	3440
51.13.11	Buffer2 Top Index Register (QuadSPIx_BUF2IND).....	3440
51.13.12	Serial Flash Address Register (QuadSPIx_SFAR).....	3441
51.13.13	Sampling Register (QuadSPIx_SMPR).....	3441
51.13.14	RX Buffer Status Register (QuadSPIx_RBSR).....	3442
51.13.15	RX Buffer Control Register (QuadSPIx_RBCT).....	3443
51.13.16	TX Buffer Status Register (QuadSPIx_TBSR).....	3444
51.13.17	TX Buffer Data Register (QuadSPIx_TBDR).....	3444
51.13.18	Status Register (QuadSPIx_SR).....	3446

Section number	Title	Page
51.13.19	Flag Register (QuadSPIx_FR).....	3449
51.13.20	Interrupt and DMA Request Select and Enable Register (QuadSPIx_RSER).....	3452
51.13.21	Sequence Suspend Status Register (QuadSPIx_SPNDST).....	3455
51.13.22	Sequence Pointer Clear Register (QuadSPIx_SPTRCLR).....	3457
51.13.23	Serial Flash A1 Top Address (QuadSPIx_SFA1AD).....	3457
51.13.24	Serial Flash A2 Top Address (QuadSPIx_SFA2AD).....	3458
51.13.25	Serial Flash B1Top Address (QuadSPIx_SFB1AD).....	3458
51.13.26	Serial Flash B2Top Address (QuadSPIx_SFB2AD).....	3459
51.13.27	RX Buffer Data Register (QuadSPIx_RBDR _n).....	3459
51.13.28	LUT Key Register (QuadSPIx_LUTKEY).....	3460
51.13.29	LUT Lock Configuration Register (QuadSPIx_LCKCR).....	3461
51.13.30	Look-up Table register (QuadSPIx_LUT0).....	3462
51.13.31	Look-up Table register (QuadSPIx_LUT1).....	3463
51.13.32	Look-up Table register (QuadSPIx_LUT _n).....	3464

Chapter 52 Resource Domain Controller (RDC)

52.1	Overview.....	3465
52.1.1	Features.....	3466
52.2	Functional Description.....	3467
52.2.1	Domain ID	3469
52.2.2	Resource Assignment	3469
52.2.3	Safe Sharing.....	3469
52.2.4	Resource Domain Control and Security Considerations	3471
52.3	Modes of Operation.....	3472
52.3.1	Low Power Modes.....	3472
52.4	Programming Interface.....	3474
52.4.1	Master Assignment Registers.....	3474
52.4.2	Peripheral Mapping	3475
52.4.3	Memory Region Map.....	3478

Section number	Title	Page
52.5	RDC Memory Map/Register Definition.....	3479
52.5.1	Version Information (RDC_VIR).....	3490
52.5.2	Status (RDC_STAT).....	3491
52.5.3	Interrupt and Control (RDC_INTCTRL).....	3492
52.5.4	Interrupt Status (RDC_INTSTAT).....	3492
52.5.5	Master Domain Assignment (RDC_MDAn).....	3493
52.5.6	Peripheral Domain Access Permissions (RDC_PDAPn).....	3494
52.5.7	Memory Region Start Address (RDC_MRSAn).....	3495
52.5.8	Memory Region End Address (RDC_MREAn).....	3496
52.5.9	Memory Region Control (RDC_MRCn).....	3496
52.5.10	Memory Region Violation Status (RDC_MRVSn).....	3498
52.6	RDC SEMA42 Memory Map/Register Definition.....	3498
52.6.1	Gate Register (RDC_SEMAPHOREx_GATEn).....	3502
52.6.2	Reset Gate Write (RDC_SEMAPHOREx_RSTGT_W).....	3503
52.6.3	Reset Gate Read (RDC_SEMAPHOREx_RSTGT_R).....	3505

Chapter 53 ROM Controller with Patch (ROMC)

53.1	Overview.....	3507
53.1.1	Features.....	3508
53.1.2	Modes of Operation.....	3508
53.1.2.1	Low Power Mode.....	3509
53.2	Clocks.....	3509
53.3	Memory Map.....	3509
53.3.1	ROM Memory Map in detail.....	3509
53.4	Functional Description.....	3510
53.4.1	ROM Controller (ROMC) Functional Description.....	3510
53.4.1.1	Functionality overview.....	3510
53.4.2	ROMC Functional Description.....	3510
53.4.2.1	ROMC Disabling.....	3511

Section number	Title	Page
53.4.2.2	ROMC Event Priority.....	3511
53.4.2.3	Data Fixing.....	3511
53.4.2.4	Opcode Patching.....	3512
53.4.2.4.1	Typical Software Response to Opcode Patch.....	3513
53.4.2.5	External Boot Feature.....	3514
53.4.2.6	Alternate Masters and ROMC.....	3515
53.5	ROMCP Memory Map/Register Definition.....	3515
53.5.1	ROMC Data Registers (ROMC_ROMPATCHnD).....	3516
53.5.2	ROMC Control Register (ROMC_ROMPATCHCNTL).....	3517
53.5.3	ROMC Enable Register High (ROMC_ROMPATCHENH).....	3518
53.5.4	ROMC Enable Register Low (ROMC_ROMPATCHENL).....	3518
53.5.5	ROMC Address Registers (ROMC_ROMPATCHnA).....	3519
53.5.6	ROMC Status Register (ROMC_ROMPATCHSR).....	3520

Chapter 54 Synchronous Audio Interface (SAI)

54.1	Overview.....	3523
54.1.1	Features.....	3523
54.1.2	Block diagram.....	3523
54.1.3	Modes of operation.....	3524
54.1.3.1	Run mode.....	3524
54.1.3.2	Stop modes.....	3524
54.1.3.3	Debug mode.....	3524
54.2	External Signals.....	3525
54.3	Functional description.....	3525
54.3.1	SAI clocking.....	3525
54.3.1.1	Audio master clock.....	3526
54.3.1.2	Bit clock.....	3526
54.3.1.3	Bus clock.....	3526

Section number	Title	Page
54.3.2	SAI resets.....	3527
54.3.2.1	Software reset.....	3527
54.3.2.2	FIFO reset.....	3527
54.3.3	Synchronous modes.....	3527
54.3.3.1	Synchronous mode.....	3527
54.3.4	Frame sync configuration.....	3528
54.3.5	Data FIFO.....	3529
54.3.5.1	Data alignment.....	3529
54.3.5.2	FIFO pointers.....	3530
54.3.6	Word mask register.....	3530
54.3.7	Interrupts and DMA requests.....	3531
54.3.7.1	FIFO request flag.....	3531
54.3.7.2	FIFO warning flag.....	3531
54.3.7.3	FIFO error flag.....	3532
54.3.7.4	Sync error flag.....	3532
54.3.7.5	Word start flag.....	3532
54.4	Memory map and register definition.....	3533
54.4.1	SAI Transmit Control Register (I2Sx_TCSR).....	3535
54.4.2	SAI Transmit Configuration 1 Register (I2Sx_TCR1).....	3538
54.4.3	SAI Transmit Configuration 2 Register (I2Sx_TCR2).....	3538
54.4.4	SAI Transmit Configuration 3 Register (I2Sx_TCR3).....	3540
54.4.5	SAI Transmit Configuration 4 Register (I2Sx_TCR4).....	3541
54.4.6	SAI Transmit Configuration 5 Register (I2Sx_TCR5).....	3542
54.4.7	SAI Transmit Data Register (I2Sx_TDR n).....	3543
54.4.8	SAI Transmit FIFO Register (I2Sx_TFR n).....	3544
54.4.9	SAI Transmit Mask Register (I2Sx_TMR).....	3544
54.4.10	SAI Receive Control Register (I2Sx_RCSR).....	3545
54.4.11	SAI Receive Configuration 1 Register (I2Sx_RCR1).....	3548
54.4.12	SAI Receive Configuration 2 Register (I2Sx_RCR2).....	3549

Section number	Title	Page
54.4.13	SAI Receive Configuration 3 Register (I2Sx_RCR3).....	3550
54.4.14	SAI Receive Configuration 4 Register (I2Sx_RCR4).....	3551
54.4.15	SAI Receive Configuration 5 Register (I2Sx_RCR5).....	3553
54.4.16	SAI Receive Data Register (I2Sx_RDRn).....	3553
54.4.17	SAI Receive FIFO Register (I2Sx_RFRn).....	3554
54.4.18	SAI Receive Mask Register (I2Sx_RMR).....	3554

Chapter 55 Smart Direct Memory Access Controller (SDMA)

55.1	Overview.....	3557
55.1.1	Block Diagram.....	3557
55.1.2	Features.....	3559
55.2	External Signals.....	3561
55.3	Clocks.....	3561
55.4	Functional Description.....	3561
55.4.1	SDMA Core.....	3563
55.4.1.1	SDMA Core Structure.....	3563
55.4.1.2	Program Control Unit (PCU).....	3566
55.4.1.2.1	Instruction Types.....	3566
55.4.1.2.2	PCU States.....	3567
55.4.1.3	SDMA Core Memory.....	3570
55.4.2	Scheduler.....	3570
55.4.2.1	Primary Functions.....	3570
55.4.2.2	Channels and DMA Requests.....	3571
55.4.2.2.1	Channels.....	3571
55.4.2.2.2	DMA Requests.....	3571
55.4.2.2.3	Mapping from DMA Requests to Channels and Priorities.....	3571
55.4.2.3	Scheduler Functional Description.....	3571
55.4.2.3.1	Scheduler Overview.....	3571
55.4.2.3.2	DMA Requests Scanning.....	3572

Section number	Title	Page
55.4.2.3.3	Mapping DMA Requests to Pending Channels.....	3573
55.4.2.3.4	Channel Overflow.....	3576
55.4.2.3.5	Runnable Channels Evaluation.....	3576
55.4.2.3.6	Next Channel Decision Tree.....	3578
55.4.2.3.7	Scheduler State Diagram.....	3580
55.4.2.3.8	Scheduler Pipeline Timing Diagram.....	3582
55.4.2.3.9	Channel-DMA Request Mapping.....	3582
55.4.2.3.10	Examples: How to Start a Channel.....	3582
55.4.2.4	Context Switching.....	3583
55.4.2.4.1	Context Switch Modes.....	3584
55.4.2.4.2	Context Switch Procedure.....	3584
55.4.2.4.3	Context Map in Memory.....	3586
55.4.3	Functional Units.....	3586
55.4.3.1	Burst DMA Unit.....	3586
55.4.3.1.1	Burst DMA Structure.....	3587
55.4.3.1.2	Burst DMA Registers.....	3588
55.4.3.1.3	Burst DMA Data Transfers.....	3589
55.4.3.1.3.1	Data Retrieval from the ARM platform Memory.....	3589
55.4.3.1.3.2	Storing Data Into the ARM platform Memory.....	3589
55.4.3.1.3.3	Transferring Data Between Two ARM platform Memory Locations-Burst DMA Unit.....	3590
55.4.3.2	Peripheral DMA Unit.....	3590
55.4.3.2.1	Peripheral DMA Structure.....	3591
55.4.3.2.2	Peripheral DMA Registers.....	3592
55.4.3.2.3	Peripheral DMA Data Transfers.....	3593
55.4.3.2.3.1	Data Retrieval from the ARM platform Memory or Peripheral.....	3593
55.4.3.2.3.2	Storing Data into the ARM platform Memory or Peripheral.	3593
55.4.3.2.3.3	Transferring Data Between Two ARM platform Memory Locations-Peripheral DMA Unit.....	3594

Section number	Title	Page
55.4.4	SDMA Security Support.....	3594
55.4.4.1	Locked Mode.....	3594
55.4.5	OnCE and PCU Debug States.....	3595
55.4.6	SDMA Clocks and Low Power Modes.....	3597
55.4.6.1	Clock Gating and Low Power Modes.....	3598
55.4.6.1.1	Coarse Clock Gating.....	3598
55.4.6.1.2	Refined Clock Gating.....	3599
55.4.6.1.3	Low Power Modes and User Control.....	3599
55.4.6.1.3.1	SLEEP Mode.....	3600
55.4.6.1.3.2	RUN Mode.....	3600
55.4.6.1.3.3	DEBUG Mode.....	3601
55.4.6.1.4	Stop Mode Response.....	3601
55.4.6.2	Reset.....	3601
55.4.7	Software Interface.....	3601
55.4.8	Initialization Information.....	3602
55.4.8.1	Hardware Reset.....	3602
55.4.8.2	Channel Script Execution.....	3603
55.4.8.3	Initialization and Script Execution Setup Sequence.....	3603
55.4.9	SDMA Programming Model.....	3604
55.4.9.1	State and Registers Per Channel.....	3604
55.4.9.2	General Purpose Registers.....	3605
55.4.9.3	Functional Unit State.....	3605
55.4.9.3.1	Program Counter Register (PC).....	3605
55.4.9.3.2	Flags.....	3605
55.4.9.3.3	Return Program Counter (RPC).....	3606
55.4.9.3.4	Loop Mode Start Program Counter (SPC).....	3606
55.4.9.3.5	Loop Mode End Program Counter (EPC).....	3606
55.4.9.4	Context Switching-Programming.....	3607

Section number	Title	Page
55.4.9.5	Address Space.....	3608
55.4.9.5.1	Instruction Memory Map.....	3609
55.4.9.5.2	Data Memory Map.....	3609
55.4.10	SDMA Initialization.....	3611
55.4.10.1	Hardware Reset-SDMA.....	3611
55.4.10.2	Standard Boot Sequence.....	3611
55.4.10.3	User-Defined Boot Sequence.....	3612
55.4.10.4	Script Loading and Context Initialization.....	3612
55.4.11	Instruction Description.....	3613
55.4.11.1	Scheduling Instructions.....	3613
55.4.11.2	Conditional Branch Instructions.....	3613
55.4.11.3	Unconditional Jump Instructions.....	3614
55.4.11.4	Subroutine Return Instructions.....	3614

55.11	SDMA Peripheral Registers.....	3791

Chapter 56 Semaphore (SEMA4)

56.1	Overview.....	3793
56.1.1	Features.....	3794
56.1.2	Modes of Operation.....	3795
56.2	External Signal Description.....	3795
56.3	Functional Description.....	3795
56.3.1	SEMA4_GATEn Operation.....	3795
56.3.2	SEMA4_CPnNTF Operation.....	3797
56.4	Initialization Information.....	3800
56.5	Application Information.....	3800
56.6	Memory map and register definition.....	3802
56.6.1	Semaphores Gate 0 Register (SEMA4_Gate00).....	3803

Section number	Title	Page
56.6.2	Semaphores Gate 1 Register (SEMA4_Gate01).....	3804
56.6.3	Semaphores Gate 2 Register (SEMA4_Gate02).....	3805
56.6.4	Semaphores Gate 3 Register (SEMA4_Gate03).....	3806
56.6.5	Semaphores Gate 4 Register (SEMA4_Gate04).....	3807
56.6.6	Semaphores Gate 5 Register (SEMA4_Gate05).....	3808
56.6.7	Semaphores Gate 6 Register (SEMA4_Gate06).....	3809
56.6.8	Semaphores Gate 7 Register (SEMA4_Gate07).....	3810
56.6.9	Semaphores Gate 8 Register (SEMA4_Gate08).....	3811
56.6.10	Semaphores Gate 9 Register (SEMA4_Gate09).....	3812
56.6.11	Semaphores Gate 10 Register (SEMA4_Gate10).....	3813
56.6.12	Semaphores Gate 11 Register (SEMA4_Gate11).....	3814
56.6.13	Semaphores Gate 12 Register (SEMA4_Gate12).....	3815
56.6.14	Semaphores Gate 13 Register (SEMA4_Gate13).....	3816
56.6.15	Semaphores Gate 14 Register (SEMA4_Gate14).....	3817
56.6.16	Semaphores Gate 15 Register (SEMA4_Gate15).....	3818
56.6.17	Semaphores Processor n IRQ Notification Enable (SEMA4_CPnINE).....	3819
56.6.18	Semaphores Processor n IRQ Notification (SEMA4_CPnNTF).....	3821
56.6.19	Semaphores (Secure) Reset Gate n (SEMA4_RSTGT).....	3823
56.6.20	Semaphores (Secure) Reset IRQ Notification (SEMA4_RSTNTF).....	3824

Chapter 57 System JTAG Controller (SJC)

57.1	Overview.....	3827
57.1.1	Features.....	3828
57.1.2	Modes of Operation.....	3829
57.2	External Signals.....	3831
57.2.1	External Signal Overview.....	3832
57.2.2	TAP Controller.....	3832
57.2.3	Accessing ExtraDebug Registers.....	3834

Section number	Title	Page
57.3	TAP Selection Block (TSB).....	3837
57.3.1	Select Mode Using Software.....	3837
57.4	Boundary Scan Register (BSR).....	3838
57.5	SoC JTAG Instruction Register (SJIR).....	3838
57.5.1	ID_CODE Instruction (IDCODE).....	3839
57.5.2	SAMPLE/PRELOAD Instruction.....	3840
57.5.3	EXTEST Instruction.....	3841
57.5.4	HIGHZ Instruction.....	3841
57.5.5	BYPASS Instruction.....	3841
57.5.6	ENABLE_ExtraDebug Instruction.....	3842
57.5.7	ENTER_DEBUG instruction.....	3842
57.5.8	TAP Select Instruction.....	3843
57.6	Security.....	3843
57.6.1	JTAG Security Modes.....	3844
57.6.1.1	Mode 1: No Debug - Maximum Security.....	3844
57.6.1.2	Mode 2: Secure JTAG - High Security.....	3844
57.6.1.2.1	Challenge/Response Mechanism in System JTAG Mode.....	3845
57.6.1.3	Mode 3: JTAG Enabled - Low Security.....	3846
57.6.2	Software Enabled JTAG.....	3846
57.6.3	Kill Trace.....	3847
57.6.4	SJC Disable Fuse.....	3848
57.7	Functional Description.....	3849
57.7.1	Static Core Debug.....	3849
57.7.2	Reset Mechanism.....	3849
57.8	Initialization/Application Information.....	3850
57.9	SJC Memory Map/Register Definition.....	3851
57.9.1	General Purpose Unsecured Status Register 1 (SJC_GPUSR1).....	3852
57.9.2	General Purpose Unsecured Status Register 2 (SJC_GPUSR2).....	3854
57.9.3	General Purpose Unsecured Status Register 3 (SJC_GPUSR3).....	3854

Section number	Title	Page
57.9.4	General Purpose Secured Status Register (SJC_GPSSR).....	3855
57.9.5	Debug Control Register (SJC_DCR).....	3856
57.9.6	Security Status Register (SJC_SSR).....	3858
57.9.7	General Purpose Clocks Control Register (SJC_GPCCR).....	3861

Chapter 58 Secure Non-Volatile Storage (SNVS)

58.1	SNVS overview.....	3863
58.1.1	SNVS features.....	3863
58.1.2	Modes of operation.....	3864
58.2	External Signals.....	3864
58.3	Clocks.....	3864
58.4	SNVS structure.....	3865
58.4.1	SNVS_HP (high power domain).....	3866
58.4.2	Non-secure real time counter.....	3867
58.4.2.1	Calibrating the time counter.....	3867
58.4.2.2	Time counter alarm.....	3868
58.4.2.3	Periodic interrupt.....	3868
58.5	SNVS_LP (low power domain).....	3868
58.5.1	Behavior during system power down.....	3869
58.5.2	Monotonic counter (MC).....	3869
58.6	SNVS reset and system power up.....	3870
58.6.1	PMIC Interface.....	3870
58.7	SNVS interrupts and alarms.....	3871
58.8	Programming Guidelines.....	3872
58.8.1	RTC control bits setting.....	3872
58.8.2	RTC value read.....	3873
58.8.3	General initialization guidelines.....	3873
58.9	SNVS Memory Map/Register Definition.....	3874
58.9.1	SNVS_HP Lock Register (SNVS_HPLR).....	3876

Section number	Title	Page
58.9.2	SNVS_HP Command Register (SNVS_HPCOMR).....	3878
58.9.3	SNVS_HP Control Register (SNVS_HPCR).....	3880
58.9.4	SNVS_HP Status Register (SNVS_HPSR).....	3883
58.9.5	SNVS_HP Real Time Counter MSB Register (SNVS_HPRTCMR).....	3885
58.9.6	SNVS_HP Real Time Counter LSB Register (SNVS_HPRTCLR).....	3886
58.9.7	SNVS_HP Time Alarm MSB Register (SNVS_HPTAMR).....	3886
58.9.8	SNVS_HP Time Alarm LSB Register (SNVS_HPTALR).....	3887
58.9.9	SNVS_LP Lock Register (SNVS_LPLR).....	3888
58.9.10	SNVS_LP Control Register (SNVS_LPCR).....	3890
58.9.11	SNVS_LP Status Register (SNVS_LPSR).....	3893
58.9.12	SNVS_LP Secure Monotonic Counter MSB Register (SNVS_LPSMCMR).....	3895
58.9.13	SNVS_LP Secure Monotonic Counter LSB Register (SNVS_LPSMCLR).....	3896
58.9.14	SNVS_LP General Purpose Register (SNVS_LPGPR).....	3896
58.9.15	SNVS_HP Version ID Register 1 (SNVS_HPVIDR1).....	3897
58.9.16	SNVS_HP Version ID Register 2 (SNVS_HPVIDR2).....	3897

Chapter 59 Shared Peripheral Bus Arbiter (SPBA)

59.1	Overview.....	3899
59.1.1	Features.....	3900
59.1.2	Modes of operation.....	3901
59.2	Clocks.....	3901
59.3	Functional description.....	3902
59.3.1	Masters arbitration.....	3902
59.4	Resource ownership control.....	3905
59.4.1	Access control	3905
59.4.1.1	Peripheral access.....	3905
59.4.1.2	Peripheral Right Register access.....	3906
59.4.2	Owner election.....	3907

Section number	Title	Page
59.4.3	Ending ownership.....	3907
59.4.3.1	Software Controlled Ownership Ending.....	3907
59.4.4	The Un-owned State.....	3908
59.5	SPBA Memory Map/Register Definition.....	3908
59.5.1	Peripheral Rights Register (SPBA_PRR _n).....	3910

Chapter 60

Sony/Philips Digital Interface (SPDIF)

60.1	Introduction	3913
60.1.1	Overview.....	3915
60.2	External Signals.....	3916
60.3	Clocks.....	3917
60.4	Functional Description.....	3917
60.4.1	SPDIF Receiver.....	3917
60.4.1.1	Audio Data Reception.....	3918
60.4.1.1.1	Application Note.....	3920
60.4.1.2	Channel Status Reception.....	3921
60.4.1.2.1	Channel Status Interrupt.....	3921
60.4.1.3	User Bit Reception.....	3921
60.4.1.4	Validity Flag Reception.....	3923
60.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	3924
60.4.1.6	Standards Compliance.....	3924
60.4.1.7	SPDIF PLOCK Detection and Rxclk Output.....	3925
60.4.1.8	Measuring Frequency of SPDIF_RxCk.....	3925
60.4.2	SPDIF Transmitter.....	3926
60.4.2.1	Audio Data Transmission.....	3926
60.4.2.2	Channel Status Transmission.....	3927
60.4.2.3	Validity Flag Transmission.....	3927
60.5	SPDIF Memory Map/Register Definition.....	3927
60.5.1	SPDIF Configuration Register (SPDIF_SCR).....	3929

Section number	Title	Page
60.5.2	CDText Control Register (SPDIF_SRCD).....	3931
60.5.3	PhaseConfig Register (SPDIF_SRPC).....	3932
60.5.4	InterruptEn Register (SPDIF_SIE).....	3933
60.5.5	InterruptStat Register (SPDIF_SIS).....	3935
60.5.6	InterruptClear Register (SPDIF_SIC).....	3937
60.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	3938
60.5.8	SPDIFRxRight Register (SPDIF_SRR).....	3939
60.5.9	SPDIFRxCChannel_h Register (SPDIF_SRC SH).....	3939
60.5.10	SPDIFRxCChannel_l Register (SPDIF_SRC SL).....	3940
60.5.11	UchannelRx Register (SPDIF_SRU).....	3940
60.5.12	QchannelRx Register (SPDIF_SRQ).....	3941
60.5.13	SPDIFTxLeft Register (SPDIF_STL).....	3941
60.5.14	SPDIFTxRight Register (SPDIF_STR).....	3942
60.5.15	SPDIFTxCChannelCons_h Register (SPDIF_STC SCH).....	3942
60.5.16	SPDIFTxCChannelCons_l Register (SPDIF_STC SCL).....	3943
60.5.17	FreqMeas Register (SPDIF_SRFM).....	3943
60.5.18	SPDIFTxClk Register (SPDIF_STC).....	3944

Chapter 61 System Reset Controller (SRC)

61.1	SRC Overview.....	3947
61.1.1	Features.....	3947
61.2	External Signals.....	3947
61.3	Clocks.....	3948
61.4	Top-level resets, power-up sequence and external supply integration.....	3949
61.4.1	Reset and Power-up Flow.....	3949
61.4.2	Finite-State Machine (FSM).....	3952
61.4.3	Power mode transitions.....	3953
61.5	Power-On Reset and power sequencing.....	3954
61.5.1	External POR using SRC_POR_B.....	3954

Section number	Title	Page
61.5.2	Internal POR.....	3955
61.6	Functional Description.....	3955
61.6.1	Reset Control.....	3955
61.6.1.1	Reset inputs and outputs.....	3955
61.6.1.2	Reset Handling.....	3957
61.6.1.2.1	Reset Qualification.....	3957
61.6.1.2.2	Reset Sequence and De-Assertion.....	3958
61.6.1.2.3	POR (SRC_POR_B).....	3958
61.6.1.2.4	COLD RESET.....	3959
61.6.1.2.5	WARM RESET.....	3960
61.6.2	Parallel Reset Requests.....	3961
61.6.3	Boot Mode Control.....	3962
61.6.3.1	BOOT_MODE Pin Latching.....	3962
61.7	SRC Memory Map/Register Definition.....	3963
61.7.1	SRC Control Register (SRC_SCR).....	3965
61.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	3968
61.7.3	SRC Reset Status Register (SRC_SRSR).....	3969
61.7.4	SRC Interrupt Status Register (SRC_SISR).....	3972
61.7.5	SRC Interrupt Mask Register (SRC_SIMR).....	3974
61.7.6	SRC Boot Mode Register 2 (SRC_SBMR2).....	3975
61.7.7	SRC General Purpose Register 1 (SRC_GPR1).....	3976
61.7.8	SRC General Purpose Register 2 (SRC_GPR2).....	3976
61.7.9	SRC General Purpose Register 3 (SRC_GPR3).....	3977
61.7.10	SRC General Purpose Register 4 (SRC_GPR4).....	3977
61.7.11	SRC General Purpose Register 5 (SRC_GPR5).....	3977
61.7.12	SRC General Purpose Register 6 (SRC_GPR6).....	3978
61.7.13	SRC General Purpose Register 7 (SRC_GPR7).....	3978
61.7.14	SRC General Purpose Register 8 (SRC_GPR8).....	3978
61.7.15	SRC General Purpose Register 9 (SRC_GPR9).....	3979

Section number	Title	Page
61.7.16	SRC General Purpose Register 10 (SRC_GPR10).....	3980

Chapter 62 Synchronous Serial Interface (SSI)

62.1	Overview.....	3981
62.1.1	Features.....	3982
62.1.2	Modes of Operation.....	3983
62.2	External Signal Description.....	3983
62.2.1	Signals Overview.....	3983
62.3	Clocks.....	3987
62.4	SSI Transmit FIFO 0 & 1 Registers.....	3987
62.5	SSI Transmit Shift Register (TXSR).....	3988
62.6	SSI Receive FIFO 0 and 1 Registers.....	3990
62.7	SSI Receive Shift Register (RXSR).....	3991
62.8	Functional Description.....	3993
62.8.1	Operating Modes.....	3993
62.8.1.1	Normal Mode.....	3995
62.8.1.1.1	Normal Mode Transmit.....	3995
62.8.1.1.2	Normal Mode Receive.....	3996
62.8.1.2	Network Mode.....	3998
62.8.1.2.1	Network Mode Transmit.....	3999
62.8.1.2.2	Network Mode Receive.....	4000
62.8.1.3	Gated Clock Mode.....	4002
62.8.1.4	I2S Mode.....	4005
62.8.1.5	AC97 Mode.....	4007
62.8.1.5.1	AC97 Fixed Mode (SSI.SACNT[1]=0).....	4009
62.8.1.5.2	AC97 Variable Mode (SSI.SACNT[1]=1).....	4009
62.8.2	External Frame and Clock Operation.....	4010
62.8.2.1	Data Alignment Formats Supported.....	4010
62.8.3	SSI Architecture.....	4011

Section number	Title	Page
62.8.4	SSI Clocking.....	4012
62.8.4.1	SSI Clock and Frame Sync Generation.....	4013
62.8.4.2	DIV2, PSR and PM Bit Description.....	4014
62.8.5	Receive Interrupt Enable Bit Description.....	4016
62.8.6	Transmit Interrupt Enable Bit Description.....	4017
62.8.7	Internal Frame and Clock Shutdown.....	4018
62.8.8	Peripheral Bus Interface.....	4020
62.8.8.1	Transfer Lengths Supported.....	4020
62.8.8.2	Transfer Bus Errors.....	4020
62.8.8.3	Clock Rate.....	4021
62.8.9	Reset.....	4021
62.9	SSI Memory Map/Register Definition.....	4021
62.9.1	SSI Transmit Data Register n (SSIx_STXn).....	4024
62.9.2	SSI Receive Data Register n (SSIx_SRXn).....	4024
62.9.3	SSI Control Register (SSIx_SCR).....	4025
62.9.4	SSI Interrupt Status Register (SSIx_SISR).....	4027
62.9.5	SSI Interrupt Enable Register (SSIx_SIER).....	4033
62.9.6	SSI Transmit Configuration Register (SSIx_STCR).....	4037
62.9.7	SSI Receive Configuration Register (SSIx_SRCR).....	4039
62.9.8	SSI Transmit Clock Control Register (SSIx_STCCR).....	4041
62.9.9	SSI Receive Clock Control Register (SSIx_SRCCR).....	4043
62.9.10	SSI FIFO Control/Status Register (SSIx_SFCSR).....	4044
62.9.11	SSI AC97 Control Register (SSIx_SACNT).....	4048
62.9.12	SSI AC97 Command Address Register (SSIx_SACADD).....	4049
62.9.13	SSI AC97 Command Data Register (SSIx_SACDAT).....	4049
62.9.14	SSI AC97 Tag Register (SSIx_SATAG).....	4050
62.9.15	SSI Transmit Time Slot Mask Register (SSIx_STMSK).....	4050
62.9.16	SSI Receive Time Slot Mask Register (SSIx_SRMSK).....	4051
62.9.17	SSI AC97 Channel Status Register (SSIx_SACCST).....	4051

Section number	Title	Page
62.9.18	SSI AC97 Channel Enable Register (SSIx_SACCEN).....	4052
62.9.19	SSI AC97 Channel Disable Register (SSIx_SACCDIS).....	4052

Chapter 63 Temperature Monitor (TEMPMON)

63.1	Overview.....	4053
63.2	Software Usage Guidelines.....	4054
63.3	TEMPMON Memory Map/Register Definition.....	4056
63.3.1	Tempsensor Control Register 0 (TEMPMON_TEMPSENSE0n).....	4057
63.3.2	Tempsensor Control Register 1 (TEMPMON_TEMPSENSE1n).....	4059
63.3.3	Tempsensor Control Register 2 (TEMPMON_TEMPSENSE2n).....	4060

Chapter 64 TrustZone Address Space Controller (TZASC)

64.1	Overview.....	4061
64.2	Clocks.....	4062
64.3	i.MX 6SoloX Specific Configuration	4062
64.4	Address Mapping in various memory mapping modes.....	4063

Chapter 65 Universal Asynchronous Receiver/Transmitter (UART)

65.1	Overview.....	4065
65.1.1	Features.....	4066
65.1.2	Modes of operation.....	4067
65.2	External Signals.....	4067
65.2.1	Detailed Signal Descriptions.....	4070
65.2.1.1	Interrupt Signals.....	4070
65.2.1.1.1	interrupt_uart - UART Interrupt.....	4070
65.2.1.2	DMA Request Signals.....	4070
65.2.1.2.1	dma_req_rx - Receiver DMA Request.....	4070
65.2.1.2.2	dma_req_tx - Transmitter DMA Request.....	4070
65.2.1.3	Special Signals.....	4070
65.2.1.3.1	stop_req - Stop Mode.....	4070

Section number	Title	Page
	65.2.1.3.2 doze_req - Doze Mode.....	4070
	65.2.1.3.3 debug_req - Debug Mode.....	4071
65.3	Clocks.....	4071
65.4	Functional Description.....	4071
65.4.1	Interrupts and DMA Requests.....	4071
65.4.2	Clocks.....	4072
65.4.2.1	Clock requirements.....	4073
65.4.2.2	Maximum Baud Rate.....	4073
65.4.2.3	Clocking in Low-Power Modes.....	4073
65.4.3	General UART Definitions.....	4074
65.4.3.1	RTS_B - UART Request To Send.....	4075
65.4.3.2	RTS Edge Triggered Interrupt.....	4075
65.4.3.3	DTR_B - Data Terminal Ready	4076
65.4.3.4	DSR_B - Data Set Ready.....	4077
65.4.3.5	DTR_B/DSR_B Edge Triggered Interrupt.....	4077
65.4.3.6	DCD_B - Data Carrier Detect.....	4077
65.4.3.7	RI_B - Ring Indicator.....	4078
65.4.3.8	CTS_B - Clear To Send.....	4078
65.4.3.9	Programmable CTS_B Deassertion.....	4078
65.4.3.10	TX_DATA - UART Transmit.....	4078
65.4.3.11	RX_DATA - UART Receive.....	4079
65.4.4	Transmitter.....	4081
65.4.4.1	Transmitter FIFO Empty Interrupt Suppression.....	4081
65.4.4.2	Transmitting a Break Condition.....	4083
65.4.5	Receiver.....	4083
65.4.5.1	Idle Line Detect.....	4084
65.4.5.2	Aging Character Detect.....	4085
65.4.5.3	Receiver Wake.....	4086
65.4.5.4	Receiving a BREAK Condition.....	4087

Section number	Title	Page
65.4.5.5	Vote Logic.....	4087
65.4.5.6	Baud Rate Automatic Detection Logic.....	4089
65.4.5.6.1	Baud Rate Automatic Detection Protocol.....	4090
65.4.5.6.2	New Baud Rate Determination.....	4090
65.4.5.6.2.1	New Autobaud Counter Stopped bit and Interrupt.....	4091
65.4.6	Escape Sequence Detection.....	4091
65.5	Binary Rate Multiplier (BRM).....	4093
65.6	Infrared Interface.....	4095
65.6.1	Generalities-Infrared.....	4095
65.6.2	Inverted Transmission and Reception bits (INVT & INVR).....	4096
65.6.3	InfraRed Special Case (IRSC) Bit.....	4096
65.6.4	IrDA interrupt.....	4097
65.6.5	Conclusion about IrDA.....	4098
65.6.6	Programming IrDA Interface.....	4099
65.6.6.1	High Speed.....	4099
65.6.6.2	Low Speed.....	4099
65.7	9-bit RS-485 Mode.....	4100
65.7.1	Generalities.....	4100
65.7.2	Transmit 9-bit RS-485 frames.....	4101
65.7.3	Receive 9-bit RS-485 frames.....	4101
65.7.3.1	RS-485 Slave Address Normal Detect Mode.....	4101
65.7.3.2	RS-485 Slave Address Automatic Detect Mode.....	4102
65.8	Low Power Modes.....	4102
65.8.1	UART Operation in System Doze Mode.....	4103
65.8.2	UART Operation in System Stop Mode.....	4103
65.8.3	Power Saving Method in UART.....	4104
65.9	UART Operation in System Debug State.....	4104
65.10	Reset.....	4105
65.10.1	Hardware reset.....	4105

Section number	Title	Page
65.10.2	Software reset.....	4105
65.11	Transfer Error.....	4105
65.12	Functional Timing.....	4106
65.12.1	IrDA Mode.....	4106
65.13	Initialization.....	4106
65.13.1	Programming the UART in RS-232 mode.....	4106
65.13.2	Programming the UART in 9-bit RS-485 mode.....	4108
65.14	References.....	4109
65.15	UART Memory Map/Register Definition.....	4109
65.15.1	UART Receiver Register (UARTx_URXD).....	4115
65.15.2	UART Transmitter Register (UARTx_UTXD).....	4117
65.15.3	UART Control Register 1 (UARTx_UCR1).....	4118
65.15.4	UART Control Register 2 (UARTx_UCR2).....	4120
65.15.5	UART Control Register 3 (UARTx_UCR3).....	4123
65.15.6	UART Control Register 4 (UARTx_UCR4).....	4125
65.15.7	UART FIFO Control Register (UARTx_UFCR).....	4127
65.15.8	UART Status Register 1 (UARTx_USR1).....	4129
65.15.9	UART Status Register 2 (UARTx_USR2).....	4132
65.15.10	UART Escape Character Register (UARTx_UESC).....	4134
65.15.11	UART Escape Timer Register (UARTx_UTIM).....	4135
65.15.12	UART BRM Incremental Register (UARTx_UBIR).....	4135
65.15.13	UART BRM Modulator Register (UARTx_UBMR).....	4136
65.15.14	UART Baud Rate Count Register (UARTx_UBRC).....	4136
65.15.15	UART One Millisecond Register (UARTx_ONEMS).....	4137
65.15.16	UART Test Register (UARTx_UTS).....	4138
65.15.17	UART RS-485 Mode Control Register (UARTx_UMCR).....	4139

Section number	Title	Page
Chapter 66		
Universal Serial Bus Controller (USB)		
66.1	Overview.....	4141
66.1.1	Features.....	4142
66.1.2	Modes of Operation.....	4143
66.1.2.1	Normal Mode.....	4144
66.1.2.2	Low-Power Mode.....	4144
66.2	External Signals.....	4145
66.3	Functional Description.....	4146
66.3.1	USB 2.0 Controller Core 0.....	4146
66.3.1.1	Host Mode.....	4146
66.3.1.2	Peripheral (Device) Mode.....	4146
66.3.2	USB 2.0 Controller Core 1.....	4147
66.3.3	USB 2.0 Controller Core 2.....	4147
66.3.4	USB Power Control.....	4147
66.3.4.1	Entering Low Power Suspend Mode.....	4147
66.3.4.2	Wake-Up Events.....	4148
66.3.4.2.1	Host Mode Events.....	4148
66.3.5	Interrupts.....	4149
66.3.5.1	USB Core Interrupts.....	4149
66.3.5.2	USB Wake-Up Interrupts.....	4149
66.4	USB Operation Model.....	4150
66.4.1	Register Interface.....	4150
66.4.1.1	Configuration, Control and Status Register Set.....	4151
66.4.1.2	Identification Registers.....	4153
66.4.1.3	OTG Operations.....	4153
66.4.1.3.1	Register Bits.....	4153
66.4.2	Host Data Structures.....	4154
66.4.2.1	Periodic Frame List.....	4155

Section number	Title	Page
66.4.2.2	Asynchronous List Queue Head Pointer.....	4156
66.4.2.3	Isochronous (High-Speed) Transfer Descriptor (iTd).....	4157
66.4.2.3.1	Next Link Pointer.....	4158
66.4.2.3.2	iTD Transaction Status and Control List.....	4159
66.4.2.3.3	iTD Buffer Page Pointer List (Plus).....	4160
66.4.2.4	Split Transaction Isochronous Transfer Descriptor (siTD).....	4162
66.4.2.4.1	Next Link Pointer.....	4162
66.4.2.4.2	siTD Endpoint Capabilities/Characteristics.....	4163
66.4.2.4.3	siTD Transfer State.....	4164
66.4.2.4.4	siTD Buffer Pointer List (plus).....	4165
66.4.2.4.5	siTD Back Link Pointer.....	4166
66.4.2.5	Queue element transfer descriptor (qTD).....	4166
66.4.2.5.1	Next qTD Pointer.....	4167
66.4.2.5.2	Alternate Next qTD Pointer.....	4168
66.4.2.5.3	qTD Token.....	4168
66.4.2.5.4	qTD Buffer Page Pointer List.....	4171
66.4.2.6	Queue Head.....	4172
66.4.2.6.1	Queue Head Horizontal Link Pointer.....	4173
66.4.2.6.2	Queue Head Endpoint Capabilities/Characteristics.....	4173
66.4.2.6.3	Transfer Overlay-Queue Head.....	4175
66.4.2.7	Periodic Frame Span Traversal Node (FSTN).....	4177
66.4.2.7.1	FSTN Normal Path Pointer	4177
66.4.2.7.2	FSTN Back Path Link Pointer	4178
66.4.3	Host Operational Model	4178
66.4.3.1	Host Controller Initialization	4178
66.4.3.2	Port Routing and Control	4180
66.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit	4182
66.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event	4183

Section number	Title	Page
66.4.3.2.3	Example Port Routing State Machine	4185
66.4.3.2.3.1	EHCI HC Owner	4185
66.4.3.2.3.2	Companion HC Owner	4186
66.4.3.2.4	Port Power	4186
66.4.3.2.5	Port Reporting Over-Current	4187
66.4.3.3	Suspend/Resume-Host Operational Model	4188
66.4.3.3.1	Port Suspend/Resume	4188
66.4.3.4	Schedule Traversal Rules	4191
66.4.3.4.1	Example - Preserving Micro-Frame Integrity	4193
66.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm	4193
66.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries	4195
66.4.3.6	Periodic Schedule	4198
66.4.3.7	Managing Isochronous Transfers Using iTDs	4200
66.4.3.7.1	Host Controller Operational Model for iTDs	4200
66.4.3.7.2	Software Operational Model for iTDs	4202
66.4.3.7.2.1	Periodic scheduling threshold.....	4204
66.4.3.8	Asynchronous Schedule	4205
66.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	4206
66.4.3.8.2	Removing Queue Heads from Asynchronous Schedule	4207
66.4.3.8.3	Empty Asynchronous Schedule Detection	4209
66.4.3.8.4	Restarting Asynchronous Schedule Before EOF	4210
66.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal	4211
66.4.3.8.4.2	Async Sched Not Active	4212
66.4.3.8.4.3	Async Sched Active	4212
66.4.3.8.4.4	Async Sched Sleeping	4213
66.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	4213
66.4.3.8.5	Asynchronous schedule traversal: Start Event.....	4213
66.4.3.8.6	Reclamation Status Bit (USBSTS Register)	4214

Section number	Title	Page
66.4.3.9	Operational Model for Nak Counter.....	4214
66.4.3.9.1	Nak Count Reload Control	4216
66.4.3.9.1.1	Wait for List Head	4217
66.4.3.9.1.2	Do Reload	4217
66.4.3.9.1.3	Wait for Start Event	4217
66.4.3.10	Managing Control/Bulk/Interrupt Transfers through Queue Heads.....	4218
66.4.3.10.1	Fetch Queue Head	4220
66.4.3.10.2	Advance Queue	4220
66.4.3.10.3	Execute Transaction	4221
66.4.3.10.3.1	Interrupt Transfer Pre-condition Criteria	4222
66.4.3.10.3.2	Asynchronous Transfer Pre-operations and Pre-condition Criteria	4222
66.4.3.10.3.3	Transfer Type Independent Pre-operations.....	4222
66.4.3.10.3.4	Halting a Queue Head	4225
66.4.3.10.3.5	Asynchronous Schedule Park Mode	4226
66.4.3.10.4	Write Back qTD	4228
66.4.3.10.5	Follow Queue Head Horizontal Pointer	4228
66.4.3.10.6	Buffer Pointer List Use for Data Streaming with qTDs	4229
66.4.3.10.7	Adding Interrupt Queue Heads to the Periodic Schedule	4231
66.4.3.10.8	Managing Transfer Complete Interrupts from Queue Heads	4231
66.4.3.11	Ping Control.....	4232
66.4.3.12	Split Transactions	4233
66.4.3.12.1	Split Transactions for Asynchronous Transfers	4234
66.4.3.12.1.1	Asynchronous - Do Start Split.....	4235
66.4.3.12.1.2	Asynchronous - Do Complete Split	4235
66.4.3.12.2	Split Transaction Interrupt	4236
66.4.3.12.2.1	Split Transaction Scheduling Mechanisms for Interrupt	4237
66.4.3.12.2.2	Host Controller Operational Model for FSTNs.....	4240
66.4.3.12.2.3	Software Operational Model for FSTNs.....	4243

Section number	Title	Page
66.4.3.12.2.4	Tracking Split Transaction Progress for Interrupt Transfers	.4244
66.4.3.12.2.5	Split Transaction Execution State Machine for Interrupt4245
66.4.3.12.2.6	Rebalancing the periodic schedule 4251
66.4.3.12.3	Split Transaction Isochronous4252
66.4.3.12.3.1	Split Transaction Scheduling Mechanisms for Isochronous	. 4252
66.4.3.12.3.2	Tracking Split Transaction Progress for Isochronous Transfers 4257
66.4.3.12.3.3	Split Transaction Execution State Machine for Isochronous	4259
66.4.3.12.3.4	Periodic Isochronous - Do Start Split4260
66.4.3.12.3.5	Periodic Isochronous - Do Complete Split4262
66.4.3.12.3.6	Complete-Split for Scheduling Boundary Cases 2a, 2b 4265
66.4.3.12.3.7	Split Transaction for Isochronous - Processing Examples 4267
66.4.3.13	Host Controller Pause 4269
66.4.3.14	Port Test Modes -Host Operational Model 4270
66.4.3.15	Interrupts-Host Operational Model4270
66.4.3.15.1	Transfer/Transaction Based Interrupts4272
66.4.3.15.1.1	Transaction Error4272
66.4.3.15.1.2	Serial Bus Babble 4272
66.4.3.15.1.3	Data Buffer Error4273
66.4.3.15.1.4	USB Interrupt (Interrupt on Completion (IOC)) 4274

Chapter 67 Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

67.1	USB PHY Overview.....	4405
67.2	Operation.....	4405
67.2.1	UTMI.....	4405
67.2.2	Digital Transmitter.....	4406
67.2.3	Digital Receiver.....	4406
67.2.4	Analog Receiver.....	4406
67.2.4.1	HS Differential Receiver.....	4407
67.2.4.2	Squelch Detector.....	4408
67.2.4.3	LS/FS Differential Receiver.....	4408
67.2.4.4	HS Disconnect Detector.....	4408
67.2.4.5	USB Plugged-In Detector.....	4408
67.2.4.6	Single-Ended USB_DP Receiver.....	4409
67.2.4.7	Single-Ended USB_DN Receiver.....	4409
67.2.4.8	9X Oversample Module.....	4409
67.2.5	Analog Transmitter.....	4409
67.2.5.1	Switchable High-Speed 45Ω Termination Resistors.....	4409
67.2.5.2	Low-Speed/Full-Speed Differential Driver.....	4410
67.2.5.3	High-Speed Differential Driver.....	4410
67.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	4410
67.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	4410

Section number	Title	Page
67.2.6	Recommended Register Configuration for USB Certification.....	4412
67.2.7	Charger detection.....	4412
67.2.7.1	Charger detect control table.....	4412
67.2.7.2	Data pin contact detector.....	4412
67.2.7.3	Charger detector.....	4413
67.2.7.4	Charger detection software flow.....	4413
67.2.7.5	Dead Battery Protect.....	4415
67.3	USB PHY Memory Map/Register Definition.....	4415
67.3.1	USB PHY Power-Down Register (USBPHY _x _PWD _n).....	4418
67.3.2	USB PHY Transmitter Control Register (USBPHY _x _TX _n).....	4420
67.3.3	USB PHY Receiver Control Register (USBPHY _x _RX _n).....	4421
67.3.4	USB PHY General Control Register (USBPHY _x _CTRL _n).....	4423
67.3.5	USB PHY Status Register (USBPHY _x _STATUS).....	4426
67.3.6	USB PHY Debug Register (USBPHY _x _DEBUG _n).....	4428
67.3.7	UTMI Debug Status Register 0 (USBPHY _x _DEBUG0_STATUS).....	4430
67.3.8	UTMI Debug Status Register 1 (USBPHY _x _DEBUG1 _n).....	4431
67.3.9	UTMI RTL Version (USBPHY _x _VERSION).....	4432
67.4	USB Analog Memory Map/Register Definition.....	4432
67.4.1	USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECT _n).....	4434
67.4.2	USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECT _n).....	4435
67.4.3	USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT).....	4437
67.4.4	USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT).....	4439
67.4.5	USB Misc Register (USB_ANALOG_USB1_MISC _n).....	4440

Chapter 68		
Ultra Secured Digital Host Controller (uSDHC)		
68.1	Overview.....	4451
68.1.1	Features.....	4454
68.1.2	Modes and Operations.....	4455
68.1.2.1	Data transfer Modes.....	4455
68.2	External Signals.....	4455
68.2.1	Signals Overview.....	4459
68.3	Clocks.....	4459
68.4	Functional Description.....	4460
68.4.1	Data Buffer.....	4460
68.4.1.1	Write Operation Sequence.....	4463
68.4.1.2	Read Operation Sequence.....	4463
68.4.1.3	Data Buffer and Block Size.....	4464
68.4.1.4	Dividing Large Data Transfer.....	4465
68.4.1.5	External DMA Request.....	4466
68.4.2	DMA AHB Interface.....	4467
68.4.2.1	Internal DMA Request.....	4468
68.4.2.2	DMA Burst Length.....	4469
68.4.2.3	AHB Master Interface.....	4469
68.4.2.4	ADMA Engine.....	4469
68.4.2.4.1	ADMA Concept and Descriptor Format.....	4470
68.4.2.4.2	ADMA Interrupt.....	4474
68.4.2.4.3	ADMA Error.....	4475
68.4.3	Register Bank with IP Bus Interface.....	4475
68.4.3.1	SD Protocol Unit.....	4476
68.4.3.2	SD control misc.....	4477
68.4.3.3	SD Clock control.....	4477
68.4.3.4	Command control.....	4477

Section number	Title	Page
68.4.3.5	Data control.....	4478
68.4.4	Clock & Reset Manager.....	4478
68.4.5	Clock Generator.....	4479
68.4.6	SDIO Card Interrupt.....	4479
68.4.6.1	Interrupts in 1-bit Mode.....	4479
68.4.6.2	Interrupt in 4-bit Mode.....	4479
68.4.6.3	Card Interrupt Handling.....	4480
68.4.7	Card Insertion and Removal Detection.....	4481
68.4.8	Power Management and Wake Up Events.....	4482
68.4.8.1	Setting Wake Up Events.....	4483
68.4.9	MMC fast boot.....	4483
68.4.9.1	Boot operation.....	4483
68.4.9.2	Alternative boot operation.....	4484
68.5	Initialization/Application of uSDHC.....	4485
68.5.1	Command Send & Response Receive Basic Operation.....	4485
68.5.2	Card Identification Mode.....	4486
68.5.2.1	Card Detect.....	4486
68.5.2.2	Reset.....	4487
68.5.2.3	Voltage Validation.....	4488
68.5.2.4	Card Registry.....	4490
68.5.3	Card Access.....	4491
68.5.3.1	Block Write.....	4491
68.5.3.1.1	Normal Write.....	4491
68.5.3.1.2	DDR Write.....	4493
68.5.3.1.3	Write with Pause.....	4493
68.5.3.2	Block Read.....	4495
68.5.3.2.1	Normal Read.....	4495
68.5.3.2.2	DDR Read.....	4495
68.5.3.2.3	Read with Pause.....	4496

Section number	Title	Page
	68.5.3.2.4 DLL (Delay Line) in Read Path.....	4497
68.5.3.3	Suspend Resume.....	4499
	68.5.3.3.1 Suspend.....	4499
	68.5.3.3.2 Resume.....	4500
68.5.3.4	ADMA Usage.....	4500
68.5.3.5	Transfer Error.....	4501
	68.5.3.5.1 CRC Error.....	4501
	68.5.3.5.2 Internal DMA Error.....	4501
	68.5.3.5.3 Transfer ADMA Error.....	4502
	68.5.3.5.4 Auto CMD12 Error.....	4502
68.5.3.6	Card Interrupt.....	4503
68.5.4	Switch Function.....	4503
68.5.4.1	Query, Enable and Disable SDIO High Speed Mode.....	4504
68.5.4.2	Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50.....	4504
68.5.4.3	Query, Enable and Disable MMC High Speed Mode.....	4505
68.5.4.4	Set MMC Bus Width.....	4505
68.5.5	ADMA Operation.....	4505
	68.5.5.1 ADMA1 Operation.....	4505
	68.5.5.2 ADMA2 Operation.....	4506
68.5.6	Fast Boot Operation.....	4506
	68.5.6.1 Normal fast boot flow	4507
	68.5.6.2 Alternative fast boot flow.....	4507
	68.5.6.3 Fast boot application case (in DMA mode).....	4508
68.6	Commands for MMC/SD/SDIO.....	4510
68.7	Software Restrictions.....	4515
68.7.1	Initialization Active.....	4515
68.7.2	Software Polling Procedure.....	4516
68.7.3	Suspend Operation.....	4516
68.7.4	Data Length Setting.....	4516

Section number	Title	Page
68.7.5	(A)DMA Address Setting.....	4516
68.7.6	Data Port Access.....	4517
68.7.7	Change Clock Frequency.....	4517
68.7.8	Multi-block Read.....	4517
68.8	uSDHC Memory Map/Register Definition.....	4517
68.8.1	DMA System Address (uSDHCx_DS_ADDR).....	4523
68.8.2	Block Attributes (uSDHCx_BLK_ATT).....	4524
68.8.3	Command Argument (uSDHCx_CMD_ARG).....	4525
68.8.4	Command Transfer Type (uSDHCx_CMD_XFR_TYP).....	4525

68.8.29	Tuning Control Register (uSDHCx_TUNING_CTRL).....	4584

Chapter 69 Video Analog-to-Digital Converter (VADC)

69.1	Overview.....	4587
69.2	External Signals.....	4588
69.3	Analog front end (AFE).....	4589
69.3.1	Video ADC features.....	4589
69.4	Video decoder.....	4590
69.4.1	Video decoder features.....	4590
69.5	AFE memory map and registers.....	4591
69.5.1	AFE_BLOCK_ID.....	4592
69.5.2	Power Down Buffers (AFE_PDBUF).....	4593
69.5.3	Software Reset (AFE_SWRST).....	4594
69.5.4	Band Gap (AFE_BGREG).....	4595
69.5.5	Accessar ID (AFE_ACCESSAR_ID).....	4596
69.5.6	Power Down ADC (AFE_PDADC).....	4596
69.5.7	Power Down SAR High (AFE_PDSARH).....	4597
69.5.8	Power Down SAR Low (AFE_PDSARL).....	4598
69.5.9	Power Down ADC Ref. High (AFE_PDADCRFH).....	4598
69.5.10	Power Down ADC Ref. Low (AFE_PDADCRFL).....	4599
69.5.11	ADC Gain (AFE_ADCGN).....	4599
69.5.12	ADC Ref Trim Low (AFE_REFTRIML).....	4600
69.5.13	ADC Ref Trim High (AFE_REFTRIMH).....	4601
69.5.14	Clamp DAC Trim (AFE_DACAMP).....	4601
69.5.15	Clamp DAC Data (AFE_CLMPDAT).....	4602

Section number	Title	Page
69.5.16	Clamp DAC Control (AFE_CLMPAMP).....	4602
69.5.17	Clamp Control (AFE_CLAMP).....	4603
69.5.18	Input Buffer (AFE_INPBUF).....	4605
69.5.19	Analog Input Filter (AFE_INPFLT).....	4606
69.5.20	ADC Digital Gain (AFE_ADCDGN).....	4607
69.5.21	Off-Chip Drive (AFE_OFFDRV).....	4608
69.5.22	VADC INPUT CONFIG (AFE_INPCONFIG).....	4608
69.5.23	VADC PROG DELAY (AFE_PROGDELAY).....	4609
69.5.24	ADC COMPARATOR TIMING (AFE_ADCOMT).....	4610
69.5.25	ALGORITHM DELAY (AFE_ALGDELAY).....	4610
69.5.26	Acc ID (AFE_ACC_ID).....	4611
69.5.27	ACC STATUS (AFE_ACCSTA).....	4611
69.5.28	ACC NUMBER OF SLICE (AFE_ACCNOSLI).....	4612
69.5.29	ACC CALIBRATE CONTROL (AFE_ACCCALCON).....	4612
69.5.30	ACC BWE WRITE CONTROL (AFE_BWEWRICTRL).....	4613
69.5.31	ACC SELECT SLICE (AFE_SELSLI).....	4614
69.5.32	ACC SELECT BYTE (AFE_SELBYT).....	4614
69.5.33	ACC READ VALUE (AFE_REDVAL).....	4615
69.5.34	ACC WRITE BYTE (AFE_WRIBYT).....	4615
69.6	Video decoder memory map and registers.....	4616
69.6.1	2D Comb Filter Control 1 (VDEC_CFC1).....	4618
69.6.2	Burst Gate (VDEC_BRSTGT).....	4618
69.6.3	Horizontal Position (VDEC_HZPOS).....	4619
69.6.4	Vertical Position (VDEC_VRTPOS).....	4619
69.6.5	Output Conditioning and HV Shift (VDEC_HVSHFT).....	4620
69.6.6	HSync Ignore Start (VDEC_HSIGS).....	4621
69.6.7	HSync Ignore End (VDEC_HSIGE).....	4621
69.6.8	VSync Control 1 (VDEC_VSCON1).....	4622
69.6.9	VSync Control 2 (VDEC_VSCON2).....	4623

Section number	Title	Page
69.6.10	Y/C Delay and Chroma Debug (VDEC_YCDEL).....	4624
69.6.11	After Clamp (VDEC_AFTCLP).....	4625
69.6.12	DC Offset (VDEC_DCOFF).....	4626
69.6.13	Chroma Swap, Invert, and Debug (VDEC_CSID).....	4627
69.6.14	Cb Gain (VDEC_CBGN).....	4628
69.6.15	Cr Gain (VDEC_CRGN).....	4628
69.6.16	Contrast (VDEC_CNTR).....	4629
69.6.17	Brightness (VDEC_BRT).....	4629
69.6.18	Hue (VDEC_HUE).....	4629
69.6.19	Chroma Burst Threshold (VDEC_CHBTH).....	4630
69.6.20	Sharpness Improvement (VDEC_SHPIMP).....	4630
69.6.21	Chroma PLL and Input Mode (VDEC_CHPLLIM).....	4631
69.6.22	Video Mode (VDEC_VIDMOD).....	4632
69.6.23	Video Status (VDEC_VIDSTS).....	4635
69.6.24	Noise Detector (VDEC_NOISE).....	4636
69.6.25	Standards and Debug (VDEC_STDDBG).....	4636
69.6.26	Manual Override (VDEC_MANOVR).....	4638
69.6.27	VSync and Signal Thresholds (VDEC_VSSGTH).....	4639
69.6.28	Debug Framebuffer (VDEC_DBGFBH).....	4640
69.6.29	Debug Framebuffer 2 (VDEC_DBGFBL).....	4640
69.6.30	H Active Start (VDEC_HACTS).....	4641
69.6.31	H Active End (VDEC_HACTE).....	4641
69.6.32	V Active Start (VDEC_VACTS).....	4642
69.6.33	V Active End (VDEC_VACTE).....	4642
69.6.34	HSync Tip (VDEC_HSTIP).....	4642
69.6.35	Bluescreen Cr (VDEC_BLSCRCR).....	4643
69.6.36	Bluescreen Cb (VDEC_BLSCRCB).....	4643
69.6.37	Luma AGC Control 2 (VDEC_LMAGC2).....	4644
69.6.38	Chroma AGC Control 2 (VDEC_CHAGC2).....	4644

Section number	Title	Page
69.6.39	Minimum Threshold (VDEC_MINTH).....	4644
69.6.40	Vertical Lines High (VDEC_VFRQOH).....	4645
69.6.41	Vertical Lines Low (VDEC_VFRQOL).....	4645
69.6.42	Asynclk Frequency 1 (VDEC_ASYNCLKFREQ1).....	4646
69.6.43	Asynclk Frequency 2 (VDEC_ASYNCLKFREQ2).....	4646
69.6.44	Asynclk Frequency 3 (VDEC_ASYNCLKFREQ3).....	4647
69.6.45	Asynclk Frequency 4 (VDEC_ASYNCLKFREQ4).....	4647

Chapter 70 Watchdog Timer (WDOG)

70.1	Overview.....	4649
70.1.1	Features.....	4650
70.2	External signals.....	4651
70.3	Clocks.....	4651
70.4	Watchdog mechanism and system integration.....	4652
70.5	Functional description.....	4653
70.5.1	Timeout event.....	4653
70.5.1.1	Servicing WDOG to reload the counter.....	4654
70.5.2	Interrupt event	4654
70.5.3	Power-down counter event.....	4655
70.5.4	Low power modes.....	4655
70.5.4.1	STOP and DOZE mode.....	4655
70.5.4.2	WAIT mode.....	4655
70.5.5	Debug mode.....	4656
70.5.6	Operations.....	4656
70.5.6.1	Watchdog reset generation.....	4656
70.5.6.2	WDOG_B generation.....	4657
70.5.7	Reset.....	4659
70.5.8	Interrupt.....	4659
70.5.9	Flow Diagrams.....	4659

Section number	Title	Page
70.6	Initialization.....	4661
70.7	WDOG Memory Map/Register Definition.....	4662
70.7.1	Watchdog Control Register (WDOGx_WCR).....	4663
70.7.2	Watchdog Service Register (WDOGx_WSR).....	4664
70.7.3	Watchdog Reset Status Register (WDOGx_WRSR).....	4665
70.7.4	Watchdog Interrupt Control Register (WDOGx_WICR).....	4666
70.7.5	Watchdog Miscellaneous Control Register (WDOGx_WMCR).....	4667

Chapter 71 Crystal Oscillator (XTALOSC)

71.1	Overview.....	4669
71.2	External Signals.....	4669
71.3	Crystal Oscillator 24 MHz.....	4670
71.3.1	Oscillator Configuration (24 MHz).....	4670
71.3.2	RC Oscillator (24 MHz).....	4671

Chapter 1

Introduction

1.1 About This Document

The i.MX 6SoloX application processors are Freescale Semiconductor's latest additions to a growing family of multimedia-focused products offering high performance processing optimized for lowest power consumption.

The i.MX 6SoloX processors feature Freescale's advanced implementation of the ARM[®]Cortex[®]-A9 core, which can be interfaced with DDR3- , LV-DDR3- and LPDDR2- DRAM memory devices.

These products are suitable for applications such as:

- High-end Mobile Internet Devices and high-end PDAs
- Netbooks
- Nettops
- High-end portable media players with HD video capability
- Portable navigation devices
- Gaming Consoles

1.1.1 Audience

This manual is intended to be used by board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands concepts of digital system design, microprocessor architecture, Input / Output (I/O) devices, industry standard communication and device interface protocols.

1.1.2 Organization

This document covers the i.MX at a system level and provides an architectural overview. Also covered are system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

1.1.3 Suggested Reading

This section lists additional reading materials that provide background for the information in this manual, as well as general information about the architecture.

1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex-A9 processor.

For information about the ARM Cortex-A9 processor see:

- <http://infocenter.arm.com>

1.1.3.2 Related Documentation

Freescale documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.freescale.com>.

1.1.4 Conventions

This document uses the following notational conventions:

cleared / set

When a bit takes the value zero, it is said to be cleared; when it takes a value of one, it is said to be set.

mnemonics

Instruction mnemonics are shown in lowercase bold

italics

Italics indicate variable command parameters, for example, **bcctrx**

Book titles in text are set in italics

15

An integer in decimal

0x

Prefix to denote hexadecimal number

0b

Prefix to denote binary number. Binary 0 and 1 are written without the prefix.

n'H4000CA00

n-bit Hexadecimal number

BLK_REG_NAME

Register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (_).

BLK_REG[FIELD]

Fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

BLK_REG[*n*]Bit number *n* within register BLK.REG.**BLK_REG[*l:r*]**Register bit ranges. Ranges are indicated by the left-most bit number *l* and the right-most bit number *r* separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.**x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a don't care or uninitialized. The binary value could be 1 or 0.

xAn italicized *x* indicates an alphanumeric variable***n, m***Italicized *n* or *m* represent integer variables**!**

Binary logic operator NOT

&&

Binary logic operator AND

||

Binary logic operator OR

^ or <O+>

Binary logic operator XOR

|

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value 0b1001.

&

Bit-wise AND. For example, 0b0001 & 0b1000 yields the value 0b0000.

{A,B}

Concatenation, where the n -bit value A is prepended to the m -bit value B to form an $(n + m)$ -bit value. For example, {0, REG m [14:0]} yeilds a 16-bit value with 0 in the most significant bit.

- or grey fill

Indicates a reserved bit field in an register. Although these bits can be written to as ones or zeros, they are always read as zeros.

>>

Shift right logical one position

<<

Shift left logical one posiiton

= <left arrow>

Assignment

==

Compare equal

!=

Compare not equal

>

Greater than

<

Less than

1.1.5 Register Access

1.1.5.1 Register Diagram Field Access Type Legend

The following figure provides the interpretation of the notation used in register diagrams for a number of common field access types.

Figure 1-1. Register Field Conventions

NOTE

For reserved register fields, software should mask off the data in the field after read (software can not rely on the contents of data read from a reserved field) and always write all zeros.

1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all bits set to 1 perform the associated operation on the primary register, while all bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read/modify/write operations. When atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

1.1.6 Signal Conventions

`_b, _B`

When appended to a signal name, indicates that a signal is active-low

`NEG_ACTIVE`

Overbar also denotes a negative active signal

`UPPERCASE`

About This Document

Package pin names, Block I/O signals

lowercase

Lowercase is used to indicate internal signals

1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
AHB	Advanced High-performance Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
AXI	Advanced eXtensible Interface
BIST	Built-in self test
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
EPROM	Erasable programmable read-only memory
FIFO	First-in-first-out
GPIO	General-purpose I/O
GPR	General-purpose register
GPS	Global Positioning System
GPU	Graphics Processing Unit
HAB	High Assurance Boot
I2C or I ² C	Inter-integrated circuit
IEEE	Institute of Electrical and Electronics Engineers
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LCD	Liquid Crystal Display
LDO	Low-Dropout
LIFO	Last-in-first-out
LRU	Least recently used
LSB	Least-significant byte
LUT	Lookup Table
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MMC	MultiMedia Card

Table continues on the next page...

Term	Meaning
MSB	Most-significant byte
MT/s	Mega transfers per second
OCRAM	On-Chip Random Access Memory
PCI	Peripheral Component Interconnect
PCIe	PCI enhanced
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable interrupt controller
POR	Power-on reset
PSRAM	Pseudo-Static Random Access Memory
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced instruction set computing
ROM	Read-Only Memory
RTOS	Real-time operating system
Rx	Receive
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous data link control
SDMA	Smart DMA
SoC	System-On-Chip
SPDIF	Sony Phillips Digital Interface
SPI	Serial peripheral interface
SRAM	Static random access memory
TFT	Thin Film Transistor
Tx	Transmit
UART	Universal asynchronous receiver/transmitter
USB	Universal serial bus
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

1.2 Introduction

This chapter introduces the architecture of the i.MX 6SoloX Multimedia Applications Processor.

The i.MX 6SoloX processor represents Freescale Semiconductor's latest achievement in integrated multimedia applications processors .

It is part of a growing family of multimedia-focused products, offering high performance processing optimized for the lowest power consumption.

1.3 Target Applications

The architecture's flexibility also allows for use in a wide variety of general embedded applications. The heart of the application chipset, the i.MX 6SoloX processor provides all of the interfaces necessary for connecting peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

1.4 features

The i.MX 6SoloX processors are based on ARM®Cortex®-A9 MPCore™ Platform, which has the following features:

- Single ARM Cortex-A9 MPCore (with TrustZone) with:
 - 32 KB L1 Instruction Cache
 - 32 KB L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor
- Single ARM®Cortex®-M4 with:
 - 16 KB L1 Instruction Cache
 - 16 KB L1 Data Cache
 - 64KB TCM
 - Floating point Unit(FPU)
 - Memory Protection Unit(MPU)

The ARM Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 256 KB unified I/D L2 cache:
- Two Master AXI (32-bit) bus interfaces output of L2 cache
- NEON MPE coprocessor
 - SIMD Media Processing Architecture
 - NEON register file with 32x64-bit general-purpose registers
 - NEON Integer execute pipeline (ALU, Shift, MAC)
 - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
 - NEON load/store and permute pipeline

- Supports single and double-precision add, subtract, multiply, divide, multiply and accumulate, and square root operations as described in the ARM VFPv3 architecture.
- Provides conversions between 16-bit, 32-bit, and 64-bit floating-point formats and ARM integer word formats

Target frequency of the core (including Neon and L1 cache) is 800 MHz non-overdrive over the specified temperature range:

- 1 GHz overdrive over the specified temperature range
- 800 MHz non-overdrive over the specified temperature range

The i.MX 6SoloX processors support latest, high volume, cost effective handheld DRAM, NOR Flash, and SD memory card standards.

The memory system consists of the following components:

- Level 1 Cache—32 KB Instruction, 32 KB Data cache per core
- Level 2 Cache—Unified instruction and data (256 KB)
- On-Chip Memory:
 - Boot ROM, including High Assurance Boot (HAB, 96 KB)
 - Internal multimedia / shared, fast access RAM (OCRAM, 128 KB)
 - Secure / non-Secure RAM (32KB)
 - Internal RAM for state save / restore OCRAM-S, 16KB
- External memory interfaces:
 - 16/32-bit LP-DDR2, 16/32-bit DDR3-800, and LV-DDR3-800
 - 8-bit NAND-Flash, including support for Raw MLC/SLC, 2 KB, 4KB and 8KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others
 - BCH ECC up to 62 bit
 - 16-bit NOR Flash
 - 16-bit PSRAM, Cellular RAM
 - Dual-channel / Single-channel QuadSPI FLASH

Each i.MX 6SoloX processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

Displays:

- LCDIF supporting one parallel 24-bit LCD display with up to 1080P(1920X1080) resolution at 60 Hz
- LVDS serial ports -- One port up to 85 MP/sec

Camera sensors:

- Two Parallel Camera ports (up to 24 bit and up to 66 MHz peak)
- NTSC/PAL Analog Video Input

Expansion cards: Four MMC/SD/SDIO card ports all supporting:

features

- 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
- 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- Compatible with SD Memory, miniSD Memory, SDIO, miniSDIO, SD Combo, MMC and MMC RS, embedded MMC and embedded SD cards
- Host clock frequency variable between 32kHz to 52 MHz
- Up to 200 Mbps data transfer for SD/SDIO cards using 4 parallel data lines
- Up to 416 Mbps data transfer for MMC cards using 8 parallel data lines
- Up to 832 Mbps data transfer for MMC/SD cards using 8 parallel data lines in DDR mode

Expansion PCI Express port (PCIe) v2.0 one lane:

- PCI Express (Gen 2.0) dual mode complex, supporting Root complex operations and Endpoint operations. Uses x1 PHY configuration.

USB:

- Two High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB Phy
- One High Speed (HS) USB 2.0 host with integrated HS-IC USB (High Speed Inter-Chip USB) Phy

Miscellaneous IPs and interfaces:

- Three I2S/SSI/AC97, up to 1.4 Mbps each
- Enhanced Serial Audio Interface (ESAI), up to 1.4 Mbps per channel
- Five UARTs, up to 4.0 Mbps each:
 - Providing RS232 interface
 - Supporting 9-bit RS485 multidrop mode
 - One of the five UARTs (UART1) supports 8-wire while others four supports 4-wire. This is due to the SoC IOMUX limitation, since all UART IPs are identical.
- Six UARTs operating up to 4.0 Mbps each, providing RS232 interface and supporting 9-bit RS485 multidrop mode. One UART supports 8-wire mode while the remaining four support 4-wire only.
- Four eCSPI (Enhanced CSPI), three of them can support up to 52 Mbps, one can be of low speed
- Four I2C, supporting 400 kbps
- Dual-Gigabit Ethernet Controller (IEEE1588 compliant), 10/100/1000 Mbps
- Eight Pulse Width Modulators (PWM)
- System JTAG Controller (SJC)
- GPIO with interrupt capabilities
- 8x8 Key Pad Port (KPP)

- Sony Philips Digital Interface (SPDIF), Rx and Tx
- Two Controller Area Network (FlexCAN), 1 Mbps each
- Three Watchdog timers (WDOG)
- Audio MUX (AUDMUX)
- MLB (MediaLB) provides interface to MOST Networks (MOST25, MOST50)

The i.MX 6SoloX processors integrate advanced power management unit and controllers:

- Provide PMU, including multiple LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use SW State Retention and Power Gating for ARM and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6SoloX processors use dedicated HW accelerators to meet the targeted multimedia performance. The use of HW accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6SoloX processors incorporate the following hardware accelerators:

- GPU—2D/3D Graphics Processing Unit
- PXP—PiXel Processing Pipeline.

Security functions are enabled and accelerated by the following hardware:

- ARM TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing cryptographic and hash engines, 16 KB secure RAM, and True and Pseudo Random Number Generator (NIST certified).
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock.
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

NOTE

The actual feature set depends on the part number. Functions, such as 2D and OpenVG hardware graphics acceleration may not be enabled for specific part numbers.

1.5 Architectural Overview

This section contains i.MX 6SoloX architectural details.

1.5.1 Block Diagram

A simplified block diagram is provided in the following section.

1.5.1.1 Simplified Block Diagram

A high level block diagram is shown in the figure below. This diagram provides a view of the i.MX 6SoloX major sub-systems (processor domains, shared peripherals domain, memories, and so on) and logical connectivity.

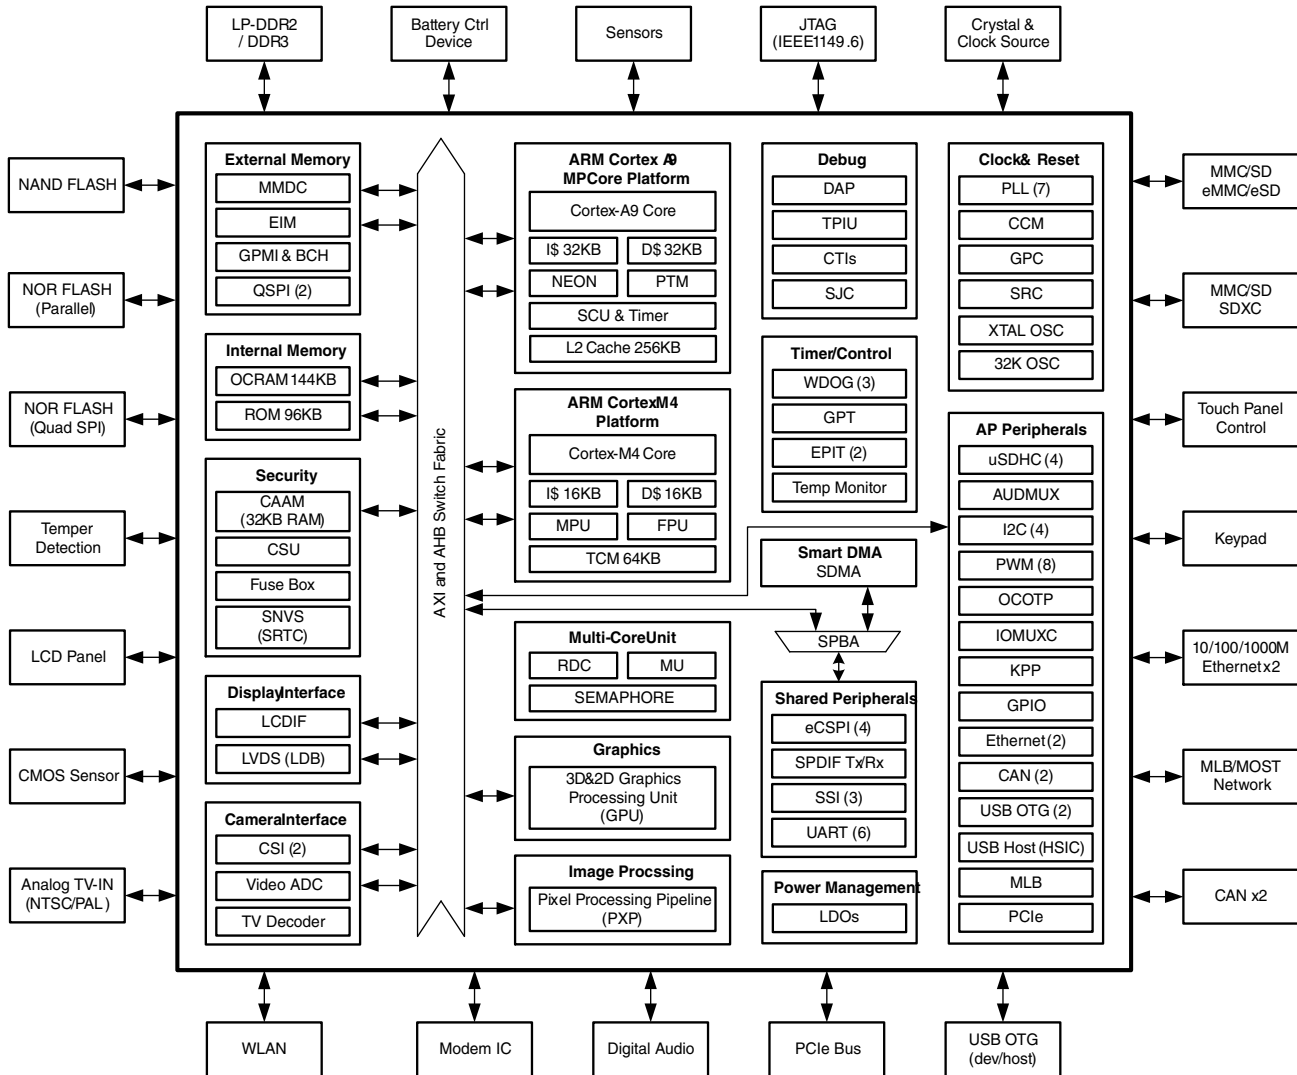

Figure 1-2. Simplified Block Diagram

1.5.2 Architectural Partitioning

Architecture supports processing-intensive tasks in the following ways:

- ARM Cortex A9 MPCore™ Platform is responsible for:
 - Operating System
 - User applications (including control over hardware accelerators and non-accelerated functions)
 - TrustZone applications

- Smart DMA enables data transfer between non-mastering peripherals and external or internal memories
- System Control is supported via:
 - Clock Control Module (CCM)
 -
 - XTALOSC- 24MHz Crystal oscillator source support
 - OSC32KHz - 32.768Hz Crystal oscillator source support
 - System Reset Controller (SRC)
 - General Power Controller (GPC)
 - Temperature Sensor for monitoring and alarming on high temperature situations.
- Multimedia is supported with:
 - GC400T Graphics Engine supports engine with separate 2D and 3D pipelines to provide both 2D and 3D acceleration. It supports:
 - DirectFB and GAL APIs
 - OpenGL ES1.1/2.0
 - OpenVG 1.1 APIs.
 - Audio
 - Audio codecs are provided by SW, which runs on ARM core, supporting (but not limited to) MP3, WMA, AAC, HE-AAC and Pro10
 - 3x SSIs
 - ESAI
 - SPDIF Tx/Rx
 - Audmux
 - ASRC (Audio sample rate conversion accelerator)
- Security is supported by:
 - High Assurance Boot (HAB4) System
 - ARM TrustZone (TZ) Trusted Execution environment
 - Peripheral access policy control, using Central Security Unit (CSU)
 - System JTAG controller (SJC)
 - Secure Real Time Clock (SRTC)
 - TrustZone Watchdog (TZ WDOG)
- Connectivity peripherals, timers and External Memory Interfaces:
 - Embedded DMAs
 - 3.3V IO voltage for seamless integration
 - Four USB 2.0 ports, including four PHYs: 2x HS-USB (OTG + HOST) and 2x HS-IC USB integrated PHYs
 - Nand-Flash (MLC up to 40-bit ECC) and NOR Flash memory interface via GPMI Nand-Flash controller

- Timers: 2xEPIT, GPT and two Watch Dog timers (one of which is used for TZ), in addition to the timers and watchdog timers integrated within the ARM Cortex A9 MPCore™ platform.
- Miscellaneous connectivity support - PCIe, FLEXCAN, MLB, MMC/SD, I2C, SPI, UART, PWM and Keypad interface

1.5.3 Endianness Support

i.MX 6SoloX supports Little Endian mode only.

1.5.4 Memory Interfaces

i.MX 6SoloX supports the following memory interfaces:

-

NOR Flash, SRAM and PSRAM, 16/8-bit NOR Flash, interface is supported by the EIM block. All EIM pins are muxed on other interfaces.

Chapter 2

Memory Maps

2.1 Memory system overview

This chapter introduces the memory architecture of the i.MX 6SX chip.

2.2 ARM Platform Memory Map

The i.MX 6SX memory map has been provided in the following tables.

Table 2-1. System memory map

Start address	End address	Size	Description
8000_0000	FFFF_FFFF	2048 MB	MMDC - x32 DDR Controller.

NOTE

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

2.3 DMA memory map

The Smart DMA memory map can be found in the following table.

Table 2-7. SDMA peripheral memory map

Peripheral	Base address	Size
Reserved for SDMA internal memory	0x0000	4KB
SPDIF	0x1000	4KB
eCSPI1	0x2000	4KB
eCSPI2	0x3000	4KB
eCSPI3	0x4000	4KB
eCSPI4	0x5000	4KB
Reserved	0x6000	4KB
Reserved for SDMA internal registers	0x7000	4KB
UART1	0x8000	4KB
ESAI	0x9000	4KB
SSI1	0xA000	4KB
SSI2	0xB000	4KB

Table continues on the next page...

Table 2-7. SDMA peripheral memory map (continued)

Peripheral	Base address	Size
SSI3	0xC000	4KB
ASRC	0xD000	4KB
Reserved for SDMA internal registers	0xE000	4KB
SPBA Registers	0xF000	4KB

NOTE

User should not address reserved memory regions. Access to reserved memory regions can cause unpredictable behavior.

Chapter 3

Interrupts and DMA Events

3.1 Overview

This chapter discusses the assignments of interrupts from the ARM domain in [A9 interrupts](#) and from DMA events in [SDMA event mapping](#)

3.2 A9 interrupts

The Global Interrupt Controller (GIC) collects up to 128 interrupt requests from all i.MX 6SLX sources and provides an interface to the Cortex A9 CPU .

The first 32 interrupts are used for interrupts that are private to the CPUs interface. These interrupts are not included in the table below. All interrupts besides the private CPU are also hooked up to the GPC in the same order.

Each interrupt can be configured as a normal or a secure interrupt. Software force registers and software priority masking are also supported. The following table describes the A9 interrupt sources.

Table 3-1. A9 domain interrupt summary

IRQ	Interrupt Source	Interrupt Description
32	IOMUXC	General Purpose Register 1 from IOMUXC. Used to notify cores on exception condition while boot.
33	DAP	Debug Access Port interrupt request.
34	SDMA	SDMA interrupt request from all channels.
35	Reserved	Reserved
36	SNVS	PMIC power off request.
37	LCDIF1	LCDIF1 Sync Interrupt
38	LCDIF2	LCDIF2 Sync Interrupt

Table continues on the next page...

Table 3-1. A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
39	CSI1	CMOS Sensor Interface interrupt request
40	PXP	PXP interrupt.
41	Reserved	Reserved.
42	GPU	GPU general interrupt request.
43	WDOG3	WDOG3 timer reset interrupt request.
44	SEMA4	SEMA4 CP1 interrupt request.
45	APBH DMA	Logical OR of APBH DMA channels 0-3 completion and error interrupts.
46	EIM	EIM interrupt request.
47	BCH	BCH operation complete interrupt.
48	GPMI	GPMI operation timeout error interrupt.
49	UART6	UART6 interrupt request.
50	eCSPI5	eCSPI5 interrupt request.
51	SNVS	SRTC consolidated interrupt.
52	SNVS	SRTC security interrupt.
53	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
54	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request.
55	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request.
56	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request.
57	uSDHC4	uSDHC4 (Enhanced SDHC) interrupt request.
58	UART1	UART1 interrupt request.
59	UART2	UART2 interrupt request.
60	UART3	UART3 interrupt request.
61	UART4	UART4 interrupt request.
62	UART5	UART5 interrupt request.
63	eCSPI1	eCSPI1 interrupt request.
64	eCSPI2	eCSPI2 interrupt request.
65	eCSPI3	eCSPI3 interrupt request.
66	eCSPI4	eCSPI4 interrupt request.
67	I2C4	I2C4 interrupt request.
68	I2C1	I2C1 interrupt request.
69	I2C2	I2C2 interrupt request.
70	I2C3	I2C3 interrupt request.
71	RDC	RDC interrupt request.
72	USB	USB HISC Host interrupt request.
73	CSI2	CSI interrupt.
74	USB	USB OTG 2 interrupt request.
75	USB	USB OTG 1 interrupt request.
76	USB_PHY	UTMI0 interrupt request.

Table continues on the next page...

Table 3-1. A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
77	USB_PHY	UTMI1 interrupt request.
78	SSI1	SSI1 interrupt request.
79	SSI2	SSI2 interrupt request.
80	SSI3	SSI3 interrupt request.
81	Temperature Monitor	Temperature Sensor (temperature greater than threshold) interrupt request.
82	ASRC	ASRC interrupt request.
83	ESAI	ESAI interrupt request.
84	SPDIF	SPDIF Rx/Tx interrupt.
85	MLB	MLB error interrupt request.
86	PMU	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
87	GPT	Logical OR of GPT rollover interrupt line, input capture 1 and 2 lines, output compare 1, 2, and 3 interrupt lines.
88	EPIT1	EPIT1 output compare interrupt.
89	EPIT2	EPIT2 output compare interrupt.
90	GPIO1	INT7 interrupt request.
91	GPIO1	INT6 interrupt request.
92	GPIO1	INT5 interrupt request.
93	GPIO1	INT4 interrupt request.
94	GPIO1	INT3 interrupt request.
95	GPIO1	INT2 interrupt request.
96	GPIO1	INT1 interrupt request.
97	GPIO1	INT0 interrupt request.
98	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15.
99	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31.
100	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15.
101	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31.
102	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15.
103	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31.
104	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15.
105	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31.
106	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15.
107	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31.
108	GPIO6	Combined interrupt indication for GPIO6 signals 0 - 15.
109	GPIO6	Combined interrupt indication for GPIO6 signals 16 - 31.
110	GPIO7	Combined interrupt indication for GPIO7 signals 0 - 15.
111	GPIO7	Combined interrupt indication for GPIO7 signals 16 - 31.
112	WDOG1	WDOG1 timer reset interrupt request.
113	WDOG2	WDOG2 timer reset interrupt request.
114	KPP	Key Pad interrupt request.

Table continues on the next page...

Table 3-1. A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
115	PWM1/PWM5	Cumulative interrupt line for PWM1/PWM5. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
116	PWM2/PWM6	Cumulative interrupt line for PWM2/PWM6. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
117	PWM3/PWM7	Cumulative interrupt line for PWM3/PWM7. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
118	PWM4/PWM8	Cumulative interrupt line for PWM4/PWM8. Logical OR of rollover, compare, and FIFO waterlevel crossing interrupts.
119	CCM	CCM interrupt request 1.
120	CCM	CCM interrupt request 2.
121	GPC	GPC interrupt request 1.
122	MU	Message unit interrupt to A9 core.
123	SRC	SRC interrupt request.
124	CPU	L2 interrupt request.
125	CPU	Parity Check error interrupt request.
126	CPU	Performance Unit interrupt.
127	CPU	CTI trigger outputs interrupt.
128	SRC	Combined CPU wdog interrupts (4x) out of SRC.
129	SAI1	SAI1 interrupt request.
130	SAI2	SAI2 interrupt request.
131	MU	Message unit Interrupt to M4 core.
132	ADC1	ADC1 interrupt request.
133	ADC2	ADC2 interrupt request.
134	ENET2	ENET2 Interrupt Request.
135	ENET2	ENET2 1588 Timer interrupt [synchronous] request.
136	SJC	SJC interrupt from General Purpose register.
137	CAAM	CAAM job ring 0 interrupt.
138	CAAM	CAAM job ring 1 interrupt.
139	QSPI1	QSPI1 interrupt request.
140	TZASC	TZASC (PL380) interrupt request.
141	QSPI2	QSPI2 interrupt request.
142	FLEXCAN1	FLEXCAN1 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein. Combined interrupt of ini_int_busoff,ini_int_error,ipi_int_mbor,ipi_int_txwarning and ipi_int_waken
143	FLEXCAN2	FLEXCAN2 combined interrupt. Logical OR of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
144	Reserved	Reserved
145	Reserved	Reserved
146	Reserved	Reserved

Table continues on the next page...

Table 3-1. A9 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
147	Reserved	Reserved
148	SEMA4	SEMA4 CP0 interrupt request
149	MLB	Interrupt request for channels [31:0]. Interrupt request for channels [63:32] available on IRQ #149 if SMX bit is set in MLB150 AHB control register (ACTL), otherwise interrupt for channels [63:32] interrupt is available on IRQ #158.
150	ENET1	ENET1 Interrupt Request.
151	ENET1	ENET1 1588 Timer interrupt [synchronous] request.
152	PCIe	PCIe interrupt request 1.
153	PCIe	PCIe interrupt request 2.
154	PCIe	PCIe interrupt request 3.
155	PCIe	PCIe interrupt request 4.
156	DCIC1	DCIC1 interrupt request.
157	DCIC2	DCIC2 interrupt request.
158	MLB	Logical OR of channel[63:32] interrupt requests.
159	PMU	Brown out of core, gpu, and chip digital regulators occurred.

3.3 CM4 interrupts

The Nested Vectored Interrupt Controller (NVIC) collects up to 128 interrupt requests from all i.MX 6SLX sources and provides an interface to the Cortex M4 Core.

The following table describes the M4 interrupt sources.

Table 3-2. M4 domain interrupt summary

IRQ	Interrupt Source	Interrupt Description
0	Cortex M4	Cache Controller interrupt
1	DAP	Debug Access Port interrupt request.
2	SDMA	SDMA interrupt request from all channels.
3	Reserved	Reserved
4	SNVS	PMIC power off request.
5	LCDIF1	LCDIF1 Sync Interrupt
6	LCDIF2	LCDIF2 Sync Interrupt
7	CSI1	CMOS Sensor Interface interrupt request
8	PXP	PXP interrupt
9	Reserved	Reserved.
10	GPU	GPU general interrupt request.

Table continues on the next page...

Table 3-2. M4 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
11	WDOG3	WDOG3 interrupt request.
12	SEMA4	SEMA4 CP1 interrupt request.
13	APBH DMA	Logical OR of APBH DMA channels 0-3 completion and error interrupts.
14	EIM	EIM interrupt request.
15	BCH	BCH operation complete interrupt.
16	GPMI	GPMI operation timeout error interrupt.
17	UART6	UART6 interrupt request.
18	eCSPI5	eCSPI5 interrupt request.
19	SNVS	SNVS consolidated interrupt.
20	SNVS	SNVS security interrupt.
21	CSU	CSU interrupt request 1. Indicates to the processor that one or more alarm inputs were asserted.
22	uSDHC1	uSDHC1 (Enhanced SDHC) interrupt request.
23	uSDHC2	uSDHC2 (Enhanced SDHC) interrupt request.
24	uSDHC3	uSDHC3 (Enhanced SDHC) interrupt request.
25	uSDHC4	uSDHC4 (Enhanced SDHC) interrupt request.
26	UART1	UART1 interrupt request.
27	UART2	UART2 interrupt request.
28	UART3	UART3 interrupt request.
29	UART4	UART4 interrupt request.
30	UART5	UART5 interrupt request.
31	eCSPI1	eCSPI1 interrupt request.
32	eCSPI2	eCSPI2 interrupt request.
33	eCSPI3	eCSPI3 interrupt request.
34	eCSPI4	eCSPI4 interrupt request.
35	I2C4	I2C4 interrupt request
36	I2C1	I2C1 interrupt request.
37	I2C2	I2C2 interrupt request.
38	I2C3	I2C3 interrupt request.
39	RDC	RDC interrupt request.
40	USB	USB HISC Host interrupt request.
41	CSI2	CSI interrupt
42	USB	USB OTG 2 interrupt request.
43	USB	USB OTG 1 interrupt request.
44	USB_PHY	UTMI0 interrupt request.
45	USB_PHY	UTMI1 interrupt request.
46	SSI1	SSI1 interrupt request.
47	SSI2	SSI2 interrupt request.
48	SSI3	SSI3 interrupt request.

Table continues on the next page...

Table 3-2. M4 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
49	Temperature Monitor	Temperature Sensor (temp. greater than threshold) interrupt request.
50	ASRC	ASRC interrupt request.
51	ESAI	ESAI interrupt request.
52	SPDIF	SPDIF Rx/Tx interrupt.
53	MLB	MLB error interrupt request.
54	PMU	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
55	GPT	Logical OR of GPT rollover interrupt line, input capture 1 & 2 lines, output compare 1, 2 & 3 interrupt lines.
56	EPIT1	EPIT1 output compare interrupt.
57	EPIT2	EPIT2 output compare interrupt.
58	GPIO1	INT7 interrupt request.
59	GPIO1	INT6 interrupt request.
60	GPIO1	INT5 interrupt request.
61	GPIO1	INT4 interrupt request.
62	GPIO1	INT3 interrupt request.
63	GPIO1	INT2 interrupt request.
64	GPIO1	INT1 interrupt request.
65	GPIO1	INT0 interrupt request.
66	GPIO1	Combined interrupt indication for GPIO1 signals 0 - 15.
67	GPIO1	Combined interrupt indication for GPIO1 signals 16 - 31.
68	GPIO2	Combined interrupt indication for GPIO2 signals 0 - 15.
69	GPIO2	Combined interrupt indication for GPIO2 signals 16 - 31.
70	GPIO3	Combined interrupt indication for GPIO3 signals 0 - 15.
71	GPIO3	Combined interrupt indication for GPIO3 signals 16 - 31.
72	GPIO4	Combined interrupt indication for GPIO4 signals 0 - 15.
73	GPIO4	Combined interrupt indication for GPIO4 signals 16 - 31.
74	GPIO5	Combined interrupt indication for GPIO5 signals 0 - 15.
75	GPIO5	Combined interrupt indication for GPIO5 signals 16 - 31.
76	GPIO6	Combined interrupt indication for GPIO6 signals 0 - 15.
77	GPIO6	Combined interrupt indication for GPIO6 signals 16 - 31.
78	GPIO7	Combined interrupt indication for GPIO7 signals 0 - 15.
79	GPIO7	Combined interrupt indication for GPIO7 signals 16 - 31.
80	WDOG1	WDOG1 timer reset interrupt request.
81	WDOG2	WDOG2 timer reset interrupt request.

115	Reserved	Reserved
116	SEMA4	SEMA4 CP0 interrupt request
117	MLB	Interrupt request for channels [31:0]. Interrupt request for channels [63:32] available on IRQ #149 if SMX bit is set in MLB150 AHB control register (ACTL), otherwise interrupt for channels [63:32] interrupt is available on IRQ #158.
118	ENET1	ENET1 Interrupt Request.

Table continues on the next page...

Table 3-2. M4 domain interrupt summary (continued)

IRQ	Interrupt Source	Interrupt Description
119	ENET1	ENET1 1588 Timer interrupt [synchronous] request.
120	PCIe	PCIe interrupt request 1.
121	PCIe	PCIe interrupt request 2.
122	PCIe	PCIe interrupt request 3.
123	PCIe	PCIe interrupt request 4.
124	DCIC1	DCIC1 interrupt request.
125	DCIC2	DCIC2 interrupt request.
126	MLB	Logical OR of channel[63:32] interrupt requests.
127	PMU	Brown out of core, gpu, and chip digital regulators occurred.

3.4 SDMA event mapping

The following table shows the DMA request signals for peripherals in i.MX 6SLX.

Table 3-3. SDMA event mapping

Event Number	DMA Source	Description
0	UART6	UART6 Rx FIFO; controlled by IOMUXC register GPR0[0]
1	ADC1 / I2C4	ADC1 DMA request ;Muxed I2C4 DMA event by IOMUXC register GPR0[1] ADC1 DMA request
2	IOMUX / CSI2	Muxed with external DMA pad #1, controlled by IOMUXC register GPR0[20].
3	eCSPI1 / I2C3	eCSPI1 Rx request; Muxed with I2C3 controlled by IOMUXC register GPR0[2].
4	eCSPI1 / I2C2	eCSPI1 Tx request; Muxed with I2C2 controlled by IOMUXC register GPR0[3].
5	eCSPI2 / I2C1	eCSPI2 Rx request; Muxed with I2C1 controlled by IOMUXC register GPR0[4].
6	eCSPI2 / PXP	eCSPI2 Tx request; Muxed with PXP controlled by IOMUXC register GPR0[5].
7	eCSPI3 / CSI1	eCSPI3 Rx request Muxed with CSI1 DMA event controlled by IOMUXC register GPR0[6]
8	eCSPI3 / LCDIF1	eCSPI3 Tx request Muxed with LCDIF1 DMA request controlled by IOMUXC register GPR0[7]
9	eCSPI4 / EPIT2	eCSPI4 Rx request; Muxed with EPIT2 DMA request controlled by IOMUXC register GPR0[8].
10	eCSPI4 / QSPI1	eCSPI4 Tx request; Muxed with QSPI1 DMA request controlled by IOMUXC register GPR0[9].
11	eCSPI5 / QSPI2	eCSPI5 Rx request muxed with QSPI2 DMA request controlled by IOMUXC register GPR0[10]
12	eCSPI5 / LCDIF2	eCSPI5 Tx request Muxed with LCDIF2 DMA request controlled by IOMUXC register GPR0[11]
13	ADC2 / GPT	ADC2 DMA request; Muxed with GPT counter event controlled by IOMUXC register GPR0[12]

Table continues on the next page...

Table 3-3. SDMA event mapping (continued)

Event Number	DMA Source	Description
14	SPDIF / IOMUX	SPDIFRX DMA request; Muxed with external DMA pad #2 controlled by IOMUXC register GPR0[13].
15	SPDIF	SPDIF TX DMA request
16	EPIT1	EPIT1 request.
17	ASRC	ASRC DMA1 request (Pair A input Request)
18	ASRC	ASRC DMA2 request (Pair B input Request)
19	ASRC	ASRC DMA3 request (Pair C input Request)
20	ASRC	ASRC DMA4 request (Pair A output Request)
21	ASRC	ASRC DMA5 request (Pair B output Request)
22	ASRC	ASRC DMA6 request (Pair C output Request)
23	ESAI / I2C3	ESAI Rx FIFO DMA request; Muxed with I2C3 controlled by IOMUXC register GPR0[6].
24	ESAI	ESAI Tx FIFO DMA request
25	UART1	UART1 Rx FIFO
26	UART1	UART1 Tx FIFO
27	UART2	UART2 Rx FIFO
28	UART2	UART2 Tx FIFO
29	UART3 / QSPI1	UART3 Rx FIFO; Muxed with QSPI1 DMA Tx request controlled by IOMUXC register GPR0[21]
30	UART3 / QSPI2	UART3 Tx FIFO; Muxed with QSPI2 DMA Tx request controlled by IOMUXC register GPR0[22]
31	UART4 / SAI1	UART4 Rx FIFO/SAI1 receive 1 DMA request; Controlled by IOMUXC register GPR0[15]
32	UART4 / SAI1	UART4 Tx FIFO/SAI1 transmit 1 DMA request; Controlled by IOMUXC register GPR0[16]
33	UART5 / SAI2	UART5 Rx FIFO/SAI2 receive 1 DMA request; Controlled by IOMUXC register GPR0[17]
34	UART5 / SAI2	UART5 Tx FIFO/SAI2 transmit 1 DMA request; Controlled by IOMUXC register GPR0[18]
35	SSI1	SSI1 receive 1 DMA request
36	SSI1	SSI1 transmit 1 DMA request
37	SSI1	SSI1 receive 0 DMA request
38	SSI1	SSI1 transmit 0 DMA request
39	SSI2	SSI2 receive 1 DMA request
40	SSI2	SSI2 transmit 1 DMA request
41	SSI2	SSI2 receive 0 DMA request
42	SSI2	SSI2 transmit 0 DMA request
43	SSI3	SSI3 receive 1 DMA request
44	SSI3	SSI3 transmit 1 DMA request
45	SSI3	SSI3 receive 0 DMA request
46	SSI3	SSI3 transmit 0 DMA request
47	UART6	UART6 Tx FIFO; controlled by IOMUXC register GPR0[19]

As shown in the table, some of the events are an output of a mux of two signals or triggers. The select of this mux is controlled by the general purpose registers in IOMUXC.

Chapter 4

External Signals and Pin Multiplexing

4.1 Overview

The i.MX contains a limited number of pins, most of which have multiple signal options. These signal to pin and pin to signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

lists the pad names of the chip, the various signals that can be assigned to each of the pads, and the default settings for each pad. lists the external signals grouped by module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

4.1.1 Muxing Options

An additional view of external signals muxing is shown by the presentation of the muxing options per block/instance.

Table 4-1. Muxing Options

Signal	Pad (Mode)	Mux/Input Select Registers
ADC1 - ADC1 Input		
ADC1_IN0	ADC1_IN0	Not multiplexed.
ADC1_IN1	ADC1_IN1	Not multiplexed.
ADC1_IN2	ADC1_IN2	Not multiplexed.
ADC1_IN3	ADC1_IN3	Not multiplexed.
ADC2 - ADC2 Input		
ADC2_IN0	ADC2_IN0	Not multiplexed.
ADC2_IN1	ADC2_IN1	Not multiplexed.
ADC2_IN2	ADC2_IN2	Not multiplexed.
ADC2_IN3	ADC2_IN3	Not multiplexed.

Signal	Pad (Mode)	Mux/Input Select Registers
DRAM_VREF	DRAM_VREF	Not multiplexed.
DRAM_ZQPAD	DRAM_ZQPAD	Not multiplexed.
NGND_KEL0	NGND_KEL0	Not multiplexed.
NVCC_CSI	NVCC_CSI	Not multiplexed.
NVCC_DRAM	NVCC_DRAM	Not multiplexed.
NVCC_DRAM_2P5	NVCC_DRAM_2P5	Not multiplexed.
NVCC_ENET	NVCC_ENET	Not multiplexed.
NVCC_GPIO	NVCC_GPIO	Not multiplexed.
NVCC_HIGH	NVCC_HIGH	Not multiplexed.
NVCC_JTAG	NVCC_JTAG	Not multiplexed.
NVCC_KEY	NVCC_KEY	Not multiplexed.
NVCC_LCD1	NVCC_LCD1	Not multiplexed.
NVCC_LOW	NVCC_LOW	Not multiplexed.
NVCC_LVDS	NVCC_LVDS	Not multiplexed.
NVCC_NAND	NVCC_NAND	Not multiplexed.
NVCC_PLL	NVCC_PLL	Not multiplexed.
NVCC_QSPI	NVCC_QSPI	Not multiplexed.
NVCC_RGMII1	NVCC_RGMII1	Not multiplexed.
NVCC_RGMII2	NVCC_RGMII2	Not multiplexed.
NVCC_SD1	NVCC_SD1	Not multiplexed.
NVCC_SD2	NVCC_SD2	Not multiplexed.
NVCC_SD4	NVCC_SD4	Not multiplexed.
NVCC_USB_H	NVCC_USB_H	Not multiplexed.
PCIE_REXT	PCIE_REXT	Not multiplexed.
PCIE_VP	PCIE_VP	Not multiplexed.
PCIE_VPH	PCIE_VPH	Not multiplexed.
PCIE_VPTX	PCIE_VPTX	Not multiplexed.
USB_OTG1_VBUS	USB_OTG1_VBUS	Not multiplexed.
USB_OTG2_VBUS	USB_OTG2_VBUS	Not multiplexed.
VADC_AFE_BANDGAP	VADC_AFE_BANDGAP	Not multiplexed.
VADC_IN0	VADC_IN0	Not multiplexed.
VADC_IN1	VADC_IN1	Not multiplexed.
VADC_IN2	VADC_IN2	Not multiplexed.
VADC_IN3	VADC_IN3	Not multiplexed.
VDDA_ADC_3P3	VDDA_ADC_3P3	Not multiplexed.
VDDA_AFE_3P3	VDDA_AFE_3P3	Not multiplexed.
VDD_AFE_1P2	VDD_AFE_1P2	Not multiplexed.
VDD_ARM_CAP	VDD_ARM_CAP	Not multiplexed.
VDD_ARM_IN	VDD_ARM_IN	Not multiplexed.

Table continues on the next page...

Table 4-1. Muxing Options (continued)

Signal	Pad (Mode)	Mux/Input Select Registers
VDD_HIGH_CAP	VDD_HIGH_CAP	Not multiplexed.
VDD_HIGH_IN	VDD_HIGH_IN	Not multiplexed.
VDD_SNVS_CAP	VDD_SNVS_CAP	Not multiplexed.
VDD_SNVS_IN	VDD_SNVS_IN	Not multiplexed.
VDD_SOC_CAP	VDD_SOC_CAP	Not multiplexed.
VDD_SOC_IN	VDD_SOC_IN	Not multiplexed.
VDD_USB_CAP	VDD_USB_CAP	Not multiplexed.
VSS	VSS	Not multiplexed.
PWM1 - Pulse Width Modulation		
PWM1_OUT	GPIO1_IO10 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO10
	RGMII2_RD3 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_RD3
	SD2_DATA0 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_SD2_DATA0
	USB_H_STROBE (ALT1)	IOMUXC_SW_MUX_CTL_PAD_USB_H_STROBE
PWM2 - Pulse Width Modulation		
PWM2_OUT	GPIO1_IO11 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO11
	RGMII2_RD2 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_RD2
	SD2_DATA1 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_SD2_DATA1
	USB_H_DATA (ALT1)	IOMUXC_SW_MUX_CTL_PAD_USB_H_DATA
PWM3 - Pulse Width Modulation		
PWM3_OUT	GPIO1_IO12 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO12
	NAND_DATA06 (ALT4)	IOMUXC_SW_MUX_CTL_PAD_NAND_DATA06
	RGMII2_RD1 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_RD1
	SD1_DATA2 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_SD1_DATA2
PWM4 - Pulse Width Modulation		
PWM4_OUT	GPIO1_IO13 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_GPIO1_IO13
	NAND_DATA07 (ALT4)	IOMUXC_SW_MUX_CTL_PAD_NAND_DATA07
	RGMII2_RD0 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_RD0
	SD1_DATA1 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_SD1_DATA1
PWM5 - Pulse Width Modulation		
PWM5_OUT	CSI_DATA04 (ALT7)	IOMUXC_SW_MUX_CTL_PAD_CSI_DATA04
	LCD1_DATA23 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA23
	RGMII2_TD3 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_TD3
PWM6 - Pulse Width Modulation		
PWM6_OUT	CSI_DATA05 (ALT7)	IOMUXC_SW_MUX_CTL_PAD_CSI_DATA05
	LCD1_DATA22 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA22
	RGMII2_TD2 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_RGMII2_TD2
PWM7 - Pulse Width Modulation		
PWM7_OUT	ENET1_MDC (ALT7)	IOMUXC_SW_MUX_CTL_PAD_ENET1_MDC
	LCD1_DATA21 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA21

Table continues on the next page...

Table 4-1. Muxing Options (continued)

Signal	Pad (Mode)	Mux/Input Select Registers
	RGMI2_TD1 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_RGMI2_TD1
PWM8 - Pulse Width Modulation		
PWM8_OUT	ENET1_MDIO (ALT7)	IOMUXC_SW_MUX_CTL_PAD_ENET1_MDIO
	LCD1_DATA20 (ALT2)	IOMUXC_SW_MUX_CTL_PAD_LCD1_DATA20
	RGMI2_TD0 (ALT3)	IOMUXC_SW_MUX_CTL_PAD_RGMI2_TD0

Chapter 5

Fusemap

5.1 Boot Fusemap

The following section details the various modes and selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by BOOT_CFG1[6:4] fuses listed in [Table 5-1](#).

Table 5-1. Boot Device Select

Boot Device	BOOT_CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]	BOOT_CFG1[3]
QSPI	0	0	0	1	QXIP Instance 0: QuadSPI0 1: QuadSPI1
WEIM	0	0	0	0	Memory Type: 0 - NOR Flash 1 - OneNAND
Serial-ROM	0	0	1	1	x
SD/eSD	0	1	0	x	x
MMC/eMMC	0	1	1	x	x
NAND	1	x	x	x	x

NOTE

Fuses marked as “Reserved” are reserved for Freescale internal (and future) use only. Customers should not attempt to burn these, as the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

Table 5-2. QSPI Boot Fusemap

Addr	7	6	5	4	3	2	1	0

Table 5-9. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
0x450[15:8]	BOOT_CFG2	8	BOOT configuration register #2, Usage varies, depending on selected boot device.	See fuse-map tab for details.	SRC
0x450[23:16]	BOOT_CFG3	8	BOOT configuration register #3	See fuse-map tab for details.	SRC
0x450[31:24]	BOOT_CFG4	8	BOOT configuration register #3	See fuse-map tab for details.	SRC
0x460[0]	Reserved	1			
0x460[1]	SEC_CONFIG[1]	1	Security Configuration (with SEC_CONFIG[0])	00 - FAB (Open) 01 - Open - allows any code to be flashed and executed, even if it has no valid signature. 1x - Closed (Security On)	SW (ROM), SRC, SNVS, TPSMP
0x460[2]	Reserved	1	Reserved	Reserved	Reserved
0x460[3]	DIR_BT_DIS	1	Direct External Memory Boot Disable	0 - Direct boot from external memory is allowed 1 - Direct boot from external memory is not allowed	SW(ROM), SRC
0x460[4]	BT_FUSE_SEL	1	Determines, whether using fuses for boot configuration, or GPIO /Serial loader.	If boot_mode="00" (Development) 0=Boot mode configuration is taken from GPIOs. 1=Boot mode configuration is taken from fuses. If boot_mode="10" (Production) 0 - Boot using Serial Loader (USB) 1- Boot mode configuration is taken from fuses.	SRC SW(ROM)
0x460[5]	FORCE_COLD_BOOT(SBMR)	1	Force cold boot when A9 core come out of reset. Reflected in SBMR reg of SRC	Fuse Function: 0 – Default behavior equivalent to the rest of the i.MX6 family allowing a fast recovery from low power modes. That is, the ROM is allowed to jump to the address previously programmed in the SRC persistent register. 1 – Fast recovery path in the ROM is not allowed and a cold boot is always performed. Customers wanting a higher level of security should burn this fuse.	SRC

Table 5-9. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
			value programmed into PAD_SETTINGS fuse bits.		
0x470[1]	BT_MMU_DISABLE	1	The fuse bit is used for ROM to not enable MMU		SW (ROM)
0x470[2]	L1 I-Cache DISABLE	1	The fuse bit is used for ROM to not enable L1 I-Cache		SW (ROM)
0x470[3]	Disable SDMMC Manufacture mode	1	The fuse bit is used to disable ROM feature "SD/MMC Manufacturing Mode".	0 - Enable 1 - Disable	SW (ROM)
0x470[4]	SD1 VOLTAGE SELECTION	1	Fuse bit to change voltage selection for SD1 pads. When set ROM will select 1.8V for SD1 pads otherwise 3.3V	0 - 3.3V 1 - 1.8V	SW (ROM)
0x470[5]	SD2 VOLTAGE SELECTION	1	Fuse bit to change voltage selection for SD2 pads. When set ROM will select 1.8V for SD3 pads otherwise 3.3V	0 - 3.3V 1 - 1.8V	SW (ROM)
0x470[6]	SD4 VOLTAGE SELECTION	1	Fuse bit to change voltage selection for SD4 pads. When set ROM will select 1.8V for SD4 pads otherwise 3.3V	0 - 3.3V 1 - 1.8V	SW (ROM)
0x470[7]	DLL Override	1	Select the DLL mode for SD/eMMC.	0 - DLL Slave Mode for SD/eMMC 1 - DLL Override Mode for SD/eMMC	SW (ROM)
0x470[8]	USDHC IOMUX SRE Enable	1	The fuse bit is used for ROM to enable SRE bit for SD pads	0 - Disable 1 - Enable	SW (ROM)
0x470[9]	USDHC_IOMUX_SION_BIT_ENABLE	1	The fuse bit is used for ROM to enable SION bit for MUX control register.	0 - Disable 1 - Enable	SW (ROM)
0x470[10]	ADD_DS__SET_G PR1_16	1	This fuse bit is used to control the drive strength of all dual-voltage IO pads. add_ds=0: the 1.8V driver is ~10% stronger (IO buffer should be in low voltage mode (ipp_lve=1)); add_ds=1: normal operation;	0 - Set 1 - Don't set	SW (ROM)
0x470[11]	ENABLE_EMMC_2 2K_PULLUP	1	The fuse bit is used for ROM to enable 22K pullup for SD pads.	0 - 47K pullup 1 - 22K pullup	SW (ROM)
0x470[12]	USDHC_PAD_PULL_DOWN	1	The fuse bit is used for ROM to enable pull down bit for SD pads.	0 - no action 1 - pull down	SW (ROM)

Table continues on the next page...

Table 5-9. Fusemap Descriptions (continued)

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Used by
0x470[13]	Override HYS bit for SD/MMC pads	1	Once this fuse be blown, the [HYS] bit of IOMUXC_SW_PAD_CTL_PAD_SDx_CLK(x is the SD port which the ROM boot from), IOMUXC_SW_PAD_CTL_PAD_SDx_CMD, IOMUXC_SW_PAD_CTL_PAD_SDx_DAT0-n(n will be 0, 3, or 7, depends on the bus width selected) will be set.		SW (ROM)
0x470[14]	eMMC 4.4 - RESET TO PRE-IDLE STATE	1	Once this fuse be blown, the CMD0 with argument 0xf0f0f0 will be sent to put the eMMC card into pre-IDLE state so that eMMC card's fast boot can work properly. This is useful for the warm boot, such as boot due to the WDOG reset.		SW (ROM)
0x470[15]	SD3_RST_POLARITY_SELECT	1	select the polarity of SD3_RST	0 – Active Low ; 1 – Active high	SW (ROM)
0x470[19:16]	POWER_MNG_CFG	4	Misscellaneous power management configuration bits.	Reserved - NOT USED	
0x470[20]	BT_LPB_POLARITY	1	Define GPIO3 polarity, for determining LPB boot mode.	0' - Active High '1' -Active Low	SW (ROM)
0x470[22:21]	LPB_BOOT	2	Defined the LowPower Boot options (tbd)	(Core / DDR- Bus) '00' - LPB Disable '01' - 1 GPIO (def freq) '10' - Div by2 '11' - Div by 4	SW (ROM)

Chapter 6

External Memory Controllers

6.1 Overview

This chip has the following external memory interfaces and controllers:

- Multi-mode DDR controller (MMDC)
- Raw NAND Flash controller, consisting of GPMI2, BCH62, and APBH_DMA components including Randomizer module.
- EIM-PSRAM/NOR Flash controller
- Quad Serial Peripheral Interface (QSPI)

6.2 Multi-mode DDR controller (MMDC) overview and feature summary

The MMDC module is a DDR controller that can support several types of DDR memories.

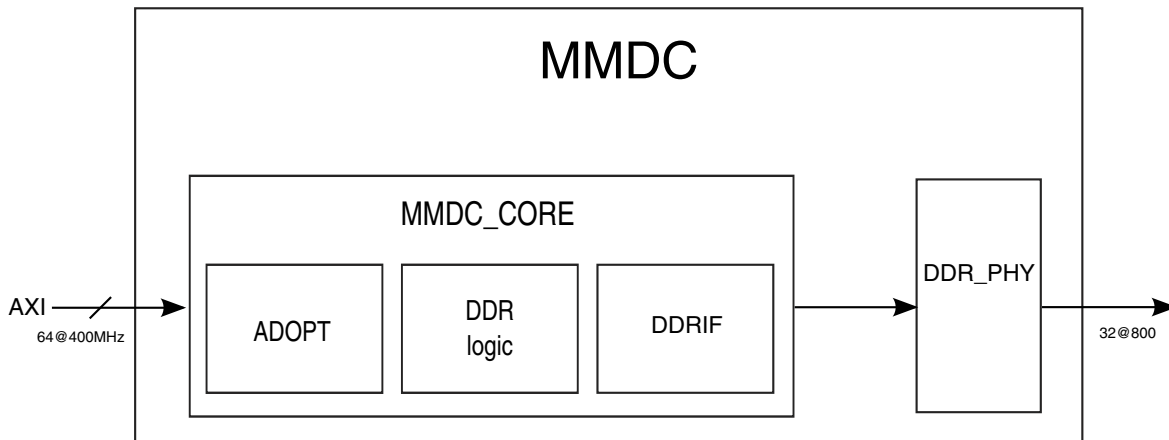

Figure 6-1. MMDC block diagram

Table 6-1. MMDC feature summary

Feature	Description
Supported standards	<ul style="list-style-type: none"> • LV-DDR3, DDR3 x16, x32 (includes SODIMM) • LPDDR2 1ch x32
DDR interface	<ul style="list-style-type: none"> • x16, x32 data bus width • Density of 256 Mbytes-8 Gbytes <ul style="list-style-type: none"> • Column size of 8-12 bits • Row size of 11-16 bits • Up to 2 Gbyte address space and configurable address space per CS. • Supports burst length of 8 (aligned) for DDR3 and burst lengths of 4 for LPDDR2
DDR performance	<ul style="list-style-type: none"> • DDR3 and LPDDR2 running at 400 MHz (800MT/s) • Supports Real-Time priority by means of QoS sideband priority signals from the chip to enable different priority levels in the re-ordering mechanism • Page hit/page miss optimizations • Consecutive read/write access optimizations • Supports deep read and write requests queues to enable bank prediction • Drives back the critical word in a read transaction as soon as it is received by the DDR device (doesn't wait until the whole data phase has been completed) • Can track open memory pages • Supports bank interleaving • Special optimization for non-aligned wrap accesses in burst length 8
AXI interface	<ul style="list-style-type: none"> • AXI bus compliant with glueless interface to PL301 AXI network interconnect • Supports bus transfers of 8,16,32 bits (single accesses and bursts) running at 400 MHz
DDR calibration and delay-lines	<ul style="list-style-type: none"> • All calibrations can be done automatically by hardware or manually by software • ZQ calibration for external DDR device (in DDR3 through the ZQ calibration command and in LPDDR2 through the MRW command). <ul style="list-style-type: none"> • Can be handled automatically for ZQ Short (periodically) and ZQ Long (at exit from self-refresh). • Can be handled manually at ZQ INIT.

Table continues on the next page...

Table 6-1. MMDC feature summary (continued)

Feature	Description
DDR general	<ul style="list-style-type: none"> • Configurable timing parameters • Configurable refresh scheme • Supports dynamic voltage, frequency change and low power mode entry through hardware negotiation with the system (req/ack handshake) • Supports automatic self-refresh and power down entry and exit • Supports fast and slow precharge power down in DDR3 • Supports various ODT control schemes. <ul style="list-style-type: none"> • Assertion/Deassertion of ODT control per read or write accesses and for active or passive CS • Supports MRW and MRR commands for LPDDR2. • Software control for moving to derated timing parameters and derated refresh rate according to temperature variation. • Supports various debug and profiling modes

6.3 Raw NAND Flash controller overview

The Raw NAND Flash controller consists of three components: BCH, GPMI, and APBH_DMA

- BCH is a 62-bit error correction hardware engine with an AXI bus master and a private connection to GPMI.
- GPMI is the NAND controller pin interface.
- APBH_DMA is the DMA engine that drives the GPMI module.

The following figure shows the modules' connectivity.

Figure 6-2. Raw NAND Flash controller sub-system

6.3.1 NAND interface features

- ONFI2.2 compliant
 - Timing modes 0-5 for both asynchronous and synchronous interface
 - Synchronous clock rate of up to 100 MHz with data rate of up to 200 MB/s
- Support for ganged ready/busy inputs
 - Support allows the use of a single package pin for all ready busy/busy input signals.
 - In ganged mode (selectable by a programmable mode bit), GPMI expects that all NAND r/b pins are hard wired to the GPMI RDY_BUSY0.
- Up to 4 NAND devices supported by 4 chip-selects and 1 ganged ready/busy.
- Legacy raw SLC, MLC type device
- BA-NAND (Micron)
- PBA-NAND and LBA-NAND (Toshiba)
- E2-NAND (Hynix)
- EF-NAND (Samsung)

- Samsung's "Toggle-mode" NAND (clock rate of up to 66 Mhz and 80 Mhz, with data rate of up to 133 MB/s and 160 MB/s respectively).
- Configurable page size of 2 Kbytes, 4 Kbytes, or 8 Kbytes.
- Configurable spare area per page of up to 512 bytes.
- Support for non-identical NAND devices not required

6.3.2 NAND control features

The NAND control supports interleaved accesses to as many as four NAND devices while hiding the busy period of each devices. However, fully-independent interleaving cannot be supported in ganged ready/busy mode because that suggests fully independent DMA channel operation on multiple paralleled-accessed chip-enables.

It also features:

- Delay line for adjusting the latching edge in case the frequency is relatively high while the delay is big
- Support for monitoring the external ready/busy signal and read status command polling to compare R/B bit.

6.3.3 Internal interface features

- AXI Master interface can access the system's memory space.
- APBH slave port for register configuration through the APBH bridge DMA.

6.3.4 APBH-DMA overview

APBH-DMA provides an APB peripheral bus system for GPMI and BCH. APBH-DMA uses a single GPMI interface to support as many as four DMA channels for four NAND devices (4 chip-enables) in interleaved mode.

6.3.5 ECC-BCH features

BCH supports:

- A data rate of up to 200 Mbytes/s
- 2 Kbyte codeword (1 Kbyte data + parity)

- Galois Field polynomial GF(2¹⁴)
- Up to 62-bit ECC for 1 Kbyte of data. (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40,42,44,46,48,50,52,54,56,58,60,62 configurable)
- 1 Kbyte codeword (1/2 Kbyte data + parity)
 - Galois Field polynomial GF(2¹³)
 - Up to 62-bit ECC for 1/2 Kbyte of data. (2,4,6,8,10,12,14,16, 18,20,22,24,26,28,30,32,34,36,38,40,42,44,46,48,50,52,54,56,58,60,62 configurable)
- Randomizer module - generates random data based on BCH ECC encoded/decoded data to reduce bit errors

6.4 EIM-PSRAM/NOR Flash controller overview

EIM, which is an external interface module, handles the interface to devices that are external to the chip, including the generation of chip selects, clocks, and control for external peripherals and memory.

It provides asynchronous and synchronous access to devices with an SRAM-like interface.

6.4.1 EIM features

- Up to four (software configurable) chip selects for external devices
 - Flexible address decoding; each chip select memory space is determined separately according to the GPR bits in IOMUXC.
 - 128 MByte maximum supported density by default (AUS bit is cleared). When the AUS bit is set, maximum supported density is 32MBytes.
- Selectable write protection for each chip select
- Support for multiplexed address/data bus operation x16 and x32 port size
- Programmable data port size for each chip select (x8, x16 and x32)
- Programmable wait-state generator for each chip select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Supports asynchronous page mode accesses (x16 and x32 port size)
- Supports a continuous burst clock that can be used as the reference clock for FPGA
- Independent synchronous memory burst read mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)

- Independent synchronous memory burst write mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Supports NAND-Flash devices with NOR-Flash like interface - OneNAND™ (Samsung)
- Independent programmable variable/fix latency support for read and write synchronous (burst) mode
- Support for little endian operation
- ARM AXI slave interface accesses only handled in parallel for single AXI ID transactions
- External interrupt support using the RDY_INT signal function as an external interrupt pin
- Boot from external device support according to boot signals, using the RDY_INT signal
 - RDY signal support assertion after reset
 - INT signal support assertion after reset for OneNAND™ (Samsung) device
 - Supports little endian mode only

6.4.2 EIM boot scenarios

EIM allows booting from NOR Flash devices. To select NOR Flash as the boot source, use either the boot mode and configuration GPIO pins or the internal boot-related fuses.

See [Sytem Boot](#) for more information.

6.4.3 EIM boot configuration

The following table shows the EIM boot configuration.

Table 6-2. EIM boot configuration

EIM_BOOT_CFG bus	EIM affected bits	EIM register
12	NUM16_BYP_GRANT	CS0GCR2
11	DZS[2]	CS0GCR1
10	AUS	CS0GCR1
[9:8]	CSREC[2:1]	CS0GCR1
[7:5]	RWSC[4:2]	CS0GCR1
	WWSC[4:2]	CS0WCR
4	ERRST	WCR
3	RAL	CS0RCR1

Table continues on the next page...

Table 6-2. EIM boot configuration (continued)

EIM_BOOT_CFG bus	EIM affected bits	EIM register
	WAL	CS0WCR
2	MUM	CS0GCR1
	OEA[1]	CS0RCR1
[1:0]	DSZ[1:0]	CS0GCR1

6.4.4 OneNAND requirements

Because Ready/Busy pin is not in use, OneNAND devices require the following actions:

- Poll the device to see whether it is ready; software performs a read from the device.
- Connect the Ready/Busy signal of the device to any GPIO pin and use it as an interrupt that indicates the on ready state.

Chapter 7

System Debug

7.1 Overview

This chapter describes the hardware and software debug and application development features and resources of the chip. It discusses the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM's CoreSight architecture, adapted to SoC (for core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with cores under debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third party tools
- TPIU, a trace port interface unit that efficiently accesses program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

7.2 Chip and ARM Platform Debug Architecture

ARM Debug architecture is based on CoreSight architecture by ARM Ltd. The CoreSight architecture provides a system wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access debug functionality without software interaction;
- To connect to a running system without performing a reset.

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit allow which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state and restarts the processor core.

7.2.1 Debug Features

- CoreSight Program Trace Macrocell (PTM): trace generator for the ARM Cortex A9™ core
- Support for a TrustZone-related 3-level debug scheme:
 - Debug in Non-Secure privileged and user, and Secure user
 - Debug in Non-Secure only
- EmbeddedICE-RT logic
 - Support for both monitor-mode and halt-mode debugging:
 - Core run/halt control, debug status/control
 - Breakpoint/watchpoint control
 - Core- and memory-mapped resource examination/modification
- Data communication channel between ARM core and host debugger via JTAG, and the Debug Access Port (DAP) module.
- PMU: Performance Metrics Unit used for system profiling and debug.
- CP15 register for debugging the MMU, I & D L1 cache, and TLB
- PL310 L2 Cache: Provides an event monitoring signal routed to pins for visibility to help in system debug.

The chip includes ARM CoreSight components for multicore debug and trace solutions.

7.2.2 Debug System components

CoreSight components include:

- Embedded Trace Buffer (ETB): RAM array to be used for on-chip capture of trace data output from the PTM

- ATB Replicator to connect the trace data to TPIU (Trace Port Interface) and ETB (Embedded Trace Buffer)
- Cross Triggering logic for event routing, including CTIs and CTMs

Other related IPs and functionality:

- ROMPATCH module to support modification of program/data information in the MCU ROM
- Debug Visibility, which selects critical signals routed to the I/O pads as alternate outputs for external visibility

7.2.2.1 AMBA trace bus (ATB)

ATB transfers trace data through the CoreSight infrastructure in a chip. Trace sources are ATB masters and sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine sources into a single trace stream.
- Association of the trace data with the generating source using trace source IDs. A CoreSight system can trace up to 111 different items at any one time.
- Capture and transfer of multiple byte bus widths, currently to 32 bits.
- A flushing mechanism to force historic trace to drain from any sources, links, or sinks up to the point that the request was initiated

7.2.2.2 ATB replicator

The ATB replicator enables two trace sinks to be wired together and to operate from the same incoming trace stream.

There are no programmable registers. This component is invisible to the user on a particular trace path, from source to sink.

- Incoming ATB Interface—The ATB replicator accepts trace data from the trace source, either directly or through a trace funnel.
- Outgoing ATB Interfaces—The ATB replicator sends identical trace data on outgoing master port interfaces.

7.2.2.3 Embedded Cross Triggering

The ECT is a modular component from ARM Limited that supports the interaction and synchronization of multiple triggering events within a chip. The main function of the ECT (CTI and CTM) is to pass debug events from one core to another. For example, the ECT can communicate debug state information from one core to another, so that program execution on both processors can be stopped at the same time if required.

The ECT consists of the following types of modules:

- Cross trigger interfaces (CTI)
- Cross trigger matrix (CTM)

Cross trigger interfaces provide the interface between a component or subsystem and the cross trigger matrix. The system requires a CTI for each subsystem that supports cross triggering. The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events. When the CTI receives a channel event it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the trigger interface.

The Cross Trigger Matrix (CTM) combines the trigger request generated from the CTIs and broadcasts them to all CTIs as channel triggers. The CTM controls the distribution of channel events. It provides Channel Interfaces (CIs) to connect to either CTIs or CTMs. This enables multiple CTIs to be linked together. The ECT is composed of three/five CTIs (Cross Trigger Interface) and two CTMs (Cross Trigger Matrix). The ECT is key in the multi-core and multi-IP debug strategy. The outcome is a SWcontrolled debug signal matrix that receives signals from various sources (i.e. cores and peripherals) and propagates/ routes them to the different debug resources of the SoC. Those debug resources can include time stamping capability, profiling capabilities, real-time trace (trace enabled or disabled), triggers, SOC level multiplexing, and debug interrupts.

NOTE

As the ECT should only be used during debug sessions, it is off (disabled) by default.

7.2.2.3.1 Cross-Trigger Matrix (CTM)

The CTM (Cross Trigger Matrix) is provided by ARM. A brief description is provided below. It is advised to refer to ARM documentation for more details.

The CTM is a relatively simple block with no configuration options. There are two CTM instances in in ARM Platform.

One of them is used to route Core's CTI's, while the second one, is used for additional CoreSight CTI. Each CTI has 4 channel lines, which CTI events are mapped to. The exact mapping is configured in the CTI logic.

7.2.2.3.2 Cross-Trigger Interface (CTI)

The Cross-Trigger Interface (CTI) component is provided by ARM. A brief description of the CTI is provided below.

There are CTIs in the chip's ARM platform. of which, dedicated to each Core, while the is used for various other signals routing.

Each of these CTIs has 8 trigger inputs and 8 trigger outputs that connect to logic in the domain to be debugged or profiled. Each CTI also includes a 4 channel interface to the CTM (4 inputs and 4 outputs).

For more information, see ARM platform chapter.

7.2.2.4 Debug Access Port (DAP)

The DAP enables debug access to the chip modules through APB-AP (the APB access port) and APB-Mux (the APB multiplexer).

AHB-AP provides system access. Debug tools can use JTAG to connect to the chip.

DAP has the following features:

- AMBA 3 Peripheral Bus Multiplexor access though AMBA 3 APB Access Port, providing debug peripheral access through the APB interface.
- External JTAG access using the JTAG Debug Port (JTAG-DP).
- Internal chip module access using:
 - AHB Access Port (AHB-AP)
 - APB Access Port (APB-AP)
 - JTAG Access Port (JTAG-AP)

APB-Mux enables system access to CoreSight components connected to the Debug APB.

The ROM table provides a list of memory locations of CoreSight components connected to the Debug APB. This is visible from both tools and system access and one configures it during system implementation.

External read/write access to the internal interface is provided by JTAG-DP. JTAG-DP provides a standard interface for debug access to the chip through DAP. It interfaces to the DAP internal bus.

Internal access to on-chip buses and other interfaces are provided by the access ports (APs). The available APs are:

- AHB-AP which provides an AHB-Lite master for access to a system AHB bus.
- APB-AP which provides an AMBA 3 APB master for access to the Debug APB that configures all CoreSight components.
- JTAG-AP which provides JTAG access to on-chip components and operates as a JTAG master port to drive JTAG chains throughout the chip.

7.2.2.5 CoreSight trace port interface (TPIU)

TPIU (Cortex-A9)

TPIU is one of the CoreSight trace sink components. It acts as a bridge between the on-chip trace data and a data stream that is then driven out the trace port.

TPIU uses the ATB interface to accept trace data from a trace source, either directly or by using a trace funnel. TPIU has 32 bit port connected to the chip pad.

The APB interface is the programming interface for the TPIU configuration.

The features of the sub-blocks are as follows:

- Formatter—Inserts source ID signals into the data packet stream so that the trace data can be re-associated with the trace source.
- Asynchronous FIFO—Enables trace data to be driven out at a speed that is not dependent on the on-chip bus clock.
- Register Bank—Contains the management, control and status registers for triggers, flushing behavior and external control.
- Trace out—The Trace out block serializes the formatted data before it goes off-chip.
- Pattern Generator—The Pattern Generator unit provides a simple set of defined bit sequences or patterns that can be output over the Trace Port and be detected by the TPA or other associated Trace Capture Device (TCD). The TCD can use these patterns to indicate if it is possible to increase or decrease the trace port clock speed.

The TPIU accepts trace data from a trace source, either direct from a trace source or using a Trace Funnel. The APB interface is the programming interface for the TPIU. The Trace Clock driving the data out to external pins can be obtained from either an on chip or off chip source, selectable via a mux.

The output of the TPIU is connected via external pins (MPS of TRACEDATA in Figure 8-8, which can be in the range of 1–16 bits). The system may utilize double data rate pins to either use a lower clock speed than that of the 32-bit ATB interface, or use fewer than 32 data pins for the output, based on the ability of the technology used. Given the speed of the ATB, 32 data pins with double data rate is recommended, with the external

interface running at half the speed of the ATB. The speed of the external interface is from TRACECLKIN, and should be selectable via an on chip or off chip clock. TRACECLK is equal to TRACECLKIN / 2, and is divided in the TPIU to clock trace data at the trace capture unit.

TPIU used to be part of the ARM platform sub blocks in previous versions of i.MX products, placing the TPIU off platform allows future debug trace sources from the chip level to connect to the TPIU by means of a funnel.

For more information, see [Program Trace Macrocell \(PTM\)](#).

TPIU (Cortex-M4)

The TPIU acts as a bridge between the on-chip trace data from the Embedded Trace Macrocell (ETM) and the Instrumentation Trace Macrocell (ITM), with separate IDs, to a data stream, encapsulating IDs where required, that is then captured by a Trace Port Analyzer (TPA). The TPIU is specially designed for low-cost debug.

7.2.2.6 Coresight Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit RAM. The ETB accepts trace data from any CoreSight-compliant component trace source with an ATB master port, such as a trace source or a trace funnel. It is included in this device to remove dependencies from the trace pin pad speed, and enable low cost trace solutions. The TraceRAM size is 2 KB.

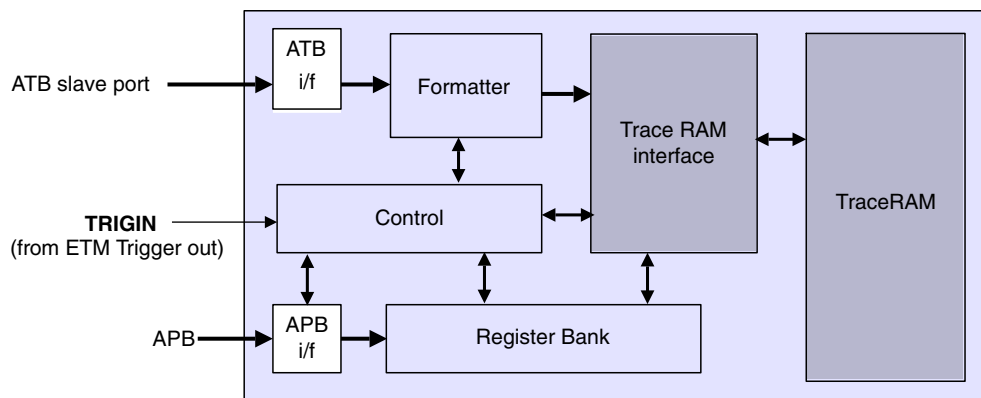

Figure 7-1. ETB Block Diagram

The ETB contains the following blocks:

- **Formatter**—Inserts source ID signals into the data packet stream so that trace data can be re-associated with its trace source after the data is read back out of the ETB.

- Control—Control registers for trace capture and flushing.
- APB interface—Read, write, and data pointers provide access to ETB registers. In addition, the APB interface supports wait states through the use of a PREADYDBG signal output by the ETB. The APB interface is synchronous to the ATB domain.
- Register bank—Contains the management, control, and status registers for triggers, flushing behavior, and external control.
- Trace RAM interface—Controls reads and writes to the Trace RAM.

7.2.2.6.1 Performance Profiling with the ETB

To create a performance profile (for example, gprof) for the target application, a means to collect trace over a long period of time is needed. The ETB buffer is too small to capture a meaningful profile in just one take. What is needed is to collect and concatenate data from the ETB buffer for multiple sequential runs. Using the ETB packet counter, the trace analysis tool can capture multiple sequential runs by executing code until the ETB is almost full, and halting or executing an interrupt handler to allow the buffer to be emptied, and then continuing executing code. The target halts or executes an interrupt handler when the buffer is almost full to empty the data and then the debugger runs the target again.

7.2.2.6.2 ETB Counter Control

The ETB packet counter is controlled by the ETB counter control register, ETB reload register, and ETB counter value register implemented in the Miscellaneous Control Module (MCM) accessible via the Private Peripheral Bus. Via the ETB counter control register the ETB control logic can be configured to cause an MCM Alert Interrupt, an NMI Interrupt, or cause a Debug halt when the down counter reaches 0. Other features of the ETB control logic include:

- Down counter to count as many as 512 x 32-bit packets.
- Reload request transfers reload value to counter.
- ATB valid and ready signals used to form counter decrement.
- The counter disarms itself when the count reaches 0.

The counter decrement enable will allow the counter to decrement at the rising edge of ATCLK when,

- The counter enable bit is set.
- The counter is armed.
- ATVALID and ATREADY are asserted.

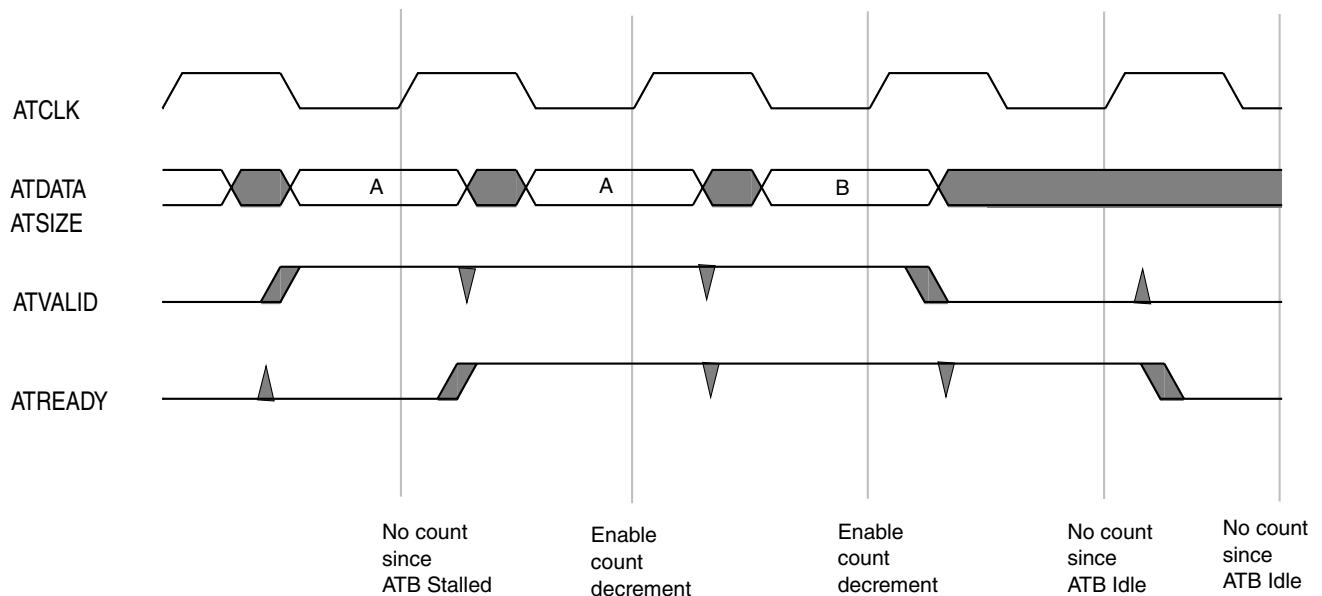

Figure 7-2. Count Decrement Enable

7.2.2.7 Embedded Trace Macrocell v3.5 (ETM)

The Cortex-M4 Embedded Trace Macrocell (ETM-M4) is a debug component that enables a debugger to reconstruct program execution. The CoreSight ETM-M4 supports only instruction trace. You can use it either with the Cortex-M4 Trace Port Interface Unit (M4-TPIU), or with the CoreSight ETB.

The main features of an ETM are:

- Tracing of 16-bit and 32-bit Thumb instructions
- Four EmbeddedICE watchpoint inputs
- A Trace Start/Stop block with EmbeddedICE inputs
- One reduced function counter
- Two external inputs
- A 24-byte FIFO queue
- Global timestamping

7.2.2.8 ITM

The ITM is an application-driven trace source that supports printf style debugging to trace Operating System (OS) and application events, and emits diagnostic system information. The ITM emits trace information as packets. There are four sources that can

generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

1. Software trace—Software can write directly to ITM stimulus registers. This emits packets.
2. Hardware trace—The DWT generates these packets, and the ITM emits them.
3. Time stamping—Timestamps are emitted relative to packets. The ITM contains a 21-bit counter to generate the timestamp. The Cortex-M4 clock or the bitclock rate of the Serial Wire Viewer (SWV) output clocks the counter.
4. Global system timestamping. Timestamps can optionally be generated using a system-wide 48-bit count value. The same count value can be used to insert timestamps in the ETM trace stream, allowing coarse-grain correlation.

7.2.3 i.MX6SoloX-Specific SJC Features

7.2.3.1 JTAG Disable Mode

In addition to different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

7.2.3.2 JTAG ID

Table 7-1. i.MX JTAG ID

Device	Silicon revision	JTAG ID (ID CODE)
i.MX 6SoloX	Rev 1.0	0891_C01Dh ¹

1. In follow-on silicon revisions, the ID value is subject to change by incrementing the first nibble as follows: 1891_C01Dh for Rev 1.1, 2891_C01Dh for Rev 1.2 , etc.

7.2.4 System JTAG Controller - SJC

The SJC module is the bridge between external development and test instrumentation and the internal JTAG-accessible debug and test resources.

It implements and manages the daisy-chained topology consisting of its own TAP and those of the SDMA, and the ARM Debug Access Port (DAP).

NOTE

Single Wire Debug (SWD) protocol is not supported.

7.2.5 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
 - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
 - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- levels of security, ranging from no security to no JTAG accessibility to the chip

7.2.6 SJC TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

7.2.7 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug_Event pin
- A master TAP controller which implements the standard JTAG state machine

- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
 - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
 - Optional: "ID_CODE" (SOC JTAG ID register), "HIGHZ"
- Supports the SDMA's DR-path-only JTAG architecture by implementing the controller portion of its TAP (including "BYPASS" as the default state) within the SJC
- The ExtraDebug registers, which implement a variety of control and status features
 - Three 32-bit insecure general purpose status registers
 - Two 32-bit secure status registers - one predefined, one general purpose.
 - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined (SOC integration team) control and status functions are supported by the SJC.

The user-defined functions will be defined and documented by the SOC integration team.

7.3 Smart DMA (SDMA) core

SDMA is a dedicated, programmable DMA engine. It is an integration of a 32-bit RISC core and DMA-specific hardware. It includes ports for the AP domain and a peripheral domain, along with a burst-capable port for direct external memory access.

The SDMA and its integration in the chip is unchanged from previous i.MX chips.

The main SDMA debug features are:

- OnCE - On Chip Emulator, provides the following capabilities:
 - SDMA core control - run/halt/single-step
 - SDMA core register/memory-map access
 - Event detection, watchpoints, and hardware breakpoints
 - Real time buffer and PC trace buffer capability
- Trace buffer
 - Contains information to identify the 32 last changes of flow detected during a program execution
- Context dump
 - Includes information about all the channel dump activity
 - Current contents of SDMA RAM
- ROMPATCH

7.3.1 SDMA On Chip Emulation Module (OnCE) Feature Summary

The SDMA debug features are primarily defined by the OnCE portion of its design.

They are summarized as follows:

- Memory And Register Access - dedicated logic enables user-access to SDMA memory and register locations. These accesses are supported only when the processor is in debug mode.
- Event Detection Unit - watches signals from the data memory bus (DMBus) which is used by the RISC core to access its RAM, ROM, and memory-mapped registers
- Watchpoints - one output signal is available to watch event matching conditions at the chip level. Match conditions are defined by programming memory-mapped registers.
- Hardware Breakpoint - a counter is decremented after an event detection. A debug request is sent to the SDMA core only when the counter reaches the value of zero. It is possible to program the initial value of the counter or to disable the use of the counter if a debug request must be generated after each event detection.
- Real Time Buffer - The Real Time Buffer Register (RTB) is a single 32-bit memory-mapped register which can be accessed as a regular memory location during program execution. It is used to store and retrieve run time information without putting the SDMA in debug mode. Each write to this register causes an event. This register is, in fact, located in the OnCE. Executing through JTAG, a buffer command exports the content of this register through the JTAG port.
- Core Control (Core Status / Single Stepping) - Commands are provided to monitor and control processor activity. The commands can halt the core, rerun the core from another address location, and get processor status.
- Trace Buffer - a 32x32 buffer which records the last 32 changes of flow during program execution. The buffer stores data in a modulo fashion (i.e. the 33rd instruction change replaces the 1st). Captured trace information is retrieved via reads to the Trace Buffer Register.

7.3.1.1 Other SDMA Debug Functionality

- Core Trace - basic core trace capability is available through debug visibility functionality only. PTM trace capability does not exist.
- ROM Patch - can be accomplished by manipulating the CHN0ADDR register through JTAG or via the MCU's ability to write to SDMA OnCE registers. This must be done right after reset and before the SDMA core is enabled to begin processing events.
- Additional debug control/status interaction with the SJC module

- SJC-controlled Debug Request
- SJC-readable Debug Acknowledge (in debug mode)
- Debug clock control - allows SJC to force clocks on for debug purposes
- Debug core state (SDMA RISC Core State) - 4 bits accessible from the SJC via JTAG

7.3.1.2 SDMA ROM Patching

After reset, the SDMA is in its IDLE_AFTER_RESET mode. A debug request also puts the SDMA in its DEBUG_IN_IDLE_AFTER_RESET mode. The new address boot must be stored in CHN0ADDR register (e.g., through the SDMA OnCE via debugger).

The user must then issue the exec_core <instruction> SDMA OnCE instruction to return to the IDLE_AFTER_RESET mode. The very first instructions of the boot code fetches the contents of this register (which is also mapped in the SDMA memory space) and jumps to the given address.

7.4 Miscellaneous

7.4.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The Cortex-A9 and VSP cores can receive resets from the following sources:

- Debug Reset (CDBGGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

Conversely, the debug system is capable of generating a system reset via a request bit in the MDM-AP control register. This allows the debugger to hold the system in reset.

7.5 Supported tools

DS-5 ARM Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

Chapter 8

System Boot

8.1 Overview

The boot process begins at Power On Reset (POR) where the hardware reset logic forces the ARM core to begin execution starting from the on-chip boot ROM.

Boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG)
- Device configuration data (DCD) and plugin
- Digital signature and encryption based High Assurance Boot (HAB)
- Wake-up from low power modes

The boot ROM supports the following boot devices:

- NOR Flash
- NAND Flash
- OneNAND Flash
- SD/MMC
- Serial (I2C/SPI) NOR Flash and EEPROM
- QuadSPI (QSPI) Flash

In normal operation, the Boot ROM uses the state of `BOOT_MODE` and eFUSES to determine the boot device. For development purposes, eFUSES used to determine the boot device may be overridden by using GPIO pin inputs.

Boot ROM code also allows the downloading of programs to be run on the device. An example is a provisioning program that can make further use of the serial connection to provision a boot device with a new image. Typically the provisioning program is

downloaded to internal RAM and allows the programming of boot devices, such as an SD/MMC Flash. The ROM Serial Downloader uses high speed USB in a non-stream mode connection.

Boot ROM allows waking up from low-power modes. On reset the ROM checks power gating status register. On waking from low power mode, the core will skip loading an image from the boot device and jump to the address saved in PERSISTENT_ENTRY0.

The device configuration data (DCD) feature allows boot ROM code to obtain SOC configuration data from an external Program Image residing on the boot device. As an example, DCD can be used to program the DDR controller for optimal settings improving the boot performance. DCD is restricted to memory areas and peripheral addresses that are considered essential for boot purposes (see [Write Data Command](#)).

A key feature of the boot ROM is the ability to perform a secure boot or High Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. HAB uses a combination of hardware and software together with a Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows a user's image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as part of the final Program Image. If configured to do so, the ROM verifies the signatures using the public keys included in the Program Image. In addition to supporting digital signature verification to authenticate Program Images, Encrypted boot is also supported. Encrypted boot can be used to prevent cloning of the Program Image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the Serial Downloader. The HAB library in the boot ROM also provides API functions, allowing additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for SEC_CONFIG is the Open configuration in which the ROM/HAB performs image authentication, but all authentication errors are ignored and the image is still allowed to execute.

8.2 Boot modes

During reset, the chip checks Power Gating Controller status register.

On normal boot, the core's behavior is defined by the Boot Mode pins settings as described in [Boot mode pin settings](#). On waking up from low power boot mode, the core skips clock settings. Boot ROM checks that PERSISTENT_ENTRY0 (see [Persistent Bits](#)) is a pointer to valid address space (OCRAM, DDR, QSPI, or EIM). If

PERSISTENT_ENTRY0 is a pointer to valid range, it starts execution using entry point from PERSISTENT_ENTRY0 register. If PERSISTENT_ENTRY0 is a pointer to invalid range, the core performs system reset.

8.2.1 Boot mode pin settings

The device has four boot modes (one is reserved for Freescale use). Boot mode is selected based on the binary value stored in the internal BOOT_MODE register.

BOOT_MODE is initialized by sampling the BOOT_MODE0 and BOOT_MODE1 inputs on the rising edge of POR_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT_MODE internal register. The state of the internal BOOT_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See the table below for settings.

Table 8-1. Boot MODE Pin Settings

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

8.2.2 High level boot sequence

The figure found here shows the high-level boot ROM code flow.

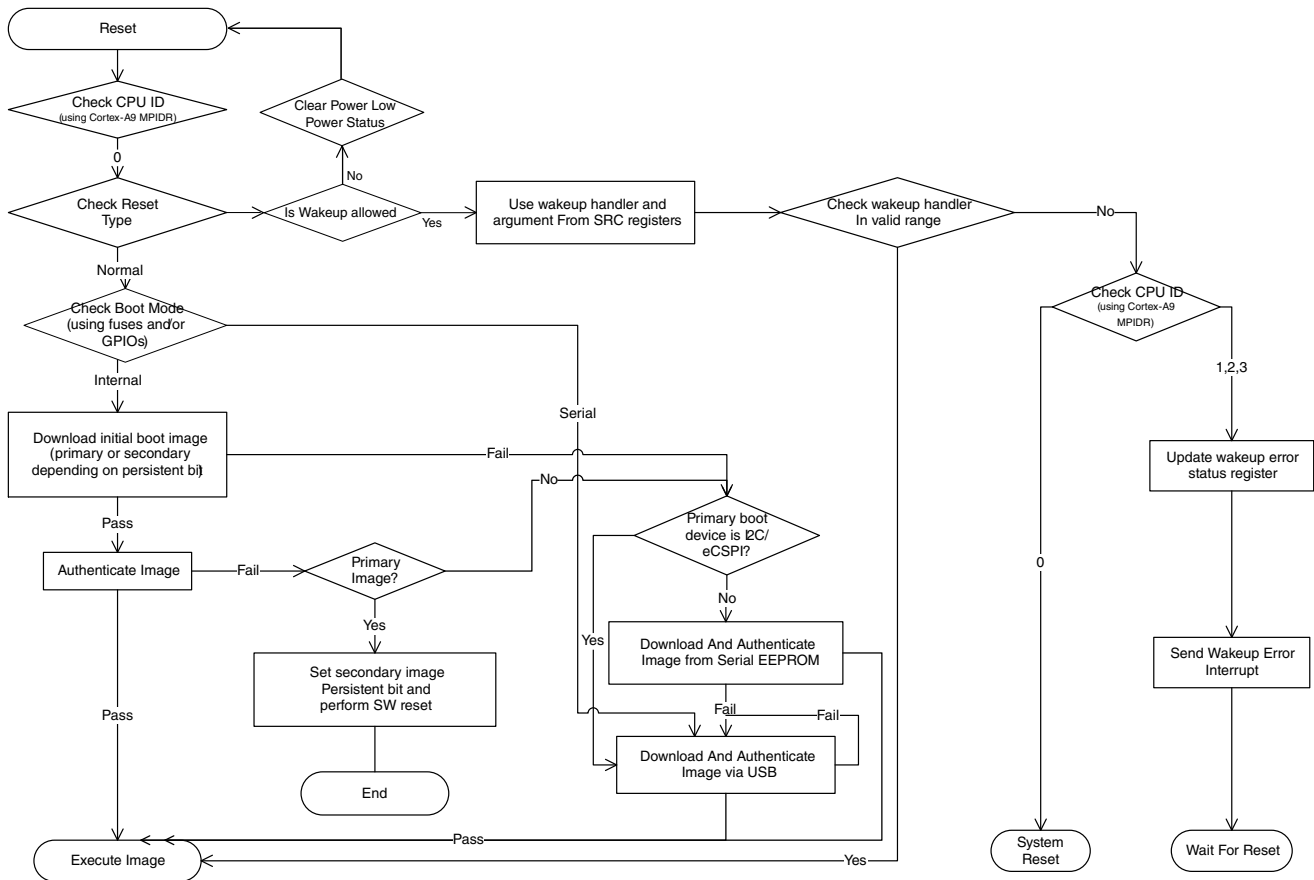

Figure 8-1. Boot Flow

8.2.3 Boot From Fuses Mode (BOOT_MODE[1:0] = 00b)

A value of 00b in the BOOT_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot Mode \(BOOT_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT_FUSE_SEL eFUSE value. If BT_FUSE_SEL = 0, indicating that the boot device (for example, Flash, SD/MMC) has not yet been programmed, the boot flow jumps directly to the Serial Downloader. If BT_FUSE_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such a case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using Boot From Fuses mode addresses this problem.

Setting BT_FUSE_SEL forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a Program Image and blow the BT_FUSE_SEL and the other boot configuration eFUSES. After reset, the Boot ROM code determines that BT_FUSE_SEL is blown (BT_FUSE_SEL = 1) and the ROM code performs internal boot according to the new eFUSE settings. This allows a user to set BOOT_MODE[1:0]=00b on a production device and burn fuses on the same device (by forcing entry to the Serial Downloader), without changing the value of BOOT_MODE[1:0] or pullups/pulldowns on the BOOT_MODE pins.

8.2.4 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG1 for a 90-second time-out if WDOG_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

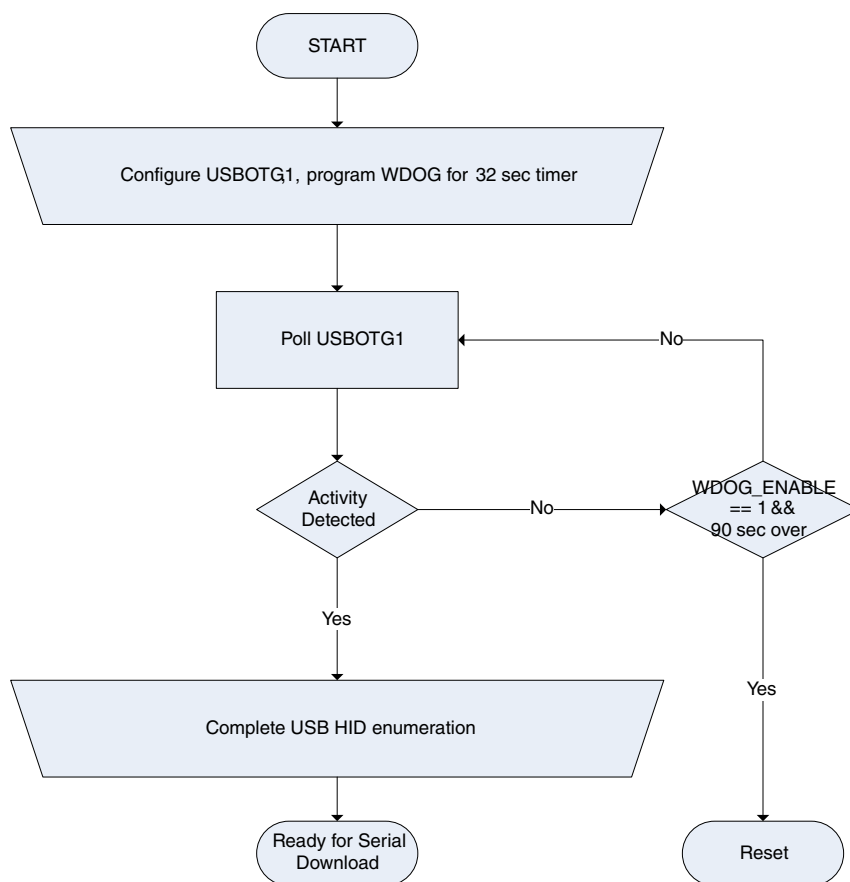

Figure 8-2. Serial Download Boot Flow

8.2.5 Internal Boot Mode (BOOT_MODE[1:0] = 0b10)

A value of 0b10 in the BOOT_MODE[1:0] register selects the internal boot mode. In this mode, the processor continues to execute boot code from the internal boot ROM.

The boot code performs hardware initialization, loads the Program Image from the chosen boot device, performs image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the Program Image. If any error occurs during internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to internal boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT_FUSE_SEL) determines whether the ROM uses GPIO pins for a select number of configuration parameters or eFUSES in this mode. See [Table 8-4](#) for more details.

- If `BT_FUSE_SEL = 1`, all boot options are controlled by the eFUSES described in [Table 8-2](#).
- If `BT_FUSE_SEL = 0`, specific boot configuration parameters may be set using GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Table 8-2](#). [Table 8-3](#) provides the details on the GPIO pins.

The use of GPIO overrides is intended for development since these pads are used for other purposes in deployed products. Freescale recommends controlling the boot configuration by eFUSES in deployed products and reserving the use of the GPIO mode for development and testing purposes only.

8.2.6 Boot security settings

Internal boot modes use one of three security configurations:

- **Closed:** This level is intended for use with shipping secure products. All HAB functions are executed and security hardware is initialized (the Security Controller, or SNVS, enters Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, and the boot flow aborted with control passing to the serial downloader. At this level, execution does not leave the internal ROM unless the target executable image has been authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. Security hardware is initialized (except the SNVS is left in Non-Secure state), DCD is processed if present, and the program image is authenticated by HAB prior to its execution. All detected errors will be logged, but have no influence on the boot flow, which continues as if the errors did not occur. This configuration is useful for secure product development, since the Program Image will run even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of authentication failure.
- **Field Return:** This level is intended for parts returned from shipped products.

NOTE

If the `DIR_BT_DIS` eFuse is not blown, authentication may be bypassed. In this case the system is not secure.

8.3 Device Configuration

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes boot device selection (SPI, EIM, NOR, SD, MMC, QSPI, etc.), boot device configuration (SD bus width, speed, etc), and so on. In general, the source for this configuration comes from eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from GPIO pins allowing further flexibility during the development process.

8.3.1 Boot eFUSE Descriptions

The table below is a comprehensive list of the configuration parameters that the ROM uses.

Table 8-2. Boot eFUSE Descriptions

Fuse	Configuration	Definition	GPIO ¹	Shipped Value	Settings ²
DIR_BT_DIS	OEM	Disables Freescale reserved modes. Must be set for secure boot.	NA	0	0 Reserved Freescale modes enabled 1 Reserved Freescale modes disabled
BT_FUSE_SEL	OEM	In internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by GPIO pins or eFUSE settings in the On-Chip OTP Controller (OCOTP). In Boot From Fuse mode BOOT_MODE[1:0] = 00, BT_FUSE_SEL fuse indicates whether bit configuration eFuses have been programmed.	NA	0	If BOOT_MODE[1:0] = 0b10 0 Bits of SBMR are overridden by GPIO pins. 1 Specific bits of SBMR are controlled by eFUSE settings. If BOOT_MODE[1:0] = 0b00 0 BOOT configuration eFuses are not yet programmed. Boot flow jumps to serial downloader. 1 BOOT configuration eFuses have been programmed. Regular boot flow is performed.
SEC_CONFIG[1:0]	SEC_CONFIG[0] - Freescale SEC_CONFIG[1] - OEM	Security Configuration as defined in Boot security settings	NA	01	00 Reserved 01 Open (allows any program image, even if authentication fails) 1x Closed (Program image executes only if authenticated)

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions
(continued)**

Fuse	Configuratio n	Definition	GPIO ¹	Shipped Value	Settings ²
FIELD_RETURN	OEM	Enables Freescale reserved modes			0 - Freescale reserved modes are enabled/ disabled based on DIR_BT_DIS value 1 - Freescale reserved modes are enabled
SRK_HASH[255:0]	OEM	256-bit hash value of super root key (SRK_HASH)	NA	0	Settings vary - used by HAB
DIE-X-CORDINATE[7:0] DIE-Y-CORDINATE[7:0] WAFER_NO[4:0] LOT_NO_ENC[42:40] LOT_NO_ENC[39:32] LOT_NO_ENC[31:24] LOT_NO_ENC[23:16] LOT_NO_ENC[15:8] LOT_NO_ENC[7:0]	Freesc ale	Device Unique ID, 64-bit UID.	NA	Unique ID	Settings vary - used by HAB
BT_MMU_DISABLE	OEM	MMU/L1 D Cache/PL310 disable bit used by boot ROM for fast HAB processing	No	0	0 - MMU/L1 D Cache/PL310 is enabled by ROM during the boot 1 - MMU/L1 D Cache/PL310 is disabled by ROM during the boot
L1 I-Cache DISABLE	OEM	L1 I Cache disable bit used by boot during entire execution	No	0	0 - L1 I Cache is enabled by ROM during the boot 1 - L1 I Cache is disabled by ROM during the boot
BT_FREQ	OEM	Frequency Selection	Yes	0	0 - ARM - 792 MHz, DDR - 396 MHz, AXI - 264 MHz 1 - ARM - 528 MHz, DDR - 307 MHz, AXI - 176 MHz
BOOT_CFG1[7:0]	OEM	Boot Configuration1	Yes	0	Specific to selected boot mode
BOOT_CFG2[7:0]	OEM	Boot Configuration2	Yes	0	Specific to selected boot mode
BOOT_CFG4[6:0]	OEM	Boot Configuration4		0	Specific to selected boot mode
BOOT_CFG4[7]	OEM	Infinite Loop Enable at start of boot ROM. Used for debugging purposes. Ignored if DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0 - Disabled 1 - Enabled
LPB_BOOT	OEM	USB Low Power Boot	No	0	00 - LPB Disable 01 - 1 GPIO (default frequencies) 10 - Divide by 2 11 - Divide by 4

Table continues on the next page...

**Table 8-2. Boot eFUSE Descriptions
(continued)**

Fuse	Configuration	Definition	GPIO ¹	Shipped Value	Settings ²
BT_LPB_POLARITY	OEM	USB Low Power Boot GPIO polarity	No	0	0 - low on GPIO pad indicates low power condition 1 - high on GPIO pad indicates low power condition
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0 - watchdog reset counter is disabled during serial downloader 1 - watchdog reset counter is enabled during serial downloader
MMC_DLL_DLY[6:0]	OEM	uSDHC Delay Line settings	No	0	uSDHC Delay Line settings
SRK_REVOKE[2:0]	OEM	SRK revocation mask	No	0	SRK revocation mask
DISABLE_SDMMC_MFG	OEM	Disable SDMMC manufacture mode	Yes	0	0: enable SD/MMC MFG mode 1: disable SD/MMC MFG mode
PAD_SETTINGS	OEM	Override values for SD/MMC and NAND boot modes	No	0	Override the following IO PAD settings: PAD_SETTINGS[0] - Slew Rate PAD_SETTINGS[3:1] Drive Strength PAD_SETTINGS[5:4] - Speed Settings .
USE_L2_CACHE_AS_OCRAM (BOOT_CFG2[0])	OEM	L2 cache memory to be configured as OCRAM	Yes	0	0: L2 cache will be used as cache 1: L2 cache will be used as OCRAM ³
OVERRIDE_HYS_SDMMC_PADS	OEM	Overrides HYS bit for SD pads	No	0	Override the IO PAD setting HYS to 1 for SD pads
eMMC_4.4_RESET_TO_PRE-IDLE_STATE	OEM	ROM reset the boot device in pre-idle state using eMMC 4.4 feature, CMD0 with argument value 0xf0f0f0	No	0	Applicable for booting from eMMC 4.4 spec or greater version devices. The fuse should not be blown for eMMC 4.3 or lesser spec version devices.

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse
3. L2 Cache will be locked after boot to prevent the leaking of cache contents.

8.3.2 GPIO Boot Overrides

The table below provides a list of GPIO boot overrides.

Table 8-3. GPIO Override Contact Assignments

Package Pin	Direction on reset	eFuse
BOOT_MODE1	Input	Boot Mode Selection

Table continues on the next page...

Table 8-3. GPIO Override Contact Assignments (continued)

Package Pin	Direction on reset	eFuse
BOOT_MODE0	Input	
LCD1_DATA00	Input	BOOT_CFG1[0]
LCD1_DATA01	Input	BOOT_CFG1[1]
LCD1_DATA02	Input	BOOT_CFG1[2]
LCD1_DATA03	Input	BOOT_CFG1[3]
LCD1_DATA04	Input	BOOT_CFG1[4]
LCD1_DATA05	Input	BOOT_CFG1[5]
LCD1_DATA06	Input	BOOT_CFG1[6]
LCD1_DATA07	Input	BOOT_CFG1[7]
LCD1_DATA08	Input	BOOT_CFG2[0]
LCD1_DATA09	Input	BOOT_CFG2[1]
LCD1_DATA10	Input	BOOT_CFG2[2]
LCD1_DATA11	Input	BOOT_CFG2[3]

LCD1_DATA23	Input	BOOT_CFG4[7]

The input pins provided are sampled at boot, and can be used to override corresponding eFUSE values, depending on the setting of the BT_FUSE_SEL fuse. Table below describes boot options control sampling in different boot modes.

Table 8-4. Boot Options Control Selection

BOOT_MODE[1:0]	BT_FUSE_SEL Value	Boot Options Controlled By
00	0	eFUSES
	1	
01 ¹	0	GPIO pins
	1	eFUSES
10	0	GPIO pins
	1	eFUSES

1. BOOT_MODE[1:0]=01 always selects serial download regardless of the setting or the fuses or GPIO pins.

8.3.3 Device Configuration Data

DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on Device Configuration Data.

8.4 Device Initialization

This section describes the details on the ROM and provides initialization details.

This includes details on:

- The ROM Memory Map
- The RAM Memory Map
- On-chip blocks that the ROM should make use of or change POR register default values
- Clock initialization
- Enabling the MMU/L2 cache
- Exception handling and interrupt handling

8.4.1 Internal ROM /RAM memory map

The following figure shows the iROM memory map.

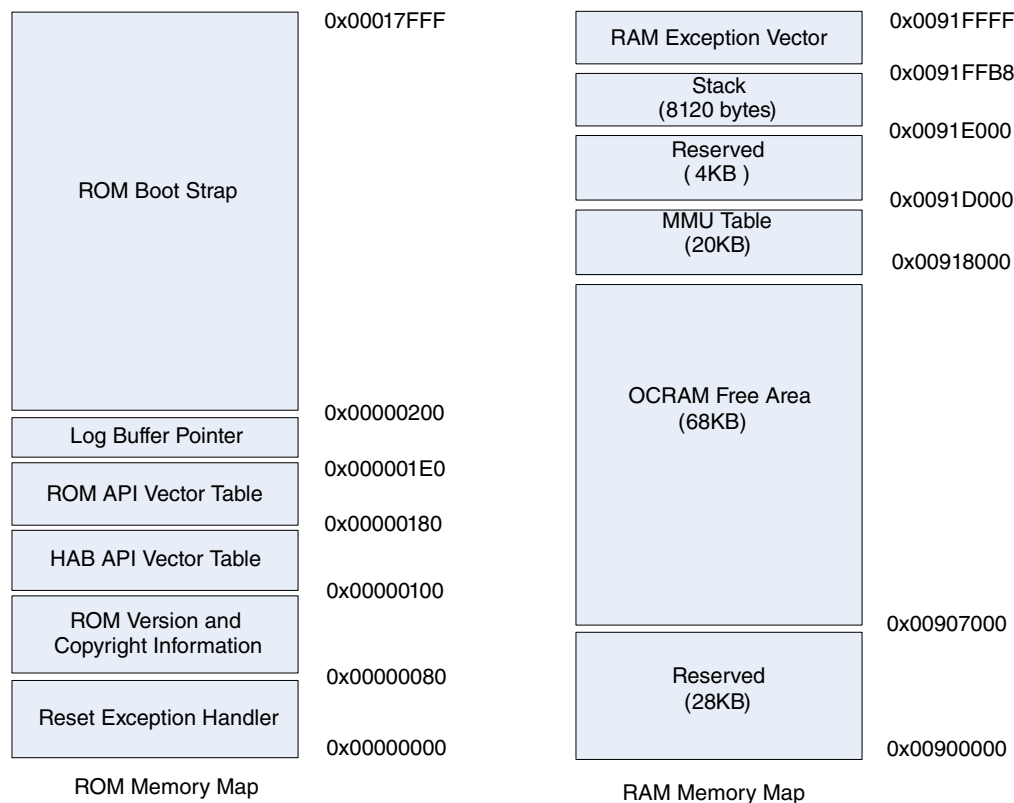

Figure 8-3. Internal Rom and Ram memory map for i.MX 6SoloX

NOTE

The entire OCRAM region can be used freely post boot.

8.4.2 Boot Block Activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

The ROM configures and uses the following blocks (listed in alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and boot device selection:

- APBH - DMA engine to drive the GPMI module
- BCH - 62-bit error correction hardware engine with AXI bus master and private connection to GPMI
- CCM - Clock Control Module
- ECSPI> - Enhanced Configurable Serial Peripheral Interface
- EIM - External Interface Module. Used for NOR and OneNAND devices

- I2C - I2C Controller
- GPMI - NAND controller pin interface
- OCOTP_CTRL - On-Chip OTP Controller. The OCOTP contains the eFUSES.
- IOMUXC - I/O Multiplexer Control allows GPIO use to override eFUSE boot settings
- IOMUXC GPR - I/O Multiplexer Control General Purpose registers
- CAAM - Cryptographic Acceleration and Assurance Module
- QSPI - QuadSPI Flash
- SNVS - Secure Non-Volatile Storage
- SRC - System Reset Controller
- USB - Used for serial download of a boot device provisioning program
- USDHC - Ultra Secure Digital Host Controller
- WDOG-1 - Watchdog Timer

8.4.3 Clocks at Boot Time

The table below shows the various clocks and their sources used by ROM.

Table 8-5. Normal Frequency Clocks Configuration

Clock	CCM signal	Source	Frequency(MHz)	Frequency(MHz)
			BT_FREQ=0	BT_FREQ=1
ARM PLL	pll1_sw_clk		792	792
System PLL	pll2_sw_clk		528	528
USB PLL	pll3_sw_clk		480	480
AHB	ahb_clk_root	528MHz PLL/PFD352	132	88
IPG	ipg_clk_root	528MHz PLL/PFD352	66	44

Following reset, each ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table, except for the boot devices listed in the second column.

Table 8-6. List Of Disabled Clocks

Clock Name	Enabled For Boot Device
CCGR0_APBHDMA_CLK_SEL	NAND
CCGR0_ASRC_CLK_SEL	
CCGR0_CAN1_CLK_SEL	
CCGR0_CAN1_SERIAL_CLK_SEL	
CCGR0_CAN2_CLK_SEL	
CCGR0_CAN2_SERIAL_CLK_SEL	

Table continues on the next page...

Table 8-6. List Of Disabled Clocks (continued)

Clock Name	Enabled For Boot Device
CCGR0_DCIC_CLK_SEL	
CCGR0_DCIC2_CLK_SEL	
CCGR1_ECSP11_CLK_SEL	ECSP11
CCGR1_ECSP12_CLK_SEL	ECSP12
CCGR1_ECSP13_CLK_SEL	ECSP13

CCGR6_PWM6_CLK_SEL	
CCGR6_PWM7_CLK_SEL	

8.4.4 Enabling MMU and Caches

The boot ROM includes a feature of enabling the Memory Management Unit (MMU) and caches to improve boot speed.

L1 instruction cache is enabled at the start of image download. L1 data cache, L2 cache and MMU are enabled during image authentication. Once HAB authentication completes the ROM disables the L1 data cache, L2 cache and MMU.

L1 Instruction cache, L1 data cache, L2 cache and MMU is controlled by eFuse. By default these features are enabled.

Enabling the MMU when booting non-securely with SEC_CONFIG=Open, and setting the CSF pointer in the Image Vector Table to NULL, has no impact on the boot performance. With this configuration it is recommended to blow BT_MMU_DISABLE fuse.

8.4.5 Exception Handling

The exception vectors located at the start of ROM are used to map all the ARM exceptions (except the reset exception) to a duplicate exception vector table in internal RAM.

During the boot phase of CPU0, the RAM vectors point to the serial downloader in ROM.

After boot the program image can overwrite the vectors as required. The code shown below is used to map the ROM exception vector table to the duplicate one in RAM.

Mapping ROM Exception Vector Table

```
;; Define linker area for ROM exception vector table
AREA IROM_VECTORS, CODE, READONLY
LDR    PC, Reset_Addr
LDR    PC, Undefined_Addr
LDR    PC, SWI_Addr
LDR    PC, Prefetch_Addr
LDR    PC, Abort_Addr
NOP                                ; Reserved vector
LDR    PC, IRQ_Addr
LDR    PC, FIQ_Addr

;; Define exception vector table
Reset_Addr    DCD    start_address
Undefined_Addr DCD    iRAM_Undefined_Handler
SWI_Addr      DCD    iRAM_SWI_Handler
Prefetch_Addr DCD    iRAM_Prefetch_Handler
Abort_Addr    DCD    iRAM_Abort_Handler
              DCD    0 ; Reserved vector
IRQ_Addr      DCD    iRAM_IRQ_Handler
FIQ_Addr      DCD    iRAM_FIQ_Handler

start_address DCD start ;reset handler vector
```

8.4.6 Interrupt Handling During Boot

No special interrupt handling routines are required during the boot process. Interrupts are disabled during boot ROM execution and may be enabled in a later boot stage.

8.4.7 Persistent Bits

Some modes of boot ROM require registers that keep their values after warm reset. SRC General Purpose registers are used for this purpose.

See the table below for persistent bits list and description.

Table 8-7. Persistent Bits

Bit Name	Bit Location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used - primary and secondary. Used only for boot modes that support redundant boot.
PERSIST_BLOCK_REWRITE	SRC_GPR10[29]	This bit is used as warning. It identifies that there are errors in NAND blocks that hold the application image. See NAND Flash for more details.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds entry function for CPU0 for waking-up from low power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds argument of entry function for CPU0 for waking-up from low power mode.

8.5 Boot Devices (Internal Boot)

The Chip supports the following boot Flash devices:

- NOR Flash with External Interface Module (EIM), located on CS0, 16-bit bus width
- OneNAND Flash with EIM interface, located on CS0, 16-bits bus width
- Raw NAND (MLC and SLC), and Toggle-mode NAND flash through GPMI-2 interface, located at CS0. Page sizes of 2 Kbyte, 4 Kbyte and 8 Kbyte. Bus widths of 8-bit with 2 through 62-bit BCH Hardware ECC (Error Correction) are supported.
- Quad SPI Flash
- SD/MMC/eSD/SDXC/eMMC4.4 via USDHC interface, supporting high capacity cards
- EEPROM boot via SPI (serial flash) and I2C (via ECSPI and I2C blocks respectively)

The selection of external boot device type is controlled by BOOT_CFG1[7:4] eFUSES. See the table below for more details.

Table 8-8. Boot Device Selection

BOOT_CFG1[7:4]	Boot Device
0000	NOR/OneNAND (EIM)
0001	QSPI
0011	Serial ROM (I2C/SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

8.5.1 NOR Flash/OneNAND using EIM Interface

The External Interface Module (EIM) works in the asynchronous mode, and supports either muxed, Address/Data, or non-muxed schemes based on fuse settings.

Table 8-9. EIM Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0000 - Boot from EIM Interface
BOOT_CFG1[3]	OEM	NOR/OneNAND Selection	Yes	0	0 - NOR 1 - OneNAND
BOOT_CFG2[7:6]	OEM	Muxing Scheme	Yes	00	00 - Muxed, 16-bit data (low half) interface 01 - Not muxed, 16-bit data (high half) interface 10 - Not muxed, 16-bit data (low half) interface 11 - Reserved
BOOT_CFG2[5:4]	OEM	OneNAND Page Size	Yes	00	00 - 1K 01 - 2K 10 - 4K 11 - Reserved

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

8.5.1.1 NOR Flash Boot Operation

Booting from the NOR Flash is supported via EIM interface. The ROM reads Image Vector Table and Boot Data structures to determine if the image can be executed directly from EIM address space or should be copied to other memory.

The start field of Boot Data Structure specifies the final location of the image (see [Image Vector Table and Boot Data](#)).

8.5.1.2 OneNAND Flash Boot Operation

At system power-up, the OneNAND device automatically copies an Initial Load Region of 1 Kbyte from the start of the flash array (sector 0 and sector 1, page 0, block 0) to its Boot RAM (OneNAND's internal RAM).

NOTE

The OneNAND boot RAM memory containing the Initial 1K Load Region must contain the IVT, DCD and the Boot Data structures.

Next, the ROM processes the DCD and then proceeds to copy the Program Image contents to the application destination pointer (located in the start entry of Boot Data (see [Image Vector Table and Boot Data](#)). The ROM determines the size of the Program Image by the length specified by size entry in Boot Data structure (see [Image Vector Table and Boot Data](#)). A failure loading data from the OneNAND device for any reason forces the Chip to enter the Serial Downloader, otherwise the booting from the OneNAND device continues.

The figure below illustrates the layout of the Program Image on a OneNAND boot device.

Figure 8-4. Program Image Layout on a OneNAND Flash Device

Prior to accessing the OneNAND device, the Chip waits approximately 500 μ s after Power On Reset. This delay is required for the OneNAND device to become ready. After this initial 500 μ s delay it can take an addition 70 μ s for the OneNAND device to load the Initial Load Region of 1 Kbyte into its boot RAM. The Chip polls the OneNAND device Interrupt Status Register to confirm that the first 1 Kbytes has been loaded to the OneNAND boot RAM before continuing with the boot flow.

8.5.1.3 IOMUX Configuration for EIM Devices

The EIM interface uses dedicated contacts on the IC.

The contacts assigned to the data signals used by EIM are shown in the table below.

Table 8-10. EIM IOMUX Pin Configuration

Signal	A/D16 (Muxed, 16-bit data low half interface)	A+DH (Not muxed, 16-bit data high half interface)	A+DL (Not muxed, 16-bit data low half interface)
DATA0	NAND_DATA00.alt6	CSI_DATA07.alt6	QSPI1A_SCLK.alt6
DATA1	NAND_DATA01.alt6	CSI_DATA06.alt6	QSPI1A_SS0_B.alt6

8.5.2 NAND Flash

The boot ROM supports a number of MLC/SLC NAND Flash devices from different vendors and LBA NAND Flash devices. The Error Correction and Control (ECC) subblock (BCH) is used to detect the errors.

8.5.2.1 NAND eFUSE Configuration

The boot ROM determines the configuration of external the NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot. See the table below for parameters details.

NOTE

BOOT_CFGx sampled on GPIO pins depends on BT_FUSE_SEL setting. See Fusemap chapter for details.

NOTE

For BOOT_CFG[3:2], Although ROM always boots from CS0_B, for multiple chip selects, such as some NAND chips which consist of multi CS. This fuse must burned correctly. The number of devices means the number of chip selects.

Table 8-11. NAND Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
BOOT_CFG1[7]	OEM	Boot Device Selection	Yes	0	1 - Boot from NAND Interface
BOOT_CFG1[6]	OEM	BT_TOGGLEMODE	Yes	0	0 - raw NAND 1 - toggle mode NAND

Table continues on the next page...

**Table 8-11. NAND Boot eFUSE Descriptions
(continued)**

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
BOOT_CFG1[5:4]	OEM	Pages In Block	Yes	0	00 - 128 01 - 64 10 - 32 11 - 256
BOOT_CFG1[3:2]	OEM	Number of devices	Yes	00	00 - 1 device 01 - 2 device 10 - 4 device 11 - Reserved
BOOT_CFG1[1:0]	OEM	Row Address Cycles	Yes	00	00 - 3 01 - 2 10 - 4 11 - 5
BOOT_CFG2[7:5]	OEM	Toggle Mode 33MHz Preamble Delay, Read Latency	Yes	000	000 - 16 GPMICLK cycles. 001 - 1 GPMICLK cycles 010 - 2 GPMICLK cycles 011 - 3 GPMICLK cycles 100 - 4 GPMICLK cycles 101 - 5 GPMICLK cycles 110 - 6 GPMICLK cycles 111 - 7 GPMICLK cycles
BOOT_CFG2[4:3]	OEM	Boot Search Count	Yes	00	00 - 2 01 - 2 10 - 4 11 - 8
BOOT_CFG2[2]	OEM	Boot Frequencies (ARM/DDR)	Yes	0	0 - 792/400 MHz 1 - 528/307 MHz
BOOT_CFG2[1]	OEM	Reset time	Yes	0	0 - 12ms 1 - 22ms (LBA NAND)
BOOT_CFG2[0]	OEM	Use L2 Cache as OCRAM	Yes	0	0 - Do not use L2 Cache as OCRAM 1 - Use L2 Cache as OCRAM
0x470[0]	OEM	Override Pad Settings	Yes	0	Override NAND Pad Settings 0 - Use default values 1 - Use PAD_SETTINGS value
0x6D0[5:0]	OEM	PAD_SETTINGS[5:0]	Yes	0	NAND Pad Settings Value
0x6D0[11:8]	OEM	READ_RETRY_SEQ_ID[3:0]	Yes	0000	0000 - Don't use ROM embedded read-retry sequence

Table 8-11. NAND Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
					0001 - use Micron 20nm read-retry sequence 0010 - use Toshiba A19nm read-retry sequence 0011 - use Toshiba 19nm read-retry sequence 0100 - use SanDisk 19nm read-retry sequence 0101 - use SanDisk 19nm read-retry sequence 0110 to 1111 - Reserved

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

8.5.2.2 NAND Flash Boot Flow and Boot Control Blocks (BCB)

There are two BCB data structures: FCB and DBBT.

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

The hardware ECC level to use is embedded inside FCB block. The FCB data structure is also protected using ECC. Driver reads raw 2112 bytes of first sector and runs through software ECC engine that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

The state diagram of FCB search is shown in the following figure.

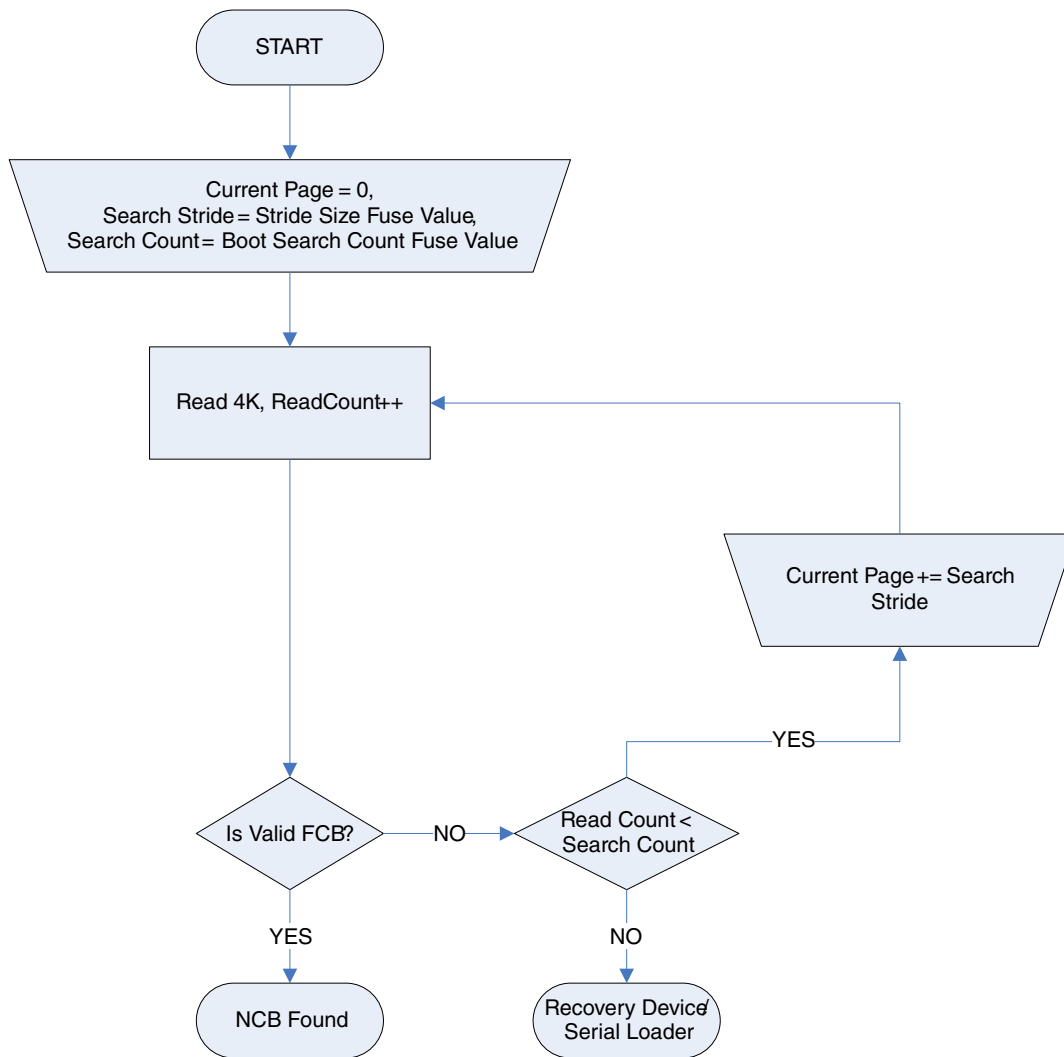

Figure 8-5. FCB Search Flow

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device boot area. See the figure below for the DBBT search flow.

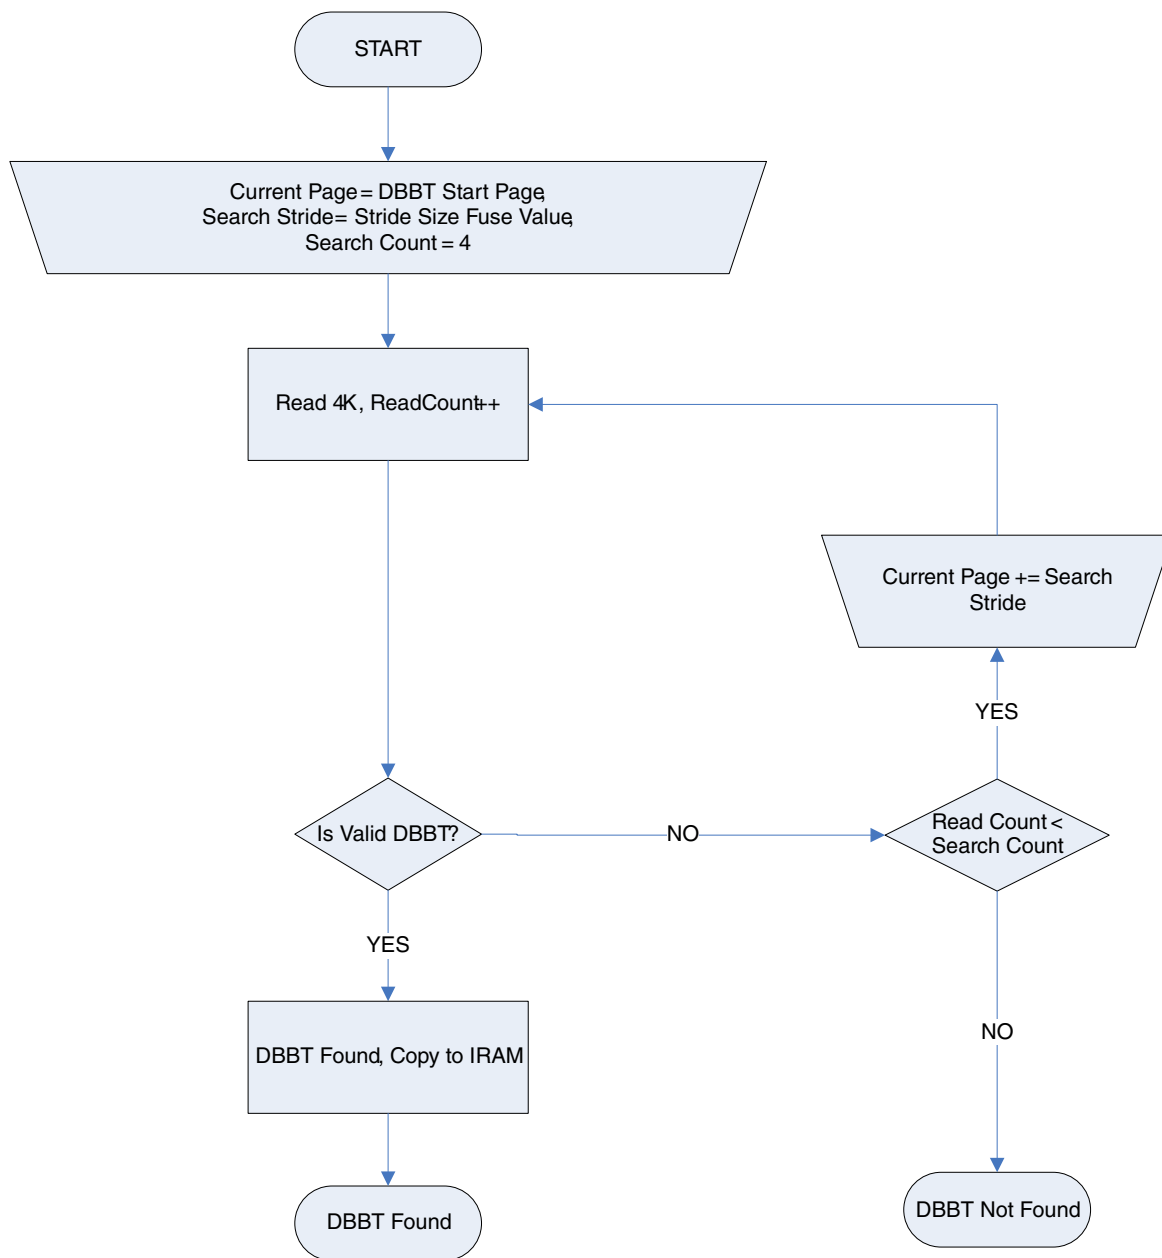

Figure 8-6. DBBT Search Flow

The BCB search and load function also monitors the ECC correction threshold and sets the PERSIST_BLOCK_REWRITE persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit and perform SW reset. (After SW reset, secondary image will be used.)

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM will go to serial loader.

8.5.2.3 Firmware Configuration Block

The FCB is the first sector in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, so in case the first NAND block becomes corrupted, the ROM will find its copy in the next NAND block. The search area should span over at least two NAND blocks. The location information for DBBT search area, FW1, and FW2 are all specified in the FCB. Flash Control Block Structure is as shown in the table below.

Table 8-12. Flash Control Block Structure

Name	Start Byte	Size in Bytes	Description
Reserved	0	4	Reserved for Fingerprint #1(Checksum)
FingerPrint	4	4	32 bit word with a value of 0x4E434220, in ascii "FCB"
Version	8	4	32-bit version number; this version of FCB is 0x00000001
m_NANDTiming	12	8	8 bytes of data for 8 NAND Timing Parameters from NAND datasheet. The 8 parameters are: m_NandTiming[0]=data_setup, m_NandTiming[1]=data_hold, m_NandTiming[2]=address_setup, m_NandTiming[3]=dsample_time, m_NandTiming[4]=nand_timing_state, m_NandTiming[5]=REA, m_NandTiming[6]=RLOH, m_NandTiming[7]=RHOH. ROM only uses first 4 parameters but FCB provides space for other 4 parameters to be used by boot-loader or other applications.
PageDataSize	20	4	Number of bytes of data in a page. Typically, this is 2048 bytes for 2112 bytes page size or 4096 bytes for 4314/4224 bytes page size or 8192 for 8568 bytes page size
TotalPageSize	24	4	Total number of bytes in page. Typically, 2112 for 2 KB page or 4224 or 4314 for 4 KB page or 8568 for 8 KB page.
SectorsPerBlock	28	4	Number of pages per block. Typically 64 or 128 or depending on NAND device type.

Table continues on the next page...

**Table 8-12. Flash Control Block Structure
(continued)**

Name	Start Byte	Size in Bytes	Description
NumberOfNANDs	32	4	Not used by ROM
TotalInternalDie	36	4	Not used by ROM
CellType	40	4	Not used by ROM
EccBlockNEccType	44	4	Value from 0 to 31 used to set BCH Error Correction level 0, 2, 4, .. or 62 for Block BN of ECC page, used in configuring BCH62 page layout registers
EccBlock0Size	48	4	Size of block B0, used in configuring BCH62 page layout registers
EccBlockNSize	52	4	Size of block BN, used in configuring BCH62 page layout registers
EccBlock0EccType	56	4	Value from 0 to 31 used to set BCH Error Correction level 0, 2, 4, .. or 62 for Block BN of ECC page, used in configuring BCH62 page layout registers
MetadataBytes	60	4	Size of metadata bytes used in configuring BCH62 page layout registers
NumEccBlocksPerPage	64	4	Number of ECC blocks BN not including B0. This value is used in configuring BCH62 page layout registers
EccBlockNEccLevelSDK	68	4	Not used by ROM
EccBlock0SizeSDK	72	4	Not used by ROM
EccBlockNSizeSDK	76	4	Not used by ROM
EccBlock0EccLevelSDK	80	4	Not used by ROM
NumEccBlocksPerPageSDK	84	4	Not used by ROM
MetadataBytesSDK	88	4	Not used by ROM
EraseThreshold	92	4	Not used by ROM
Firmware1_startingPage	104	4	Page number address where first copy of bootable firmware is located
Firmware2_startingPage	108	4	Page number address where second copy of bootable firmware is located
PagesInFirmware1	112	4	Size of first copy of firmware in pages
PagesInFirmware2	116	4	Size of second copy of firmware in pages
DBBTSearchAreaStartAddress	120	4	Page address for bad block table search area
BadBlockMarkerByte	124	4	This is an input offset in BCH page for ROM to swap with first byte of metadata after reading a page using BCH62. ROM supports restoration of manufacturer marked bad block markers in the page and this offset is the bad block marker offset location
BadBlockMarkerStartBit	128	4	This is an input bit offset in BadBlockMarkerByte for ROM to use when swapping 8 bits with first byte of metadata.
BBMarkerPhysicalOffset	132	4	This is the offset where manufacturer leaves bad block marker on a page

Table continues on the next page...

**Table 8-12. Flash Control Block Structure
(continued)**

Name	Start Byte	Size in Bytes	Description
BCHType	136	4	0 for BCH20 and 1 for BCH62. The Chip is backward compatible to BCH20 and this field tell ROM to use BCH20 or BCH62 block
TMTiming2_ReadLatency	140	4	Toggle mode NAND timing parameter read latency, ROM use this value to configure timing2 register of GPMI
TMTiming2_PreambleDelay	144	4	Toggle mode NAND timing parameter Preamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CEDelay	148	4	Toggle mode NAND timing parameter CE Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_PostambleDelay	152	4	Toggle mode NAND timing parameter Postamble Delay. ROM use this value to configure timing2 register of GPMI
TMTiming2_CmdAddPause	156	4	Toggle mode NAND timing parameter Cmd Add Pause. ROM use this value to configure timing2 register of GPMI
TMTiming2_DataPause	160	4	Toggle mode NAND timing parameter Data Pause. ROM use this value to configure timing2 register of GPMI
TMSpeed	164	4	This is the toggle mode speed for ROM to configure gpmi clock. 0 for 33 MHz, 1 for 40 MHz and 2 for 66 MHz
TMTiming1_BusyTimeout	168	4	Toggle mode NAND timing parameter Busy Timeout. ROM use this value to configure timing1 register of GPMI
DISBBM	172	4	If 0 ROM will swap BadBlockMarkerByte with metadata[0] after reading a page using BCH62. If the value set is 1 then ROM will not do swapping
BBMark_spare_offset	176	4	The offset in mata data place which stores the data in Bad block marker place.
Onfi_sync_enable	180	4	Enable the Onfi nand sync mode support
Onfi_sync_speed	184	4	Speed for onfi nand sync mode: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ
Onfi_syncNANDData	188	28	parameters for onfi nand sync mode timing. They are read_latency, ce_delay, preamble_delay, postamble_delay, cmdadd_pause, data_pause, busy_timeout
DISBB_Search	216	4	Disable the badblock search function when reading the firmware, only using DBBT.
Randomizer_Enable	220	4	Enable randomizer support with randomizer type 2. This is for DBBT and firmware.
Reserved	224	60	Reserved for future use

Table continues on the next page...

Table 8-12. Flash Control Block Structure (continued)

Name	Start Byte	Size in Bytes	Description
read_retry_enable	284	4	Enable read retry for DBBT and firmware
Reserved	288	4	Reserved and must be kept as 0

The FCB data structure is protected using 62-bit ECC. The layout of FCB page is illustrated in the figure below.

Figure 8-7. Layout of the FCB Page

The detailed parameters of FCB pages are listed in the table below.

Table 8-13. Parameters Setting for FCB Page

Parameter	Value
TotalPageSize	2048+64=2112
MetadataBytes	32
EccBlock0Size	128
EccBlock0EccType	31
BCHType	0
EccBlockNSize	128
EccBlockNEccType	31
NumEccBlocksPerPage	7

In order to reduce the disturbances caused by a neighboring cell in the FCB page in the NAND chip, a randomizer is enabled when reading FCB page. The randomizer is used to reduce bit errors in FCB. Ensure the randomizer is enabled when burning FCB pages in NAND flash. To control randomizer for the pages except for FCB, a new field called Randomizer_Enable is added into FCB structure. If the Randomizer_Enable field is set as 0, randomizer will be disabled when reading the pages except FCB, being set as a non-zero value will enable randomizer. For detailed randomizer information, please see [Randomizer](#)

8.5.2.4 Discovered Bad Block Table

See the table below for DBBT format.

Table 8-14. DBBT Structure

Name	Start Byte	Size in Bytes	Description
reserved	0	4	-
FingerPrint	4	4	32-bit word with a value of 0x44424254, in ascii "DBBT"
Version	8	4	32-bit version number; this version of DBBT is 0x00000001
reserved	12	4	-
DBBT_NUM_OF_PAGES	16	4	Size of DBBT in pages
reserved	20	4*PageSize-20	-
reserved	4*PageSize	4	-
Number of Entries	4*PageSize + 4	4	Number of bad blocks
Bad Block Number	4*PageSize + 8	4	First bad block number
Bad Block Number	4*PageSize + 12	4	Second bad block number
...-	-	-	...next bad block number
...-	-	-	...-
Last bad block number	-	-	last bad block number

8.5.2.5 Bad Block Handling in the ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

If Bad Block table start page is null, check the manufactory made Bad Block marker. The location of Bad Block maker is at the first 3 or last 3 pages in every block of the NAND flash. NAND manufacturers normally use one byte in the spare area of certain pages within a block to mark a block is bad or not. 0xFF means good block, non FF means bad block.

In order to preserve the BI (bad block information), flash updater or gang programmer applications need to swap Bad Block Information (BI) data to byte 0 of metadata area for every page before programming NAND flash. ROM when loading firmware copies back the value at metadata[0] to BI offset in page data. The figure below shows how the factory bad block marker is preserved.

Bad block information at column address 2048

meta data

Swap byte

Bad block information at 4th block data area

Figure 8-8. Factory Bad Block Marker Preservation

In the FCB structure, there are two elements `m_u32BadBlockMarkerByte` and `m_u32BadBlockMarkerStartBit` to indicate the byte and bit place in the page data, that manufacturer marked the bad block marker.

8.5.2.6 Read Retry Handling in the ROM

Read retry is used to recover from NAND bit errors beyond the ECC correction threshold. If reading a page failed and the `read_retry_enable` field in FCB is set as 1, ROM will issue read retry command sequence to shift the read level before reading the page again. If the previous reading failed, ROM will keep shifting the read level until reading succeeds or all levels had been tried. The state diagram of read retry is shown in the figure below.

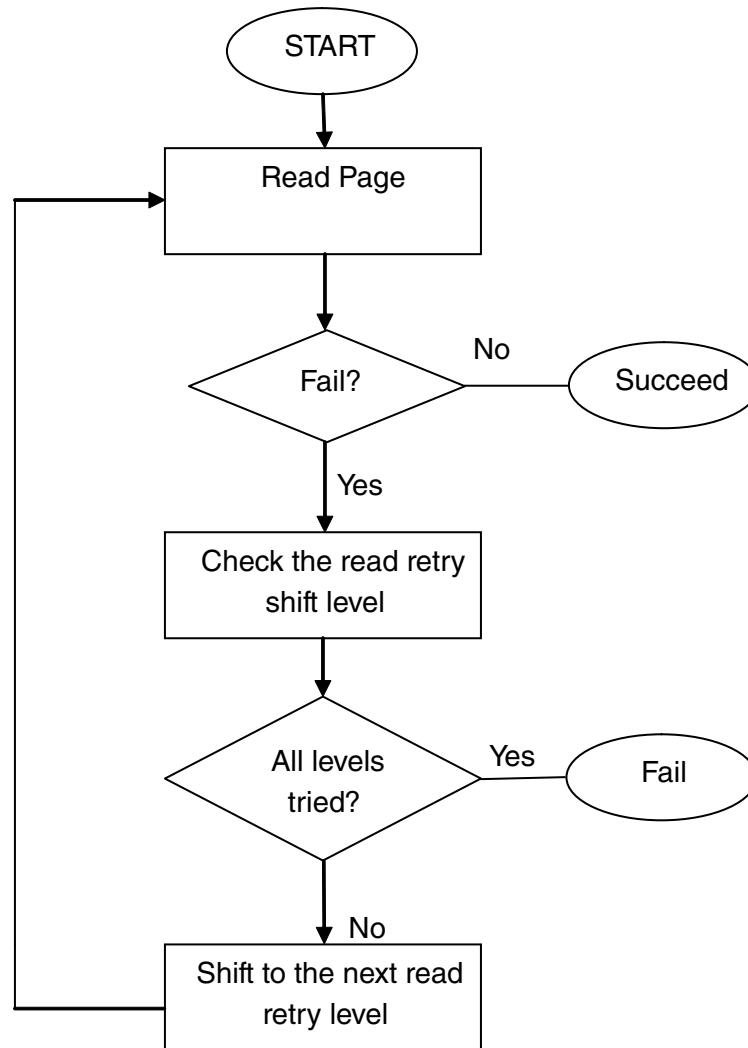

Figure 8-9. Read Retry Flow

Different vendors and different process may have different read retry sequences. At present, ROM supports five (5) read retry sequences. Blowing the fuse `READ_RETRY_SEQ_ID[3:0]` can select to use which sequence.

The detailed read retry sequences are listed in the table below.

Table 8-15. Read retry sequences

Vendor	Process	READ_RETRY_SEQ_ID[3:0]	Comment
Micron	20nm	2'b0001	The detail of this RR sequence is documented in "64Gb, 128Gb, 256Gb, 512Gb Asynchronous/Synchronous NAND Features(Release: 4/20/12)", please contact Micron for this doc.

Table continues on the next page...

Table 8-15. Read retry sequences (continued)

8.5.2.7 Toggle Mode DDR NAND Boot

If BT_TOGGLEMODE efuse is blown then ROM does the following to boot from Samsung's toggle mode DDR NAND.

8.5.2.7.1 GPMI and BCH Clocks Configuration

ROM sets the clock source and the dividers in CCM registers.

If BOOT_CFG1[6] is set(toggle mode), GPMI/BCH CLK source is PLL2PFD4, and running at 66MHZ, otherwise GPMI/ BCH CLK source is PLL3, running at 24 Mhz. ROM sets default values to timing0, timing1 and timing2 gpmi registers for 24 MHz clock speed. It uses fuse BOOT_CFG2[7:5] to configure GPMI timing2 register parameters preamble delay and read latency, the default value for these parameters is 2 when fuses are not blown.

Default timing parameter values used by ROM for toggle-mode device:

- Timing0.ADDRESS_SETUP = 5
- Timing0.DATA_SETUP = 10
- Timing0.DATA_HOLD = 10
- Timing1.DEVICE_BUSY_TIMEOUT = 0 x 500
- Timing2.READ_LATENCY = BOOT_CFG2[7:5] if blown, otherwise 2
- Timing2.CE_DELAY = 2
- Timing2.PREAMBLE_DELAY = BOOT_CFG2[7:5] if blown, otherwise 2

- Timing2.POSTAMBLEDelay = 3
- Timing2.CMDADD_PAUSE = 4
- Timing2.DATA_PAUSE = 6

Default timing parameters can be overridden by TMTiming2_ReadLatency, TMTiming2_PreambleDelay, TMTiming2_CEDelay, TMTiming2_PostambleDelay, TMTiming2_CmdAddPause, TMTiming2_DataPause parameters of FCB.

8.5.2.7.2 Setup DMA for DDR Transfers

In DMA descriptors GPMI is configured to read page data at double data rate, the word length is set to 16 and transfer count to half of page size.

8.5.2.7.3 Reconfigure Timing and Speed Using Values in FCB

After reading FCB page with GPMI set to default timings and speed 33 MHz, ROM reconfigures CCM dividers to run gpmi/bch clks to desired speed specified in FCB for rest of boot process. The GPMI timing registers are also reconfigured to values specified in FCB.

The GPMI speed can be configured using FCB parameter TMSpeed: 0 - 24MHZ, 1 - 33MHZ, 2 - 40MHZ, 3 - 50MHZ, 4 - 66MHZ, 5 - 80MHZ, 6 - 100MHZ, 7 - 133MHZ, 8 - 160MHZ, 9 - 200MHZ.

The GPMI timing0 register fields data_setup, data_hold and address_setup are set to values specified for data_setup, data_hold and address_setup in FCB member m_NANDTiming.

The GPMI timing1.DEVICE_BUSY_TIMEOUT is set to value specified in FCB member TMTiming1_BusyTimeout.

The GPMI timing2 register values are set using FCB members TMTiming2.READ_LATENCY, CE_DELAY, PREAMBLE_DELAY, POSTAMBLEDelay, CMDADD_PAUSE and DATA_PAUSE.

8.5.2.8 Typical NAND Page Organization

8.5.2.8.1 BCH ECC Page Organization

The first data block is called block 0 and the rest of the blocks are called block N. Separate ECC level scan be used for block 0 and block N.

The metadata bytes should be located at the beginning of a page, starting at byte 0, followed by data block 0, followed by ECC bytes for data block 0, followed by block 1 and its ECC bytes, and so on until N data blocks. The ECC level for block 0 can be different from the ECC level of rest of the blocks.

For NAND boot, with page size restrictions and data block size restricted to 512 bytes, only few combinations of ECC for block 0 and block N are possible.

The figure below shows the valid layout for 2112 byte sized page.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
---	---------------------	-------	---------------------	-------	---------------------	-------	---------------------	-------

Figure 8-10. Valid Layout for 2112 bytes Sized Page

The example below is for 13 bits of parity(GF13). The number of ECC bits required for a data block is calculated using (ECC_Correction_Level * 13) bits.

In the above layout the ECC size for EccB0 and EccBN should be selected to not exceed a total page size of 2112 bytes. EccB0 and EccBN can be one of 2, 4, 6, 8, 10, 12, 14, 16, 18, 20 bits ECC correction level. The total bytes would then be:

$$[M + (\text{data_block_size} \times 4) + ([\text{EccB0} + (\text{EccBN} \times 3)] \times 13) / 8] \leq 2112;$$

M = metadata bytes and data_block_size is 512.

There are 4 data blocks of 512 bytes each in a page of 2k page sized NAND. The values of EccB0 and EccBN should be such that the above calculation would not result in a value greater than 2112 bytes.

M	Block0 512 bytes	EccB0	Block1 512 bytes	EccBN	Block2 512 bytes	EccBN	Block3 512 bytes	EccBN
	Block4 512 bytes	EccBN	Block5 512 bytes	EccBN	Block6 512 bytes	EccBN	Block7 512 bytes	EccBN

Figure 8-11. Valid Layout for 4 Kbytes Sized Page

Different NAND manufacturers have different sizes for a 4K page; 4314 bytes is typical.

$$[M + (\text{data_block_size} \times 8) + ([\text{EccB0} + (\text{EccBN} \times 7)] \times 13) / 8] \leq 4314;$$

M= metadata bytes and data_block_size is 512.

There are 8 data blocks of 512 bytes each in a page of a 4k page sized NAND. The values of EccB0 and EccBN should be such that above calculation should not result in a value greater than the size of a page in a 4k page NAND.

8.5.2.8.2 Metadata

The number of bytes used for metadata is specified in FCB. Metadata for BCH encoded pages will be placed at the beginning of a page. ROM only cares about the first byte of metadata to swap it with bad block marker byte in page data after each page read; it is important to have at least one byte for the metadata bytes field in FCB data structure.

8.5.2.9 IOMUX Configuration for NAND

The table below shows the RawNAND IOMUX pin configuration.

Table 8-16. NAND IOMUX Pin Configuration

Signal	Pad Name
NAND_CLE	NAND_CLE.alt0

8.5.3 Expansion Device

The ROM supports booting from MMC/eMMC and SD/eSD compliant devices.

8.5.3.1 Expansion Device eFUSE Configuration

SD/MMC/eSD/eMMC/SDXC boot can be performed using either USDHC ports, based on setting of the BOOT_CFG2[4:3] (Port Select) fuse or it's associated GPIO input value at boot. All USDHC ports support eMMC4.3 and eMMC4.4 fast boot.

See the table below for details.

Table 8-17. USDHC Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
BOOT_CFG1[7:6]	OEM	Boot Device Selection	Yes	00	01 - Boot from USDHC Interfaces

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [GPIO Boot Overrides](#) for corresponding GPIO pin.

Boot code supports following standards.

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST_BOOT.
- SDXCv3.0

MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4Kbyte of data from MMC/SD/eSD/eMMC device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

The maximum image size to load in SD/MMC boot is 32MB. This is due to the limited number of uSDHC ADMA Buffer Descriptors allocated by ROM.

NOTE

The Initial 4Kbyte of Program Image must contain the IVT, DCD and the Boot Data structures.

Table 8-18. SD/MMC Frequencies

	SD	MMC	MMC (DDR Mode)
Identification (KHz)	347.22		
Normal Speed Mode (MHz)	25	20	25
High Speed Mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

NOTE

The boot ROM code reads application image length and application destination pointer from image.

8.5.3.2 MMC and eMMC Boot

The following table provides MMC and eMMC boot details.

Table 8-19. MMC and eMMC Boot Details

Normal Boot Mode	<p>During initialization (normal boot mode) the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, voltage validation is performed and the ROM boot code checks high voltage settings and card capacity. The ROM boot code supports both high capacity and low capacity MMC/eMMC cards. After initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in Normal boot mode or 40MHz in High Speed mode). eMMC is also interfaced via USDHC and follows the same flow as MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in BOOT_PARTITION_ENABLE field or the user partition has been mentioned, ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 Device Supporting Special Boot Mode	<p>If using an eMMC4.3 or eMMC4.4 device supporting special boot mode, it can be initiated by pulling the CMD line low. If BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via DATA lines and ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. eMMC4.3/eMMC4.4 device with "Boot mode" feature can only be supported via ESDHCV3-3 and with or without BOOT ACK. If BOOT ACK is enabled ROM waits 50 ms to get the BOOT ACK and if BOOT ACK is received by ROM. If BOOT ACK is disabled ROM waits 1 second for data. If BOOT ACK or data was received then eMMC4.3/eMMC4.4 is booted in "Boot mode", otherwise eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse. BOOT ACK is selected by BOOT_CFG2[1].</p>
eMMC4.4 Device	<p>If using eMMC4.4 device, Double Data Rate (DDR) mode can be used. This mode can be selected by BOOT_CFG2[7:5] (Bus Width) fuse.</p>

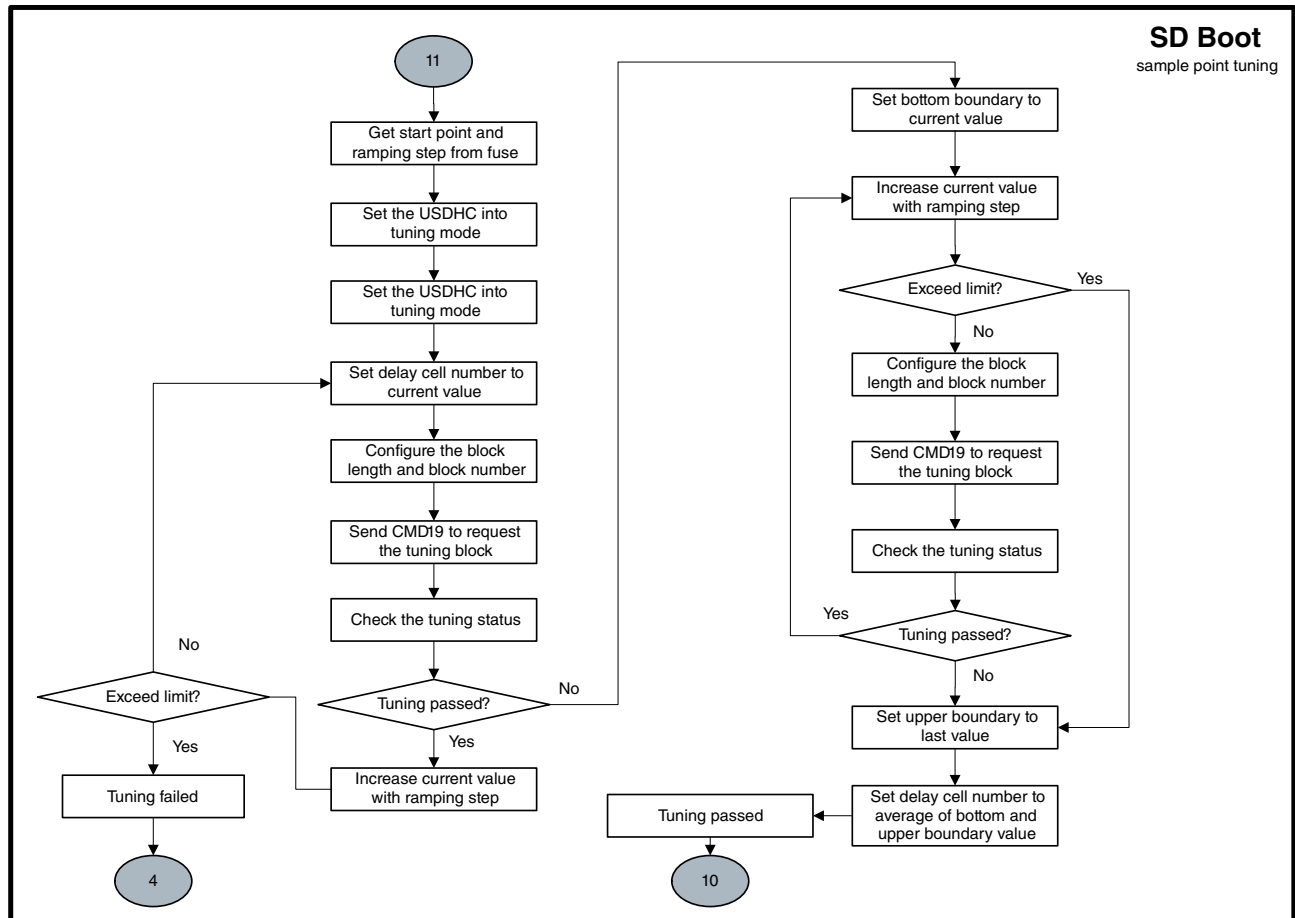

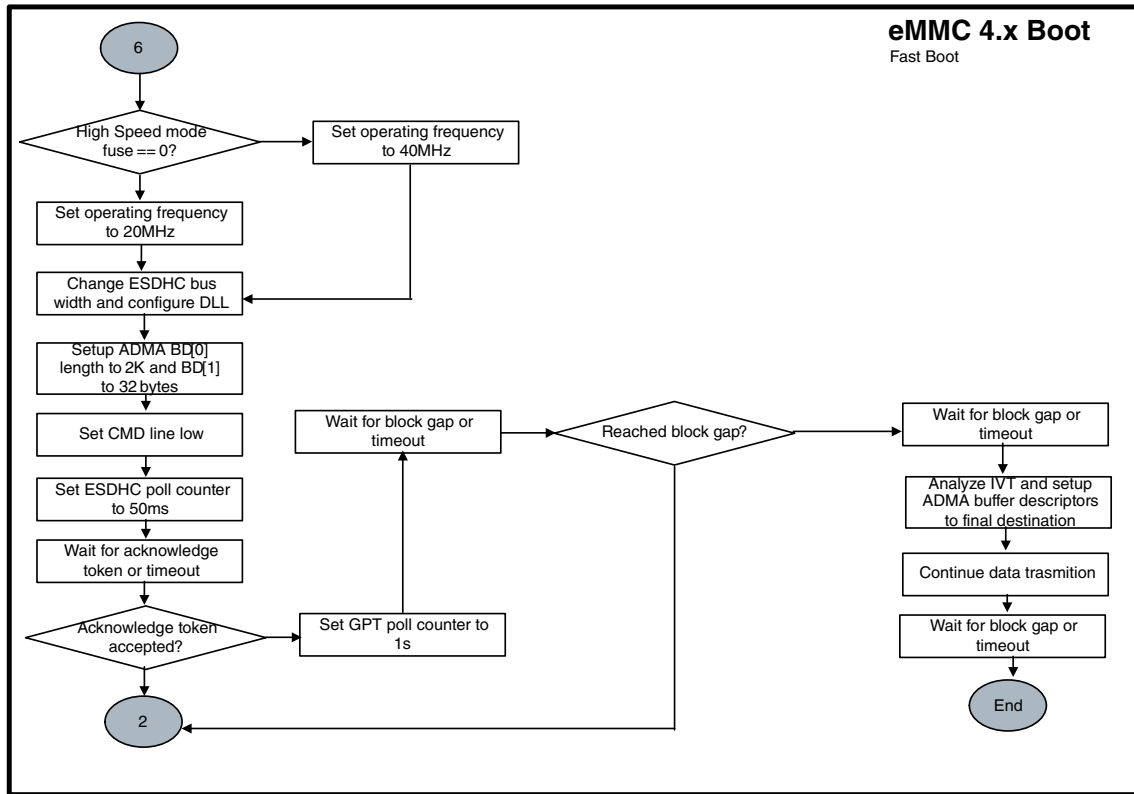

Figure 8-18. Expansion Device Boot Flow (6 of 6)
i.MX 6SoloX Applications Processor Reference Manual, Rev. 0, 2/2015

8.5.3.3 SD, eSD and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, SD/eSD/SDXC card voltage validation is performed. During voltage validation, boot code first checks with high voltage settings; if that fails, it checks with low voltage settings.

The capacity of the card is also checked. Boot code supports high capacity and low capacity SD/eSD/SDXC cards after voltage validation card initialization is done.

During card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes the card is a normal SD card or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, boot code switches to a higher frequency (25 MHz in Normal Speed mode or 50 MHz in High Speed Mode). ROM also supports FAST_BOOT mode booting from eSD card. This mode can be selected by BOOT_CFG1[4] (Fast Boot) fuse described in [Table 8-17](#).

For UHSI cards, clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2, USDHC3 and USDHC4 ports. This will enable the voltage switch process to set the signaling voltage to 1.8V during voltage validation. The bus width is fixed at 4 bits wide and a sampling point tuning process is needed to calibrate the number of delay cells. If SD Loopback Clock eFuse is set, the feedback clock will come directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by BOOT_CFG1[3:2], and the SD Loopback Clock is selected by BOOT_CFG1[0].

UHSI calibration start value (MMC_DLL_DLY[6:0]) and step value (BOOT_CFG2[7:5]) can be set to optimize the sample point tuning process.

If SD Power Cycle Enable eFuse is 1, ROM will set SD_RST pad low, wait 5ms and then set SD_RST pad high. If SD_RST pad is connected to SD power supply enable logic on board, it enables power cycle of SD card. This may be crucial in case when SD logic is in 1.8V states and must be reset to 3.3V states.

8.5.3.4 IOMUX Configuration for SD/MMC

Table 8-20. SD/MMC IOMUX Pin Configuration

8.5.3.5 Redundant Boot Support for Expansion Device

ROM supports redundant boot for expansion device. Primary or Secondary image is selected depending on PERSIST_SECONDARY_BOOT setting (see [Table 8-7](#)).

If PERSIST_SECONDARY_BOOT is 0, the boot ROM uses address 0x0 for primary image.

If PERSIST_SECONDARY_BOOT is 1, the boot ROM will read secondary image table from address 0x200 on boot media and will use address specified in the table.

Table 8-21. Secondary Image Table Format

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- tag: used as indication of valid secondary image table. Must be 0x00112233.
- firstSectorNumber is the first 512B sector number of the secondary image.

For secondary image support, the primary image must reserve space for secondary image table. See the figure below for typical structures layout on expansion device.

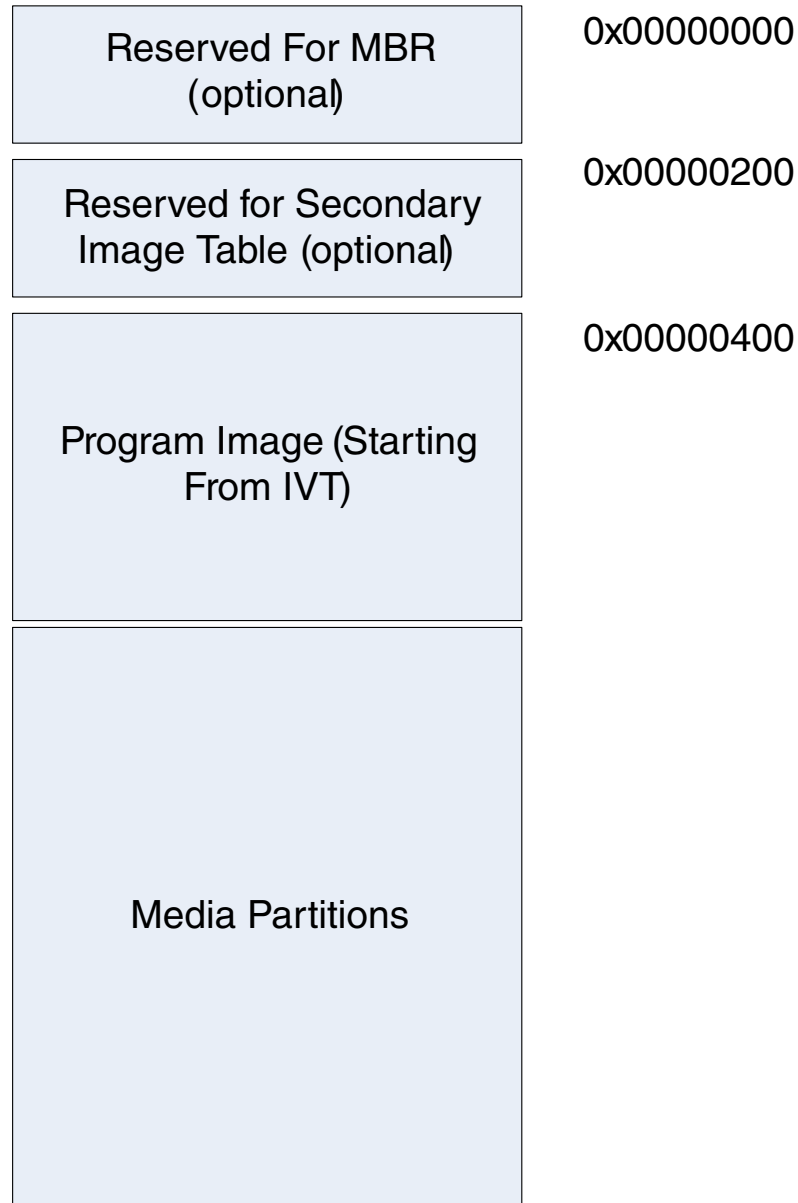

Figure 8-19. Expansion Device Structures Layout

For Closed mode, if there are failures during primary image authentication, the boot ROM will turn on PERSIST_SECONDARY_BOOT bit (see [Table 8-7](#)) and perform software reset. (After software reset, secondary image will be used.)

8.5.4 Serial ROM through SPI and I2C

The chip supports boot from serial memory devices, such as EEPROM and Serial Flash using the SPI.

The following ports are available for serial boot: eCSPI (eCSPI1, eCSPI2, eCSPI3, eCSPI4, eCSPI5) and I2C Controller (I2C1, I2C2 and I2C3) interfaces.

8.5.4.1 Serial ROM eFUSE Configuration

The boot ROM code determines the type of device using the following parameters, either provided by eFUSE settings or sampled on the I/O pins, during boot.

See the table below for details:

Table 8-22. Serial ROM Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO ¹	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0000	0011 - Boot from Serial ROM
BOOT_CFG4[6]	OEM	EEPROM Recovery Enable	Yes	0	0 - Disabled EEPROM recovery 1 - Enabled EEPROM recovery
BOOT_CFG4[5:4]	OEM	CS select (SPI only)	Yes	00	00 - ECSPi _x _SS0 01 - ECSPi _x _SS1 10 - ECSPi _x _SS2 11 - ECSPi _x _SS3
BOOT_CFG4[3]	OEM	SPI Addressing (SPI only)	Yes	0	0 - 2-bytes (16-bit) 1 - 3-bytes (24-bit)
BOOT_CFG4[2:0]	OEM	Port Select	Yes	00	000 - ECSPi-1 001 - ECSPi-2 010 - ECSPi-3 011 - ECSPi-4 100 - ECSPi-5 101- I2C1 110- I2C2 111- I2C3

1. Setting can be overridden by GPIO settings when BT_FUSE_SEL fuse is intact. See [Table 1](#) for corresponding GPIO pin.

The ECPSI-1/ECPSI-2/ECPSI-3/ECPSI-4/ECSPi-5 block can be used as boot device using ECSPi interface for serial ROM boot. The SPI interface is configured to operate at 15MHz for 3-byte addressing device and 3.75MHz for 2-byte addressing devices.

I2C-1/I2C-2/I2C-3 block can be used as boot device using I2C interface, for serial ROM boot. The I2C interface is configured to operate at 343.75 Kbps.

The boot ROM will copy 4Kbyte of data from Serial ROM device to internal RAM. After checking the Image Vector Table header value (0xD1) from Program Image, the ROM code performs a DCD check. After successful DCD extraction, the ROM code extracts from Boot Data Structure the destination pointer and length of image to be copied to RAM device from where code execution occurs.

NOTE

The Initial 4K of Program Image must contain the IVT, DCD and the Boot Data structures.

8.5.4.2 I2C Boot

The boot flow when booting from an I2C device is shown in [Figure 8-20](#).

The boot ROM code reads the fuses BOOT_CFG1[7:4] (Boot Device Selection) and BOOT_CFG1[7:4] (Port select) to detect EEPROM device type. The ROM program copies 4K data from the EEPROM device to internal RAM. The boot ROM code next copies the initial 4Kbyte of data as well as rest of image directly to application destination extracted from application image.

The chip uses the Device Select Code/Device Address in the table below to boot from an EEPROM.

Table 8-23. EEPROM via I2C Device Select Code

Bits	Device Type Identifier				Chip Enable Address ¹			R/W
	7	6	5	4	3	2	1	0
Device Select Code	1	0	1	0	0	0	0	R/W

1. These address bits, should be configured at the memory device, to match this '000' value.

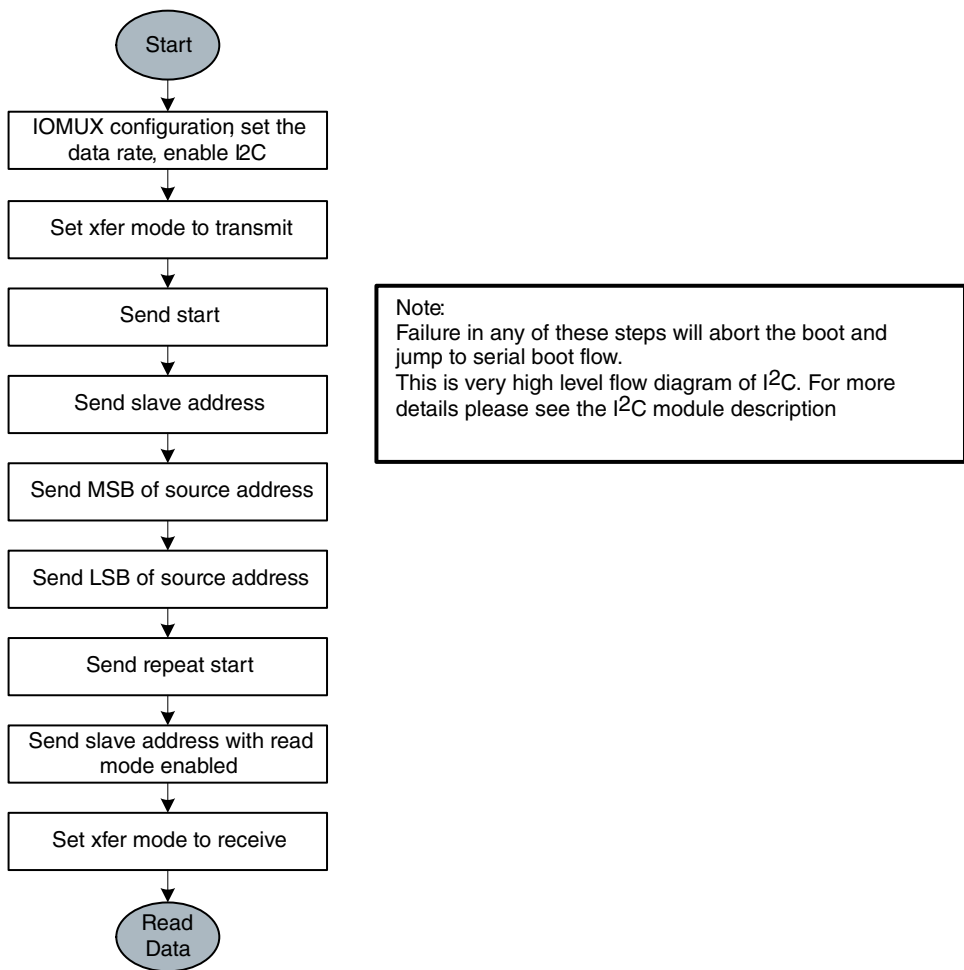

Figure 8-20. I2C Flow Chart

8.5.4.2.1 I2C IOMUX Pin Configuration

The contacts assigned to the signals used by the I2C blocks is shown in the table below.

Table 8-24. I2C IOMUX Pin Configuration

Signal	I2C1	I2C2	I2C3
SDA	GPIO1_IO01.alt0	GPIO1_IO03.alt0	KEY_ROW4.alt2
SCL	GPIO1_IO00.alt0	GPIO1_IO02.alt0	KEY_COL4.alt2

8.5.4.3 ECSPI Boot

The Enhanced Configurable SPI (ECSPI) interface is configured in master mode and the EEPROM device is connected to ECSPI interface as a slave.

The boot ROM code copies 4 KB data from EEPROM device to the internal RAM. If DCD verification is successful, the ROM code copies the initial 4 KB data, as well as the rest of the image extracted from application image, directly to the application destination. The ECSPI can read data from EEPROM using 2 or 3 byte addressing. Its burst length is 32 bytes.

NOTE

The Serial ROM Chip Select Number is determined by BOOT_CFG4[5:4] (Chip Select) fuse.

When using the SPI as boot device, the Chip supports booting from both Serial EEPROM and Serial Flash devices. The boot code determines which device is being used by reading the appropriate eFUSE/I/O values at boot (see [Table 8-22](#) for details).

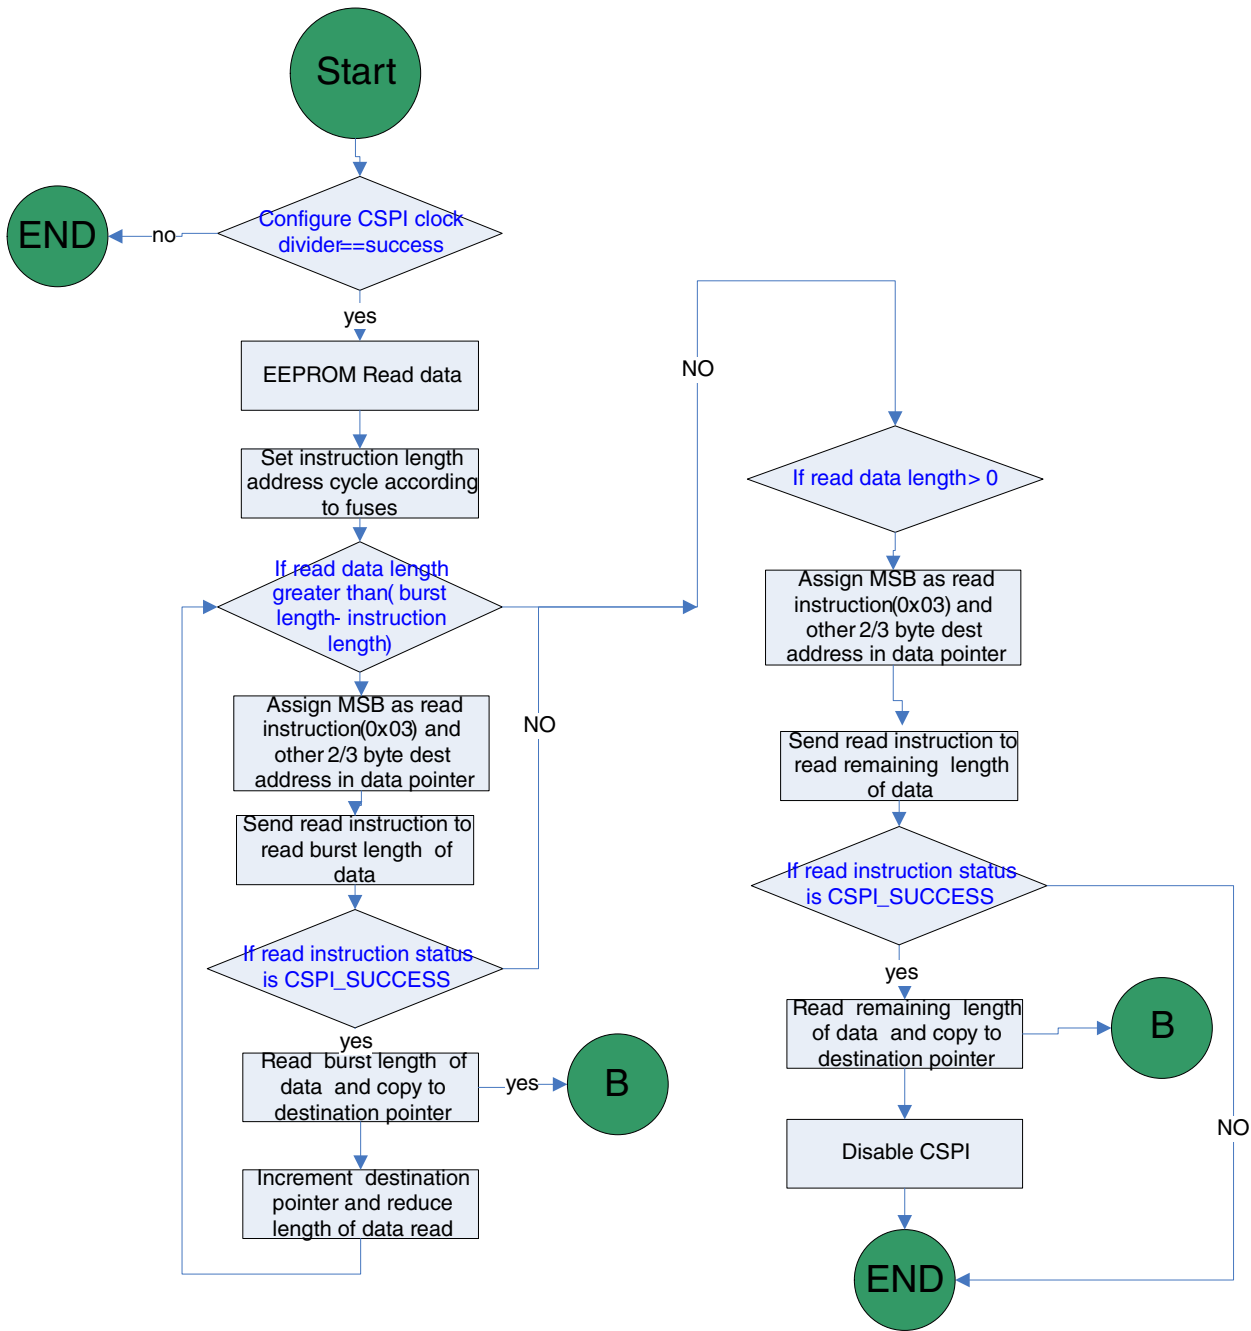

Figure 8-21. CSPI Flow chart

8.5.4.3.1 ECSPI IOMUX Pin Configuration

The contacts assigned to the signals used by the three CSPI blocks is shown in the table below.

Table 8-25. SPI IOMUX Pin Configuration

Signal	eCSPI1	eCSPI2	eCSPI3	eCSPI4	eCSPI5
MISO	KEY_COL1.alt3	SD4_CLK.alt2	SD4_DATA6.alt3	SD2_DATA3.alt3	QSPI1A_SS1_B.alt3
MOSI	KEY_ROW0.alt3	SD4_CMD.alt2	SD4_DATA5.alt3	SD2_CMD.alt3	QSPI1A_DQS.alt3
SCLK	KEY_COL0.alt3	SD4_DATA1.alt2	SD4_DATA4.alt3	SD2_CLK.alt3	QSPI1B_SS1_B.alt3
SS0	KEY_ROW1.alt3	SD4_DATA0.alt2	SD4_DATA7.alt3	SD2_DATA2.alt3	QSPI1B_DQS.alt3
SS1	KEY_ROW3.alt7	SD3_DATA0.alt2	SD4_CMD.alt6	SD1_DATA3.alt6	QSPI1A_DATA2.alt2
SS2	KEY_COL3.alt7	SD3_DATA1.alt2	SD4_CLK.alt6	SD2_DATA1.alt6	QSPI1A_DATA3.alt2
SS3	KEY_ROW2.alt7	SD4_DATA2.alt6	SD4_DATA0.alt6	SD2_DATA0.alt6	QSPI1B_DATA3.alt2

8.6 QuadSPI Serial Flash Memory Boot

8.6.1 QuadSPI eFUSE Configuration

Table 8-26. QSPI Boot eFUSE Descriptions

Fuse	Config	Definition	GPIO	Shipped Value	Settings
BOOT_CFG1[7:4]	OEM	Boot Device Selection	Yes	0001	0001 - Boot from QuadSPI
BOOT_CFG1[3]	OEM	QuadSPI Interface Selection	Ye	0	0 - QSPI1 1 - QSPI2

8.6.2 QuadSPI Serial Flash BOOT Operation

The Boot ROM will attempt to boot from QuadSPI flash if the "BOOT_CFG1[7:4]" fuses are programmed to "0001" as shown in the QuadSPI eFUSE Configuration table. The ROM will initialize the requested the QuadSPI Interface as selected in Fuse bit BOOT_CFG1[3] in the QuadSPI eFUSE Configuration. QuadSPI interface initialization is a two step process.

The ROM expects the QuadSPI configuration parameters as explained in the QuadSPI Configuration Parameters to be present in the Serial Flash memory from offset 0x400 of serial flash of length 368 bytes. The ROM reads these configuration parameters using the default read command configured in the LUT of the QuadSPI interface with SCLOCK operating at 18 MHz.

In the second step, ROM configures the selected QuadSPI interface with the configuration parameters read from the serial flash and starts the boot procedure. Refer to Table 19-12 for details regarding QuadSPI configuration parameters and to the QuadSPI boot flow chart for detailed boot flow chart of QuadSPI.

Both booting an XIP and non XIP image is supported from serial flash. For XIP boot, the image has to be built for QuadSPI address space and for non XIP the image can be built to execute from DDR or OCRAM.

For QUAD mode boot, the Boot ROM expects the Quad Enable bit inside the QSPI Flash to be already set before booting starts. Therefore, the QUAD enable bit must be set in the non-volatile register of the flash at the time of programming.

NOTE

If the SPI flash device requires quad enable command, it can be sent via configuration structure fields: `device_quad_mode_en`, `device_cmd`, `write_cmd_ipcr`, `write_enable_ipcr`, `busy_bit_offset`, `read_status_ipcr`.

8.6.3 QuadSPI Configuration Parameters

The QuadSPI Configuration Parameters Table is built in boot image at fixed offset 0x400 from QSPI NOR A1 base address (368 bytes). Table below lists various QuadSPI Configuration Parameters.

Table 8-27. QuadSPI Configuration Parameters

Name	Offset	Size in Bytes	Description															
DQS Loopback	0	4	DQS LoopBack Mode to enable Dummy Pad, 0 - Disable, 1 - Enable															
Hold Delay	4	4	Hold Delay for QSPI[0,1] A/B															
			<table border="1"> <thead> <tr> <th>Value</th> <th>QSPI1 B</th> <th>QSPI1 A/QSPI2 A</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>Disable</td> <td>Disable</td> </tr> <tr> <td>01</td> <td>Disable</td> <td>Enable</td> </tr> <tr> <td>10</td> <td>Enable</td> <td>Disable</td> </tr> <tr> <td>11</td> <td>Enable</td> <td>Enable</td> </tr> </tbody> </table>	Value	QSPI1 B	QSPI1 A/QSPI2 A	00	Disable	Disable	01	Disable	Enable	10	Enable	Disable	11	Enable	Enable
			Value	QSPI1 B	QSPI1 A/QSPI2 A													
			00	Disable	Disable													
			01	Disable	Enable													
10	Enable	Disable																
11	Enable	Enable																

Table continues on the next page...

Table 8-27. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description																
Reserved	8	4	Reserved to 0																
Reserved	12	4	Reserved to 0																
device_quad_mode_en	16	4	Send Quad enable command to SPI device.																
device_cmd	20	4	Command to send to SPI device.																
write_cmd_ipcr	24	4	IPCR register value for write command																
write_enable_ipcr	28	4	IPCR register value for Enable																
Chip Select hold time	32	4	This is chip select hold time in terms of Serial clock (For Example 1 serial clock cycle 0-15).																
Chip Select setup time	36	4	Chip select setup time in terms of Serial clock (For example 1 serial clock).																
Serial Flash A1 size	40	4	Serial Flash A1 size in units of bytes																
Serial Flash A2 size	44	4	Serial Flash A2 size in units of bytes																
Serial Flash B1 size	48	4	Serial Flash B1 size in units of bytes																
Serial Flash B2	52	4	Serial Flash B2 size in units of bytes																
Serial Clock Frequency	56	4	This is serial clock frequency select parameter. <table border="1" data-bbox="602 1046 1433 1377"> <thead> <tr> <th>Value</th> <th>Clock</th> </tr> </thead> <tbody> <tr> <td>00</td> <td>18 MHz</td> </tr> <tr> <td>01</td> <td>49 MHz</td> </tr> <tr> <td>02</td> <td>55 MHz</td> </tr> <tr> <td>03</td> <td>60 MHz</td> </tr> <tr> <td>04</td> <td>66 MHz</td> </tr> <tr> <td>05</td> <td>76 MHz</td> </tr> <tr> <td>06</td> <td>99Mhz (only SDR mode)</td> </tr> </tbody> </table>	Value	Clock	00	18 MHz	01	49 MHz	02	55 MHz	03	60 MHz	04	66 MHz	05	76 MHz	06	99Mhz (only SDR mode)
Value	Clock																		
00	18 MHz																		
01	49 MHz																		
02	55 MHz																		
03	60 MHz																		
04	66 MHz																		
05	76 MHz																		
06	99Mhz (only SDR mode)																		
busy_bit_offset	60	4	SPI Flash device busy bit offset in its status register, used for enabling Quad mode of SPI device																
Mode of operation of serial Flash	64	4	This field describes the mode of operation of Serial flash <table border="1" data-bbox="602 1566 1433 1736"> <thead> <tr> <th>Value</th> <th>Mode</th> </tr> </thead> <tbody> <tr> <td>01</td> <td>Single</td> </tr> <tr> <td>02</td> <td>Dual</td> </tr> <tr> <td>04</td> <td>Quad</td> </tr> </tbody> </table>	Value	Mode	01	Single	02	Dual	04	Quad								
Value	Mode																		
01	Single																		
02	Dual																		
04	Quad																		
Serial Flash Port B Selection	68	4	Port A is always available. This field informs the device ROM the availability of Port B.																

Table continues on the next page...

Table 8-27. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description
			0 – Port B is not used 1 – Port B is used
Dual Data Rate mode enable	72	4	This field enables the device ROM to enable DDR mode. 0 – DDR mode is disabled 1 – DDR mode is enabled
Data Strobe Signal enable in Serial Flash	76	4	This field enables Data Strobe signal in Serial Flash which supports it. 0 – Disable DQS 1 – Enable DQS
Parallel Mode enable	80	4	This field enables parallel mode. Data will be read from serial Flash in parallel mode. Refer to QSP chapter for detail. 0 – Disable Parallel mode in QSPI 1 – Enable Parallel Mode in QSPI
CS1 on Port A	84	4	This field enables CS1 on port A 0 – Disable CS1 on Port A 1 – Enable CS1 on Port A
CS1 on Port B	88	4	This field enables CS1 on port B 0 – Disable CS1 on Port B 1 – Enable CS1 on Port B
Full Speed Phase Selection	92	4	Select the edge of the sampling clock valid for full speed commands: 0: Select sampling at non-inverted clock 1: Select sampling at inverted clock This bit is also used to shift the dqs_enable when DQS mode is selected
Full Speed Delay Selection	96	4	Select the delay w.r.t. the reference edge for the sample point valid for full speed commands: 0: One clock cycle delay 1: Two clock cycles delay This bit is also used to shift the dqs_enable when DQS mode is selected
DDR Sampling Point	100	4	Select the sampling point for incoming data when serial flash is in DDR mode. NOTE: Valid Values are (b000-b111)
LUT program sequence	104	256	256 Bytes of Look up table program sequence. ROM programs the LUT of QuadSPI with this parameter supplied. It assumes that the optimize read command sequence which will be used to read data from Serial flash and fill the AHB buffer is programmed at index 0.
read_status_ipcr	360	4	IPCR value of Read Status Reg
enable_dqs_phase	364	4	Enable DQS Phase
Reserved	368	36	Not used
io_pad_override_setting	404	4	The number override pad settings of QSPI

Table continues on the next page...

Table 8-27. QuadSPI Configuration Parameters (continued)

Name	Offset	Size in Bytes	Description
Reserved	408	100	Reserved
tag	508	4	End flag of QSPI parameters area

8.6.4 IOMUX Configuration for QSPI Devices

The QSPI interface uses dedicated contacts on the IC. The contacts assigned to the data signals used by QSPI are shown in the table below.

Table 8-28. QSPI IOMUX Pin Configuration

Signal	QSPI1	QSPI2
A_SCLK	QSPI1A_SCLK.alt0	NAND_CLE.alt2
A_SS0_B	QSPI1A_SS0_B.alt0	NAND_ALE.alt2
A_SS1_B	QSPI1A_SS1_B.alt0	NAND_DATA06.alt2
A_DATA0	QSPI1A_DATA0.alt0	NAND_WP_B.alt2
A_DATA1	QSPI1A_DATA1.alt0	NAND_READY_B.alt2
A_DATA2	QSPI1A_DATA2.alt0	NAND_CE0_B.alt2
A_DATA3	QSPI1A_DATA3.alt0	NAND_CE1_B.alt2
A_DQS	QSPI1A_DQS.alt0	NAND_DATA07.alt2
B_SCLK	QSPI1B_SCLK.alt0	NAND_DATA02.alt2
B_SS0_B	QSPI1B_SS0_B.alt0	NAND_DATA03.alt2
B_SS1_B	QSPI1A_SS1_B.alt0	NAND_DATA04.alt2
B_DATA0	QSPI1B_DATA0.alt0	NAND_DATA01.alt2
B_DATA1	QSPI1B_DATA1.alt0	NAND_DATA00.alt2
B_DATA2	QSPI1B_DATA2.alt0	NAND_WE_B.alt2
B_DATA3	QSPI1B_DATA3.alt0	NAND_RE_B.alt2
B_DQS	QSPI1A_DQS.alt0	NAND_DATA05.alt2

8.6.5 QuadSPI boot flow chart

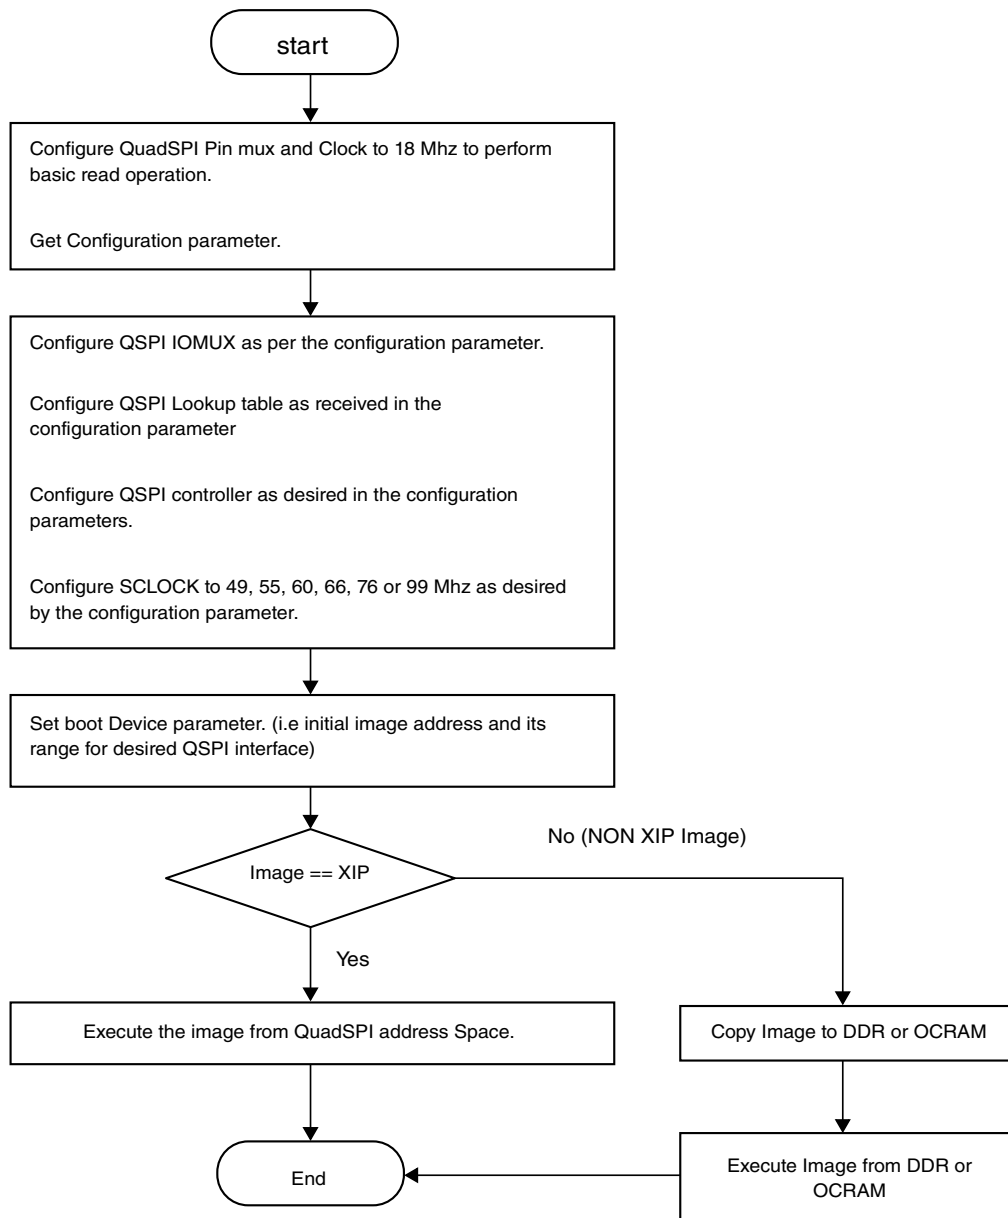

Figure 8-22. QuadSPI boot flow chart

NOTE

If flash is configured for "High performance mode (where command is generated only once)" in LUT program sequence. then external reset should be routed to flash reset to allow rebooting in case of any device reset other than Power On Reset. Also this high performance mode must be exited by application before any Low power mode entry where the device is supposed to reboot from QSPI flash on Low power mode exit. In general, any preserved configuration in external flash will not be understood by device after reset.

8.7 Program image

This section describes the data structures that are required to be included in a user's program image. A program image consists of:

- Image vector table—A list of pointers located at a fixed address that the ROM examines to determine where other components of the program image are located
- Boot data—A table indicating the program image location, program image size in bytes, and the plugin flag
- Device configuration data—IC configuration data
- User code and data

8.7.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

Table 8-29. Image Vector Table Offset and Initial Load Region Size

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
NAND	1 Kbyte = 0x400 bytes	4 Kbyte
OneNAND	256 bytes = 0x100 bytes	1 Kbyte
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
I2C/SPI EEPROM	1 Kbyte = 0x400 bytes	4 Kbyte

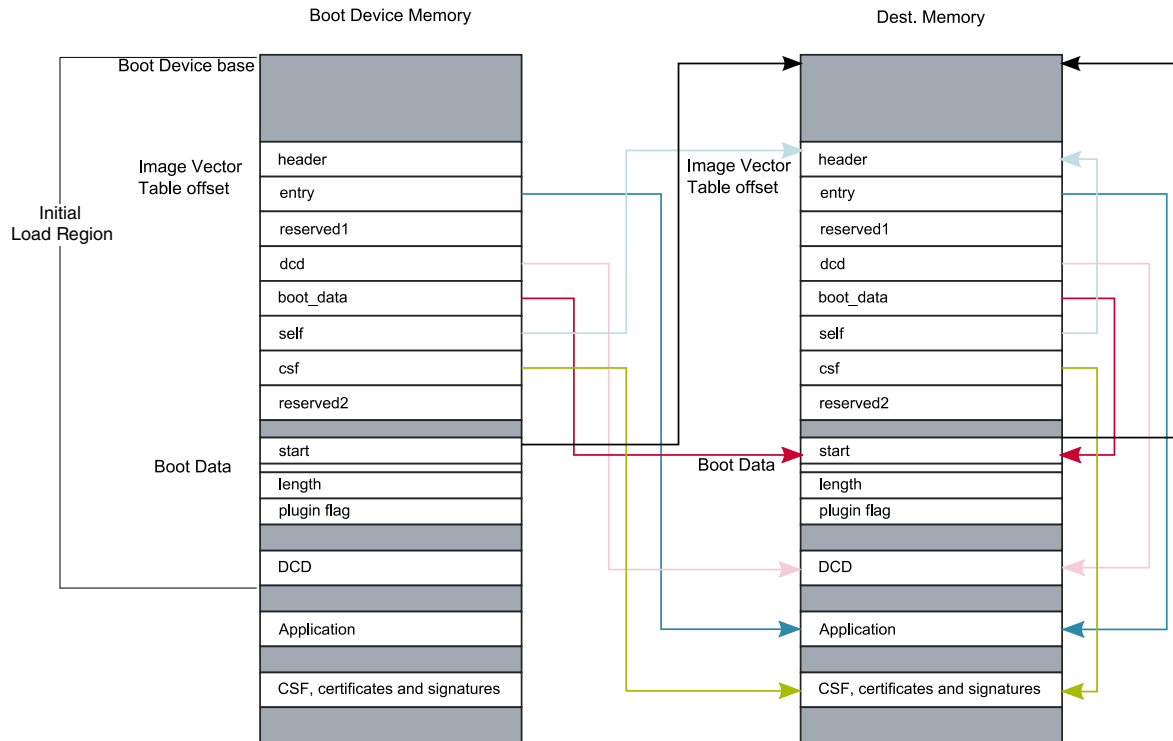

Figure 8-23. Image Vector Table

8.7.1.1 Image Vector Table Structure

The IVT has the following format where each entry is a 32 bit word:

Table 8-30. IVT Format

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See Device Configuration Data (DCD) for further details on DCD.
boot data: Absolute address of the Boot Data
self: Absolute address of the IVT. Used internally by the ROM
csf: Absolute address of Command Sequence File (CSF) used by the HAB library. See High Assurance Boot (HAB) for details on secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

The IVT header has the following format:

Table 8-31. IVT Header Format

Tag	Length	version
-----	--------	---------

where:

Tag: A single byte field set to 0xD1

Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)

Version: A single byte field set to 0x40 or 0x41

8.7.1.2 Boot Data Structure

The Boot Data must follow the format defined in the table found here, each entry is a 32-bit word.

Table 8-32. Boot Data Format

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see Plugin Image)

8.7.2 Device Configuration Data (DCD)

Upon reset, the Chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is configuration information contained in a Program Image, external to the ROM, that the ROM interprets to configure various peripherals on the Chip.

For example, the EIM default settings allow the core to interface to a NOR flash device immediately out of reset. This allows the Chip to interface with any NOR flash device, but has the cost of slow performance. Additionally, some components such as DDR require some sequence of register programming as part of configuration before it is ready to be used. The DCD feature can be used to program the EIM registers and MMDC registers to the optimal settings.

The ROM determines the location of the DCD table based on information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big endian byte array of the allowable DCD commands. The maximum size of the DCD limited to 1768 bytes.

Table 8-33. DCD Data format

Header
[CMD]
[CMD]
...

The DCD header is 4 bytes with the following format:

Table 8-34. DCD Header

Tag	Length	Version
-----	--------	---------

where:

Tag: A single byte field set to 0xD2

Length: a two byte field in big endian format containing the overall length of the DCD, in bytes, including the header

Version: A single byte field set to 0x41

8.7.2.1 Write Data Command

The Write Data Command is used to write a list of given 1-, 2- or 4-byte values or bitmasks to a corresponding list of target addresses.

The format of Write Data Command, again a big endian byte array, is shown in the table below.

Table 8-35. Write Data Command Format

Tag	Length	Parameter
	Address	
	Value/Mask	
	[Address]	
	[Value/Mask]	
	...	
	[Address]	
	[Value/Mask]	

where:

Tag: A single byte field set to 0xCC

Length: A two byte field in big endian format containing the length of the Write Data Command, in bytes, including the header

Address: target address to which data should be written

Value/Mask: data value or bitmask to be written to preceding address

The Parameter field is a single byte divided into bitfields as follows:

Table 8-36. Write Data Command Parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4

flags: control flags for command behavior.

Data Mask = bit 3: if set, only specific bits may be overwritten at target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, bits at the target address overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes and flags parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

Table 8-37. Interpretation of Write Data Command Flags

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address = val_msk	Set bitmask

NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values is larger or any of the bitmasks is wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within an allowed region, none of the values are written. The list of allowable blocks and target addresses for the Chip are given below.

Table 8-38. Valid DCD Address Ranges

Address range	Start address	Last Address
IOMUX Control (IOMUXC) registers	0x020E0000	0x020E3FFF
IOMUXC GPR	0x020E4000	0x020E7FFF

Table continues on the next page...

Table 8-38. Valid DCD Address Ranges (continued)

Address range	Start address	Last Address
CCM register set	0x020C4000	0x020C7FFF
ANADIG registers	0x020C8000	0x020C8FFF
MMDC register set	0x021B0000	0x021B3FFF
OCRAM free space	0x00907000	0x00937FF0
EIM registers	0x021B8000	0x021BBFFF
DDR	0x10000000	0xFFFF7FFF
QSPI	QSPI1: 0x021E0000 QSPI2: 0x021E4000	QSPI1: 0x021E3FFF QSPI2: 0x021E7FFF
EPIT	EPIT1: 0x020D0000	EPIT1: 0x020D3FFF

8.7.2.2 Check Data Command

The Check Data Command is used to test for a given -1, 2- or 4-byte bitmasks from a source address.

The Check Data Command is a big endian byte array with format shown in the table below.

Table 8-39. Check Data Command Format

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: A single byte field set to 0xCF

Length: A two byte field in big endian format containing the length of the Check Data Command, in bytes, including the header

Address: source address to test

Mask: bit mask to test

Count: optional poll count. If count is not specified this command will poll indefinitely until the exit condition is met. If count = 0, this command behaves as for NOP.

The Parameter field is a single byte divided into bitfields as follows:

Table 8-40. Check Data Command Parameter field

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: width of target locations in bytes. Either 1, 2 or 4
 flags: control flags for command behavior.
 Data Mask = bit 3: if set, only specific bits may be overwritten at target address
 (otherwise all bits may be overwritten)
 Data Set = bit 4: if set, bits at the target address overwritten with this flag
 (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

Table 8-41. Interpretation of Check Data Command Flags

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set
1	0	(*address & mask) != mask	Any bit clear
1	1	(*address & mask) != 0	Any bit set

NOTE

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

8.7.2.3 NOP Command

This command has no effect.

The format of NOP Command is a big endian four byte array as shown in the table below.

Table 8-42. NOP Command Format

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: A single byte field set to 0xC0

Length: A two byte field in big endian containing the length of the NOP Command in bytes.
 Fixed to a value of 4.

Undefined: This byte is ignored and can be set to any value.

8.7.2.4 Unlock Command

The Unlock Command is used to prevent specific engine features being locked when exiting ROM.

The format of Unlock Command, again a big endian byte array, is shown in the table below.

Table 8-43. Unlock Command Format

Tag	Length	Eng
	Value	
	Value	
	...	
	Value	

where:

Tag: A single byte field set to 0xB2
 Eng: Engine to be left unlocked.
 Values: [optional] unlock values required by engine.

NOTE

This command may not be used in DCD structure if the SEC_CONFIG is configured as closed.

8.8 Plugin Image

The ROM supports a limited number of boot devices. For using other devices as boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) for firmware with the missing boot drivers. >Additionally plugin can customize supported boot drivers. It is more flexible when doing device initialization, such as condition judging, delay assertion, applying custom settings to boot device and memory system.

>In addition to standard images, the chip also supports plugin images. Plugin images return execution to the ROM whereas a standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot Data Structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end the plugin function must return with the program image parameters. (See [High level boot sequence](#) for details about boot flow).

The boot ROM authenticates the plugin image prior to running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef unsigned char (*) plugin_download_f(void **start, size_t *bytes, UINT32
*ivt_offset)
```

ARGUMENTS PASSED:

- start - Image load address on exit.
- bytes - Image size on exit.
- ivt_offset - Offset in bytes of the IVT from the image start address on exit.

RETURN VALUE:

- 1 - on success
- 0 - on failure

8.9 Serial Downloader

The Serial Downloader provides a means to download a Program Image to the chip over USB serial connection.

In this mode the ROM programs WDOG1 for a 90-second time-out if WDOG_ENABLE eFuse is 1 and continuously polls for USB connection. If no activity is found on USB OTG1 and the watchdog timer expires, the ARM core is reset.

NOTE

The downloaded image must continue to service the watchdog timer to avoid an undesired reset from occurring.

The USB boot flow is shown in the figure below.

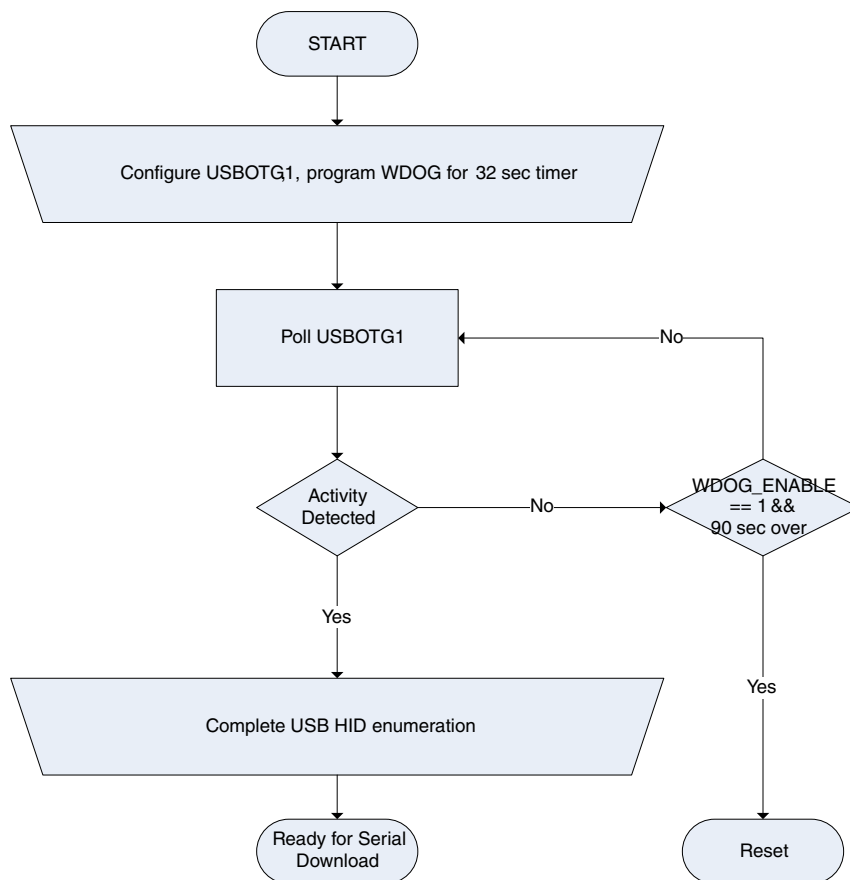

Figure 8-24. Serial Download Boot Flow

8.9.1 USB

USB support is composed of the USBOH3 (USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of 4 HID reports are used to implement SDP protocol for data transfers as described in [Table 8-44](#).

Table 8-44. USB HID Reports

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
1	control OUT	Host to device	17 bytes	SDP command from host to device

Table continues on the next page...

Table 8-44. USB HID Reports (continued)

Report ID (first byte)	Transfer Endpoint	Direction	Length	Description
2	control OUT	Host to device	Up to 1025 bytes	Data associated with report 1 SDP command
3	interrupt	Device to host	5 bytes	HAB security configuration. Device sends 0x12343412 in closed mode and 0x56787856 in open mode.
4	interrupt	Device to host	Up to 65 bytes	Data in response to SDP command in report 1

8.9.1.1 USB Configuration Details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for USB device driver are listed in the table below.

Table 8-45. VID/PID and Strings for USB Device Driver

Descriptor	Value
VID	0x15A2 (Freescale vendor ID)
PID ¹	
String Descriptor1 (manufacturer)	Freescale Semiconductor, Inc.
String Descriptor2 (product)	S Blank SE Blank NS Blank
String Descriptor4	Freescale Flash
String Descriptor5	Freescale Flash

1. Allocation based on BPN (Before Part Number)

8.9.1.2 IOMUX Configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses dedicated contacts on the IC. See the Chip data sheet for details.

8.9.2 Serial Download protocol

The 16 byte SDP command from host to device is sent using HID report 1.

The table below describes 16 byte SDP command data structure:

Table 8-46. 16 Byte SDP Command Data Structure

BYTE Offset	Size	Name	Description
0	2	COMMAND TYPE	The following commands are supported for ROM: <ul style="list-style-type: none"> • 0x0101 READ_REGISTER • 0x0202 WRITE_REGISTER • 0x0404 WRITE_FILE • 0x0505 ERROR_STATUS • 0x0A0A DCD_WRITE • 0x0B0B JUMP_ADDRESS
2	4	ADDRESS	Only relevant for following commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS. For READ_REGISTER and WRITE_REGISTER commands, this field is address to a register. For WRITE_FILE and JUMP_ADDRESS commands, this field is an address to internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for 8-bit access, 0x10 for 16-bit and 0x20 for 32-bit access. Only relevant for READ_REGISTER and WRITE_REGISTER commands.
7	4	DATA COUNT	Size of data to read or write. Only relevant for WRITE_FILE, READ_REGISTER, WRITE_REGISTER and DCD_WRITE commands. For WRITE_FILE and DCD_WRITE commands DATA COUNT is in byte units.
11	4	DATA	Value to write. Only relevant for WRITE_REGISTER command.
15	1	RESERVED	Reserved

8.9.2.1 SDP Command

SDP commands are described in the following sections.

8.9.2.1.1 READ REGISTER

The transaction for command READ_REGISTER consists of following reports: Report1 for command, Report3 for security configuration and Report4 for response or register value.

The register to read is specified in ADDRESS field of SDP command. First device sends Report3 with security configuration followed by Report4 with bytes read at given address. If count is greater than 64 then multiple reports with report id 4 are sent until entire data requested by host is sent. The STATUS is either 0x12343412 for closed parts and 0x56787856 for open or field return parts.

Report1, Command, Host to Device:

1	Valid values for READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register Value
---	----------------

ID 4 bytes of data containing register value. If number of bytes requested is less than 4 then remaining bytes should be ignored by host.

Multiple reports of report id 4 are sent until entire data requested is sent

Report4, Response, Device to Host: Last response report

4	Register Value
---	----------------

ID 64 bytes of data containing register value. If number of bytes requested is less than 64 then remaining bytes should be ignored by host.

8.9.2.1.2 WRITE REGISTER

The transaction for command WRITE_REGISTER consists of the following reports: Report1 for command, Report3 for security configuration and Report4 for write status.

Host sends Report1 with WRITE_REGISTER command. The register to write is specified in ADDRESS field of SDP command of Report1, with FORMAT field set to data type (number of bits to write 8, 16 or 32) and value to write in DATA field of SDP command. Device writes the DATA to register address and returns WRITE_COMPLETE code using Report4 and security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

8.9.2.1.3 WRITE_FILE

The transaction for command WRITE_FILE consists of following reports: Report1 for command-phase, Report2 for data-phase, Report3 for hab mode and Report4 to indicate data received in full.

The size of each Report2 is limited to 1024 bytes (limitation of USB HID protocol) hence multiple Report2 packets will be sent by host in data phase until entire data is transferred to device. Once entire data (DATA_COUNT bytes) is received then device sends report 3 with hab mode and report 4 with 0x88888888, indicating file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

=====Optional Begin=====

Host sends ERROR_STATUS command to query if HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with first 4 bytes to indicate file download has completed with code 0x88888888. On failure device will report HAB error status.

8.9.2.1.4 ERROR_STATUS

The transaction for SDP command ERROR_STATUS consists of three reports.

Report1 is used by host to send the command; device sends global error status in 4 bytes of Report4 after returning security configuration in Report3. When device receives ERROR_STATUS command it will return global error status that is updated for each command. This command is useful to find out if last command resulted in device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	4 bytes Error status
---	----------------------

ID first 4 bytes status in 64 bytes report 4

8.9.2.1.5 DCD WRITE

The SDP command DCD_WRITE is used by host to send multiple register writes in one shot. This command is provided to speed up the process of programming register writes such as to configure external RAM device.

The command goes with Report1 from host with COMMAND TYPE set to DCD_WRITE, ADDRESS which is used for temporary location of DCD data and DATA_COUNT to number of bytes sent in data out phase. In data phase host sends data for number of registers using Report2. Device completes the transaction with Report3 indicating security configuration and report 4 with WRITE_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16 byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with first 4 bytes to indicate write is completed with code 0x128A8A12. On failure device will report HAB error status.

See [Device Configuration Data \(DCD\)](#) for DCD format description.

8.9.2.1.6 JUMP ADDRESS

The SDP command JUMP_ADDRESS will be the last command host can send to the device, after this command device will jump to the address specified in the ADDRESS field of SDP command and start executing.

This command should typically follow after WRITE_FILE command. The command is sent by host in command-phase of transaction using Report1, there is no data phase for this command but device send status report3 to complete the transaction. And if HAB authentication fails then it will also send report 4 with HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

ID 16 byte SDP Command

Report3, Response, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

This report is sent by device only in case of an error jumping to the given address, device reports error in Report4, Response, Device to Host:

4	4 bytes HAB error status
---	--------------------------

ID 4 bytes status, 64 bytes report length

8.10 Recovery Devices

The Chip supports recovery devices. If primary boot device fails, boot ROM will try to boot from recovery device using one of I2C or ECSPi ports.

For enabling recovery device BOOT_CFG4[6] fuse must be set. Additionally Serial EEPROM fuses must be set as described in [Serial ROM through SPI and I2C](#).

8.11 USB Low Power Boot

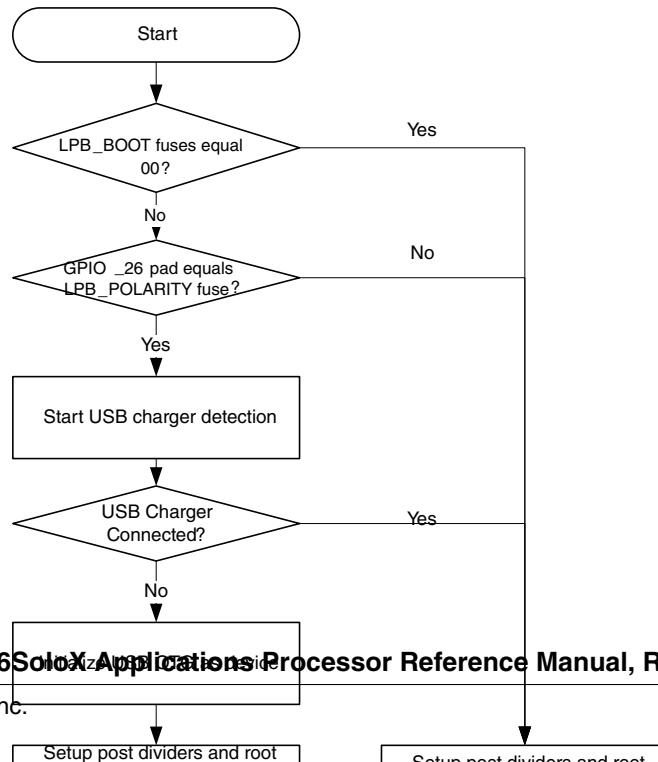

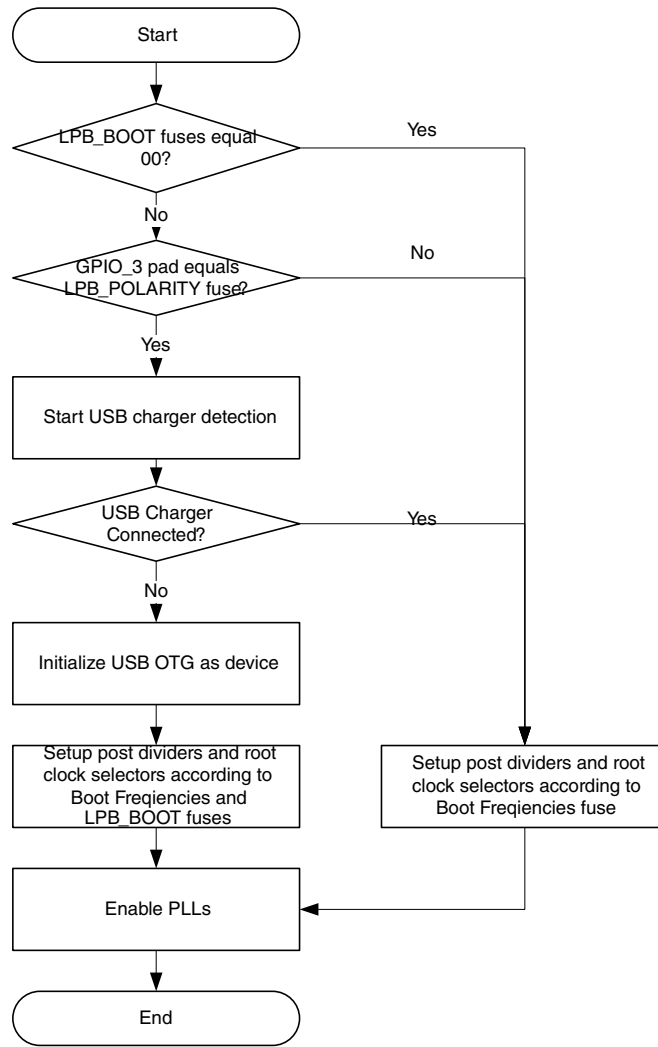

ROM supports USB Low Power Boot. This feature enables a device with dead or weak battery to power up and boot if the device is connected to a USB upstream port, no matter the upstream port is a USB charger or USB host/hub.

If a USB dedicated charger or host/hub charger are connected, as soon as the device is connected to the upstream port, a stable current (Max.1.5A) can be supplied by charger. If USB host/hub are connected, the maximal 100mA current is supplied to the device, the device should be able to power up to boot the image with less than 100mA.

If LPB_BOOT fuses are blown, the Chip will check if there is low power condition via GPIO_3 pad. If there is low power boot condition USB charger detection will be activated. If there is no USB charger, ROM will initialize USB as device and apply division factors on ARM, DDR, AXI and AHB root clocks based on LPB_BOOT fuses value (see the table below). Polarity of low power boot condition on GPIO_3 pad is set by BT_LPB_POLARITY fuse (see the figure below).

Table 8-69. USB Low Power Boot Frequencies

LPB_BOOT	Boot Frequencies=0	Boot Frequencies=1
00	ARM_CLK_ROOT=792MHz MMDC_CLK_ROOT=396MHz FABRIC_CLK_ROOT=396MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CLK_ROOT=307MHz FABRIC_CLK_ROOT=307MHz AHB_CLK_ROOT=77MHz
01	ARM_CLK_ROOT=792MHz MMDC_CLK_ROOT=396MHz FABRIC_CLK_ROOT=396MHz AHB_CLK_ROOT=132MHz	ARM_CLK_ROOT=396MHz MMDC_CLK_ROOT=307MHz FABRIC_CLK_ROOT=307MHz AHB_CLK_ROOT=102MHz
10	ARM_CLK_ROOT=396MHz MMDC_CLK_ROOT=198MHz FABRIC_CLK_ROOT=198MHz AHB_CLK_ROOT=66MHz	ARM_CLK_ROOT=198MHz MMDC_CLK_ROOT=153MHz FABRIC_CLK_ROOT=153MHz AHB_CLK_ROOT=51MHz
11	ARM_CLK_ROOT=198MHz MMDC_CLK_ROOT=99MHz FABRIC_CLK_ROOT=99MHz AHB_CLK_ROOT=49MHz	ARM_CLK_ROOT=99MHz MMDC_CLK_ROOT=76MHz FABRIC_CLK_ROOT=76MHz AHB_CLK_ROOT=38MHz

8.12 SD/MMC Manufacture Mode

When internal boot and recover boot (if enabled) failed, SDMMC_MFG_DISABLE fuse bit isn't set, and EEPROM Recovery fuse bit is set, boot will go to SD/MMC manufacture mode before serial download mode. In manufacture mode, one bit bus width is used despite of the fuse setting.

In manufacture mode, SD or MMC card will be scanned on uSDHC1. If card is detected and valid boot image is found in card, then boot image will be loaded then executed. Pad of SD1_CD is used to detect whether card is inserted.

By default, SD/MMC manufacture mode is enabled, blow the fuse of DISABLE_SDMMC_MFG to disable it.

NOTE

Secondary boot is not supported on SD/MMC manufacture mode.

NOTE

SD/MMC Manufacture Mode is only supported on the 19x19 mm (VM) package. The USDHC1 signals are not available on the other packages.

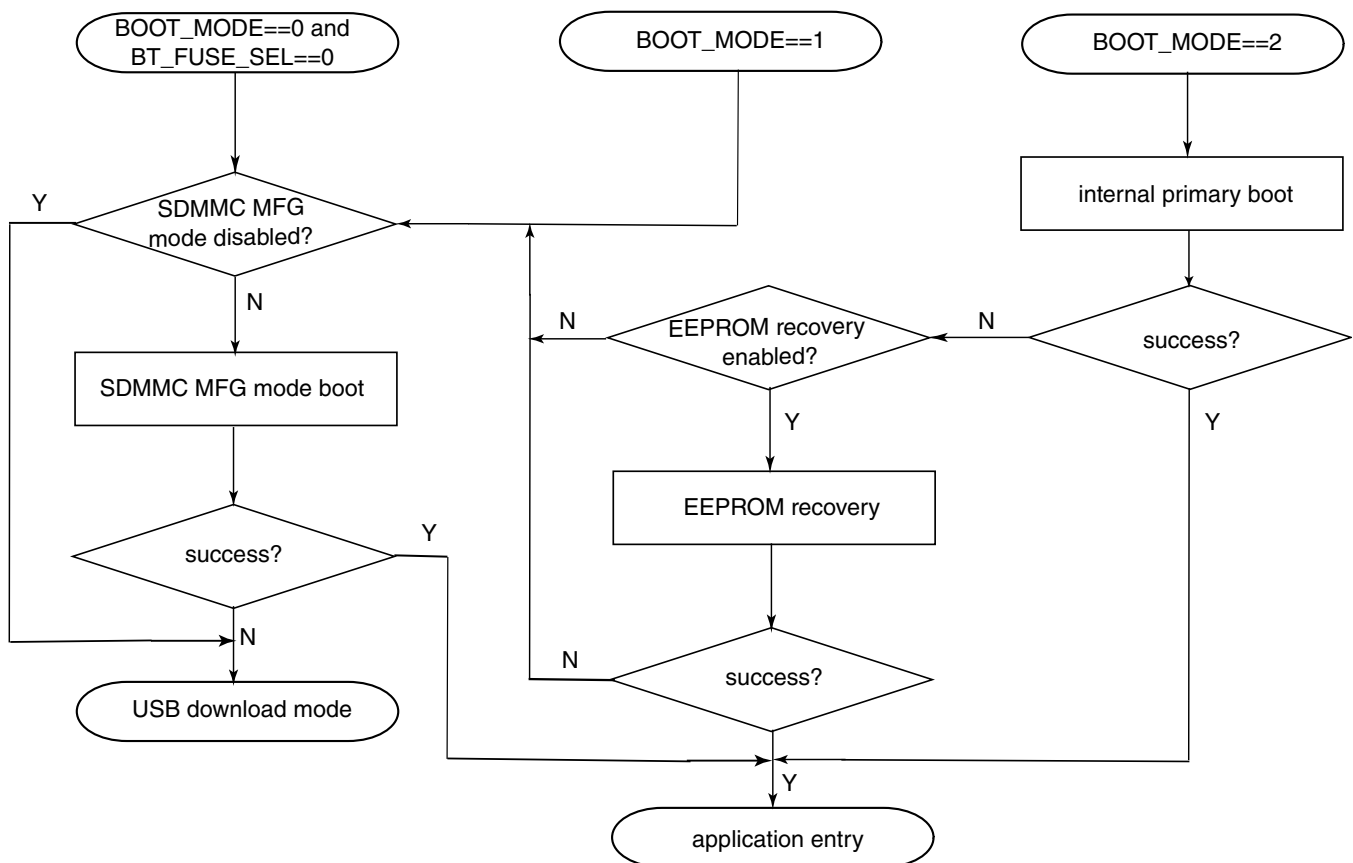

Figure 8-26. SD/MMC Manufacture boot flow

8.13 High Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying areas of code or data in programmable memory to make it behave in an incorrect manner. The HAB also prevents attempts to gain access to features which should not be available.

The integration of the HAB feature with the ROM code ensures that Chip does not enter an operational state if the existing hardware security blocks have detected a condition that may be a security threat or areas of memory deemed to be important have been modified. The HAB uses RSA digital signatures to enforce these policies.

Figure 8-27. Secure Boot Components

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to ensure the system security state is as expected. The HAB also makes use of CAAM hardware block to accelerate SHA-256 message digest operations performed during signature verifications and AES-128 operations for encrypted boot operations. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator cannot be used. The RSA key sizes supported are 1024, 2048 and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by HAB are:

- X.509 Public key certificate support
- CMS signature format support
- Proprietary encrypted boot support. Note that encrypted boot depends on the CAAM HW module. When CAAM is disabled (i.e. when the EXPORT_CONTROL fuse is blown) then encrypted boot is not available.

NOTE

For further details on making use of the secure boot feature using HAB contact your local Freescale representative.

8.13.1 HAB API Vector Table Addresses

For devices that perform a secure boot, the HAB library may be called by boot stages that execute after ROM code.

The RVT table contains the pointers to the HAB API functions and is located at 0x00000100.

NOTE

For additional information on secure boot including the HAB API, contact your local Freescale representative.

Chapter 9

Multimedia

9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- LCDIF (LCD interface): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: pixel/image processing engine for EPD and LCD display
- Single Graphic processing units support for 2D/3D
- CSI (camera sensor interface): up to 24-bit parallel interface for image sensor
- LVDS Bridge (LDB): providing up to one LVDS interface
- Two (identical) Display Content Integrity Checker (DCIC) are used to authenticate sensitive displayed data
- Video ADC
- TV Decoder

The following figure shows the high level integration scheme of the chip display and graphics system.

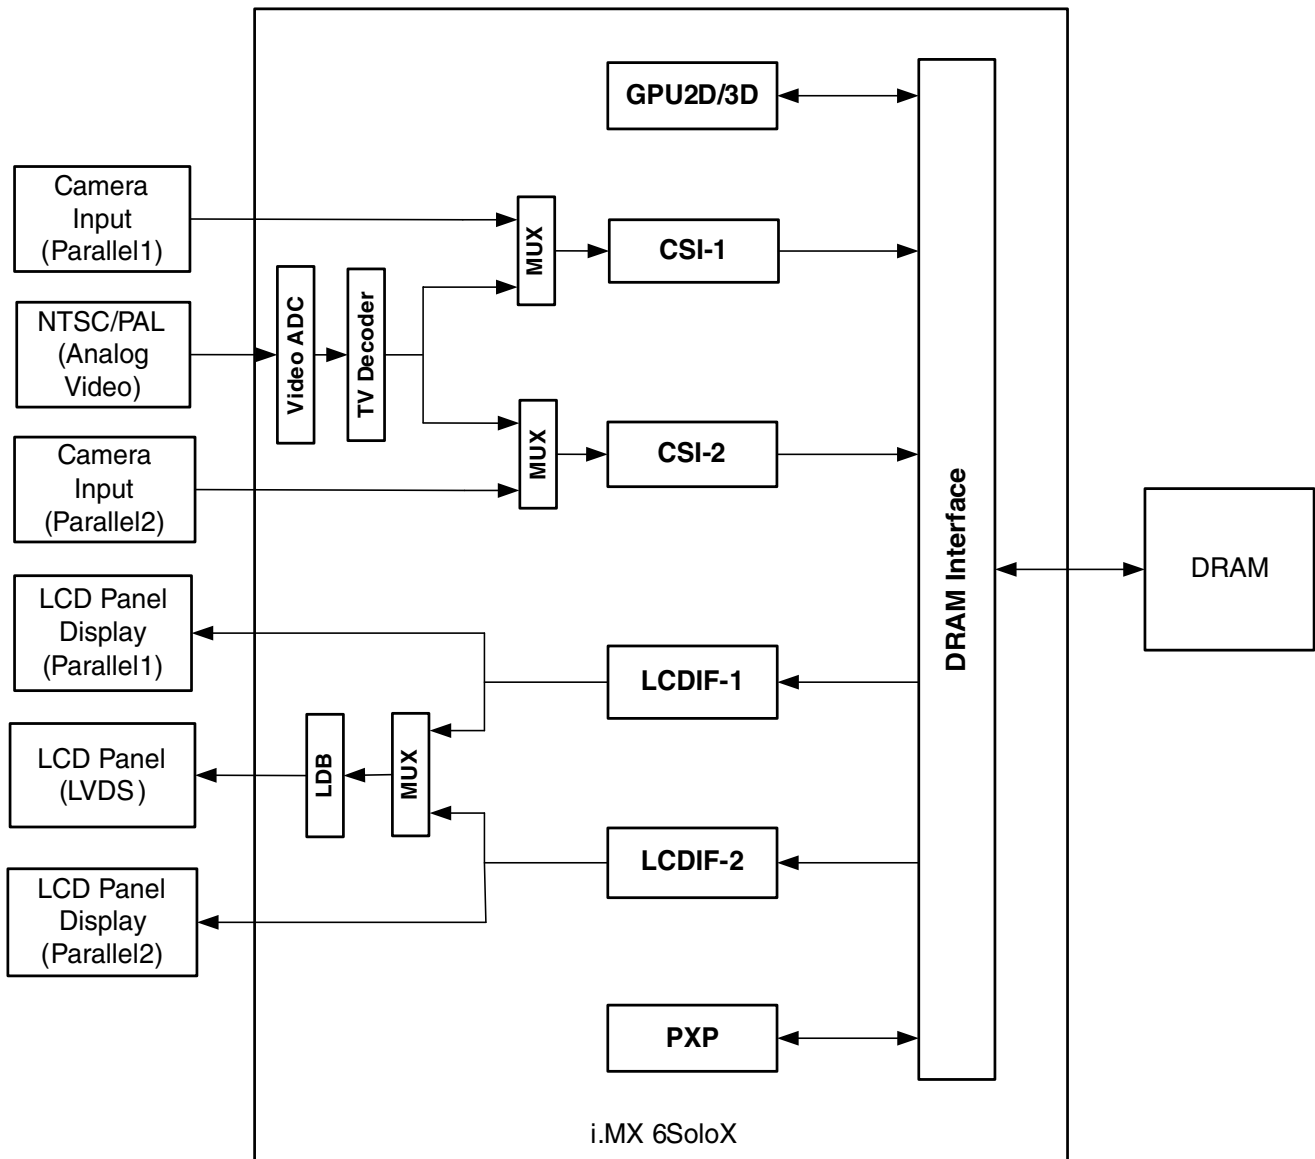

Figure 9-1. Chip display and graphics subsystem

9.1.1 PiXeI Pipeline

The pixel pipeline is used to perform image processing on image/video buffers before sending to an LCD display .

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling

- Supports overlay with Alpha blending
- Supports Rotation of 0, 90, 180 and 270 degrees in conjunction with vertical and horizontal flip options

9.1.2 LCD Interface

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers. In addition to these displays, it is also common to provide support for digital video encoders that accept ITU-R BT.656 format 4:2:2 YCbCr digital component video and convert it to analog TV signals. The LCDIF block supports these different interfaces by providing fully programmable functionality.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24/32 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.
- ITU-R BT.656 mode (called Digital Video Interface or DVI mode here) including progressive-to-interlace feature and RGB to YCbCr 4:2:2 color space conversion to support 525/60 and 625/50 operation

9.1.3 CMOS Sensor Interface

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.

- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 32-bit receive FIFO packing.
- 128 × 32 FIFO to store received image pixel data. Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

9.1.4 Video ADC features

The Video ADC includes the following features.

- Internal voltage and current reference generator
- 10-bit resolution
- 4 analog inputs. All inputs usable for CVBS.
- Programmable anti-aliasing filter, gain, and clamp

9.1.5 TV Decoder

The TV decoder is comprised of the following blocks:

- NTSC/PAL decoder
- Video processing, noise reduction, de-interlacing and scaling

9.2 2D/3D Graphics Processing Unit

This GPU2D/3D module includes GPU2D and GPU3D function.

9.2.1 2D feature summary

GPU2D has the following features:

- Bit BLT & stretch BLT
- Rectangle fill and clear
- Line drawing
- High performance stretch and shrink
- Mono expansion for text rendering
- ROP2, ROP3, and ROP4
- Alpha blending including Java 2 Porter-Duff compositing blending rules
- Support rendering size of 32Kx32K
- 90/180/270 degree rotation
- Transparency by monochrome mask, chroma key, or pattern mask
- Color space conversion between YUV and RGB
- High quality image scaling, using up to 9x9 separable filter
- Bit-Blit Formats
 - A1R5G5B5 (source/destination)
 - A4R4G4B4 (source/destination)
 - X1R5G5B5 (source/destination)
 - X4R4G4B4 (source/destination)
 - R5G6B5 (source/destination)
 - X8R8G8B8 (source/destination)
 - A8R8G8B8 (source/destination)
 - 8-bit color index (source only)
 - A8 (source/destination)
 - 1-bit monochrome (source only)
- Filter Blit Formats
 - A1R5G5B5 (source/destination)
 - A4R4G4B4 (source/destination)
 - A8R8G8B8 (source/destination)
 - R5G6B5 (source/destination)
 - X1R5G5B5 (source/destination)
 - X4R4G4B4 (source/destination)
 - X8R8G8B8 (source/destination)
 - YUV (source only):
 - NV12 (4:2:0, 2 planes)
 - NV16 (4:2:2, 2 planes)
 - UYVY (4:2:2, interleave)

- YUY2 (4:2:2, interleave)
- YV12 (4:2:0, 3 planes)
- 8-bit color index(source only)

9.2.2 2D Performance

- Geometry Rate: 26.6M Triangles/sec
- Pixel Rate: 256M pixels/sec

9.2.3 2D Software

API / Driver Support

- GDI/DirectDraw
- DirectFB
- X11 EXA

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

9.2.4 OpenGL Features

Summary of features in the GPU3D includes:

- OpenGL ES 2.0 compliance, including extensions; OpenGL ES 1.1; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Support for 8 fragment shader simultaneous textures
- Support for 4 vertex shader simultaneous textures
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear

- 8k x 8k texture size and 8k x 8k rendering target
- 4 Vertex DMA streams

9.2.5 OpenGL Performance

- TBD

9.2.6 OpenGL Software

API / Driver Support

- OpenVG 1.1
- EGL 1.4
- OpenVG 1.1

Operating Systems

- Windows CE
- Linux Embedded and X11
- Android

9.3 LVDS Display Bridge (LDB)

LVDS Display Bridge (LDB) will be used to connect to the External LVDS Display Interface.

9.3.1 LDB Overview

Table 9-1. IP Parametric Table

Name	Description
Function	Connectivity to displays with LVDS interface
External I/O Pins Notes: Those are LVDS IO pads	LVDS Display port: 1 channels. Each channel consists of: <ul style="list-style-type: none"> • 1 clock pair • 4 data pairs Each pair contains - LVDS special differential pad (PadP, PadM). total of 10 IO pads.

Table continues on the next page...

Table 9-1. IP Parametric Table (continued)

Name	Description
SoC Buses	None. Only configuration signals.
Interrupts	None
DMA Requests	None
Number of instantiations	1
Clock sources and range	DI0_CLK - Display interface clock: 20-85 MHz DI0_SER_CLK - Serializer clock: 140-595 MHz

The purpose of the LDB is to support flow of synchronous RGB data to external display devices through the LVDS interface. This support covers all aspects of these activities:

- Connectivity to relevant devices - Displays with LVDS receivers.
- Arranging the data as required by the external display receiver and by LVDS display standards.
- Synchronization and control capabilities.

9.3.2 LDB External Ports

The LDB has the following ports:

- Two input parallel display ports.
- Two Output LVDS channels - Each channel consisting of 4 data pair, and 1 clock pair (pair=LVDS pad contains PadP, PadM).
- Control signals - to configure LDB parameters and operations.
- Clocks from SOC PLLs.

9.3.3 Input Parallel Display Ports

One parallel RGB input ports are supported. Only synchronous access mode is supported.

Each RGB data interface contains the following:

- RGB Data of 18 or 24 bits
- Pixel clock
- Control signals: HSYNC, VSYNC, DE, and 1 additional optional general purpose control.

Total of up to 28 bits per data interface are transferred per pixel clock cycle.

Rates supported:

- For single-channel output: Up to 85 MHz per interface. (e.g. WXGA - 1366x768 @ 60 Hz + 35% blanking).

9.3.3.1 Output LVDS Ports

There is 1 LVDS channel. These inputs are used to communicate RGB data and controls to external LCD displays with LVDS interface, or through LVDS receivers.

The LVDS ports may be used as follows:

- One single-channel output

9.4 Display Content Integrity Checker (DCIC)

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

9.5 Audio subsystem

[Audio subsystem module overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

9.5.1 Audio subsystem module overview

The following figure shows a high level block diagram of the audio subsystem.

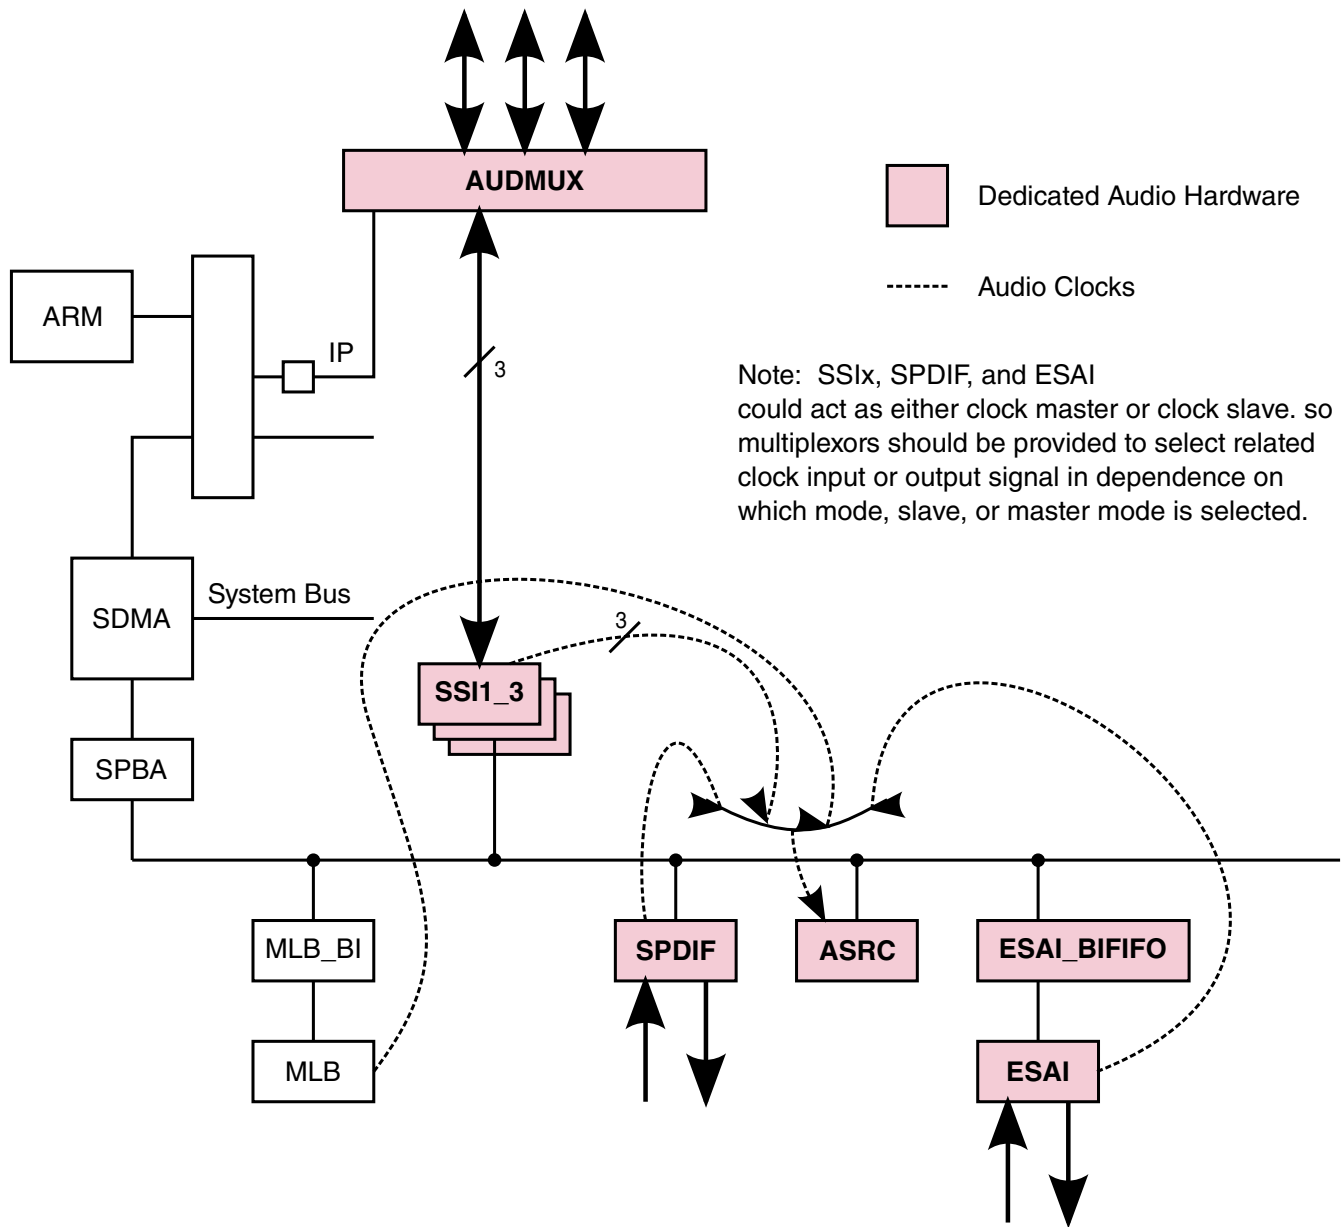

Figure 9-2. Audio subsystem block diagram

SSI1–3 are synchronous serial interfaces used to transfer audio data. SSI1–3 are on the shared peripheral bus. Instead of connecting to the IOMUX directly, their serial lines connect to the digital audio mux (AUDMUX).

AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself. The ARM controls AUDMUX, but AUDMUX can route data even when the ARM is in a low-power mode.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system. SPDIF is connected to the shared peripheral bus.

9.5.2 Synchronous Serial Interface (SSI)

The Synchronous Serial Interface (SSI) is a full-duplex serial port that allows communication with external devices using a variety of serial protocols. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock/frame sync options.

The SSI has two pairs of 15x32 FIFOs and hardware support for an external DMA controller in order to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream which reduces CPU overhead in use cases where two timeslots are being used simultaneously.

The three SSIs may support three audio streams (possibly at different sample rates) simultaneously. SSI1, SSI2 and SSI3 are located on the Shared Peripheral Bus. Since the SDMA can directly access SSI1...SSI3 (being on the Shared Peripheral Bus), they can be used for high-bandwidth data transfers in order to optimize bus bandwidth consumption.

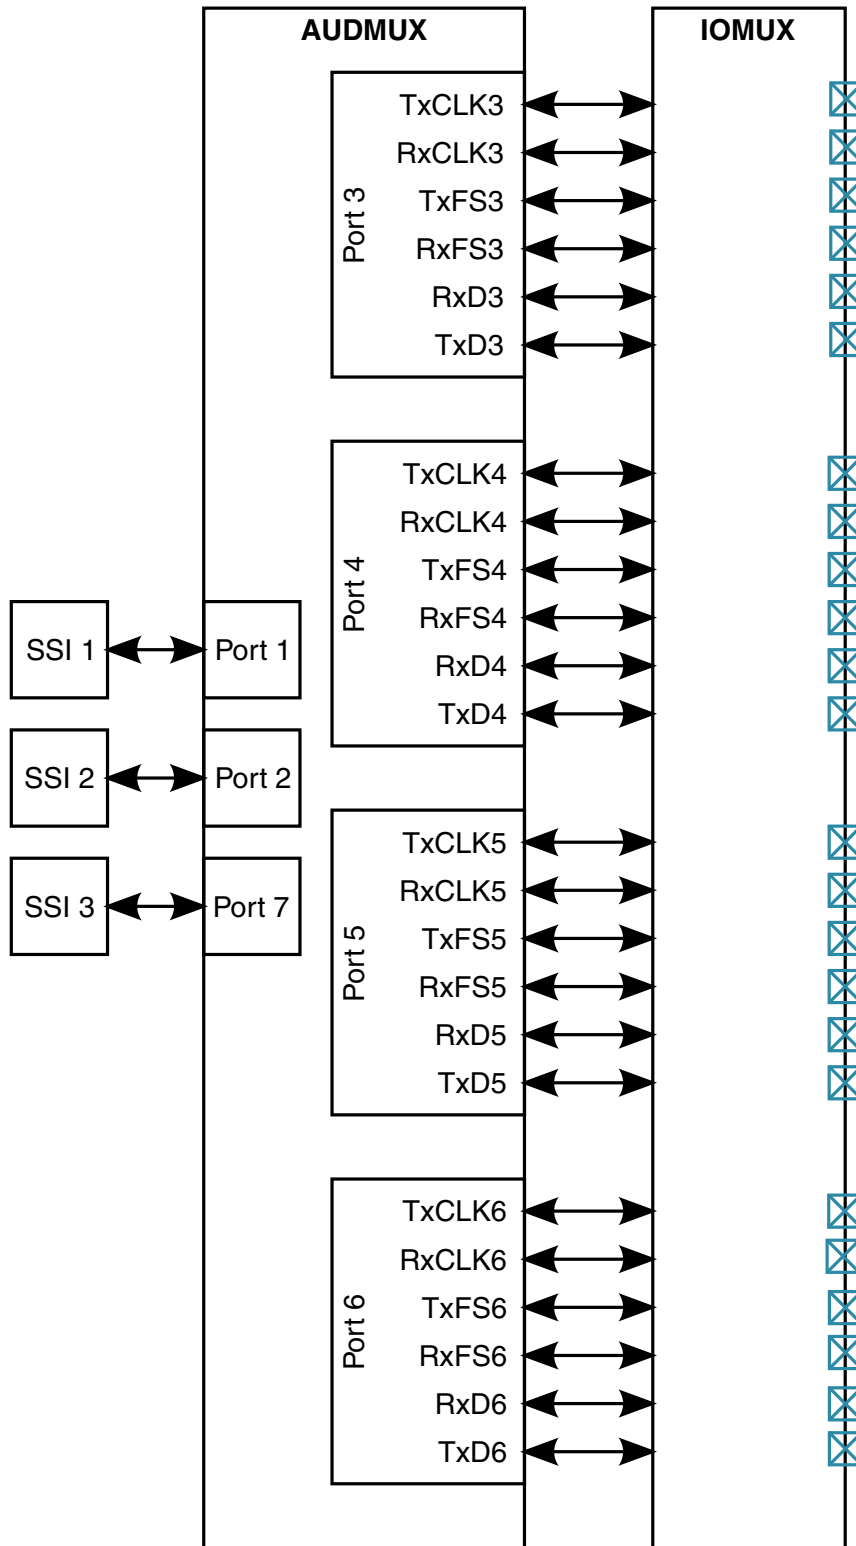

9.5.3 Digital Audio MUX (AUDMUX)

The Digital Audio Mux (AUDMUX) provides a programmable interconnect fabric for voice, audio, and synchronous data routing between host serial interfaces, such as SSI, and peripheral serial interfaces—that is, audio and voice codecs.

The AUDMUX includes two types of interfaces. Internal ports connect to the processor serial interfaces, and External ports connect to off-chip audio devices. A desired connectivity is achieved by configuring the appropriate host and peripheral ports.

The AUDMUX provides flexible, programmable routing of the on-chip serial interfaces to and from off-chip audio devices. The AUDMUX routes audio data (and even splices together multiple time-multiplexed audio streams) but does not decode or process audio data itself.

The following figure illustrates how the AUDMUX is connected in the system.

⊠ - IO PAD (more than one PAD is available for each signal, only one option shown above).

Figure 9-3. AUDMUX System Block Diagram
 i.MX 6SoloX Applications Processor Reference Manual, Rev. 0, 2/2015

9.5.4 Synchronous Audio Interface (SAI)

The Synchronous Audio Interface (SAI) implements supports full-duplex serial interfaces with frame synchronization such as I2S, AC97, and CODEC/DSP interfaces.

- Transmitter with independent Bit Clock and Frame Sync supporting 1 data line
- Receiver with independent Bit Clock and Frame Sync supporting 1 data line
- Maximum Frame Size of 32 Words
- Word size programmable from 8-bits to 32-bits
- Word size configured separately for first word and remaining words in frame.
- Asynchronous FIFO for each Transmit and Receive data line
- Graceful restart after FIFO Error

9.5.5 Enhanced Serial Audio Interface (ESAI)

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The ESAI has 12 pins for data and clocking connection to external devices. The ESAI is internally connected to the ESAI_BIFIFO, and does not connect directly to the shared peripheral bus. The ESAI interface is designed for a 24-bit data bus, while the shared peripheral data bus is 32-bit wide. Also, the ESAI data paths are only double buffered, not allowing efficient DMA service in the applications processor environment. The ESAI_BIFIFO allows increasing the data buffering and data width matching to the shared peripheral bus.

9.5.6 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo that allows the processor transmit digital audio over it using the IEC60958 standard, consumer format. i.MX 6SoloX provides one SPDIF transmitter with one output.

The SPDIF allows the handling of both SPDIF channel status (CS) and User (U) data.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphasic mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The SSI's clock sources should provide a clock that is at least $64 \times F_s$, where F_s is the sampling frequency. The external clock source should provide at least $128 \times F_s$. Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example, $128x$, $256x$ or $512x$). Also, clock frequency precision of 100ppm or better should be provided.

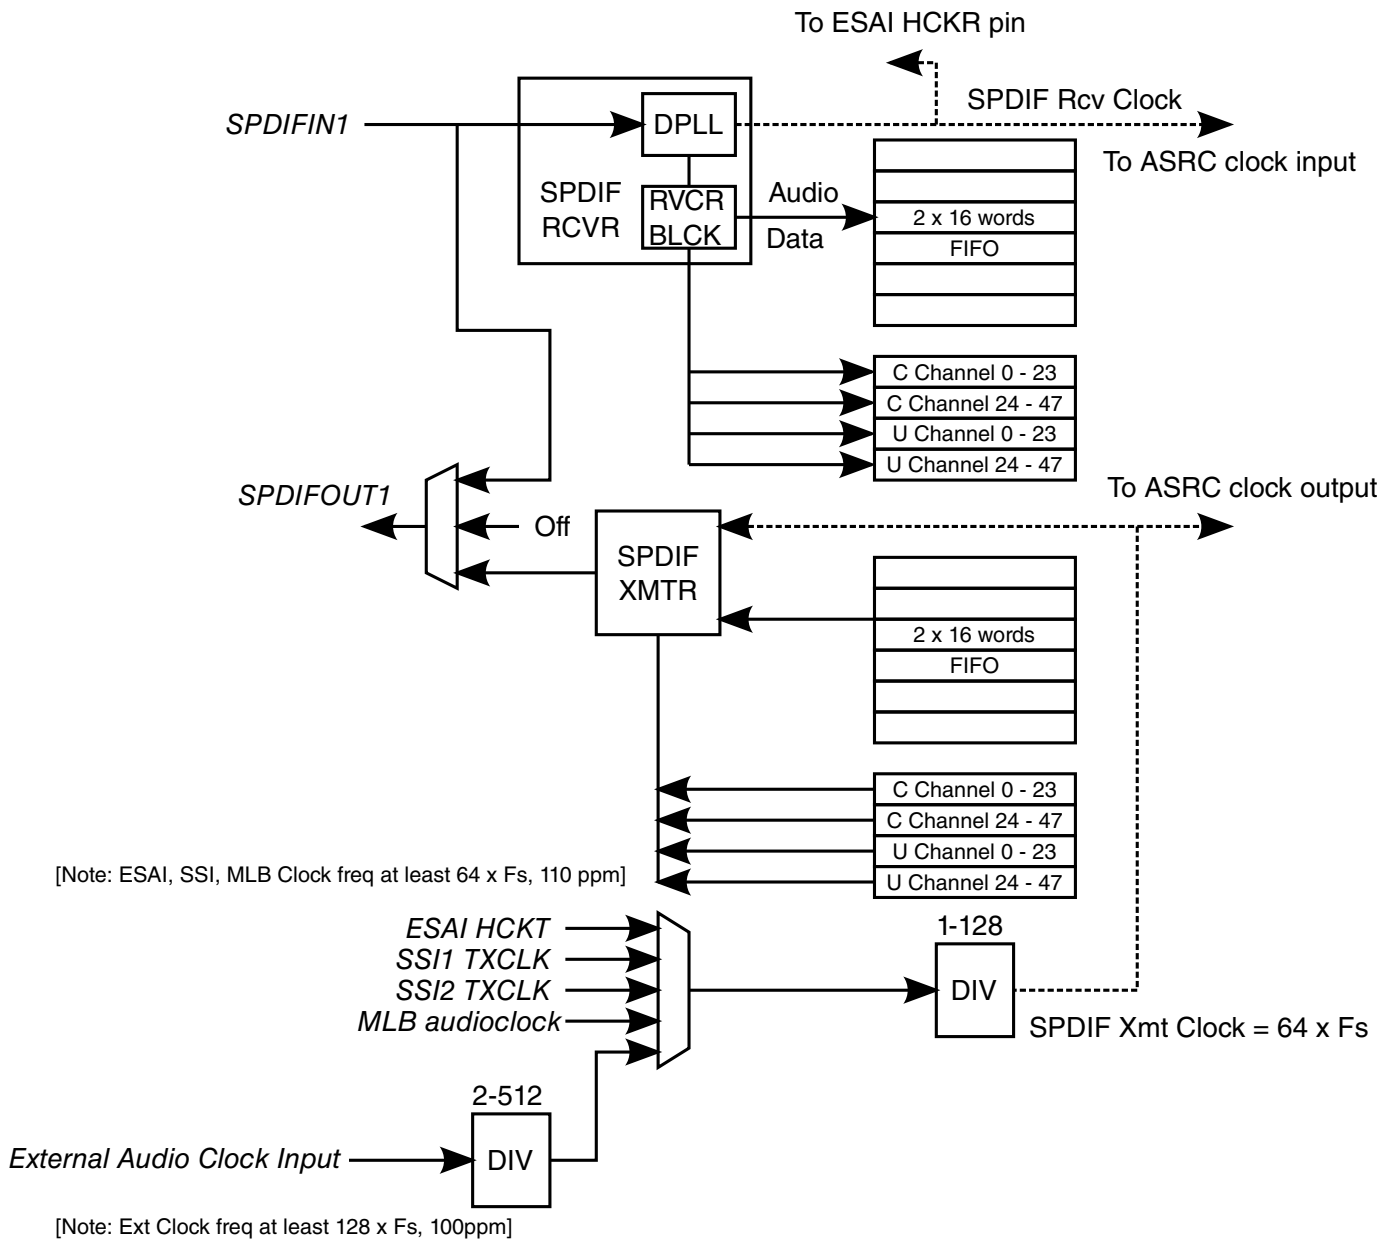

Figure 9-4. SPDIF Transceiver Clock Diagram

Chapter 10

Clock and Power Management

10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The device targets many applications where low power consumption, long battery life, always-on and instant-on capabilities, and no need for active cooling are paramount. For this reason, the design constantly focuses on reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility:

This introduction contains information about:

- Structural components of the power and clock management systems of the device
- Power, clock and thermal management techniques supported by the device

All the numerical values are typical or examples, for accurate values one should use the datasheet.

10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, the Clock and Power rails are considered managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of clock, power and thermal management system of the chip is presented in the figure below.

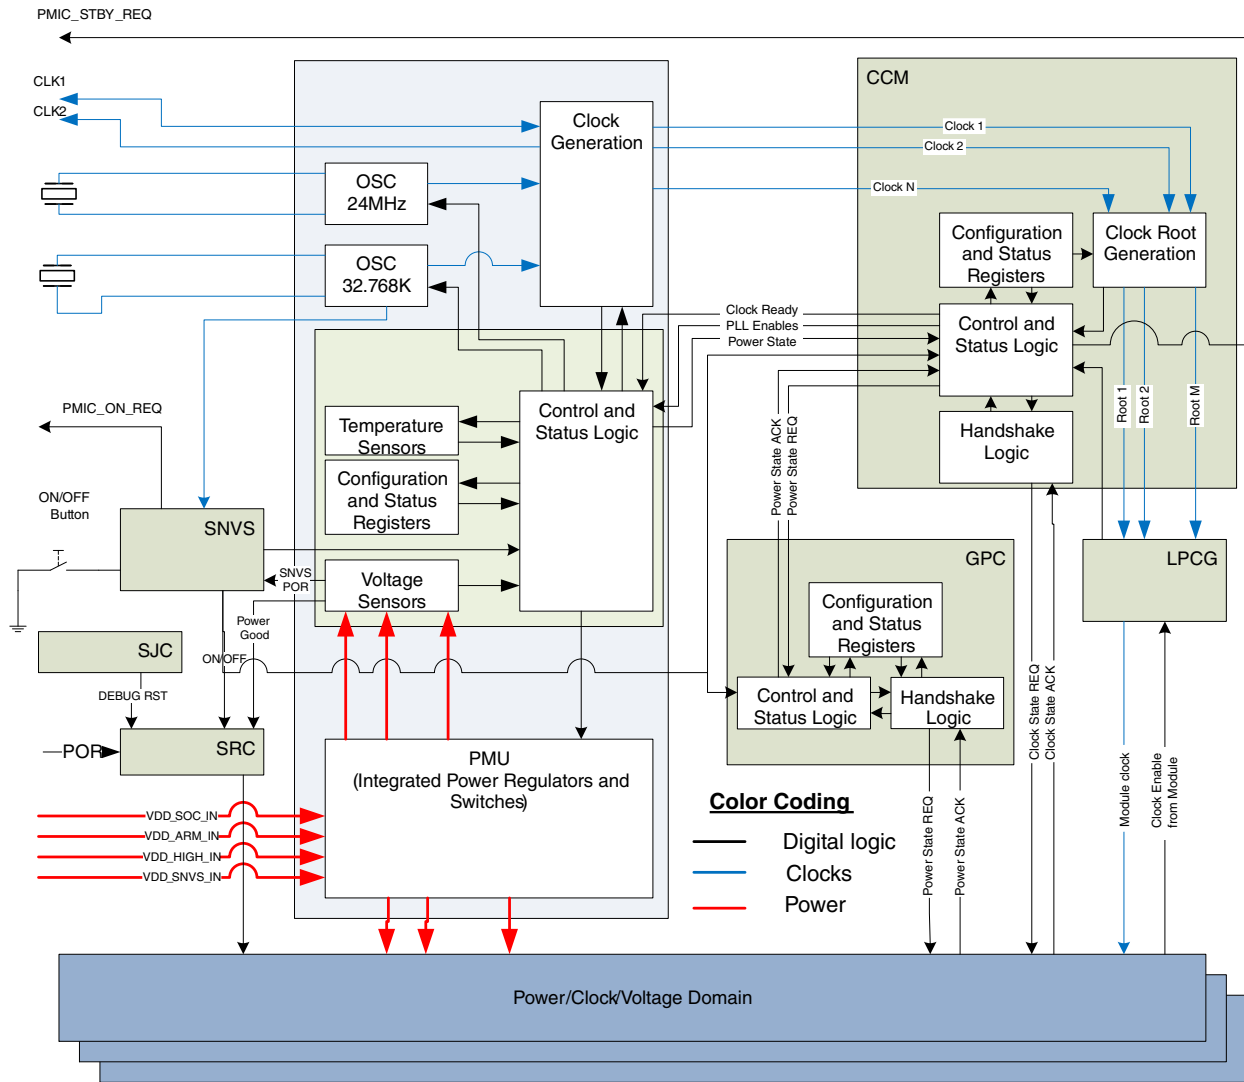

Figure 10-1. Power and clock management framework

10.2.1 Centralized components of clock generation and management

Centralized components of clock generation and management sub-system are implemented in the following blocks:

- CCM (Clock Control Module): The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating.

- See [Clock Controller Module \(CCM\)](#) for information on the CCM architecture, functional description and programming model.
- LPCG (Low Power Clock Gating): This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

10.2.2 Centralized components of power generation, distribution and management

Centralized components of power generation, distribution and management sub-system are implemented in the following blocks:

- PMU (Integrated Power Management Unit). See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- GPC (General Power Controller). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with the centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management defines the minimal managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The software component managing shared resources should take

into account the joint constraints of all the modules belonging to that resource domain.

10.3 Clock Management

10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in figure below.

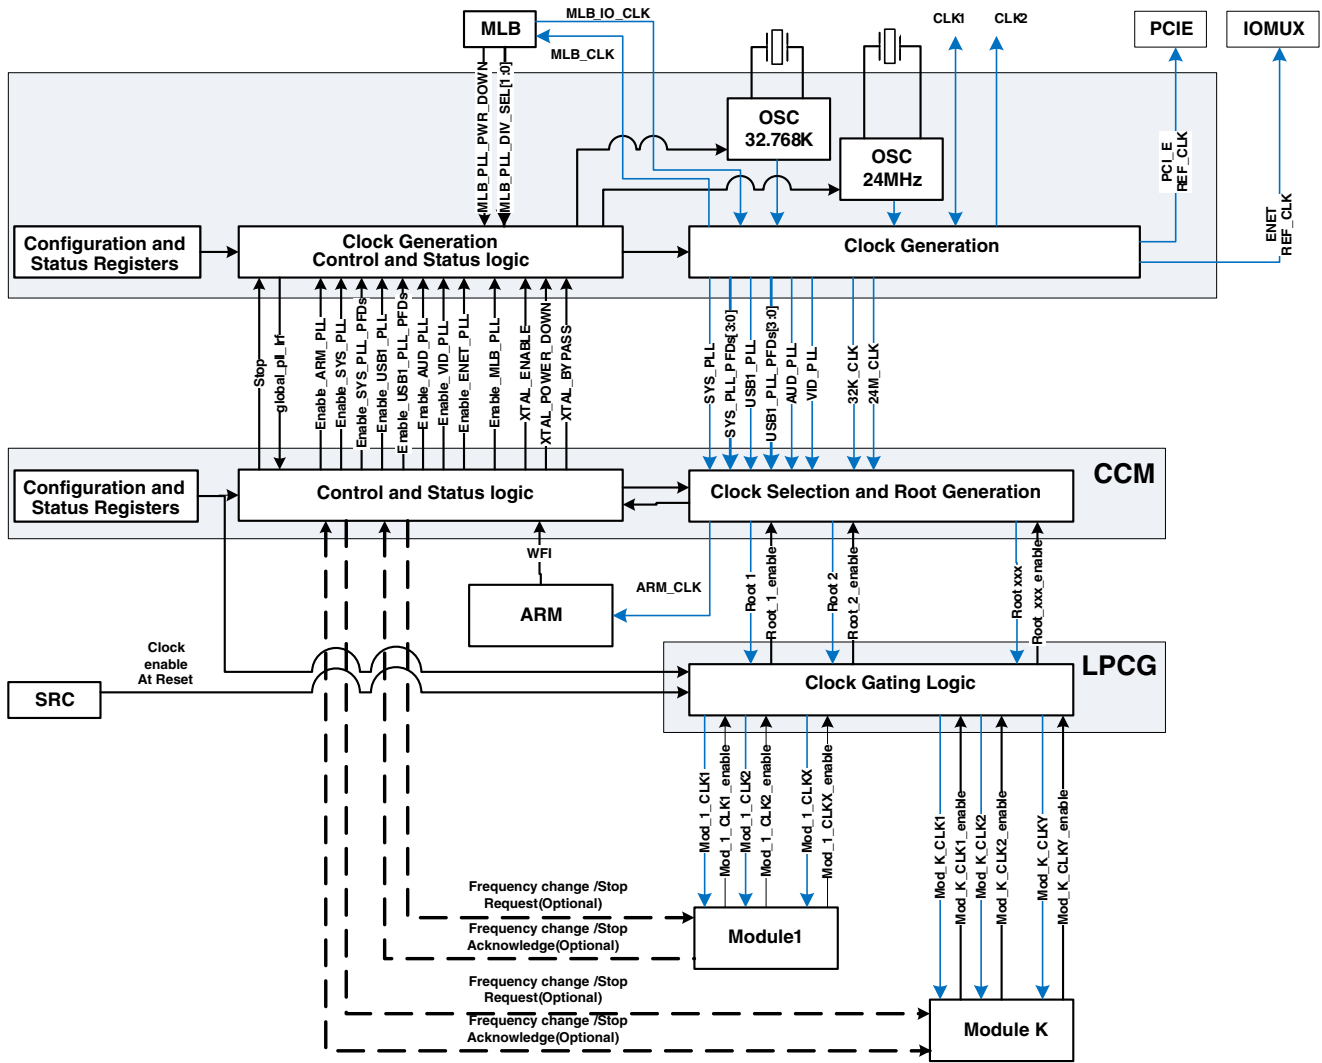

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

Clock Management

Figure 10-3. Primary Clock Generation

10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

10.3.2.2 LVDS I/O ports

There is one LVDS I/O port used for clock generation. The low jitter differential I/O port are provided to input and output clocks. They can take input clocks from outside of the SoC and provide them to the PLLs or to the other modules, or they can take the outputs of the PLLs and provide them outside of the SoC as a functional or reference clock.

10.3.2.3 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces $18/N \times F_{vco}$ at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0GHz.
- PLL2 (also referred to as System_PLL or 528_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528MHz output frequency with 24MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs (PLL2_PFD0...PLL2_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, DDR interface, NAND/NOR interface modules, etc.
- PLL3 (also referred to as USB1_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3_PFD0...PLL3_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480MHz with a 24MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650MHz to 1300MHz, and the frequency resolution is better than 1Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency
- PLL6 (also referred to as ENET_PLL) - This PLL implements a fixed $20 + (5/6)$ multiplier. With a 24MHz input, it has a VCO frequency of 500MHz. This PLL is used to generate:
 - 50 or 25 MHz for the external ethernet interface.
 - 125MHz for reduced gigabit ethernet interface.
 - 100MHz for general purposes.
- PLL7 (also referred to as USB2_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as HOST PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480MHz with a 24MHz oscillator.

10.3.2.3.1 General PLL Control and Status Functions

PLLs configuration and control functions are accessible via individual per PLL and PFDs and global configuration and status registers.

Reference input clock for any of the PLLs except the MLB PLL could be selected individually by the `BYPASS_CLK_SRC` field of the PLL control register. See [CCM Analog Memory Map/Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the `BYPASS` bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (`ENABLE=0`), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the `ENABLE` bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related `PFDx_CLKGATE` bit in `CCM_ANALOG_PFD_480n` or `CCM_ANALOG_PFD_528n`, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at www.freescale.com for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

10.3.2.4 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the [Power modes](#), namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources [PLL clock change](#) or by changing the divider ratio.
- Graceful changing of the DDR memory controller clock. See [MMDC handshake](#) and [Self refresh and Frequency change entry/exit](#) for more details.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces (SAI, SSI, ESAI), Audio Sample Rate Converter (ASRC), or general purpose serial interfaces (UART, CAN) in general causes synchronization loss and should not be done.

10.3.2.5 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from four sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

10.3.3 Peripheral components of clock management system

The figure found here shows the clock interface of a functional module in the system.

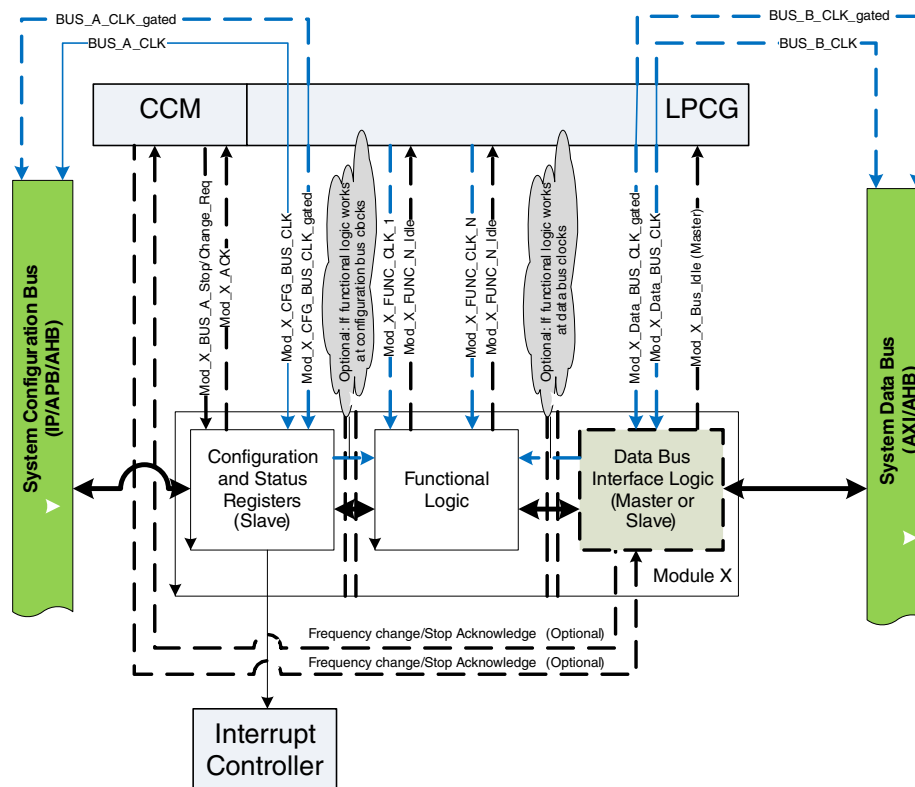

Figure 10-4. Clock interface of the functional module in system

10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of modules supporting master clock protocol are GPU and USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM_CMEOR).

10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, EPIT and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

10.4 Power management

10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks. A high level block diagram of the power management system in the SoC environment is shown in the figure below.

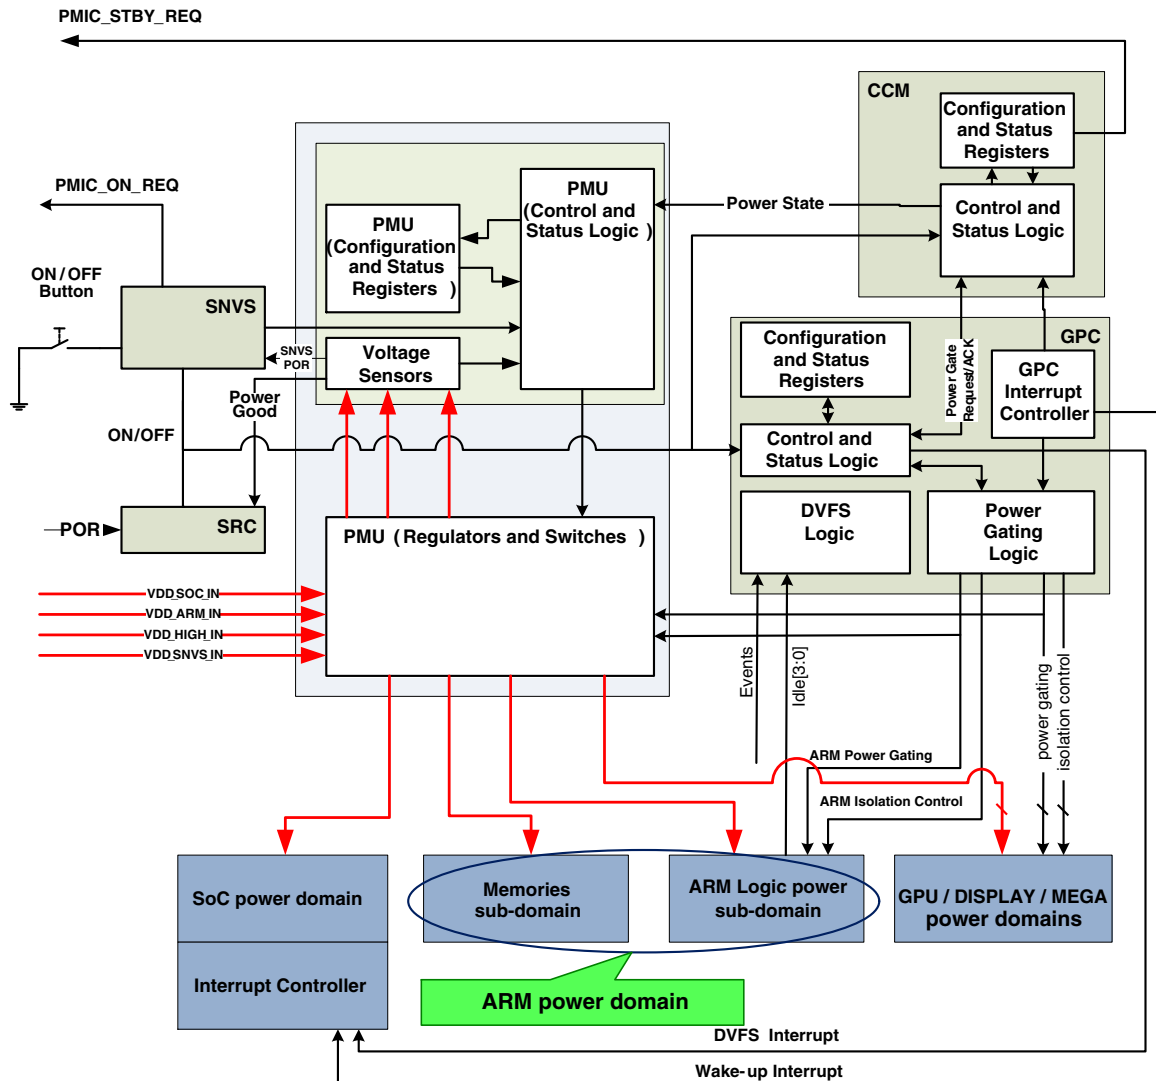

Figure 10-5. Power Management System

10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

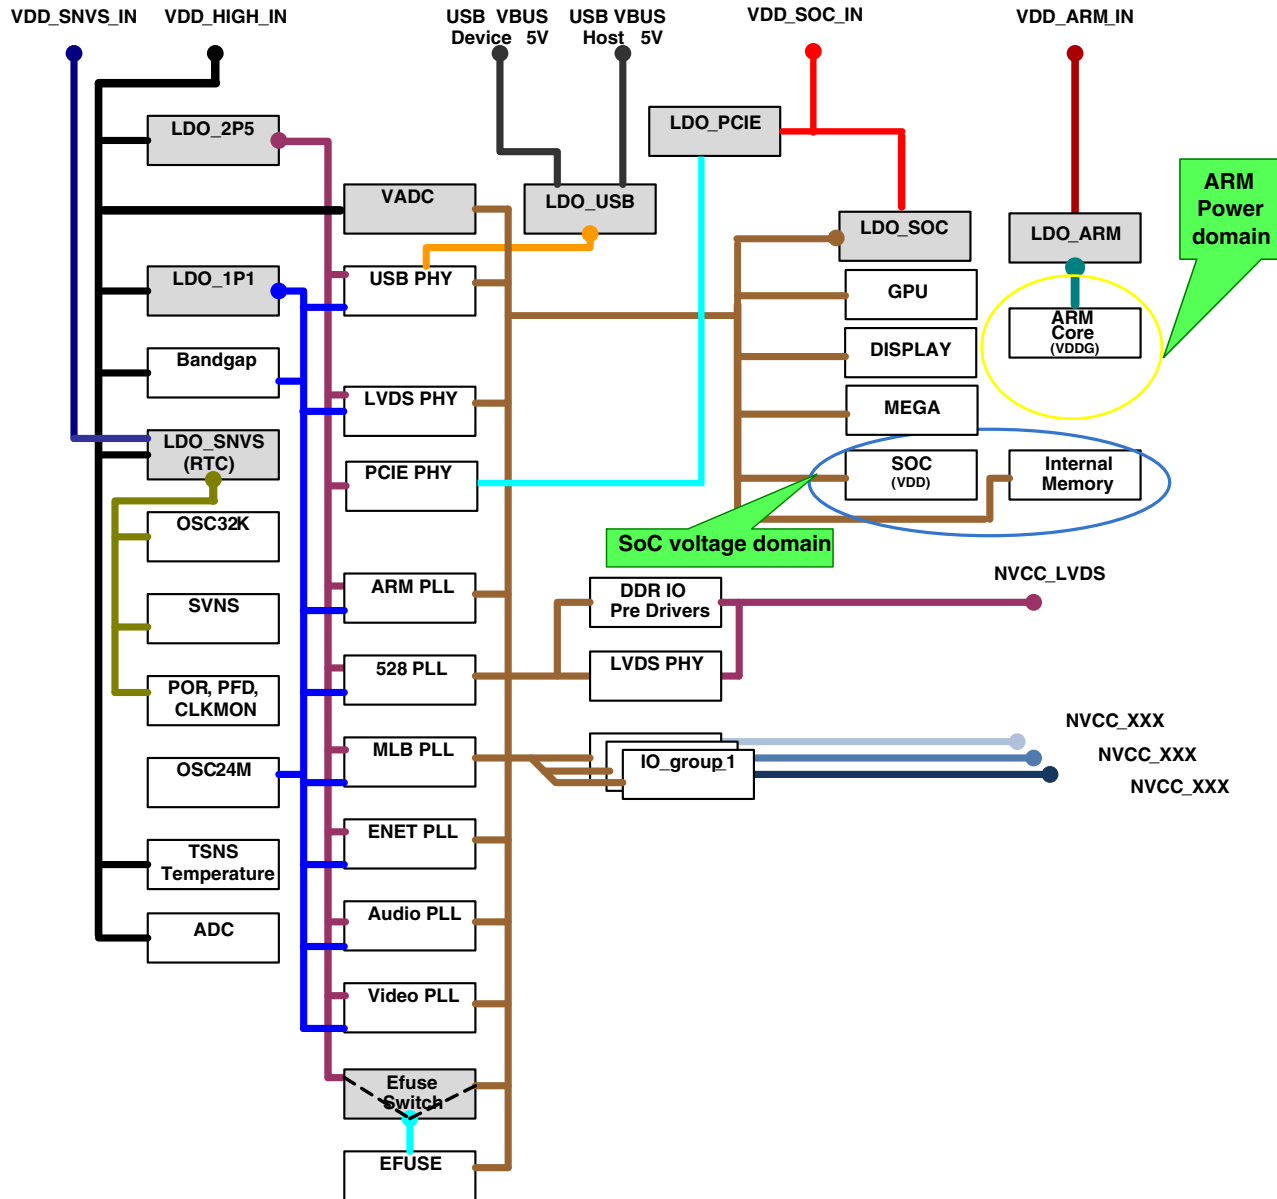

Figure 10-6. i.MX 6SoloX Power Tree

The integrated PMU includes the following components:

- Three Digital LDO regulators
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

10.4.1.1.1 Digital LDO Regulators

The integrated PMU includes three digital LDO regulators: LDO_ARM (VDD_ARM_IN, VDD_ARM_CAP), LDO_PCIE (VDD_SOC_IN, PCIE_VP/VPTX), and LDO_SOC (VDD_SOC_IN, VDD_SOC_CAP). LDO_ARM and LDO_SOC regulators provide power to the ARM core power domain. LDO_SOC provides power to the GPU, Display, and SoC power domains (except always-ON SNVS domain).

NOTE

The name "digital" only refers to the type of load. It is not related to the LDO design or feature set.

The digital LDO regulators can operate in the following modes:

- **Internal Bypass** - The regulation pass device (FET) is switched fully on, passing the external input voltage to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and the FET. Be aware that a period of time (see datasheet) is required to switch from the internal digital bypass mode to the analog regulation mode. Typically it takes less than 100us. Please refer to [PMU](#) for further details on bypass and power gate configuration.
- **Power Gate** - The regulation FET is switched fully off, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage will fall to a level where the residual leakage of the power FET balances with the leakage of the load.
- **Analog regulation mode** - The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

These digital regulators also feature brownout detection, which is helpful to sense when supplies are starting to collapse. Note that the core will be interrupted on a brownout. Please see details in [Miscellaneous Control Register \(PMU_MISC2n\)](#).

For further details of LDO programming and configuration please refer to [Digital Regulator Core Register \(PMU_REG_CORE\)](#).

The power management system is built under assumption that in typical applications the single (and simple) shared power supply will be used for ARM core domain and SoC domain. The combined load gains some efficiency, especially in low power modes and saves BoM significantly.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal LDO. In "full speed" modes LDO bypass is considered in both domains. The dynamic voltage scaling to low load workpoints for ARM domain is implemented by programming associated LDO.

10.4.1.1.2 Analog LDO regulators

There are two analog LDO regulators used for general system purposes:

- LDO_1P1 - The LDO_1P1 (VDD_HIGH_IN, NVCC_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24MHz oscillator.
- LDO_2P5 - The LDO_2P5 (VDD_HIGH_IN, VDD_HIGH_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 40Ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, special I/Os (LVDS I/O,DDR I/O), and other analog and mix signal components integrated into the SoC.

10.4.1.1.3 USB LDO

The USB_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS_IN supply and generates the SNVS_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH_IN is present, then the SNVS_IN supply is internally shorted to the VDDHIGH_IN supply to allow coin cell recharging if necessary.

10.4.1.2 GPC - General Power Controller

The GPC block provides hardware assistance to Dynamic Voltage Frequency Scaling (DVFS) and power gating, and includes the sub-blocks listed here.

- DVFS load tracking block - This block allows hardware tracking on the core load and generates an interrupt when a frequency change is requested. It does not generate any request for voltage and/or frequency changes made by a hardware signal. The frequency/voltage changing process requires interaction with the CCM block, as well as either the integrated PMU modules or the external programmable regulator. This process should be completed by either the CPU interrupt routine or a DMA transaction.
- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
 - Provides the user with the ability to switch off power to a target subsystem.
 - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
 - Provides programmable registers that adjust the timing of the power control signals.
 - Controls the CPU power domain and the GPU, Display, PCIe PHY, and Mega power domain.
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
 - Supports up to 128 interrupts
 - Provides an option to mask/unmask each interrupt
 - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR, WARM, and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

Figure below shows the power domain interface in the system

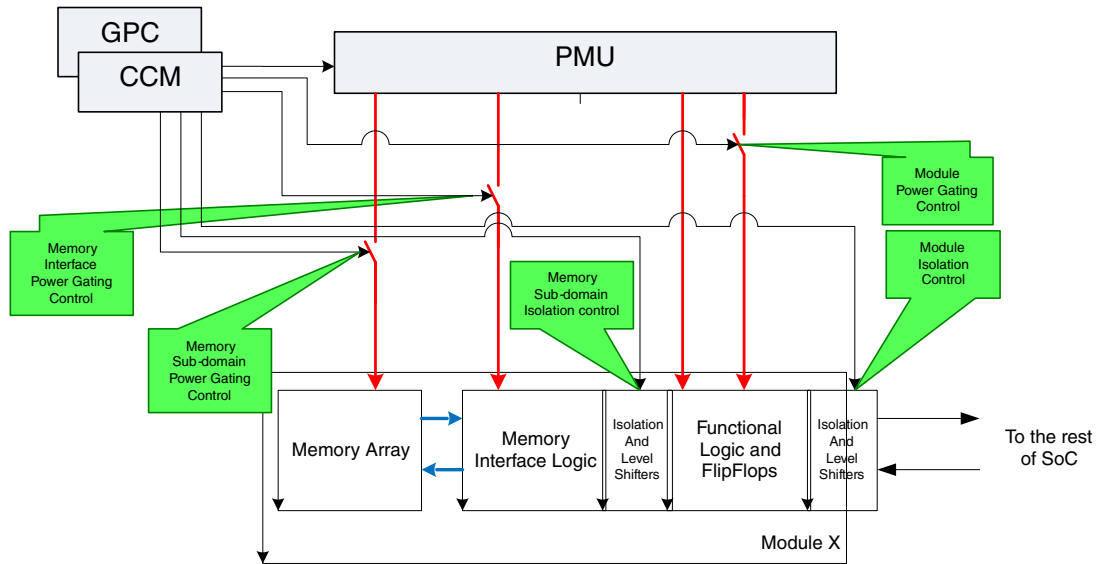

Figure 10-7. Power domain interface in system

10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for memory arrays and interface logic). This domain can be supplied either from an integrated power supply or from an external controllable regulator, preferably high efficiency DCDC converter.
- ARM Memory array - Memory arrays are connected to a separate and dedicated power domain (separated from the Main logic and ARM domain). In normal operation mode (functional, non-DVFS mode), the memory arrays domain voltage level should be kept equal to (same as) the rest of the core logic domains (Main, ARM). Please refer to the Datasheet for further information about voltage level difference between domains allowed in different power modes.
- Display domain - The DISPLAY domain contains GIS, CSI, PXP, LCDIF, PCIe, DCIC, LDB and VADC. It is supplied by internal regulator.
- MEGA domain - The MEGA Domain domain contains MMDC, OCRAM, OCRAM_L2, AXI Monitor, QSPI, EIM, ENET, SAI, MLB, USBOH2, uSDHC, BCH, AUDMUX, SDMA, SSI, eCSPI1-4, UART1, SPDIF, ASRC, ESAI and CAAM. It is supplied by internal regulator.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply.

- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC including CM, SRC, GPC, M4, OCRM_S, ROMCP, eCSPI5, FlexCAN, I2C, UART2-6, KPP, PWM, WDOG, GPIO, GPT, EPIT, CSU, IOMUX, SJC. It is supplied by an internal regulator.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- Cortex-A9 Core Platform - DVFS and power gating.
- ARM Cortex-A9 memories - Power gating only.
- GPU - Power gating only.
- Display - Power gating only.
- MEGA - Power gating only.
- PCIE_PHY - Power gating only.

See table below for details of the system power domains layout and dependencies.

10.4.1.4.2 Domain Memory and domain logic state retention in case of Power Gating

The following is the list of relevant memories and logic domains with the description of their state-retention support:

- Cortex-A9 Core Platform is sub-divided into three sub-domains listed below:
- Cortex-A9 Core Platform logic: The software state retention for all logic is implemented in this domain. That means that the content of relevant registers should be stored in some memory retaining its state (L2 cache for example) while the logic domain is power-gated. Details on how to implement the software retention can be found in the Cortex-A9 Core Platform TRM.
- Cortex-A9 Core L1 memories - No retention. The L1 memories have a dedicated supply on the package (VDD_CACHE_CAP) which should be connected to the Cortex-A9 Core Platform supply. The L1 cache should be flushed prior to power gating in order to allow powering up of the CPU at the same state as before power gating.
- Cortex-A9 Core L2 memories - hardware state-retention since its supplies are driven by the SoC supplies. When Cortex-A9 core is power gated, L2 Cache can be either leaved on with its content retained or power gated together with the core.

- MEGA: This module can be powered gated (together) independently of Cortex-A9 power gating. MEGA is not allowed power down when Cortex-A9 is on. MEGA will be powered on automatically together with Cortex-A9.
- GPU, DISPLAY: These modules can be power gated (together) independently of Cortex-A9 power gating, because it resides on a separate power domain.
- ANALOG PHY IPs - PCIe - hardware state-retention since its supplies are driven by non-gated supplies.
- SoC - hardware state-retention in Standby mode.
- SNVS_LP - hardware state-retention even when SoC supplies are removed.

10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

10.4.1.4.3.1 Cortex-A9 Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
 - Configure the GPC/PGC PGC_CPU_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
 - Configure the GPC/PGC PGC_CPU_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
 - Configure the GPC PGC PGC_CPU_CTRL PCR bit to allow the power down of the platform
 - Cortex-A9 Core Platform should execute a "WFI" instruction.

Figure 10-8. Cortex-A9 Core Platform isolation and power on switch flow

10.4.1.4.3.2 GPU/Display/MEGA

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the GPU, Display, and MEGA clocks.
2. Configure the GPC/PGC Registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the GPU, Display and MEGA logic from the rest of the SoC logic:

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC_CNTR to power down GPU/Display/MEGA

Figure 10-9. GPU / Display / MEGA isolation and power on switch flow

10.4.1.4.3.3 SoC

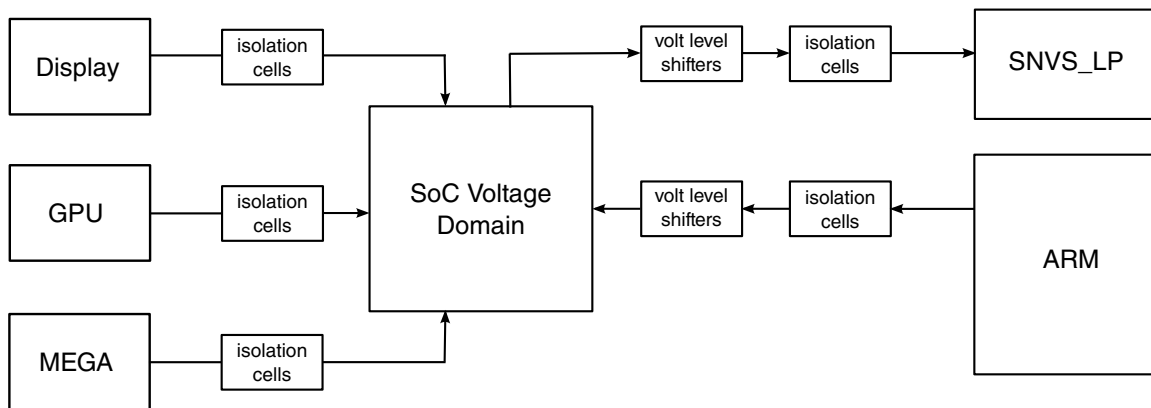

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM_CCR[COSC_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS_LP is powered through an "always on" supply, configuring the SNVS_LP DP_EN to "1" allows changing the PMIC_ON_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- Cortex-A9 Core Platform and MEGA - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the Cortex-A9 Core Platform executes the "WFI" instruction.
- GPU and Display - Isolation needs to be enabled before power-down. This should be taken care through software configuration of the PGC.
- SNVS_LP - Different from the 2 cases above the SNVS_LP isolation isolates the signals coming from the SoC to the SNVS_LP. This is required for saving the contents of the SNVS_LP. (such as the real-time clock) The isolation is activated in 2 ways:
 - Automatically through the power-fail detector in the PMU
 - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

Figure 10-10. Isolation cells and Voltage level shifters placing

10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- ARM - Cortex-A9 Core Platform including L1 and L2 cache - Scalable voltage in both dynamic and static scenarios
- SoC and PCIe LDO Domains - Scalable voltage only in static scenarios
- ANALOG components including PCIe, LVDS and PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS_LP - Fixed voltage

10.4.1.6 Voltage domain management

10.4.1.6.1 Dynamic

10.4.1.6.1.1 DVFS

Dynamic Voltage and Frequency Scaling (DVFS) is a well-known technique to reduce power consumption in mobile devices. In order to improve power saving efficiency, DVFS is applied on the ARM core voltage domain.

In this scenario the Dynamic Voltage and Frequency Scaling (DVFS) block is used. More details can be found in [DVFS-CORE \(DVFS\)](#). The DVFS block can monitor separately the IDLE indication of each of the Cortex-A9 Cores. The DVFS performs the following:

- Simple, non-overlapping averaging providing a level-based average index of the tracked CPU load
- Sums the CPU load and the load detected from additional load indicators weighted according to software configurations
- Calculates an exponential moving average of the tracked load
- Provides up, down and "panic" threshold comparators and counters for generating interrupts to the Cortex-A9 Core Platform
- Frequency pattern generator is able to manage the frequency update requests periodically

The DVFS interrupts are then forwarded to the Cortex-A9 Core Platform. The Cortex-A9 Core Platform reacts according to the DVFS interrupt types. The following are 2 examples for handling different DVFS interrupt types:

- Upper threshold is reached, meaning that the Core is heavily loaded and the core frequency needs to be increased according to the following flow:
 - Configure PMU to raise the core voltage
 - Wait until the voltage is stable
 - Configure CCM to raise the frequency.
- Lower threshold is reached, meaning that the Core is "IDLE" most of the time and the core frequency can be decreased according to the following flow:
 - Configure CCM to reduce the frequency.
 - Configure PMU to lower the core voltage.

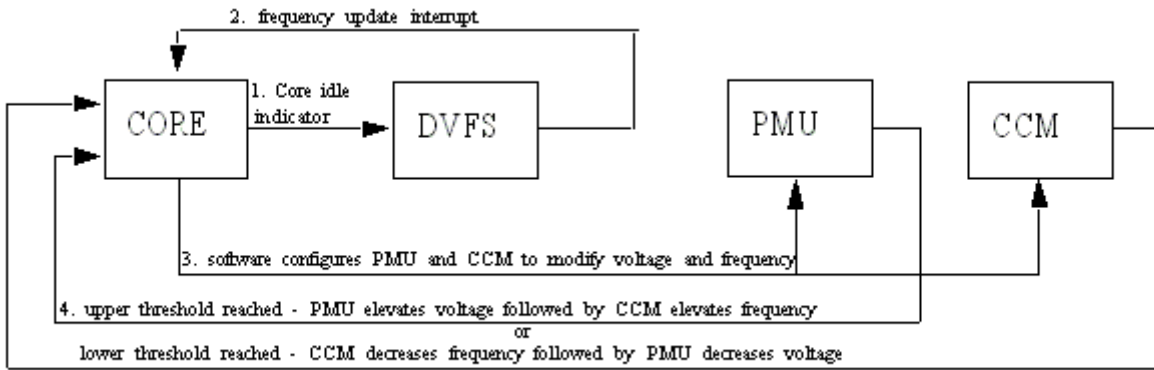

Figure 10-11. High Level DVFS working flow

NOTE

PMU can not be used to change the voltage in case the LDO is bypassed.

10.4.1.6.1.2 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and PCIE LDOs voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

10.4.1.6.2 Static

10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM_CCR), CCM Low Power Control Register (CCM_CLPCR) and PMU Miscellaneous Register 0 (PMU_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM_CCR[RBC_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM_CCR[REG_BYP_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- Cortex-A9 Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

10.4.1.6.2 ANALOG PHYs IPs -

The PCIe analog PHYs can also be configured to consume less power when the are in a non-active state. Details on how to put the IPs in low power mode can be found in each of the IP documentation. Further reduction can be achieved by settings the ENABLE_WEAK_LINREG in the PMU PMU_REG_2P5 register.

10.4.1.6.3 Voltage domain dependencies

When applying voltage changes for power saving the following voltage domain limitations should be taken into account:

- In dynamic scenarios the SOC and PCIE voltage supplies should not differ
- In dynamic scenario's the ARM supply should not be higher than the SoC supply by more the 50mV.

The above limitations are also mentioned in datasheet.

10.4.1.6.4 IO voltage

10.4.1.7 System domains layout

The following table describes the different power modes.

Table 10-1. Power Modes

	RUN	System IDLE	Low Power IDLE	SUSPEND (STOP)
CCM LPM Mode	RUN	WAIT	WAIT	STOP
ARM Core	ON	Low-Freq Voltage	Power Down	Power Down
L1 Cache	ON	ON	Power Down	Power Down
L2 Cache	ON	ON	ON	Power Down
SOC	Nominal Voltage	Nominal Voltage	Nominal Voltage	Standby Voltage
MEGA	ON (Run)	ON (System IDLE)	ON / Power Down (Low Power IDLE)	ON / Power Down (SUSPEND)

Table continues on the next page...

Table 10-1. Power Modes (continued)

	RUN	System IDLE	Low Power IDLE	SUSPEND (STOP)
GPU	ON / Power Down	Power Down	Power Down	Power Down
DISPLAY / PCIE	ON / Power Down	Power Down	Power Down	Power Down
AUDIO / Memory / ENET / USB / MLB	ON	ON	ON / Power Down	ON / Power Down
M4	ON / Clock Gated	ON / Clock Gated	ON / Clock Gated	Always Clock Gated
PLL	ON as needed	ON as needed	Power Down	Power Down
XTALOSC	ON	ON	OFF	OFF
RC OSC	OFF	OFF	ON	OFF
DRAM	ON	Self-Refresh	Self-Refresh	Self-Refresh
DRAM IO Low Power	No	No	Yes	Yes
LDO_ARM	ON	ON	Power Gate	Power Gate
LDO_SOC	ON	ON	Digital Bypass	Digital Bypass
LDO_2P5	ON	ON	OFF	OFF
LDO_1P1	ON	ON	OFF	OFF
WEAK_2P5	OFF	OFF	ON	OFF
WEAK_1P1	OFF	OFF	ON	OFF
Bandgap	ON	ON	OFF	OFF
Low Power Bandgap	OFF	ON	ON	OFF
MMDC clock	400MHz	24MHz	OFF	OFF
AHB clock	133MHz	24MHz	3MHz	OFF
IPG clock	66MHz	12MHz	1.5MHz	OFF
PER clock	66/24MHz	24MHz	1MHz	OFF
Module clocks	On as needed	On as needed	On as needed	OFF
GPIO wakeup	Yes	Yes	Yes	Yes
RTC wakeup	Yes	Yes	Yes	Yes
USB remote wakeup	Yes	Yes	Yes (depends if off)	Yes (depends if off, need weak2p5 for HSIC)
Other wakeup source	Yes	Yes	Yes (depends if off)	No

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU_MISC0[STOP_MODE_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop_mode signal. Blocks not described in the section below are unaffected by stop_mode.

If the stop_mode_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop_mode_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

Table 10-2. STOP mode configuration

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
reg_core	bypassed if not power gated.	bypassed if not power gated
reg_pu	bypassed if not power gated.	bypassed if not power gated.
reg_soc	bypassed	bypassed
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration
LVDS clock I/O CLK1	off	off

10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM A9) for preserving memory contents and device state in low-power modes
- Dynamic Voltage and Frequency Scaling (DVFS) support for the ARM A9 processor cluster
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

Table 10-3. Power saving design/architecture and power saving techniques

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
Cortex-A9 Core Platform DVFS	√		
Cortex-A9 Core Platform SRPG (Software)		√	
Cortex-A9 Core Platform Power Gating		√	
Cortex-M4 Asymmetric multicore	√	√	√
GPU Power Gating	√ ¹	√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (SW)			√
Architecture: L2 cache, Video / Audio / Graphics acceleration	√		
Architecture: PCIe, LVDS, USB integration			√
Low Power DDR: LPDDR2, LV-DDR3			√

1. Applicable to use cases where GPU operation is not required.

10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain and the GPU domain, as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

10.4.2.3 Peripheral Power management

10.4.2.3.1 Main memory power management

Main system memory, DDR3, and LPDDR2 are some of the most power-hungry system components, but the SoC provides several options to manage DDR power.

Automated power saving modes are supported by the MMDC hardware. This feature allows the DDR memory to automatically enter self-refresh mode when there are no DDR accesses for a configurable time. The default setting is 1024 clock cycles which can be optimized based on the customer use case and application.

See [Power Saving and Clock Frequency Change modes](#) for further details on MMDC power saving features and programmability options.

Software may support DDR frequency scaling. Automated frequency changing procedure is supported by MMDC and CCM modules.

NOTE

DDR frequency changes cost extra time and power. Slowing requestors while keeping DDR at full speed may increase total system power. Software may also implement Cooperative Dynamic Frequency Scaling in order to keep the system balanced, (that is, keep the system in balance when DDR throughput is equal or slightly higher than total amount of requests generated by all requestors).

Reducing the DDR frequency while in DLL-ON mode may be not efficient because:

- Reduction in DDR frequency will cause bus duty cycle to increase and thus reduces chance of automatic MMDC power saving (place memory into SR).
- Total amount of read/write operation does not change (power is per-operation).
- The termination is active longer, though, lowering frequency below 396 MHz may enable lowering drive strengths and termination.

When possible at lower performance use cases, software may switch DDR3 to DLL-off mode. This allows it to greatly reduce DDR3 frequency and thus disable or reduce termination and drive strength, which significantly reduces the power consumption of the DDR3 interface.

A good strategy for many types of workloads is to combine most activity in bursts (natively possible, for example, for typical multimedia applications, communication, etc.) and run this segment at maximal speed, then switch to DLL-OFF mode to support background activity (communication, display refresh, housekeeping).

The DRAM Interface power dissipation depends on many variables, however, proper termination and drive strength is key for power and thermal performance. Memory and controllers provide a host of programmable options for the drive strength of the output buffers and for the on-die termination impedance.

The ideal settings for drive strength and ODT also depend on the clock frequency to ensure that inter-symbol interference (ISI) effects are not introduced.

DDR PHY power is proportional to the amount and type of bus activity.

In cases where the DDR is placed into self-refresh, software can configure DDR I/O to be floated or lowered to the minimum drive allowed by JEDEC.

Modifying the DDR drive strength must be done by code that is executing from a memory region other than DDR (for example, IRAM). No access to DDR (including page table walks, cache misses, alternate bus master accesses, etc.) is allowed while the DDR I/O pads are being re-configured.

10.4.2.3.2 Video-Graphics system power management

10.4.2.3.3 IO power reduction

SW should configure IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)
- Set DDR type IO to CMOS mode if possible, specifically RGMII segment
- Disable all unused LVDS pads (ANALOG, LDB)

10.4.3 Examples of External Power Supply Interfacing in the i.MX based systems

This section presents the examples of external power supply interfacing to the chip.

The scenario based on integrated PMU system is presented below. This scenario minimizes BoM and board design complexity.

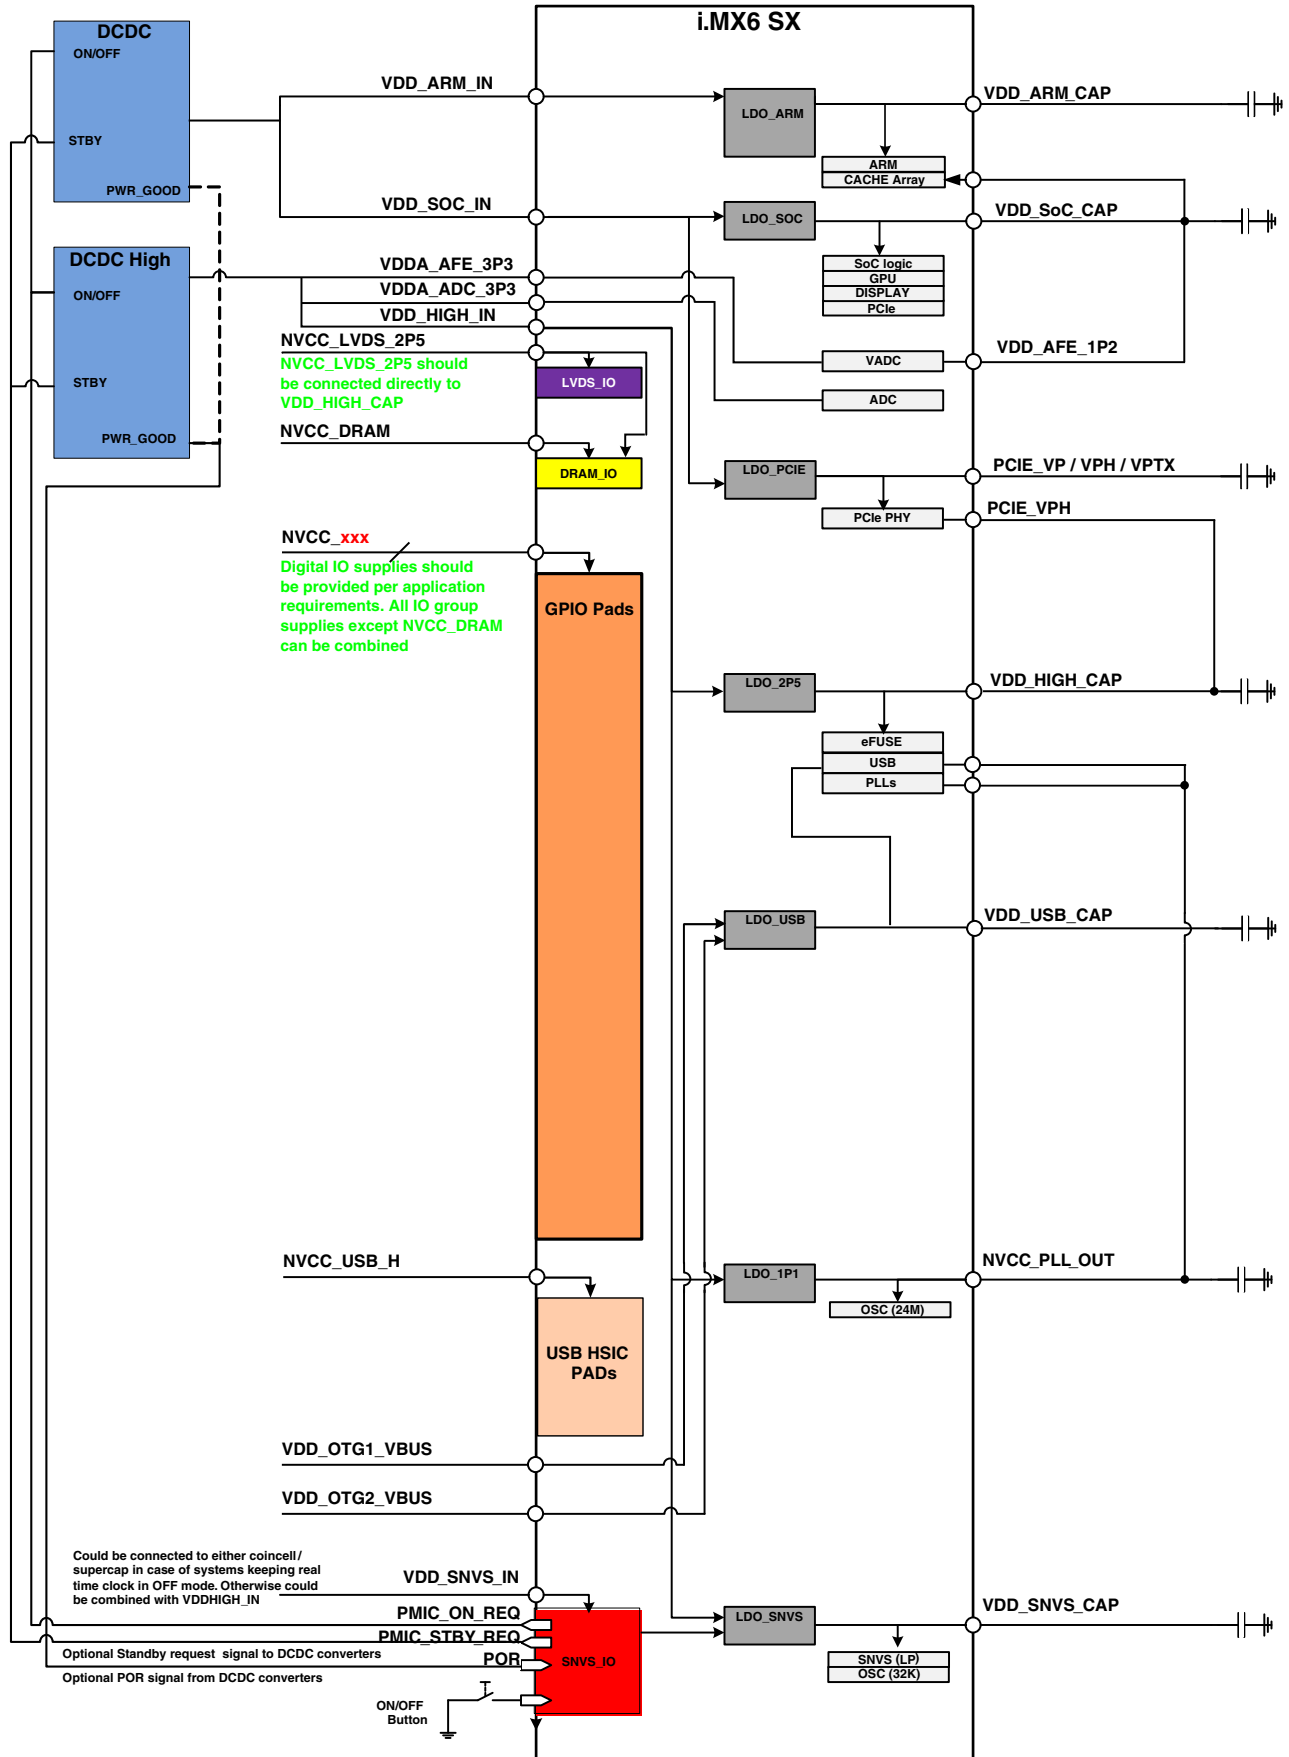

Figure 10-12. Supplying i.MX 6SoloX power using integrated PMU
i.MX 6SoloX Applications Processor Reference Manual, Rev. 0, 2/2015

10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a `pmic_en_b` and `set_pwr_off_irq` signal. PMIC logic also supports the SNVS_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC Mode uses `pmic_en_b` to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- **Debounce:** The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the `set_pwr_off_irq` interrupt. While in the ON state and the button is pressed longer than the debounce time the `set_pwr_off_irq` is generated.
- **Off to On Time:** The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. Once the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- **Max Timeout:** The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the `pmic_en_b` is generated by the state of the state machine.

Figure 10-13. Dumb PMIC Mode State Machine

The Smart PMIC mode is meant to connect to another PMIC. The `pmic_en_b` signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the `set_pwr_off_irq`.

Chapter 11

System Security

11.1 Overview

Security is a common requirement for platforms built using the i.MX 6SoloX, although the specific needs vary greatly depending on the platform and market. The type and cost of assets to be protected on a portable consumer device are very different from those to be protected on automotive or industrial platforms, and the same applies to the kind of attacks and level of resources threatening those assets. The platform designer must select an appropriate set of counter measures to meet the relevant platform security needs.

For the platform designer to meet the requirements for each market, the i.MX 6SoloX incorporates a range of security features which can be used individually or in concert to underpin the platform security architecture. Most of the i.MX 6SoloX security features provide protection against particular kinds of attack and can be configured at various levels according to the required degree of protection. These features are designed to work together and can be integrated with appropriate software to create defensive layers. In addition to protection features, the i.MX 6SoloX includes a general purpose accelerator to enhance the performance of selected industry standard cryptographic algorithms.

The following is an introduction to the i.MX 6SoloX security components.

- High Assurance Boot (HAB) feature in the System Boot up to RSA-4096 signature verification
- Secure Non Volatile Storage (SNVS)
- TrustZone (TZ) Architecture in the ARM Cortex A7 Platform, TrustZone aware Interrupt Controller (GIC) and TrustZone Watchdog Timer (WDOG-2)
- TrustZone Address Space Controller (TZC-380) - providing security address region control functions on DDR memory space.
- On-chip RAM (OCRAM) with TrustZone protection using OCRAM controller.
- 32 Kbyte of on-chip Secure RAM
- On chip OTP (OCOTP) with on-chip electrical fuses
- Central Security Unit (CSU)

- Resource Domain Controller (RDC)
- Secure JTAG Controller (SJC)
- Locked mode in the Smart Direct Memory Access (SDMA) controller
- DryICE (real-time monitors for frequency, temperature and voltage)
- 10 tamper pins with 5 active tamper detection sources support
- Hardware Cryptographic Accelerators
 - Symmetric: AES-128, AES-192, AES-256, DES, 3DES, and ARC4
 - Hash Message Digest and HMAC: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, and MD-5
 - Public Key RSA (up to 4096 bit) and ECC (up to 1023 bit)
- DPA protection for 3DES engine
- True and Pseudo Random Number Generator

11.2 Central Security Unit (CSU)

11.2.1 CSU Overview

The CSU manages the system security policy for peripheral access on the SoC. The CSU allows trusted code to set individual security access privileges on each of the peripherals, using one of eight security access privilege levels. Also, according to programmed policy, the CSU may assign bus master security privileges during bus transactions.

11.2.2 CSU Features

The Central Security Unit (CSU) sets access control policies between bus masters and bus slaves, allowing peripherals to be separated into distinct security domains. This protects against unauthorized access to data e.g. when software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring DMA bus master privileges in the CSU consistent with software privileges defends against such attempted accesses.

CSU has the following security related features:

- Peripheral access policy - Appropriate bus master privileges and identity are required to access each peripheral.
- Masters privilege policy - CSU overrides bus master privilege signals, i.e. user/supervisor secure/non-secure, according to access control policy.

11.2.3 CSU Functional Description

The CSU enables secure software to set bus privilege security policy within the platform.

Security policies may be set, and optionally locked in the CSU registers. These privilege values may originate in the command sequence file (CSF) which is processed by the High Assurance Boot (HAB) itself or by an HAB authenticated image which executes after the initial boot ROM phase.

11.2.3.1 CSU Peripheral Access Policy

According to its programmed policy, the CSU determines the bus master privileges and the masters that are allowed to access each of the slave peripherals.

There are four security modes of operation (i.e. bus privileges) in the system distinguished by security (TrustZone/non-TrustZone) and privilege (Supervisor/User) setting of the module. Below is the list of these security modes from the highest security level to the lowest:

- TrustZone (Secure) Privilege (Supervisor) Mode - Highest Security Level
- TrustZone (Secure) non-Privilege (User) Mode - Medium Security Level
- non-TrustZone (Regular) Privilege (Supervisor) Mode - Medium Security Level
- non-TrustZone (Regular) non-Privilege (User) Mode - Lowest Security Level

This functionality is implemented as follows:

The Configure Slave Level (CSL) Register value for a specified peripheral resource defines the output signal -- `csu_sec_level` for that peripheral. The value of this signal determines by what master privileges a peripheral is accessible. The relationship between the value of the `csu_sec_level` signal and security operation mode is shown in the table below. The CSL registers reside in the CSU module. Details, describing CSL register fields and how they are programmed to control access privileges for specific peripherals, can be found in the Security Reference Manual.

Table 11-1. Permission Access Table

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(0) 000	RD+WR	RD+WR	RD+WR	RD+WR	8'b1111_1111
(1) 001	None	RD+WR	RD+WR	RD+WR	8'b1011_1011
(2) 010	RD	RD	RD+WR	RD+WR	8'b0011_1111
(3) 011	None	RD	RD+WR	RD+WR	8'b0011_1011

Table continues on the next page...

Table 11-1. Permission Access Table (continued)

CSU_SEC_LEVEL[2:0]	Non-Secure User Mode	Non-Secure Spvr Mode	Secure (TZ) User Mode	Secure (TZ) Spvr Mode	CSL register value
(4) 100	None	None	RD+WR	RD+WR	8'b0011_0011
(5) 101	None	None	None	RD+WR	8'b0010_0010
(6) 110	None	None	RD	RD	8'b0000_0011
(7) 111	None	None	None	None	Any other value

11.3 Secure Non-Volatile Storage (SNVS)

11.3.1 SNVS Overview

SNVS is a hardware device that includes a security state machine and security violation detection circuits that, together with High Assurance Boot software, determine whether the chip is currently in a secure state.

When the security state machine indicates a secure state, the SNVS allows use of special cryptographic keys to decrypt long-term secrets such as public/private keypairs, Digital Rights Management keys and proprietary software. When the SNVS detects a potential security violation, such as a tamper alert, the SNVS sends an interrupt to alert the Operating System of the event. The SNVS also includes a general purpose real-time counter.

The SNVS includes the following features:

- Security State Machine driven by High Assurance Boot software and tamper detection circuits
- Master Key Control that protects the integrity and secrecy of the Master Key (OTPMK) stored in fuses
- Tamper detection circuits that detect JTAG events, power glitches, Master Key ECC check failure, and software-reported and hardware-reported security violations
- 256-bit Zeroizable Master Key that can be automatically erased in the event of a security breach
- Tamper-protected Secure Realtime Counter that continues running when the chip is powered off
- Non-volatile Monotonic Counter used to protect against “roll-back” attacks
- Non-volatile General Purpose Register can be used to store a 32-bit value across power cycles
- Non-Secure Real Time Counter with programmable alarm and periodic interrupt

11.3.2 Tamper Detection

Tamper Detection is a special mechanism provided through a chip pin to signal when the device encounters unauthorized opening or tampering.

When not in use, the Tamper Detection signal is pulled-down internally. In case of use, it should be connected to a Tamper Detection contact in a target system (Normally closed, pulled-up to the VDD_SNVS_IN).

An always-ON power supply (coin-cell battery) should be present in the system. If the tamper detection feature is enabled by software then opening of the tamper contact:

- Switches system power ON with a Tamper Detection alarm interrupt asserted (for software reaction)
- Activate security related hardware (e.g. automatic and immediate erasure of the Zeroizable Master Key and deny access and erase secure memory contents)

11.4 High Assurance Boot (HAB)

HAB, which is the high assurance boot feature in the system boot ROM, detects and prevents execution of unauthorized software (malware) during the boot sequence.

When unauthorized software is permitted to gain control of the boot sequence, it can be exploited for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks; or repurposing the platform.

Unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from USB connections or removable devices.

HAB protects against unauthorized software by:

- Using digital signatures to recognize authentic software. This allows the user to boot the device to a known initial state, running software signed by the device manufacturer.

11.5 RDC Overview

The Resource Domain Controller (RDC) provides robust support for the isolation of destination memory mapped locations such as peripherals and memory to a single core, a bus master, or set of cores and bus masters.

Many of today's processors have multiple cores for increased performance and flexibility. In some cases, the cores serve different functions (e.g. user level applications versus real time machine control) and in such cases the software for each core may be developed by different providers.

Without careful collaboration between the two operating systems inadvertent malfunction or degradation in performance may result. Similarly, malware present on one core should not be able to affect the operating conditions of the other domain. The RDC provides isolation to allow for more robust and secure operation on the chip. Details can be found in the RDC chapter.

11.6 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This allows program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution. System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary scan) testing.

SJC provides the following security levels:

- JTAG Disabled-JTAG use is permanently blocked.
- No-Debug-All security sensitive JTAG features are permanently blocked.
- Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- JTAG Enabled-JTAG use is unrestricted.

Security levels are selected via e-fuse configuration.

Chapter 12

ARM Cortex A9 MPCore Platform (ARM)

12.1 Overview

The Cortex-A9 Core Platform consists of an ARM[®]Cortex[®]-A9 MPCore processor, which includes a Neon co-processor, a private timer and watch-dog, and 32 KB + 32 KB L1 data and instruction caches per core.

The Cortex-A9 Core Platform consists of a unified 256 KB L2 cache, SCU (Snoop Control Unit), and Generic Interrupt Controller (GIC). In addition, the Cortex-A9 Core Platform includes various components composing the ARM CoreSight debug/Trace system, including PTM and a x CTI, 2xCTM, and 16KB ETB.

The Cortex-A9 processor utilizes two AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

The core supports debug through real-time trace via PTM, and static debug via JTAG.

The core platform supports static debug through the debug logic to SOC. This includes the capability of real time trace via ARM's CoreSight PTM, ETB and TPIU modules. The CTI and CTM modules allow cross-triggering of internal and external trigger sources.

12.2 External Signals

The following table describes the external signals of ARM:

Table 12-1. ARM_CORTEX_A9 External Signals

Signal	Description	Pad	Mode	Direction
ARM_A9_EVENTI	Input event signal	LCD1_RESET	ALT3	Input
ARM_A9_EVENTO	Output event signal	LCD1_DATA18	ALT3	Output
ARM_A9_TRACE00	Trace signal	LCD1_DATA00	ALT3	IO

Table continues on the next page...

**Table 12-1. ARM_CORTEX_A9 External Signals
(continued)**

Signal	Description	Pad	Mode	Direction
ARM_A9_TRACE01	Trace signal	LCD1_DATA01	ALT3	IO
ARM_A9_TRACE02	Trace signal	LCD1_DATA02	ALT3	IO
ARM_A9_TRACE03	Trace signal	LCD1_DATA03	ALT3	IO
ARM_A9_TRACE04	Trace signal	LCD1_DATA04	ALT3	IO
ARM_A9_TRACE05	Trace signal	LCD1_DATA05	ALT3	IO
ARM_A9_TRACE06	Trace signal	LCD1_DATA06	ALT3	IO
ARM_A9_TRACE07	Trace signal	LCD1_DATA07	ALT3	IO
ARM_A9_TRACE08	Trace signal	LCD1_DATA08	ALT3	IO
ARM_A9_TRACE09	Trace signal	LCD1_DATA09	ALT3	IO
ARM_A9_TRACE10	Trace signal	LCD1_DATA10	ALT3	IO
ARM_A9_TRACE11	Trace signal	LCD1_DATA11	ALT3	IO
ARM_A9_TRACE12	Trace signal	LCD1_DATA12	ALT3	IO
ARM_A9_TRACE13	Trace signal	LCD1_DATA13	ALT3	IO
ARM_A9_TRACE14	Trace signal	LCD1_DATA14	ALT3	IO
ARM_A9_TRACE15	Trace signal	LCD1_DATA15	ALT3	IO
ARM_A9_TRACE_CLK	Trace clock	LCD1_DATA16	ALT3	IO
ARM_A9_TRACE_CTL	Trace control signal	LCD1_DATA17	ALT3	IO

12.3 Platform configuration

The [Bus](#), [Cortex A9 Core](#), and [L2 Cache](#) configuration options are contained in the following subsections.

Table 12-2. Cortex-A9 revision

Core	MP004-BU-50000-r2p10-0rel0
Neon	AT397-BU-50001- r2p0-00rel0
PL310	PL310-BU-00000-r3p2-00rel0

12.3.1 Platform and SCU configuration

Table 12-3. Cortex-A9 configuration

Option	Selected Value	Comments
MP_MODE	Yes	Multi-Processor mode
POWER_DOMAIN_WRAPPER	No	Wrappers to support power off of individual cores.

Table continues on the next page...

Table 12-3. Cortex-A9 configuration (continued)

Option	Selected Value	Comments
PTM_INTERFACE_PRESENT	Yes	Use PTM as part of Trace/Debug logic.
PARITY	Yes	Using RAM arrays which support parity.
CORE_NUM		Number of cores
INT_NUM	128	Number of interrupts (SPIs) in GIC
ACP_PRESENT	No	Accelerator Coherency Port (ACP)
MASTER_NUM	2	Number of 64-bit AXI output master ports.

12.3.2 Core configuration

Table 12-4. Cortex-A9 Core configuration

Option	Selected Value	Comments
DCACHESIZE	32	L1 Data cache size
ICACHESIZE	32	L1 Instruction cache size
TLBSIZE	128	
JAZELLE_PRESENT	Yes	Providing ARM's Jazelle technology hardware extensions.
FPU_PRESENT	No	The FPU functions are provided by NEON, thus additional FPU cannot be used.
NEON_PRESENT	Yes	Use MPE, NEON Co-Processor and FPU
PRELOAD_ENGINE_PRESENT	No	May only be beneficial in Video processing.

12.3.3 PL310 L2 Cache configuration

Table 12-5. PL310 L2 Cache configuration

Option	Selected Value	Comments
Cache way size	64 KB	(For total of 256 KB L2 size)
Number of cache ways	16	Performance enhancement versus 8 ways
RAM latencies	4 ¹	
Data RAM banking	Yes	Significantly improves cache throughput
Slave port 1 present	Yes	
Master port 1 present	Yes	
Parity logic	Yes	For military / surveillance applications, and side ease the process of identify memory related issues.
Lockdown by master	Yes	Increase L2 optimization
Lockdown by line	Yes	Increase L2 optimization
AXI ID width	5	

Table continues on the next page...

Table 12-5. PL310 L2 Cache configuration (continued)

Option	Selected Value	Comments
Address filtering	No	Help in timing closure, not required for symmetric AXI bus connectivity scheme.
Speculative read	Yes	Performance boost, when used with CortexA9.
Size of L2 cache	256 KB	Size is implied by Cache-Size times cache-ways (i.e. 256 KB)

1. Preliminary estimate, final value TBD.

12.3.4 Endian Modes

The Cortex-A9 Core Platform supports little endian mode only. Big Endian is not supported even though both modes are supported by the Cortex-A9 processor.

12.3.5 Memory Parity error support

The ARM Cortex A9 MPCore™ platform supports Parity Fail signals for several of the RAM arrays.

Parity fail indication is provided by "PARITYFAILn[7:0]" and "PARITYFAILSCU[N:0]" buses for system notification. On parity error event, these signals will be ORed together to provide a single event (interrupt) to the core, in case of any parity fail event.

12.4 Performance and Power

This section will discuss the operational conditions and performance goals for the Cortex-A9 Core Platform.

12.4.1 Low-Power design

The Cortex-A9 Core Platform low-power design is based on these characteristics:

- Symmetric processing and ARM design by using the same clock frequency on core
- Low leakage of LP process
- C4 package

As a result, the proposed power modes and power management scheme is as follows:

- The same voltage level must be used for the logic part of the whole platform.

- Separate voltage for memories array is required to allow DVFS.
- On-chip power switches are not utilized by gating the power of the platform directly from the regulator.

12.4.1.1 SRPG (State Retention Power Gating)

ARM core SRPG is implemented by software save & restore of essential configuration registers prior to the complete power-down of the entire ARM platform.

Save & restore utilizes "Dormant mode" for the primary core (L1 cache flushed, L2 preserved), and power down mode of all other cores, as follows:

Power Down flow¹

- Power down request
- Save cores' essential registers and platform registers to L2/DDR memory by Dormant mode routines.
- Perform L1 cache clean operation on all cores
- Enter WFI state
- Power Gating of all cores' and platform logic

Power Up flow¹

- Power up request to GPC external controller (interrupt)
- Supply power
- Reset
- Restore registers of platform and cores from memory by Dormant mode routines.

12.4.1.2 Dynamic Voltage and Frequency Scaling (DVFS)

The Cortex-A9 Core Platform has been designed, in conjunction with external control logic and software, to support dynamic scaling of voltage and frequency.

12.4.2 Clocks, frequency goals

12.4.2.1 ARM Clock

For ARM clock please see the product data sheet.

1. Dormant mode implementation information, provided by ARM, is preliminary.

12.4.2.2 Bus Clocks

The AXI master ports are designed to run at half the frequency of the Cortex A9 core clock.

The on-platform debug components clock is asynchronous to the ARM core clock.

12.4.2.3 Debug Clocks

The ARM platform contains several debug components.

Their clock frequencies are as follows:

- Trace buffer (ETB) clock - 133 MHz
- Trace port (TPIU) clock - 133 MHz
- AHB clock - 133 MHz

12.5 Core Platform Sub-Blocks details

12.5.1 ARM Cortex A9 MPCore™ Processor

The information presented in this section focuses on design aspects of the ARM Cortex A9 MPCore™ in the AP subsystem.

The ARM Cortex A9 is a high-performance, low-power, synthesisable processor with an L1 cache subsystem that provides full virtual memory capabilities. The Cortex A9 processor implements the ARMv7-A architecture and runs 32-bit ARM instructions, 16-bit and 32-bit Thumb2 instructions, and 8-bit Java™ byte-codes in Jazelle state.

The ARM Cortex A9 MPCore™ processor in the chip consists of:

- Cortex A9 processor in a cluster and a Snoop Control Unit (SCU) that can be used to ensure coherency within the cluster.
- A set of private memory-mapped peripherals, including a global timer and a watchdog and private timer for each Cortex-A9 processor present in the cluster.
- An integrated Interrupt Controller is an implementation of the Generic Interrupt Controller architecture. The integrated Interrupt Controller registers sit beside the timers and watchdog control registers in the private memory region of the Cortex-A9 MPCore.

Individual Cortex-A9 processors in the Cortex-A9 MPCore cluster are symmetrically implemented with hardware configurations as specified in [Platform configuration](#).

12.5.2 Media Processing Engine (MPE - NEON)

The Media Processing Engine (MPE) implements ARM NEON technology, a media and signal processing architecture that adds instructions targeted at audio, video, 3-D graphics, image, and speech processing.

Advanced SIMD instructions are available in both ARM and Thumb states. The MPE also implements a VFPv3-D32 Floating-Point Unit.

The ARM Cortex A9 MPCore™ Platform includes MPE per core.

12.5.3 Generic Interrupt Controller (GIC)

The Cortex-A9 MPCore contains an integrated interrupt controller that shares the same programmer's model as the PL390 (GIC), although there are implementation-specific differences.

12.5.3.1 Interrupt Controller Features

- 128 interrupt sources
- The Cortex-A9 multiprocessor contains the following types of interrupts:
 - Up to 16 Software Generated Interrupts (SGIs)
 - Private Peripheral Interrupt (PPI) - an interrupt generated by a peripheral that is specific to a single Cortex-A9 processor (there are 5 PPIs for each Cortex-A9 processor interface)
 - Shared Peripheral Interrupt (SPI) - an interrupt generated by a peripheral which the Interrupt Controller can route to any or all Cortex-A9 processor interfaces. The Interrupt Controller supports a maximum of 224 SPIs .
 - Lockable Shared Peripheral Interrupts (LSPI) - there are 31 LSPIs, interrupts 32-62. The user can configure and then lock these interrupts against further change using CFGSDISABLE. The LSPIs are present only if the SPIs are present.

For more information, see ARM MPCORE Technical Reference Manual.

12.5.3.2 About the Interrupt Controller

The Interrupt Controller is a single functional unit that is located in a Cortex-A9 multiprocessor design.

The Interrupt Controller is memory-mapped. The Cortex-A9 processors access it by using a private interface through the SCU.

12.5.3.3 Interrupt Controller Clock frequency

The interrupt controller's clock period is 2x multiple of the main clock period.

The watchdogs and timers use the same clock as the interrupt controller.

12.5.3.4 TrustZone support

The Interrupt Controller permits all implemented interrupts to be individually defined as Secure or Non-secure.

The user can program Secure interrupts to use either the IRQ or FIQ interrupt mechanism of a Cortex-A9 processor through the FIQen bit in the ICPICR Register.

Non-secure interrupts are always signalled using the IRQ mechanism of a Cortex-A9 processor.

12.5.4 Instruction and data caches (L1)

The Cortex-A9 processor is configured with a 32 Kbyte Instruction Cache and a 32 Kbyte Data Cache.

12.5.4.1 L1 features

- Four-way set associative cache
- Virtually indexed and physically addressed
- Capable of providing two words per cycle for all requesting sources
- Eight 32-bit words per cache line
- 128 indexes per tag RAM

12.5.5 L2 Cache and controller (PL310)

The platform includes unified (data / instruction) L2 cache unit, based on the cache controller IP by ARM.

The Cortex-A9 processor utilizes 2x AXI-64 master ports connected from the SCU to the Level 2 Cache. The L2 cache also utilizes 2x AXI-64 to access the L3 memory or other SoC peripherals in a symmetric way.

See [Table 12-5](#) for more information.

12.6 Debug and Trace Sub-blocks (CoreSight components)

This section gives a brief overview of the modules that are implemented within the Cortex-A9 Core Platform.

The Cortex-A9 Core Platform debug blocks are part of the overall CoreSight debug system which include the 16KB ETB, 2 x CTM's, 2 x CTI's, ATB replicator, DAP, TPIU and APB address decode.

The CoreSight™ compatible Program Flow Trace Macrocell (PTM) provides control for ARM software tracing and debug. The Cross Trigger Interface (CTI) is included in the Cortex-A9 platform to provide a common programming model for use by the debug tools, control the trigger sources, and interface to the Cross Trigger Matrix (CTM). The debug is controlled via an ARM Debug Access Port (DAP).

For details of the full CoreSight debug subsystem, see the [System Debug](#) chapter.

12.6.1 Debug Access Port (DAP)

The Debug Access Port (DAP) is an implementation of an ARM Debug Interface version 5.1 (ADIV5.1) comprised of a number of components supplied in a single configuration.

All the supplied components fit into the various architectural components for Debug Ports (DPs), which are used to access the DAP from an external debugger and Access Ports (APs), to access on-chip system resources.

The debug port and access ports together are referred to as the DAP. The DAP provides real-time access for the debugger without halting the processor to:

- AMBA system memory and peripheral registers
- All debug configuration registers

The DAP also provides debugger access to JTAG scan chains of system components, (to non-CoreSight compliant processors, for example).

12.6.2 Program Trace Macrocell (PTM)

The PTM unit is a nonintrusive trace macrocell that filters and compresses instruction trace for use in system debugging and system profiling.

The PTM unit has an external interface outside of the processor called the *Advanced Trace Bus* (ATB) interface. The PTM is an evolution of the ETM, designed for the Cortex A9 cores, handling program trace only.

The Cortex A9 PTM provides real time instruction trace for the Cortex A9. It's designed to be used with the CoreSight Design Kit.

Real time tracing is controlled by specifying a set of filtering and triggering resources which include address and data comparators, counters and sequencers.

Two main schemes can be used for connecting PTMs:

1. Single PTM - shared by core and resources.
2. Nx PTMs, where N is numbers of cores in the system.

12.6.2.1 Program Flow Trace (PFT)

The CoreSight Program Flow Trace Macrocell (PTM) is based on the Program Flow Trace (PFT) architecture. The PTM generates information that trace tools use to reconstruct the execution of all or part of a program.

The PFT architecture assumes the trace tools can access a copy of the code being traced. For this reason, the PTM generates trace only at certain points in program execution, called waypoints. This reduces the amount of trace data generated by the PTM compared to the ETM protocol. Waypoints are changes in the program flow or events, such as an exception. The trace tools use waypoints to follow the flow of program execution.

For full reconstruction of the program flow, the PTM traces:

- Indirect branches, with target address and condition code
- Direct branches with only the condition code
- Instruction barrier instructions
- Exceptions, with indication of where the exception occurred
- Changes in processor instruction set state
- Changes in processor security state

- Context-ID changes
- Entry to and return from Debug state when Halting Debug-mode is enabled

You can also configure the PTM to trace:

- Cycle count between traced waypoints
- Global system timestamps
- Target addresses for taken direct branches

PTM components include the following main components:

- Processor Interface to monitor the behavior of the processor.
- Trace Generation to create a real-time trace stream.
- Filtering and Triggering Resources used to affect when trace is generated and to control the capturing of trace by the trace tools.
- Main FIFO (72 bytes) flattens out any bursts in the trace stream, and signals an overflow in the trace when it becomes full, halting trace generation until the FIFO empties.
- ATB interface for PTM output.
- APB interface to access the PTM registers.

12.6.3 Cross Trigger Interface (CTI)

This block controls the Trigger Interface (TI). The CTI combines and maps the trigger requests, and broadcasts them to all other interfaces on the ECT as channel events.

When the CTI receives a channel event, it maps this onto a trigger output. This enables subsystems to cross trigger with each other. The receiving and transmitting of triggers is performed through the TI. Each CTI has 3/5 trigger inputs.

See [System Debug](#) for more information on the CTI.

12.6.4 Embedded Trace Buffer (ETB)

The ETB provides on-chip storage of trace data using 32-bit, 16KB RAM.

The ETB accepts trace data from the Cortex-A9 via an ATB port (passing through a replicator in between). Providing an on-chip buffer alleviates the pin count, bandwidth, and pad design requirements associated with sending trace data to a debugger directly through package pins in near real-time.

Features:

- compiled memory for the trace buffer and can be used as general purpose memory
- AMBA Peripheral Bus programming interface for configuration and memory access

12.6.4.1 AMBA Trace Bus (ATB) Replicator

The ATB Replicator enables two trace sinks (ETB and an off platform port generally connected to a Trace Port Interface Unit-TPIU) to be wired together and receive ATB trace data from the same trace source (PTM).

There are no programmable registers. It takes incoming trace data from a single source (PTM) and replicates it as multiple masters.

Chapter 13

ARM Cortex M4 Platform (CM4)

13.1 Overview

This block details the ARM Cortex-M4 core. The Cortex-M4 implements the ARMv7-ME instruction set architecture (ISA). It provides compatibility with Cortex-M3 and adds significant new capabilities with DSP and SIMD extensions. The basic multiply-accumulate instructions support operations up to $32 \times 32 + 64$. Cortex-M4 also includes a single-precision floating-point unit (FPU), which includes an extension register file of thirty-two 32-bit floating-point data registers. Cortex-M4 complex includes the FPU and two 32-bit system bus interfaces. The Cortex-M4 implementation includes two tightly-coupled local memories and two cache memories connected to these bus interfaces although the device implementation connects to the 64-bit system bus interconnect and supports a 32-byte cache line size.

- L1 2-way set-associative 16kB Instruction cache with 32B line size length
- L1 2-way set-associative 16kB Data cache with 32B line size length

The ARM Cortex-M4 core provides additional general processing capability to the SoC with lower power and fast interrupt response time. The typical use cases for the Cortex-M4 include automotive applications and systems interfaced with CAN that must be able to meet the CAN wakeup requirement, which would otherwise be difficult for the Cortex-A9 to do while running a complex OS.

13.1.1 Cortex-M4 Block Diagram

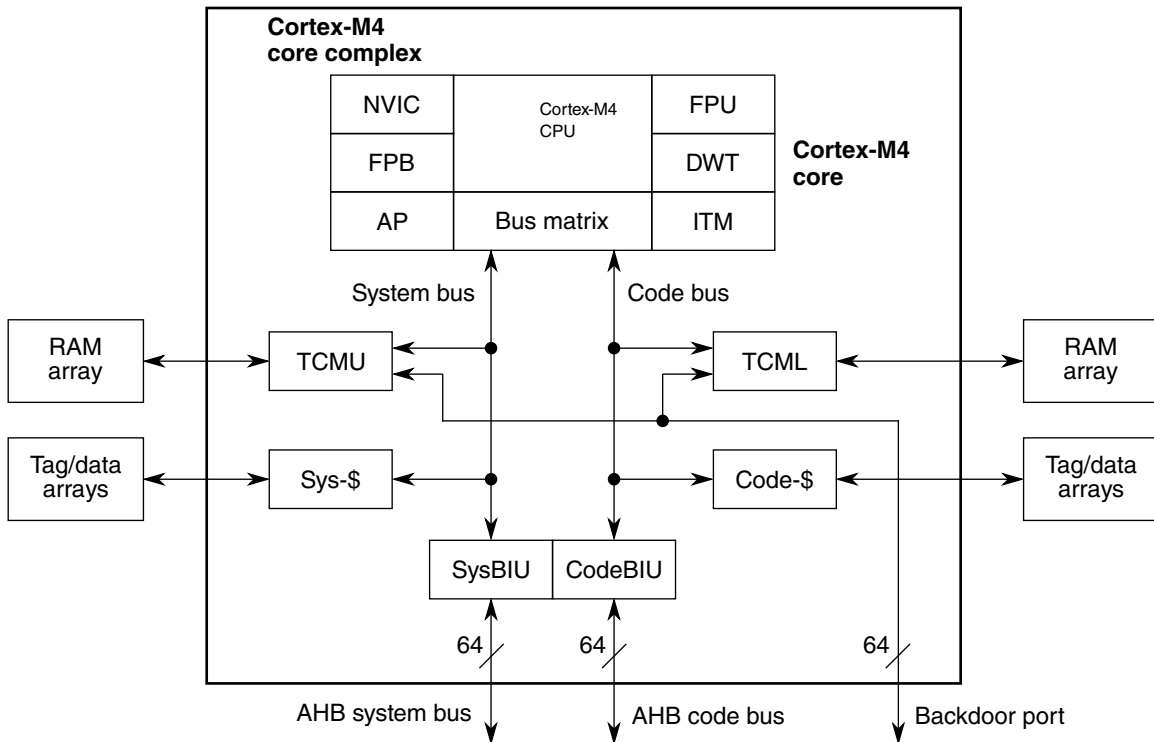

Figure 13-1. Cortex-M4 Block Diagram

Cortex-M4 core features a single issue, three stage pipeline microarchitecture. A high-level spatial pipeline block diagram of the CPU is shown below. The stages of the pipeline include:

- Fe - Instruction fetch stage where data is returned from instruction memory
- De - Instruction decode stage, generation of Load/Store Unit (LSU) address using forwarded register ports and immediate offset of LR register branch forwarding
- Ex - Instruction execute stage, single pipeline with multi-cycle stalls, LSU address/data pipelining to AHB interface, multiply/divide and ALU with branch result

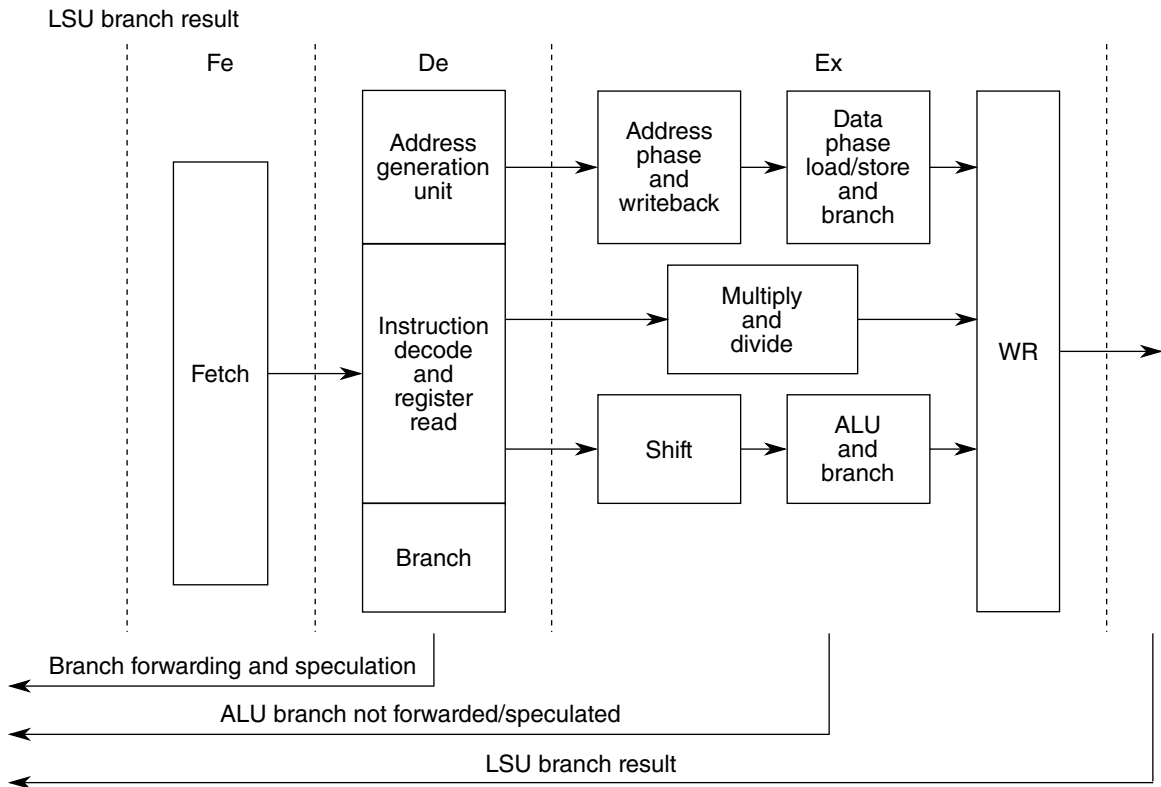

Figure 13-2. Cortex-M4 Pipeline Block Diagram

13.1.2 Integration Layer Block Diagram

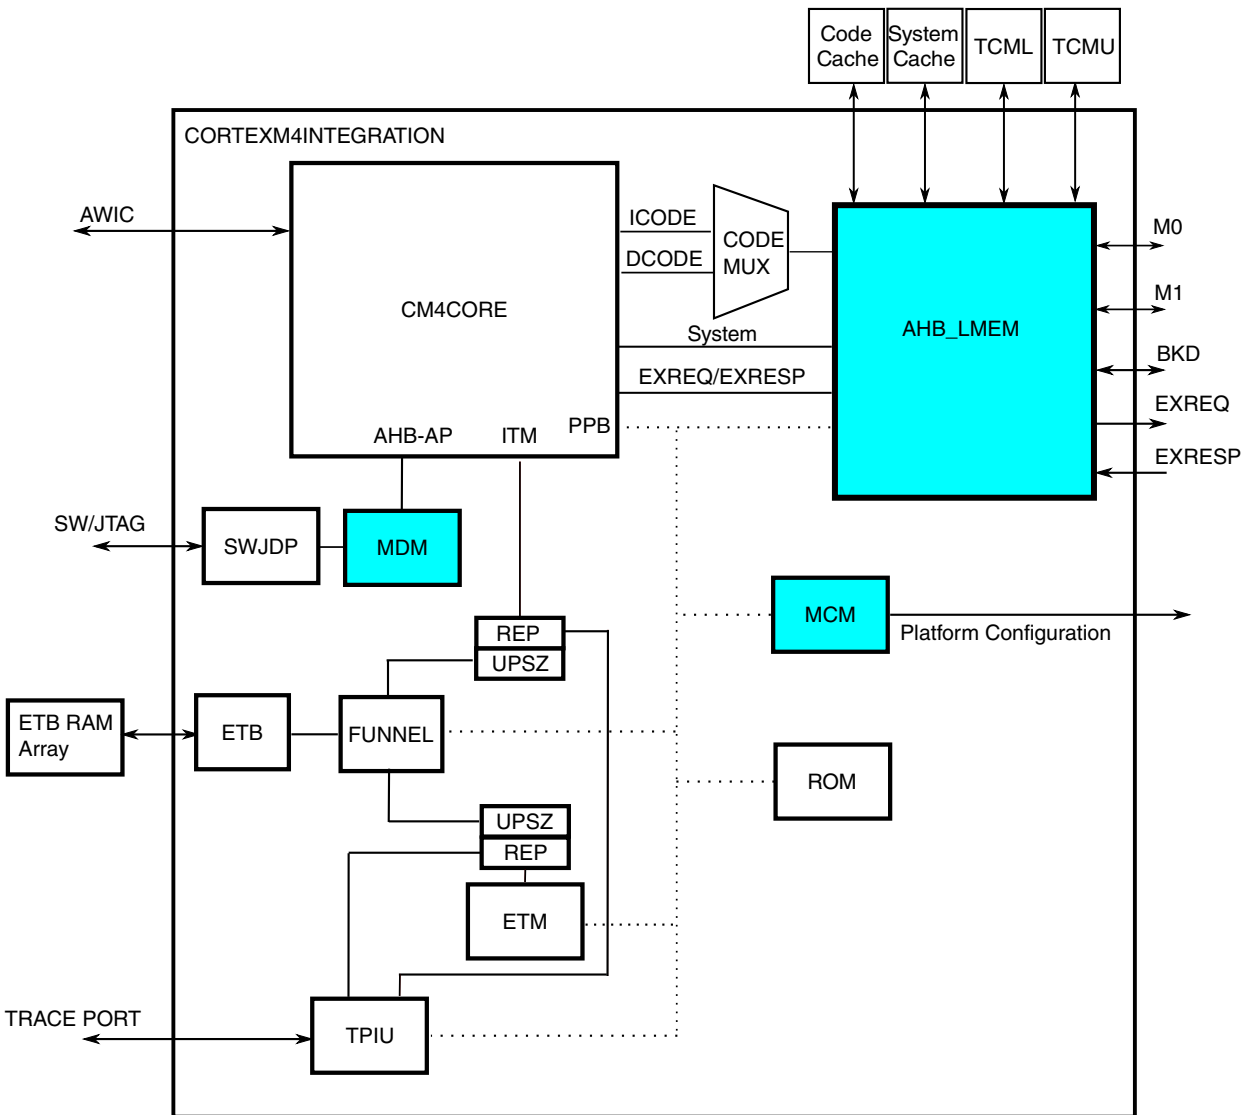

Figure 13-3. Cortex M4 Integration Layer Block Diagram

The Cortex M4 Integration Layer includes the following blocks:

- CM4CORE - Cortex M4 Core
- CODE MUX - Muxing logic for I- and D-Code Busses
- AHB_LMEM - AHB bus Local Memory (Include TCMC and Cache Controller)
- SWJDP - Single-Wire/JTAG Debug Port
- MDM - Miscellaneous Debug Module
- ETB - Embedded Trace Buffer
- TPIU - Trace Port Interface Unit
- ETM - Embedded Trace Macrocell
- FUNNEL - Coresight Funnel

- UPSZ - ATB Upsizer
- REP - ATB Replicator
- MCM - Miscellaneous Control Module
- ROM - ROM Table

13.2 Cortex-M4 Platform Features

13.2.1 Core Module Features

The following are the Cortex-M4 core module features:

- Cortex-M4 Core
 - 3-stage pipelined processor supporting ARM v7-M ISA with DSP extensions
 - Single precision FPU supporting the variant of the ARMv7-M Floating-Point Extension (FPv4-SP)
 - MPU - Memory Protection Unit supporting up to 8 regions
 - Modified Harvard connections to AHB_LMEM and the crossbar switch
 - NVIC - Nested Vectored Interrupt Controller with 128 interrupt connections and 16 levels
 - SWJ-DP - Serial-Wire JTAG Debug Port
 - TPIU - Trace Port Interface Unit
 - ETB - Embedded Trace Buffer with support for a 2 Kbyte RAM
- AHB LMEM
 - TCMC - Tightly Coupled Memory Controller with support for 64 Kbyte RAM
 - Two 16 KB of combined data/instructions caches to minimize the performance impact of memory access latencies. One for the system bus and one for I/D bus.

13.2.2 Network Interconnect Features

The CoreLink Network Interconnect (PL301) is a 2nd generation highly configurable IP component. The PL301 in the core platform has 2 master and 2 slave bus connections.

- Network Interconnect (PL301)
 - 2 on-platform masters, 64-bit AHB interfaces
 - 2 off-platform slaves, S0 is 32-bit AXI interface, S1 is 64-bit AXI interface

13.3 Cortex-M4 Instruction Fetches on the System Bus

The Cortex-M4 processors implement multiple 32-bit bus interfaces that support a Harvard memory architecture. Specifically, the cores provide a modified Harvard connection with 2-cycle pipelined AMBA-AHB code and system buses. The modified Harvard memory architecture results since the bus interfaces are activated by address range and include both instruction fetches and operand data references on a given bus port. A traditional Harvard architecture separates instruction fetches and operand data references onto specific bus ports regardless of access address.

The code bus is typically used for instruction fetching and data accesses of PC-relative data, while the system bus is typically used for operand data references to the on- and off-chip memories and peripheral accesses. This bus structure fully supports concurrent instruction fetch and data accesses, but the Cortex-M4 implementations can generate both types of references on each bus. Additionally, there is a separate 32-bit Private Peripheral Bus (PPB) connection to several important modules (for example, the Nested Vectored Interrupt Controller) accessible to only the core. By placing the various code and data sections in the appropriate locations within the memory map, overall system performance can be maximized.

To provide a “clean timing interface” on the core's system bus, instruction and vector fetch requests to this bus are registered. This increases fetch time by an additional cycle of latency because instructions fetched from the system bus take a minimum of two cycles. This also means that back-to-back instruction fetches from the system bus are not possible.

Instruction fetch requests to the code bus are not registered. It is recommended that performance critical code be located such that it fetches from the ICode bus interface as defined by addresses $< 0x2000_0000$ (the system bus interface includes the addresses $> = 0x2000_0000$ and $< 0xE000_0000$ and the Private Peripheral Bus is used for addresses $> = 0xE000_0000$).

NOTE

In the device, the memory map includes aliased address spaces that are mapped into the ICode region for code sections that reside in the system address space. As a simple example, the DDR address space is located in the system region of the memory map, but a subset of this space is aliased so that it appears in the ICode region that instructions mapped into the DDR space can be executed as maximum performance.

13.4 Major Platform Bus Interfaces

- The platform supports the AMBA AHB and AXI bus protocol.
 - HBSTRB is the only v6 extension that is supported

- HRESP[1] (SPLIT/RETRY) is not supported.
- HTRANS[1:0] = 2b01 (BUSY) is not supported
- HBURST - The platform and its memory controllers support the full range of AHB burst sizes
- M0, M1 are 64-bit AHB-lite master bus interfaces, S0 is 32-bit AXI slave bus interface, S1 is 64-bit AXI slave bus interface
- Support AXI standard exclusive access on system bus address (above 0x2000_0000). Exclusive access is only supported on memory controllers that include an exclusive monitor.

13.5 Cortex-M4 Boot Requirements

- Cortex-A9 always boots as the primary core.
- Cortex-M4 does not have a boot ROM and at POR is not provided a clock
- Cortex-A9 ROM is responsible for the following:
 - Loading and authenticating A9 bootloader and initiating Cortex-M4 firmware as a unified image
 - Setting up Cortex-M4 initial exception table in TCRAML
 - Launching the Cortex-M4 by enabling its clock

13.6 Clocks and Resets

The platform inputs several reset signals. The following table describes the use of each reset.

Table 13-1. Platform Reset Descriptions

Reset Name	Description
ipg_core_async_reset_b	asynchronous reset for CORTEX-M4
ipg_hard_async_reset_b	asynchronous system reset for platform modules
ipg_hard_async_po_reset_b	asynchronous power-on reset used in CM4 Core

The platform generates an internal reset, debug_reset_b, which is used to reset the following debug modules:

- AHB-AP
- SWJ-DP
- MDM
- TPIU
- ETB

Debug Configuration

- ETM
- UPSIZERs
- REPLICATORs
- FUNNEL
- ETB Almost Full logic in MCM

The platform inputs several clocks. The following table describes each clock input:

Table 13-2. Platform Clock Descriptions

Clock Input Name	Description
sw_clk_tck	Single Wire/ JTAG Test Clock
trace_clk_in	TPIU - Trace Port Clock
tcmc_hclk	TCMC Clock
cm4_hclk	Gated CPU Clock. Platform output "cm4_gate_hclk" can be used as the enable signal.
cm4_fclk	Free-running CPU Clock
ipg_clk_nic	Gated PL301 Clock

The platform clocks, cm4_fclk, cm4_hclk, tcmc_hclk and ipg_clk_nic are equal in frequency and phase.

13.7 Debug Configuration

The Cortex-M4 debug solution includes components described in the following table.

Table 13-3. Debug Components Description

Module	Description
SWJ-DP	Debug Port with support for SWD, JTAG
AHB-AP	AHB Master Interface from JTAG to debug module and SOC system memory maps
MDM-AP	Provides centralized control and status registers for an external debugger to control the device.
ROM Table	Identifies which debug IP is available.
Core Debug	Singlestep, Register Access, Run, Core Status
CoreSight Trace Funnel	The CSTF combines multiple trace streams onto a single ATB bus.
CoreSight Trace Replicator	The ATB replicator enables two trace sinks to be wired together and operate from the same incoming trace stream.
ETM (Embedded Trace Macrocell)	ETMv3.5 Architecture
CoreSight ETB (Embedded Trace Buffer)	Memory mapped buffer used to store trace data.
ITM	S/W Instrumentation Messaging + Simple Data Trace Messaging + Watchpoint Messaging

Table continues on the next page...

Table 13-3. Debug Components Description (continued)

Module	Description
DWT (Data and Address Watchpoints)	4 data and address watchpoints
FPB (Flash Patch and Breakpoints)	<p>The FPB implements hardware breakpoints and patches code and data from code space to system space.</p> <p>The FPB unit contains two literal comparators for matching against literal loads from Code space, and remapping to a corresponding area in System space.</p> <p>The FPB also contains six instruction comparators for matching against instruction fetches from Code space, and remapping to a corresponding area in System space. Alternatively, the six instruction comparators can individually configure the comparators to return a Breakpoint Instruction (BKPT) to the processor core on a match, so providing hardware breakpoint capability.</p>
TPIU (Trace Port Interface Unit)	<p>Synchronous Mode (5-pin) = TRACE_D[3:0] + TRACE_CLKOUT</p> <p>Synchronous Mode (3-pin) = TRACE_D[1:0] + TRACE_CLKOUT</p> <p>Asynchronous Mode (1-pin) = TRACE_SWO</p>
MCM (Miscellaneous Control Module)	The MCM provides miscellaneous control functions including control of the ETB and trace path switching.

The ETB is configured to support a 2 Kbyte off-platform RAM for trace data storage. The following figure describes how the ETB is connected to the other Cortex-M4 trace modules.

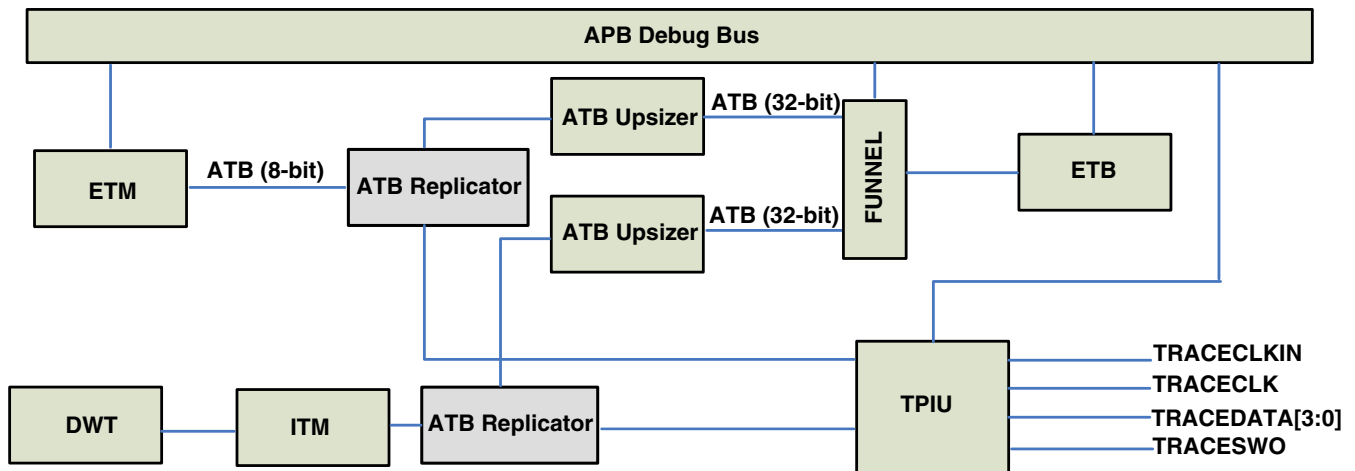

Figure 13-4. Core Trace Connections

Additional logic is implemented in the MCM to cause a debug halt or an interrupt when the ETB becomes almost full. The type of interrupt response is selectable, between a normal interrupt (interrupt vector = 16) or a NMI. For more details on the ETB "almost" full functionality and programming model, please refer to the MCM block guide.

The MCM also has control bits used to disable the ETM-to-TPIU trace path, and to disable the ITM-to-TPIU trace path. These control bits are cleared at reset, and therefore these trace paths are active after reset.

The *cm4_edbg_req* platform input is the external debug request signal that is routed into the core. The ETM's and ETB's debug request are OR'ed with this signal on the platform. Any other gating must be done outside the platform.

13.8 Platform JTAG Requirements

The Miscellaneous Debug Module (MDM) contains the DAP (Debug Access Port) status, control and ID registers as well as the DAP mux. Access to these DAP registers is through the SWJ-DP. The read-only DAP status register is located at `DAPADDR[31:0] = 32'h0100_0000`, while the DAP control register is located at `DAPADDR=32'h0100_0004`. The IDR is located at `DAPADDR = 32'h0100_00FC`.

The platform's 32-bit *dap_status[31:1]* input vector is registered in the MDM. Bit 0 is reserved for platform itself.

The *mdm_ap_control[31:0]* platform output vector controls SoC-defined functions. The *mdm_ap_control[0]* is reserved for platform itself.

The IDR is a read-only register with a value of `32'h001C_0000`.

13.9 Local Memory Controller (LMEM)

The Local Memory Controller provides the ARM®Cortex-M4™ processor with tightly-coupled processor-local memories and bus paths to all slave memory spaces.

13.9.1 LMEM Block Diagram

The Cortex-M4 processor has a modified 32-bit Harvard bus architecture. Using a 32-bit address space, low-order addresses (`0x0000_0000` through `0x1FFF_FFFF`) use the Processor Code (PC) bus, and high-order addresses (`0x2000_0000` through `0xFFFF_FFFF`) use the Processor System (PS) bus. As the bus names imply, normal operation has code accesses on the PC bus and data accesses on the PS bus.

This device has been augmented with tightly-coupled memories for the PC and PS buses. The memories include RAMs and caches. These local memories provide zero wait state access to RAM and cacheable address spaces.

The local memory controller includes four memory controllers and their attached memories:

- SRAM lower (SRAM_L) controller via the PC bus
- SRAM upper (SRAM_U) controller via the PS bus
- Cache memory controller via the PC bus
- Cache memory controller via the PS bus

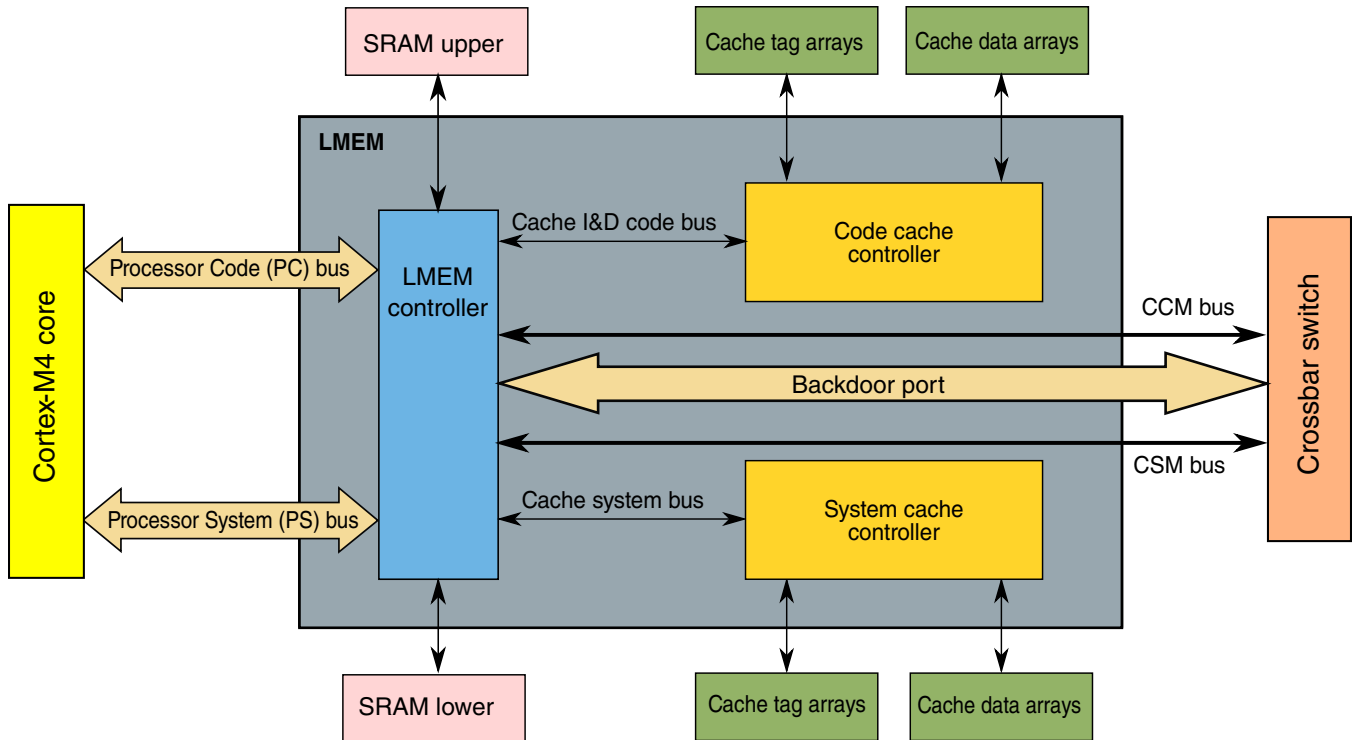

Figure 13-5. Local memory controller block diagram

NOTE

The SRAM and cache controllers reside within the LMEM, but the single-port synchronous RAM arrays used by these controllers are external.

The LMEM contains address decode logic for the PC and PS buses. This logic routes the core's accesses to the various system resources. The address spaces are device-specific and are specified in the device's Chip Configuration chapter.

13.9.2 Cache features

A cache is a block of high-speed memory locations containing address information (commonly known as a tag) and the associated data. The purpose is to decrease the average time of a memory access. Caches operate on two principles of locality:

- Spatial locality — An access to one location is likely to be followed by accesses from adjacent locations (for example, sequential instruction execution or usage of a data structure).
- Temporal locality — An access to an area of memory is likely to be repeated within a short time period (for example, execution of a code loop).

To minimize the quantity of control information stored, the spatial locality property is used to group several locations together under the same tag. This logical block is commonly known as a cache line.

When data is loaded into a cache, access times for subsequent loads and stores are reduced, resulting in overall performance benefits. An access to information already in a cache is known as a cache hit, and other accesses are called cache misses.

Normally, caches are self-managing, with the updates occurring automatically. Whenever the processor wants to access a cacheable location, the cache is checked. If the access is a cache hit, the access occurs immediately. Otherwise, a location is allocated and the cache line is loaded from memory. Different cache topologies and access policies are possible. However, they must comply with the memory coherency model of the underlying architecture.

Caches introduce a number of potential problems, mainly because of:

- memory accesses occurring at times other than when the programmer would normally expect them,
- the existence of multiple physical locations where a data item can be held.

The local memory controller supports three modes of operation:

1. Write-through — access to address spaces with this cache mode are cacheable.
 - A read miss on the input bus causes a line read on the output bus of a 32-byte-aligned memory address containing the desired address. This miss data is loaded into the cache and is marked as valid and not modified.
 - A write-through read hit to a valid cache location returns data from the cache with no output bus access.
 - A write-through write miss bypasses the cache and writes to the output bus (no allocate on write miss policy for write-through mode spaces).
 - A write-through write hit updates the cache hit data and writes to the output bus.
2. Write-back — access to address spaces with this cache mode are cacheable.
 - A write-back read miss on the input bus will cause a line read on the output bus of a 32-byte-aligned memory address containing the desired address. This miss data is loaded into the cache and marked as valid and not modified.

- A write-back read hit to a valid cache location will return data from the cache with no output bus access.
 - A write-back write miss will do a "read-to-write" (allocate on write miss policy for write-back mode spaces). A line read on the output bus of a 16 byte aligned memory address containing the desired write address is performed. This miss data is loaded into the cache and marked as valid and modified; and the write data will then update the appropriate cache data locations.
3. Non-cacheable — access to address spaces with this cache mode are not cacheable. These accesses bypass the cache and access the output bus.

13.9.3 LMEM Function

The LMEM receives the following requests:

- Core master bus requests on the Processor Code (PC) bus,
- Core master bus requests on the Processor Space (PS) bus, and
- SRAM controller requests from all other bus masters on the backdoor port.

The LMEM address decode logic routes these accesses and also provides any crossbar switch slave target logic. Finally, the Local Memory controller provides the needed MPU connections for checking all SRAM controller and cacheable accesses.

The programming model for the Code and System Caches is accessed via the core's Private Peripheral Bus (PPB).

13.9.3.1 Processor Code accesses

Processor Code accesses are routed to the SRAM_L if they are mapped to that space. All other PC accesses are routed to the Code Cache Memory Controller. This controller then processes the cacheable accesses as needed, while bypassing the non-cacheable, cache write-through, cache miss, and cache maintenance accesses to the CCM bus and the crossbar switch using the Master0 port.

13.9.3.2 Processor Space accesses

Processor Space accesses are routed to the SRAM_U if they are mapped to that space. All other PS accesses are routed to the PS Cache Memory Controller. This controller then processes the cacheable accesses as needed, while bypassing the non-cacheable, cache write-through, cache miss, and cache maintenance accesses to the CCM bus and the crossbar switch using the Master1 port.

13.9.3.3 Backdoor port accesses

All LMEM backdoor port accesses are for the SRAM controller. These accesses go to the SRAM_L or the SRAM_U depending on their specific address.

13.9.3.4 SRAM Function

13.9.3.4.1 SRAM Configuration

The figure below shows how the SRAM controller is configured.

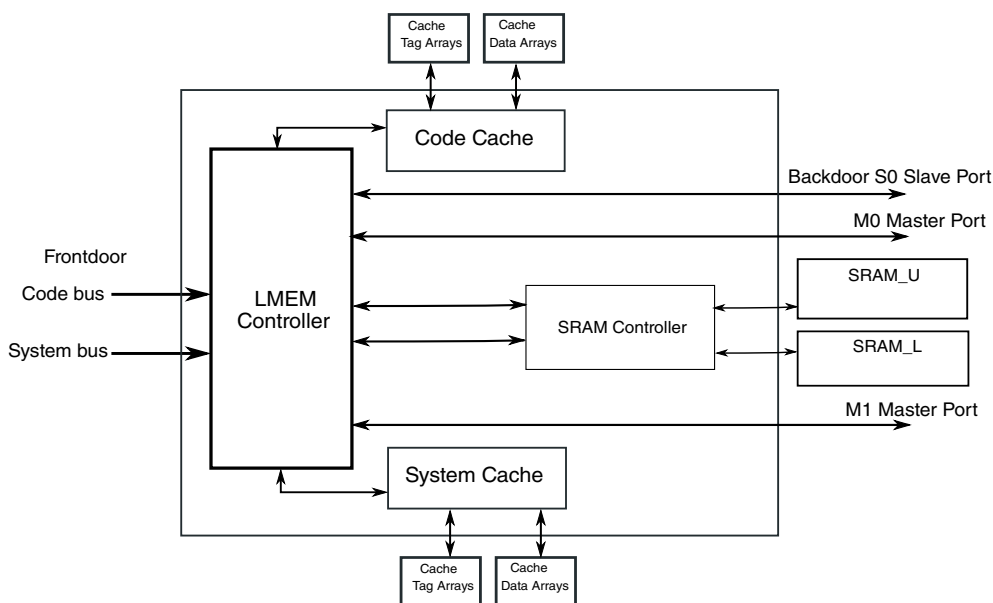

Figure 13-6. SRAM Configuration

13.9.3.4.2 SRAM Arrays

The on-chip SRAM is split into two logical arrays, SRAM_L and SRAM_U.

From equal-sized memories, valid address ranges for SRAM_L and SRAM_U are then defined as:

- $SRAM_L = 0x1FFF_8000 - (0x1FFF_8000 + SRAM_size/2)$
- $SRAM_U = 0x2000_0000 - (0x2000_0000 + SRAM_size/2)$

13.9.3.4.3 SRAM accesses

The SRAM is split into two logical arrays that are 64-bits wide:

- SRAM_L — Accessible by the code bus of the Cortex-M4 core and by the backdoor port.
- SRAM_U — Accessible by the system bus of the Cortex-M4 core and by the backdoor port.

The backdoor port makes the SRAM accessible to the non-core bus masters (such as DMA).

The figure below illustrates the SRAM accesses within the device.

Figure 13-7. SRAM access diagram

The following simultaneous accesses can be made to different logical halves of the SRAM:

- Core code and core system
- Core code and non-core master
- Core system and non-core master

NOTE

Two non-core masters cannot access SRAM simultaneously. The required arbitration and serialization is provided by the crossbar switch. The SRAM_{L,U} arbitration is controlled by the SRAM controller based on the configuration bits in the MCM module.

13.9.3.5 Cache Function

The caches on this device are structured as follows. Both caches have a 2-way set-associative cache structure with a total size of 32 KBytes. The caches have a 32-bit address, 64-bit data paths and a 32-byte line size. The cache tags and data storage use single-port, synchronous RAMs.

For these 16-KByte caches, each cache TAG function uses two 256 x 22-bit RAM arrays and the cache DATA function uses two 1024 x 32-bit RAM arrays. The cache TAG entries store 20 bits of upper address as well as a modified and valid bit per cache line. The cache DATA entries store eight bytes of code or data.

All normal cache accesses use physical addresses. This leads to the following cache address use:

CACHE - 16 KByte size = (256 sets) x (32-byte lines) x (2-way set associative)

TAG:

- address[31:13] used in tag for compare (hit) logic
- address[12:5] used to select 1 of 256 sets
- address[3:0] not used

DATA

- address[31:13] not used
- address[12:5] used to select one of 256 sets
- address[4:2] used to select one of eight 32-bit words within a set
- address[1:0] used to select the byte within the 32-bit word

13.9.3.6 Cache Control

The Code and System Caches are disabled at reset. Cache tag and data arrays are not cleared at reset. Therefore, to enable the caches, cache commands must be done to clear and initialize the required tag array bits and to configure and enable the caches.

13.9.3.6.1 Cache set commands

The cache set commands may operate on:

- all of way 0,
- all of way 1, or
- all of both ways (complete cache).

Cache set commands are initiated using the upper bits in the CCR register. Cache set commands perform their operation on the cache independent of the cache enable bit, CCR[ENCACHE].

A cache set command is initiated by setting the CCR[GO] bit. This bit also acts as a busy bit for set commands. It stays set while the command is active and is cleared by the hardware when the set command completes.

Supported cache set commands are given in the table below. Set commands work as follows:

- Invalidate – Unconditionally clear valid and modify bits of a cache entry.
- Push – Push a cache entry if it is valid and modified, then clear the modify bit. If entry not valid or not modified, leave as is.
- Clear – Push a cache entry if it is valid and modified, then clear the valid and modify bits. If entry not valid or not modified, clear the valid bit.

Table 13-4. Cache Set Commands

CCR[27:24]				Command
PUSH W1	INVW1	PUSH W0	INVW0	
0	0	0	0	NOP
0	0	0	1	Invalidate all way 0
0	0	1	0	Push all way 0
0	0	1	1	Clear all way 0
0	1	0	0	Invalidate all way 1
0	1	0	1	Invalidate all way 1; invalidate all way 0 (invalidate cache)
0	1	1	0	Invalidate all way 1; push all way 0
0	1	1	1	Invalidate all way 1; clear all way 0
1	0	0	0	Push all way 1
1	0	0	1	Push all way 1; invalidate all way 0
1	0	1	0	Push all way 1; push all way 0 (push cache)
1	0	1	1	Push all way 1; clear all way 0
1	1	0	0	Clear all way 1
1	1	0	1	Clear all way 1; invalidate all way 0
1	1	1	0	Clear all way 1; push all way 0
1	1	1	1	Clear all way 1; clear all way 0 (clear cache)

After a reset, complete an invalidate cache command before using the cache. It is possible to combine the cache invalidate command with the cache enable. That is, setting CCR to 0x8500_0003 will invalidate the cache and enable the cache and write buffer.

13.9.3.6.2 Cache line commands

Cache line commands operate on a single line in the cache at a time. Cache line commands can be performed using a physical or cache address.

- A cache address consists of a set address and a way select. The line command acts on the specified cache line.
- Cache line commands with physical addresses first search both ways of the cache set specified by bits [11:4] of the physical address. If they hit, the commands perform their action on the hit way.

Cache line commands are specified using the upper bits in the CLCR register. Cache line commands perform their operation on the cache independent of the cache enable bit (CCR[ENCACHE]). Using a cache address, the command can be completely specified using the CLCR register. Using a physical address, the command must also use the CSAR register to specify the physical address.

A line cache command is initiated by setting the line command go bit (CLCR[LGO] or CSAR[LGO]). This bit also acts as a busy bit for line commands. It stays set while the command is active and is cleared by the hardware when the command completes.

The CLCR[27:24] bits select the line command as follows:

Table 13-5. Cache Line Commands

CLCR[27:24]			Command
LACC	LADSEL	LCMD	
0	0	00	Search by cache address and way
0	0	01	Invalidate by cache address and way
0	0	10	Push by cache address and way
0	0	11	Clear by cache address and way
0	1	00	Search by physical address
0	1	01	Invalidate by physical address
0	1	10	Push by physical address
0	1	11	Clear by physical address
1	0	00	Write by cache address and way
1	0	01	Reserved, NOP
1	0	10	Reserved, NOP
1	0	11	Reserved, NOP
1	1	xx	Reserved, NOP

13.9.3.6.2.1 Executing a series of line commands using cache addresses

A series of line commands with incremental cache addresses can be performed by just writing to the CLCR.

- Place the command in CLCR[27:24],
- Set the way (CLCR[WSEL]) and tag/data (CLCR[TDSEL]) controls as needed,
- Place the cache address in CLCR[CACHEADDR], and
- Set the line command go bit (CLCR[LGO]).

When one line command completes, initiate the next command by following these steps:

- Increment the cache address (at bit 2 to step through data or at bit 4 to step through lines), and
- Set the line command go bit (CLCR[LGO]).

13.9.3.6.2.2 Executing a series of line commands using physical addresses

Perform a series of line commands with incremental physical addresses using the following steps:

- Write to the CLCR.
 - Place the command in CLCR[27:24]
 - Set the tag/data (CLCR[TDSEL]) control
- Place the physical address in CSAR[PHYADDR] and set the line command go bit (CSAR[LGO]).

When one line command completes, initiate the next command by following these steps:

- Increment the physical address (at bit 2 to step through data or at bit 4 to step through lines), and
- Set the line command go bit (CSAR[LGO]).

The line command go bit is shared between the CLCR and CSAR registers, so that the above steps can be completed in a single write to the CSAR register.

13.9.3.6.2.3 Line command results

At completion of a line command, the CLCR register contains information on the initial state of the line targeted by the command. For line commands with cache addresses, this information is read before the line command action is performed from the targeted cache line. For line commands with physical addresses, this information is read on a hit before the line command action is performed from the hit cache line or has initial valid bit

cleared if the command misses. In general, if the valid indicator (CLCR[LCIVB] is cleared, the targeted line was invalid at the start of the line command and no line operation was performed.

Table 13-6. Line command results

CLCR[22:20]			For cache address commands	For physical address commands
LCWAY	LCIMB	LCIVB		
0	0	0	Way 0 line was invalid	No hit
0	0	1	Way 0 valid, not modified	Way 0 valid, not modified
0	1	0	Way 0 line was invalid	No hit
0	1	1	Way 0 valid and modified	Way 0 valid and modified
1	0	0	Way 1 line was invalid	No hit
1	0	1	Way 1 valid, not modified	Way 1 valid, not modified
1	1	0	Way 1 line was invalid	No hit
1	1	1	Way 1 valid and modified	Way 1 valid and modified

At completion of a line command other than a write, the CCVR (Cache R/W Value Register) contains information on the initial state of the line tag or data targeted by the command. For line commands, CLCR[TDSEL] selects between tag and data. If the line command used a physical address and missed, the data is don't care. For write commands, the CCVR holds the write data.

13.10 Miscellaneous Control Module (MCM)

The Miscellaneous Control Module (MCM) provides a myriad of miscellaneous control functions.

13.10.1 MCM features

The MCM includes the following features:

- Program-visible information on the platform configuration and revision

13.10.2 MCM Interrupts

The MCM generates two interrupt requests:

- Non-maskable interrupt
- Normal interrupt

13.10.2.1 Non-maskable interrupt

The MCM's NMI is generated if:

- ISCR[ETBN] is set, when
 - The ETB counter is enabled, ETBCC[CNTEN] = 1
 - The ETB count expires
 - The response to counter expiration is an NMI, MCM_ETBCC[RSPT] = 10

13.10.2.2 Normal interrupt

The MCM's normal interrupt is generated if any of the following is true:

- ISCR[ETBI] is set, when
 - The ETB counter is enabled, ETBCC[CNTEN] = 1
 - The ETB count expires
 - The response to counter expiration is a normal interrupt, ETBCC[RSPT] = 01

13.11 LMEM Memory Map/Register Definition

LMEM memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
E000_2000	Cache control register (LMEM_PCCCR)	32	R/W	0000_0000h	13.11.1/480

13.11.1 Cache control register (LMEM_PCCCR)

Address: E000_2000h base + 0h offset = E000_2000h

LMEM_PCCCR field descriptions

Field	Description
31 GO	Initiate Cache Command Setting this bit initiates the cache command indicated by bits 27-24. Reading this bit indicates if a command is active NOTE: This bit stays set until the command completes. Writing zero has no effect. 0 Write: no effect. Read: no cache command active. 1 Write: initiate command indicated by bits 27-24. Read: cache command active.
30–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 PUSHW1	Push Way 1 0 No operation 1 When setting the GO bit, push all modified lines in way 1
26 INWV1	Invalidate Way 1 NOTE: If the PUSHW1 and INWV1 bits are set, then after setting the GO bit, push all modified lines in way 1 and invalidate all lines in way 1 (clear way 1). 0 No operation 1 When setting the GO bit, invalidate all lines in way 1
25 PUSHW0	Push Way 0 0 No operation 1 When setting the GO bit, push all modified lines in way 0
24 INWV0	Invalidate Way 0

Table continues on the next page...

LMEM_PCCCR field descriptions (continued)

Field	Description
	<p>NOTE: If the PUSHW0 and INVW0 bits are set, then after setting the GO bit, push all modified lines in way 0 and invalidate all lines in way 0 (clear way 0).</p> <p>0 No operation 1 When setting the GO bit, invalidate all lines in way 0.</p>
23–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 PCCR3	Forces no allocation on cache misses (must also have ACCR2 asserted)
2 PCCR2	Forces all cacheable spaces to write through
1 ENWRBUF	Enable Write Buffer 0 Write buffer disabled 1 Write buffer enabled
0 ENCACHE	Cache enable 0 Cache disabled 1 Cache enabled

13.11.2 Cache line control register (LMEM_PCCLCR)

This register defines specific line-sized cache operations to be performed using a specific cache line address or a physical address.

If a physical address is specified, both ways of the cache are searched, and the command is only performed on the way which hits.

Address: E000_2000h base + 4h offset = E000_2004h

LMEM Memory Map/Register Definition

LMEM_PCCLCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LACC	Line access type 0 Read 1 Write
26 LADSEL	Line Address Select When using the cache address, the way must also be specified in CLCR[WSEL]. When using the physical address, both ways are searched and the command is performed only if a hit. 0 Cache address 1 Physical address
25–24 LCMD	Line Command 00 Search and read or write 01 Invalidate 10 Push 11 Clear
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 LCWAY	Line Command Way Indicates the way used by the line command.
21 LCIMB	Line Command Initial Modified Bit If command used cache address and way, then this bit shows the initial state of the modified bit If command used physical address and a hit, then this bit shows the initial state of the modified bit. If a miss, this bit reads zero.
20 LCIVB	Line Command Initial Valid Bit If command used cache address and way, then this bit shows the initial state of the valid bit If command used physical address and a hit, then this bit shows the initial state of the valid bit. If a miss, this bit reads zero.
19–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

13.11.6 Cache line control register (LMEM_PSCLCR)

This register defines specific line-sized cache operations to be performed using a specific cache line address or a physical address.

If a physical address is specified, both ways of the cache are searched, and the command is only performed on the way which hits.

Address: E000_2000h base + 804h offset = E000_2804h

LMEM_PSCLCR field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27 LACC	Line access type 0 Read 1 Write
26 LADSEL	Line Address Select When using the cache address, the way must also be specified in CLCR[WSEL].

Table continues on the next page...

LMEM_PSCLCR field descriptions (continued)

Field	Description
	When using the physical address, both ways are searched and the command is performed only if a hit. 0 Cache address 1 Physical address
25–24 LCMD	Line Command 00 Search and read or write 01 Invalidate 10 Push 11 Clear
23 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 LCWAY	Line Command Way Indicates the way used by the line command.
21 LCIMB	Line Command Initial Modified Bit If command used cache address and way, then this bit shows the initial state of the modified bit If command used physical address and a hit, then this bit shows the initial state of the modified bit. If a miss, this bit reads zero.
20 LCIVB	Line Command Initial Valid Bit If command used cache address and way, then this bit shows the initial state of the valid bit If command used physical address and a hit, then this bit shows the initial state of the valid bit. If a miss, this bit reads zero.
19–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 TDSEL	Tag/Data Select Selects tag or data for search and read or write commands. 0 Data 1 Tag
15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14 WSEL	Way select Selects the way for line commands. 0 Way 0 1 Way 1
13 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
12–2 CACHEADDR	Cache address CLCR[11:4] bits are used to access the tag arrays CLCR[11:2] bits are used to access the data arrays
1 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

MCM_PLAMC field descriptions (continued)

Field	Description
AMC	Each bit in the AMC field indicates whether there is a corresponding connection to the AXBS master input port. 0 A bus master connection to AXBS input port <i>n</i> is absent 1 A bus master connection to AXBS input port <i>n</i> is present

13.12.3 Fault address register (MCM_FADR)

When a properly-enabled cache write buffer error interrupt event is detected, the faulting address is captured in the MCM_FADR register. The MCM logic supports capturing a single cache write buffer bus error event; if a subsequent error is detected before the captured error information has been read from the corresponding registers and the MCM_ISCR[CWBER] indicator cleared, the MCM_FATR[BEOVR] flag is set. However, no additional information is captured.

The bits in this register are set by hardware and signaled by the assertion of MCM_ISCR[CWBER]. Attempted writes to this location are terminated with an error.

Address: E000_0000h base + 20h offset = E000_0020h

- * Notes:
- x = Undefined at reset.

MCM_FADR field descriptions

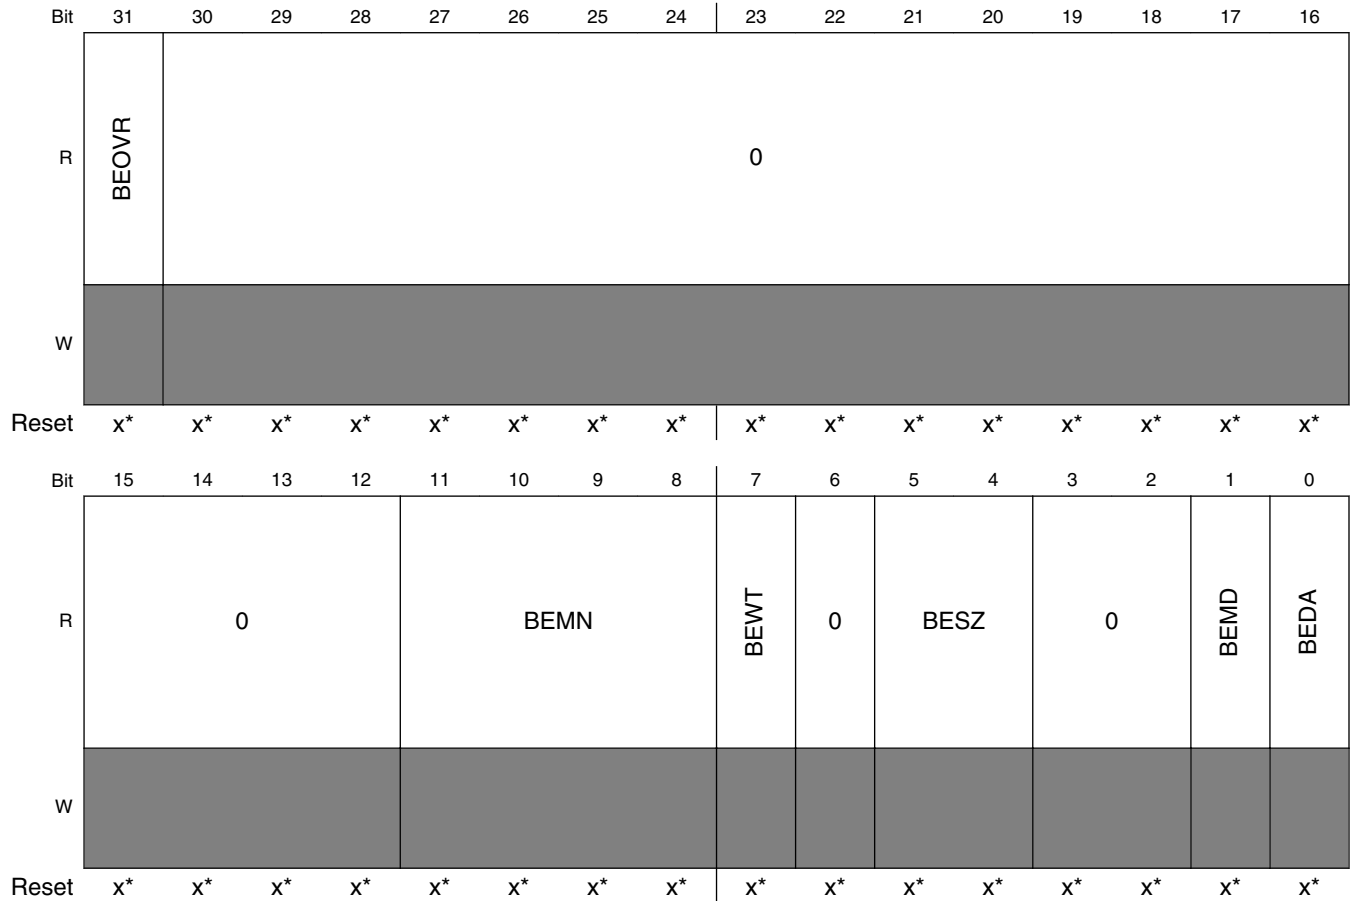

Field	Description
ADDRESS	Fault address

13.12.4 Fault attributes register (MCM_FATR)

When a properly-enabled cache write buffer error interrupt event is detected, the faulting attributes are captured in the MCM_FATR register.

The bits in this register are set by hardware and signaled by the assertion of MCM_ISCR[CWBER]. Attempted writes to this location are terminated with an error.

Address: E000_0000h base + 24h offset = E000_0024h

* Notes:

- x = Undefined at reset.

MCM_FATR field descriptions

Field	Description
31 BEOVR	<p>Bus error overrun</p> <p>Indicates if another cache write buffer bus error is detected before system software has retrieved all the error information from the original event, this overrun flag is set. The window of time is defined from the detection of the original cache write buffer error termination until the MCM_ISCR[CWBER] is written with a 1 to clear it and rearm the capture logic. This bit is set by the hardware and cleared whenever software writes a 1 to the CWBER bit.</p> <p>0 No bus error overrun 1 Bus error overrun occurred. The FADR and FDR registers and the other FATR bits are not updated to reflect this new bus error.</p>
30–12 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
11–8 BEMN	<p>Bus error master number</p> <p>Crossbar switch bus master number of the captured cache write buffer bus error. For this device, this value is always 0x1.</p>

Table continues on the next page...

MCM_FATR field descriptions (continued)

Field	Description
7 BEWT	<p>Bus error write</p> <p>Indicates the type of system bus access when the error was detected. Since this logic is monitoring data transfers from the cache write buffer, this bit is always a logical one, signaling a write operation.</p> <p>0 Read access 1 Write access</p>
6 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
5-4 BESZ	<p>Bus error size</p> <p>Indicates the size of the cache write buffer access when the error was detected.</p> <p>00 8-bit access 01 16-bit access 10 32-bit access 11 Reserved</p>
3-2 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
1 BEMD	<p>Bus error privilege level</p> <p>Indicates the privilege level of the cache write buffer access when the error was detected.</p> <p>0 User mode 1 Supervisor/privileged mode</p>
0 BEDA	<p>Bus error access type</p> <p>Indicates the type of cache write buffer access when the error was detected. This attribute is always a logical one signaling a data reference.</p> <p>0 Instruction 1 Data</p>

13.12.5 Fault data register (MCM_FDR)

When a properly-enabled cache write buffer error interrupt event is detected, the faulting data is captured in the MCM_FDR register.

The bits in this register are set by hardware and signaled by the assertion of MCM_ISCR[CWBER]. For byte and halfword writes, only the accessed byte lanes contain valid data; the contents of the other bytes are undefined. Attempted writes to this location are terminated with an error.

Address: E000_0000h base + 28h offset = E000_0028h

* Notes:

- x = Undefined at reset.

MCM_FDR field descriptions

Field	Description
DATA	Fault data

Chapter 14

Analog-to-Digital Converter (ADC)

14.1 Overview

The analog-to-digital converter (ADC) is a successive approximation ADC designed for operation within an integrated microcontroller system-on-chip.

14.1.1 Features

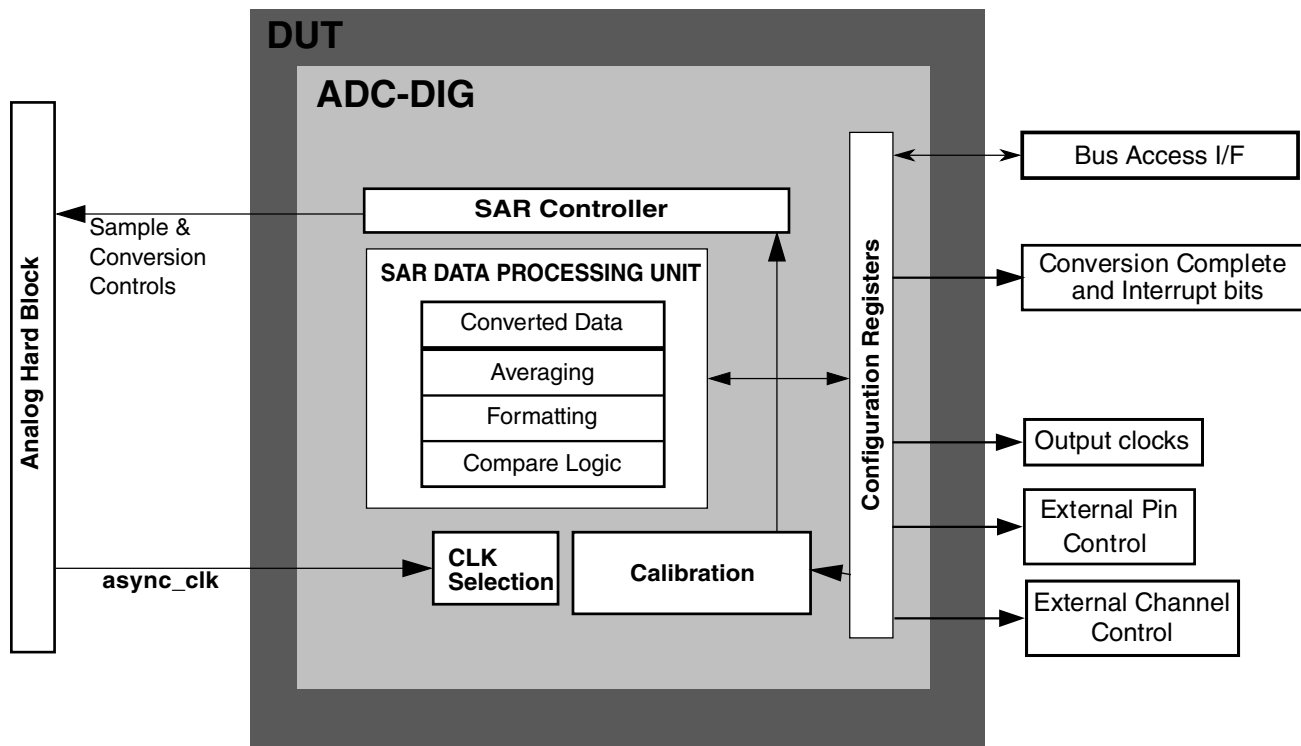

The features of the ADC-Digital are as follows:

- Two 12-bit ADCs.
- Configuration registers
 - 32-bit, word aligned, byte enabled registers. (Byte and Halfword access is not supported)
- Linear successive approximation algorithm with up to 12-bit resolution with 10/11 bit accuracy.
- Up to 10 ENOB (dedicated Single Ended Channels)
- Up to 1MS/s sampling rate
- Up to 16 single-ended external analog inputs
- Single or continuous conversion (automatic return to idle after single conversion)
- Output Modes: (in right-justified unsigned format)
 - 12-bit
 - 10-bit
 - 8-bit
- Configurable sample time and conversion speed/power
- Conversion complete and hardware average complete flag and interrupt
- Input clock selectable from up to four sources
- Asynchronous clock source for lower noise operation with option to output the clock
- Selectable asynchronous hardware conversion trigger with hardware channel select
- Selectable voltage reference, Internal, External, or Alternate

Overview

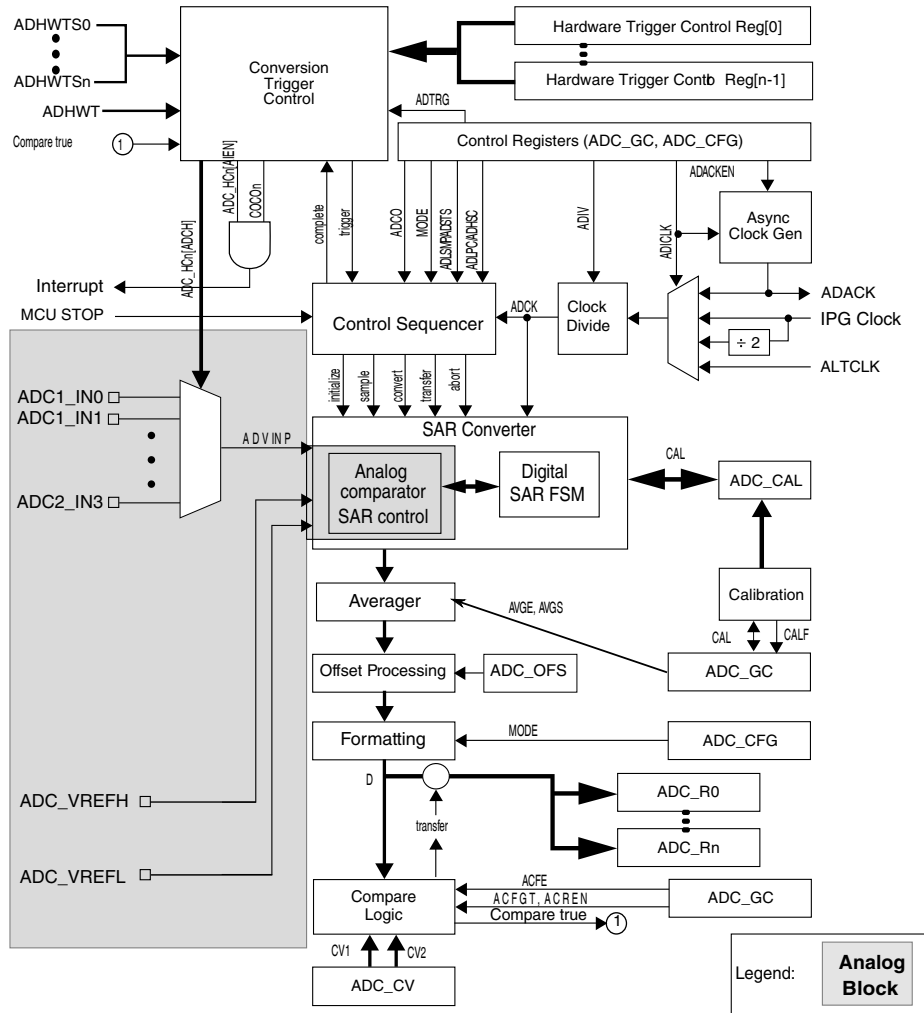

- Automatic compare with interrupt for less-than, greater-than or equal-to, within range, or out-of-range, programmable value
- Operation in low power modes for lower noise operation
- Temperature sensor
- Hardware average function
- Self-calibration mode

14.1.2 ADC-Digital I/F block diagram

14.1.3 ADC-Digital block diagram

The following figure shows a top-level block diagram of the ADC.

14.1.4 ADC module interface

The ADC is connected to many interfaces such as the clocks and reset, access bus, voltage references, interrupt controller, hardware triggers, ADC pin control, and analog I/F as shown in the following figure.

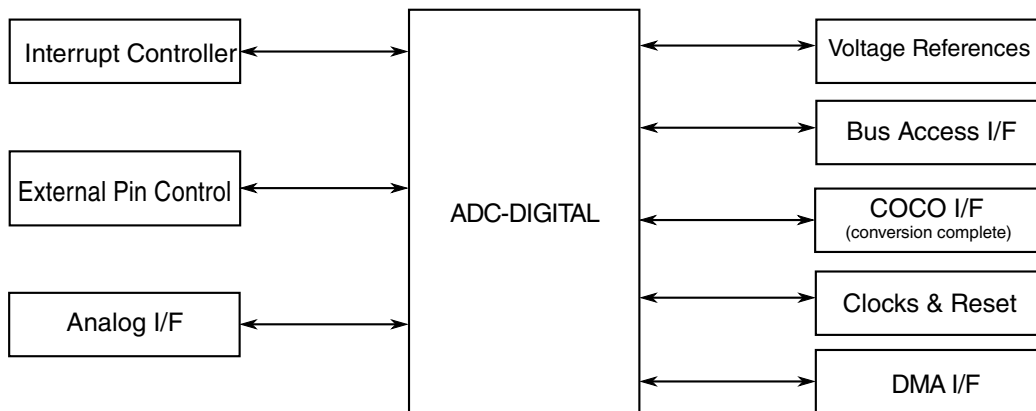

Figure 14-2. ADC-Digital module interface

14.1.5 Modes of Operation

By default, the ADC is in disabled mode. In this state, no conversion or other actions occur. All of the ADC control registers are accessible in this state through an access bus interface. To enable the ADC, required configurations should be done by programming the ADC configuration registers.

14.2 External Signals

The following table describes the external signals of ADC:

Table 14-1. ADC External Signals

Signal	Description	Pad	Mode	Direction
ADC_VREFH	Voltage reference high	ADC_VREFH	No Muxing	I
ADC_VREHL	Voltage reference low	ADC_VREHL	No Muxing	I
ADC1_IN0	Analog channel 1 input 0	ADC1_IN0	No Muxing	I
ADC1_IN1	Analog channel 1 input 1	ADC1_IN1	No Muxing	I
ADC1_IN2	Analog channel 1 input 2	ADC1_IN2	No Muxing	I
ADC1_IN3	Analog channel 1 input 3	ADC1_IN3	No Muxing	I

Table continues on the next page...

Table 14-1. ADC External Signals (continued)

Signal	Description	Pad	Mode	Direction
ADC2_IN0	Analog channel 2 input 0	ADC2_IN0	No Muxing	I
ADC2_IN1	Analog channel 2 input 1	ADC2_IN1	No Muxing	I
ADC2_IN2	Analog channel 2 input 2	ADC2_IN2	No Muxing	I
ADC2_IN3	Analog channel 2 input 3	ADC2_IN3	No Muxing	I

14.3 Functional Description

There are three possible states which ADC module can be in

1. Disabled State
2. Idle state
3. Performing conversions

Disabled State:

The ADC module is disabled during reset, stop mode (if internal clock is not selected as source of Clock), or when the ADCH bits of the hardware control (ADC_HCn) registers are all high.

Idle State:

The module is idle when a conversion has completed and another conversion has not been initiated. When idle and the asynchronous clock output enable is disabled (ADACKEN=0), the module is in its lowest power state.

Conversion State:

The ADC can perform an analog-to-digital conversion on any of the software selectable channels. All modes perform conversion by a successive approximation algorithm.

To meet accuracy specifications the ADC module must be calibrated using the on chip calibration function. Calibration is recommended to be done after any reset.

When the conversion is completed, the result is placed in the data result registers (ADC_Rn). The conversion complete flag (COCON) bits in Hardware Status register is/are then set and an interrupt is generated, if the respective conversion complete interrupt has been enabled (ADC_HCn[AIEN]=1).

The ADC module has the capability of automatically comparing the result of a conversion with the contents of the compare value registers. The compare function is enabled by setting the ACFE (ADC compare function Enable) bit in ADC general control register.

The ADC module has the capability of automatically averaging the result of multiple conversions. The hardware average function is enabled by setting the AVGE bit in ADC general control register.

14.3.1 Clock Select and Divide Control

The ADC digital module has three clock sources:

- IPG clock
- Alternate Clock (ALTCLK) is connected to the signal as described in the chip-specific SARADC information.
- Internal clock (ADACK) is a dedicated clock used only by the ADC.

ADC digital block generates IPG clock/2 by internally dividing the IPG clock. The final clock is chosen from the following clocks.

- IPG clock
- IPG clock divided by 2
- ALTCLK
- ADACK

Out of the above four clocks one is chosen depending on the configuration of ADCLK[1:0] bits of ADC_CFG. This chosen clock is divided depending on the configuration of ADIV[1:0] bits of ADC_CFG. The final generated clock is used as conversion clock for ADC.

ADICLK	Selected Clock Source
00	IPG clock
01	IPG clock divided by 2
10	Alternate clock (ALTCLK)
11	Asynchronous clock (ADACK)

- The IPG clock. This is the default selection following reset.

- The IPG clock divided by two. For higher IPG clock rates, this allows a maximum divide by 16 of the IPG clock with using the ADIV bits.
- ALTCLK, as defined for this chip.
- The asynchronous clock (ADACK). This clock is generated from a clock source within the ADC module. Conversions are possible using ADACK as the input clock source while the MCU is in stop mode.

Whichever clock is selected, its frequency must fall within the specified frequency range for ADCK. If the available clocks are too slow, the ADC may not perform according to specifications. If the available clocks are too fast, the clock must be divided to the appropriate frequency. This divider is specified by the ADIV bits and can be divide-by 1, 2, 4, or 8.

14.3.2 Voltage Reference Selection

The ADC can be configured to accept one of three voltage reference pairs as the reference voltages (V_{REFSH} and V_{REFSL}) used for conversions. Each pair contains a positive reference which must be between the minimum Ref Voltage High and V_{DDAD} , and a ground reference which must be at the same potential as V_{SSAD} . The three pairs are external (V_{REFH} and V_{REFL}), alternate (V_{ALTH} and V_{ALTL}) and the internal bandgap (V_{BGH} and V_{BGL}). These voltage references are selected using the REFSEL bits in the ADC_CFG register. The alternate (V_{ALTH} and V_{ALTL}) voltage reference pair may select additional external pins or internal sources depending on MCU configuration.

14.3.3 Hardware Triggering and Channel Selection

The ADC module has a trigger input (known as alternate Trigger) which provides asynchronous hardware conversion trigger when the ADTRG bit in ADC configuration register (ADC_CFG) is set and any of the external hardware trigger select is high.

To be reliably captured, the Alternate trigger pulse must be high for sufficient time to satisfy clocking requirement of capturing Flop and the external hardware trigger select event must be set for sufficient time before and after the positive edge of Alternate trigger pulse to meet the setup / hold requirement of capturing flop.

If an external hardware trigger select event gets asserted during a conversion it must stay asserted until end of current conversion and remain set until the receipt of the an Alternate Trigger to initiate a new conversion.

When the Alternate trigger source is available and hardware triggering is enabled (`ADC_CFG[ADTRG]=1`), a conversion is initiated on the rising edge of the Alternate Trigger after a external hardware trigger select event has occurred.

If a conversion is in progress when a rising edge of a trigger occurs, the rising edge is ignored. In continuous conversion configuration, only the initial rising edge to launch continuous conversions is observed and until conversion gets aborted the ADC will continue to do conversions on the same ADC Hardware Trigger Control register that initiated the conversion. The hardware trigger function operates in conjunction with any of the conversion modes and configurations.

The channel selected for the conversion will depend on the settings of active Hardware Trigger register field `ADC_HCn[ADCH]` of enabled external hardware trigger.

NOTE

Asserting more than one external hardware trigger select signal at the same time will result in unknown results. To avoid this, only select one external hardware trigger select signal prior to the next intended conversion.

When the conversion is completed, the result is placed in the data registers associated with the external hardware trigger received (active trigger selects `ADC_Rn`). The conversion complete flag associated with the external hardware trigger received (`ADC_HS[COCON]`) is then set and an interrupt is generated if the respective conversion complete interrupt has been enabled (`ADC_HCn[AIEN]=1`).

14.3.4 Conversion Control

Conversions is performed as determined by the `MODE` bits in `ADC_CFG` register.

Conversions can be initiated by either by a software trigger or hardware trigger. In addition, the ADC module can be configured for low power operation, long sample time, continuous conversion, hardware average and automatic compare of the conversion result to a software determined compare value.

14.3.4.1 Initiating Conversions

A conversion is initiated:

- Following a write to `ADC_HC0` (with `ADCHn` bits not all 1's) and if software triggered operation is selected (`ADTRG=0`).

- Following a hardware trigger event if hardware triggered operation is selected (ADTRG=1) and an external hardware trigger select event has occurred. The channel selected will depend on the active trigger select signal active selects ADC_HC1; if neither is active the off condition is selected).

Note

Selecting more than one external hardware trigger select signal (ext_hwts[n]) prior to a conversion completion will generate unknown results. To avoid this, only select one hardware trigger select signal (ext_hwts[n]) prior to a conversion completion.

- Following the transfer of the result to the data registers when continuous conversion is enabled (ADCO=1 in ADC_GC register).

If continuous conversion is enabled, a new conversion is automatically initiated after the completion of the current conversion. In software triggered operation (ADTRG=0), continuous conversions begin after ADC_HC0 is written and continue until aborted. In hardware triggered operation (ADTRG=1 and one external hardware trigger select event has occurred), continuous conversions begin after a hardware trigger event and continue until aborted.

If hardware averaging is enabled, a new conversion is automatically initiated after the completion of the current conversion until the correct number of conversions is completed. In software triggered operation, conversions begin after ADC_HC0 is written. In hardware triggered operation, conversions begin after a hardware trigger. If continuous conversions is also enabled, a new set of conversions to be averaged are initiated following the last of the selected number of conversions.

14.3.4.2 Completing Conversions

A conversion is completed when the result of the conversion is transferred into the data result registers. (provided the compare function & hardware averaging is disabled), this is indicated by the setting of COCON. If hardware averaging is enabled, COCON sets only, if the last of the selected number of conversions is complete. If the compare function is enabled, COCON sets and conversion result data is transferred only if the compare condition is true. If both hardware averaging and compare functions are enabled, then COCON sets only if the last of the selected number of conversions is complete and the compare condition is true. An interrupt is generated, if ADC_HCn[AIEN] is high at the

time that COCON is set and if DMAEN is set, DMA request is asserted, if COCON is set. Both the requests get deasserted when COCON is low, cleared, which happens when data is read.

In all modes a blocking mechanism prevents a new result from overwriting previous data in ADC_Rn, if the previous data is in the process of being read. When blocking is active (OVWREN=0 in ADC_CFG), the conversion result data transfer is blocked, COCON is not set, and the new result is lost. In all other cases of operation, when a conversion result data transfer is blocked, another conversion is initiated regardless of the state of ADCO (single or continuous conversions enabled).

Note

If continuous conversions are enabled, the blocking mechanism could result in the loss of data occurring at specific timepoints. To avoid this issue, the data must be read in fewer cycles than an ADC conversion time, accounting for interrupt or software polling loop latency.

If single conversions are enabled, the blocking mechanism could result in several discarded conversions and excess power consumption. To avoid this issue, the data registers must not be read after initiating a single conversion until the conversion completes.

14.3.4.3 Aborting Conversions

Any conversion in progress is aborted when:

- The MCU enters stop mode with ADACK not enabled.
- In software trigger mode, write to ADC_HC0 register, while ADC_HC0 is actively (already) controlling a conversion, aborts the current conversion. Since, any of the ADC_HC1 - ADC_HCn registers are not used for software trigger operation therefore, write to any of them neither initiate a new conversion nor abort the software triggered active conversion.
- In hardware trigger mode, write to any one of the ADC_HC0 - ADC_HCn register, while that specific ADC_HC0 - ADC_HCn register is actively controlling a conversion, aborts the current conversion.
- A write to any ADC register besides the ADC_HC0: ADC_HCn registers occurs . This indicates a mode of operation change has occurred and the current conversion is therefore invalid.

Note

When a conversion is aborted, the contents of the data result registers, ADCR_n are not altered. The data result registers continue to hold the values, transferred after the completion of the last successful conversion. If the conversion is aborted by a reset or stop (not operated with internal ADACK), ADCR_n (data result register) return to their reset states.

14.3.4.4 Power Control

The ADC module remains in its idle state until a conversion is initiated. If ADACK is selected as the conversion clock source but the asynchronous clock output is disabled (ADACKEN=0), the ADACK clock generator will also remain in its idle state (disabled) until a conversion is initiated. If the asynchronous clock output is enabled (ADACKEN=1), it will remain active regardless of the state of the ADC or the MCU power mode.

Power consumption when the ADC is active can be reduced by setting ADLPC..

14.3.4.5 Sample Time and Total Conversion Time

The total conversion time depends upon the following:

- the sample phase time (as determined by ADLSMP and ADSTS bits in ADC_CFG register),
- the compare phase time (determined by MODE bits)
- the frequency of the conversion clock (fADCK).
- the MCU bus frequency (for Handshaking and selection of clock)

Functional Description

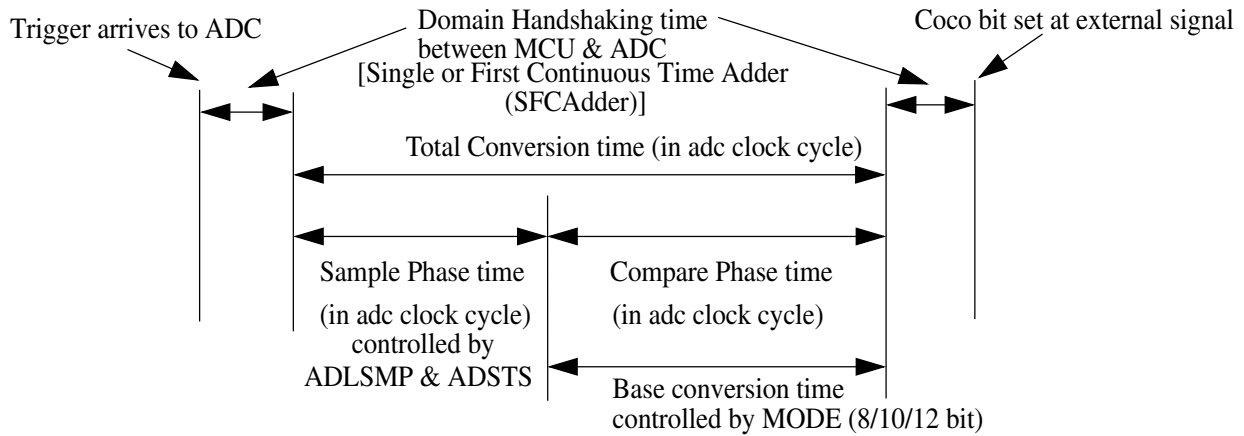

Figure 14-3. ADC conversion time details

After the module becomes active, sampling of the input begins. ADLSMP and ADSTS decide the sample time duration. When sampling is complete, the converter is isolated from the input channel and a successive approximation algorithm is performed to determine the digital value of the analog signal. The result of the conversion is transferred to ADC_Rn upon completion of the conversion algorithm.

If the bus frequency is less than the f_{ADCK} frequency, precise sample time for continuous conversions cannot be guaranteed .

The maximum total conversion time is determined by the clock source chosen and the divide ratio selected. The clock source is selectable by the ADICLK bits in ADC_CFG register, and the divide ratio is specified by the ADIV bits.

The maximum total conversion time for all configurations is summarized in [Equation 1 on page 508](#). Refer to [Table 14-2](#) through [Table 14-5](#) for the variables referenced in the equation.

$$\text{ConversionTime} = \text{SFCAdder} + \text{AverageNum} \times (\text{BCT} + \text{LSTAdder})$$

Equation 1.

Table 14-2. Single or First Continuous Time Adder (SFCAdder)

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
x	0x, 10	3 ADCK cycles (before starting of conversion) + 1ADCK (after end of conversion) + 2 bus clock cycles
1	11	3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) +

Table continues on the next page...

Table 14-2. Single or First Continuous Time Adder (SFCAdder) (continued)

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
		2 bus clock cycles
0	11	1.5 μ s + 3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles

Table 14-3. Average Number Factor (AverageNum)

AVGE	AVGS[1:0]	Average Number Factor (AverageNum)
0	xx	1
1	00	4
1	01	8
1	10	16
1	11	32

Table 14-4. Base Conversion Time (BCT) (compare phase duration)

Mode	Base Conversion Time (BCT) (compare phase duration)
8 bit	17 ADCK cycles
10 bit	21 ADCK cycles
12 bit	25 ADCK cycles

Table 14-5. Long Sample Time

ADLSMP	ADSTS	Long Sample Time Adder (LSTAdder)
0	00	3 ADCK cycles
0	01	5 ADCK cycles
0	10	7 ADCK cycles (default)
0	11	9 ADCK cycles
1	00	13 ADCK cycles
1	01	17 ADCK cycles
1	10	21 ADCK cycles
1	11	25 ADCK cycles

Note

The ADCK frequency must be between f_{ADCK} minimum and f_{ADCK} maximum to meet ADC specifications.

14.3.4.6 Conversion Time Examples

The following examples uses [Equation 1 on page 508](#) and the information provided in tables [Table 14-2](#) through [Table 14-5](#).

14.3.4.6.1 Typical conversion time configuration

A typical configuration for ADC conversion is: 10-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, ADLSMP=0,ADLSTS=10 and high speed conversion disabled. The conversion time for a single conversion is calculated by using [Equation 1 on page 508](#) and the information provided in [Table 14-6](#) through [Table 14-8](#). The table below list the variables of [Equation 1 on page 508](#).

Table 14-6. Typical Conversion Time

Variable	Time
SFCAdder	5 ADCK cycles + 5 bus clock cycles
AverageNum	1
BCT	21 ADCK cycles
LSTAdder	7

The resulting conversion time is generated using the parameters listed in [Table 14-6](#). So for Bus clock equal to 40 Mhz and ADCK equal to 40 Mhz the resulting conversion time is 0.95 us.

14.3.4.6.2 Long conversion time configuration

A configuration for long ADC conversion is: 12-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-8 ratio selected, and a bus frequency of 40 MHz, long sample time enabled (ADLSMP=1, ADSTS=11) and configured for longest adder and high speed conversion disabled. Average enabled for 32 conversions (AVGE=1, AVGS=11). The conversion time for this conversion is calculated by using equation on [Sample Time and Total Conversion Time](#) and the information provided in [Table 14-2](#) through [Table 14-5](#). The table below lists the variables of equation.

Table 14-7. Typical Conversion Time

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	32
BCT	25 ADCK cycles
LSTAdder	25 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 14-7](#). So for Bus clock equal to 40 Mhz and ADCK equal to 5 Mhz the resulting conversion time is 10.0226 us (AverageNum). This results in a total conversion time of 320.725 us.

14.3.4.6.3 Short conversion time configuration

A configuration for short ADC conversion is: 8-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, long sample time disabled (ADLSMP=0, ADSTS=00) and high speed conversion enabled. The conversion time for this conversion is calculated by using the equation and the information provided in [Table 14-2](#) to [Table 14-5](#). The table below list the variables of equation.

Table 14-8. Typical Conversion Time

Variable	Time
SFCAdder	3 ADCK cycles + 5 bus clock cycles
AverageNum	1
BCT	17 ADCK cycles
LSTAdder	3 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 14-8](#). So for Bus clock equal to 40Mhz and ADCK equal to 40Mhz the resulting conversion time is 700 ns.

14.3.4.7 Hardware Average Function

The hardware average function can be enabled (AVGE=1) to perform a hardware average of multiple conversions. The number of conversions is determined by the AVGS[1:0] bits, which select 4, 8, 16 or 32 conversions to be averaged. While the hardware average function is in progress the ADACT bit will be set.

After the selected input is sampled and converted, the result is placed in an accumulator from which an average is calculated once the selected number of conversions has been completed. When hardware averaging is selected the completion of a single conversion will not set the COCON bit.

If the compare function is either disabled or evaluates true, after the selected number of conversions are completed, the average conversion result is transferred into the data result registers, ADC_Rn , and the COCON bit is set. An ADC interrupt is generated upon the setting of COCON if the respective ADC interrupt is enabled (AIENn=1).

14.3.5 Automatic Compare Function

The compare function can be configured to check if the result is less than or greater-than-or-equal-to a single compare value, or if the result falls within or outside a range determined by two compare values. The compare mode is determined by ACFGT, ACREN and the values in the compare value register (ADC_CV). After the input is sampled and converted, the compare values (CV1 and CV2) are used as described in the table below. There are six compare modes as shown in the table below.

Table 14-9. Compare Modes

ACFGT	ACREN	CV1 relative to CV2	Function	Compare Mode Description
0	0	-	Less than threshold	Compare true if the result is less than the CV1 registers.
1	0	-	Greater than or equal to threshold	Compare true if the result is greater than or equal to CV1 registers.
0	1	Less than or equal	Outside range, not inclusive	Compare true if the result is less than CV1 Or the result is Greater than CV2
0	1	Greater than	Inside range, not inclusive	Compare true if the result is less than CV1 And the result is greater than CV2
1	1	Less Than or equal	Inside range, inclusive	Compare true if the result is greater than or equal to CV1 And the result is less than or equal to CV2
1	1	Greater than	Outside range, inclusive	Compare true if the result is greater than or equal to CV1 Or the result is less than or equal to CV2

With the ADC range enable bit set, ADCREN =1, if compare value 1(CV1 value) is less than or equal to the compare value 2 (CV2 value), setting ACFGT will select a trigger-if-inside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-outside-compare-range, not-inclusive-of-endpoints function.

If CV1 is greater than the CV2, setting ACFGT will select a trigger-if-outside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-inside-compare-range, not-inclusive-of-endpoints function.

If the condition selected evaluates true, COCO_n is set.

Upon completion of a conversion while the compare function is enabled, if the compare condition is not true, COCO_n is not set and the conversion result data will not be transferred to the result register. If the hardware averaging function is enabled, the compare function compares the averaged result to the compare values. The same compare function definitions apply. An ADC interrupt is generated upon the setting of COCO_n if the respective ADC interrupt is enabled (ADC_HC_n[AIEN]=1).

Note

The compare function can monitor the voltage on a channel while the MCU is in wait or stop3 mode. The ADC interrupt wakes the MCU when the compare condition is met.

14.3.6 Calibration Function

The ADC contains a self-calibration function that is required to achieve the specified accuracy. Calibration should be run or valid calibration values should be written after power up and system reset (as the calibration register will be reset on reset assertion) with specified settings before any conversion is initiated. The calibration function sets the calibration value at the end of running the full calibration sequence in ADC_CAL register. The user must configure the ADC correctly prior to starting the calibration process, and must allow the process to run the full calibration sequence by checking the status of ADC_GC[*CAL*] and ADC_GS[*CALF*] so that the generated calibration value can be loaded.

Prior to calibration, the user must configure the ADC's clock source and frequency, low power configuration, voltage reference selection, sample time, averaging, and the high speed configuration according to the application's clock source availability and needs. If the application uses the ADC in a wide variety of configurations, the configuration for which the highest accuracy is required should be selected, or multiple calibrations can be done for the different configurations. The input channel, conversion mode, continuous function and compare function are all ignored during the calibration process.

To initiate calibration, the user sets the CAL bit and the calibration will automatically begin if the ADTRG bit = 0. If ADTRG = 1, the CAL bit will not get set and the calibration fail flag (CALF) will be set. While calibration is active, no ADC register can be written and no stop mode may be entered or the calibration routine will be aborted causing the CAL bit to clear and the CALF bit to set.

At the end of a calibration sequence the COCO[0] bit of the ADC_HS register will be set. The ADC_HCn[AIEN] bit can be used to allow an interrupt to occur at the end of a calibration sequence. If, at the end of calibration routine, the CALF bit is not set, the automatic calibration routine completed successfully.

To complete calibration, the user must follow the below procedure :

- Configure ADC_CFG with actual operating values for maximum accuracy.
- Configure the ADC_GC values along with CAL bit
- Check the status of CALF bit in ADC_GS and the CAL bit in ADC_GC
- When CAL bit becomes '0' then check the CALF status and COCO[0] bit status

When complete the user may reconfigure and use the ADC as desired.

A second calibration may also be performed if desired by clearing and again setting the CAL bit

Overall the calibration routine may take as many as 14000 ADCK cycles and 100 bus cycles, depending on the results and the clock source chosen.

14.3.7 User Defined Offset Function

The ADC Offset Correction Register (ADC_OFS) contains the user configured offset value. This register is 13 bit wide. The value in MSB (13th bit) is the operation bit, if this bit is '0' then the value in rest 12 bit is added with the converted result value to generate final result to be loaded into ADC_Rn and if this bit is '1' then this field is subtracted from converted value to generate final Result (ADC_Rn). If the Final result is above the maximum or below the minimum result value, it is forced to the appropriate limit for the current mode of operation. Forced to 0x0FFF if over and 0x0000 if lower for 12 bit mode.

The offset value has no effect during calibration and BIST test on final result.

The formatting of the ADC Offset Register is different from the Data Result Registers (ADC_Rn) to preserve the resolution of the value regardless of the conversion mode selected. Lower order bits are ignored in lower resolution modes. For example, in 8b single-ended mode, the bits OFS[11:4] are subtracted from D[7:0] when bit OFS[12] (sign bit) is '1' ; indicates subtraction and bits OFS[4:0] are ignored. For 12b single-ended mode, bits OFS[11:0] are directly subtracted from the conversion result data CDATA[11:0] when OFS[12] (sign bit) is '1'. The similar is the addition operation when OFS[12](sign bit) is 0.

ADC_OFS is manually set according to user requirements once the self calibration sequence is done (CAL is cleared). The user have to write ADC_OFS with desired value.

NOTE

There is an effective limit to the values of Offset that can be set by the user. If the magnitude of the offset is too great the results of the conversions will cap off at the limits.

The offset function may be employed by the user to remove application offsets or DC bias values. An offset correction that results in an out-of-range value will be forced to the minimum or maximum value.

For applications which may change the offset repeatedly during operation, it is recommended to store the initial offset value in flash so that it can be recovered and added to any user offset adjustment value and the sum stored in the ADC_OFS registers.

14.3.8 Temperature Sensor

The ADC module includes a temperature sensor whose output is connected to one of the ADC analog channel inputs (ADC_HCn[AIEN] = 011010 = 26). This channel can be selected through configuring the ADCHn bits of any ADC_HCn register. Any trigger on this will give a temperature value converted for further processings.

[Equation 2 on page 515](#) provides an approximate transfer function of the temperature sensor .

$$\text{Temp} = 25 - ((V_{\text{TEMP}} - V_{\text{TEMP25}}) \div m)$$

Equation 2. Temperature Sensor Transfer Function

where:

- V_{TEMP} is the voltage of the temperature sensor channel at the ambient temperature.
- V_{TEMP25} is the voltage of the temperature sensor channel at 25°C.
- m is the hot or cold voltage versus temperature slope in V/°C.

For temperature calculations, use the V_{TEMP25} and m values from the ADC Electricals table.

In application code, the user reads the temperature sensor channel, calculates V_{TEMP} , and compares to V_{TEMP25} . If V_{TEMP} is greater than V_{TEMP25} the cold slope value is applied in [Equation 2 on page 515](#). If V_{TEMP} is less than V_{TEMP25} the hot slope value is applied in [Equation 2 on page 515](#).

For more information on using the temperature sensor, consult AN3031.

14.3.9 MCU Wait Mode Operation

Wait mode is a **lower power-consumption standby mode** from which **recovery is fast** because **the clock sources remain active**. If a conversion is in progress when the MCU enters wait mode, it continues until completion. Conversions can be initiated while the MCU is in wait mode by means of the hardware trigger or if continuous conversions are enabled.

The bus clock, bus clock divided by two, and ADACK are available as conversion clock sources while in wait mode. The use of ALTCLK as the conversion clock source in wait is dependent on the definition of ALTCLK for the specific MCU.

A conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from wait mode.

If the compare and hardware averaging functions are disabled, a conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from wait mode if the respective ADC interrupt is enabled ($ADC_HCn[AIEN]=1$).

If the hardware averaging function is enabled the COCON will set (and generate an interrupt if enabled) when the selected number of conversions are complete.

If the compare function is enabled the COCON will set (and generate an interrupt if enabled) only if the compare conditions are met.

If a single conversion is selected and the compare trigger is not met, the ADC will return to its idle state and cannot wake the MCU from wait mode unless a new conversion is initiated by the hardware trigger.

14.3.10 MCU Stop Mode Operation

Stop mode is a low power-consumption standby mode during which most or all clock sources on the MCU are disabled. Stop mode entered when stop indication comes from the MCU.

14.3.10.1 Stop Mode With ADACK Disabled

If the asynchronous clock, ADACK, is not selected as the conversion clock, executing a stop instruction aborts the current conversion and places the ADC in its idle state. The contents of the ADC registers, including ADC_Rn are unaffected by stop mode. After exiting from stop mode, a software or hardware trigger is required to resume conversions.

14.3.10.2 Stop Mode With ADACK Enabled

If ADACK is selected as the conversion clock, the ADC continues operation during stop mode. For guaranteed ADC operation, the MCU's voltage regulator must remain active during stop mode.

If a conversion is in progress when the MCU enters stop mode, it continues until completion. Conversions can be initiated while the MCU is in stop mode by means of the hardware trigger or if continuous conversions are enabled.

A conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from stop mode :

Note

The ADC module can wake the system from low-power stop and cause the MCU to begin consuming run-level currents without generating a system level interrupt. To prevent this scenario, software should ensure the conversion result data transfer blocking mechanism (discussed in [Completing Conversions](#)) is cleared when entering stop and continuing ADC conversions.

14.4 Initialization Information

This section gives an example that provides some basic direction on how to initialize and configure the ADC module. User can configure the module for 8, 10, 12 bit resolution, single or continuous conversion, and a polled or interrupt approach, among many other options.

14.4.1 ADC Module Initialization Example

This section describes the initialization sequence along with pseudo-code.

14.4.1.1 Initialization Sequence

Before the ADC module can be used to complete conversions, an initialization procedure must be performed. A typical sequence is as follows:

- Calibrate the ADC by following the calibration instructions in [Calibration Function](#)
- Update the configuration register (ADC_CFG) to select the input clock source and the divide ratio used to generate the internal clock, ADCK. This register is also used for selecting sample time and low-power configuration.
- Update Genral control register (ADC_GC) to select whether conversions will be continuous or completed only once (ADCO) and to select whether to perform hardware averaging, etc.
- Update Trigger control register (ADC_HCn) to select the conversion trigger (hardware or software, i.e. configure ADTRG bit) and compare function options, if enabled.

14.4.1.2 Pseudo-Code Example

In this example, the ADC module is set up with interrupts enabled to perform a single 10-bit conversion at low power with a long sample time on input channel 1, where the internal ADCK clock is derived from the bus clock divided by 1.

ADC_CFG

Bit 7	ADLPC	1	Configures for low power (lowers maximum clock speed).
Bit 6:5	ADIV	00	Sets the ADCK to the input clock ÷ 1.
Bit 4	ADLSMP	1	Configures for long sample time.
Bit 3:2	MODE	10	Sets mode at 10-bit conversions.
Bit 1:0	ADICLK	00	Selects bus clock as input clock source.

ADC_GC

Bit 7	CAL	0	Flag indicates if a conversion is in progress.
Bit 6	ADCO	0	Software trigger selected.
Bit 5	AVGE	0	Compare function disabled.
Bit 4	ACFE	0	Compare function disabled.
Bit 3	ACFGT	0	Not used in this example.
Bit 2	ACREN	0	Not used in this example.
Bit 1	DMAEN	0	Not used in this example.
Bit 0	ADACKEN	0	Not used in this example.

ADC_HC0

Bit 7	AIEN	1	Conversion complete interrupt enabled.
Bit 4:0	ADCH	00001	Input channel 1 selected as ADC input channel.

ADC_R0

Holds results of conversion. Read high byte (ADCRHA) before low byte (ADCRLA) so that conversion data cannot be overwritten with data from the next conversion.

ADC_CV

Holds compare values when compare function enabled.

ADC_PCTL

AD1 pin I/O control disabled. All other AD pins remain general purpose I/O pins.

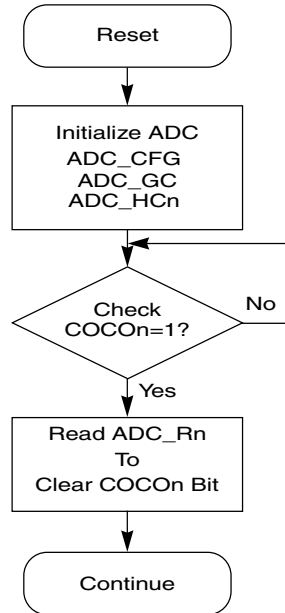

Figure 14-4. Initialization Flowchart for Example

14.5 Application Information

This section contains information for using the ADC module in applications. The ADC has been designed to be integrated into a microcontroller for use in embedded control applications requiring an A/D converter.

14.5.1 Sources of Error

Several sources of error exist for A/D conversions. These are discussed in the following sections.

14.5.1.1 Sampling Error

For proper conversions, the input must be sampled long enough to achieve the proper accuracy. Given the maximum input resistance of approximately $7\text{k}\Omega$ and input capacitance of approximately 1.3 pF , sampling to within $1/4\text{LSB}$ (at 12-bit resolution)

can be achieved within the nominal sample window (6 cycles @ 40 MHz maximum ADCK frequency) provided the resistance of the external analog source (R_{AS}) is kept below 4 k Ω .

Higher source resistances or higher-accuracy sampling is possible by setting ADLSMP and changing the ADSTS bits (to increase the sample window) or decreasing ADCK frequency to increase sample time.

14.5.1.2 Pin Leakage Error

Leakage on the I/O pins can cause conversion error if the external analog source resistance (R_{AS}) is high. If this error cannot be tolerated by the application, keep R_{AS} lower than $V_{DDAD} / (2^N * I_{LEAK})$ for less than 1/4LSB leakage error ($N = 8$ in 8-bit, 10 in 10-bit or 12 in 12-bit mode).

14.5.1.3 Noise-Induced Errors

System noise that occurs during the sample or conversion process can affect the accuracy of the conversion. The ADC accuracy numbers are guaranteed as specified only if the following conditions are met:

- There is a 0.1 μ F low-ESR capacitor from V_{REFH} to V_{REFL} .
- There is a 0.1 μ F low-ESR capacitor from V_{DDAD} to V_{SSAD} .
- If inductive isolation is used from the primary supply, an additional 1 μ F capacitor is placed from V_{DDAD} to V_{SSAD} .
- V_{SSAD} (and V_{REFL} , if connected) is connected to V_{SS} at a quiet point in the ground plane.
- Operate the MCU in wait or stop mode before initiating (hardware triggered conversions) or immediately after initiating (hardware or software triggered conversions) the ADC conversion.
 - For software triggered conversions, immediately follow the write to ADCSC1 with a wait instruction or stop instruction.
 - For stop mode operation, select ADACK as the clock source. Operation in stop reduces V_{DD} noise but increases effective conversion time due to stop recovery.
- There is no I/O switching, input or output, on the MCU during the conversion.

There are some situations where external system activity causes radiated or conducted noise emissions or excessive V_{DD} noise is coupled into the ADC. In these situations, or when the MCU cannot be placed in wait or stop or I/O activity cannot be halted, these recommended actions may reduce the effect of noise on the accuracy:

- Place a 0.01 μF capacitor (CAS) on the selected input channel to V_{REFL} or V_{SSAD} (this improves noise issues, but affects the sample rate based on the external analog source resistance).
- Average the result by converting the analog input many times in succession and dividing the sum of the results. Four samples are required to eliminate the effect of a 1LSB, one-time error.
- Reduce the effect of synchronous noise by operating off the asynchronous clock (ADACK) and averaging. Noise that is synchronous to ADCK cannot be averaged out.

14.5.1.4 Code Width and Quantization Error

Note

This will remain the same as long as the result is rounded for 8 and 10-bit modes. If the result is truncated in 8/10b modes then they will match 12b mode where the quantization error is -1 to 0

The ADC quantizes the ideal straight-line transfer function into 4096 steps (in 12-bit mode). Each step ideally has the same height (1 code) and width. The width is defined as the delta between the transition points to one code and the next. The ideal code width for an N bit converter (in this case N can be 8, 10 or 12), defined as 1LSB, is:

$$1\text{lsb} = (V_{REFH} - V_{REFL}) / 2^N$$

There is an inherent quantization error due to the digitization of the result. For 8-bit or 10-bit conversions the code transitions when the voltage is at the midpoint between the points where the straight line transfer function is exactly represented by the actual transfer function. Therefore, the quantization error will be $\pm 1/2$ lsb in 8- or 10-bit mode. As a consequence, however, the code width of the first (0x000) conversion is only 1/2 lsb and the code width of the last (0xFF or 0x3FF) is 1.5 lsb.

For 12-bit conversions the code transitions only after the full code width is present, so the quantization error is -1 lsb to 0 lsb and the code width of each step is 1 lsb.

14.5.1.5 Linearity Errors

The ADC may also exhibit non-linearity of several forms. Every effort has been made to reduce these errors but the system should be aware of them because they affect overall accuracy. These errors are:

- Zero-scale error (E_{ZS}) (sometimes called offset) — This error is defined as the difference between the actual code width of the first conversion and the ideal code width (1/2 lsb in 8-bit or 10-bit modes and 1 lsb in 12-bit mode). If the first conversion is 0x001, the difference between the actual 0x001 code width and its ideal (1 lsb) is used.
- Full-scale error (E_{FS}) — This error is defined as the difference between the actual code width of the last conversion and the ideal code width (1.5 lsb in 8-bit or 10-bit modes and 1LSB in 12-bit mode). If the last conversion is 0x3FE, the difference between the actual 0x3FE code width and its ideal (1LSB) is used.
- Differential non-linearity (DNL) — This error is defined as the worst-case difference between the actual code width and the ideal code width for all conversions.
- Integral non-linearity (INL) — This error is defined as the highest-value the (absolute value of the) running sum of DNL achieves. More simply, this is the worst-case difference of the actual transition voltage to a given code and its corresponding ideal transition voltage, for all codes.
- Total unadjusted error (TUE) — This error is defined as the difference between the actual transfer function and the ideal straight-line transfer function and includes all forms of error.

14.5.1.6 Code Jitter, Non-Monotonicity, and Missing Codes

Analog-to-digital converters are susceptible to three special forms of error. These are code jitter, non-monotonicity, and missing codes.

Code jitter is when, at certain points, a given input voltage converts to one of two values when sampled repeatedly. Ideally, when the input voltage is infinitesimally smaller than the transition voltage, the converter yields the lower code (and vice-versa). However, even small amounts of system noise can cause the converter to be indeterminate (between two codes) for a range of input voltages around the transition voltage. This range is normally around $\pm 1/2$ lsb in 8-bit or 10-bit mode, or around 2 lsb in 12-bit mode, and increases with noise.

This error may be reduced by repeatedly sampling the input and averaging the result. Additionally the techniques discussed in [Noise-Induced Errors](#) reduces this error.

Non-monotonicity is defined as when, except for code jitter, the converter converts to a lower code for a higher input voltage. Missing codes are those values never converted for any input value.

In 8-bit or 10-bit mode, the ADC is guaranteed to be monotonic and have no missing codes.

14.6 Memory map and register definition

The ADC-Digital contains 32-bit, word aligned, byte enables registers; byte or half word access are not supported. All configuration registers are accessible via 32-bit access bus Interface. Write access to reserved locations have no impact while read access to reserved locations always return 0.

NOTE

No protection or indication mechanism is available (for example, 32-bit access starting with address offset value 0x01 or 0x02 or 0x03). The ADC does not check for correctness of the programmed values in the registers and the programmer must ensure that correct values are being written.

ADC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
228_0000	Control register for hardware triggers (ADC1_HC0)	32	R/W	See section	14.6.1/525

14.6.1 Control register for hardware triggers (ADCx_HC0)

ADC_HC0 can be used for both software and hardware trigger mode. Other ADC_HCn(n=1..) are for use only in hardware trigger mode. The ADC_HC0 to ADC_HCn(n=0,1) registers have identical fields, and are used to control ADC operation. At any one point in time, only one of the ADC_HC0 to ADC_HCn(n=0,1) registers is actively controlling ADC conversions. Updating ADC_HC0 while ADC_HCn(n=0,1) is actively controlling a conversion is allowed (and vice-versa for any of the ADC_HCn(n=0,1) registers). Writing ADC_HC0 while ADC_HC0 is actively controlling a conversion aborts the current conversion. In software trigger mode (ADTRG=0), writes to ADC_HC0 subsequently initiates a new conversion (if the ADCH bits are equal to a value other than all 1s). Similarly, writing any of the ADC_HCn(n=0,1) registers while that specific ADC_HC register is actively controlling a conversion aborts the current conversion. ADC_HC1 register is not used for software trigger operation and therefore writes to any of them do not initiate a new conversion.

14.6.3 Status register for HW triggers (ADCx_HS)

Bit 0 is used for both software and hardware trigger modes of operation. Bit 1 to bit (n-1) indicate the rest of the HW triggers' statuses similar to bit 0, potentially corresponding to multiple ADC_HC registers (for use only in hardware trigger mode).

Address: Base address + 8h offset

ADCx_HS field descriptions

Field	Description
31–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 COCO1	See description for COCO0.
0 COCO0	Conversion Complete Flag The COCO _n flag is a read-only bit that is set each time a conversion is completed when the compare function is disabled (ADC_GC[ACFE]=0) and the hardware average function is disabled (ADC_GC[AVGE]=0). When the compare function is enabled (ADC_GC[ACFE]=1), the COCO _n flag is set upon completion of a conversion only if the compare result is true. When the hardware average function is enabled (ADC_GC[AVGE]=1), the COCO _n flag is set upon completion of the selected number of conversions (determined by the ADC_CFG[AVGS] field). The COCO0 flag will also set at the completion of a Calibration and Test sequence. A COCO _n bit is cleared when the respective ADC_HC _n is written or when the respective ADC_R _n is read.

14.6.4 Data result register for HW triggers (ADCx_R0)

Contains the result of an ADC conversion of the channel selected by the respective hardware trigger and channel control register (ADC_HC0:ADC_HCn). For every ADC_HC0:ADC_HCn status and channel control register, there is a respective ADC_R0:ADC_Rn data result register. Unused bits in the ADC_Rn register are cleared in unsigned right justified modes. For example when configured for 10-bit single-ended mode, D[31:10] are cleared. The table below describes the behavior of the data result registers in the different modes of operation.

Table 14-29. Data Result Register Description

ADCx_CFG field descriptions

Field	Description
31–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 OVWREN	Data Overwrite Enable Controls the overwriting of the next converted Data onto the existing (previous) unread data into the Data result register. 1 Enable the overwriting. 0 Disable the overwriting. Existing Data in Data result register will not be overwritten by subsequent converted data.
15–14 AVGS	Hardware Average select Determines how many ADC conversions will be averaged to create the ADC average result. This functionality is activated when ADC_GC[AVGE] = 1. 00 4 samples averaged 01 8 samples averaged 10 16 samples averaged 11 32 samples averaged
13 ADTRG	Conversion Trigger Select Selects the type of trigger used for initiating a conversion. Two types of trigger are selectable: software trigger and hardware trigger. When software trigger is selected, a conversion is initiated following a write to ADC_HC0. When hardware trigger is selected, a conversion is initiated following the assertion of a pulse on Alternate Hardware trigger input along with the assertion of the enable of respective the hardware Triggers input .

Table continues on the next page...

ADCx_CFG field descriptions (continued)

Field	Description
	0 Software trigger selected 1 Hardware trigger selected
12–11 REFSEL	Voltage Reference Selection Selects the voltage reference source used for conversions (see the chip-specific SARADC information for details). 00 Selects VREFH/VREFL as reference voltage. 01 Reserved 10 Reserved 11 Reserved
10 ADHSC	High Speed Configuration This bit configures the ADC for high speed operation. The internal ADC clock is higher than normal. 0 Normal conversion selected. 1 High speed conversion selected.
9–8 ADSTS	Defines the sample time duration. This has two modes, short and long. When long sample time is selected (ADLSMP=1) this works for long sample time otherwise this works for short sample. This allows higher impedance inputs to be accurately sampled or to maximize conversion speed for lower impedance inputs. Longer sample times can also be used to lower overall power consumption when continuous conversions are enabled if high conversion rates are not required. 00 Sample period (ADC clocks) = 2 if ADLSMP=0b Sample period (ADC clocks) = 12 if ADLSMP=1b 01 Sample period (ADC clocks) = 4 if ADLSMP=0b Sample period (ADC clocks) = 16 if ADLSMP=1b 10 Sample period (ADC clocks) = 6 if ADLSMP=0b Sample period (ADC clocks) = 20 if ADLSMP=1b 11 Sample period (ADC clocks) = 8 if ADLSMP=0b Sample period (ADC clocks) = 24 if ADLSMP=1b
7 ADLPC	Low-Power Configuration Puts the ADC hard block into low power mode and reduces the comparator enable period by controlling its timing in the SAR controller block towards the analog hard block. The signal indicating low power mode to the Analog block is asserted when this bit is set. 0 ADC hard block not in low power mode. 1 ADC hard block in low power mode.
6–5 ADIV	Clock Divide Select Selects the divide ratio used by the ADC to generate the internal clock ADCK. 00 Input clock 01 Input clock / 2 10 Input clock / 4 11 Input clock / 8

Table continues on the next page...

ADCx_GC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 CAL	Calibration CAL begins the calibration sequence when set. This bit stays set while the calibration is in progress and is cleared when the calibration sequence is complete. The ADC_GS[CALF] bit must be checked to determine the result of the calibration sequence. Once started, the calibration routine cannot be interrupted by writes to the ADC registers or the results will be invalid and the ADC_GS[CALF] bit will set. Setting the CAL bit will abort any current conversion.
6 ADCO	Continuous Conversion Enable Enables continuous conversions. 0 One conversion or one set of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion. 1 Continuous conversions or sets of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion.
5 AVGE	Hardware average enable Enables the hardware average function of the ADC. 0 Hardware average function disabled 1 Hardware average function enabled
4 ACFE	Compare Function Enable Enables the compare function. 0 Compare function disabled 1 Compare function enabled
3 ACFGT	Compare Function Greater Than Enable Configures the compare function to check the conversion result relative to the compare value register (ADC_CV) based upon the value of ACREN (bit 2 in ADC_GC register). The ACFE bit must be set for ACFGT to have any effect. 0 Configures "Less Than Threshold, Outside Range Not Inclusive and Inside Range Not Inclusive" functionality based on the values placed in the ADC_CV register. 1 Configures "Greater Than Or Equal To Threshold, Outside Range Inclusive and Inside Range Inclusive" functionality based on the values placed in the ADC_CV registers.
2 ACREN	Compare Function Range Enable Configures the compare function to check the conversion result of the input being monitored is either between or outside the range formed by the compare values in register (ADC_CV) determined by the value of ACFGT. The ACFE bit must be set for ACFGT to have any effect. 0 Range function disabled. Only the compare value 1 of ADC_CV register (CV1) is compared. 1 Range function enabled. Both compare values of ADC_CV registers (CV1 and CV2) are compared.
1 DMAEN	DMA Enable Enables the DMA logic.

Table continues on the next page...

ADCx_GC field descriptions (continued)

Field	Description
	0 DMA disabled (default) 1 DMA enabled
0 ADACKEN	Asynchronous clock output enable Enables the ADC's asynchronous clock source and the clock source output regardless of the conversion and input clock select (ADC_CFG[ADICLK]) settings of the ADC. Based on MCU configuration, the asynchronous clock may be used by other modules (see module introduction section). Setting this bit allows the clock to be used even while the ADC is idle or operating from a different clock source. Also, latency of initiating a single or first-continuous conversion with the asynchronous clock selected is reduced since the ADACK clock is already operational. 0 Asynchronous clock output disabled; Asynchronous clock only enabled if selected by ADICLK and a conversion is active. 1 Asynchronous clock and clock output enabled regardless of the state of the ADC

14.6.8 General status register (ADCx_GS)

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 1Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	0																
W	[Shaded]

Reset														0	0	0	

ADCx_GS field descriptions

Field	Description
31–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 AWKST	Asynchronous wakeup interrupt status Holds the status of asynchronous interrupt status that occurred during stop mode. This bit is set when ipg_stop is deasserted and ipg_clk has started. It is cleared by writing '1' to it. Clearing this bit also deasserts the Asynchronous interrupt to CPU. 1 Asynchronous wake up interrupt occurred in stop mode. 0 No asynchronous interrupt.
1 CALF	Calibration Failed Flag Displays the result of the calibration sequence. The calibration sequence will fail if Hardware Trigger is selected (i.e. ADC_CFG[ADTRG] = 1), or any ADC register is written, or any stop mode is entered before the calibration sequence completes. The CALF bit is cleared by writing a 1 to it. 0 Calibration completed normally. 1 Calibration failed. ADC accuracy specifications are not guaranteed.
0 ADACT	Conversion Active Indicates that a conversion or hardware averaging is in progress. ADACT is set when a conversion is initiated and cleared when a conversion is completed or aborted. 0 Conversion not in progress. 1 Conversion in progress.

14.6.9 Compare value register (ADCx_CV)

Contains compare values used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1). The compare values are right justified as shown Figure . Therefore, the compare function only uses the compare value register bits that are related to the ADC mode of operation. (e.g. in 8 bit mode, CV1 = ADC_CV[7:0] and CV2 = ADC_CV[23:16], similarly in 10 bit mode, CV1 = ADC_CV[9:0] and CV2 = ADC_CV[25:16] etc.) The compare value 2 in this register is utilized only when the compare range function is enabled (ADC_GC[ACREN]=1).

Address: Base address + 20h offset

ADCx_CV field descriptions

Field	Description
31–28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
27–16 CV2	Compare Value 2 Contains a compare value used to compare with the conversion result when the compare function and compare range function are enabled (ADC_GC[ACFE]=1, ADC_GC[ACREN]=1).
15–12 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CV1	Compare Value 1 Contains a compare value used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1).

14.6.10 Offset correction value register (ADCx_OFS)

Contains the user-defined offset error correction value. This register is 13 bits wide. The value in the most significant bit (13th bit) is the operation bit. If this bit is ‘0’ then the value in the other 12 bits is added with the converted result value to generate final result to be loaded into ADC_Rn; if this bit is ‘1’ then this field is subtracted from converted value to generate final result (ADC_Rn).

Address: Base address + 24h offset

12 SIGN	Sign bit 0 The offset value is added with the raw result 1 The offset value is subtracted from the raw converted value
OFS	Offset value User configurable offset value.

14.6.11 Calibration value register (ADCx_CAL)

Contains calibration information that is generated by the calibration function. This register contains a calibration value of four bits(CAL[3:0]); this is automatically set once the self calibration sequence is done (ADC_SC[CAL] bit is cleared). If this register is written to by the user after calibration, the linearity error specifications may not be met.

Address: Base address + 28h offset

ADCx_CAL field descriptions

Field	Description
31–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
CAL_CODE	Calibration Result Value This value is automatically loaded and updated at the end of calibration.

Chapter 15

AHB to IP Bridge (AIPSTZ)

15.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). The peripheral bridge acts as an interface between the system bus and lower bandwidth IP Slave (IPS) bus peripherals.

15.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. Access permissions are based on bus master (e.g. DMA or core) privilege levels and resource domain. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

15.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 15-1. AIPSTZ Clocks

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

15.3 General Operation

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

It occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

The AIPSTZ prevents access to a peripheral if the transaction originated from a source from a resource domain that has been explicitly omitted. Resource domains are assigned in the RDC submodule. Please refer to the RDC chapter for programming details.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

15.4 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

15.5 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

Masters and peripherals are assigned to one or more resource domains in the RDC submodule (see the RDC chapter for details). Depending on RDC programming, masters transactions through the AIPSTZ may or may not be allowed access to peripherals in different resource domains.

15.6 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

15.7 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ_MPRs), the Peripheral Access Control registers (AIPSTZ_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

15.7.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

Table 15-2. Peripheral Access Configuration options

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (`sec_config_X`) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 15-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

```
sec_config_0 [7:0] = 8'b0011_0011
```

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

Table 15-3. Security Levels

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your Freescale representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line ``csu_sec_level[2:0]'` corresponding to each peripheral X.

15.8 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

AIPSTZ memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
0	Master Priviledge Registers (AIPSTZ_MPR)	32	R/W	7700_0000h	15.8.1/544
40	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)	32	R/W	4444_4444h	15.8.2/547
44	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR1)	32	R/W	4444_4444h	15.8.3/550
48	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR2)	32	R/W	4444_4444h	15.8.4/553
4C	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR3)	32	R/W	4444_4444h	15.8.5/556
50	Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR4)	32	R/W	4444_4444h	15.8.6/559

15.8.1 Master Priviledge Registers (AIPSTZ_MPR)

Each AIPSTZ_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 15-6](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in [Table 15-7](#).

Table 15-6. MPROT Field

Bit	Field	Description
3	MBW	Master Buffer Writes - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	Master Trusted for Reads - This bit determines whether the master is trusted for read accesses.
1	MTW	Master Trusted for Writes - This bit determines whether the master is trusted for write accesses.
0	MPL	Master Privilege Level - This bit determines how the privilege level of the master is determined.

NOTE

The reset value is set to 0000_0000_7700_0000, which makes master 0 and master 1 (ARM CORE) the trusted masters. Trusted software can change the settings after reset.

Table 15-7. Master Index Allocation

Master Index	Master Name	Comments
Master 0	All masters excluding ARM core, SDMA and CAAM	Share the same number allocation.
Master 1	ARM A9 CORE	
Master 2	CAAM	
Master 3	SDMA	
Master 4	Reserved	
Master 5	ARM M4 Core	
Master 6-15	Reserved

15.8.2 Off-Platform Peripheral Access Control Registers (AIPSTZ_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ_OPACR has the following format shown in [Table 15-9](#)

Table 15-9. OPAC Field

Bit	Field	Description
3	BW	Buffer Writes - This bit determines whether write accesses to this peripheral are allowed to be buffered. ¹
2	SP	Supervisor Protect - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	Write Protect - This bit determines whether the peripheral allows write accesses.
0	TP	Trusted Protect - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

Address: 0h base + 40h offset = 40h

Chapter 16

Asynchronous Sample Rate Converter (ASRC)

16.1 Overview

The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated with an input clock into a signal associated with a different output clock.

The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The ASRC supports up to three sampling rate pairs.

The incoming audio data to this chip may be received from various sources at different sampling rates. The outgoing audio data of this chip may have different sampling rates and it can also be associated with output clocks that are asynchronous to the input clocks.

The ASRC is implemented as a co-processor in hardware, with minimal ARM Platform intervention required.

[Figure 16-1](#) is a system view of the connection between the ASRC block and other blocks.

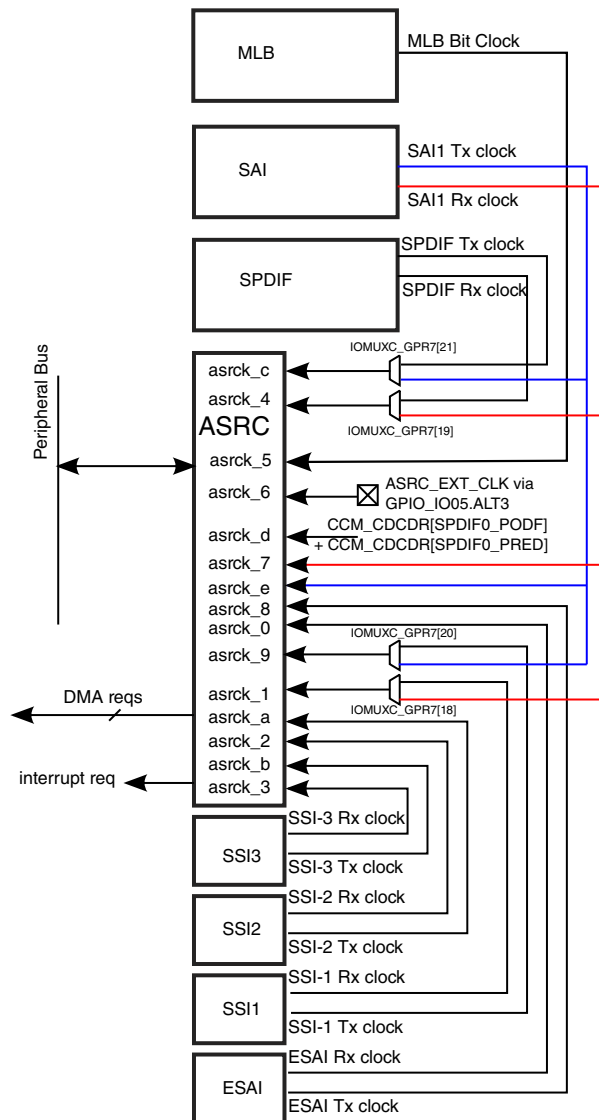

Figure 16-1. General System Overview

Figure 16-2 is the ASRC block diagram.

The red dotted line designates the ASRC block. Objects outside the dotted line represent SoC-level resources.

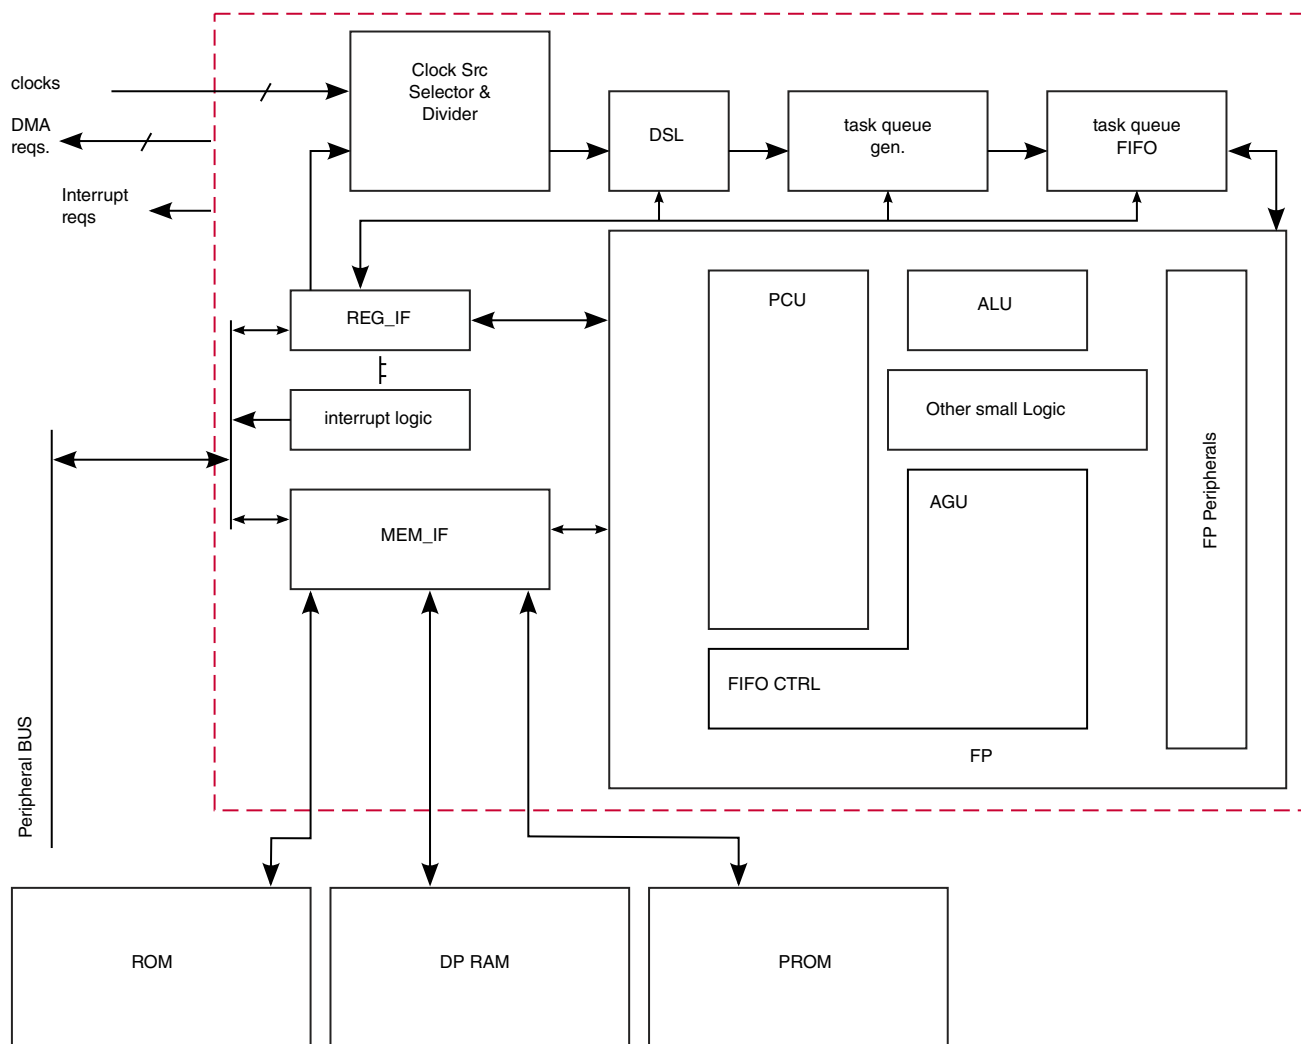

Figure 16-2. ASRC block diagram

16.1.1 Features

Table 16-1. ASRC Specifications

Parameters	Test Conditions	Minimum	Typical	Maximum	Unit
Channels Supported		0 ¹		10	
Pairs of Rate Conversion		1	-	3	
THD+N	120MHz < F _{SASRC} ² <160MHz		-120		dB
Dynamic Range				144	dB
Settling Time			40		ms
Comment:					

1. When a pair has zero channels, the pair will be disabled, although the pair enable bit may be set in ASRCTR register.
 2. F_{SASRC} is the processing clock of ASRC block.

Other Features:

- Support user-programmable threshold for the input/output FIFOs.
- Support flexible 8/16/24 bit width of input data, and 16/24 bit width of output data.
- Designed for rate conversion between 44.1kHz, 32kHz, 48kHz, 96kHz, and 192kHz. The useful signal bandwidth is below 24kHz.
- Other input sampling rates in the range of 8kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Other output sampling rates in the range of 30kHz to 200kHz is also supported, but possibly with less desirable bandwidth.
- Automatic accommodation to slow variations in the incoming and outgoing sampling rates.
- Linear phase
- Tolerant to sample clock jitter

Clock/Data Connections

- The sampling rate clocks are directly connected to the ASRC block, the ratio estimation of the input clocks with output clocks are done in ASRC hardware.
- The clock signals come from the following blocks, for example:
 - ESAI, receiving bit clock and transmitting bit clock
 - SPDIF, receiving bit clock and transmitting bit clock
 - other audio peripherals etc.
- The exchange of audio data is done by the processor accessing ASRC block through registers defined on shared peripheral bus.

16.1.2 Modes of Operation

See [ASRC Memory Map/Register Definition](#) for a definition of the registers and parameters used in ASRC.

16.1.2.1 Data Transfer Schemes

16.1.2.1.1 Data Input Modes

The input mode for each of the three channel sets may be set independently. Three modes of supplying data to the ASRC input FIFOs are available:

- Polling
- Interrupt
- DMA

In all input-data transfer schemes, the ASRC fetches data from each enabled FIFO and processes the data sample-by-sample after each rising edge of the associated input sampling clock until the FIFO level reaches a threshold.

After the threshold is reached, the ASRC requests data. The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers `ASRMCRx`, $x=A, B$ or C .

If the ASRC attempts to fetch data from an empty FIFO, an error is generated and the `ASRSTR_AOLE` bit is set. If the ASRC overload interrupt is enabled (`ASRIER_AOLIE` bit is set), an interrupt is generated.

When writing data to an input FIFO, you must ensure that it is in a predefined sequence. For example, when writing to an input FIFO, the sequence should be: `channel_0`, `channel_1`, `channel_2`, ..., `channel_n`, `channel_0`, `channel_1`, `channel_2`, etc. Here `channel_n` stands for the data intended for the n -th channel. The hardware will re-allocate each data to its corresponding channel FIFO. The channel being re-allocated is shown by `ASRCCR_ACIX`, $x=A, B$ or C .

Mode 1 (Polling Mode)

Polling mode is the default mode following power-on or individual reset, and is selected by clearing the associated channel set A, B, or C data-input interrupt enable bit (`ASRIER_ADIE x` , where $x=A, B$ or C). In this mode, data-input interrupts are disabled. When the FIFO level is below the threshold, the associated status bit (`ASRSTR_AIDIE x` , where $x=A, B$, or C) is set. To clear the status bit, the FIFO must be written with enough data to raise the level above the threshold.

Mode 2 (Interrupt Mode)

The ASRC input FIFOs can also be serviced by interrupts. To enable interrupts, the corresponding data-input interrupt enable bits (`ASRIER_ADIE x` , where $x=A, B$, or C) should be set. An interrupt is automatically generated any time the input FIFO level is below the threshold. The interrupt is cleared when enough data is written to the FIFO to raise the level above the threshold.

Mode 3 (DMA Mode)

The ASRC input FIFOs can also be filled using DMA. In this mode, the data-input interrupt-enable bits (`ASRIER_ADIE x` , where $x=A, B$, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

16.1.2.1.2 Data Output Modes

The output mode for each of the 3 channel sets (A, B, and C) may be set independently.

Three modes of retrieving data from the ASRC output FIFOs are available:

- Polling
- Interrupt
- DMA

In all output-data transfer schemes, the ASRC places a processed sample into the associated output FIFO. After a threshold is reached, the ASRC requests that data be transferred out of the FIFO.

The FIFO size for each channel set is 64 samples and the threshold is set at 32 samples. The threshold can be defined by interface registers ASRMCR_x, x=A, B or C.

If the ASRC attempts to place data into a FIFO that is already full, an error is generated and the ASRSTR_AOLE bit is set. If the ASRC overload interrupt is enabled (ASRIER_AOLIE bit is set), an interrupt is generated.

Each output FIFO is organized in the same channel order in which the associated input FIFO was written.

Three transfer modes are supported by Interface Block.

Mode 1 (Polling Mode)

The ASRC output FIFOs can be serviced by polling. In this mode, ensure the associated output-data interrupt enable bit (ASRIER_ADOE_x, where x=A, B, or C) is cleared. In this mode, all output-data interrupts are disabled. Any time the output FIFO exceeds the threshold the associated status bit (ASRSTR_AODF_x, where x=A, B, or C) is set. To clear the status bit, enough data must be read from the associated output FIFO to lower the level below the threshold.

Mode 2 (Interrupt Mode)

The ASRC output FIFOs may also be serviced using interrupts. To enable this mode, the corresponding output-data interrupt-enable bits (ASRIER_ADOE_x, where x=A, B, or C) should be set. Any time the output FIFO level exceeds the threshold, an interrupt is automatically generated. The interrupt is cleared when enough data is read from the FIFO to lower the level below the threshold.

Mode 3 (DMA Mode)

The ASRC output FIFOs can also be read using DMA. In this mode, the output-data interrupt-enable bits (ASRIER_ADOE_x, where x=A, B, or C) should be cleared and the DMA controller should be configured to use the ASRC as a request source.

16.1.2.2 Word Alignment Supported

16.1.2.2.1 Input Data Alignment Modes

The position and length of input data word to the input data FIFOs ASRDIA, ASRDIB, ASRDIC are programmable. The control bits are defined in ASRMCR1x {x=A, B, or C}. It supports the following modes.

Table 16-2. Input Data Alignment

16.2 External Signals

The following table describes the external signals of ASRC:

Table 16-4. ASRC External Signals

Signal	Description	Pad	Mode	Direction
ASRC_EXT_CLK	ASRC External Clock	GPIO1_IO05	ALT3	IO

16.3 Clocks

The table found here describes the clock sources for ASRC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 16-5. ASRC Clocks

Clock name	Clock Root	Description
asrck_clock_d	spdif1_clk_root	ASRC module clock (SPDIF clock)
ipg_clk	ahb_clk_root	Peripheral clock
mem_clk	ahb_clk_root	Peripheral access clock

16.4 Interrupts

ASRC has several interrupts events.

The priorities are shown as [Table 16-6](#) .

Table 16-6. Interrupt Priorities/Vector

Priority	Description
lowest	ASRC Pair A input data needed
	ASRC Pair B input data needed
	ASRC Pair C input data needed
	ASRC Pair A output data ready
	ASRC Pair B output data ready
	ASRC Pair C output data ready
	ASRC Overload

16.5 DMA requests

ASRC has six DMA requests. They are directly connected to the lowest six status bits in the ASRSTR register.

Table 16-7. DMA requests

Type	Description
0	ASRC Pair A input data needed
1	ASRC Pair B input data needed
2	ASRC Pair C input data needed
3	ASRC Pair A output data ready
4	ASRC Pair B output data ready
5	ASRC Pair C output data ready

16.6 Functional Description

This section provides a complete functional description of the block.

16.6.1 Algorithm Description

16.6.1.1 Signal processing flow

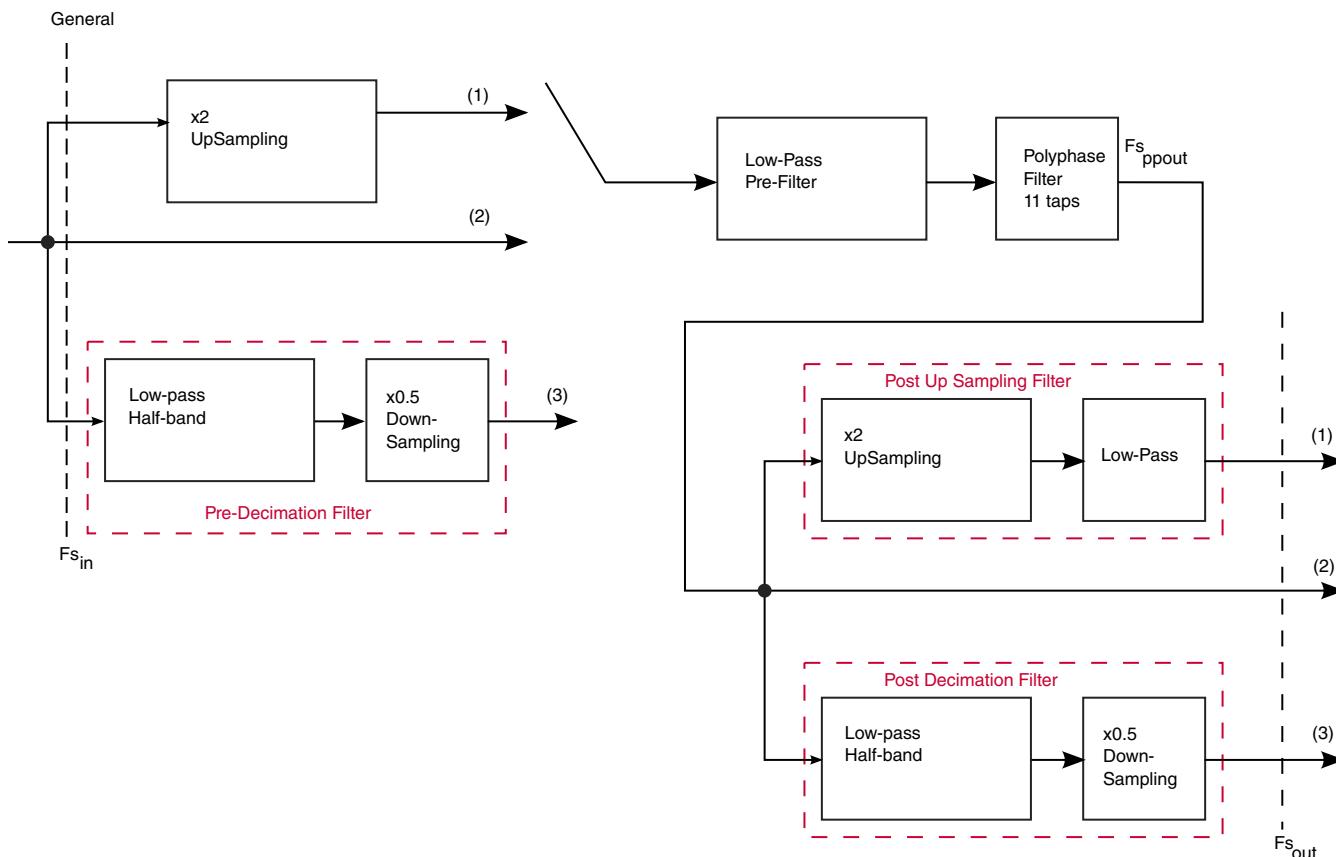

Figure 16-3. Signal processing configurations

The figure above shows the possible configurations of the ASRC. Each configuration consists of 2 to 4 stages.

- x2 up-sampling rate expander (zero insertion only) (input branch 1), direct connection (input branch 2), or low-pass pre decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (input branch 3),
- low-pass pre-filter, the low-pass bandwidth is at most $0.25 \times F_s$, where F_s is the sampling rate of the input signal to this low-pass pre-filter,
- polyphase filter,
- x2 post upsampling filter (consisting of a x2 up-sampling rate expander (zero insertion only) with low-pass half-band FIR filter) (output branch 1), direct connection (output branch 2), or low-pass post decimation filter (consisting of a low-pass half-band FIR filter with x0.5 downsampling rate decimator) (output branch 3).

By flowing through different processing branches and different setups of the pre-filter, this ASRC scheme can be used to handle different rate conversion requirements.

- Configuration (a): Input Branch 1+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (b): Input Branch 1+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (c): Input Branch 1+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/2$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (d): Input Branch 2+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (e): Input Branch 2+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (f): Input Branch 2+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/4$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

- Configuration (g): Input Branch 3+Output Branch 1:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}/2$.

- Configuration (h): Input Branch 3+Output Branch 2:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = Fs_{out}$.

- Configuration (i): Input Branch 3+Output Branch 3:

The signal bandwidth observed before the polyphase filter is at most $BW_{in} = Fs_{in}/8$.
The signal sampling rate of the polyphase filter output is $Fs_{ppout} = 2Fs_{out}$.

Table 16-8. Pre-processing, post-processing options

{Pre_Proc, Post_Proc}		Fsout (KHz)								
		8	32	44.1	48	64	88.2	96	128	192
Fsin (KHz)	8	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	12	{0,2}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	16	{1,2}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}	{0,0}
	24	{1,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}	{0,0}
	32	{1,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}	{0,0}
	44.1	{2,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}	{0,0}
	48	{2,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	64	{2,2}	{0,2}	{0,2}	{0,2}	{0,1}	{0,1}	{0,1}	{0,1}	{0,0}
	88.2	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	96	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
	128	NA	{1,2}	{1,2}	{1,2}	{1,1}	{1,1}	{1,1}	{1,1}	{1,1}
192	NA	{2,2}	{2,2}	{2,2}	{2,1}	{2,1}	{2,1}	{2,1}	{2,1}	

NOTE: In the {Pre_Proc, Post_Proc} pair, the meaning of the values are:

Pre_Proc:

- 0 --- Pre-processing Branch 1 as shown in [Figure 16-3](#)
- 1 --- Pre-processing Branch 2 as shown in [Figure 16-3](#)
- 2 --- Pre-processing Branch 3 as shown in [Figure 16-3](#), decimation-by-2

Post_Proc:

- 0 --- Post-processing Branch 1 as shown in [Figure 16-3](#)
- 1 --- Post-processing Branch 2 as shown in [Figure 16-3](#)
- 2 --- Post-processing Branch 3 as shown in [Figure 16-3](#)

The latencies of the different option can be roughly calculated as follows:

- For PreProc = 0, PostProc = 1 : min latency = constant_A / input-sample-rate + constant_B / output-sample-rate
- For PreProc = 0, PostProc = 0 : min latency = constant_A / input-sample-rate + constant_C / output-sample-rate
- For PreProc = 1, PostProc = 1 : min latency = constant_D / input-sample-rate + constant_B / output-sample-rate

The constants above (e.g., constant_A means the Constant for Preproc = 0, constant_B means the Constant for Postproc = 1, ...) are only influenced by the PreProc/PostProc and (input/output) sampling rate to which they are connected. Input latencies have no relationship with the output latencies, but both elements add together to form the total latencies.

For a rough estimation, the constants can be set as:

- Constant for Preproc = 0: 39

- Constant for Preproc = 1: 78.5
- Constant for Preproc = 2: 235
- Constant for Postproc = 0: 42.5
- Constant for Postproc = 1: 8.5
- Constant for Postproc = 2: 172

The max latency can be derived from this value by using the following formula (where 32 means the input/output FIFO depth that will arouse data transfer):

- $\text{max latency} = \text{min latency} + 32 / \text{input-sample-rate} + 32 / \text{output-sample-rate}$

16.6.1.2 Operation of the Filter

16.6.1.2.1 Support of Physical Clocks

This design supports physical sampling clocks. The clocks can be provided by Sony/Phillips digital interface (SPDIF), enhanced serial audio interface (ESAI), media local bus controller (MLB), Core master clock derivative as ASRCK1.

Functional Description

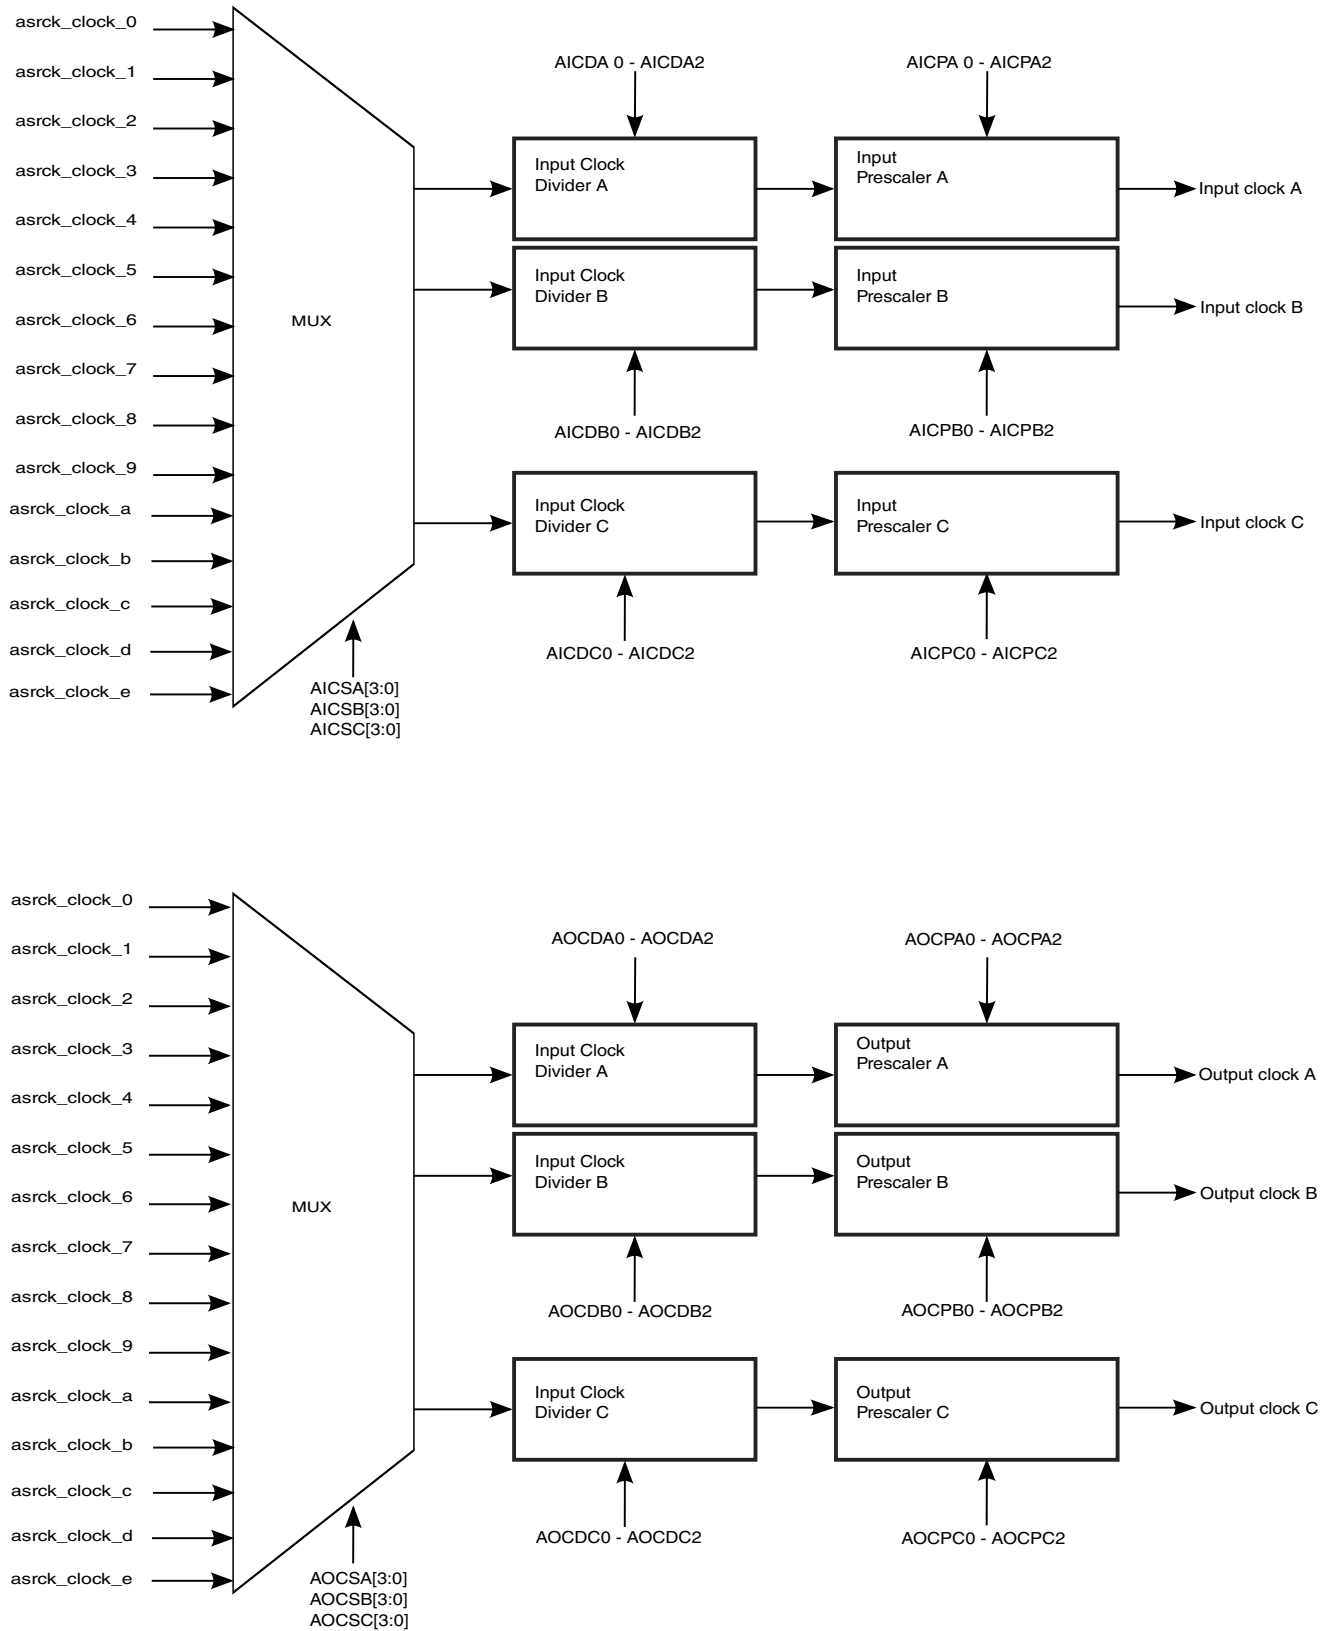

Figure 16-4. Clock Source Selector & Divider

Software can set the ASRC Clock Source Register (ASRC_CSR) and the Clock Divider Register to select the desired clock source and divide it to the needed sample rate clock for use by the ASRC. The clocks have the following restriction. If the prescaler is set to 1, the clock divider can only be set to 1 and the clock source must have a 50% duty cycle.

16.7 Startup Procedure

The following example shows the normal setup procedure for the ASRC block.

```
#include "asrc_common.h"
#include "stdio.h"
#include "soc_api.h"

16.8 ASRC Memory Map/Register Definition

All useful registers are listed in the memory map below. The access of undefined registers will behave as normal registers.

All the interface registers are LSB aligned except the input FIFOs and the output FIFOs, and each register has only 24 effective bits.

The input FIFO and output FIFO word alignment can be defined using ASRMCR1{A,B,C} registers in 32-bit interface system.

ASRC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
203_4000	ASRC Control Register (ASRC_ASRCCTR)	32	R/W	0000_0000h	16.8.1/582

16.8.1 ASRC Control Register (ASRC_ASRCTR)

The ASRC control register (ASRCTR) is a 24-bit read/write register that controls the ASRC operations.

Address: 203_4000h base + 0h offset = 203_4000h

ASRC_ASRCCTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 -	This field is reserved. Reserved. Should be written as zero for compatibility.
22 ATSC	ASRC Pair C Automatic Selection For Processing Options When this bit is 1, pair C will automatic update its pre-processing and post-processing options (ASRCFG:PREMODC, ASRCFG:POSTMODC see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair C. This bit should be disabled when {USRC, IDRC}={1,1}.
21 ATSB	ASRC Pair B Automatic Selection For Processing Options When this bit is 1, pair B will automatic update its pre-processing and post-processing options (ASRCFG:PREMODB, ASRCFG:POSTMODB see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair B. This bit should be disabled when {USRB, IDRB}={1,1}.
20 ATSA	ASRC Pair A Automatic Selection For Processing Options When this bit is 1, pair A will automatic update its pre-processing and post-processing options (ASRCFG:PREMODA, ASRCFG:POSTMODA see ASRC Misc Control Register 1 for Pair C) based on the frequencies it detected. To use this option, the two parameter registers(ASR76K and ASR56K) should be set correctly (see ASRC Misc Control Register 1 for Pair C and ASRC Misc Control Register 1 for Pair C). When this bit is 0, the user is responsible for choosing the proper processing options for pair A. This bit should be disabled when {USRA, IDRA}={1,1}.
19 -	This field is reserved. Reserved. Should be written as zero for compatibility.
18 USRC	Use Ratio for Pair C Use ratio as the input to ASRC. This bit is used in conjunction with IDRC control bit.
17 IDRC	Use Ideal Ratio for Pair C When USRC=0, this bit has no usage. When USRC=1 and IDRC=0, ASRC internal measured ratio will be used. When USRC=1 and IDRC=1, the idea ratio from the interface register ASRIDRHC, ASRIDRLC will be used. It is suggested to manually set ASRCFG:POSTMODC, ASRCFG:PREMODC according to Table 16-8 in this case.
16 USRB	Use Ratio for Pair B Use ratio as the input to ASRC. This bit is used in conjunction with IDRB control bit.
15 IDRB	Use Ideal Ratio for Pair B When USRB=0, this bit has no usage. When USRB=1 and IDRB=0, ASRC internal measured ratio will be used.

Table continues on the next page...

ASRC_ASRCR field descriptions (continued)

Field	Description
	When USRB=1 and IDRB=1, the idea ratio from the interface register ASRIDRHB, ASRIDRLB will be used. It is suggested to manually set ASRCFG:POSTMODB, ASRCFG:PREMODB according to Table 16-8 in this case.
14 USRA	Use Ratio for Pair A Use ratio as the input to ASRC. This bit is used in conjunction with IDRA control bit.
13 IDRA	Use Ideal Ratio for Pair A When USRA=0, this bit has no usage. When USRA=1 and IDRA=0, ASRC internal measured ratio will be used. When USRA=1 and IDRA=1, the idea ratio from the interface register ASRIDRHA, ASRIDRLA will be used. It is suggested to manually set ASRCFG:POSTMODA, ASRCFG:PREMODA according to Table 16-8 in this case.
12–5 -	This field is reserved. Reserved. Should be written as zero for compatibility.
4 SRST	Software Reset This bit is self-clear bit. Once it is been written as 1, it will generate a software reset signal inside ASRC. After 9 cycles of the ASRC processing clock, this reset process will stop, and this bit will be cleared automatically.
3 ASREC	ASRC Enable C Enable the operation of the conversion C of ASRC. When ASREC is cleared, operation of conversion C is disabled.
2 ASREB	ASRC Enable B Enable the operation of the conversion B of ASRC. When ASREB is cleared, operation of conversion B is disabled.
1 ASREA	ASRC Enable A Enable the operation of the conversion A of ASRC. When ASREA is cleared, operation of conversion A is disabled.
0 ASRCEN	ASRC Enable Enable the operation of ASRC.

16.8.2 ASRC Interrupt Enable Register (ASRC_ASRIER)

Address: 203_4000h base + 4h offset = 203_4004h

Field	Description
	1 interrupt enabled 0 interrupt disabled
3 ADOEA	Data Output A Interrupt Enable Enables the data output A interrupt. 1 interrupt enabled 0 interrupt disabled
2 ADIEC	Data Input C Interrupt Enable Enables the data input C interrupt. 1 interrupt enabled 0 interrupt disabled
1 ADIEB	Data Input B Interrupt Enable Enables the data input B interrupt. 1 interrupt enabled 0 interrupt disabled
0 ADIEA	Data Input A Interrupt Enable Enables the data input A Interrupt. 1 interrupt enabled 0 interrupt disabled

16.8.3 ASRC Channel Number Configuration Register (ASRC_ASRCNCR)

The ASRC channel number configuration register (ASRCNCR) is a 24-bit read/write register that sets the number of channels used by each ASRC conversion pair.

There are 10 channels available for distribution among 3 conversion pairs, they are ordered as 0,1,...,9. The bottom [0, ANCA-1] channels are used for pair A, the top [10-ANCC, 9] channels are used for pair C, and the [ANCA, ANCA+ANCB-1] channels are allocated for pair B. In case that ANCA=0, then the [0, ANCB-1] channels are assigned for pair B.

Address: 203_4000h base + Ch offset = 203_400Ch

ASRC Memory Map/Register Definition

1. $ANCC+ANCB+ANCA \leq 10$. Hardware is not checking the constraint. Programmer should take the responsibility to ensure the constraint is satisfied.

16.8.4 ASRC Filter Configuration Status Register (ASRC_ASRCFG)

The ASRC configuration status register (ASRCFG) is a 24-bit read/write register that sets and/or automatically senses the ASRC operations.

Address: 203_4000h base + 10h offset = 203_4010h

ASRC_ASRCFG field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 INIRQC	Initialization for Conversion Pair C is served When this bit is 1, it means the initialization for conversion pair C is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREC=0 or ASRCTR:ASRCEN=0).
22 INIRQB	Initialization for Conversion Pair B is served When this bit is 1, it means the initialization for conversion pair B is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREB=0 or ASRCTR:ASRCEN=0).
21 INIRQA	Initialization for Conversion Pair A is served When this bit is 1, it means the initialization for conversion pair A is served. This bit is cleared by disabling the ASRC conversion pair (ASRCTR:ASREA=0 or ASRCTR:ASRCEN=0).
20 NDPRC	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair C 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
19 NDPRB	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair B 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameter. Use the parameters already stored in RAM.
18 NDPRA	Not Use Default Parameters for RAM-stored Parameters For Conversion Pair A 0 Use default parameters for RAM-stored parameters. Override any parameters already in RAM. 1 Don't use default parameters for RAM-stored parameters. Use the parameters already stored in RAM.
17–16 POSTMODC[1-0]	Post-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal Processing Flow. 01 Select Direct-Connection as defined in Signal Processing Flow. 10 Select Downsampling-by-2 as defined in Signal Processing Flow.
15–14 PREMODC[1-0]	Pre-Processing Configuration for Conversion Pair C These bits will be read/write by user if ASRCTR:ATSC=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSC=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODC[1-0] have no use.
13–12 POSTMODB[1-0]	Post-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration.

Table continues on the next page...

ASRC_ASRCFG field descriptions (continued)

Field	Description
	00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow
11–10 PREMODB[1-0]	Pre-Processing Configuration for Conversion Pair B These bits will be read/write by user if ASRCTR:ATSB=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSB=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODB[1-0] have no use.
9–8 POSTMODA[1-0]	Post-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCTR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSA=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the post-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow
7–6 PREMODA[1-0]	Pre-Processing Configuration for Conversion Pair A These bits will be read/write by user if ASRCTR:ATSA=0, and can also be automatically updated by the ASRC internal logic if ASRCTR:ATSA=1 (see ASRC Misc Control Register 1 for Pair C). These bits set the selection of the pre-processing configuration. 00 Select Upsampling-by-2 as defined in Signal processing flow 01 Select Direct-Connection as defined in Signal processing flow 10 Select Downsampling-by-2 as defined in Signal processing flow 11 Select passthrough mode. In this case, POSTMODA[1-0] have no use.
-	This field is reserved. Reserved. Should be written as zero for compatibility.

16.8.5 ASRC Clock Source Register (ASRC_ASRCR)

The ASRC clock source register (ASRCR) is a 24-bit read/write register that controls the sources of the input and output clocks of the ASRC.

The clock connections are shown in [Figure 1](#) :

Address: 203_4000h base + 14h offset = 203_4014h

ASRC_ASRSTR field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
23–22 -	This field is reserved. Reserved. Should be written as zero for compatibility.
21 DSL CNT	DSL Counter Input to FIFO ready When set, this bit indicates that new DSL counter information is stored in the internal ASRC FIFO. When clear, this bit indicates that new DSL counter information is in the process of storage into the internal ASRC FIFO. When ASRIER:AFPWE=1, the rising edge of this signal will propose an interrupt request. Writing any value with this bit set will clear the interrupt request proposed by the rising edge of this bit.
20 ATQOL	Task Queue FIFO overload When set, this bit indicates that task queue FIFO logic is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
19 AOOLC	Pair C Output Task Overload When set, this bit indicates that pair C output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
18 AOOLB	Pair B Output Task Overload When set, this bit indicates that pair B output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
17 AOOLA	Pair A Output Task Overload When set, this bit indicates that pair A output task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
16 AIOLC	Pair C Input Task Overload When set, this bit indicates that pair C input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
15 AIOLB	Pair B Input Task Overload When set, this bit indicates that pair B input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
14 AIOLA	Pair A Input Task Overload When set, this bit indicates that pair A input task is overloaded. This may help to check the reason why overload interrupt happens. The bit is cleared when writing ASRSTR:AOLE as 1.
13 AODOC	Output Data Buffer C has overflowed When set, this bit indicates that output data buffer C has overflowed. When clear, this bit indicates that output data buffer C has not overflowed The bit is cleared when writing ASRSTR:AOLE as 1.
12 AODOB	Output Data Buffer B has overflowed

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
	<p>When set, this bit indicates that output data buffer B has overflowed. When clear, this bit indicates that output data buffer B has not overflowed</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
11 AODOA	<p>Output Data Buffer A has overflowed</p> <p>When set, this bit indicates that output data buffer A has overflowed. When clear, this bit indicates that output data buffer A has not overflowed</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
10 AIDUC	<p>Input Data Buffer C has underflowed</p> <p>When set, this bit indicates that input data buffer C has underflowed.</p> <p>When clear, this bit indicates that input data buffer C has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
9 AIDUB	<p>Input Data Buffer B has underflowed</p> <p>When set, this bit indicates that input data buffer B has underflowed.</p> <p>When clear, this bit indicates that input data buffer B has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
8 AIDUA	<p>Input Data Buffer A has underflowed</p> <p>When set, this bit indicates that input data buffer A has underflowed.</p> <p>When clear, this bit indicates that input data buffer A has not underflowed.</p> <p>The bit is cleared when writing ASRSTR:AOLE as 1.</p>
7 FPWT	<p>FP is in wait states</p> <p>This bit is for debug only.</p> <p>When set, this bit indicates that ASRC is in wait states.</p> <p>When clear, this bit indicates that ASRC is not in wait states.</p>
6 AOLE	<p>Overload Error Flag</p> <p>When set, this bit indicates that the task rate is too high for the ASRC to handle. The reasons for overload may be:</p> <ul style="list-style-type: none"> - too high input clock frequency, - too high output clock frequency, - incorrect selection of the pre-filter, - low ASRC processing clock, - too many channels, - underrun, - or any combination of the reasons above. <p>Since the ASRC uses the same hardware resources to perform various tasks, the real reason for the overload is not straight forward, and it should be carefully analyzed by the programmer.</p> <p>If ASRIER:AOLIE=1, an interrupt will be proposed when this bit is set.</p> <p>Write any value with this bit set as one into the status register will clear this bit and the interrupt request proposed by this bit.</p>
5 AODFC	<p>Number of data in Output Data Buffer C is greater than threshold</p>

Table continues on the next page...

ASRC_ASRSTR field descriptions (continued)

Field	Description
	When set, this bit indicates that number of data already existing in ASRDORC is greater than threshold and the processor can read data from ASRDORC. When AODFC is set, the ASRC generates data output C interrupt request to the processor, if enabled (that is, ASRIER:ADOEC = 1). A DMA request is always generated when the AODFC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
4 AODFB	Number of data in Output Data Buffer B is greater than threshold When set, this bit indicates that number of data already existing in ASRDORB is greater than threshold and the processor can read data from ASRDORB. When AODFB is set, the ASRC generates data output B interrupt request to the processor, if enabled (that is, ASRIER:ADOEB = 1). A DMA request is always generated when the AODFB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
3 AODFA	Number of data in Output Data Buffer A is greater than threshold When set, this bit indicates that number of data already existing in ASRDORA is greater than threshold and the processor can read data from ASRDORA. When AODFA is set, the ASRC generates data output A interrupt request to the processor, if enabled (that is, ASRIER:ADOEA = 1). A DMA request is always generated when the AODFA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
2 AIDEC	Number of data in Input Data Buffer C is less than threshold When set, this bit indicates that number of data still available in ASRDIRC is less than threshold and the processor can write data to ASRDIRC. When AIDEC is set, the ASRC generates data input C interrupt request to the processor, if enabled (that is, ASRIER:ADIEC = 1). A DMA request is always generated when the AIDEC bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
1 AIDEB	Number of data in Input Data Buffer B is less than threshold When set, this bit indicates that number of data still available in ASRDIRB is less than threshold and the processor can write data to ASRDIRB. When AIDEB is set, the ASRC generates data input B interrupt request to the processor, if enabled (that is, ASRIER:ADIEB = 1). A DMA request is always generated when the AIDEB bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.
0 AIDEA	Number of data in Input Data Buffer A is less than threshold When set, this bit indicates that number of data still available in ASRDIRA is less than threshold and the processor can write data to ASRDIRA. When AIDEA is set, the ASRC generates data input A interrupt request to the processor, if enabled (that is, ASRIER:ADIEA = 1). A DMA request is always generated when the AIDEA bit is set, but a DMA transfer takes place only if a DMA channel is active and triggered by this event.

16.8.9 ASRC Parameter Register n (ASRC_ASRPMnn)

Parameter registers determine the performance of ASRC.

The parameter registers must be initialized by software before ASRC is enabled. Recommended values are given in [ASRC Misc Control Register 1 for Pair C](#) below,

Table 16-21. ASRC Parameter Registers (ASRPM1~ASRPM5)

Register	Offset	Access	Reset Value	Recommend Value
asrcpm1	0x40	R/W	0x00_0000	0x7fffff
asrcpm2	0x44	R/W	0x00_0000	0x255555
asrcpm3	0x48	R/W	0x00_0000	0xff7280
asrcpm4	0x4C	R/W	0x00_0000	0xff7280
asrcpm5	0x50	R/W	0x00_0000	0xff7280

Address: 203_4000h base + 40h offset + (4d × i), where i=0d to 4d

16.8.18 ASRC Ideal Ratio for Pair C-High Part (ASRC_ASRIDRHC)

The ideal ratio registers (ASRIDRHC, ASRIDRLC) hold the ratio value IDRATIOC. $IDRATIOC = F_{s_{inC}}/F_{s_{outC}} = T_{s_{outC}}/T_{s_{inC}}$ is a 32-bit fixed point value with 26 fractional bits. This value is only useful when $ASRC_{CTR}:\{USRC, IDRC\}=2'b11$.

Address: 203_4000h base + 90h offset = 203_4090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASRC_ASRIDRHC field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23–8 -	This field is reserved. Reserved
IDRATIOC[31:24]	IDRATIOC[31:24]. High part of ideal ratio value for pair C.

16.8.19 ASRC Ideal Ratio for Pair C-Low Part (ASRC_ASRIDRLC)

The ideal ratio registers (ASRIDRHC, ASRIDRLC) hold the ratio value IDRATIOC. $IDRATIOC = F_{s_{inC}}/F_{s_{outC}} = T_{s_{outC}}/T_{s_{inC}}$ is a 32-bit fixed point value with 26 fractional bits. This value is only useful when $ASRC_{CTR}:\{USRC, IDRC\}=2'b11$.

Address: 203_4000h base + 94h offset = 203_4094h

ASRC_ASRIDRLC field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
IDRATIOC[23:0]	IDRATIOC[23:0]. Low part of ideal ratio value for pair C.

16.8.20 ASRC 76kHz Period in terms of ASRC processing clock (ASRC_ASR76K)

The register (ASR76K) holds the period of the 76kHz sampling clock in terms of the ASRC processing clock with frequency $F_{S_{ASRC}}$. $ASR76K = F_{S_{ASRC}}/F_{S_{76k}}$. Reset value is 0x0A47 which assumes that $F_{S_{ASRC}}=200\text{MHz}$. This register is used to help the ASRC internal logic to decide the pre-processing and the post-processing options automatically (see [ASRC Misc Control Register 1 for Pair C](#) and [ASRC Misc Control Register 1 for Pair C](#)). In a system when $F_{S_{ASRC}}=133\text{MHz}$, the value should be assigned explicitly as 0x06D6 in user application code.

Address: 203_4000h base + 98h offset = 203_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ASRC_ASRMCRA field descriptions

Field	Description
31–24 [unimplemented]	This is a 24-bit register the upper byte is unimplemented. This field is reserved.
23 ZEROBUFA	Initialize buf of Pair A when pair A is enabled. Always clear option. This bit is used to control whether the buffer is to be zeroized when pair A is enabled. 1 Don't zeroize the buffer 0 Zeroize the buffer
22 EXTTHRSA	Use external thresholds for FIFO control of Pair A This bit will determine whether the FIFO thresholds externally defined in this register is used to control ASRC internal FIFO logic for pair A. 1 Use external defined thresholds. 0 Use default thresholds.
21 BUFSTALLA	Stall Pair A conversion in case of Buffer Near Empty/Full Condition This bit will determine whether the near empty/full FIFO condition will stall the rate conversion for pair A. This option can only work when external ratio is used. Near empty condition is the condition when input FIFO has less than 4 useful samples per channel. Near full condition is the condition when the output FIFO has less than 4 vacant sample words to fill per channel.

Field	Description
	3'b001 16-bit audio data. 3'b010 8-bit audio data.
8 IMSB	Data Alignment of the input FIFO This bit will determine the data alignment of the input FIFO. 1 MSB aligned. 0 LSB aligned.
7-3 -	This field is reserved. Reserved. Should be written as zero for future compatibility.
2 OMSB	Data Alignment of the output FIFO This bit will determine the data alignment of the output FIFO. 1 MSB aligned. 0 LSB aligned.
1 OSGN	Sign Extension Option of the output FIFO This bit will determine the sign extension option of the output FIFO. 1 Sign extension. 0 No sign extension.
0 OW16	Bit Width Option of the output FIFO This bit will determine the bit width option of the output FIFO. 1 16-bit output data 0 24-bit output data.

Chapter 17

Digital Audio Multiplexer (AUDMUX)

17.1 Overview

The Digital Audio Multiplexer (AUDMUX) provides a programmable interconnect device for voice, audio, and synchronous data routing between Synchronous Serial Interface Controller (SSI) and audio/voice codec's (also known as coder-decoders) peripheral serial interfaces.

This section includes a top level diagram that shows the functional organization of the block, including all off-chip signals.

AUDMUX allows the users to reconfigure the audio system signal routing through programming, as opposed to altering the PCB design. The full description of the block is in [Functional Description](#).

[Figure 17-1](#) shows the block diagram.

Figure 17-1. AUDMUX Block Diagram

AUDMUX supports single source to single destination connectivity or single source to multiple destination connectivity.

AUDMUX includes two types of interfaces: Internal ports and External ports. Internal ports are hard wired to Synchronous Serial Interface Controller (SSI). The connection between each SSI and AUDMUX's Internal ports cannot be modified, however, routing of the signals connected to each of the internal port can be routed within AUDMUX. External ports are connected to IOMUX module where the ports connect to off-chip audio devices and serial interfaces of other processors. The connectivity of the External port and IOMUX cannot be configured, but the output or input of the signal can be routed easily by setting the appropriate AUDMUX registers.

17.1.1 Features

Key features of the block include:

- Three internal ports
- Four external ports
- Full 6-wire SSI interfaces for asynchronous receive and transmit
- Configurable 4-wire (synchronous) or 6-wire (asynchronous) peripheral interfaces
- Independent Tx/Rx Frame sync and clock direction selection for host or peripheral
- Each host interface's capability to connect to any other host or peripheral interface in a point-to-point or point-to-multipoint (network mode)

17.1.2 Modes and Operations

The AUDMUX supports the modes described in [Operating Modes](#).

17.2 External Signals

The following table describes the external signals of AUDMUX:

Table 17-1. AUDMUX External Signals

Signal	Description	Pad	Mode	Direction
AUD3_RXC	Receive clock signal	LCD1_CLK	ALT2	I
		SD4_CMD	ALT3

17.3 Clocks

This section provides information about AUDMUX clocking including clock inputs and the clock diagram.

The following table describes the clock source for AUDMUX. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 17-2. AUDMUX Clocks

Clock name	Clock Root	Description
ipg_clk_s	ipg_clk_root	Peripheral access clock

17.3.1 Clock Inputs

The IP Bus read/write clock-peripheral clock (ipg_clk_s) is an input to the AUDMUX. It is used for all AUDMUX register accesses. It is driven only when there is an AUDMUX access on the IP Bus.

17.3.2 Clock Diagram

The figure below shows the clocking used in the AUDMUX.

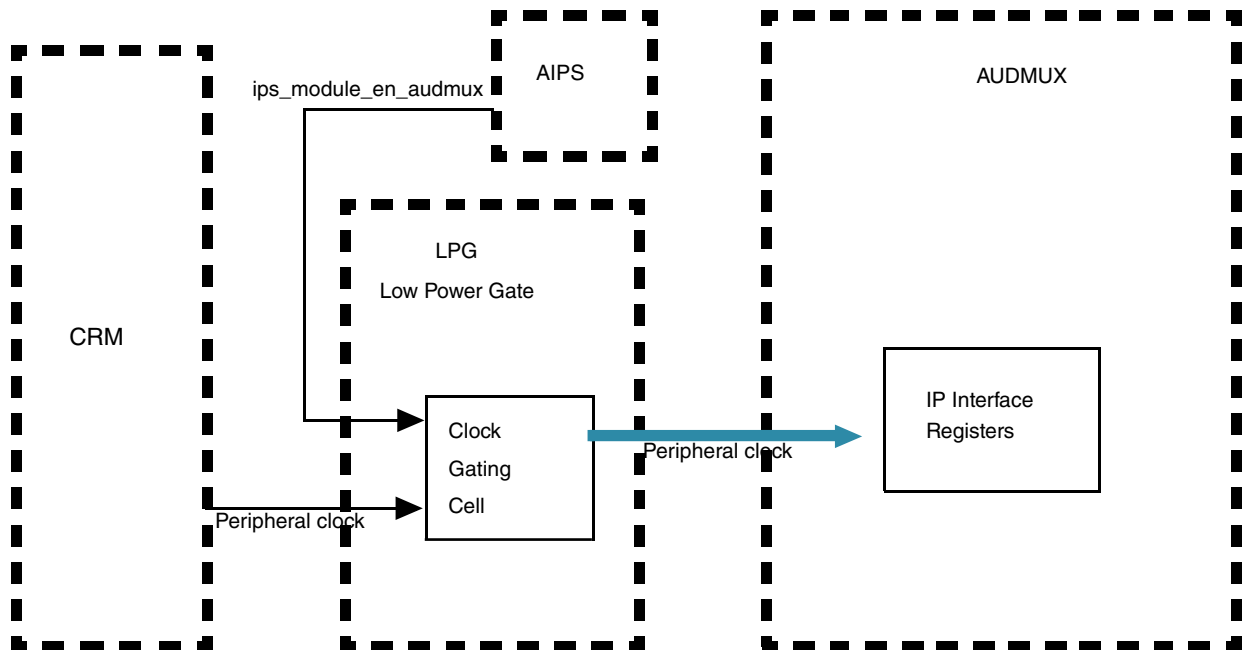

Figure 17-2. AUDMUX Clocking Scheme

17.3.3 Clocking Restrictions

- Since the AUDMUX requires only peripheral clock, it places no restrictions on the bus frequency.
- All registers in the AUDMUX are control registers so their values will not change frequently. These values will be programmed when changing between use cases (not during operation in a particular mode).

17.4 Default Register Configuration

There are two configuration registers for each port. Each pair of configuration registers is identical for each port; however, the default values following a reset differ as shown in the Memory Map.

[Default Port Configuration](#), describes the default configuration of the ports.

17.4.1 Default Port Configuration

After a reset, each port defaults to normal mode ($PDCRn[MODE] = 0$) with synchronous timing mode ($PTCRn[SYN] = 1$) enabled.

The default port-to-port connections are as follows:

- Port 1 to Port 6
 - Port 6 provides the clock and frame sync.
- Port 2 to Port 5
 - Port 5 provides the clock and frame sync.
- Port 3 to Port 4
 - Port 4 provides the clock and frame sync.
- Port 7 to Port 7 (in data loopback mode)
 - Clock and frame syncs are inputs.

17.5 Functional Description

This section provides a complete functional description of the AUDMUX.

17.5.1 Operating Modes

This section describes all functional operation modes of the AUDMUX.

[Figure 17-1](#) shows the AUDMUX block diagram.

All of the ports are essentially identical; there is no functional difference among Ports 1 through 7. The main difference is whether a port is hard wired to synchronous serial interface (SSI) or hard wired to the chip's pads. Each of the connection is hard wired to specific AUDMUX port. AUDMUX provides flexibility in routing the signal within the module, but all Internal and External port connections are fixed to specific configuration.

All ports can be configured as four- or six-wire interfaces. When configured as a six-wire interface, Receive Frame Sync (RXFS) and Receive Clock (RXC) signals of SSI interface enable the serial interface to be used in asynchronous mode with separate receive and transmit clocks.

AUDMUX supports both Normal mode (not to be confused with SSI's Normal Mode), External Network mode and Internal Network mode. The definition of each mode will be given in the next section.

All ports have a TXRXEN bit to provide flexibility in supporting network mode configurations. The TXRXEN bit reverses the functions of transmit and receive data lines where the transmit line is configured as receive and transmit line to be configured as transmit line. This function is provided so that mastership of the serial bus can be passed among multiple external devices connected to a single port.

In addition to supporting the External Network mode (default), all ports support an internal network mode:

- With internal network mode, single point-to-multipoint network configuration with an arbitrary number of slaves can be supported if the external slaves are put into the high-impedance state (as defined in the SSI network mode protocol) and have pull-up resistors on their TxD pins. (Alternatively, this can be viewed as requiring a pull-up resistor on the corresponding AUDMUX RxD pin.)

Bit clock direction selection enables each port to be configured as a master or slave in the flow.

Possible scenarios include:

- SSI (hard wired to internal port) transmits data to a voice codec and a BT (Blue tooth) codec (both on external Port 4Port 5) and the Bottom Connector (on external Port 5Port 6) simultaneously using network mode. SSI is configured as the master.
- An external processor (external port - Port 4Port 3) drives a voice codec and a BT codec (both on external Port 5Port 4) and the Bottom Connector (on Port 6Port 5) simultaneously using network mode. The external processor is the master.

17.5.1.1 Port Receive Data Modes

Each port has logic to select which data lines are used to create the RXD line for the corresponding host interface.

[Figure 17-3](#) shows the logic used to create the RXD line for Port 1. This logic has the following modes of operation (as determined by MODE:

- Normal (not to be confused with SSI's normal mode)
- Internal network mode

The subsequent sections describe the various modes of the port receive data logic. The following terms are used to define the operation of the AUDMUX:

- Network mode- Time-Division Multiplexed protocol for sending unique data to multiple devices on a serial bus or single devices with multi-channel capabilities.
- Internal network mode-Physical bus configuration where multiple serial buses are effectively connected within the AUDMUX via digital logic to create point-to

multipoint connectivity. An arbitrary number of devices are supported. Devices must be put into the high-impedance state as specified by the network mode protocol.

- External network mode-Physical bus configuration where multiple serial buses are electrically connected together on a printed circuit board (that is, external to the AUDMUX). Devices must put their TXD lines into the high-impedance state as specified by the network mode protocol. TXD lines of devices must be pulled high.

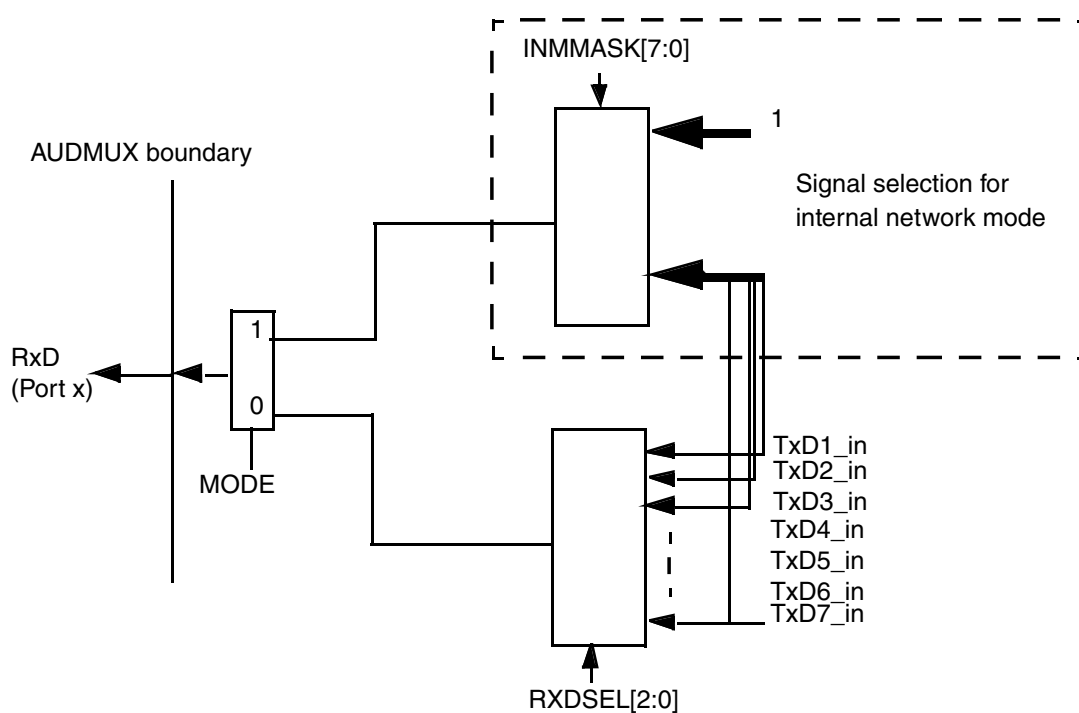

Figure 17-3. Receive Data Logic for Port x

17.5.1.1.1 Normal Mode

In normal mode ($\text{MODE} = 0$), not to be confused with SSI's Normal Mode, the port is connected in a single device point-to-single device port configuration (as a master or a slave) and the $\text{RXDSEL}[2:0]$ setting selects the transmit signal from any port. In normal mode, any data format can be used (that is, SSI normal mode, SSI network mode, AC-97, and others).

If a user wishes to transmit SSI1's data (TXD) to port 5, PDCR5's $\text{RXDSEL}[2:0]$ must be set to 000b. If the clock (TCK) and frame clock (TFS) are sent out to the external device from SSI1, PTCR5's $\text{TFSEL}[3:0]$ and $\text{TCSEL}[3:0]$ must be set to 0000b (port1) and 0000b (port1), while setting PTCR5's TFSDIR and TCLKDIR to 1.

If either or both of the clocks are to be received from external device to SSI1, PTCR5's TCLKDIR and/or TFSDIR must be set to 0 (input), and PTCR1's TFSEL[3:0] and/or TCLKDIR[3:0] to 0100b (port5).

Likewise, if a user wishes to receive serial data from Port 4 and send the receiving data to SSI2's RXD, one must set PDCR2's RXDSEL[2:0] to 11b. If the frame (RXFS) and bit clocks (RXC) are to be received from the external device, PTCR2's RFSEL[3:0] and RCSEL[3:0] must be set to 011b while PTCR4's RFSDIR and RCLKDIR set to 0.

17.5.1.1.2 Internal Network Mode

In internal network mode (MODE = 1), the output of the AND gate is routed (via the output of the port) to the RXD signal of the corresponding host interface.

The INMMASK bit vector selects the transmit signals of the ports that are to be connected in network mode. The transmit signals received at the AUDMUX ports (TxDn_in) are ANDed together to form the output. In internal network mode, only one device can be transmitting in its predesignated timeslot and all other transmit signals must remain high (be in high-impedance state and pulled-up). Therefore, non-active signals in the selection will be high and do not influence the output of the AND gate.

Network mode is a protocol where a master SSI is connected to more than one slave SSI device and communication occurs on a time-slotted frame. Though network mode can allow master-slave and slave-slave communication, internal network mode supports only master-slave communication.

There are two scenarios where internal network mode can be used with external network mode:

1. Slave-only devices are attached to an external port.
2. A master device is attached to an external port and all slave devices connected to the same external port are disabled.

NOTE

When internal network mode is enabled at an external port, RXDSEL[3:0] for RxDn_obe selection is ignored and RxD_obe is always driven high (that is, asserted for all timeslots). All slave devices connected to the same port must be disabled.

Internal Network Mode Example 1

SSI_m and SSI_n are used with Port 3 in internal network mode as shown in [Figure 17-4](#). No pull-up resistors are required because the interfaces combined in internal network mode are on-chip interfaces.

Figure 17-4. Block Diagram For Example 1

See [Figure 17-5](#) for the timing diagram of Example 1. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for SSI_m and SSI_n (as well as their output enables) are shown. Note that the on-chip interfaces drive a logic '1' when their output enables are logic '0'. The combined TXD line, which is the logical AND of the individual TXD lines, is used for Port 3's TXD line.

Figure 17-5. Example Using Internal Ports For Transmit Data

Internal Network Mode Example 2

The SSI, Port 3, and Port 4 are used with Port 5 in internal network mode, as shown in the following figure. Note that Port 3 and Port 4 are external ports. Therefore, pull-up resistors are required on the Port 3 RXD and Port 4 RXD pins. This example shows the timing associated with using adjacent timeslots for the SSI, Port 3 and Port 4 .

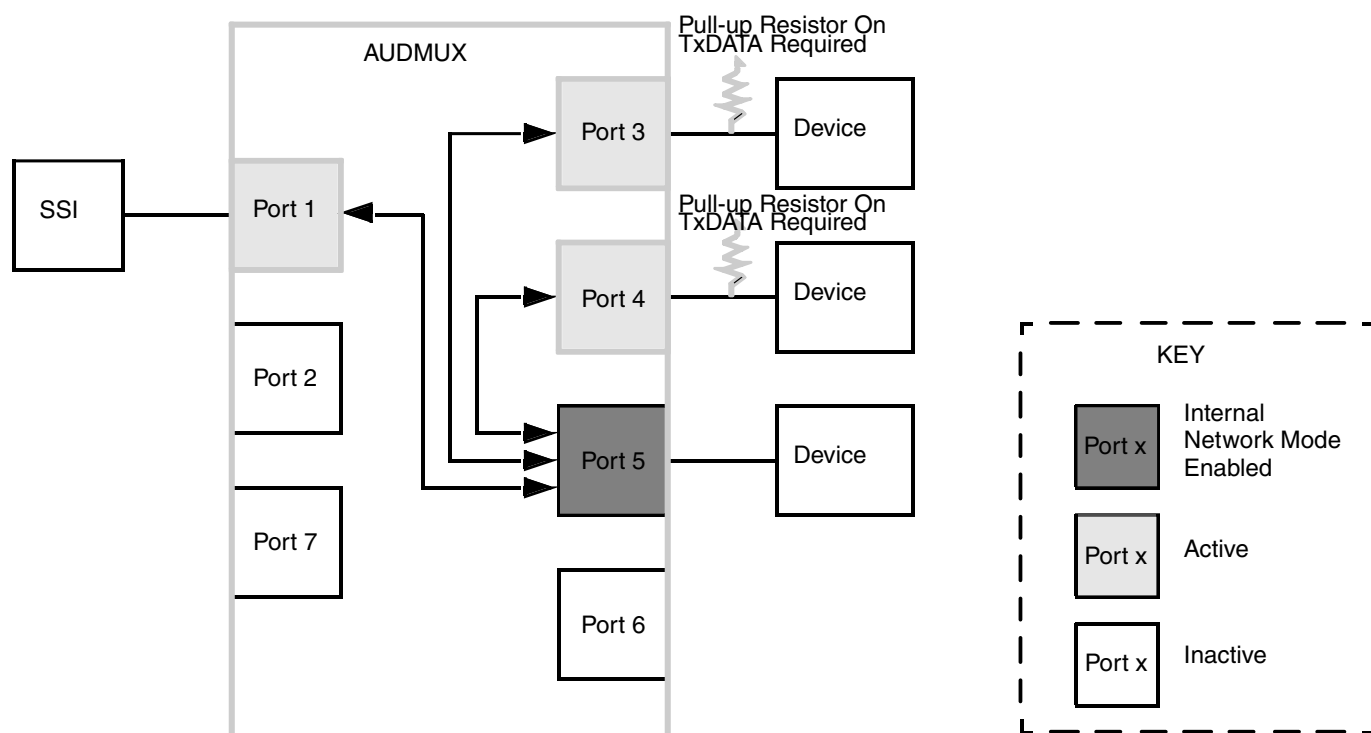

Figure 17-6. Block Diagram For Example 2

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' within half of a period of the bitclock. The required resistance must be no larger than:

$R_{max} = 1 / (2 * f_{bc} * C)$ where:

- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The following figure shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI, Port 3 and Port 4 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data lines from Port 3 and Port 4 at the pad are pulled high by pull-up resistors when they are in the high-impedance state. The data lines from Port 3 and Port 4 at the AUDMUX are pure digital signals and are constantly driven. The combined TXD line, which is the logical AND of the SSI, Port 3 and Port 4's TXD lines, is used for Port 5's TXD line.

Functional Description

Note the highlighted areas in the [Figure 17-7](#). This shows the transition time that occurs while a TXD line is being pulled high. In this example, this transition time is a maximum of 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis should be enabled at Port 3's RXD pad and Port 4's RXD pad to prevent the digital signals created by the pad from toggling rapidly during the pull-up period. The pads typically require a transition within 25ns unless hysteresis is enabled. Instead of using hysteresis, one could select a pull-up resistor sufficiently high to pull-up the signal at the pad within 25 ns; however, that would result in a higher resistance value and higher current drain.

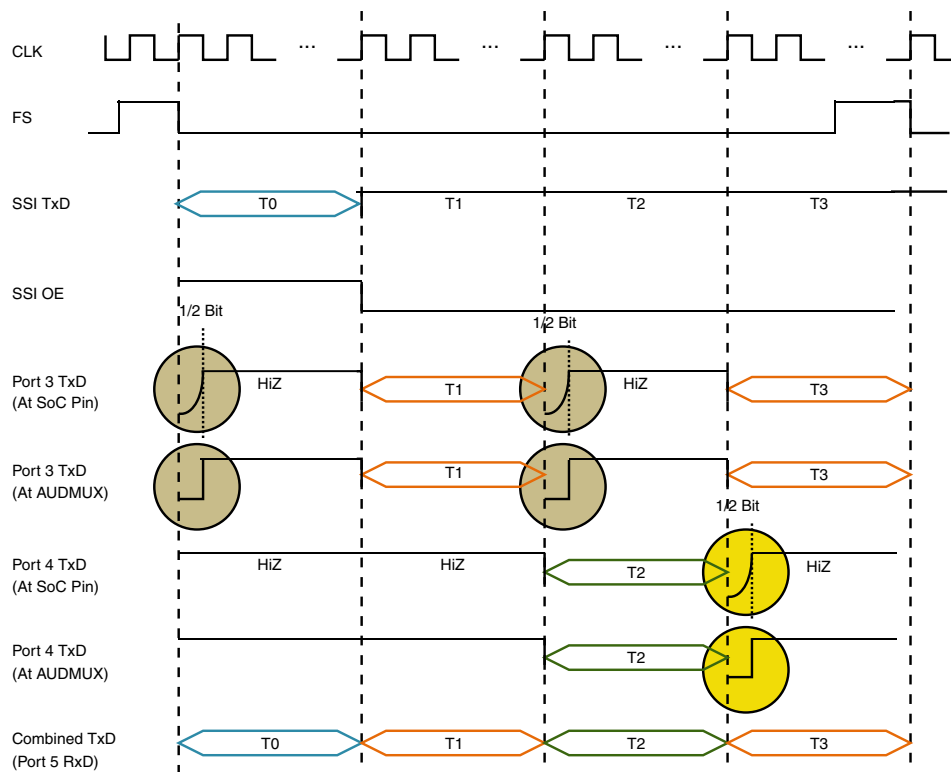

Figure 17-7. Example Using External Ports for Transmit Data in Consecutive Timeslots

Internal Network Mode Example 3

The SSI and Port 3 are used with Port 5 in internal network mode as shown in the following figure. Note that Port 3 is an external port. Therefore, a pull-up resistor is required on the Port 3TXD pin. This example shows the timing associated with inserting empty timeslots after the timeslots have been used by external ports.

Figure 17-8. Block Diagram For Example 3

The resistance value of the pull-up resistors must be sufficiently high such that a value of '0' can be pulled up to logic '1' by the time that the next occupied timeslot occurs. This allows a much weaker pull-up to be used as compared to Example 2. The required resistance must be no larger than:

$R_{max} = (4 * n + 1) / (2 * f_{bc} * C)$ where:

- n is the number of bits per timeslot
- f_{bc} is the frequency of the bitclock
- C is the total system capacitance (ICs, board traces, and so on)

The figure below shows the timing diagram for this example. The clock and frame sync signals show the bit and frame timing for the serial bus. The vertical dashed lines divide the frame into four timeslots.

The data lines for the SSI and Port 3 are shown. Note that the SSI transmits a logic '1' when its corresponding output enable is a logic '0'. The data line from Port 3 at the pad is pulled high by a pull-up resistor when they are in the high-impedance state. The data line from Port 3 at the AUDMUX is a pure digital signal and is constantly driven. The combined TXD line, which is the logical AND of the SSI and Port 3's TXD lines, is used for Port 5's RXD line.

Note the highlighted area in the [Figure 17-9](#). This shows the transition time that occurs while Port 3's TXD line is being pulled high. In this example, this transition time is a maximum of two timeslots plus 1/2 the period of the serial bitclock. This prevents corruption of the first data bit of the next timeslot. It is critical that the pull-up resistance is sufficient for the given bitclock frequency and system capacitance.

Note that hysteresis must be enabled at Port 3's RXD pad to prevent the digital signal created by the pad from toggling rapidly during the extended pull-up period. The pads typically require a transition within 25 ns unless hysteresis is enabled.

Figure 17-9. Example Using External Ports For Transmit Data In Nonconsecutive Timeslots

17.5.1.1.3 Transmit Data Output Enable Assertion

The TXD line from the internal network mode master (connected at any internal port) is put into the high-impedance state at the pad depending upon the assertion or deassertion of TxD_obe, its corresponding output enable generated by the network mode master.

In the case of an external network mode master (connected at an external port), the corresponding TxD_obe is always asserted after the port data register configuration.

17.5.1.2 Tx/Rx Switch and External Network Mode

External network mode is the traditional network mode connection. It is called external network mode to differentiate from the internal network mode. In external network mode, devices are connected to a single external port in a star or multi-drop configuration.

In network mode, there can be only one master (driving the frame sync and clock source) with the other devices configured in normal slave mode or network slave mode. Unlike internal network mode, both master-slave and slave-slave communication can take place in external network mode. Codec devices transmit on a single timeslot while processor serial interfaces (that is, SSI) can process more than one timeslot of data while in network master or slave mode.

The following figure shows the Tx/Rx data switch. `RxD_obe` is the output buffer enable signal and `RxD_out` is the data transmit signal from the serial interface. The `TxD_in` signal is the receive data signal going towards the `RXDSEL` muxes of all ports.

`D_TxRx` is the data pin which serves as the chip-level transmit data pin when the TxRx switch is not enabled. `D_RxTx` is the data pin which serves as the chip-level receive data pin when the TxRx switch is not enabled. The roles of these pins are reversed when the TxRx switch is enabled.

When `TXRXEN` is disabled (`TXRXEN=0`), `RxD_out` is routed to `D_TxRx` and `D_RxTx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Db_obe`.

When the Tx/Rx switch is enabled (`TXRXEN=1`), `RxD_out` is routed to `D_RxTx` and `D_TxRx` is routed to `TxD_in`. The output buffer enable, selected by `RXDSEL[2:0]`, is routed to `Da_obe`.

If the `RXDSELn[2:0]` field for any Port *n* is configured to select data from an internal port, the output buffer enable is selected by `RXDSELn[2:0]` and is routed to `Dan_obe/Dbn_obe`. In the case when the `RXDSELn[2:0]` field for Port *n* is configured to select data from an external port, the output buffer enable is always high and routed to `Dan_obe/Dbn_obe`, depending on the `TXRXENn` switch configuration.

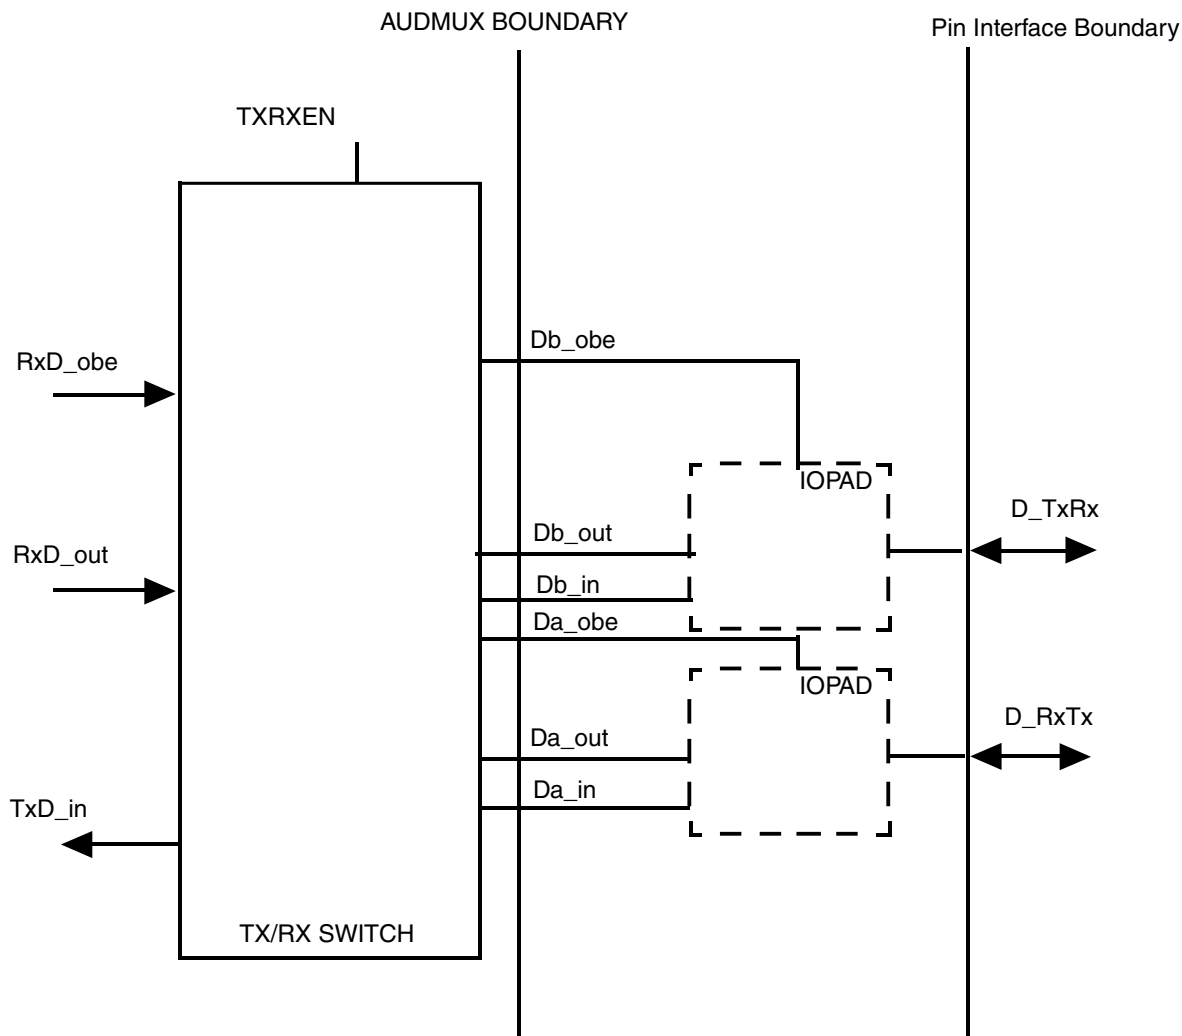

Figure 17-10. Tx/Rx Switch

17.5.1.3 Timing Modes

The AUDMUX ports are constructed as 6-wire interfaces. However, they can be used either in synchronous or asynchronous modes as determined by the SYN bit.

17.5.1.3.1 Synchronous Mode (4-Wire Interface)

In Synchronous mode, each port set in SYN=1 will be a 4-wire interface (that is, RXD, TXD, TXC, TXFS). In this setup, receive data timing is determined by TXC and TXFS..

As shown in the following figure, SSI signals interfaced to Port x signals are routed to Port y. When SYN = 1 the 6-wire signal from SSI is reduced to 4-wire within the internal logic.

TFS_in, RFS_in, TCLK_in, and RCLK_in are the input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

The TFS_out and TCLK_out are selected at Port x by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected at Port x by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, Port y is configured as a 4-wire port; TFSEL selects the FS_obe and FS_out signals. In this mode, the configuration of RFSEL and RCSEL is not used, since the RFS_out and RCLK_out pins at Port y are not available.

Figure 17-11. Frame Sync and Clock Routing When External Port Is 4-Wire

17.5.1.3.2 Asynchronous Mode (6-Wire Interface)

In Asynchronous mode, the port has a 6-wire interface (meaning RXD, TXD, TXC, TXFS, RXC, RXFS). This mode has additional receive clock (RXC) and frame sync (RXFS) signals as compared to the synchronous or 4-wire interface.

As shown in the figures below, Port x signals can be routed to Port y, producing 6-wire to 6-wire port connectivity.

TFS_in, RFS_in, TCLK_in, and RCLK_in are input frame sync and bit clocks from the serial interface (Port x) with their corresponding output buffer enable signals (_obe). TFS_out, RFS_out, TCLK_out, and RCLK_out are the frame sync and bit clocks that are transmitted to the serial interface from the other ports.

TFS_out and TCLK_out are selected by the TFSEL and TCSEL mux settings, respectively. RFS_out and RCLK_out are selected by the RFSEL and RCSEL mux settings, respectively. Similarly, in the external direction, the TFSEL selects the TxFS_obe and TxFS_out signals and TCSEL selects the TxCLK_obe and TxClk_out signals. The RFSEL selects the RxFS_obe and RxFS_out signals and RCSEL selects the RxCLK_obe and RxCLK_out signals.

NOTE

Because FS_in and CLK_in from external interfaces are also routed to the TFSEL and TCSEL muxes of the external ports, these signals do not have corresponding buffer enable signals. Consequently, their corresponding inputs to the TFSEL and TCSEL mux of the external ports have to be tied high.

Figure 17-12. Frame Sync Routing When External Port Is 6-Wire

Figure 17-13. Clock Routing When External Port Is 6 Wire

17.5.2 Connectivity Between Ports

Four basic types of connections are provided by the AUDMUX:

- Internal port to external port
- External port to external port
- Internal port to internal port
- Loopback

The corresponding data connections are described in the following sections.

17.5.2.1 Internal Port to External Port Connectivity

The internal port is connected to a processor's serial interface. TxD_obe is the buffer enable signal from the serial interface, TxD_in is the input transmit data from the serial interface to the AUDMUX, and RxD_out is the receive data output from the AUDMUX to the serial interface.

RXDSEL[2:0] of the external port selects the buffer enable signal (TxD_obe) and transmit data output (TxD_out) signal from the TxD_obe and RxD_in signals. RXDSEL[2:0] is a common signal to both selection muxes.

NOTE

Because buffer TxD_in signals from external interfaces do not have corresponding buffer enable signals, their buffer enable signals into the selection mux are tied high. This will ensure that selection of TxD_in, as RxD_out will also drive the RxD_obe output high.

Transmit Data from the serial interface goes into the RXDSEL data mux and comes out as RxD_out. RxD_out is routed to Da_TxRx when TXRXEN is disabled and to D_RxTx when TXRXEN is enabled. Similarly, D_RxTx is routed to TxD_in when TXRXEN is disabled and D_TxRx is routed to TxD_in when TXRXEN is enabled. The routing of frame syncs is shown in [Figure 17-12](#) and the routing of interface clocks is shown in [Figure 17-10](#).

If internal network mode is disabled, then RXDSEL selects the TxD_in, which is sent from the AUDMUX to the serial interface connected at Port x. When the internal network mode is selected, RxD_out is constructed by ANDing selected TxD_in signals from the ports (as determined by INMMASK).

If there is more than one device attached to the external port at D_TxRx and D_RxTx and one of the devices is a network master, then two conditions must be noted:

1. When the external master is enabled in network mode, then the serial interface at Port x must be configured as a slave (normal or network mode). No Tx/Rx switching is required.
2. When the external master is disabled and the serial interface at Port x and other slave devices must communicate, then the serial interface at Port x must be configured as a network mode master and the Tx/Rx switch at Port y must be enabled (TXRXEN=1). This will ensure that the transmit and receive paths are connected appropriately.

To communicate with more than one port, internal network mode can be enabled at Port x. In internal network mode, it is possible to communicate with any device attached to the other ports. Internal network mode shall be enabled at the port that is the SSI network mode master.

17.5.2.2 External Port to External Port Connectivity

External ports can communicate with external ports directly.

External ports can communicate together in three ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. Since an external port is being used as the internal network mode master, all other devices on the same AUDMUX port as the internal network mode master must be disabled. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

17.5.2.3 Internal Port to Internal Port Connectivity

Internal ports can communicate with other internal ports directly, thereby providing a means for synchronous interprocessor communication.

Internal ports can communicate together in two ways:

1. Each port's receive logic is configured in normal mode (MODE = 0) . Each port's RXDSEL[2:0] field is configured to select the other port's transmit data. Bit fields associated with clock/frame sync selection and direction are configured for each port. Either port can be the master.
2. One port is configured in internal network mode (MODE = 1) . All desired data lines are combined by the AND gate as determined by INMMASK[7:0]. This configuration can be used with a combination of internal and external ports. All external ports must have a pull-up resistor on its RXD pin. Bit fields associated with clock/frame sync selection and direction are configured for each port. Any port can be the master.

17.5.2.4 Loopback Connectivity

AUDMUX ports can communicate with themselves in order to provide loopback functionality. Port x can route its TXD signal to its own RxD_out signal by setting RXDSELx[2:0] to its own port number. This is supported by all ports in the AUDMUX.

In addition, ports can provide loopback support in internal network mode. With internal network mode, the internal network mode master can loop its TXD signal (combined with those of other ports, if desired) back into its RxD_out signal. Port x's INMMASK should be set such that bit (x - 1) is clear in order to enable the loopback.

17.6 AUDMUX Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a specific sub-block instantiation, see the system memory map in this manual.

The AUDMUX memory map is shown in the following table.

AUDMUX memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
21D_8000	Port Timing Control Register 1 (AUDMUX_PTCR1)	32	R/W	AD40_0800h	17.6.1/647
21D_8004	Port Data Control Register 1 (AUDMUX_PDCR1)	32	R/W	0000_A000h	17.6.2/649
21D_8008	Port Timing Control Register 2 (AUDMUX_PTCR2)	32	R/W	A500_0800h	17.6.3/650
21D_800C	Port Data Control Register 2 (AUDMUX_PDCR2)	32	R/W	0000_8000h	17.6.4/652
21D_8010	Port Timing Control Register 3 (AUDMUX_PTCR3)	32	R/W	9CC0_0800h	17.6.5/653
21D_8014	Port Data Control Register 3 (AUDMUX_PDCR3)	32	R/W	0000_6000h	17.6.6/655
21D_8018	Port Timing Control Register 4 (AUDMUX_PTCR4)	32	R/W	0000_0800h	17.6.7/656
21D_801C	Port Data Control Register 4 (AUDMUX_PDCR4)	32	R/W	0000_4000h	17.6.8/658
21D_8020	Port Timing Control Register 5 (AUDMUX_PTCR5)	32	R/W	0000_0800h	17.6.9/659
21D_8024	Port Data Control Register 5 (AUDMUX_PDCR5)	32	R/W	0000_2000h	17.6.10/661
21D_8028	Port Timing Control Register 6 (AUDMUX_PTCR6)	32	R/W	0000_0800h	17.6.11/662
21D_802C	Port Data Control Register 6 (AUDMUX_PDCR6)	32	R/W	0000_0000h	17.6.12/664
21D_8030	Port Timing Control Register 7 (AUDMUX_PTCR7)	32	R/W	0000_0800h	17.6.13/665

AUDMUX_PTCR1 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output.
30–27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
26 TCLKDIR	Transmit Clock Direction Control. This bit sets the direction of the TXC pin of the interface as an output or input. When set as an input, the TCSEL settings are ignored. When set as an output, the TCSEL settings determine the source port of the clock.

Table continues on the next page...

AUDMUX_PTCR1 field descriptions (continued)

Field	Description
	0 TXC is an input. 1 TXC is an output.
25–22 TCSEL[3:0]	Transmit Clock Select. Selects the source port from which TXC is sourced. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
21 RFS_DIR	Receive Frame Sync Direction Control. This bit sets the direction of the RXFS pin of the interface as an output or input. When set as an input, the RFSEL settings are ignored. When set as an output, the RFSEL settings determine the source port of the frame sync. 0 RXFS is an input. 1 RXFS is an output.
20–17 RFSEL[3:0]	Receive Frame Sync Select. Selects the source port from which RXFS is sourced. RXFS can be sourced from TXFS and RXFS from other ports. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved
16 RCLKDIR	Receive Clock Direction Control. This bit sets the direction of the RXC pin of the interface as an output or input. When set as an input, the RCSEL settings are ignored. When set as an output, the RCSEL settings determine the source port of the clock. NOTE: RCLKDIR and SYN should not be changed at the same time. 0 RXC is an input. 1 RXC is an output.
15–12 RCSEL[3:0]	Receive Clock Select. Selects the source port from which RXC is sourced. RXC can be sourced from TXC and RXC from other ports. 0xxx Selects TXC from port. 1xxx Selects RXC from port. x000 Port 1 x110 Port 7 x111 Reserved
11 SYN	Synchronous/Asynchronous Select. When SYN is set, synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals (that is, the port is a 4-wire interface). When SYN is cleared, asynchronous mode is chosen and separate clock and frame sync signals are used for the transmit and receive sections (that is, the port is a 6-wire interface). NOTE: RCLKDIR and SYN should not be changed at the same time. 0 Asynchronous mode 1 Synchronous mode (default)
Reserved	This read-only field is reserved and always has the value 0.

17.6.2 Port Data Control Register 1 (AUDMUX_PDCR1)

PDCR1 is the Port Data Control Register for Port 1.

Address: 21D_8000h base + 4h offset = 21D_8004h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W	[Shaded]

AUDMUX_PDCR1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–13 RXDSEL[2:0]	Receive Data Select. Selects the source port for the RXD data. RXDSEL is ignored if MODE = 1 (that is, Internal Network Mode is enabled). xxx Port number for RXD 000 Port 1 110 Port 7 111 Reserved
12 TXRXEN	Transmit/Receive Switch Enable. Swaps the transmit and receive signals. 0 No switch (Transmit Pin = Transmit, Receive Pin = Receive) 1 Switch (Transmit Pin = Receive, Receive Pin = Transmit)
11–9 Reserved	This read-only field is reserved and always has the value 0.
8 MODE	Mode Select. This field selects the mode in which the port is to operate. The modes of operation include the following: <ul style="list-style-type: none"> Normal mode, in which the RXD from the port selected by RXDSEL is routed to the port. Internal Network mode in which RXD from other ports are ANDed together. RXDSEL is ignored. INMMASK determines which RXD signals are ANDed together. 0 Normal mode 1 Internal Network mode

Table continues on the next page...

AUDMUX_PDCR1 field descriptions (continued)

Field	Description
INMMASK[7:0]	Internal Network Mode Mask. Bit mask that selects the ports from which the RXD signals are to be ANDed together for internal network mode. Bit 6 represents RXD from Port 7 and bit0 represents RXD from Port 1. 0 Includes RXDn for ANDing 1 Excludes RXDn from ANDing

17.6.3 Port Timing Control Register 2 (AUDMUX_PTCR2)

PTCR2 is the Port Timing Control Register for Port 2.

Address: 21D_8000h base + 8h offset = 21D_8008h

AUDMUX_PTCR2 field descriptions

Field	Description
31 TFS_DIR	Transmit Frame Sync Direction Control. This bit sets the direction of the TXFS pin of the interface as an output or input. When set as an input, the TFSEL settings are ignored. When set as an output, the TFSEL settings determine the source port of the frame sync. 0 TXFS is an input. 1 TXFS is an output.
30-27 TFSEL[3:0]	Transmit Frame Sync Select. Selects the source port from which TXFS is sourced. 0xxx Selects TXFS from port. 1xxx Selects RXFS from port. x000 Port 1 x110 Port 7 x111 Reserved

Table continues on the next page...

Chapter 18

62-BIT Correcting ECC Accelerator (BCH)

18.1 Overview

The hardware ECC accelerator provides a forward error-correction function for improving the reliability of various storage media that may be attached to the device.

For example, NAND flash devices use a spare area to store ecc codes to correct some hard bit errors in data stored within the device, allowing higher device yields and, therefore, lower NAND device costs.

The Bose, Ray-Chaudhuri, Hocquenghem (BCH) Encoder and Decoder module is capable of correcting from 2 to 62 single bit errors within a block of data no larger than about 1900 bytes (512 bytes or 1024 bytes are typical) in applications such as protecting data and resources stored on modern NAND flash devices. The correction level in the BCH block is programmable to provide flexibility for varying applications and configurations of flash page size. The design can be programmed to encode protection of 2 to 62 bit errors when writing flash and to correct the corresponding number of errors on decode. The correction level when decoding **MUST** be programmed to the same correction level as was used during the encode phase.

BCH-codes are a type of block-code, which implies that all error-correction is performed over a block of N-symbols. The BCH operation will be performed over $GF(2^{13} = 8192)$ or $GF(2^{14} = 16384)$, which is the Galois Field consisting of 8191 or 16383 one-bit symbols. BCH-encoding (or encode for any block-code) can be performed by two algorithms: systematic encoding or multiplicative encoding. Systematic encoding is the process of reading all the symbols which constitute a block, dividing continuously these symbols by the generator polynomial for the $GF(8192)$ or $GF(16384)$ and appending the resulting t parity symbols to the block to create a BCH codeword (where t is the number of correctable bits).

The BCH encode process creates $t \times 13$ (or $t \times 14$)-bit parity symbols for each data block when the data is written to the flash device. The parity symbols are written to the flash device after the corresponding data block, and together these are collectively called the codeword. The codeword can be used during the decode process to correct errors that occur in either the data or parity blocks.

The BCH decoder processes code words in a 4-step fashion:

1. Syndrome Calculation (SC): This is the process of reading in all of the symbols of the codeword and continuously dividing by the generator polynomial for the field. $2 \times t$ syndromes must be calculated for each codeword and inspection of the syndromes determines if there are errors: a non-zero set of syndromes indicates one or more errors. This process is implemented parallel hardware to minimize processing time since it must be done every time the decode is performed.
2. Key Equation Solver (KES): The syndromes represent $2t$ -linear equations with $2t$ -unknown variables. The process of solving these equations and selecting from the numerous solutions constitutes the KES module. When the KES block completes its operations, it generates an error locator polynomial (σ) that is used in the proceeding block to determine the locations and values of the errors.
3. Chien Search (CS): This block takes input from the KES block and uses the Chien Algorithm for finding the locations of the errors based on the error locator polynomial. The method basically involves substituting all 8191 symbols from the GF(8192) or 16383 symbols from the GF(16383) into the locator polynomial. All evaluations that produce a zero solution indicate locations of the various errors. Since each located error corresponds to a single bit, the bit in the original data may be corrected by simply flipping the polarity of the incorrect location.
4. Correction: this block has to convert the symbol index and mask information to memory byte indexes and masks.

The BCH block, shown in the figure, was designed to operate in a pipelined fashion to maximize throughput. Aside from the initial latency to fill the pipeline stages, the BCH throughput is about 7/4 cycles/byte. Thus, the bottleneck in performing NAND reads and error corrections is the BCH rate. Current GPMI read rates are approximately 1/2 cycles/byte maximally for the current generation of NAND flash. Fortunately, BCH has a different master clock from GPMI, this gives some flexibility to match the throughput rate. The CPU is not directly involved in generating parity symbols, checking for errors, or correcting them.

Figure 18-1. Hardware BCH Accelerator

18.2 Operation

Before performing any NAND flash read or write operations, software should first program the BCH's flash layout registers (see [Flash Page Layout](#)) to specify how data is to be formatted on the flash device.

The BCH hardware allows full programmability over the flash page layout to enable users flexibility in balancing ECC correction levels and ever-changing flash page sizes.

To initiate a NAND Flash write, software will program a GPMI DMA operation. The DMA need only program the GPMI control registers (and handle the requisite flash addressing handshakes) since the BCH will handle all data operations using its AXI bus interface. The BCH will then send the data to the GPMI controller to be written to flash

Operation

as it computes the parity symbols. At the end of each data block the BCH will insert the parity symbols into the data stream so that the GPMI sees only a continuous stream of data to be written.

NAND Flash read operations operate in a similar manner. As the GPMI controller reads the device, all data is sent to the BCH hardware for error detection/correction. The BCH controller writes all incoming read data to system memory and in parallel computes the syndromes used to detect bit errors. If errors are detected within a block, the BCH hardware activates the error correction logic to determine where bit errors have occurred and ultimately correct them in the data buffer in system memory. After an entire flash page has been read and corrected, the BCH will signal an interrupt to the CPU.

The figure below indicates how data read from the GPMI is operated on within the BCH hardware. As the BCH receives data from the GPMI (top row), it is written to memory by the BCH's Bus Interface Unit (BIU) (second row). For blocks requiring correction, the KES logic will be activated after the entire block has been received. Once the error locator polynomial has been computed, the corrections are determined by the Chien Search and fed back to the BIU, which performs a read, modify, write operation on the buffer in memory to correct the data.

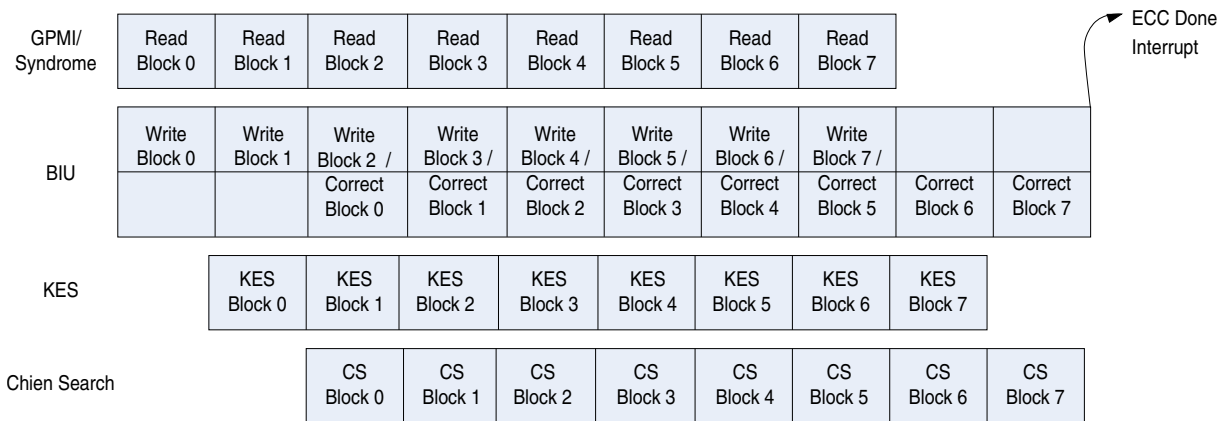

Figure 18-2. Block Pipeline while Reading Flash

18.2.1 BCH Limitations and Assumptions

- The BCH is programmable to support 2 to 62 bit error correction. ECC0 is supported as a pass-through, non-correcting mode.
- Data block sizes must be a multiple of 4 bytes and be aligned in system memory.
- The BCH supports a programmable number of metadata/auxiliary data bytes, from 0 to 255.

- Metadata will be written at the beginning of the flash page to facilitate fast access for filesystem operations.
- Metadata may be treated as an independent block for ECC purposes or combined with the first data block to conserve bits in the flash.
- The BCH does not support a partial page write (this can be accomplished by programming the BCH layout registers such that the BCH only sees a portion of the page).
- Flash read operations can read the entire page or the first block on the page.
- The BCH also supports a memory-to-memory mode of operation that does not require the use of DMA or the GPMI.

18.2.2 Flash Page Layout

The BCH supports a fully programmable flash page layout. The BCH maintains four independent layout registers that can describe four completely different NAND devices or layouts.

When the BCH initiates an operation, it selects one of the layouts by using the chip select as an index into the BCH_LAYOUTSELECT register that determines which layout should be used for the operation.

Three possible (generic) flash layout schemes are supported, as indicated in the figure below. (In each case, the metadata size may also be programmed to 0 bytes). Metadata may either be combined with the first block of data or the size of the first data block can be programmed to 0 to allow the metadata to be protected by its own ECC parity bits.

Figure 18-3. FLASH Page Layout Options

Each layout is determined by a pair of registers that define the following parameters:

- **DATA0_SIZE:** Indicates the number of data bytes in the first block on the page (this should not include parity or metadata bytes). This should be set to 0 when the metadata is to be covered separately with its own ECC. This must be a multiple of 4 bytes.
- **ECC0:** Indicates the ECC level to be used for the first block on the flash (data0+metadata).
- **META_SIZE:** Indicates the number of bytes (from 0-255) that are stored as metadata.
- **NBLOCKS:** Indicates the number of subsequent DATAN blocks on the flash, or the number of blocks following the DATA0 block.
- **DATAN_SIZE:** Indicates the number of data bytes in all subsequent data blocks. This **MUST** be a multiple of 4 bytes.
- **ECCN:** Indicates the ECC level to be used for the subsequent data blocks.

- GF0 or GFN: Indicates the Galois field the meta / data blocks are using
- PAGE_SIZE: Indicates the total number of bytes available per page on the physical flash device. This includes the spare area and is typically 4096+128, 4096+218, or 2048+64 bytes.

18.2.3 Determining the ECC layout for a device

Since the BCH is programmable, a system can trade off ECC levels for flash size and layout configurations.

The following examples indicate how to determine a valid layout based on the required storage space and flash size. For all cases, the size of the parity will be 13 (or 14 for GF(2¹⁴))*ECC level *bits*-- so for ECC8, 13 (or 14) bytes are required (per block).

18.2.3.1 4K+218 flash, 10 bytes metadata, 512 byte data blocks, separate metadata, Assuming GF(2¹³)

In this case, we have 8 data blocks each consisting of 512 bytes. Since the flash has 218 spare bytes (1744 bits), first estimate an ECC level for the data blocks by first subtracting the number of metadata bytes from the spare bytes (218 – 10 = 208 bytes = 1664 bits) then dividing the number of bits by 8 (number of blocks) and then by 13 (bits per ECC level).

$$(218 - 10) \times 8 = 1664/13(8) = 16$$

Therefore all the data blocks could be covered by ECC16 if the metadata had no parity. This isn't acceptable, so assume ECC14 for all the data blocks. Now calculate the number of free bits for the metadata parity as

$$1664 - (14) \times 13 \times 8 = 208$$

Therefore, 208 bits remain for metadata parity. Dividing by 13 (bits/ECC) gives 16, so the metadata can be covered with ECC16. The settings for this device would then be

Table 18-1. Settings for 4K+218 FLASH

Setting	Value
PAGE_SIZE	4096+218=4314=0x10DA
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	16=0x10

Table continues on the next page...

Table 18-1. Settings for 4K+218 FLASH (continued)

Setting	Value
GF0	GF(2 ¹³)
DATAN_SIZE	512=0x200 (in register interface, assigned as 0x80)
ECCN	14=0x0E
GFN	GF(2 ¹³)
NBLOCKS	8

18.2.3.2 4K+128 flash, 10 bytes metadata, 1024 byte data blocks, separate metadata, assuming GF(2¹³) for data and GF(2¹⁴) for metadata

This flash will have 118 bytes available for ECC (after subtracting the metadata size), therefore, 994 bits.

Dividing by 4*14 (number of blocks * ECC level) we get 17.75, therefore we can support ECC16 on the data blocks. The number of free spare bits becomes 944 - 16 * 4 * 14 = 944 - 896 = 48, divided by 13 = 3.69, therefore the metadata can be also covered by ECC2.

Table 18-2. Settings for 4K+128 FLASH

Setting	Value
PAGE_SIZE	4096+128=4224=0x1080
META_SIZE	10=0x0A
DATA0_SIZE	0
ECC0	2
GF0	GF(2 ¹³)
DATAN_SIZE	1024=0x400 (in register interface, assigned as 0x100)
ECCN	16
GFN	GF(2 ¹⁴)
NBLOCKS	4

In this case, there will be additional unused spare bits, with the BCH will pad out with zeros.

18.2.4 Data Buffers in System Memory

While the data on the flash is interleaved with parity symbols, the BCH assumes that the data buffers in memory are contiguous.

Metadata read from the flash will be stored to the location pointed to by the GPMI_AUXILIARY register and data will be written to the address specified in the GPMI_PAYLOAD register as is shown in the following figure where the block length is 512 bytes for example. Since the number of blocks on a flash page is programmable, the BCH also writes individual block correction status to the auxiliary pointer at the word-aligned address following the end of the metadata. Optionally, the computed syndromes may also be written to the auxiliary area if the DEBUGSYNDROME bit is set in the control register.

As blocks complete processing, the bus master will accumulate the status for each block and write it to the auxiliary data buffer following the metadata. The metadata area will be padded with 0's until the next word boundary and the status for blocks 0-3 will be written to the next word. The status for subsequent blocks will then be written to the buffer. The status for the first block (metadata block) is also stored in the STATUS_BLK0 register in the BCH_STATUS register. The completion codes for the blocks are indicated in the [Table 18-3](#). Note that the definition of the bytes and their ordering in the auxiliary and payload storage areas are user defined. When this data is read back from the flash and put into memory, it will resemble the original buffer that was written out to the flash.

Minimum System Memory Footprint:

*Computed syndrome area consists of 2*t 13 (or 14)-bit symbols written as 16-bit half word.*

Figure 18-4. BCH Data Buffers in Memory

Table 18-3. Status Block Completion Codes

Code	Description
0xFF	Block is erased
0xFE	Block is uncorrectable
0x00	No errors found
0x01-0x3E	Number of errors corrected

The following figure shows the layout of the bytes within the status field.

Status bytes are allocated based on the NBLOCKS programmed into the flash format register. The number of status bytes will be computed by the NBLOCKS+1. The status area will be padded with zeros to the next word boundary.

Syndrome data written for debug purposes will follow the end of the status block.

Figure 18-5. Memory-to-Memory Operations

18.3 Memory to Memory (Loopback) Operation

The BCH supports a memory-to-memory mode of operation where both the encoded and decoded buffers reside in system memory.

This can be useful for applications where data must be protected by ECC, but the storage device does not reside on the GPMI bus.

The BCH operation in memory to memory mode is much simpler than in GPMI mode since DMAs are not required to manage the operation. Instead, software simply writes the BCH_DATAPTR and BCH_METAPTR with the addresses of the data and metadata (auxiliary) buffers and the BCH_ENCODEPTR with the address of the buffer for encoded data. To initiate the operation, software simply sets the M2M_ENCODE and M2M_ENABLE bits in the control register. The BCH can be programmed to either issue an interrupt at the end of the operation or software may poll the status bits for completion.

Memory to memory decode operations work in a similar manner. The encoded data address is written to the BCH_ENCODEPTR and the data and meta pointers are written to buffers that correspond to the desired decoded data addresses. To initiate a decode, software must set the M2M_ENCODE bit to 0 while writing the M2M_ENABLE bit. Note that the addresses written to the BCH_DATAPTR, BCH_METAPTR and BCH_ENCODEPTR registers should always be aligned on a 4 byte boundary. In other words, the 2 lower bits of the address should always be written with zeros.

18.4 Programming the BCH/GPMI Interfaces

Programming the BCH for NAND operations consists largely of disabling the soft reset and clock bits (SFTRST and CLKGATE) from the BCH_CTRL register and then programming the flash layout registers to correspond to the format of the attached NAND device(s).

The BCH_LAYOUTSELECT register should also be programmed to map the chip select of each attached device into one of the four layout registers.

The bulk of the programming is actually applied to the GPMI through PIO operations embedded in DMA command structures. The DMA will perform all the requisite handshaking with the GPMI interface to negotiate the address portion of the transfer, then the BCH will handle all the movement of data from memory to the GPMI (writes) or the GPMI to memory (reads). The BCH will direct all data blocks to the buffer pointed to by the PAYLOAD_BUFFER and the metadata will be written to the AUXILIARY_BUFFER. Both of these registers are located in the GPMI PIO data space and are communicated to the BCH hardware at the beginning of the transfer. Thus, the normal multi-NAND DMA based device interleaving is preserved, that is, four NANDs on four separate chip selects can be scheduled for read or write operations using the BCH. Whichever channel finishes its ready wait first and enters the DMA arbiter with its lock bit set owns the GPMI command interface and through it owns the BCH resources for the duration of its processing.

18.4.1 BCH Encoding for NAND Writes

The BCH encoder flowchart in [Figure 18-6](#) shows the detailed steps involved in programming and using the BCH encoder. This flowchart shows how to use the BCH block with the GPMI.

To use the BCH encoder with the GPMI's DMA, create a DMA command chain containing ten descriptor structures, as shown in [Figure 18-8](#) and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The ten descriptors perform the following tasks:

1. Disable the BCH block (in case it was enabled) and issue NAND write setup command byte (under CLE) and address bytes (under ALE).
2. Configure and enable the BCH and GPMI blocks to perform the NAND write.
3. Disable the BCH block and issue NAND write execute command byte (under CLE).
4. Wait for the NAND device to finish writing the data by watching the ready signal.
5. Check for NAND timeout through PSENSE.
6. Issue NAND status command byte (under CLE).
7. Read the status and compare against expected.
8. If status is incorrect or incomplete, branch to error handling descriptor chain.
9. Otherwise, write is complete and emit GPMI interrupt.

18.4.1.1 DMA Structure Code Example

The following code sample illustrates the coding for one write transaction involving 4096 bytes of data payload (eight 512-byte blocks) and 10 bytes of auxiliary payload (also referred to as metadata) to a 4K NAND page sitting on GPMI CS2.

```
//-----
// generic DMA/GPMI/ECC descriptor struct, order sensitive!
//-----
typedef struct {
    // DMA related fields
    unsigned int dma_nxtcmdar;
    unsigned int dma_cmd;
    unsigned int dma_bar;
    // GPMI related fields
    unsigned int gpmi_ctrl0;
    unsigned int gpmi_compare;
    unsigned int gpmi_eccctrl;
    unsigned int gpmi_ecccount;
    unsigned int gpmi_data_ptr;
    unsigned int gpmi_aux_ptr;
} GENERIC_DESCRIPTOR;
//-----
// allocate 10 descriptors for doing a NAND ECC Write
//-----
GENERIC_DESCRIPTOR write[10];
//-----
// DMA descriptor pointer to handle error conditions from psense checks
//-----
unsigned int * dma_error_handler;
//-----
// 8 byte NAND command and address buffer
// any alignment is ok, it is read by the GPMI DMA
// byte 0 is write setup command
// bytes 1-5 is the NAND address
// byte 6 is write execute command
// byte 7 is status command
//-----
unsigned char nand_cmd_addr_buffer[8];
//-----
// 4096 byte payload buffer used for reads or writes
// needs to be word aligned
//-----
unsigned int write_payload_buffer[(4096/4)];
//-----
// 65 byte meta-data to be written to NAND
// needs to be word aligned
//-----
unsigned int write_aux_buffer[65];
//-----
// Descriptor 1: issue NAND write setup command (CLE/ALE)
//-----
write[0].dma_nxtcmdar = &write[1]; // point to the next descriptor
write[0].dma_cmd = BF_APBH_CHn_CMD_XFER_COUNT (1 + 5) | // 1 byte command, 5 byte address
                  BF_APBH_CHn_CMD_CMDWORDS (3) | // send 3 words to the GPMI
                  BF_APBH_CHn_CMD_WAIT4ENDCMD (1) | // wait for command to finish

processing
                  BV_FLD(APBH_CHn_CMD, COMMAND, NO_DMA_XFER); // no dma transfer
```

18.4.1.2 Using the BCH Encoder

To use the BCH encoder, first turn off the module-wide soft reset bit in both the GPMI and BCH blocks before starting any DMA activity.

Turning off the soft reset must take place by itself, prior to programming the rest of the control registers. Turn off the BCH bus master soft reset bit. Turn off the clock gate bits.

Program the remainder of the GPMI, BCH and APBH DMA as follows:

```
// bring APBH out of reset
APBH_CTRL0_CLR(BM_APBH_CTRL0_SFRST);
APBH_CTRL0_CLR(BM_APBH_CTRL0_CLKGATE);

// bring BCH out of reset
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);

// bring gpmi out of reset
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_SFTRST);
GPMI_CTRL0_CLR(BM_GPMI_CTRL0_CLKGATE);
GPMI_CTRL1_SET(BM_GPMI_CTRL1_DEV_RESET | // deassert reset
               BM_GPMI_CTRL1_BCH_MODE ); // enable BCH mode

// enable pinctrl
PINCTRL_CTRL_WR(0x00000000);

// enable gpmi pins
PINCTRL_MUXSEL0_CLR(0x0000ffff); // data bits
PINCTRL_MUXSEL1_CLR(0x03ffffff); // control bits
PINCTRL_MUXSEL8_CLR(0x0003f3ff); // control bits
PINCTRL_MUXSEL8_SET(0x00015155); // control bits
```

Note that for writing NANDs (ECC encoding), only GPMI DMA command complete interrupts are used. The BCH engine is used for writing to the NAND but may optionally produce an interrupt. From the sample code in [DMA Structure Code Example](#):

- DMA descriptor 1 prepares the NAND for data write by using the GPMI to issue a write setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is disabled and not used for these commands.

- DMA descriptor 2 enables the BCH engine for encoding to begin the initial writing of the NAND data by specifying where the data and auxiliary payload are coming from in system memory.
- DMA descriptor 3 issues the write commit command byte under CLE to the NAND.
- DMA descriptor 4 waits for the NAND to complete the write commit/transfer by watching the NAND's ready line status. This descriptor relinquishes the NANDLOCK on the GPMI to enable the other DMA channels to initiate NAND transactions on different NAND CS lines.
- DMA descriptor 6 issues a NAND status command byte under "CLE" to check the status of the NAND device following the page write.
- DMA descriptor 7 reads back the NAND status and compares the status with an expected value. If there are differences, then the DMA processing engine follows an error-handling DMA descriptor path.
- DMA descriptor 8 disables the BCH engine and emits a GPMI interrupt to indicate that the NAND write has been completed.

18.4.2 BCH Decoding for NAND Reads

When a page is read from NAND flash, BCH syndromes will be computed and, if correctable errors are found, they will be corrected on a per block basis within the NAND page.

This decoding process is fully overlapped with other NAND data reads and with CPU execution. The BCH decoder flowchart in the figure below shows the steps involved in programming the decoder. The hardware flow of reading and decoding a 4096-byte page is shown in [Figure 18-10](#).

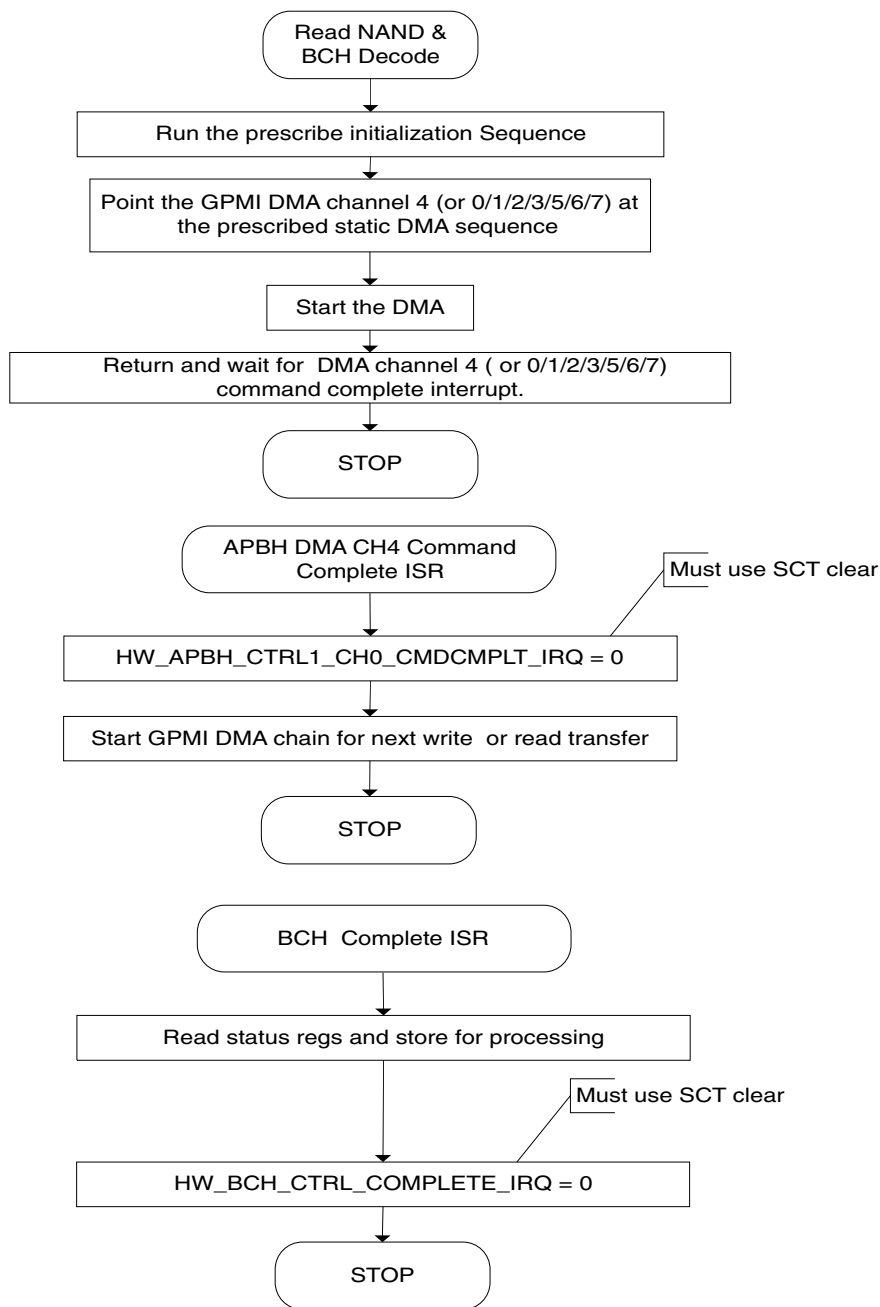

Figure 18-9. BCH Decode Flowchart

Conceptually, an APBH DMA Channel command chain with seven command structures linked together is used to perform the BCH decode operation (as shown in [Figure 18-10](#)).

Note

The GPMI's DMA command structures controls the BCH decode operation.

To use the BCH decoder with the GPMI's DMA, create a DMA command chain containing seven descriptor structures, as shown in the figure below and detailed in the DMA structure code example that follows it in [DMA Structure Code Example](#). The seven DMA descriptors perform the following tasks:

1. Issue NAND read setup command byte (under "CLE") and address bytes (under "ALE").
2. Issue NAND read execute command byte (under "CLE").
3. Wait for the NAND device to complete accessing the block data by watching the ready signal.
4. Check for NAND timeout through "PSENSE".
5. Configure and enable the BCH block and read the NAND block data.
6. Disable the BCH block.
7. Descriptor NOP to allow NANDLOCK in the previous descriptor to the thread-safe.

Programming the BCH/GPMI Interfaces

Descriptor 1: Disable BCH engine and issue NAND read set-up command and address (CLE/ALE).

Descriptor 2: NAND read execute command (CLE).

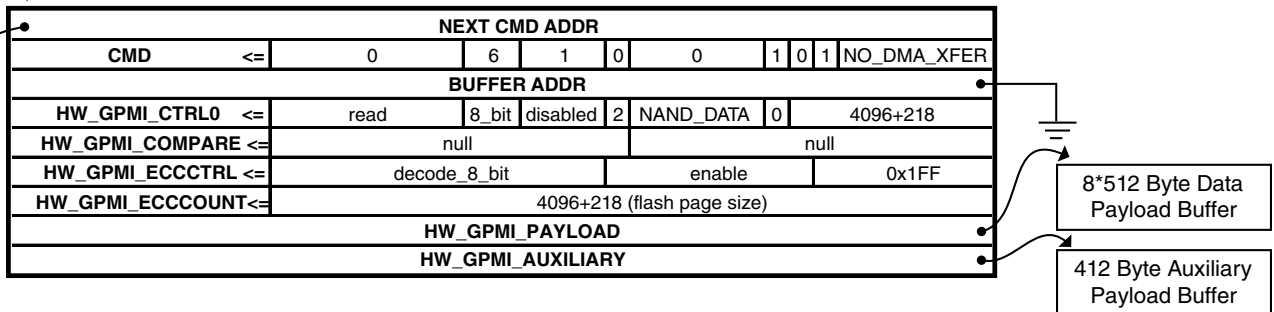

Descriptor 3: Wait for NAND ready.

Descriptor 4: PSENSE compare for time-out.

Descriptor 5: Enable BCH engine and read NAND data.

Descriptor 6: Disable BCH engine (wait for ready is a NOP here).

Descriptor 7: NOP to ensure NANDLOCK in previous descriptor .

Figure 18-10. BCH Decode DMA Descriptor Chain

18.4.2.1 DMA Structure Code Example

The following sample code illustrates the coding for one read transaction, consisting of a seven DMA command structure chain for reading all 4096 bytes of payload data (eight 512-byte blocks) and 65 bytes of metadata with the associative parity bytes ($8 * (18) + 9$) from a 4K NAND page sitting on GPMI CS2.

```
//-----
// generic DMA/GPMI/ECC descriptor struct, order sensitive!
//-----
typedef struct {
    // DMA related fields
    unsigned int dma_nxtcmdar;
    unsigned int dma_cmd;
    unsigned int dma_bar;
    // GPMI related fields
    unsigned int gpmi_ctrl0;
    unsigned int gpmi_compare;
    unsigned int gpmi_eccctrl;
    unsigned int gpmi_ecccount;
    unsigned int gpmi_data_ptr;
    unsigned int gpmi_aux_ptr;
} GENERIC_DESCRIPTOR;
//-----
// allocate 7 descriptors for doing a NAND ECC Read
//-----
GENERIC_DESCRIPTOR read[7];
//-----
// DMA descriptor pointer to handle error conditions from psense checks
//-----
unsigned int * dma_error_handler;
//-----
// 7 byte NAND command and address buffer
// any alignment is ok, it is read by the GPMI DMA
// byte 0 is read setup command
// bytes 1-5 is the NAND address
// byte 6 is read execute command
//-----
unsigned char nand_cmd_addr_buffer[7];
//-----
// 4096 byte payload buffer used for reads or writes
// needs to be word aligned
//-----
unsigned int read_payload_buffer[(4096/4)];
//-----
// 412 byte auxiliary buffer used for reads
// needs to be word aligned
//-----
unsigned int read_aux_buffer[(412/4)];
//-----
// Descriptor 1: issue NAND read setup command (CLE/ALE)
//-----
read[0].dma_nxtcmdar = &read[1]; // point to the next descriptor
read[0].dma_cmd = BF_APBH_CHn_CMD_XFER_COUNT (1 + 5) | // 1 byte command, 5 byte address
                 BF_APBH_CHn_CMD_CMDWORDS (3) | // send 3 words to the GPMI
                 BF_APBH_CHn_CMD_WAIT4ENDCMD (1) | // wait for command to finish
                 // before continuing
                 BF_APBH_CHn_CMD_SEMAPHORE (0) |
                 BF_APBH_CHn_CMD_NANDWAIT4READY (0) |
                 BF_APBH_CHn_CMD_NANDLOCK (1) | // prevent other DMA channels from
                 // taking over
                 BF_APBH_CHn_CMD_IRQONCMPLT (0) |
```

Programming the BCH/GPMI Interfaces

```

                BF_APBH_CHn_CMD_CHAIN          (1)      | // follow chain to next command
                BV_FLD(APBH_CHn_CMD, COMMAND, DMA_READ); // read data from DMA, write to
NAND

```

18.4.2.2 Using the Decoder

As illustrated in [Figure 18-10](#) and the sample code in [DMA Structure Code Example](#) :

- DMA descriptor 1 prepares the NAND for data read by using the GPMI to issue a NAND read setup command byte under CLE, then sends a 5-byte address under ALE. The BCH engine is not used for these commands.
- DMA descriptor 2 issues a one-byte read execute command to the NAND device that triggers its read access. The NAND then goes not ready.

- DMA descriptor 3 performs a wait for ready operation allowing the DMA chain to remain dormant until the NAND device completes its read access time.
- DMA descriptor 5 handles the reading and error correction of the NAND data. This command's PIOs activate the BCH engine to write the read NAND data to system memory and to process it for any errors that need to be corrected. This DMA descriptor contains two PIO values that are system memory addresses pointing to the PAYLOAD data area and to the AUXILIARY data area. These addresses are used by the BCH engine's AHB master to move data into system memory and to correct it. While this example is reading an entire 4K page—payload plus metadata—it is equally possible to read just one 512-byte payload block or just the uniquely protected metadata block in a single 7 DMA structure transfer.
- DMA descriptor 6 disables the BCH engine with the NANDLOCK asserted. This is necessary to ensure that the GPMI resource is not arbitrated to another DMA channel when multiple DMA channels are active concurrently.
- DMA descriptor 7 deasserts the NANDLOCK to free up the GPMI resource to another channel.

As the BCH block receives data from the GPMI:

- The decoder transforms the read NAND data block into a BCH code word and computes the codeword syndrome.
- If no errors are present, then the BCH block can immediately report back to firmware. This report is passed as the BCH_CTRL_COMPLETE_IRQ interrupt status bit and the associated status registers in BCH_STATUS0/1 registers.
- If an error is present, then the BCH block corrects the necessary data block or parity block bytes, if possible (not all errors are correctable).

As the BCH decoder reads the data and parity blocks, it records a special condition, i.e., that all of the bits of a payload data block or metadata block are one, including any associated parity bytes. The all-ones case for both parity and data indicates an erased block in the NAND device.

The BCH_STATUS0 register contains a 4-bit field that indicates the final status of the auxiliary block. A value of 0x0 indicates no errors found for a block.

- A value of 1 to 20 inclusive indicates that many correctable errors were found and fixed.
- A value of 0xFE indicates uncorrectable errors detected on the block.

- A value of 0xFF indicates that the block was in the special ALL ONES state and is therefore considered to be an ERASED block.
- All other values are disallowed by the hardware design.

Recall that up to eight NAND devices can have DMA chains in-flight at once, i.e. they can all be contending for access to the GPMI data bus. It is impossible to predict which NAND device will enter the BCH engine with a transfer first, because each chain includes a wait4ready command structure. As a result, firmware should look at the BCH_STATUS0_COMPLETED_CE bit field to determine which block is being reported in the status register. There is also a 16-bit HANDLE field in the GPMI_ECCCTRL register that is passed down the pipeline with each transaction. This handle field can be used to speed firmware's detection of which transaction is being reported.

These examples of reading and writing have focused on full page transfers of 4K page NAND devices. Other device configurations can be specified by changing the ECCOUNT field in the GPMI registers and reprogramming the BCH's FLASHnLAYOUTm registers.

The BCH and GPMI blocks are designed to be very efficient at reading single 512 (or 1024)-byte pages in one transaction. With no errors, the transaction takes less than 20 HCLKs longer than the time to read the raw data from the NAND.

To summarize, the APBH DMA command chain for a BCH decode operation is shown in [Figure 18-10](#). Seven DMA command structures must be present for each NAND read transaction decoded by the BCH. The seven DMA command structures for multiple NAND read transaction blocks can be chained together to make larger units of work for the BCH, and each will produce an appropriate error report in the BCH PIO space. Multiple NAND devices can have such multiple chains scheduled. The results can come back out of order with respect to the multiple chains.

18.4.3 Interrupts

There are two interrupt sources used in processing BCH protected NAND read and write transfers.

Since all BCH operations are initiated by GPMI DMA command structures, the DMA completion interrupt for the GPMI is an important ISR. Both of the flow charts of [Figure 18-6](#) and [Figure 18-9](#) show the GPMI DMA complete ISR skeleton. In both reads and writes, the GPMI DMA completion interrupt is used to schedule work *INTO* the error correction pipeline. As the front end processing completes, the DMA interrupt is

generated and additional work, such as DMA chains, are passed to the GPMI DMA to keep it *fed*. For write operations, this is the only interrupt that is generated for processing the NAND write transfer.

For reads, however, two interrupts are needed. Every read is started by a GPMI DMA command chain and the front end queue is fed as described above. The back end of the read pipeline is drained by monitoring the BCH completion interrupt found in `HW_BCH_CTRL_COMPLETE_IRQ`.

An BCH transaction consists of reading or writing all of the blocks requested in the `HW_GPMI_ECCCTRL_BUFFER_MASK` bit field. As every read transaction completes, it posts the status of all of the blocks to the `HW_BCH_STATUS0` and `HW_BCH_STATUS1` registers and sets the completion interrupt. The five stages of the BCH read pipeline completes, one in the GPMI and four in the BCH, are independently stalled as they complete and try to deliver to the next stage in the data flow. Several of these stages can be skipped if no-errors are found or once an uncorrectable error is found in a block.

In any case, the final stage will stall if the status register is busy waiting for the CPU to take status register results. The hardware monitors the state of the `HW_BCH_CTRL_COMPLETE_IRQ` bit. If it is still set when the last pipeline stage is ready to post data, then the stage will stall. It follows that the next previous stage will stall when it is ready to hand off work to the final stage, and so on up the pipeline.

CAUTION

It is important that firmware read the STATUS0/1 results and save them before clearing the interrupt request bit. Otherwise, a transaction and its results could be completely lost.

18.4.4 Randomizer

BCH ECC has a Randomizer module that is interfaced through the GPMI APBHDMA chain. The Randomizer can generate random data based on BCH ECC encoded/decoded data. It can be employed to reduce the disturbances caused by a neighboring cell in the NAND chip, thus reducing bit errors.

To enable the Randomizer module, set `GPMI_ECCCTRL[RANDOMIZER_ENABLE]` to 1, then set `GPMI_ECCCOUNT[RANDOMIZER_PAGE]` to select randomizer page number needed to be randomized. All these registers can be programmed by the DMA chain. The randomized data should start from the zero column address and be the size of the whole NAND page. If the randomizer function is enabled,

GPMI_ECCCTRL[ENABLE_ECC] should also be enabled. To bypass BCH error correction function, set BCH_FLASHxLAYOUT0[ECC0] and BCH_FLASHxLAYOUT1[ECCN] to 0.

18.5 Behavior During Reset

A soft reset (SFTRST) can take multiple clock periods to complete, so do NOT set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically. The exemplary code is shown below.

```
// A soft reset can take multiple clocks to complete, so do NOT gate the
// clock when setting soft reset. The reset process will gate the clock
// automatically. Poll until this has happened before subsequently
// preparing soft-reset and clock gate
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
// asserting soft-reset
BCH_CTRL_SET(BM_BCH_CTRL_SFTRST);
// waiting for confirmation of soft-reset
while (!BCH_CTRL.B.CLKGATE)
{
// busy wait
}
// Done.
BCH_CTRL_CLR(BM_BCH_CTRL_SFTRST);
BCH_CTRL_CLR(BM_BCH_CTRL_CLKGATE);
```

18.6 BCH Memory Map/Register Definition

BCH Hardware Register Format Summary

BCH memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
180_8000	Hardware BCH ECC Accelerator Control Register (BCH_CTRL)	32	R/W	C000_0000h	18.6.1/705
180_8004	Hardware BCH ECC Accelerator Control Register (BCH_CTRL_SET)	32	R/W	C000_0000h	18.6.1/705
180_8008	Hardware BCH ECC Accelerator Control Register (BCH_CTRL_CLR)	32	R/W	C000_0000h	18.6.1/705

18.6.1 Hardware BCH ECC Accelerator Control Register (BCH_CTRLn)

The BCH CTRL provides overall control of the hardware ECC accelerator

Address: 180_8000h base + 0h offset + (4d × i), where i=0d to 3d

BCH_CTRLn field descriptions

Field	Description
31 SFTRST	Set this bit to 0 to enable normal BCH operation. Set this bit to 1 (default) to disable clocking with the BCH and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the BCH block to its default state. This bit resets all state machines except for the AHB master state machine 0x0 RUN — Allow BCH to operate normally. 0x1 RESET — Hold BCH in reset.
30 CLKGATE	This bit must be set to 0 for normal operation. When set to 1 it gates off the clocks to the block. 0x0 RUN — Allow BCH to operate normally. 0x1 NO_CLKS — Do not clock BCH gates in order to minimize power consumption.
29–23 RSVD5	This field is reserved. This read-only field is reserved and always has the value 0.
22 DEBUGSYNDROME	(For debug purposes only). Enable write of computed syndromes to memory on BCH decode operations. Computed syndromes will be written to the auxiliary buffer after the status block. Syndromes will be written as padded 16-bit values.
21–20 RSVD4	This field is reserved. This read-only field is reserved and always has the value 0
19–18 M2M_LAYOUT	Selects the flash page format for memory-to-memory operations.
17 M2M_ENCODE	Selects encode (parity generation) or decode (correction) mode for memory-to-memory operations.
16 M2M_ENABLE	NOTE! WRITING THIS BIT INITIATES A MEMORY-TO-MEMORY OPERATION. The BCH module must be inactive (not processing data from the GPMI) when this bit is set. The M2M_ENCODE and M2M_LAYOUT bits as well as the ENCODEPTR, DATAPTR, and METAPTR registers are used for memory-to-memory operations and must be correctly programmed before writing this bit.
15–11 RSVD3	This field is reserved. This read-only field is reserved and always has the value 0
10 DEBUG_STALL_IRQ_EN	1 = interrupt on debug stall mode is enabled. The IRQ is raised on every block
9 RSVD2	This field is reserved. This read-only field is reserved and always has the value 0.
8 COMPLETE_IRQ_EN	1 = interrupt on completion of correction is enabled.
7–4 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
3 BM_ERROR_IRQ	AHB Bus interface Error Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
2 DEBUG_STALL_IRQ	DEBUG STALL Interrupt Status. Write a 1 to the SCT clear address to clear the interrupt status bit.
1 RSVD0	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

BCH_CTRL n field descriptions (continued)

Field	Description
0 COMPLETE_IRQ	This bit indicates the state of the external interrupt line. Write a 1 to the SCT clear address to clear the interrupt status bit. NOTE: subsequent ECC completions will be held off as long as this bit is set. Be sure to read the data from BCH_STATUS0, 1 before clearing this interrupt bit.

18.6.2 Hardware ECC Accelerator Status Register 0 (BCH_STATUS0 n)

The BCH STAT register provides visibility into the run-time status of the BCH and status information when processing is complete. It provides overall status of the hardware ECC accelerator.

Address: 180_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	HANDLE								COMPLETED_CE							
W	[Read-Only]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BCH Memory Map/Register Definition

BCH_STATUS0n field descriptions

Field	Description
31–20 HANDLE	Software supplies a 12 bit handle for this transfer as part of the GPMI DMA PIO operation that started the transaction. That handle passes down the pipeline and ends up here at the time the BCH interrupt is signaled.
19–16 COMPLETED_CE	This is the chip enable number corresponding to the NAND device from which this data came.
15–8 STATUS_BLK0	Count of symbols in error during processing of first block of flash (metadata block). The number of errors reported will be in the range of 0 to the ECC correction level for block 0. 0x00 ZERO — No errors found on block. 0x01 ERROR1 — One error found on block. 0x02 ERROR2 — One errors found on block. 0x03 ERROR3 — One errors found on block. 0x04 ERROR4 — One errors found on block. 0xFE UNCORRECTABLE — Block exhibited uncorrectable errors. 0xFF ERASED — Page is erased.
7–5 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
4 ALLONES	1 = All data bits of this transaction are ONE.
3 CORRECTED	1 = At least one correctable error encountered during last processing cycle.
2 UNCORRECTABLE	1 = Uncorrectable error encountered during last processing cycle.
RSVD0	This field is reserved.

Table continues on the next page...

BCH_STATUS0n field descriptions (continued)

Field	Description
	This read-only field is reserved and always has the value 0.

18.6.3 Hardware ECC Accelerator Mode Register (BCH_MODEn)

The BCH MODE register provides additional mode controls.

Contains additional global mode controls for the BCH engine.

Address: 180_8000h base + 20h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD																ERASE_THRESHOLD															
W	[Shaded]																ERASE_THRESHOLD															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

BCH_MODEn field descriptions

Field	Description
31–8 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.
ERASE_ THRESHOLD	This value indicates the maximum number of zero bits on a flash subpage for it to be considered erased. For SLC NAND devices, this value should be programmed to 0 (meaning that the entire page should consist of bytes of 0xFF. For MLC NAND devices, bit errors may occur on reads (even on blank pages), so this threshold can be used to tune the erased page checking algorithm.

18.6.4 Hardware BCH ECC Loopback Encode Buffer Register (BCH_ENCODEPTRn)

When performing memory to memory operations, indicates the address of the encode buffer. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register.

For memory to memory operations, this register is used as the pointer to the encoded data, which is an output when encoding and an input while decoding.

Address: 180_8000h base + 30h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

BCH_ENCODEPTRn field descriptions

Field	Description
ADDR	Address pointer to encode buffer. This is the source for decode operations and the destination for encode operations. This value must be aligned on a 4 bytes boundary.

18.6.5 Hardware BCH ECC Loopback Data Buffer Register (BCH_DATAPTRn)

When performing memory to memory operations, indicates the address of the data buffer.

For memory to memory operations, this register is used as the pointer to the data to encode or the destination buffer for decode operations.

Address: 180_8000h base + 40h offset + (4d × i), where i=0d to 3d

BCH_DATAPTRn field descriptions

Field	Description
ADDR	Address pointer to data buffer. This is the source for encode operations and the destination for decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 byte boundary.

18.6.6 Hardware BCH ECC Loopback Metadata Buffer Register (BCH_METAPTRn)

When performing memory to memory operations, indicates the address of the metadata buffer.

For memory to memory operations, this register is used as the pointer to the metadata to encode or the extracted metadata for decode operations.

Address: 180_8000h base + 50h offset + (4d × i), where i=0d to 3d

BCH_METAPTR_n field descriptions

Field	Description
ADDR	Address pointer to metadata buffer. This is the source for encode metadata read operations and the destination for metadata decode operations. This register should be programmed before writing a 1 to the M2M_ENABLE bit in the CTRL register. This value must be aligned on a 4 bytes boundary.

18.6.7 Hardware ECC Accelerator Layout Select Register (BCH_LAYOUTSELECT_n)

The BCH LAYOUTSELECT register provides a mapping of chip selects to layout registers.

When the BCH engine receives a request to process a data block from the GPMI interface, it will use this register to map the incoming chip select to one of the four possible flash layout registers

Address: 180_8000h base + 70h offset + (4d × i), where i=0d to 3d

7–6 CS3_SELECT	Selects which layout is used for chip select 3.
5–4 CS2_SELECT	Selects which layout is used for chip select 2.
3–2 CS1_SELECT	Selects which layout is used for chip select 1.
CS0_SELECT	Selects which layout is used for chip select 0.

18.6.8 Hardware BCH ECC Flash 0 Layout 0 Register (BCH_FLASH0LAYOUT0 n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT1 register to control the format for the devices selecting layout 0 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

Address: 180_8000h base + 80h offset + (4d × i), where i=0d to 3d

BCH_FLASH0LAYOUT0n field descriptions

Field	Description
31–24 NBLOCKS	Number of subsequent blocks on the flash page (excluding the data0 block). A value of 0 indicates that only the DATA0 block is present and a value of 8 indicates that 8 subsequent blocks are present for a total of 9 blocks on the flash (including the DATA0 block). Any values from 0 to 255 are supported by the hardware.
23–16 META_SIZE	Indicates the size of the metadata (in bytes) to be stored on a flash page. The BCH design support from 0 to 255 bytes for metadata—if set to 0, no metadata will be stored. Metadata is stored before the associated data in block 0. If the DATA0_SIZE field is programmed to a 0, then metadata effectively be stored with its own parity. When both the metadata and data0 fields are programmed with non-zero values, the first block will contain both portions of data and covered by a single parity block.
15–11 ECC0	Indicates the ECC level for the first block on the flash page. The first block covers metadata plus the associated data from the DATA0_SIZE field. 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed : — 0x1E ECC60 — ECC 60 to be performed 0x1F ECC62 — ECC 62 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATA0_SIZE	Indicates the size of the data 0 block (in DWORDS / four bytes) to be stored on the flash page. If set to 0, the first block only contains metadata.

18.6.9 Hardware BCH ECC Flash 0 Layout 1 Register (BCH_FLASH0LAYOUT1n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH0LAYOUT0 register to control the format for the device selecting layout 0 in the LAYOUTSELECT register.

Address: 180_8000h base + 90h offset + (4d × i), where i=0d to 3d

BCH_FLASH0LAYOUT1n field descriptions

Field	Description
31–16 PAGE_SIZE	Indicates the total size of the flash page (in bytes). This should be set to the page size including spare area. The page size is programmable to accommodate different flash configurations that may be available in the future.
15–11 ECCN	Indicates the ECC level for the subsequent blocks on the flash page (blocks 1-n). Subsequent blocks only contain data (no metadata). 0x0 NONE — No ECC to be performed 0x1 ECC2 — ECC 2 to be performed 0x2 ECC4 — ECC 4 to be performed : — 0x1E ECC60 — ECC 60 to be performed 0x1F ECC62 — ECC 62 to be performed
10 GF13_0_GF14_1	Select GF13 or GF14: 0-GF13; 1-GF14
DATAN_SIZE	Indicates the size of the subsequent data blocks (in DWORDS / four bytes) to be stored on the flash page. The size of subsequent data blocks does not have to match the data size for block 0, which is important when metadata is stored separately or for balancing the amount of data stored in each block.

18.6.10 Hardware BCH ECC Flash 1 Layout 0 Register (BCH_FLASH1LAYOUT0n)

The flash format register contains a description of the logical layout of data on the flash device. This register is used in conjunction with the FLASH1LAYOUT1 register to control the format for the devices selecting layout 1 in the LAYOUTSELECT register.

Each pair of layout registers describes one of four supported flash configurations. Software should program the LAYOUTSELECT register for each supported GPMI chip select to select from one of the four layout values. Each pair of registers contains settings that are used by the BCH block while reading / writing the flash page to control data, metadata, and flash page sizes as well as the ECC correction level. The first block written to flash can be programmed to have different ECC, metadata, and data sizes from subsequent data blocks on the device. In addition, the number of blocks stored on a page of flash is not fixed, but instead is determined by the number of bytes consumed by the initial (block 0) and subsequent data blocks.

See the BCH programming reference manual for more information on setting up the flash layout registers.

18.6.16 Hardware BCH ECC Debug Register0 (BCH_DEBUG0n)

The hardware BCH accelerator internal state machines and signals can be seen in the ECC debug register.

The BCH_DEBUG0 register provides access to various internal state information which might prove useful during hardware debug and validation.

Address: 180_8000h base + 100h offset + (4d × i), where i=0d to 3d

BCH_DEBUG0n field descriptions

Field	Description
31–25 RSVD1	This field is reserved. This read-only field is reserved and always has the value 0.
24–16 KES_DEBUG_SYNDROME_SYMBOL	The 9 bit value in this bit field shifts into the syndrome register array at the input of the KES engine whenever BCH_DEBUG0_KES_DEBUG_SHIFT_SYND is toggled. 0x0 NORMAL — Bus master address generator for SYND_GEN writes operates normally. 0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxiliary block.
15 KES_DEBUG_SHIFT_SYND	Toggling this bit causes the value in BCH_DEBUG0_KES_SYNDROME_SYMBOL to be shift into the syndrome register array at the input to the KES engine. After shifting in 16 symbols, one can kick off both KES and CF cycles by toggling BCH_DEBUG0_KES_DEBUG_KICK. Make sure that set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
14 KES_DEBUG_PAYLOAD_FLAG	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input payload flag. 0x1 DATA — Payload is set for 512 bytes data block. 0x1 AUX — Payload is set for 65 or 19 bytes auxiliary block.
13 KES_DEBUG_MODE4K	When running the stand alone debug mode on the error calculator, the state of this bit is presented to the KES engine as the input mode (4K or 2K pages). 0x1 4k — Mode is set for 4K NAND pages. 0x1 2k — Mode is set for 2K NAND pages.
12 KES_DEBUG_KICK	Toggling causes KES engine FSM to start as if kick by the Bus Master. This allows stand alone testing of the KES and Chien Search engines. Be sure to set KES_BCH_DEBUG0_KES_STANDALONE mode to 1 before kicking.
11 KES_STANDALONE	Set to one, cause the KES engine to suppress toggling the KES_BM_DONE signal to the bus master and suppress toggling the CF_BM_DONE signal by the CF engine. 0x0 NORMAL — Bus master address generator for SYND_GEN writes operates normally. 0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxiliary block.

Table continues on the next page...

BCH_DEBUG0n field descriptions (continued)

Field	Description
10 KES_DEBUG_STEP	<p>10 KES_DEBUG_STEP</p> <p>Toggling this bit causes the KES FSM to skip passed the stall state if it is in DEBUG_STALL mode and completed processing a block.</p>
9 KES_DEBUG_STALL	<p>9 KES_DEBUG_STALL</p> <p>Set to one to cause KES FSM to stall after notifying Chien search engine to start processing its block but before notifying the bus master that the KES computation is complete. This allows a diagnostic to stall the FSM after each blocks key equations are solved. This also has the effect of stalling the CSFE search engine so it's state can be examined after it finishes processing the KES stalled block.</p> <p>0x0 NORMAL — KES FSM proceeds to next block supplied by bus master. 0x1 WAIT — KES FSM waits after current equations are solved and the search engine is started.</p>
8 BM_KES_TEST_BYPASS	<p>8 BM_KES_TEST_BYPASS</p> <p>1 = Point all SYND_GEN writes to dummy area at the end of the AUXILLIARY block so that diagnostics can preload all payload, parity bytes and computed syndrome bytes for test the KES engine.</p> <p>0x0 NORMAL — Bus master address generator for SYND_GEN writes operates normally. 0x1 TEST_MODE — Bus master address generator always addresses last four bytes in Auxiliary block.</p>
7-6 RSVD0	<p>7-6 RSVD0</p> <p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
DEBUG_REG_SELECT	<p>DEBUG_REG_SELECT</p> <p>The value loaded in this bit field is used to select the internal register state view of KES engine or the Chien search engine.</p>

18.6.17 KES Debug Read Register (BCH_DBGKESREADn)

The hardware BCH ECC accelerator key equation solver internal state machines and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 110h offset + (4d × i), where i=0d to 3d

BCH_DBGKESREADn field descriptions

Field	Description
VALUES	This register returns the ROM BIST CRC value after a BIST test.

18.6.18 Chien Search Debug Read Register (BCH_DBGCSFEREADn)

The hardware BCH ECC accelerator Chien Search internal state machines and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 120h offset + (4d × i), where i=0d to 3d

BCH_DBGCSFEREAD_n field descriptions

Field	Description
VALUES	Reserved

18.6.19 Syndrome Generator Debug Read Register (BCH_DBGSYNDGENREAD_n)

The hardware BCH ECC accelerator syndrome generator internal state machines and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 130h offset + (4d × i), where i=0d to 3d

BCH_DBGSYNDGENREAD_n field descriptions

Field	Description
VALUES	Reserved

18.6.20 Bus Master and ECC Controller Debug Read Register (BCH_DBGAHBMREAD_n)

The hardware BCH ECC accelerator bus master, ECC controller internal state machines, and signals can be seen in the ECC debug registers.

Address: 180_8000h base + 140h offset + (4d × i), where i=0d to 3d

BCH_DBGAHBMREADn field descriptions

Field	Description
VALUES	Reserved

18.6.21 Block Name Register (BCH_BLOCKNAME_n)

Read only view of the block name string BCH.

Fixed pattern read only value is for test purposes. It can be read as an ASCII string with the zero termination coming from the first byte of the BLOCKVERSION register.

Address: 180_8000h base + 150h offset + (4d × i), where i=0d to 3d

BCH_BLOCKNAME_n field descriptions

Field	Description
NAME	The name is in the ASCII characters BCH (0x20, H, C, B).

18.6.22 BCH Version Register (BCH_VERSION_n)

This register always returns a known read value for debug purposes and indicates the version of the block and RTL version in use.

Address: 180_8000h base + 160h offset + (4d × i), where i=0d to 3d

BCH_VERSION_n field descriptions

Field	Description
31–24 MAJOR	Fixed read-only value indicates the MAJOR field of the RTL version.
23–16 MINOR	Fixed read-only value indicates the MINOR field of the RTL version.
STEP	Fixed read-only value reflecting the stepping of the RTL version.

18.6.23 Hardware BCH ECC Debug Register 1 (BCH_DEBUG1n)

The BCH_DEBUG1 register provides erased zero count information and pre-erase check.

Address: 180_8000h base + 170h offset + (4d × i), where i=0d to 3d

BCH_DEBUG1n field descriptions

Field	Description
31 DEBUG1_ PREERASECHK	Blank page enables pre-erase check. 0x0 Turn off pre-erase check 0x1 Turn on pre-erase check
30–9 RSVD	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

BCH_DEBUG1n field descriptions (continued)

Field	Description
ERASED_ ZERO_COUNT	The zero counts on one page.

Chapter 19

Clock Controller Module (CCM)

19.1 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
 - PLL1 also referenced as ARM PLL
 - PLL2 also referenced as System PLL
 - PLL3 also referenced as USB1 PLL
 - PLL4 also referenced as Audio PLL
 - PLL5 also referenced as Video PLL
 - PLL6 also referenced as ENET PLL
 - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.
- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of DVFS and power gating operations.

19.1.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.

- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
 - PLL - Interfaces for each PLL
 - LPCG - Low Power Clock Gating unit
 - SRC - System Reset Controller
 - GPC - General Power Controller

19.1.2 CCM Block Diagram

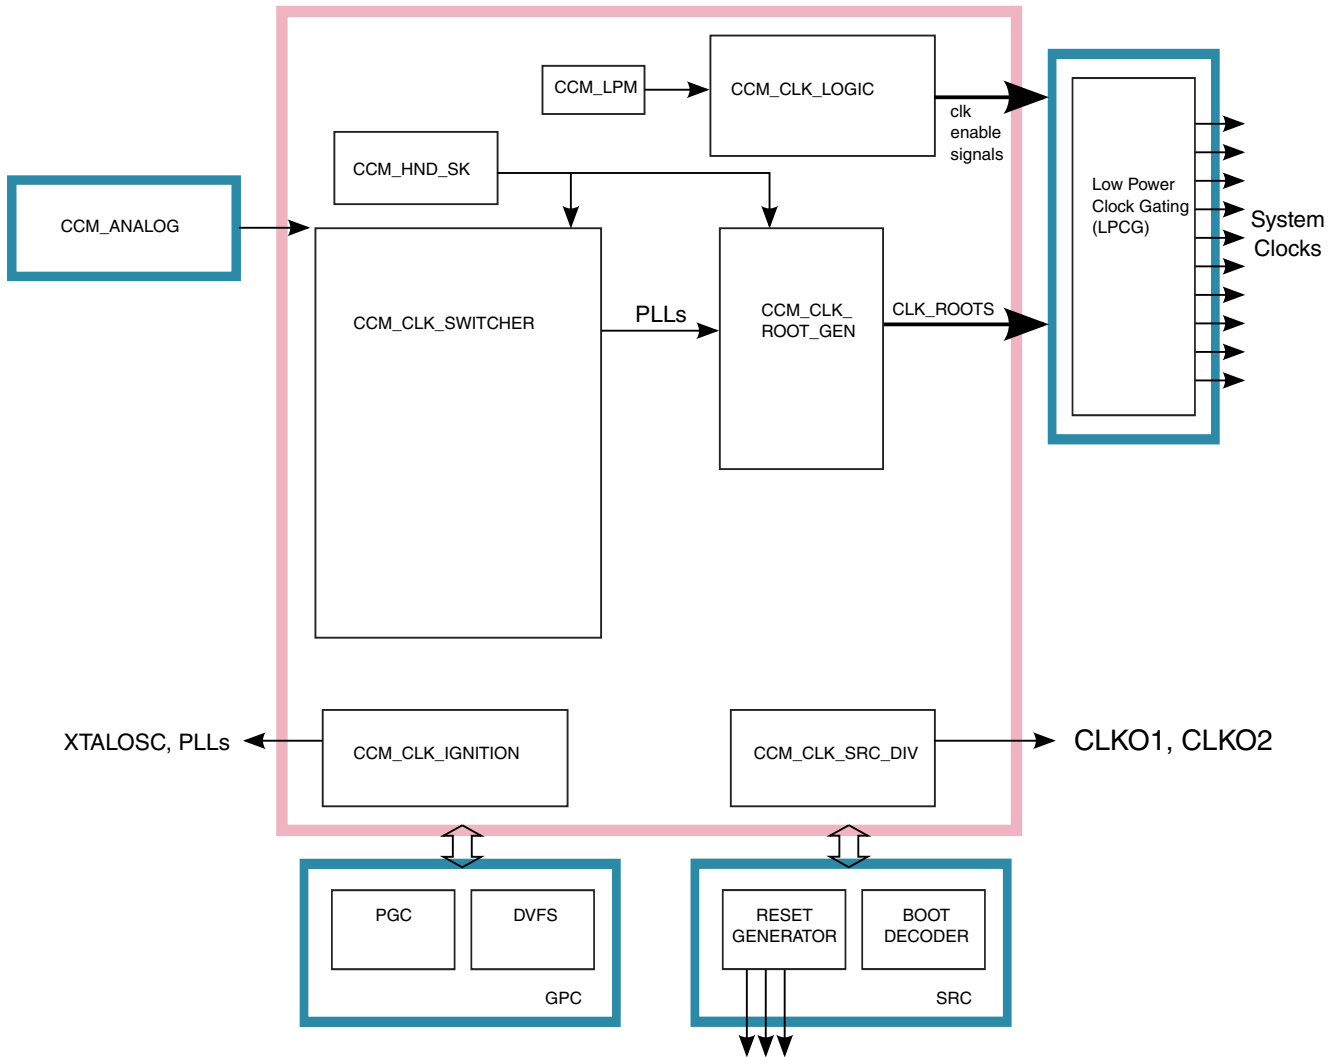

Figure 19-1. Block Diagram

CCM Contains the following sub-blocks:

Table 19-1. CCM Sub-blocks

Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates three switcher clock outputs (pll1_sw_clk, pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

Table 19-1. CCM Sub-blocks (continued)

Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_HND_SK	Manages the handshake when changing root clock dividers that require handshake, and manages the frequency change in case of dvfs scenario.

19.2 External Signals

The following table describes the external signals of CCM:

Table 19-2. CCM External Signals

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	GPIO1_IO11	ALT3	O
		SD1_CMD	ALT7	
CCM_CLKO2	Observability clock 2 output	GPIO1_IO12	ALT3	O
		SD1_DATA1	ALT7	
CCM_REF_EN_B	Enable external reference clock (CKIH)	GPIO1_IO02	ALT6	O

19.3 CCM Clock Tree

The figure found here shows the clock tree configuration and clock roots for CCM.

For detailed sub-block information, please see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

NOTE

The default frequency values (in MHz) for the PLLs and PFDs is the maximum allowed frequency. The PLL and PFD control registers should not be programmed to exceed these values.

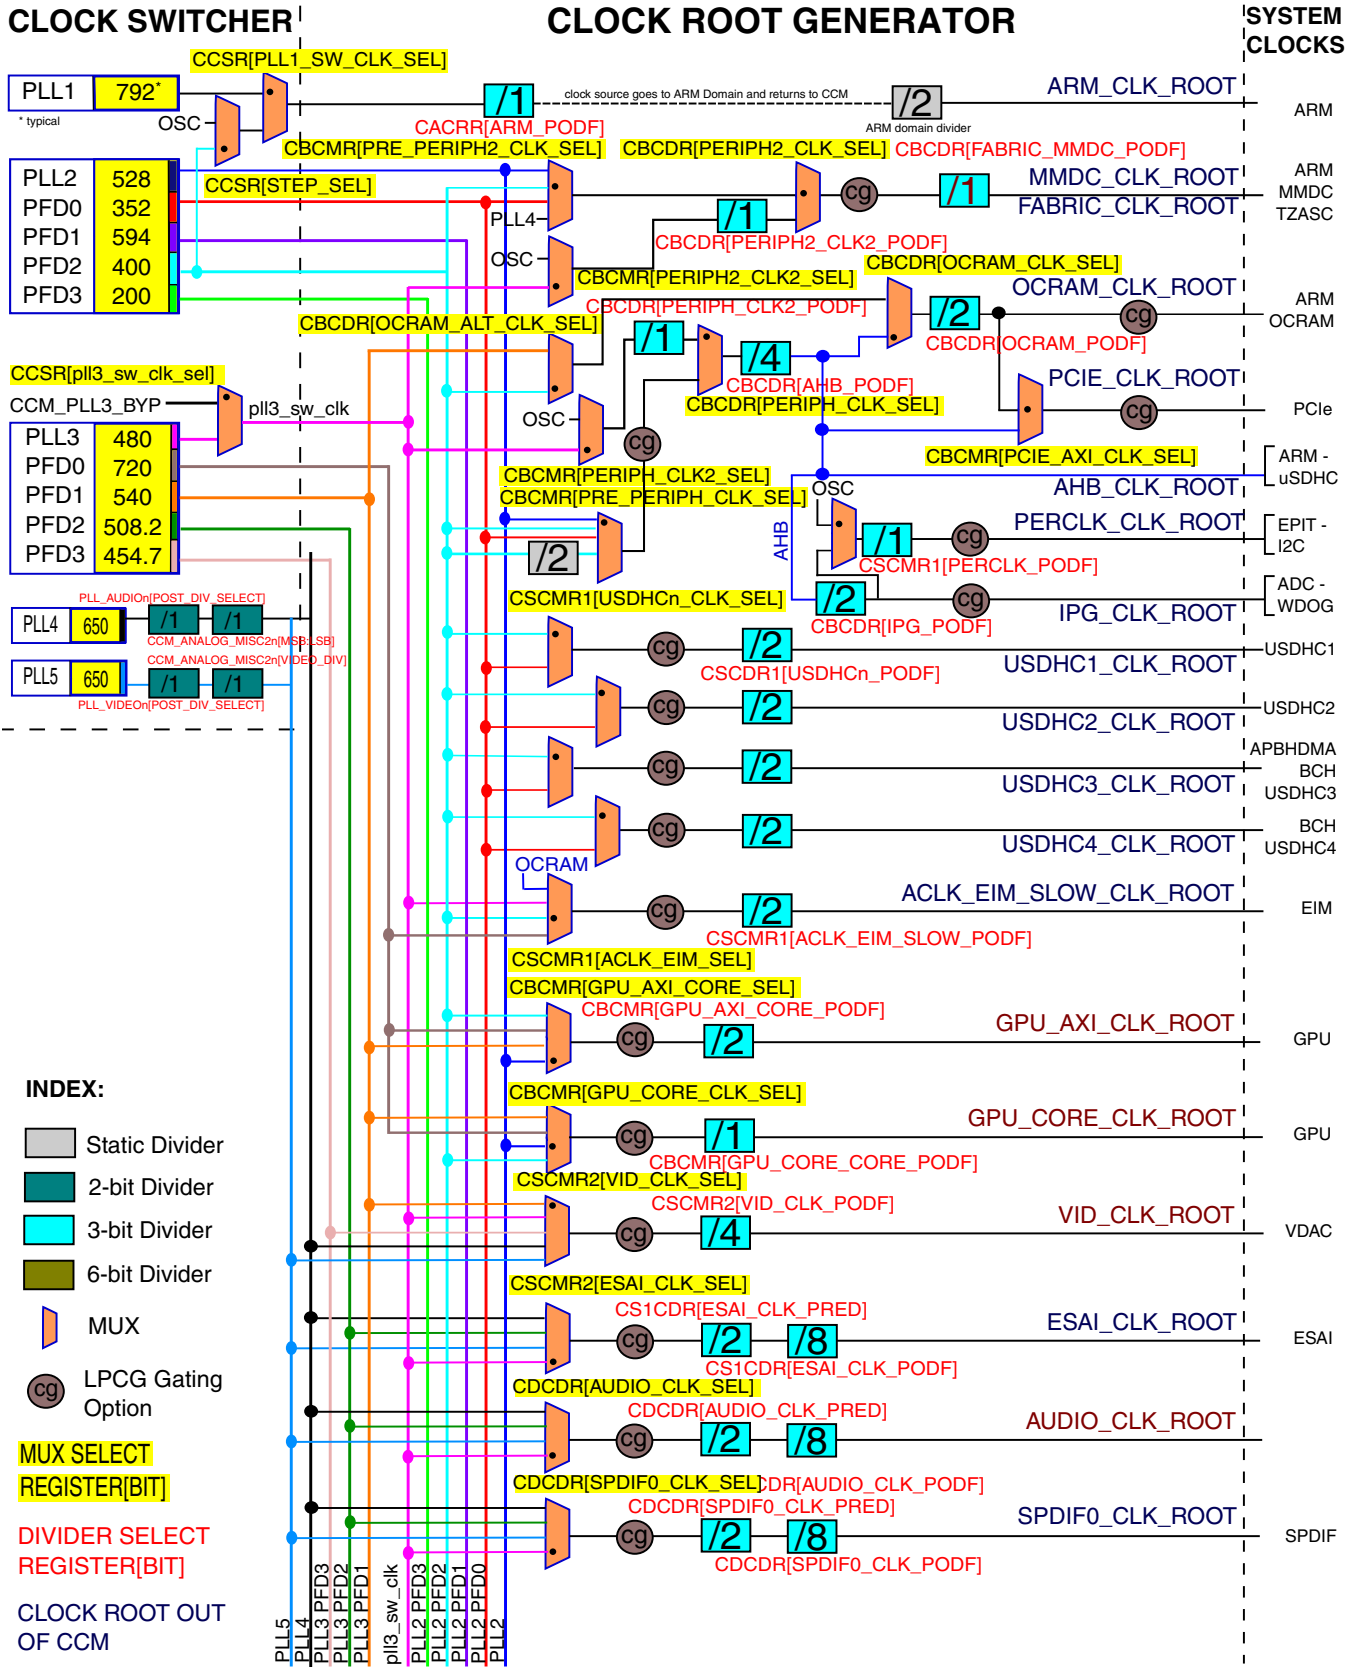

Figure 19-2. Clock Tree - Part 1

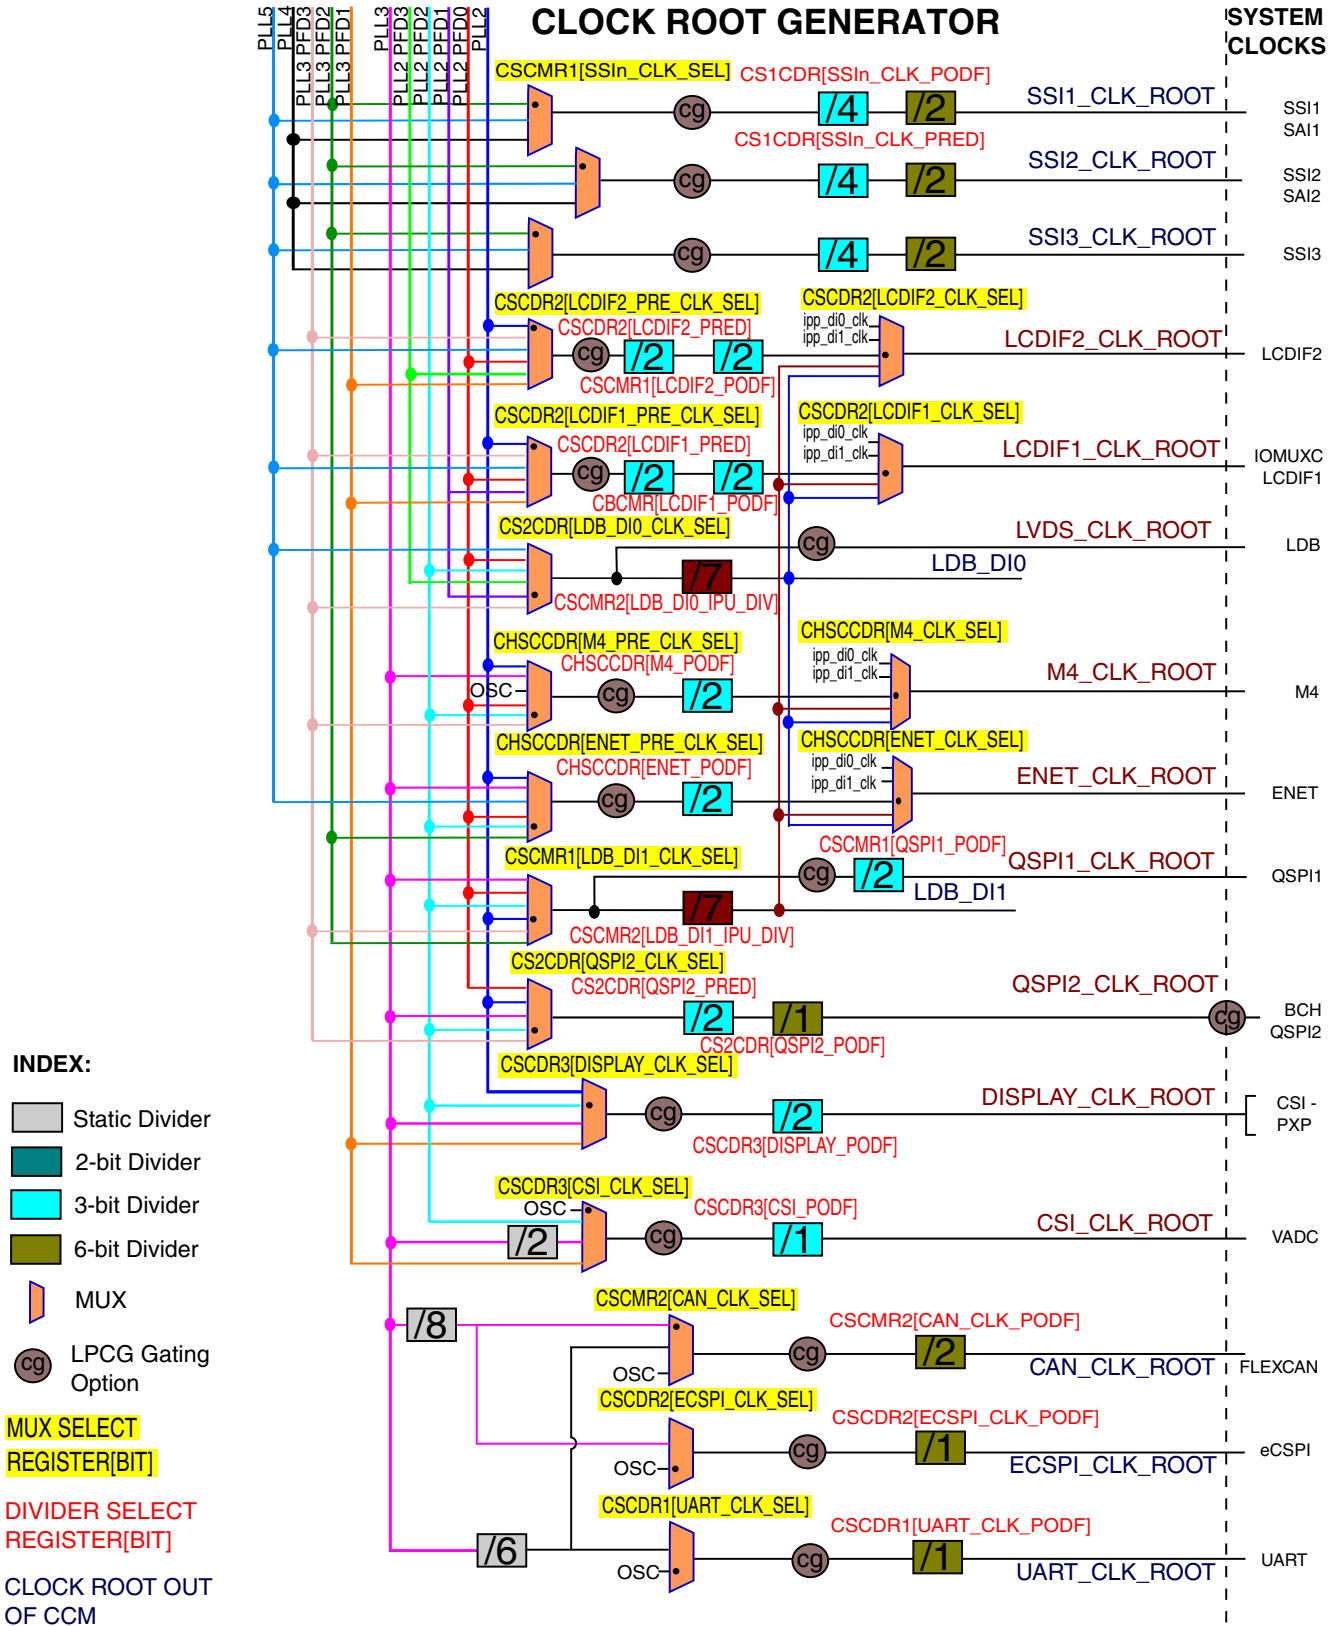

Figure 19-3. Clock Tree - Part 2

19.4 System Clocks

The table found here shows the CCM output clocks' system-level connectivity.

The gating option in the table can either be CGR bit or clock enable from the block itself. Applicable override bits are also shown.

Table 19-3. System Clocks, Gating, and Override

Module	Module Clock	Clock Root	Module Clock Gating Enable	Module Override Enable
ADC	ipg_clk	ipg_clk_root

19.5 Functional Description

This section provides a complete functional description of the block.

19.5.1 Clock Generation

19.5.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG_CLK and supplied to modules that need it.

19.5.1.1.1 CKIL synchronizing to IPG_CLK

CKIL is synchronized to ipg_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

19.5.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

19.5.1.3 PLL reference clock

There are several PLLs in this chip.

Functional Description

PLL1 - ARM PLL (typical functional frequency)

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

19.5.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM_ANALOG_PLL_ARM[DIV_SELECT].

PLL output frequency = Fref * DIV_SEL/2

NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

19.5.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

19.5.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus 4 PFD outputs. The System PLL supports spread spectrum modulation for use in applications to minimize radiated emissions. The spread spectrum PLL output clock is frequency modulated so that the energy is spread over a wider

bandwidth, thereby reducing peak radiated emissions. Due to this feature support, the associated lock time of this PLL is longer than other PLLs in the SoC that do not support spread spectrum modulation.

Spread spectrum operation is controlled by configuring the CCM_ANALOG_PLL_SYS_SS register. When enabled, the PLL output frequency will decrease by the amount defined in the STEP field, until it reaches the limiting frequency in the STOP field. The frequency will then similarly return to the original nominal frequency. The following equations control the spread-spectrum operation:

$$\text{Spread spectrum range} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STOP]}}{\text{CCM_ANALOG_PLL_SYS_DENOM[B]}}$$

$$\text{Modulation frequency} = \text{Fref} \times \frac{\text{CCM_ANALOG_PLL_SYS_SS[STEP]}}{2 \times \text{CCM_ANALOG_PLL_SYS_SS[STOP]}}$$

Although this PLL does have a DIV_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

19.5.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4, /8, /16 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM_ANALOG_PLL_AUDIO, CCM_ANALOG_PLL_VIDEO, and CCM_ANALOG_MISC2 register sets according to the following equation.

$$\text{PLL output frequency} = \text{Fref} * (\text{DIV_SELECT} + \text{NUM/DENOM})$$

19.5.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The PLL outputs a clock. The reference clocks generated by this PLL are:

- ref_enetpll0 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield

- ref_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM_ANALOG_PLL_ENET[DIV_SELECT] bitfield
- ref_enetpll2 fixed at 25 MHz

19.5.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to $F_{vco} * 18/N$, N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx_CLKGATE bit in CCM_ANALOG_PFD_480n or CCM_ANALOG_PFD_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at www.freescale.com for procedure details.

19.5.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM_CLK_SWITCHER

CCM_CLK_ROOT_GEN

19.5.1.5.1 Clock Switcher

The Clock Switcher (CCM_CLK_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 19-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

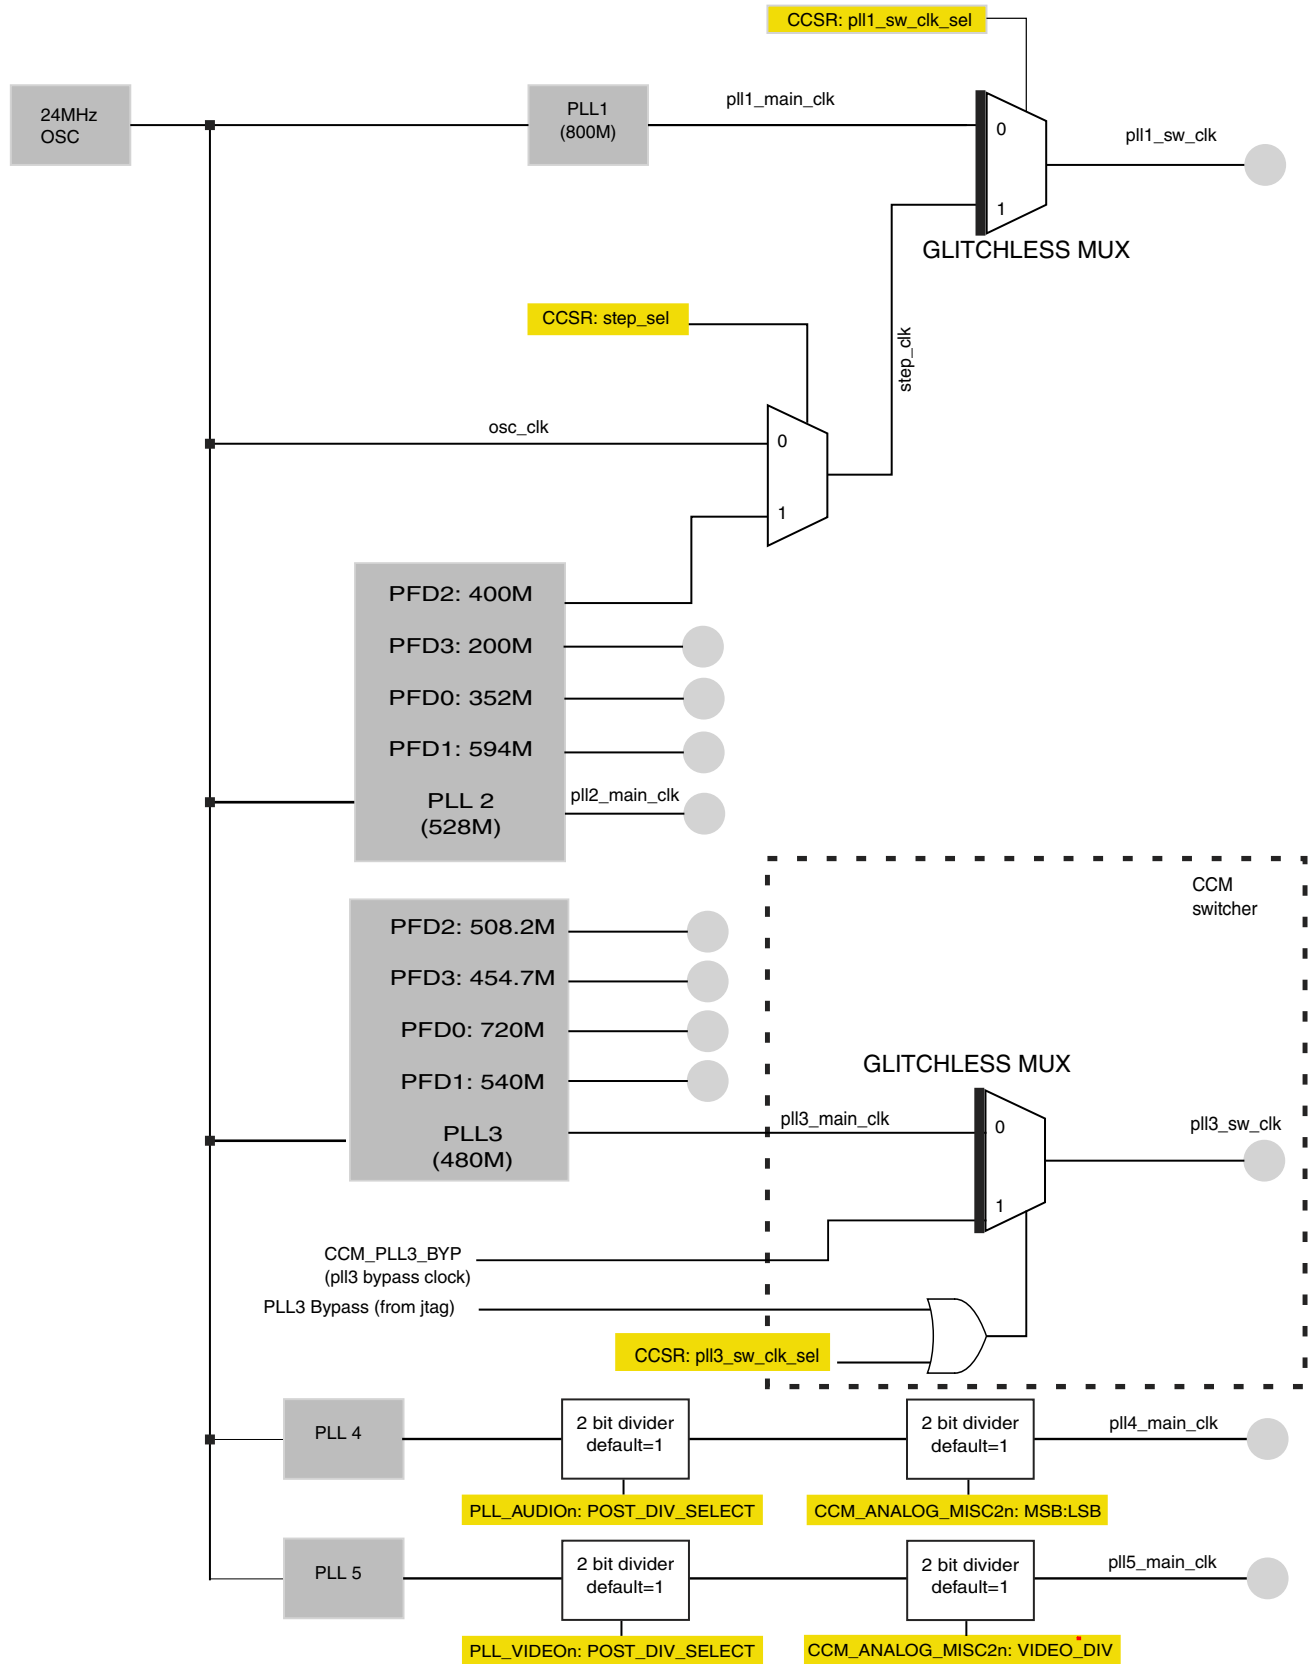

Figure 19-4. Switcher clock generation

19.5.1.5.2 PLL bypass procedure

In addition to PLL bypass options in CCM_ANALOG module, switcher and clk_root_gen sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

19.5.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

19.5.1.5.4 Clock Root Generator

The Clock Root Generator (CCM_CLK_ROOT_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

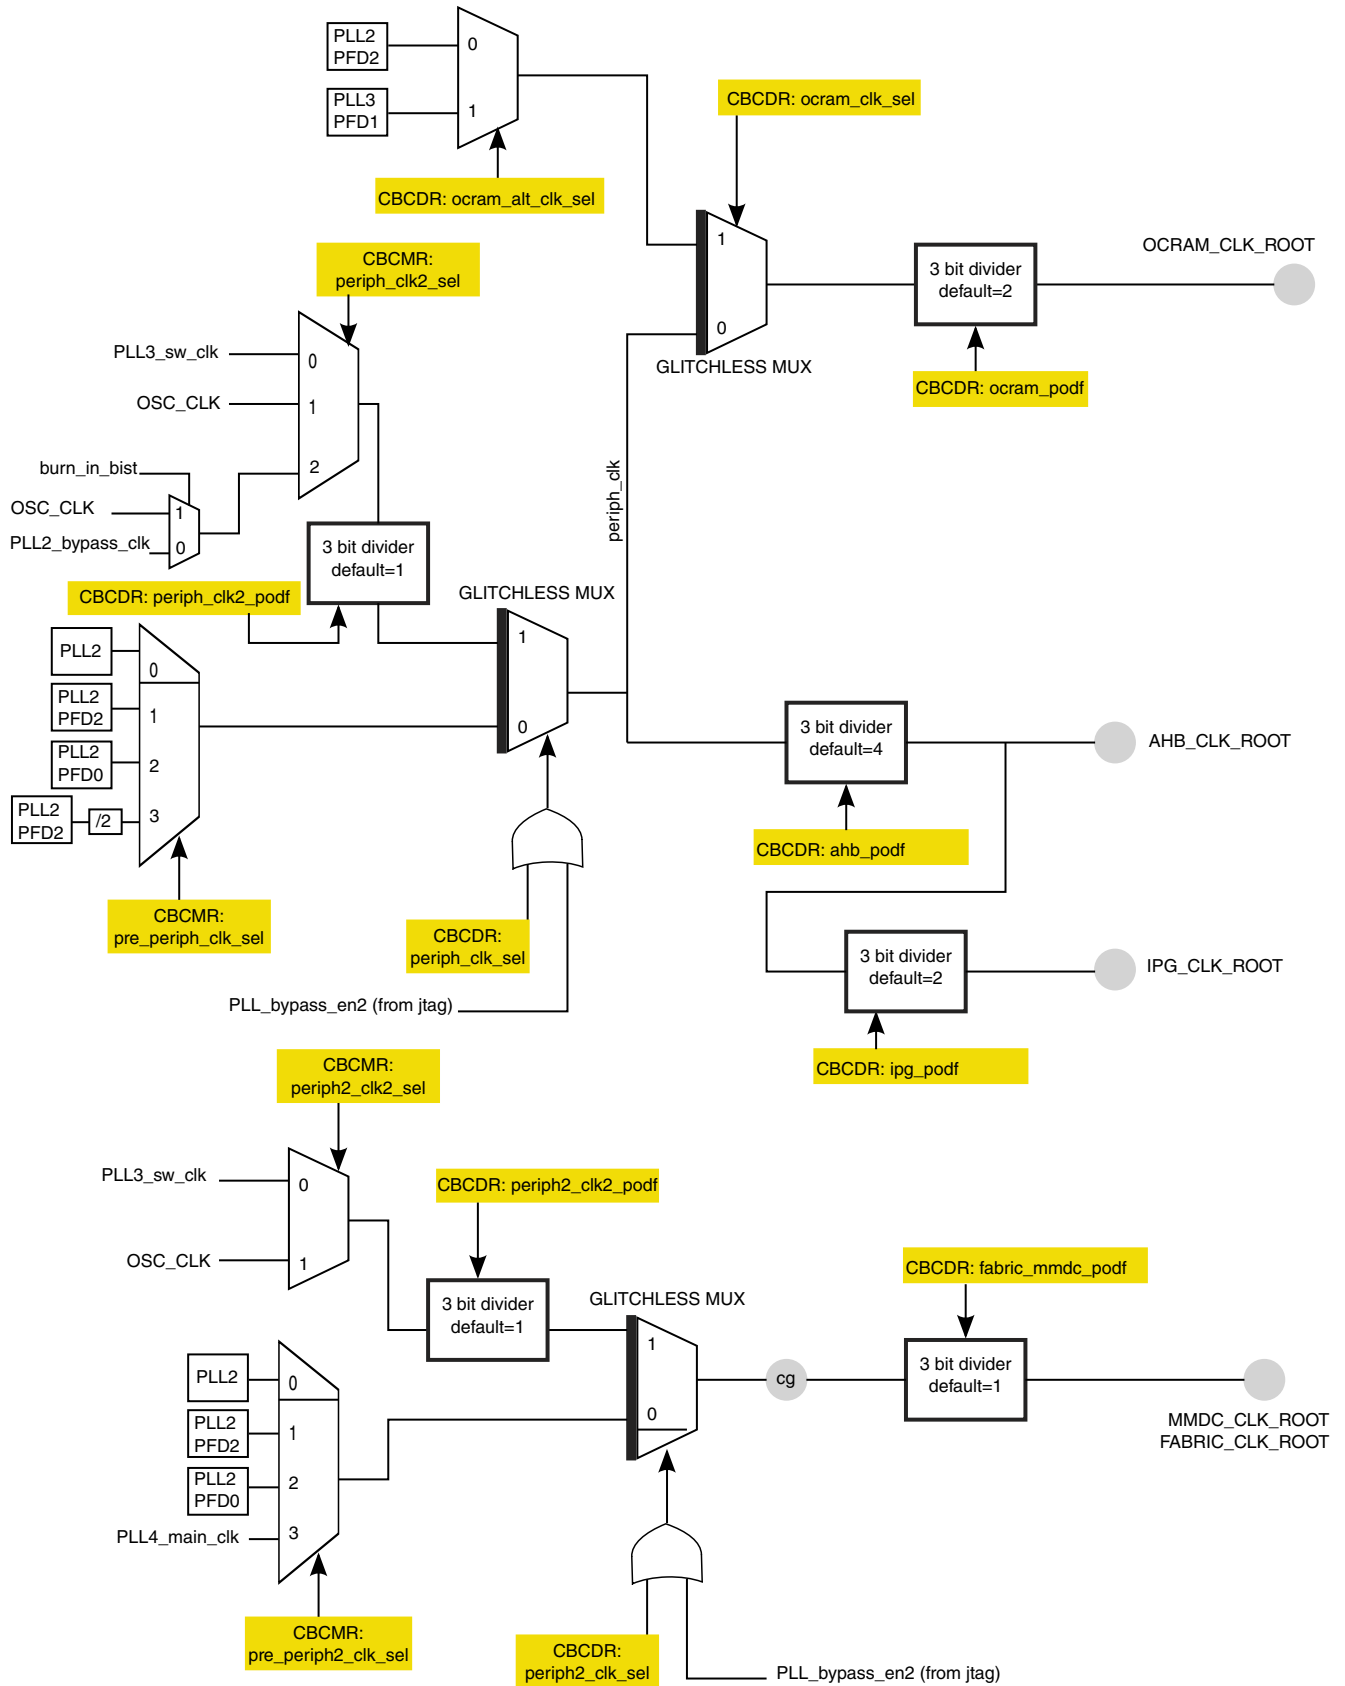

Figure 19-5. BUS clock generation

NOTE

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

19.5.1.5.5 Initial values controlled by the System JTAG Controller (SJC).

The initial values of the following dividers and muxes can be controlled by SJC.

In regular functional mode, the SJC will drive the reset values stated in the CCM register memory map. If SJC is programmed to change those values, then the reset value for those dividers/muxes will be taken from the SJC programability.

Software can update the changed reset value after reset sequence. The control signals and the dividers/muxes are listed below:

- [2:0] init_periph2_clk2_podf
- [1:0] init_ipg_podf
- [2:0] init_ahb_podf
- [2:0] init_axi_podf
- [2:0] init_periph_clk2_podf
- init_periph_clk_sel
- init_periph2_clk_sel

19.5.1.5.6 Divider change handshake

Modifying the following dividers will start the handshake with MMDC.

- mmdc_podf
- periph_clk_sel
- periph2_clk_sel
- arm_podf
- ahb_podf

19.5.1.6 Disabling / Enabling PLLs

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

19.5.1.7 Clock Switching Multiplexers

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM utilizes several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. In order for the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

Table 19-5. Glitchless Multiplexers

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
periph2_clk_mux	CBCDR[periph2_clk_sel]	CDHIPR[periph2_clk_sel_busy]
axi_alt_clk_mux	CBCDR[axi_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	
pll1_sw_clk_mux	CCSR[pll1_sw_clk_sel]	

NOTE

Any change of the `periph_clk_sel` and `periph2_clk_sel` sync mux select will involve handshake with the MMDC. Refer to the CCDCR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in . In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the `FABRIC_CLK_ROOT` away from the PLL2 or one of its PFDs by programming `CBCMR[PERIPH2_CLK2_SEL]` and `CBCDR[PERIPH2_CLK2_PODF]` to provide an appropriate frequency clock, then glitchlessly switch to it by programming `CBCDR[PERIPH2_CLK_SEL]`.

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The input clocks to the mux are required to be gated before switching the source clock in the CCM clock mux and the output should also be gated. If the input and output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

19.5.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

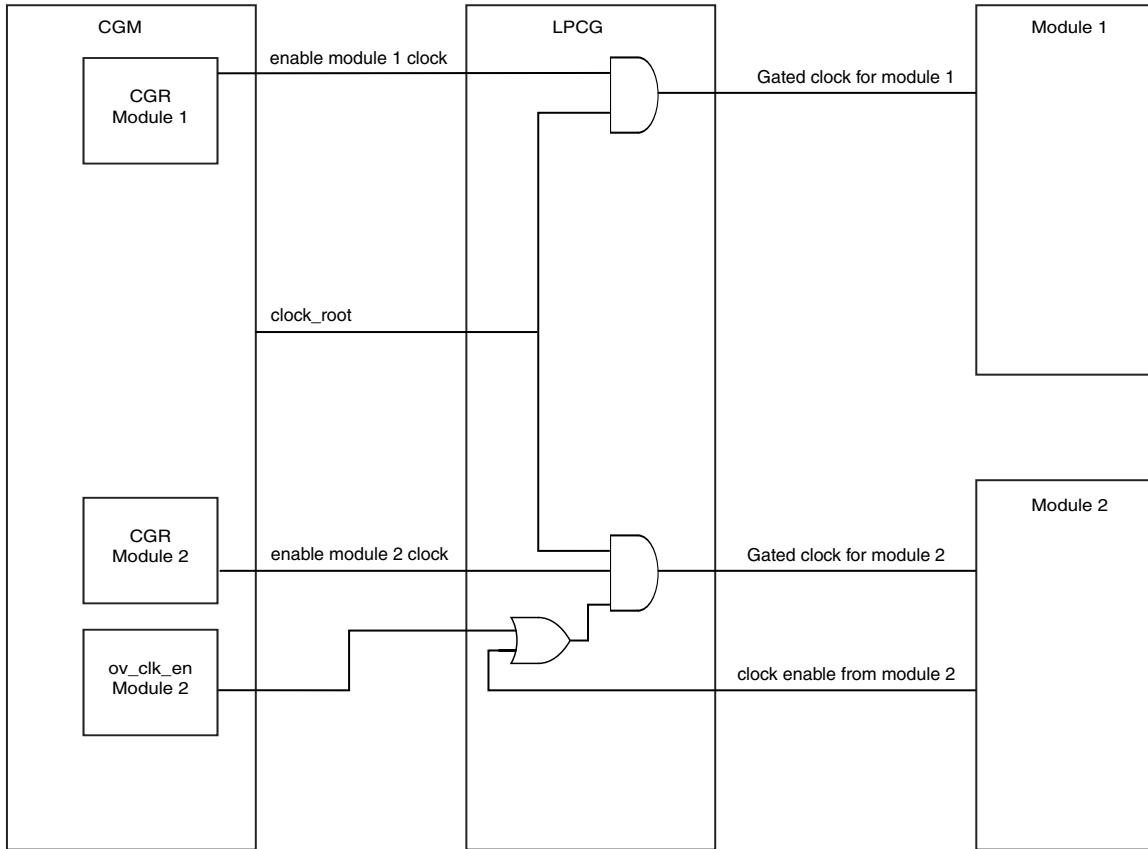

Figure 19-6. Clock split in LPCG

19.5.1.8.1 MMDC handshake

CCM will assert the `mmdc_freq_change_req` signal.

MMDC will assert the signals to acknowledge that the frequency change request has been received and that the frequency can now be changed safely.

CCM will commence the actual change of division ratio of mmdc dividers or apply mux change on root clocks once both of the non-masked acknowledges are asserted.

NOTE

MMDC handshakes can be masked.

19.5.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM_ANALOG module.

NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

NOTE

CCM_ANALOG will not control the voltage value in Bypass mode

19.5.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

19.5.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

19.5.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

19.5.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.
3. Observability to indicate WAIT mode.

NOTE

Setting MMDC CGR bits to 01 can hang the entire system since the MMDC clock and fabric clock share the same clock root.

Any enabled interrupt assertion will start the exit from WAIT mode.

19.5.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

19.5.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform and GPU. External supply voltage can be reduced to decrease leakage.

19.5.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM_PMIC_STBY_REQ asserted, if vstby bit is set
- osc_en signal is negated
- osc_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM_PMIC_STBY_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP_GPC until STOP mode is exited.

19.5.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC_STBY_REQ to notify power management IC to change voltage from standby voltage to functional voltage.
2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref_en_b signal and deasserting cosc_pwrdown signal respectively.
3. After the number of cycles of CKILs defined in stby_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore ARM power by GPC_PUP_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC_PUP_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. Once assertion of notification from src that the resets for the power gated modules has been finished, (src_power_gating_reset_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals ccm_ipg_stop and system_in_stop_mode.

19.6 CCM Memory Map/Register Definition

NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at Boot Time](#) for more information.

19.6.1 CCM Control Register (CCM_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 20C_4000h base + 0h offset = 20C_4000h

CCM_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled. 1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_ COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode. REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core. 000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip oscillator is ready by a interrupt cosc_ready and by status bit cosc_ready. The cosc_en bit should be changed only when on chip oscillator is not chosen as the clock source. 0 disable on chip oscillator 1 enable on chip oscillator
11–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
OSCNT	Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if sbyos bit was defined, to notify that on chip oscillator output is ready for the dpll_ip to use and only then the gate in dpll_ip can be opened. 0000000 count 1 ckil 1111111 count 128 ckil's

19.6.2 CCM Control Divider Register (CCM_CCDCR)

The figure below represents the CCM Control Divider Register (CCDR), which contains bits that control the loading of the dividers that need handshake with the modules they affect. The table below provides its field descriptions.

Address: 20C_4000h base + 4h offset = 20C_4004h

CCM_CCDCR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 -	This field is reserved. Reserved
16 mmdc_mask	During divider ratio mmdc_axi_podf change or sync mux periph2_clk_sel change (but not jtag) or SRC request during warm reset, mask handshake with mmdc module. 0 allow handshake with mmdc module 1 mask handshake with mmdc. Request signal will not be generated.
Reserved	This read-only field is reserved and always has the value 0.

19.6.3 CCM Status Register (CCM_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 20C_4000h base + 8h offset = 20C_4008h

CCM_CSR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 cosc_ready	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.

Table continues on the next page...

CCM_CSR field descriptions (continued)

Field	Description
	0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3–1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm 0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

19.6.4 CCM Clock Switcher Register (CCM_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 20C_4000h base + Ch offset = 20C_400Ch

CCM_CCSR field descriptions

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 step_sel	Selects the option to be chosen for the step frequency when shifting ARM frequency. This will control the step_clk. NOTE: This mux is allowed to be changed only if its output is not used, i.e. ARM uses the output of pll1, and step_clk is not used. 0 derive clock from osc_clk (24M) - source for lp_apm. 1 derive clock from PLL2 PFD2
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 pll1_sw_clk_sel	Selects source to generate pll1_sw_clk. 0 pll1_main_clk 1 step_clk
1 -	This field is reserved. Reserved
0 pll3_sw_clk_sel	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes. 0 pll3_main_clk 1 pll3 bypass clock

19.6.5 CCM Arm Clock Root Register (CCM_CACRR)

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 20C_4000h base + 10h offset = 20C_4010h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

101	divide by 6
110	divide by 7
111	divide by 8

19.6.6 CCM Bus Clock Divider Register (CCM_CBCDR)

The figure below represents the CCM Bus Clock Divider Register (CBCDR). The CBCDR register contains bits to control the clock generation sub module dividers. The table below provides its field descriptions.

Address: 20C_4000h base + 14h offset = 20C_4014h

CCM_CBCDR field descriptions

Field	Description
31-30 -	This field is reserved. Reserved
29-27 periph_clk2_podf	Divider for periph2 clock podf. 000 divide by 1 001 divide by 2

Table continues on the next page...

CCM_CBCDR field descriptions (continued)

Field	Description
	010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
26 periph2_clk_sel	Selector for peripheral2 main clock (source of mmdc_clk_root). NOTE: Any change of this mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph2_clk2_clk clock source.
25 periph_clk_sel	Selector for peripheral main clock (source of MMDC_CLK_ROOT). NOTE: Alternative clock source should be used when PLL is relocked. For PLL relock procedure pls refer to the PLL chapter. NOTE: Any change of this sync mux select will involve handshake with the MMDC. Refer to the CCDR and CDHIPR registers for the handshake bypass and busy bits. 0 PLL2 (pll2_main_clk) 1 derive clock from periph_clk2_clk clock source.
24–19 -	This field is reserved. Reserved
18–16 ocram_podf	Post divider for ocram clock. NOTE: Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
15–13 -	This field is reserved. Reserved
12–10 ahb_podf	Divider for AHB PODF. NOTE: Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5

Table continues on the next page...

CCM_CBCDR field descriptions (continued)

Field	Description
	101 divide by 6 110 divide by 7 111 divide by 8
9–8 ipg_podf	Divider for ipg podf. NOTE: SDMA module will not support ratio of 1:3 and 1:4 for ahb_clk:ipg_clk. In case SDMA is used, then those ratios should not be used. 00 divide by 1 01 divide by 2 10 divide by 3 11 divide by 4
7 ocram_alt_clk_sel	OGRAM alternative clock select 0 PLL2 PFD2 will be selected as alternative clock for OGRAM root clock 1 PLL3 PFD1 will be selected as alternative clock for OGRAM root clock
6 ocram_clk_sel	OGRAM clock source select 0 Periph_clk output will be used as OGRAM clock root 1 AXI alternative clock will be used as OGRAM clock root
5–3 fabric_mmdc_podf	Post divider for fabric / mmdc clock. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
periph2_clk2_podf	Divider for periph2_clk2 podf. NOTE: Divider should be updated when output clock is gated. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

19.6.7 CCM Bus Clock Multiplexer Register (CCM_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

NOTE

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

The change for arm_clk_sel should be done through sdma so that ARM will not use this clock during the change and the clock will be gated in LPCG.

19.6.17 CCM Divider Handshake In-Process Register (CCM_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 20C_4000h base + 48h offset = 20C_4048h

CCM_CDHIPR field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 arm_podf_busy	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 periph_clk_sel_busy	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 -	This field is reserved. Reserved

Table continues on the next page...

CCM_CDHIPR field descriptions (continued)

Field	Description
3 periph2_clk_sel_ busy	<p>Busy indicator for periph2_clk_sel mux control.</p> <p>0 mux is not busy and its value represents the actual division.</p> <p>1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.</p>
2 mmdc_podf_busy	<p>Busy indicator for mmdc_axi_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the mmdc_axi_podf will be applied.</p>
1 ahb_podf_busy	<p>Busy indicator for ahb_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.</p>
0 ocram_podf_ busy	<p>Busy indicator for ocram_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ocram_podf will be applied.</p>

19.6.18 CCM Low Power Control Register (CCM_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 20C_4000h base + 54h offset = 20C_4054h

CCM_CLPCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 mask_l2cc_idle	Mask L2CC IDLE for entering low power mode. NOTE: Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 mask_scu_idle	Mask SCU IDLE for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 mask_core0_wfi	Mask WFI of core0 for entering low power mode NOTE: Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 bypass_mmdc_lpm_hs	Bypass handshake with mmdc on next entrance to low power mode (STOP or WAIT). CCM doesn't wait for the module's acknowledge. Handshake also will be bypassed, if CGR3 CG10 is set to gate fast mmdc clock. 0 handshake with mmdc on next entrance to low power mode will be performed. . 1 handshake with mmdc on next entrance to low power mode will be bypassed.
20–12 -	This field is reserved. Reserved
11 cosc_pwrdown	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed. The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation. 0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 stby_count	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). NOTE: Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit. 00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode. 0 Voltage will not be changed to standby voltage after next entrance to STOP mode. (PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. (PMIC_STBY_REQ will be asserted - '1').
7 dis_ref_osc	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed. The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation. NOTE: When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits. 0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'

Table continues on the next page...

CCM_CLPCR field descriptions (continued)

Field	Description
6 SBYOS	Standby clock oscillator bit. This bit defines if <code>cosc_pwrdown</code> , which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if <code>cosc_pwrdown=1</code> for the on chip oscillator. 0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and <code>cosc_pwrdown</code> will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and <code>cosc_pwrdown</code> will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after <code>oscnt</code> count, CCM will continue with the exit from the STOP mode process.
5 ARM_clk_dis_ on_lpm	Define if ARM clocks (<code>arm_clk</code> , <code>soc_mxclk</code> , <code>soc_pclk</code> , <code>soc_dbg_pclk</code> , <code>vl_wrck</code>) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning. NOTE: Software should not enable ARM power gating in wait mode if this bit is cleared. 0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode. .
4-3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of <code>dsm_request</code> signal. 00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved

19.6.19 CCM Interrupt Status Register (CCM_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

CCM_CISR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 0.
26 arm_podf_loaded	CCM interrupt request 1 generated due to frequency change of arm_podf. The interrupt will commence only if arm_podf is loaded during a arm dvfs operation. 0 interrupt is not generated due to frequency change of arm_podf 1 interrupt generated due to frequency change of arm_podf

Table continues on the next page...

CCM_CISR field descriptions (continued)

Field	Description
25–24 Reserved	This read-only field is reserved and always has the value 0.
23 -	This field is reserved. Reserved
22 periph_clk_sel_ loaded	CCM interrupt request 1 generated due to update of periph_clk_sel. 0 interrupt is not generated due to update of periph_clk_sel. 1 interrupt generated due to update of periph_clk_sel.
21 mmdc_podf_ loaded	CCM interrupt request 1 generated due to frequency change of mmdc_podf_loaded 0 interrupt is not generated due to frequency change of mmdc_podf_loaded 1 interrupt generated due to frequency change of mmdc_podf_loaded
20 ahb_podf_loaded	CCM interrupt request 1 generated due to frequency change of ahb_podf 0 interrupt is not generated due to frequency change of ahb_podf 1 interrupt generated due to frequency change of ahb_podf
19 periph2_clk_sel_ loaded	CCM interrupt request 1 generated due to frequency change of periph2_clk_sel 0 interrupt is not generated due to frequency change of periph2_clk_sel 1 interrupt generated due to frequency change of periph2_clk_sel
18 -	This field is reserved. Reserved
17 ocram_podf_ loaded	CCM interrupt request 1 generated due to frequency change of ocram_podf 0 interrupt is not generated due to frequency change of ocram_podf 1 interrupt generated due to frequency change of ocram_podf
16–7 Reserved	This read-only field is reserved and always has the value 0.
6 cosc_ready	CCM interrupt request 2 generated due to on board oscillator ready, i.e. oscnt has finished counting. 0 interrupt is not generated due to on board oscillator ready 1 interrupt generated due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 0.
0 lrf_pll	CCM interrupt request 2 generated due to lock of all enabled and not bypassed PLLs 0 interrupt is not generated due to lock ready of all enabled and not bypassed PLLs 1 interrupt generated due to lock ready of all enabled and not bypassed PLLs

19.6.20 CCM Interrupt Mask Register (CCM_CIMR)

The figure below represents the CCM Interrupt Mask Register (CIMR). The table below provides its field descriptions.

Address: 20C_4000h base + 5Ch offset = 20C_405Ch

CCM_CIMR field descriptions

Field	Description
31–27 Reserved	This read-only field is reserved and always has the value 1.
26 arm_podf_loaded	mask interrupt generation due to frequency change of arm_podf 0 don't mask interrupt due to frequency change of arm_podf - interrupt will be created 1 mask interrupt due to frequency change of arm_podf
25–23 -	This field is reserved. Reserved
22 mask_periph_clk_sel_loaded	mask interrupt generation due to update of periph_clk_sel. 0 don't mask interrupt due to update of periph_clk_sel - interrupt will be created 1 mask interrupt due to update of periph_clk_sel

Table continues on the next page...

CCM_CIMR field descriptions (continued)

Field	Description
21 mask_mmdc_ podf_loaded	mask interrupt generation due to update of mask_mmdc_podf 0 don't mask interrupt due to update of mask_mmdc_podf - interrupt will be created 1 mask interrupt due to update of mask_mmdc_podf
20 mask_ahb_podf_ loaded	mask interrupt generation due to frequency change of ahb_podf 0 don't mask interrupt due to frequency change of ahb_podf - interrupt will be created 1 mask interrupt due to frequency change of ahb_podf
19 mask_periph2_ clk_sel_loaded	mask interrupt generation due to update of periph2_clk_sel. 0 don't mask interrupt due to update of periph2_clk_sel - interrupt will be created 1 mask interrupt due to update of periph2_clk_sel
18 -	This field is reserved. Reserved
17 mask_ocram_ podf_loaded	mask interrupt generation due to frequency change of ocram_podf 0 don't mask interrupt due to frequency change of ocram_podf - interrupt will be created 1 mask interrupt due to frequency change of ocram_podf
16–7 Reserved	This read-only field is reserved and always has the value 1.
6 mask_cosc_ ready	mask interrupt generation due to on board oscillator ready 0 don't mask interrupt due to on board oscillator ready - interrupt will be created 1 mask interrupt due to on board oscillator ready
5–1 Reserved	This read-only field is reserved and always has the value 1.
0 mask_lrf_pll	mask interrupt generation due to lrf of PLLs 0 don't mask interrupt due to lrf of PLLs - interrupt will be created 1 mask interrupt due to lrf of PLLs

19.6.21 CCM Clock Output Source Register (CCM_CCOSR)

The figure below represents the CCM Clock Output Source Register (CCOSR). The CCOSR register contains bits to control the clock that will be generated on the output `ipp_do_clko1` (CCM_CLKO). The table below provides its field descriptions.

Address: 20C_4000h base + 60h offset = 20C_4060h

CCM_CCOSR field descriptions

Field	Description
31–25 Reserved	This read-only field is reserved and always has the value 0.
24 CLKO2_EN	Enable of CCM_CLKO2 clock 0 CCM_CLKO2 disabled. 1 CCM_CLKO2 enabled.
23–21 CLKO2_DIV	Setting the divider of CCM_CLKO2 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
20–16 CLKO2_SEL	Selection of the clock to be generated on CCM_CLKO2 00001 mmdc_clk_root 00010 usdhc4_clk_root

Table continues on the next page...

CCM_CGPR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode. NOTE: This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry. 0 Disable the clock to the ARM platform memories when entering Low Power Mode 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable. 0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.
15–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 efuse_prog_supply_gate	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programming 0 fuse programming supply voltage is gated off to the efuse module 1 allow fuse programming.
3 -	This field is reserved. Reserved
2 mmdc_ext_clk_dis	Disable external clock driver of MMDC during STOP mode 1 disable during stop mode 0 don't disable during stop mode.
1 -	Reserved. Keep default value set to '1' for proper operation.
0 pmic_delay_scaler	Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

19.6.23 CCM Clock Gating Register 0 (CCM_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CCM Memory Map/Register Definition

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

The figure below represents the CCM Clock Gating Register 0 (CCM_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 20C_4000h base + 68h offset = 20C_4068h

Field	Description
31–30 CG15	pwm7 clocks (pwm7_clk_enable)
29–28 CG14	pwm6 clocks (pwm6_clk_enable)
27–26 CG13	pwm5 clocks (pwm5_clk_enable)
25–24 CG12	i2c4 serial clock (i2c4_serial_clk_enable)
23–22 CG11	gis clocks (gis_clk_enable)
21–20 CG10	vadc clocks (vadc_clk_enable)
19–18 CG9	Reserved
17–16 CG8	pwm8 clocks (pwm8_clk_enable)
15–14 CG7	Reserved
13–12 CG6	Reserved
11–10 CG5	eim_slow clocks (eim_slow_clk_enable)
9–8 CG4	usdhc4 clocks (usdhc4_clk_enable)

Table continues on the next page...

CCM_CCGR6 field descriptions (continued)

Field	Description
7–6 CG3	usdhc3 clocks (usdhc3_clk_enable)
5–4 CG2	usdhc2 clocks (usdhc2_clk_enable)
3–2 CG1	usdhc1 clocks (usdhc1_clk_enable)
CG0	usboh3 clock (usboh3_clk_enable)

19.6.30 CCM Module Enable Override Register (CCM_CMEOR)

The follow figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit will be applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 20C_4000h base + 88h offset = 20C_4088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	1		1		1											
W		mod_en_ov_can1_cpi		mod_en_ov_can2_cpi												
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	1						1		mod_en_usdhc	mod_en_ov_epit	mod_en_ov_gpt	1				
W					mod_en_ov_gpu											
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

CCM_CMEOR field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 1.

Table continues on the next page...

CCM_CMEOR field descriptions (continued)

Field	Description
30 mod_en_ov_ can1_cpi	Override clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 mod_en_ov_ can2_cpi	Override clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27-11 Reserved	This read-only field is reserved and always has the value 1.
10 mod_en_ov_gpu	Override clock enable signal from GPU - clock will not be gated based on GPU signal 'gpu_busy' . 0 don't override module enable signal 1 override module enable signal
9-8 Reserved	This read-only field is reserved and always has the value 1.
7 mod_en_usdhc	override clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 mod_en_ov_epit	Override clock enable signal from EPIT - clock will not be gated based on EPIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 mod_en_ov_gpt	Override clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

19.7 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

CCM_ANALOG memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20C_8000	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM)	32	R/W	0001_3042h	19.7.1/820

19.7.1 Analog ARM PLL control Register (CCM_ANALOG_PLL_ARMn)

The control register provides control for the system PLL.

Address: 20C_8000h base + 0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_ARMn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.

Table continues on the next page...

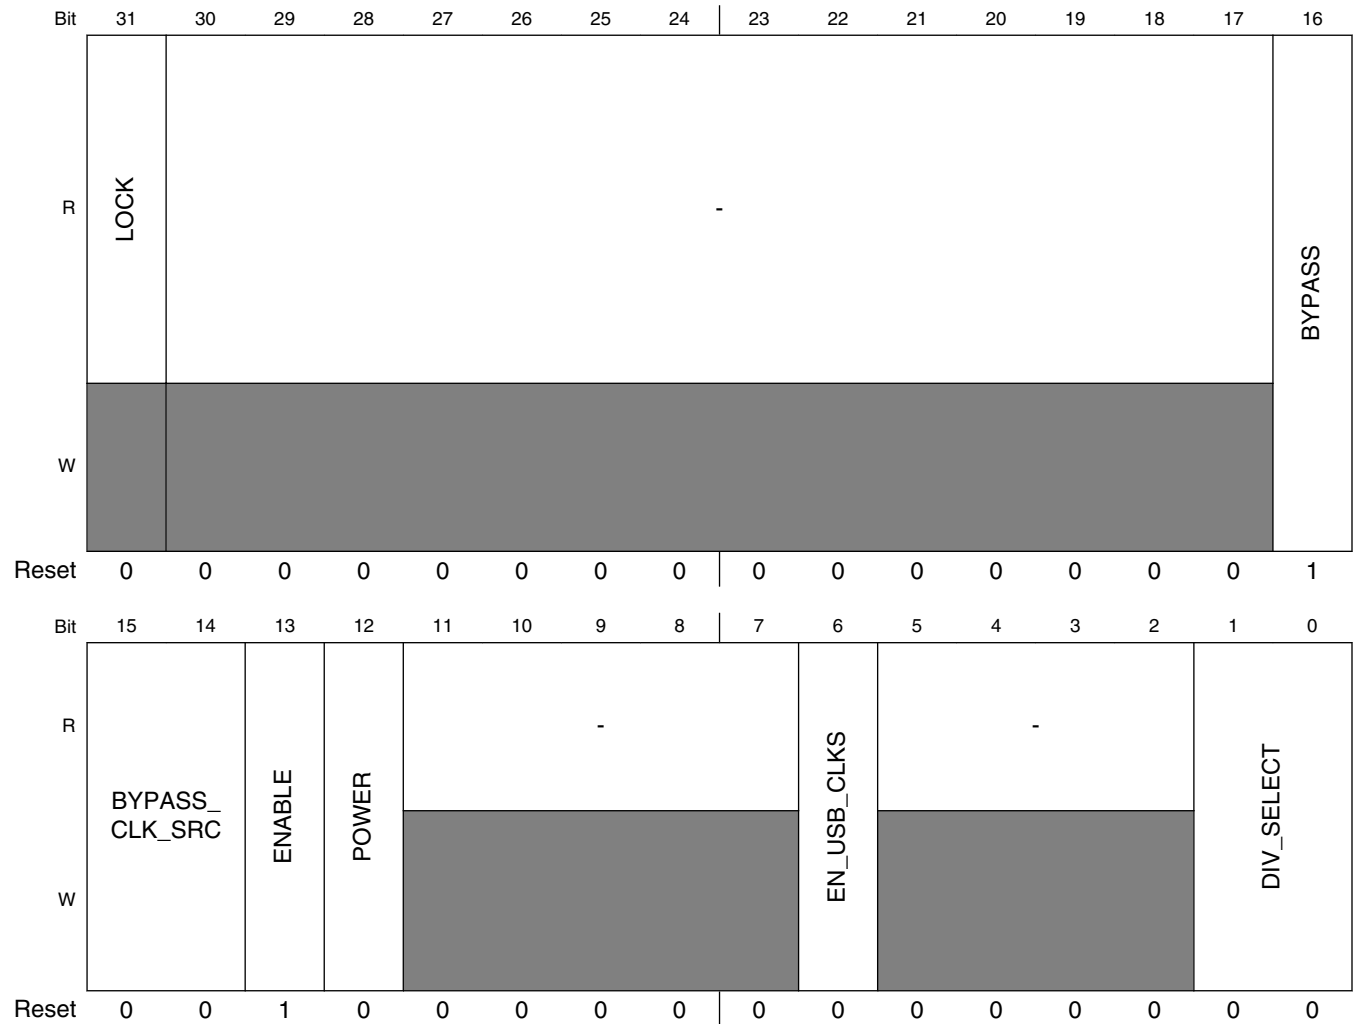

CCM_ANALOG_PLL_ARMn field descriptions (continued)

Field	Description
30–20 -	Always set to zero (0).
19 PLL_SEL	Reserved
18 LVDS_24MHZ_SEL	Analog Debug Bit
17 LVDS_SEL	Analog Debug Bit
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. NOTE: Changing the Bypass clock source also changes the PLL reference clock source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div_select / 2.0$.

19.7.2 Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 20C_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB1n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30-17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

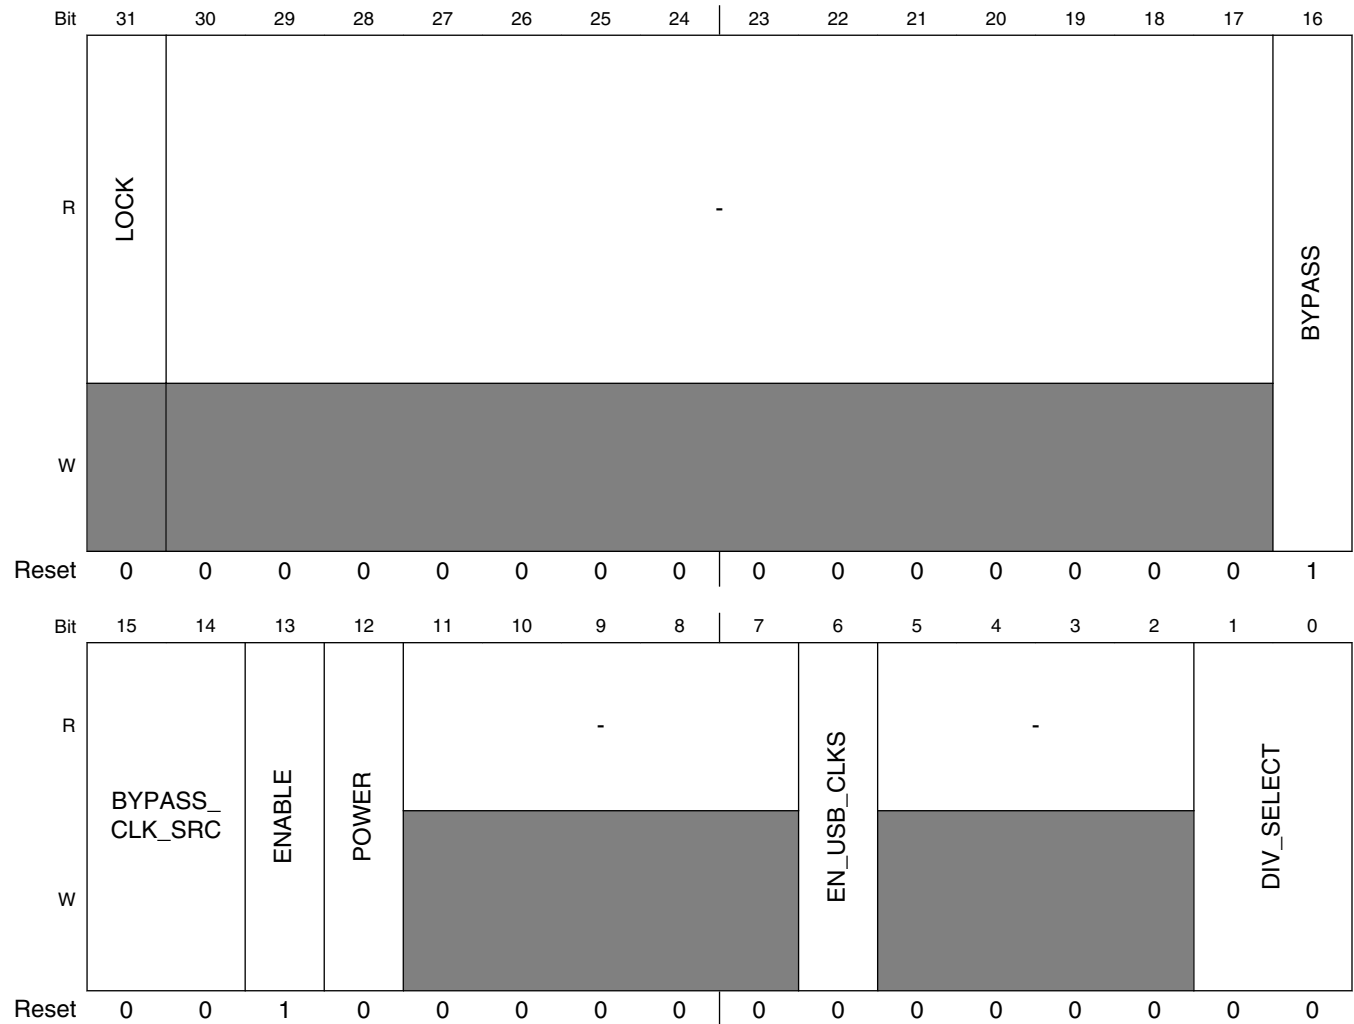

CCM_ANALOG_PLL_USB1n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 GPANAIO — 0x3 CHRG_DET_B —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs. 0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - $F_{out}=F_{ref}*20$; 1 - $F_{out}=F_{ref}*22$.

19.7.3 Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 20C_8000h base + 20h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_USB2n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30-17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.

Table continues on the next page...

CCM_ANALOG_PLL_USB2n field descriptions (continued)

Field	Description
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
DIV_SELECT	This field controls the PLL loop divider. 0 - $F_{out}=F_{ref}*20$; 1 - $F_{out}=F_{ref}*22$.

19.7.4 Analog System PLL Control Register (CCM_ANALOG_PLL_SYSn)

The control register provides control for the 528MHz PLL.

Address: 20C_8000h base + 30h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PLL_SYSn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 GPANAIO — 0x3 CHRG_DET_B —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

19.7.5 528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 20C_8000h base + 40h offset = 20C_8040h

CCM_ANALOG_PLL_SYS_SS field descriptions

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	0 — Spread spectrum modulation disabled 1 — Soread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

19.7.6 Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDION)

The control register provides control for the audio PLL.

Address: 20C_8000h base + 70h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_AUDIO_n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_AUDIO_n field descriptions (continued)

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

19.7.7 Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)

This register contains the numerator (A) of Audio PLL fractional loop divider. (Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 20C_8000h base + 80h offset = 20C_8080h

**CCM_ANALOG_PLL_AUDIO_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider.

19.7.8 Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM)

This register contains the Denominator (B) of Audio PLL fractional loop divider. (unsigned number)

Address: 20C_8000h base + 90h offset = 20C_8090h

CCM_ANALOG_PLL_AUDIO_DENOM field descriptions

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

19.7.9 Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEOn)

The control register provides control for the Video PLL.

Address: 20C_8000h base + A0h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_VIDEO_n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18 PFD_OFFSET_EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_VIDEO_n field descriptions (continued)

Field	Description
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

19.7.10 Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM)

This register contains the numerator (A) of Video PLL fractional loop divider.(Signed number)

Absolute value should be less than denominator

Address: 20C_8000h base + B0h offset = 20C_80B0h

CCM_ANALOG_PLL_VIDEO_NUM field descriptions

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator of fractional loop divider(Signed number), absolute value should be less than denominator

19.7.11 Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM)

This register contains the Denominator (B) of Video PLL fractional loop divider. (Unsigned number)

Address: 20C_8000h base + C0h offset = 20C_80C0h

CCM_ANALOG_PLL_VIDEO_DENOM field descriptions

Field	Description
31-30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

19.7.12 Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET n)

The control register provides control for the ENET PLL.

Address: 20C_8000h base + E0h offset + (4d × i), where i=0d to 3d

CCM Analog Memory Map/Register Definition

CCM_ANALOG_PLL_ENETn field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_ REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20 ENET2_125M_ EN	Enable the PLL providing the ENET2 125 MHz reference clock
19 ENABLE_125M	Enables an offset in the phase frequency detector.
18 PFD_OFFSET_ EN	Enables an offset in the phase frequency detector.
17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 REF_CLK_24M — Select the 24MHz oscillator as source. 0x1 CLK1 — Select the CLK1_N / CLK1_P as source. 0x2 Reserved — 0x3 Reserved —

Table continues on the next page...

CCM_ANALOG_PLL_ENET n field descriptions (continued)

Field	Description
13 ENET1_125M_ EN	Enable the PLL providing the ENET1 125 MHz reference clock.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–4 -	Always set to zero (0).
3–2 ENET1_DIV_ SELECT	Controls the frequency of the ethernet1 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz
ENET0_DIV_ SELECT	Controls the frequency of the ethernet0 reference clock. 00 25MHz 01 50MHz 10 100MHz (not 50% duty cycle) 11 125MHz

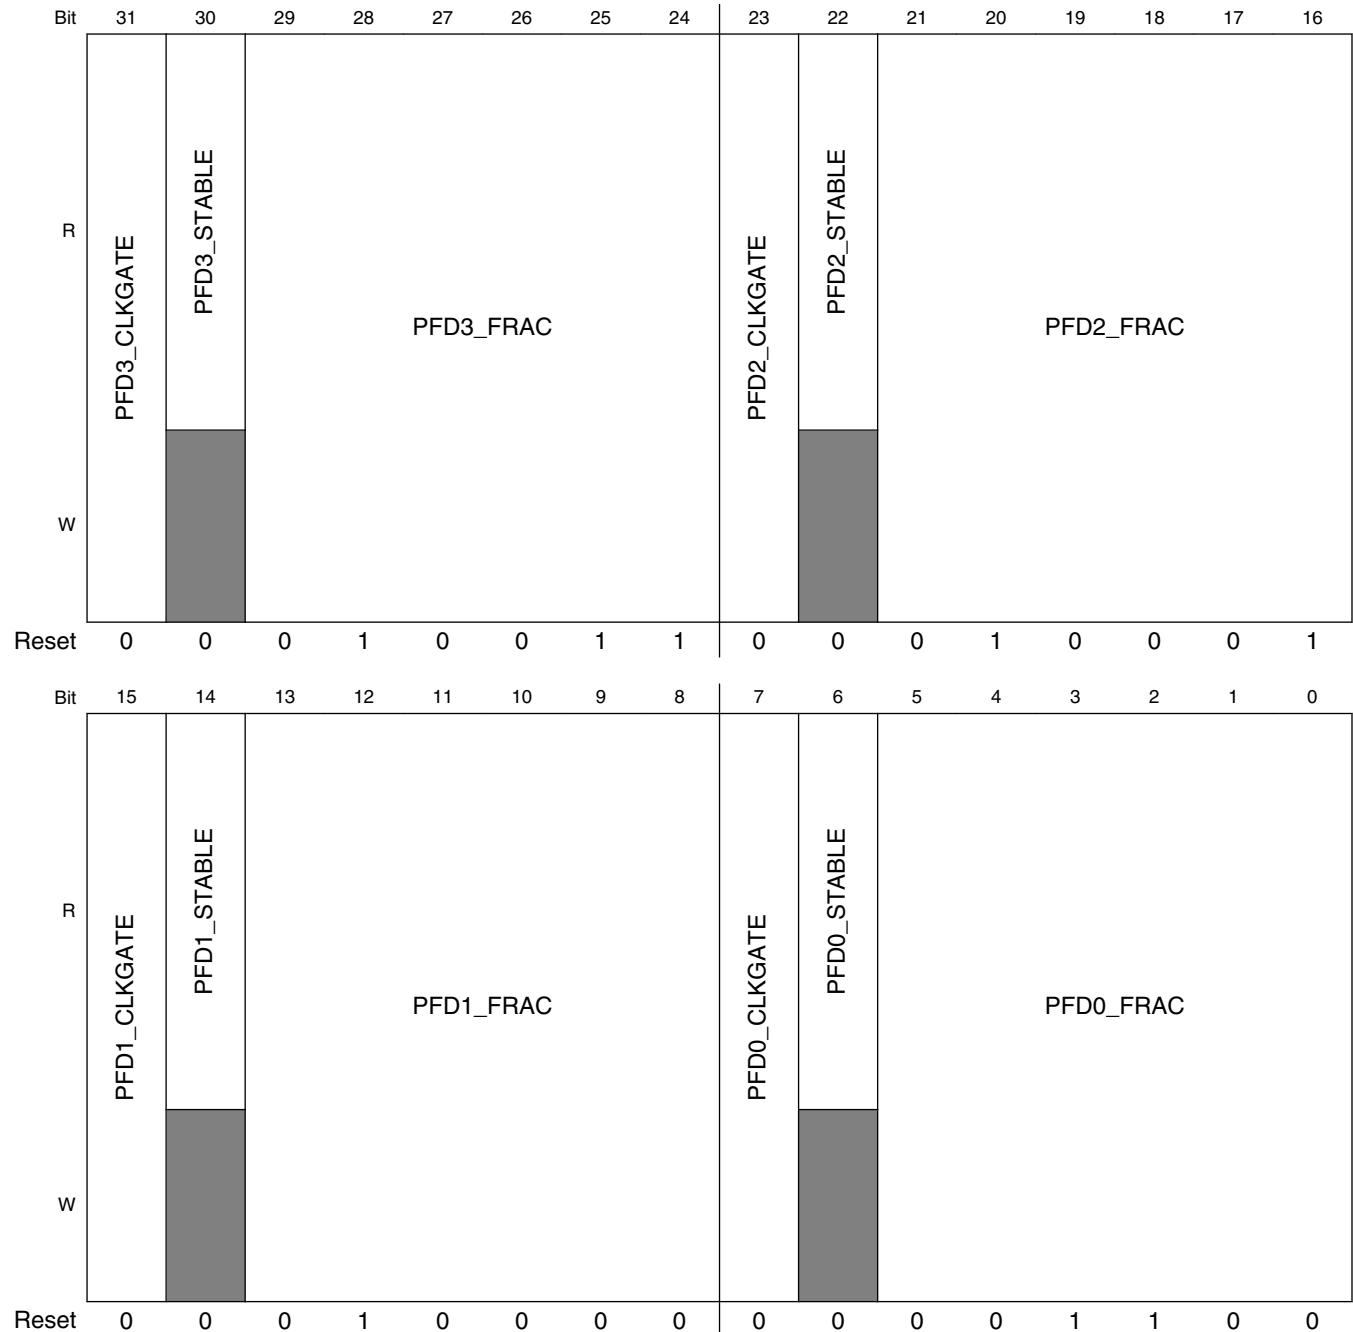

19.7.13 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 n)

The PFD_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

CCM Analog Memory Map/Register Definition

Address: 20C_8000h base + F0h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_480n field descriptions (continued)

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD3_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD2_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD1_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD0_FRAC}$ where PFD0_FRAC is in the range 12-35.

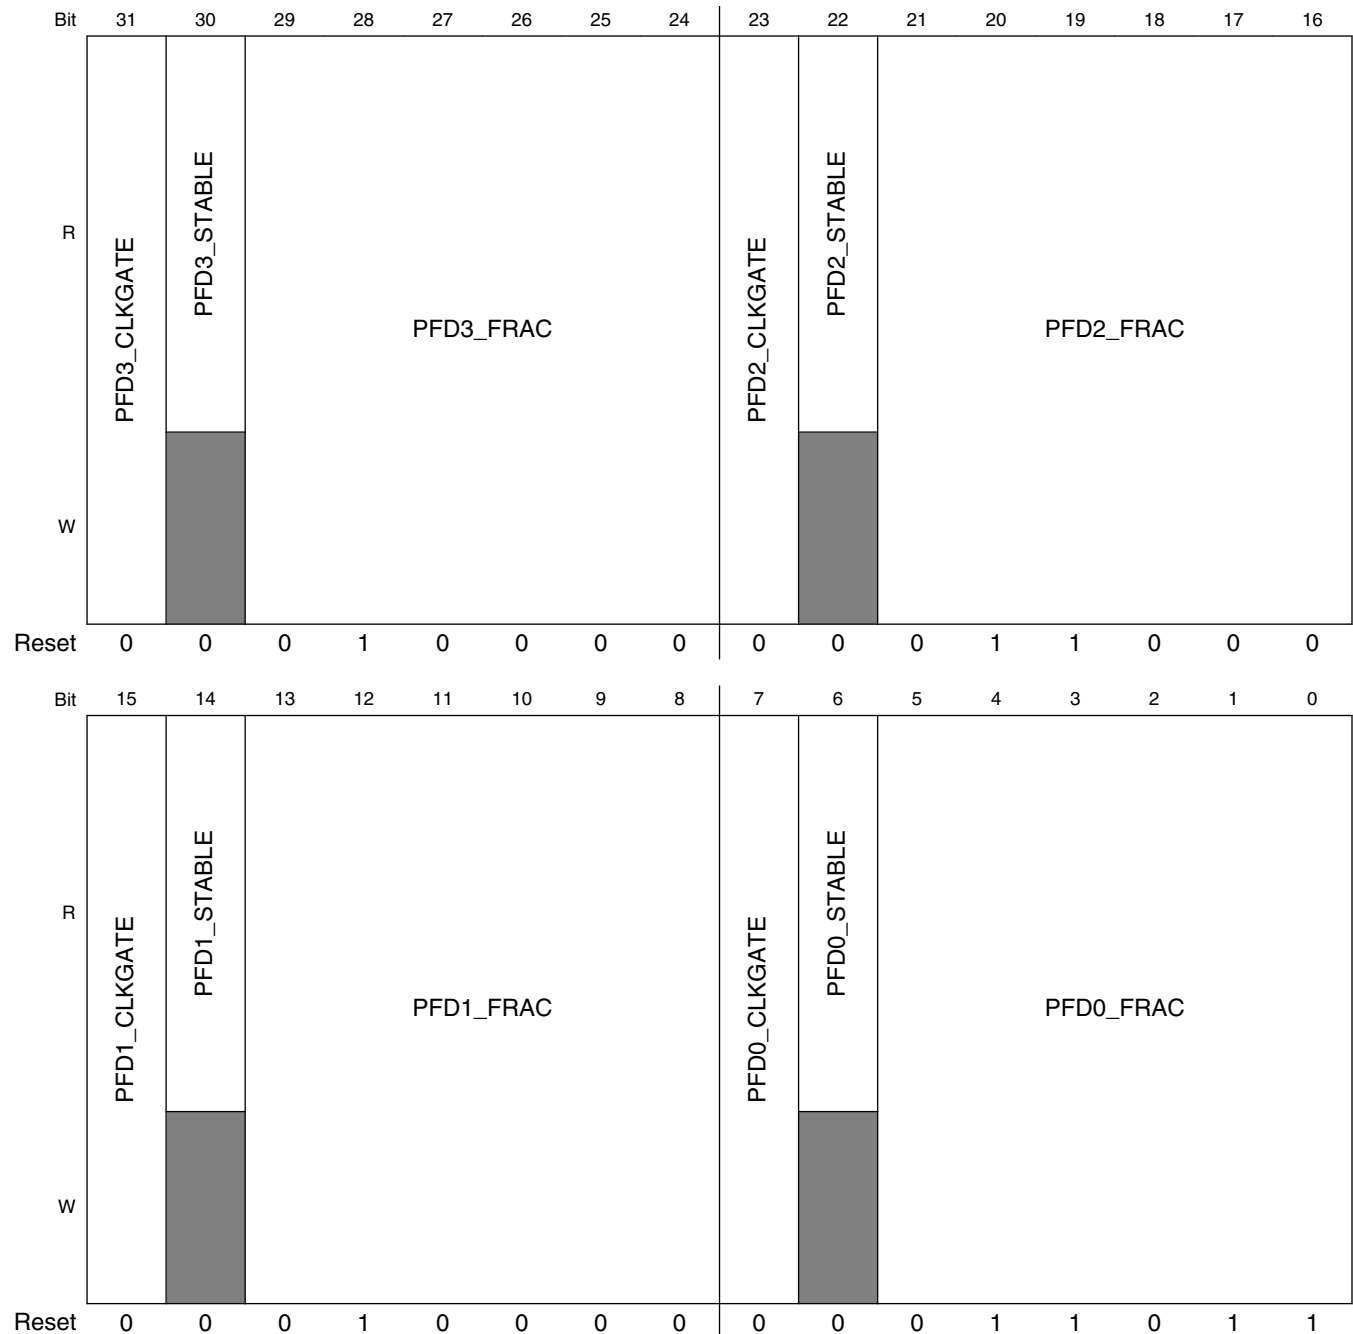

19.7.14 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528n)

The PFD_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

CCM Analog Memory Map/Register Definition

Address: 20C_8000h base + 100h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_PFD_528n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

CCM_ANALOG_PFD_528n field descriptions (continued)

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD3_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled. Need to assert this bit before PLL powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD2_FRAC}$ where PFD2_FRAC is in the range 12-35. NOTE: The maximum allowed frequency of PFD2 is 400MHz
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled. Need to assert this bit before PLL powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD1_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled. Need to assert this bit before PLL powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \times 18 / \text{PFD0_FRAC}$ where PFD0_FRAC is in the range 12-35. NOTE: For QSPI boot at 76 MHz, this PFD is relocked to 307MHz, so the default value for this field (modified by ROM) would be 0x1f. Also for Low Freq Boot, ROM will relock this PFD to 307MHz, hence default would be 0x1f.

19.7.15 Miscellaneous Register 0 (CCM_ANALOG_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 20C_8000h base + 150h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_MISC0n field descriptions

Field	Description
31 VID_PLL_ PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)
29 RTC_XTAL_ SOURCE	This field indicates which chip source is being used for the rtc clock. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 0 Internal ring oscillator 1 RTC_XTAL
28–26 CLKGATE_ DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block. NOTE: Do not change the field during a low power event. This is not a field that the user would normally need to modify. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC) 0 ALLOW_AUTO_GATE — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 NO_AUTO_GATE — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_ EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency. NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)

Table continues on the next page...

CCM_ANALOG_MISC0n field descriptions (continued)

Field	Description
14–13 OSC_I	<p>This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.</p> <p>NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)</p> <p>00 NOMINAL — Nominal 01 MINUS_12_5_PERCENT — Decrease current by 12.5% 10 MINUS_25_PERCENT — Decrease current by 25.0% 11 MINUS_37_5_PERCENT — Decrease current by 37.5%</p>
12 RTC_RINGOSC_EN	<p>Enables the internal ring oscillator that can be used in lieu of an external 32k crystal. The accuracy is relatively poor ~(10-40KHz) over process and environmental conditions. The crystal oscillator is automatically chosen to source the rtc clock if present. The choice is made based on the output of the clock monitor block.</p> <p>NOTE: Not related to CCM. See Crystal Oscillator (XTALOSC)</p>
11–10 STOP_MODE_CONFIG	<p>Configure the analog behavior in stop mode.</p> <p>00 All analog except rtc powered down on stop mode assertion. XtalOsc=on, RCOsc=off; 01 Certain analog functions such as certain regulators left up. XtalOsc=on, RCOsc=off; 10 XtalOsc=off, RCOsc=on, Old BG=on, New BG=off. 11 XtalOsc=off, RCOsc=on, Old BG=off, New BG=on.</p>
9–8 -	<p>This field is reserved. Reserved</p>
7 REFTOP_VBGUP	<p>Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p>
6–4 REFTOP_VBGADJ	<p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p> <p>000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%</p>
3 REFTOP_SELFBIASOFF	<p>Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.</p> <p>NOTE: Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p> <p>0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.</p>

Table continues on the next page...

CCM_ANALOG_MISC0n field descriptions (continued)

Field	Description
2-1 -	This field is reserved.
0 REFTOP_PWD	<p>Control bit to power-down the analog bandgap reference circuitry.</p> <p>NOTE: A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die.</p> <p>NOTE: Not related to CCM. See Power Management Unit (PMU)</p>

19.7.16 Miscellaneous Register 1 (CCM_ANALOG_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anaclk1/1b and anaclk2/2b LVDS IO's.

Address: 20C_8000h base + 160h offset + (4d × i), where i=0d to 3d

CCM_ANALOG_MISC1n field descriptions

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. NOTE: Not related to CCM. See Power Management Unit (PMU)

Table continues on the next page...

CCM_ANALOG_MISC1n field descriptions (continued)

Field	Description
30 IRQ_ANA_BO	This status bit is set to one when when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. NOTE: Not related to CCM. See Power Management Unit (PMU)
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature. NOTE: Not related to CCM. See Temperature Monitor (TEMPMON)
28 IRQ_TEMFLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature. NOTE: Not related to CCM. See Temperature Monitor (TEMPMON)
27 IRQ_TEMP PANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature. NOTE: Not related to CCM. See Temperature Monitor (TEMPMON)
26–18 -	This field is reserved. Reserved
17 PFD_528_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 LVDSCLK2_ IBEN	This enables the LVDS input buffer for anaclk2/2b. Do not enable input and output buffers simultaneously.
12 LVDSCLK1_ IBEN	This enables the LVDS input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
11 LVDSCLK2_ OBEN	This enables the LVDS output buffer for anaclk2/2b. Do not enable input and output buffers simultaneously.
10 LVDSCLK1_ OBEN	This enables the LVDS output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously.
9–5 LVDS2_CLK_ SEL	This field selects the clk to be routed to anaclk2/2b. 00000 ARM_PLL — Arm PLL 00001 SYS_PLL — System PLL 00010 PFD4 — ref_pfd4_clk == pll2_pfd0_clk 00011 PFD5 — ref_pfd5_clk == pll2_pfd1_clk 00100 PFD6 — ref_pfd6_clk == pll2_pfd2_clk 00101 PFD7 — ref_pfd7_clk == pll2_pfd3_clk 00110 AUDIO_PLL — Audio PLL 00111 VIDEO_PLL — Video PLL

Table continues on the next page...

CCM_ANALOG_MISC1n field descriptions (continued)

Field	Description
	01000 MLB_PLL — MLB PLL
	01001 ETHERNET_REF — ethernet ref clock (ENET_PLL)
	01010 PCIE_REF — PCIe ref clock (125M)
	01100 USB1_PLL — USB1 PLL clock
	01101 USB2_PLL — USB2 PLL clock
	01110 PFD0 — ref_pfd0_clk == pll3_pfd0_clk

Chapter 20

CMOS Sensor Interface (CSI)

20.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit / 24-bit data port for YCbCr, YUV, or RGB data input.
- 8-bit / 10-bit / 16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit / pixel data format to 32-bit receive FIFO packing.
- 256 x 32 FIFO to store received image pixel data.
- Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.

External Signals

- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).
- Supports simple deinterlacing of interlaced input.
- Supports TV Decoder (VADC) input.

20.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

20.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI_DATA[15:0].
- To connect with one 24-bit data, either video pass-through or TV Decoder input, the sensor data interface should connect to CSI_DATA[23:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI_DATA[7:0] and CSI_DATA[15:8].

20.4.1 Data Transfer with the Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the RxFIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1 and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in word and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF_PARA register, the user should set the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. In the CSIIMAG_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF_LEVEL and DMA_REQ_EN_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the RxFIFO reaches the trigger level, a DMA request will be sent to the embedded DMA controller and the data will be read out from the RxFIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA_TSF_DONE_FB1 or DMA_TSF_DONE_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA_REFLASH_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The RxFIFO has the overrun protection mechanism in case the RxFIFO is overrun during data transfer. If the RxFIFO is full and more data needs to be received during the data transfer, the RxFIFO will be overwritten continuously and all 128 words of data in the RxFIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the external memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in word and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF_LEVEL and DMA_REQ_EN_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data

will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA_BURST_TYPE_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA_TSF_DONE_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF_DMA_DONE_INTEN is enabled in CSICR1 register. The DMA_REFLASH_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

20.4.2 Gated Clock Mode

VSYNC, HSYNC, and PIXCLK signals are used in gated clock mode.

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

20.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

Figure 20-1. Non-Gated Clock Mode Timing Diagram

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into Rx FIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.

Figure 20-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programmed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

Below is the TV Decoder input mode timing diagram.

Figure 20-2. TV Decoder Input Mode Timing Diagram

20.4.4 CCIR656 Interlace Mode

In CCIR656 mode, only the PIXCLK and CSI_DATA[13:6] signals are used. The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering—that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

Figure below describes the frame structure in PAL system, showing vertical and horizontal blanking.

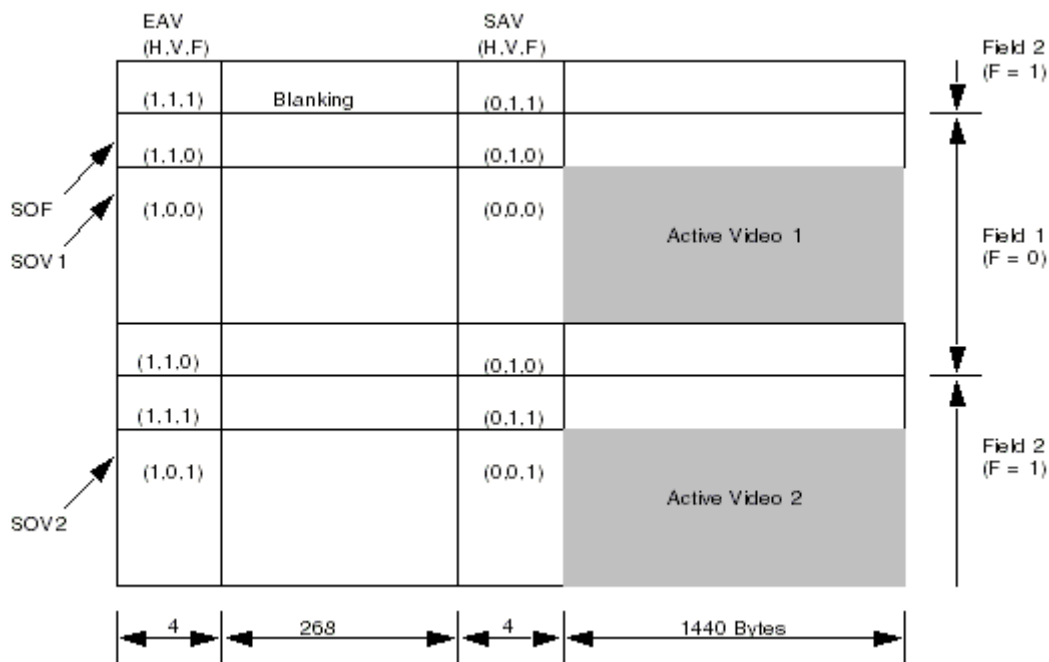

Figure 20-3. CCIR656 Interlace Mode (PAL)

Figure below describes the general timing for a single line, showing SAV and EAV.

Figure 20-4. CCIR656 General Line Timing

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

Table 20-5. Coding for SAV and EAV

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

Table 20-7. Representations by F-Bit

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

20.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

Figure below shows the typical flow of progressive mode.

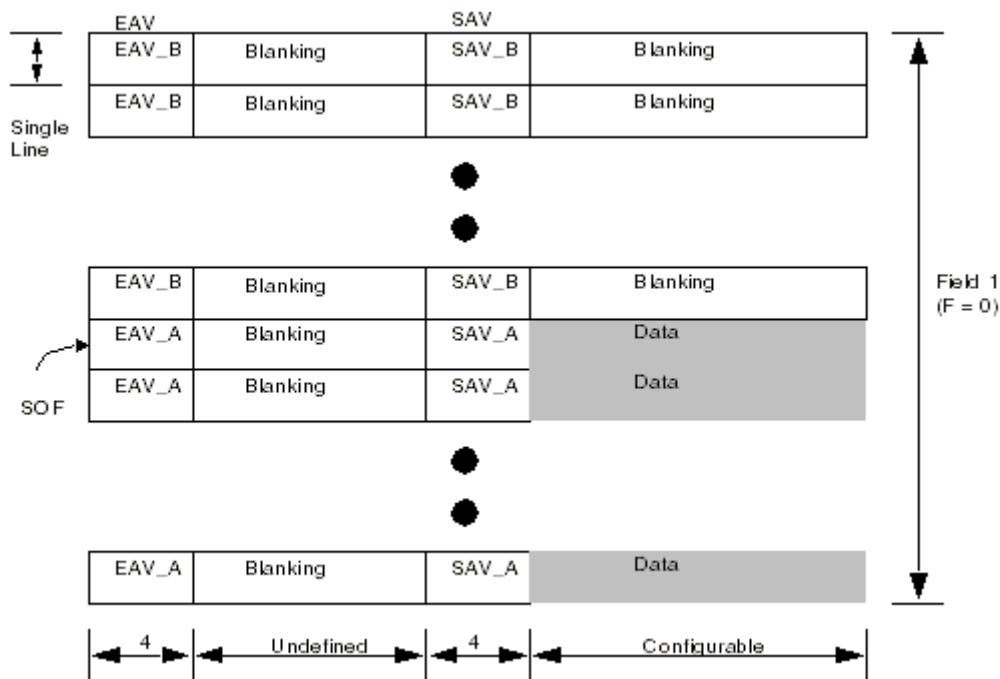

Figure 20-5. CCIR656 Progressive Mode (General Case)

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

20.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

20.4.7 Deinterlacer

Deinterlacing is the process of converting interlaced video, such as CCIR656 input or TV Decoder (VADC) input, into a non-interlaced form.

The CSI uses the weaving method to do deinterlacing. Weaving is done by adding consecutive fields together. CSI uses top-field detection function. No matter input is NTSC or PAL mode, the combined frame will always put the top-field first and then bottom-field.

20.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

20.5.1 Start Of Frame Interrupt (SOF_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

20.5.2 End Of Frame Interrupt (EOF_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

20.5.3 Change Of Field Interrupt (COF_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF_INT bit in the CSI Status Register (CSISTAT) before checking that F1_INT or F2_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

20.5.4 CCIR Error Interrupt (ECC_INT)

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC_INT status bit is set.

20.5.5 RxFIFO Full Interrupt (RxFF_INT)

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF_LEVEL in CSICR3.

20.5.6 Statistic FIFO Full Interrupt (STATFF_INT)

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF_LEVEL in CSICR3.

20.5.7 RxFIFO Overrun Interrupt (RFF_OR_INT)

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

20.5.8 Statistic FIFO Overrun Interrupt (SFF_OR_INT)

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

20.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1)

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

20.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2)

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

20.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF)

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

20.5.12 AHB Bus Response Error Interrupt (HRESP_ERR_INT)

An AHB Bus response error interrupt is generated when a bus error is detected.

20.5.13 DMA Field 0 Transfer Done Interrupt (DMA_FIELD0_DONE)

A DMA transfer done interrupt of field 0 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

20.5.14 DMA Field 1 Transfer Done Interrupt (DMA_FIELD1_DONE)

A DMA transfer done interrupt of field 1 is generated when one field of data are transferred from RxFIFO to the frame buffer in external memory. This signal should work on interlaced mode.

20.5.15 Base Address Change Error Interrupt (BASEADDR_CHANGE_ERROR)

A Base Address change error is generated when the base address changed while the last frame data transfer are not finished.

20.6 Data Packing Style

Careful attention to endianness is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK_DIR and the SWAP16_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring PIXEL_BIT bit in CSI Control Register 1 (CSICR1) and TWO_8BIT_SENSOR bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of PACK_DIR bit. The packed data is stored in the RX FIFO according to the setting of the SWAP16_EN bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the CSI_DATA[7:0]. The other sensor is connected to CSI_DATA[15:8].

20.6.1 RX FIFO Path

20.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the PACK_DIR bit should be set to 0. 8-bit data format from a sensor is packed to 32 bits as P3.P2.P1.P0, where P0 is the pixel coming in time slot 0 (first data) and P3 is the pixel coming in time slot 3 (the last data in the 32-bit word). When the data is addressed as bytes by software, P0 is transferred first, P1 is transferred next, and so on. 10-bit data format is packed to 32 bits as 000000.P1.000000.P0, where P0 is the 10-bit data coming in time slot 0 (first pixel)

and P1 is the 10-bit data coming in time slot 1 (second pixel). 16-bit data, from two sensors, is packed to 32 bits as P3.P2.P1.P0, where P0 and P1 are the two 8-bit data coming in time slot 0 (P0 is the first pixel of the sensor connected with CSI_DATA[7:0] and P1 is the first pixel of the sensor connected with CSI_DATA[15:8]). P2 and P3 are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

20.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as P0 first, followed by P1, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled RG, and the LSB labeled GB. P0 is represented as RG0 and GB0.

CSI receives data in one of the following sequence:

- RG0, GB0, RG1, GB1, while RG0 comes out at time slot 0 (first data), and GB1 comes out at time slot 3 (last data)
- GB0, RG0, GB1, RG1

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

- 8-bit data from sensor: RG0, GB0, RG1, GB1, ...
- 32-bit data before storage in the CSI RX FIFO (PACK_DIR bit = 1):
RG0GB0RG1GB1
- 32-bit data in CSI RX FIFO (SWAP16_EN bit enabled): RG1GB1RG0GB0
- 32-bit transfer to system memory: RG1GB1RG0GB0
- 16-bit read by display controller: RG0GB0, RG1GB1

20.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the figure below.

Figure 20-6. Sample Timing Diagram for RGB888 8 bits/cycle Data

Figure 20-7. Sample Timing Diagram for RGB888 24 bits/cycle Data

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the figure below. The dummy zero can be packed at the LSB position or MSB position. Using `RGB888A_FORMAT_SEL` in `CSI_CSICR18[18]` to determine to put the dummy bytes packed at LSB or MSB position.

20.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK_DIR and SWAP16_EN bits in the CSICR1 register have no effect on the input path. The PACK_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

...

When the PACK_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

20.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

NOTE

Register accesses to CSI1 and CSI2 require the DCIC1 and DCIC2 clocks to be enabled

CSI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
221_4000	CSI Control Register 1 (CSI1_CSICR1)	32	R/W	4000_0800h	20.7.1/878
221_4004	CSI Control Register 2 (CSI1_CSICR2)	32	R/W	0000_0000h	20.7.2/882
221_4008	CSI Control Register 3 (CSI1_CSICR3)	32	R/W	0000_0000h	20.7.3/884
221_400C	CSI Statistic FIFO Register (CSI1_CSISTATFIFO)	32	R	0000_0000h	20.7.4/886

20.7.1 CSI Control Register 1 (CSIx_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

CSIx_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	<p>SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO.</p> <p>NOTE: Example of swapping enabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x 33441122</p> <p>NOTE: Example of swapping disabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x11223344</p>

Table continues on the next page...

CSIx_CSICR1 field descriptions (continued)

Field	Description
	0 Disable swapping 1 Enable swapping
30 EXT_VSYNC	External VSYNC Enable. This bit controls the operational VSYNC mode. NOTE: This only works when the CSI is in CCIR progressive mode. 0 Internal VSYNC mode 1 External VSYNC mode
29 EOF_INT_EN	End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt. 0 EOF interrupt is disabled. 1 EOF interrupt is generated when RX count value is reached.
28 PrP_IF_EN	CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked. 0 CSI to PrP bus is disabled 1 CSI to PrP bus is enabled
27 VIDEO_MODE	Video mode select. This bit controls the video mode in CCIR mode and TV decoder input. 0 Progressive mode is selected 1 Interlace mode is selected
26 COF_INT_EN	Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt. This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1. 0 COF interrupt is disabled 1 COF interrupt is enabled
25 SF_OR_INTEN	STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt. 0 STATFIFO overrun interrupt is disabled 1 STATFIFO overrun interrupt is enabled
24 RF_OR_INTEN	RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt. 0 RxFIFO overrun interrupt is disabled 1 RxFIFO overrun interrupt is enabled
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done. 0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt. 0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable
20 FB2_DMA_DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done.

Table continues on the next page...

CSIx_CSICR1 field descriptions (continued)

Field	Description
	0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_ DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done. 0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt. 0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt. 0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt. 0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved. This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC. This bit only works in gated-clock-that is, GCLK_MODE = 1 and CCIR_EN = 0. 0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic. 0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.
8 FCC	FIFO Clear Control. This bit determines how the RxFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RxFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RxFIFO and CLR_STATFIFO bits. 0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.
7 PACK_DIR	Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO. 0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0BBBB, it will appear as 0BBBBAAAA in STAT FIFO. 1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0BBBB, it will appear as 0AAAABBBB in STAT FIFO.

Table continues on the next page...

CSIx_CSICR1 field descriptions (continued)

Field	Description
6 CLR_STATFIFO	Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block. This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored. Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF. The bit is restored to 0 automatically after finish. Normally reads 0.
5 CLR_RXFIFO	Asynchronous RXFIFO Clear. This bit clears the RXFIFO. This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored. Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that. The bit is restored to 0 automatically after finish. Normally reads 0.
4 GCLK_MODE	Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode. This bit works only in traditional mode-that is, CCIR_EN = 0. Otherwise this bit is ignored. 0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored. 1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.
3 INV_DATA	Invert Data Input. This bit enables or disables internal inverters on the data lines. 0 CSI_D[7:0] data lines are directly applied to internal circuitry 1 CSI_D[7:0] data lines are inverted before applied to internal circuitry
2 INV_PCLK	Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module. 0 CSI_PIXCLK is directly applied to internal circuitry 1 CSI_PIXCLK is inverted before applied to internal circuitry
1 REDGE	Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data. 0 Pixel data is latched at the falling edge of CSI_PIXCLK 1 Pixel data is latched at the rising edge of CSI_PIXCLK
0 PIXEL_BIT	Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller. 0 8-bit data for each pixel 1 10-bit data for each pixel

20.7.2 CSI Control Register 2 (CSIx_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: Base address + 4h offset

CSIx_CSICR2 field descriptions

Field	Description
31–30 DMA_BURST_TYPE_RFF	Burst Type of DMA Transfer from RxFIFO. Selects the burst type of DMA transfer from RxFIFO. X0 INCR8 01 INCR4 11 INCR16
29–28 DMA_BURST_TYPE_SFF	Burst Type of DMA Transfer from STATFIFO. Selects the burst type of DMA transfer from STATFIFO. X0 INCR8 01 INCR4 11 INCR16

CSIx_CSICR2 field descriptions (continued)

Field	Description
27 -	This field is reserved. Reserved. These bit is reserved and should read 0.
26 DRM	Double Resolution Mode. Controls size of statistics grid. 0 Stats grid of 8 x 6 1 Stats grid of 8 x 12
25–24 AFS	Auto Focus Spread. Selects which green pixels are used for auto-focus. 00 Abs Diff on consecutive green pixels 01 Abs Diff on every third green pixels 1x Abs Diff on every four green pixels
23 SCE	Skip Count Enable. Enables or disables the skip count feature. 0 Skip count disable 1 Skip count enable
22–21 -	This field is reserved. Reserved. These bits are reserved and should read 0.
20–19 BTS	Bayer Tile Start. Controls the Bayer pattern starting point. 00 GR 01 RG 10 BG 11 GB
18–16 LVRM	Live View Resolution Mode. Selects the grid size used for live view resolution. 0 512 x 384 1 448 x 336 2 384 x 288 3 384 x 256 4 320 x 240 5 288 x 216 6 400 x 300
15–8 VSC	Vertical Skip Count. Contains the number of rows to skip. SCE must be 1, otherwise VSC is ignored. 0-255 Number of rows to skip minus 1
HSC	Horizontal Skip Count. Contains the number of pixels to skip. SCE must be 1, otherwise HSC is ignored. 0-255 Number of pixels to skip minus 1

20.7.3 CSI Control Register 3 (CSIx_CSICR3)

This read/write register acts as an extension of the functionality of the CSI Control register 1, adding additional control and features.

Address: Base address + 8h offset

CSIx_CSICR3 field descriptions

Field	Description
31–16 FRMCNT	Frame Counter. This is a 16-bit Frame Counter (Wraps around automatically after reaching the maximum)
15 FRMCNT_RST	Frame Count Reset. Resets the Frame Counter. (Cleared automatically after reset is done) 0 Do not reset 1 Reset frame counter immediately
14 DMA_REFLASH_RFF	Reflash DMA Controller for RxFIFO. This bit reflash the embedded DMA controller for RxFIFO. It should be reflash before the embedded DMA controller starts to work. (Cleared automatically after reflash is done) 0 No reflash 1 Reflash the embedded DMA controller
13 DMA_REFLASH_SFF	Reflash DMA Controller for STATFIFO. This bit reflash the embedded DMA controller for STATFIFO. It should be reflash before the embedded DMA controller starts to work. (Cleared automatically after reflash is done) 0 No reflash 1 Reflash the embedded DMA controller

Table continues on the next page...

CSIx_CSICR3 field descriptions (continued)

Field	Description
12 DMA_REQ_EN_ RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_ SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller. 0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent. 000 4 Words 001 8 Words 010 12 Words 011 16 Words 100 24 Words 101 32 Words 110 48 Words 111 64 Words
7 HRESP_ERR_ EN	Hresponse Error Enable. This bit enables the hresponse error interrupt. 0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	RxFIFO Full Level. When the number of data in RxFIFO reaches this level, a RxFIFO full interrupt is generated, or an RxFIFO DMA request is sent. 000 4 Words 001 8 Words 010 16 Words 011 24 Words 100 32 Words 101 48 Words 110 64 Words 111 96 Words
3 TWO_8BIT_ SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller. 0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_ EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode. 0 Zero packing disabled 1 Zero packing enabled

CSIx_CSICR3 field descriptions (continued)

Field	Description
1 ECC_INT_EN	<p>Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode.</p> <p>0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.</p>
0 ECC_AUTO_EN	<p>Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode.</p> <p>0 Auto Error correction is disabled. 1 Auto Error correction is enabled.</p>

20.7.4 CSI Statistic FIFO Register (CSIx_CSISTATFIFO)

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: Base address + Ch offset

CSIx_CSISTATFIFO field descriptions

Field	Description
STAT	Static data from sensor

20.7.5 CSI RX FIFO Register (CSIx_CSIRFIFO)

This read-only register contains received image data. Writing to this register has no effect.

Address: Base address + 10h offset

CSIx_CSIRFIFO field descriptions

Field	Description
IMAGE	Received image data

20.7.6 CSI RX Count Register (CSIx_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: Base address + 14h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSIx_CSIRXCNT field descriptions

Field	Description
31–22 -	This field is reserved. Reserved. These bits are reserved and should read 0.
RXCNT	RxFIFO Count. This 22-bit counter for RxFIFO is updated each time the RxFIFO is read by CPU or DMA. This counter should be set to the expected number of words to receive that would generate an EOF interrupt.

20.7.7 CSI Status Register (CSIx_CSISR)

This read/write register shows sensor interface status, and which kind of interrupt is being generated. The corresponding interrupt bits must be set for the status bit to function. Status bits should function normally even if the corresponding interrupt enable bits are not enabled.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CSIx_CSISR field descriptions

Field	Description
31–29 -	Reserved. These bits are reserved and should read 0.
28 BASEADDR_CHHANGE_ERROR	When using base address switching enable, this bit will be 1 when switching occur before DMA complete. This bit will be clear by writing 1. When this interrupt happens, follow the steps listed below. 1. Unassert the CSI enable, CSIx_CSICR18 bit31, 2. Reflash the DMA, assert the CSIX_CSICR3 bit 14, 3. Assert the CSI enable, CSIx_CSICR18 bit31.
27 DMA_FIELD0_DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).

Table continues on the next page...

CSIx_CSISR field descriptions (continued)

Field	Description
26 DMA_FIELD1_ DONE	When DMA field 0 is complete, this bit will be set to 1 (clear by writing 1).
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1) 0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1) 0 RxFIFO has not overflowed. 1 RxFIFO has overflowed.
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_ DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the StatFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO) 0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_ DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_ DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1) 0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RxFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO) 0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1) 0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)

Table continues on the next page...

CSIx_CSISR field descriptions (continued)

Field	Description
	0 SOF is not detected. 1 SOF is detected.
15 F2_INT	CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match) NOTE: Only works in CCIR Interlace mode. 0 Field 2 of video is not detected 1 Field 2 of video is about to start
14 F1_INT	CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match) NOTE: Only works in CCIR Interlace mode. 0 Field 1 of video is not detected. 1 Field 1 of video is about to start.
13 COF_INT	Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1) 0 Video field has no change. 1 Change of video field is detected.
12–8 -	This field is reserved. Reserved. These bits are reserved and should read 0.
7 HRESP_ERR_INT	Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1) 0 No hresponse error. 1 Hresponse error is detected.
6–2 -	This field is reserved. Reserved. These bits are reserved and should read 0.
1 ECC_INT	CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1) 0 No error detected 1 Error is detected in CCIR coding
0 DRDY	RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO) 0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.

20.7.8 CSI DMA Start Address Register - for STATFIFO (CSIx_CSIDMASA_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: Base address + 20h offset

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16

CSIx_CSIDMATS_STATFIFO field descriptions

Field	Description
DMA_TSF_SIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transferred by the embedded DMA controller. The size should be words aligned.

20.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSIx_CSIDMASA_FB1)

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: Base address + 28h offset

Field	Description
31–2 DMA_START_ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

20.7.12 CSI Frame Buffer Parameter Register (CSIx_CSIFBUF_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

NOTE

There are some limitations when using the stride feature in CSI. The line width must be the multiple of the burst length x (32/ pixel width). For example, burst length is 8, pixel width are 16 bits; in this case the line width must be the multiple of 16.

Address: Base address + 30h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSIx_CSIFBUF_PARA field descriptions

Field	Description
31–16 -	This field is reserved. Reserved. These bits are reserved and should read 0.
FBUF_STRIDE	Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in word) minus the width of the image(in word) is the stride. The stride should be word aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.

20.7.13 CSI Image Parameter Register (CSIx_CSIIMAG_PARA)

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transferred in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: Base address + 34h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CSIx_CSICR19 field descriptions

Field	Description
31–8 -	This field is reserved.
DMA_RFIFO_ HIGHEST_FIF LEVEL	This byte stores the highest FIFO level achieved by CSI FIFO timely and will be clear by writing 8'ff to it.

Chapter 21

Display Content Integrity Checker (DCIC)

21.1 Overview

The goal of the DCIC is to verify that a safety-critical information sent to a display is not corrupted.

Such a verification is mandatory for warning icons in the instrument cluster of a car, to comply with the ASIL B (Automotive Safety Integrity Level B) specification. It is also required in other safety-sensitive systems.

Using external muxing DCIC can monitor either one of the LCDIF outputs or feedback signals going from IO pads of Parallel display interface. The figure below shows DCIC integration in system with two LCDIF ports.

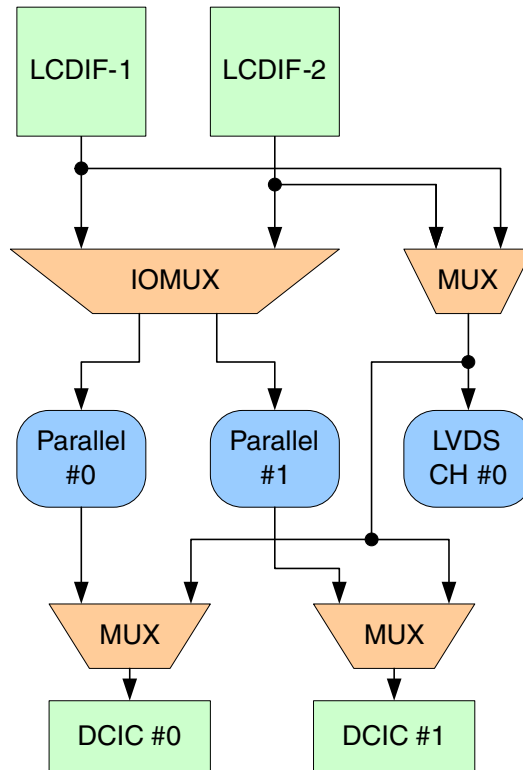

Figure 21-1. DCIC system integration example

21.1.1 Block Diagram

The figure below shows DCIC top level block diagram.

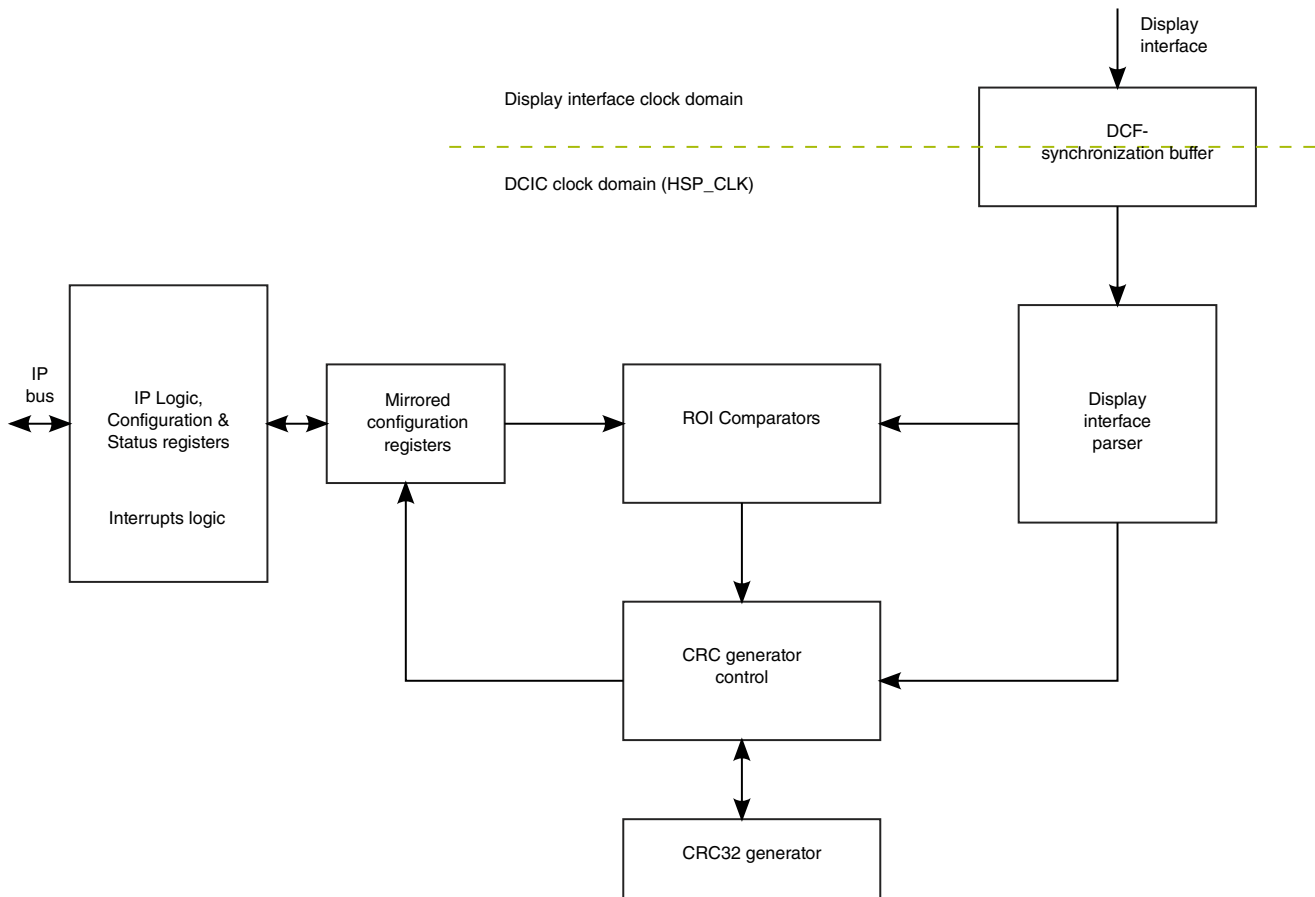

Figure 21-2. DCIC Block Diagram

21.1.2 Features

- Pixel clock up to 148.5 MHz
- Configurable polarity of Display Interface control signals
- 24-bit pixel data bus
- Up to 16 rectangular ROIs with a configurable location and size
- Independent CRC32 signature calculation for each ROI
- External controller mismatch indication signal

21.2 External Signals

The following table describes the external signals of DCIC1:

Table 21-1. DCIC1 External Signals

Signal	Description	Pad	Mode	Direction
DCIC1_OUT	DCIC1 Output Signal	CSI_DATA07	ALT7	O
		GPIO1_IO08	ALT7	
		SD3_DATA0	ALT6	

Table 21-2. DCIC2 External Signals

Signal	Description	Pad	Mode	Direction
DCIC2_OUT	DCIC2 Output Signal	CSI_DATA06	ALT7	O
		GPIO1_IO07	ALT7	
		SD3_DATA1	ALT6	

21.3 Functional Description

This section provides a complete functional description of the block.

21.3.1 Generic synchronous parallel display interface

The figure below depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure signals are shown with negative polarity, but both polarity modes are supported by DCIC through configuration of appropriate bits of DCICCR register.

The sequence of events for active matrix interface timing is:

- IPP_DISP_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP_DISP_CLK runs continuously.
- HSYNC causes the panel to start a new line.
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse.
- DRDY acts like an output enable signal. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off.

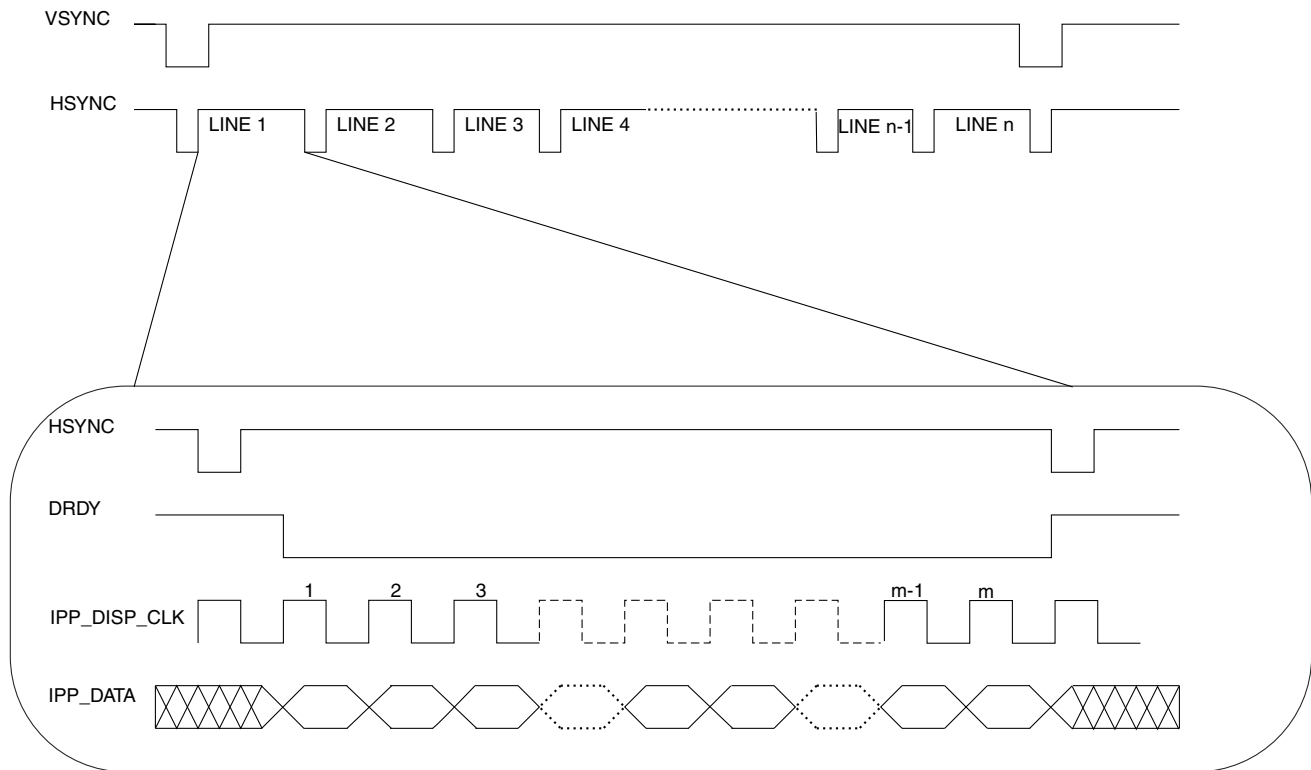

Figure 21-3. Interface Timing Diagram for TFT (Active Matrix) Panels

21.3.2 CRC Polynomial

DCIC uses the CRC32 polynomial to calculate the data signature.

Initial value for CRC calculation is 0x00000000.

$$X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^8 + X^7 + X^5 + X^4 + X^2 + X + 1$$

CRC generator uses XOR-ed combination of input data bits and previous result bits.

21.3.3 Mode of operation

After DCIC is configured and enabled, providing LCDIF is already enabled, first VSYNC is being watched. VSYNC assertion zeroes main position counters and initializes CRC storage registers.

Each HSYNC assertion after first line in frame that holds valid pixel data (non blanking) will signal new line, i.e. increment Y-counter and zeroize X-counter. Each valid data cycle (DATA_EN asserted) will increment X-counter. Thus X & Y values used to configure the module should be the coordinates on the actual visual part of the screen without blanking intervals. X & Y position counters are constantly compared to ROIs configuration. When current position matches one of the enabled ROIs, it triggers the enablement of CRC generator, which will use the current pixel data and previous pixel CRC result for this ROI. The result of the new calculation stored separately for each ROI. Next VSYNC, apart of signalling new frame start, will cause sampling calculated CRC values into configuration registers domain. These values then will be compared to expected signatures and appropriate status bits / interrupts will be asserted.

21.3.4 Interrupts

There are two maskable interrupts:

- Functional - Asserted when match results ready.
- Error - Asserted when there is a signature mismatch.

Both interrupts are generated immediately after completing the signature match check. Software should clean the interrupts by writing "1" to appropriate status bits (FI_STAT, ROI_MATCH_STAT). EI_STAT bit is a result of OR between all ROI_MATCH_STAT bits, hence it will be cleared automatically when these bits are clear.

Interrupt masks can be set/reset only while FREEZE_MASK bit isn't set. This bit can not be set back to zero.

21.3.5 Software reset

Disabling and enabling the module operation (IC_EN bit, [DCIC Control Register \(DCIC_DCICC\)](#)) will reset all the logic apart of configuration registers domain. Status bits of DCICS ([DCIC Status Register \(DCIC_DCICS\)](#)) register will also be cleared.

21.3.6 Clock domains

Asynchronous FIFO is being used to sample raw display interface signals and transfer them into DCIC fast clock domain (hsp_clk).

Display interface clock is always slower than DCIC fast clock.

IP registers are driven by the same fast clock and will be synchronized to system IP Bus clock by external IP_SYNC module.

21.3.7 External controller mismatch indication signal

Besides of interrupts to SoC core, DCIC provides an additional mismatch indication for external controller. The signal, if enabled, continuously oscillating at a rate which is an integer division of the main clock (hsp clock).

- When the status bit of the mismatch interrupt is set - i.e. from mismatch detection until the CPU clears the bit: division x16
- Otherwise: division x4

The indication signal is idle while integrity check is disabled.

21.3.8 Power saving

Disabling the module by clearing IC_EN bit will stop all module activities, including sampling of input signals into the FIFO.

21.3.9 System Considerations

- The DCIC always assumes a 24-bit pixel. For proper functionality with lower color depth, one must ensure that:
 - When the CPU calculates the reference signature, it applies the same mapping of a pixel to a 24-bit field as that performed by the LCDIF.
 - The display is connected to the appropriate pins.
 - The simplest mapping would be
 - Map the pixel to the data bus in the same way as for 24 bpp
 - Set the values at the extra LSBs to zero.
- Parameter updates
 - The reference signature can be freely updated from frame to frame, in coordination with the changing content (since it is used only once per frame, just before the interrupt)
 - Each ROI can be freely and independently enabled/disabled between frames (since the enable bit is double buffered)
 - The size and location of a ROI can be modified while it is disabled.
 - Display interface signals polarity can be changed only when the module is disabled.
- ROI (regions of interest) don't overlap, i.e. each pixel belongs to single ROI at most.

- DCIC operation is intended for monitoring relatively static portions of graphic interface, otherwise it will be complicated software task to keep up with frame synchronization and update expected signature for each frame.
- There should be no processing done at LCDIF on monitored ROIs, which can't be taken in consideration by software when calculating the expected signature.

21.4 DCIC Memory Map/Register Definition

Important: All write accesses have to be full word (32-bit) accesses. No error/abort will be responded in case of different access size, but no data will be written. Similarly, there will be no error response in case of access to undefined memory space.

Read access will return 32-bit data, which may be truncated on system level in case it wasn't full word acces.

DCIC memory map

Chapter 22

Enhanced Configurable SPI (ECSPI)

22.1 Overview

The Enhanced Configurable Serial Peripheral Interface (ECSPI) is a full-duplex, synchronous, four-wire serial communication block.

The ECSPI contains a 64 x 32 receive buffer (RXFIFO) and a 64 x 32 transmit buffer (TXFIFO). With data FIFOs, the ECSPI allows rapid data communication with fewer software interrupts. The figure below shows a block diagram of the ECSPI.

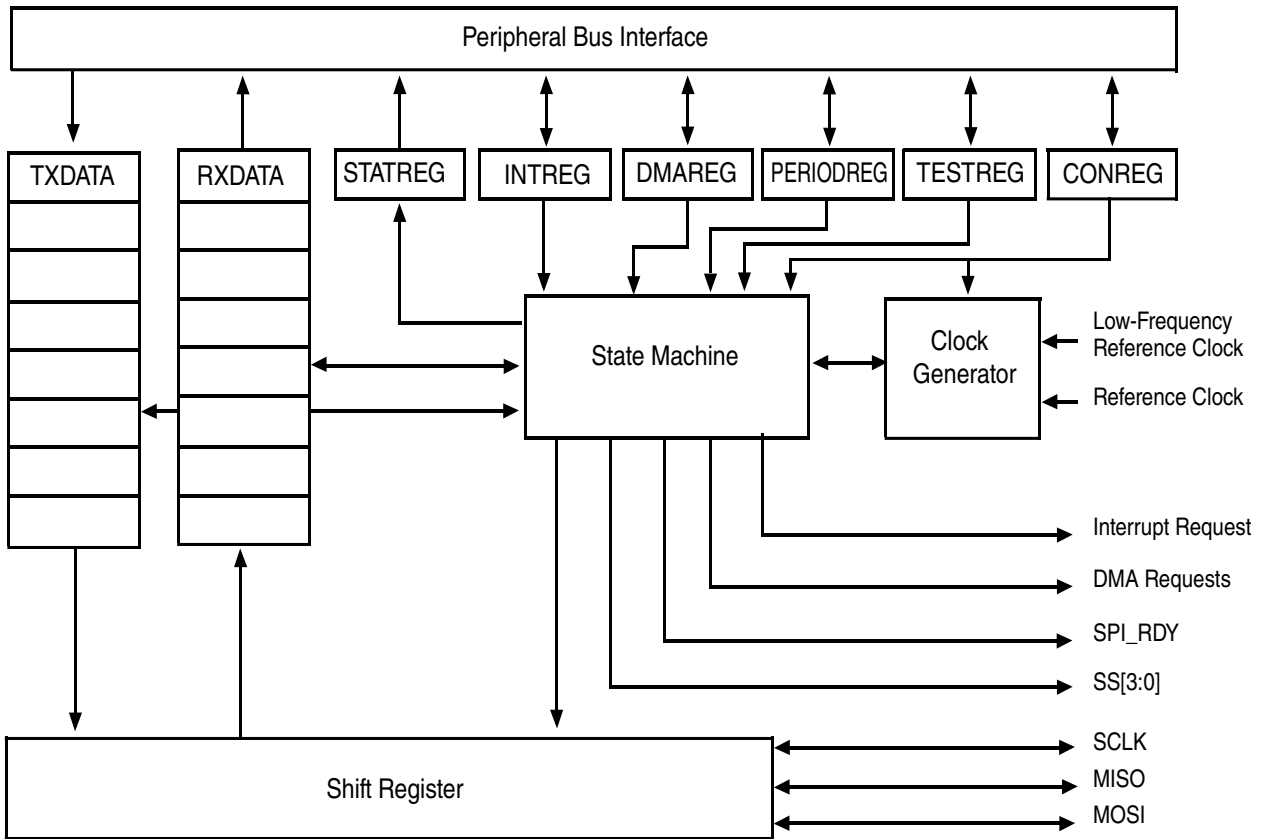

Figure 22-1. ECSPI Block Diagram

22.1.1 Features

Key features of the ECSPI include:

- Full-duplex synchronous serial interface
- Master/Slave configurable
- Four Chip Select (SS) signals to support multiple peripherals
- Transfer continuation function allows unlimited length data transfers
- 32-bit wide by 64-entry FIFO for both transmit and receive data
- Polarity and phase of the Chip Select (SS) and SPI Clock (SCLK) are configurable
- Direct Memory Access (DMA) support
- Max operation frequency up to the reference clock frequency.

22.1.2 Modes and Operations

The ECSPI supports the modes described in the indicated sections:

- [Master Mode](#)
- [Slave Mode](#)
- [Low Power Modes](#)

As described in [Operations](#), the ECSPI supports the operations described in the indicated sections:

- [Typical Master Mode](#)
 - [Master Mode with SPI_RDY](#)
 - [Master Mode with Wait States](#)
 - [Master Mode with SS_CTL\[3:0\] Control](#)
 - [Master Mode with Phase Control](#)
- [Typical Slave Mode](#)

22.2 External Signals

The following table describes the external signals of ECSPI:

Table 22-1. ECSPI1 External Signals

Signal	Description	Pad	Mode	Direction
ECSPI1_MISO	Master data in; slave data out	KEY_COL1	ALT3	IO
		QSPI1A_DATA1	ALT2	
ECSPI1_MOSI	Master data out; slave data in	KEY_ROW0	ALT3	IO
		QSPI1A_DATA0	ALT2

Figure 22-2 shows the ECSPi in master mode connected to four external devices in a one-way communication link.

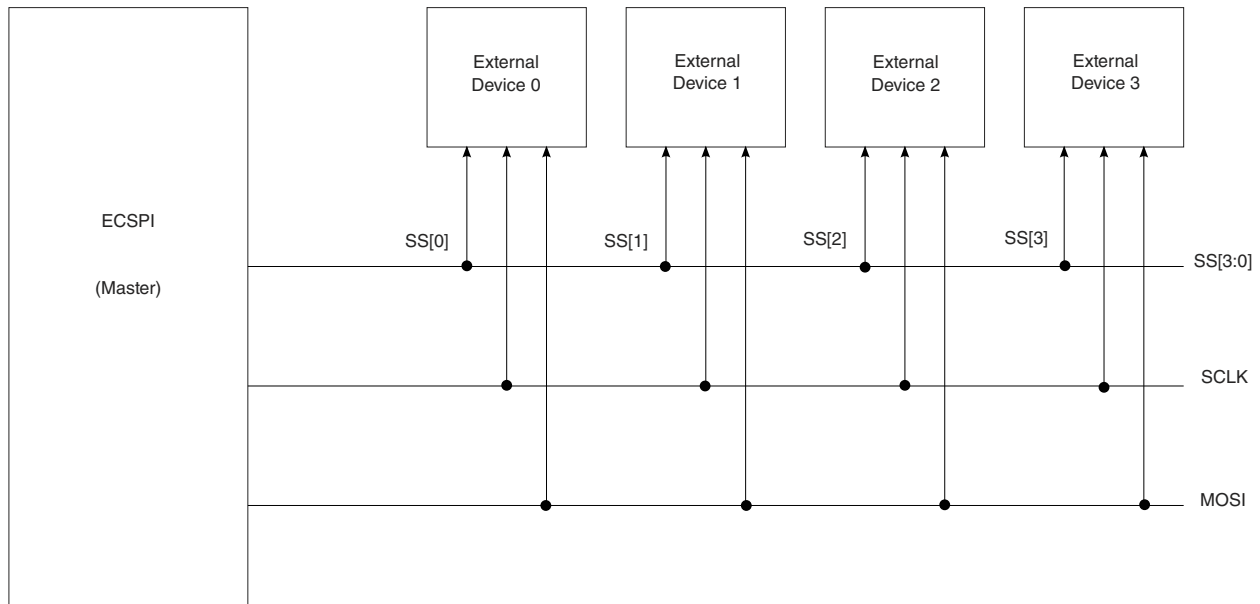

Figure 22-2. Example Connection Diagram

22.3 Clocks

The following table describes the clock sources for eCSPI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 22-6. eCSPI Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_per	ecspi_clk_root	eCSPI module clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

22.4 Functional Description

This section provides a complete functional description of the ECSPI. The figure found here shows the relationship of SCLK and data lines while ECSPI has been configured with different POL and PHA settings.

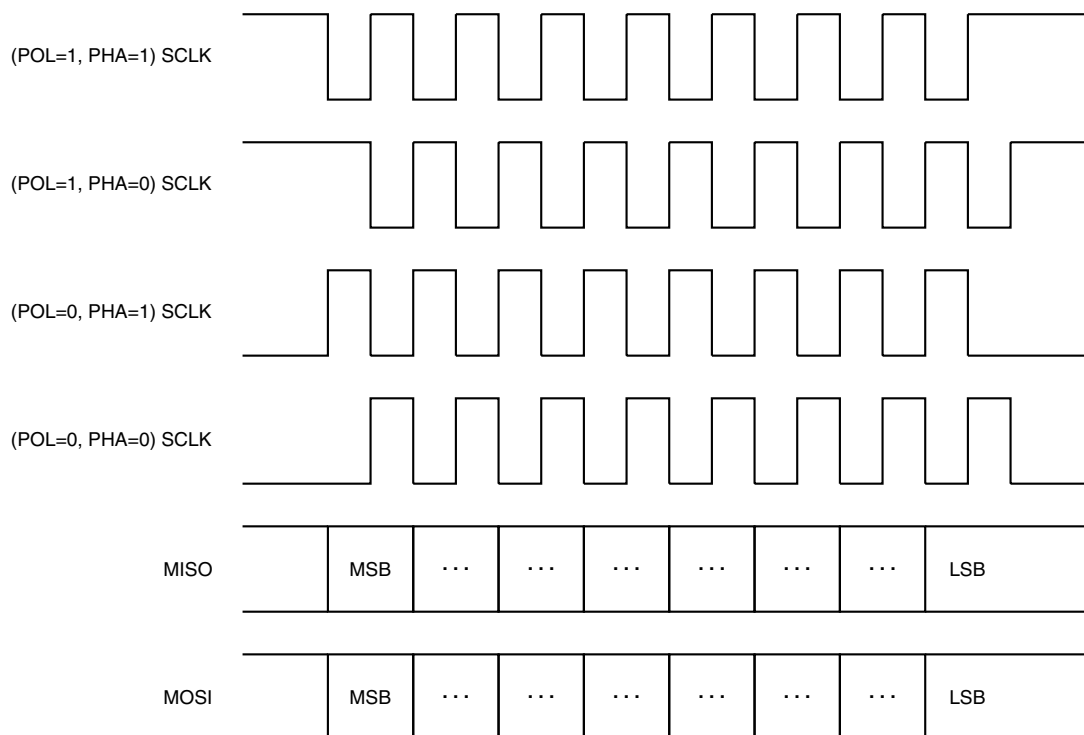

Figure 22-3. ECSPI SCLK, MISO, and MOSI Relationship

22.4.1 Master Mode

When the ECSPI is configured as a master, it uses a serial link to transfer data between the ECSPI and an external slave device.

One of the Chip Select (SS) signals and the clock signal (SCLK) are used to transfer data between two devices. If the external device is a transmit-only device, the ECSPI master's output port can be ignored and used for other purposes. In order to use the internal TXFIFO and RXFIFO, two auxiliary output signals, Chip Select (SS) and SPI_RDY, are used for data transfer rate control. Software can also configure the sample period control register to a fixed data transfer rate.

22.4.2 Slave Mode

When the ECSPI is configured as a slave, software can configure the ECSPI Control register to match the external SPI master's timing.

In this configuration, Chip Select (\overline{SS}) becomes an input signal, and is used to control data transfers through the Shift register, as well as to load/store the data FIFO.

Slave mode only supports the case when SSCTL (SSB_CTRL[x] bit) is cleared. The accurate burst length should always be specified using the BURST_LENGTH parameter. SSCTL (SSB_CTRL[x] bit) set to 1 is not supported in slave mode.

22.4.3 Low Power Modes

The ECSPI does not operate under low power mode.

It holds its operation when its clock is gated off in master mode. In slave mode, the ECSPI does not respond when its clock is gated off.

22.4.4 Operations

The information found here describes the ECSPI's operations.

22.4.4.1 Typical Master Mode

The ECSPI master uses the Chip Select (SS) signal to enable an external SPI device, and uses the SCLK signal to transfer data in and out of the Shift register.

The SPI_RDY enables fast data communication with fewer software interrupts. By programming the ECSPI_PERIODREG register accordingly, the ECSPI can be used for a fixed data transfer rate.

When the ECSPI is in Master mode the SS, SCLK, and MOSI are output signals, and the MISO signal is an input.

Figure 22-4. Typical SPI Burst (8-bit Transfer)

In the above figure, the Chip Select (SS) signal enables the selected external SPI device, and the SCLK synchronizes the data transfer. The MOSI and MISO signals change on rising edge of SCLK and the MISO signal is latched on the falling edge of the SCLK. The figure above shows a data of 0xD2 is shifted out, and a data of 0x66 is shifted in.

22.4.4.1.1 Master Mode with SPI_RDY

By default, the ECSPI does not use the SPI_RDY signal in master mode (MODE =1).

A SPI burst begins when the following events happen:

- The ECSPI is enabled, TXFIFO has data in it, and ECSPI_CONREG[XCH] bit or the ECSPI_CONREG[SMC] bit is set.
- When the SPI Data Ready Control (ECSPI_CONREG[DRCTL]) bits contains either 01 or 10, the SPI_RDY signal controls when a SPI burst starts.

A SPI burst is defined as a bus transaction that starts when the slave select is asserted and ends when the slave select is negated. The Chip Select (SS) signal will remain asserted until all the bits in a SPI burst are shifted out.

If ECSPI_CONREG[DRCTL] is set to 01, the SPI burst can be triggered only if a falling edge of the SPI_RDY signal has been detected.

The following figure shows the relationship between a SPI burst and the falling edge of SPI_RDY signal.

Figure 22-5. Relationship Between a SPI Burst and SPI_RDY: Falling-Edge Triggered

A SPI burst does not start until the falling edge of the SPI_RDY signal is detected. The next SPI burst starts when the next SPI_RDY falling edge is detected, after the last burst has finished.

If SPI Data Ready Control (ECSPI_CONREG[DRCTL]) is set to 10, the SPI burst can be triggered only if the SPI_RDY signal is low.

The following figure shows the relationship between a SPI burst and the SPI_RDY signal. The SPI burst does not begin until the SPI_RDY signal goes low. The ECSPI will keep transmitting SPI burst if the SPI_RDY signal remains low.

Figure 22-6. Relationship Between a SPI Burst and SPI_RDY: Low-Level Triggered

22.4.4.1.2 Master Mode with Wait States

Wait states can be inserted between SPI bursts. This provides a way for software to slow down the SPI burst to meet the timing requirements of a slower SPI device.

The following figure shows wait states inserted between SPI bursts.

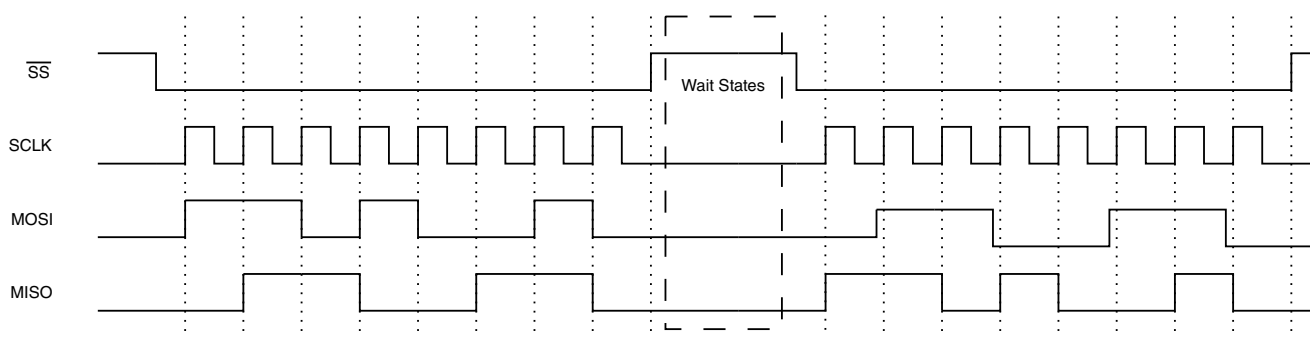

Figure 22-7. SPI Bursts with Wait States

In this case, the number of wait states is controlled by `ECSPI_PERIODREG[SAMPLE PERIOD]` and the wait states' clock source is selected by `ECSPI_PERIODREG[CSRC]`.

22.4.4.1.3 Master Mode with SS_CTL[3:0] Control

The SPI SS Control (`SS_CTL[3:0]`) controls whether the current operation is single burst or multiple bursts.

When the SPI SS Wave Form Select (SS_CTL[3:0]) is set, the current operation is multiple bursts transfer. When the SPI SS Wave Form Select (SS_CTL[3:0]) bit is cleared, the current operation is single burst transfer. A SPI burst can contains multiple words as defined in the BURST LENGTH field of the ECSPI_CONREG register.

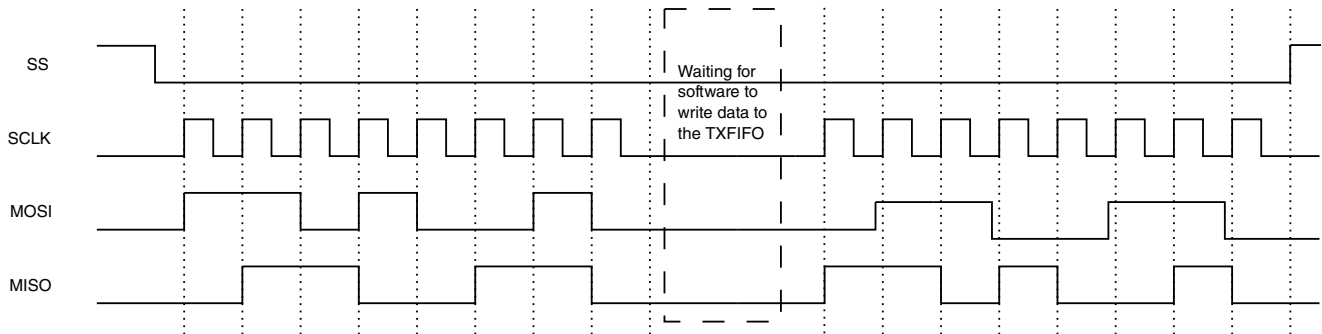

Figure 22-8. SPI Burst While SS_CTL[3:0] is Clear

In [Figure 22-8](#), two 8-bit bursts in the TXFIFO have been combined and transmitted in one SPI burst. The maximum length of a single SPI burst is defined in the BURST LENGTH field of the ECSPI_CONREG control register. ([Figure 22-8](#) corresponds to a BURST LENGTH of 8.) This provides a way for transferring a longer SPI burst by writing data into TXFIFO while the ECSPI is transmitting.

Figure 22-9. SPI Bursts While SS_CTL[3:0] is Set

In [Figure 22-9](#), two FIFO entries are transmitted, one entry with each SPI burst. The ECSPI will continue to transmit SPI bursts until the TXFIFO is empty. When wait states can be inserted between SPI bursts, the SS will negate between SPI bursts until the wait states finish.

22.4.4.1.4 Master Mode with Phase Control

The Phase Control (ECSPI_CONREG[PHA]) bit controls how the transmit data shifts out and the receive data shifts in.

When the Phase control (ECSPI_CONREG[PHA]) bit is set, the transmit data will shift out on the rising edge of SCLK, and the receive data is latched on the falling edge of SCLK. The most-significant bit is output on the first rising SCLK edge.

When ECSPI_CONREG[PHA] is cleared, the transmit data is shifted out on the falling edge of SCLK and the receive data is latched on the rising edge of SCLK. The MSB is output when the host processor loads the transmitted data.

Inverting the SCLK polarity does not impact the edge-triggered operations because they are internal to the serial peripheral interface master. [Figure 22-10](#) shows how SPI burst works with different POL and PHA configuration.

Figure 22-10. SPI Burst with Different POL and PHA Configurations

22.4.4.2 Typical Slave Mode

When the ECSPI is configured as a slave (Mode = 0), software can configure the ECSPI Control register to match the external SPI master's timing. In this configuration, SS becomes an input signal, and is used to latch data in and out of the internal data Shift registers, as well as to advance the data FIFO.

Functional Description

The SS, SCLK, and MOSI are inputs and MISO is output. Most of the timing diagrams are similar to the diagrams shown previously for the SPI in Master mode (Mode = 1), because the inputs come from a SPI master device.

However, the timing is different when SS is used to advance the data FIFO. When the SS_CTL[3:0] is set while the ECSPI is configured in Slave mode, the data FIFO will advance on the rising edge of the SS signal. When the polarity is reversed (SSPOL = 1), the data FIFO will advance on the falling edge of the SS signal.

The figure below shows a SPI burst in which the data FIFO is advanced by the rising edge of the SS signal.

Figure 22-11. Advancing the Data FIFO on the Rising Edge of \overline{SS}

In the above case, only the most significant 7 bits are loaded to the RXFIFO.

22.4.5 Reset

Whenever a device reset occurs, a reset is performed on the ECSPI, resetting all registers to their default values.

Software can reset the block using the CONREG[EN] bit; see [ECSPI](#).

22.4.6 Interrupts

Interrupt control provides a way to manage the ECSPI FIFOs:

- For transmitting data, software can enable the TXFIFO empty, TXFIFO data request, and TXFIFO full interrupts to maintain the TXFIFO using an interrupt service routine.
- For receiving data, software can enable the RXFIFO ready, RXFIFO data request, and RXFIFO full interrupts to retrieve data from the RXFIFO using an interrupt service routine.

Other interrupt sources can be used to control or debug the SPI bursts:

- The transfer-completed interrupt means that there is no data left in the TXFIFO and that the data in the Shift register has been shifted out.
- The RXFIFO overflow interrupt means that the RXFIFO received more than 64 words and will not accept any other words.

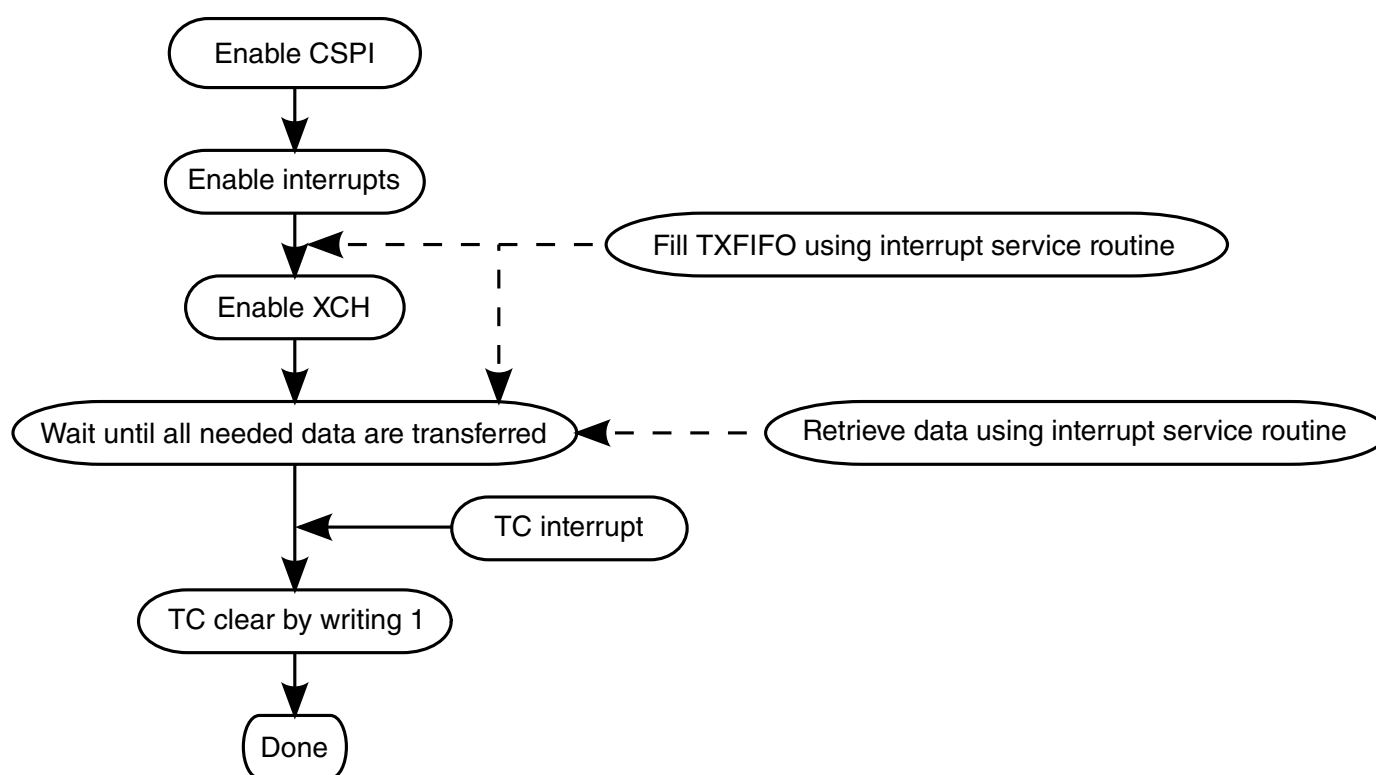

Figure 22-12. Program Sequence of SPI Burst Using Interrupt Control

22.4.7 DMA

DMA control provides another method to utilize the FIFOs in the ECSPI. By using DMA request and acknowledge signals, larger amounts of data can be transferred, and will reduce interrupts and host processor loading. When the appropriate conditions are matched, the block will send out a DMA request.

The DMA can deal with the following conditions:

- TXFIFO empty
- TXFIFO data request
- RXFIFO data request
- RXFIFO full

The figure below shows a program sequence of SPI bursts using DMA control.

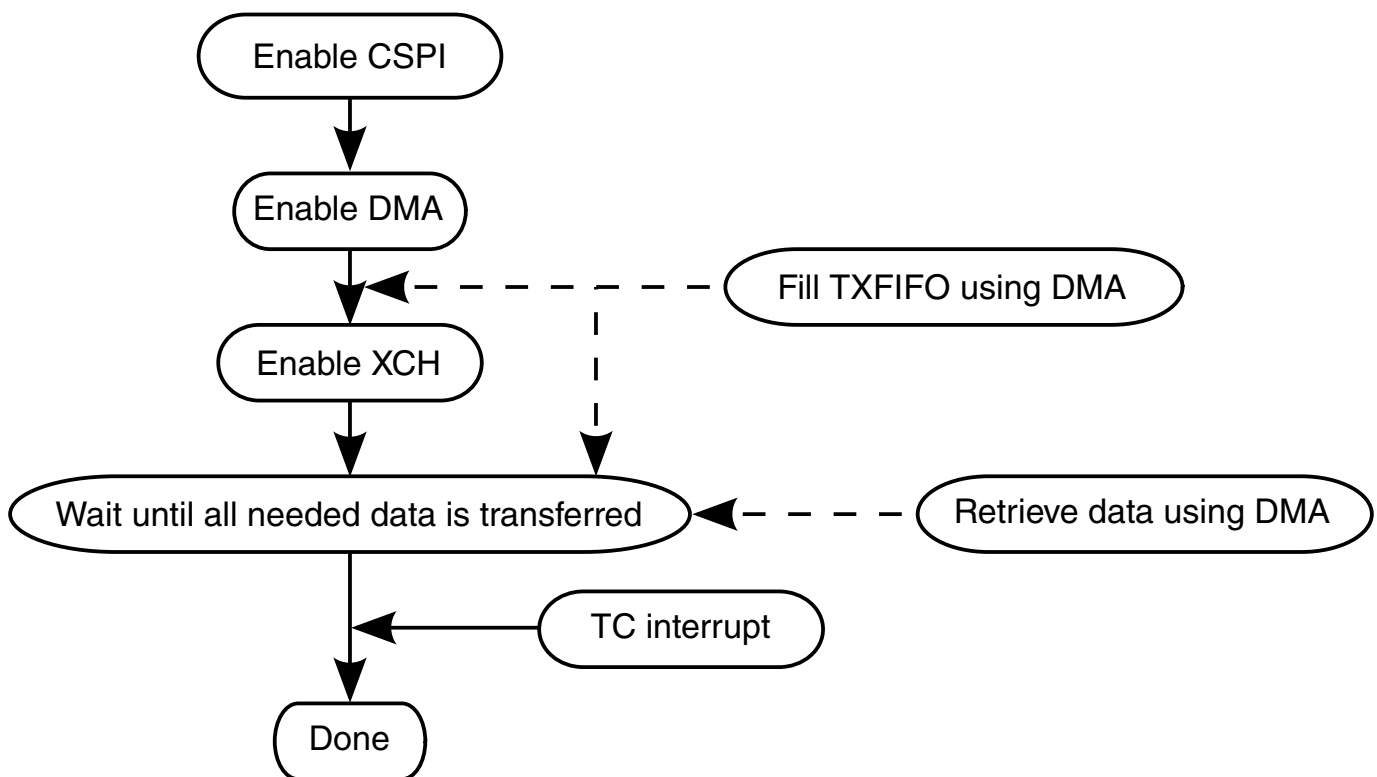

Figure 22-13. Program Sequence of SPI Burst Using DMA

22.4.8 Byte Order

The ECSPI does not support byte re-ordering in hardware.

22.5 Initialization

This section provides initialization information for ECSPI.

To initialize the block:

1. Clear the EN bit in ECSPI_CONREG to reset the block.
2. Enable the clocks for ECSPI.
3. Set the EN bit in ECSPI_CONREG to put ECSPI out of reset.
4. Configure corresponding IOMUX for ECSPI external signals.
5. Configure registers of ECSPI properly according to the specifications of the external SPI device.

22.6 Applications

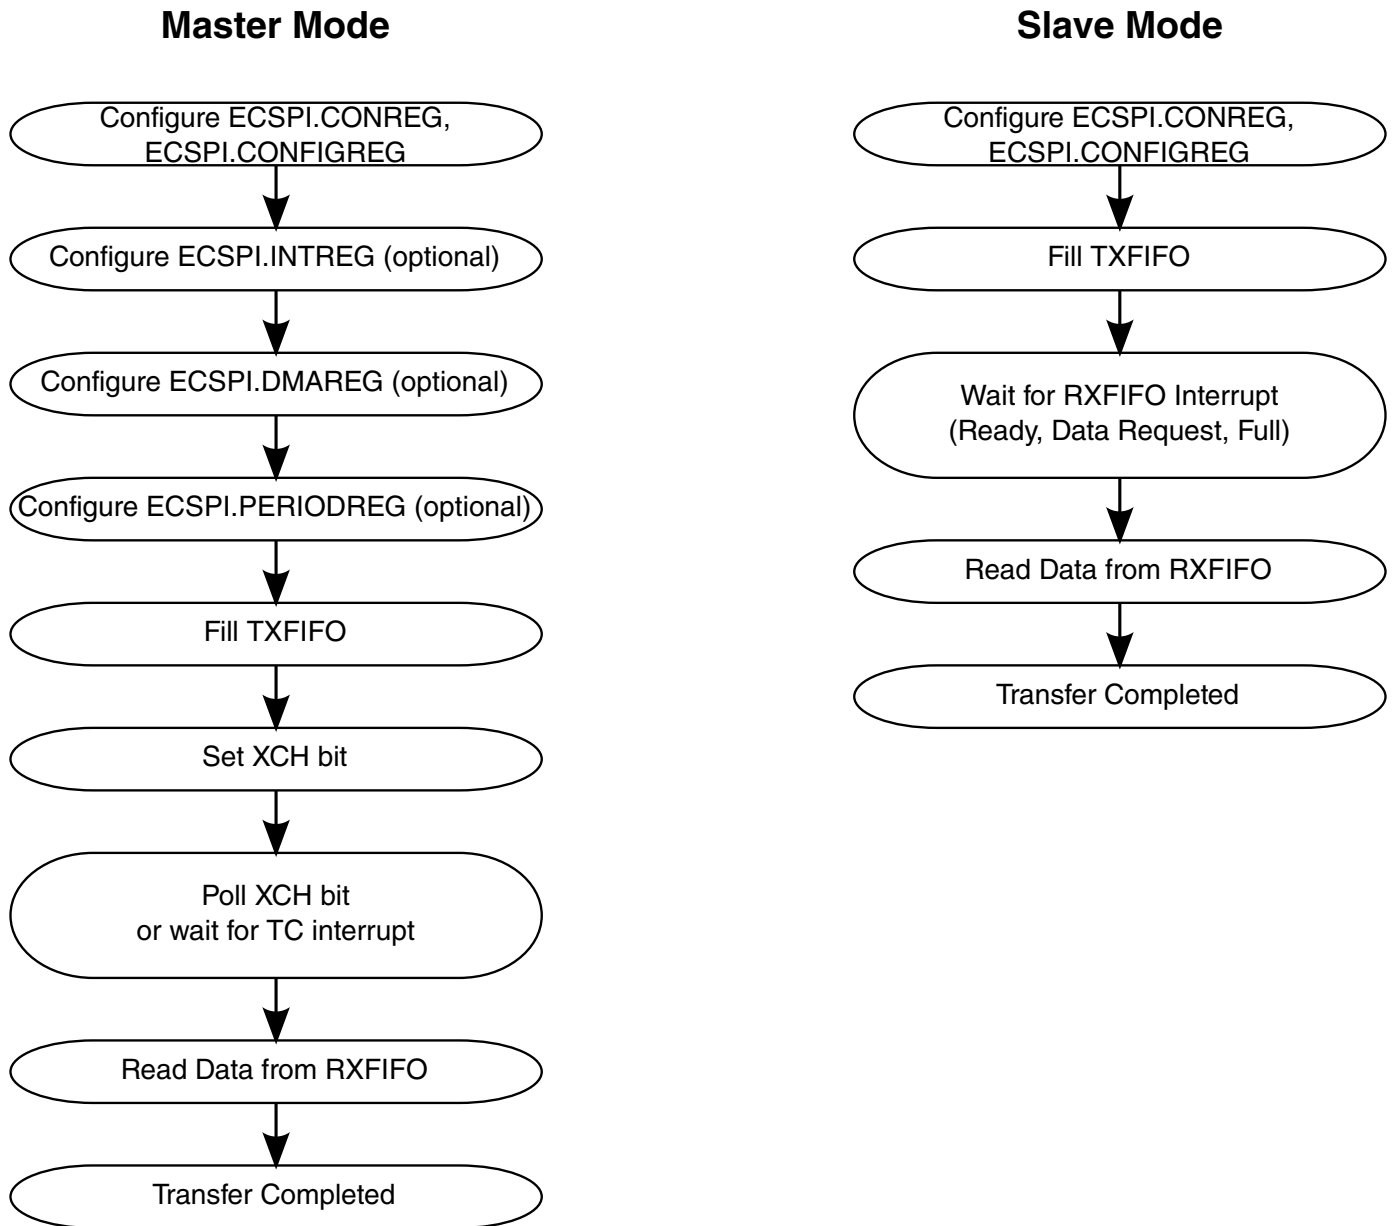

Figure 22-14. Flowchart of the ECSPI Operation

22.7 ECSPI Memory Map/Register Definition

This section includes the block memory map and detailed descriptions of all registers. For the base address of a particular block instantiation, see the system memory map.

ECSPI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
200_8000	Receive Data Register (ECSPI1_RXDATA)	32	R	0000_0000h	22.7.1/932

22.7.1 Receive Data Register (ECSPiX_RXDATA)

The Receive Data register (ECSPI_RXDATA) is a read-only register that forms the top word of the 64 x 32 receive FIFO. This register holds the data received from an external SPI device during a data transaction. Only word-sized read operations are allowed.

Address: Base address + 0h offset

ECSPiX_RXDATA field descriptions

Field	Description
ECSPI_RXDATA	Receive Data. This register holds the top word of the receive data FIFO. The FIFO is advanced for each read of this register. The data read is undefined when the Receive Data Ready (RR) bit in the Interrupt Control/Status register is cleared. Zeros are read when ECSPI is disabled.

22.7.2 Transmit Data Register (ECSPIx_TXDATA)

The Transmit Data (ECSPI_TXDATA) register is a write-only data register that forms the bottom word of the 64 x 32 TXFIFO. The TXFIFO can be written to as long as it is not full, even when the SPI Exchange bit (XCH) in ECSPI_CONREG is set. This allows software to write to the TXFIFO during a SPI data exchange process. Writes to this register are ignored when the ECSPI is disabled (ECSPI_CONREG[EN] bit is cleared).

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPIx_TXDATA field descriptions

Field	Description
ECSPI_TXDATA	Transmit Data. This register holds the top word of data loaded into the FIFO. Data written to this register must be a word operation. The number of bits actually transmitted is determined by the BIT_COUNT field of the corresponding SPI Control register. If this field contains more bits than the number specified by BIT_COUNT, the extra bits are ignored. For example, to transfer 10 bits of data, a 32-bit word must be written to this register. Bits 9-0 are shifted out and bits 31-10 are ignored. When the ECSPI is operating in Slave mode, zeros are shifted out when the FIFO is empty. Zeros are read when ECSPI is disabled.

22.7.3 Control Register (ECSPIx_CONREG)

The Control Register (ECSPI_CONREG) allows software to enable the ECSPI, configure its operating modes, specify the divider value, and SPI_RDY control signal, and define the transfer length.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ECSPiX_CONREG field descriptions

Field	Description
31–20 BURST_LENGTH	<p>Burst Length. This field defines the length of a SPI burst to be transferred. The Chip Select (SS) will remain asserted until all bits in a SPI burst are shifted out. A maximum of 2¹² bits can be transferred in a single SPI burst.</p> <p>In master mode, it controls the number of bits per SPI burst. Since the shift register always loads 32-bit data from transmit FIFO, only the n least-significant (n = BURST LENGTH + 1) will be shifted out. The remaining bits will be ignored.</p> <p>In slave mode, only when SS_CTL is cleared, this field will take effect in the transfer.</p> <p>Number of Valid Bits in a SPI burst.</p> <p>0x000 A SPI burst contains the 1 LSB in a word. 0x001 A SPI burst contains the 2 LSB in a word. 0x002 A SPI burst contains the 3 LSB in a word. ... 0x01F A SPI burst contains all 32 bits in a word. 0x020 A SPI burst contains the 1 LSB in first word and all 32 bits in second word. 0x021 A SPI burst contains the 2 LSB in first word and all 32 bits in second word. ... 0xFFE A SPI burst contains the 31 LSB in first word and 2⁷ -1 words. 0xFFF A SPI burst contains 2⁷ words.</p>
19–18 CHANNEL_SELECT	<p>SPI CHANNEL SELECT bits. Select one of four external SPI Master/Slave Devices. In master mode, these two bits select the external slave devices by asserting the Chip Select (SSn) outputs. Only the selected Chip Select (SSn) signal can be active at a given time; the remaining three signals will be negated.</p> <p>00 Channel 0 is selected. Chip Select 0 (SS0) will be asserted. 01 Channel 1 is selected. Chip Select 1 (SS1) will be asserted. 10 Channel 2 is selected. Chip Select 2 (SS2) will be asserted. 11 Channel 3 is selected. Chip Select 3 (SS3) will be asserted.</p>
17–16 DRCTL	<p>SPI Data Ready Control. This field selects the utilization of the $\overline{\text{SPI_RDY}}$ signal in master mode. ECSPI checks this field before it starts an SPI burst.</p> <p>00 The $\overline{\text{SPI_RDY}}$ signal is a don't care. 01 Burst will be triggered by the falling edge of the SPI_RDY signal (edge-triggered). 10 Burst will be triggered by a low level of the SPI_RDY signal (level-triggered). 11 Reserved.</p>
15–12 PRE_DIVIDER	<p>SPI Pre Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the pre-divider of the reference clock.</p> <p>0000 Divide by 1. 0001 Divide by 2. 0010 Divide by 3. ... 1101 Divide by 14. 1110 Divide by 15. 1111 Divide by 16.</p>
11–8 POST_DIVIDER	<p>SPI Post Divider. ECSPI uses a two-stage divider to generate the SPI clock. This field defines the post-divider of the reference clock using the equation: 2ⁿ.</p> <p>0000 Divide by 1.</p>

Table continues on the next page...

ECSPiX_CONREG field descriptions (continued)

Field	Description
	0001 Divide by 2. 0010 Divide by 4. ... 1110 Divide by 2^{14} . 1111 Divide by 2^{15} .
7-4 CHANNEL_ MODE	SPI CHANNEL MODE selects the mode for each SPI channel. CHANNEL MODE[3] is for SPI channel 3. CHANNEL MODE[2] is for SPI channel 2. CHANNEL MODE[1] is for SPI channel 1. CHANNEL MODE[0] is for SPI channel 0. 0 Slave mode. 1 Master mode.
3 SMC	Start Mode Control. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). It controls how the ECSPI starts a SPI burst, either through the SPI exchange bit, or immediately when the TXFIFO is written to. 0 SPI Exchange Bit (XCH) controls when a SPI burst can start. Setting the XCH bit will start a SPI burst or multiple bursts. This is controlled by the SPI SS Wave Form Select (SS_CTL). Refer to XCH and SS_CTL descriptions. 1 Immediately starts a SPI burst when data is written in TXFIFO.
2 XCH	SPI Exchange Bit. This bit applies only to channels configured in Master mode (CHANNEL MODE = 1). If the Start Mode Control (SMC) bit is cleared, writing a 1 to this bit starts one SPI burst or multiple SPI bursts according to the SPI SS Wave Form Select (SS_CTL). The XCH bit remains set while either the data exchange is in progress, or when the ECSPI is waiting for an active input if SPIRDY is enabled through DRCTL. This bit is cleared automatically when all data in the TXFIFO and the shift register has been shifted out. 0 Idle. 1 Initiates exchange (write) or busy (read).
1 HT	Hardware Trigger Enable. This bit is used in master mode only. It enables hardware trigger (HT) mode. Note, HT mode is not supported by this product. 0 Disable HT mode. 1 Enable HT mode.
0 EN	SPI Block Enable Control. This bit enables the ECSPI. This bit must be set before writing to other registers or initiating an exchange. Writing zero to this bit disables the block and resets the internal logic with the exception of the ECSPiX_CONREG. The block's internal clocks are gated off whenever the block is disabled. 0 Disable the block. 1 Enable the block.

22.7.4 Config Register (ECSPiX_CONFIGREG)

The Config Register (ECSPI_CONFIGREG) allows software to configure each SPI channel, configure its operating modes, specify the phase and polarity of the clock, configure the Chip Select (SS), and define the HT transfer length. Note, HT mode is not supported by this product.

Address: Base address + Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ECSPiX_CONFIGREG field descriptions

Field	Description
31–29 -	This field is reserved. Reserved
28–24 HT_LENGTH	HT LENGTH. This field defines the message length in HT Mode. Note, HT mode is not supported by this product. The length in bits of one message is (HT LENGTH + 1).
23–20 SCLK_CTL	SCLK CTL. This field controls the inactive state of SCLK for each SPI channel. SCLK CTL[3] is for SPI channel 3. SCLK CTL[2] is for SPI channel 2. SCLK CTL[1] is for SPI channel 1. SCLK CTL[0] is for SPI channel 0. 0 Stay low. 1 Stay high.
19–16 DATA_CTL	DATA CTL. This field controls inactive state of the data line for each SPI channel. DATA CTL[3] is for SPI channel 3. DATA CTL[2] is for SPI channel 2. DATA CTL[1] is for SPI channel 1. DATA CTL[0] is for SPI channel 0. 0 Stay high. 1 Stay low.
15–12 SS_POL	SPI SS Polarity Select. In both Master and Slave modes, this field selects the polarity of the Chip Select (SS) signal. SS POL[3] is for SPI channel 3. SS POL[2] is for SPI channel 2. SS POL[1] is for SPI channel 1. SS POL[0] is for SPI channel 0.

Table continues on the next page...

ECSPIx_CONFIGREG field descriptions (continued)

Field	Description
	0 Active low. 1 Active high.
11–8 SS_CTL	<p>SPI SS Wave Form Select. In master mode, this field controls the output wave form of the Chip Select (SS) signal when the SMC (Start Mode Control) bit is cleared. The SS_CTL are ignored if the SMC bit is set.</p> <p>SS CTL[3] is for SPI channel 3. SS CTL[2] is for SPI channel 2. SS CTL[1] is for SPI channel 1. SS CTL[0] is for SPI channel 0.</p> <p>In slave mode, this bit controls when the SPI burst is completed.</p> <p>An SPI burst is completed by the Chip Select (SS) signal edges. (SSPOL = 0: rising edge; SSPOL = 1: falling edge) The RXFIFO is advanced whenever a Chip Select (SS) signal edge is detected or the shift register contains 32-bits of valid data.</p> <p>0 In master mode - only one SPI burst will be transmitted. 1 In master mode - Negate Chip Select (SS) signal between SPI bursts. Multiple SPI bursts will be transmitted. The SPI transfer will automatically stop when the TXFIFO is empty.</p> <p>0 In slave mode - an SPI burst is completed when the number of bits received in the shift register is equal to (BURST LENGTH + 1). Only the n least-significant bits (n = BURST LENGTH[4:0] + 1) of the first received word are valid. All bits subsequent to the first received word in RXFIFO are valid.</p> <p>1 Reserved</p>
7–4 SCLK_POL	<p>SPI Clock Polarity Control. This field controls the polarity of the SCLK signal. See Figure 22-10 for more information.</p> <p>SCLK_POL[3] is for SPI channel 3. SCLK_POL[2] is for SPI channel 2. SCLK_POL[1] is for SPI channel 1. SCLK_POL[0] is for SPI channel 0.</p> <p>0 Active high polarity (0 = Idle). 1 Active low polarity (1 = Idle).</p>
SCLK_PHA	<p>SPI Clock/Data Phase Control. This field controls the clock/data phase relationship. See Figure 22-10 for more information.</p> <p>SCLK PHA[3] is for SPI channel 3. SCLK PHA[2] is for SPI channel 2. SCLK PHA[1] is for SPI channel 1. SCLK PHA[0] is for SPI channel 0.</p> <p>0 Phase 0 operation. 1 Phase 1 operation.</p>

22.7.5 Interrupt Control Register (ECSPIx_INTREG)

The Interrupt Control Register (ECSPI_INTREG) enables the generation of interrupts to the host processor. If the ECSPI is disabled, this register reads zero.

Address: Base address + 10h offset

7 TCEN	Transfer Completed Interrupt enable. This bit enables the Transfer Completed Interrupt. 0 Disable 1 Enable
6 ROEN	RXFIFO Overflow Interrupt enable. This bit enables the RXFIFO Overflow Interrupt. 0 Disable 1 Enable
5 RFEN	RXFIFO Full Interrupt enable. This bit enables the RXFIFO Full Interrupt. 0 Disable 1 Enable
4 RDREN	RXFIFO Data Request Interrupt enable. This bit enables the RXFIFO Data Request Interrupt when the number of data entries in the RXFIFO is greater than RX_THRESHOLD. 0 Disable 1 Enable
3 RREN	RXFIFO Ready Interrupt enable. This bit enables the RXFIFO Ready Interrupt. 0 Disable 1 Enable

Table continues on the next page...

ECSPIx_INTREG field descriptions (continued)

Field	Description
2 TFEN	TXFIFO Full Interrupt enable. This bit enables the TXFIFO Full Interrupt. 0 Disable 1 Enable
1 TDREN	TXFIFO Data Request Interrupt enable. This bit enables the TXFIFO Data Request Interrupt when the number of data entries in the TXFIFO is less than or equal to TX_THRESHOLD. 0 Disable 1 Enable
0 TEEN	TXFIFO Empty Interrupt enable. This bit enables the TXFIFO Empty Interrupt. 0 Disable 1 Enable

22.7.6 DMA Control Register (ECSPIx_DMAREG)

The Direct Memory Access Control Register (ECSPI_DMAREG) provides software a way to use an on-chip DMA controller for ECSPI data. Internal DMA request signals enable direct data transfers between the ECSPI FIFOs and system memory. The ECSPI sends out DMA requests when the appropriate FIFO conditions are matched.

If the ECSPI is disabled, this register is read as 0.

Address: Base address + 14h offset

ECSPiX_DMAREG field descriptions

Field	Description
31 RXTDEN	RXFIFO TAIL DMA Request Enable. This bit enables an internal counter that is increased at each read of the RXFIFO. This counter is cleared automatically when it reaches RX DMA LENGTH. If the number of words remaining in the RXFIFO is greater than or equal to RX DMA LENGTH, a DMA request is generated even if it is less than or equal to RX_THRESHOLD. 0 Disable 1 Enable
30 -	This field is reserved. Reserved
29-24 RX_DMA_LENGTH	RX DMA LENGTH. This field defines the burst length of a DMA operation. Applies only when RXTDEN is set.
23 RXDEN	RXFIFO DMA Request Enable. This bit enables/disables the RXFIFO DMA Request. 0 Disable 1 Enable
22 -	This field is reserved. Reserved
21-16 RX_THRESHOLD	RX THRESHOLD. This field defines the FIFO threshold that triggers a RX DMA/INT request. A RX DMA/INT request is issued when the number of data entries in the RXFIFO is greater than RX_THRESHOLD.
15-8 -	This field is reserved. Reserved
7 TEDEN	TXFIFO Empty DMA Request Enable. This bit enables/disables the TXFIFO Empty DMA Request. 0 Disable 1 Enable
6 -	This field is reserved. Reserved
TX_THRESHOLD	TX THRESHOLD. This field defines the FIFO threshold that triggers a TX DMA/INT request. A TX DMA/INT request is issued when the number of data entries in the TXFIFO is greater than TX_THRESHOLD.

22.7.7 Status Register (ECSPiX_STATREG)

The ECSPI Status Register (ECSPiX_STATREG) reflects the status of the ECSPI's operating condition. If the ECSPI is disabled, this register reads 0x0000_0003.

Address: Base address + 18h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

ECSPiX_STATREG field descriptions

Field	Description
31–8 -	This field is reserved. Reserved
7 TC	Transfer Completed Status bit. Writing 1 to this bit clears it. 0 Transfer in progress. 1 Transfer completed.
6 RO	RXFIFO Overflow. When set, this bit indicates that RXFIFO has overflowed. Writing 1 to this bit clears it. 0 RXFIFO has no overflow. 1 RXFIFO has overflowed.
5 RF	RXFIFO Full. This bit is set when the RXFIFO is full. 0 Not Full. 1 Full.
4 RDR	RXFIFO Data Request. 0 When RXTDE is set - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is set - Number of data entries in the RXFIFO is greater than RX_THRESHOLD or a DMA TAIL DMA condition exists. 0 When RXTDE is clear - Number of data entries in the RXFIFO is not greater than RX_THRESHOLD. 1 When RXTDE is clear - Number of data entries in the RXFIFO is greater than RX_THRESHOLD.
3 RR	RXFIFO Ready. This bit is set when one or more words are stored in the RXFIFO. 0 No valid data in RXFIFO. 1 More than 1 word in RXFIFO.
2 TF	TXFIFO Full. This bit is set when if the TXFIFO is full.

Table continues on the next page...

ECSPIx_STATREG field descriptions (continued)

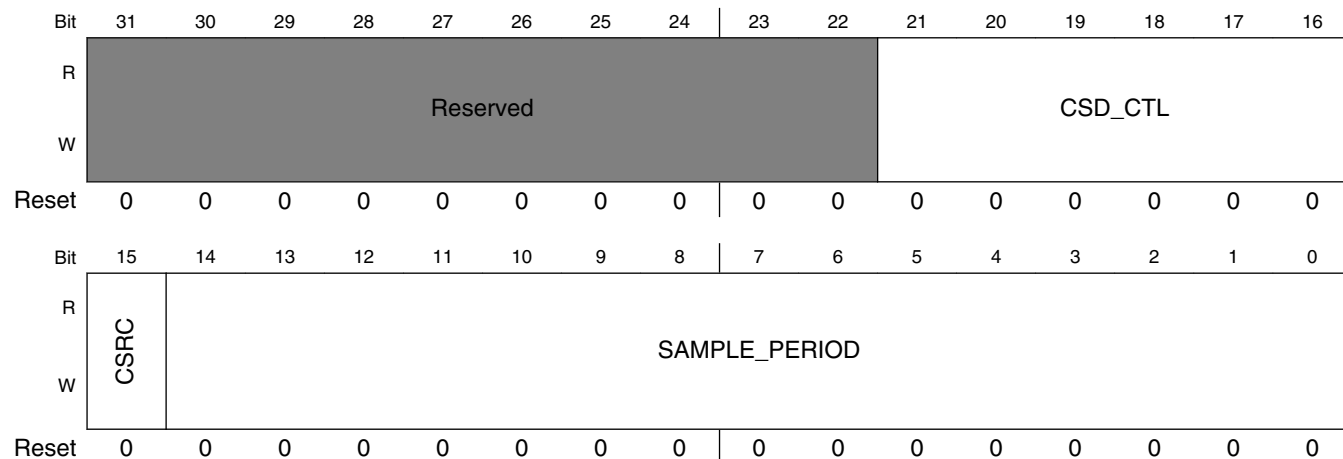

Field	Description
	0 TXFIFO is not Full. 1 TXFIFO is Full.
1 TDR	TXFIFO Data Request. 0 Number of empty slots in TXFIFO is greater than TX_THRESHOLD. 1 Number of empty slots in TXFIFO is not greater than TX_THRESHOLD.
0 TE	TXFIFO Empty. This bit is set if the TXFIFO is empty. 0 TXFIFO contains one or more words. 1 TXFIFO is empty.

22.7.8 Sample Period Control Register (ECSPIx_PERIODREG)

The Sample Period Control Register (ECSPI_PERIODREG) provides software a way to insert delays (wait states) between consecutive SPI transfers. Control bits in this register select the clock source for the sample period counter and the delay count indicating the number of wait states to be inserted between data transfers.

The delay counts apply only when the current channel is operating in Master mode (ECSPI_CONREG[CHANNEL MODE] = 1).ECSPI_PERIODREG also contains the CSD CTRL field used to insert a delay between the Chip Select's active edge and the first SPI Clock edge.

Address: Base address + 1Ch offset

ECSPIx_PERIODREG field descriptions

Field	Description
31-22 -	This field is reserved. Reserved

Table continues on the next page...

ECSPiX_PERIODREG field descriptions (continued)

Field	Description
21–16 CSD_CTL	Chip Select Delay Control bits. This field defines how many SPI clocks will be inserted between the chip select's active edge and the first SPI clock edge. The range is from 0 to 63.
15 CSRC	Clock Source Control. This bit selects the clock source for the sample period counter. 0 SPI Clock (SCLK) 1 Low-Frequency Reference Clock (32.768 KHz)
SAMPLE_PERIOD	Sample Period Control. These bits control the number of wait states to be inserted in data transfers. During the idle clocks, the state of the SS output will operate according to the SS_CTL control field in the ECSPiX_CONREG register. 0x0000 0 wait states inserted 0x0001 1 wait state inserted 0x7FFE 32766 wait states inserted 0x7FFF 32767 wait states inserted

22.7.9 Test Control Register (ECSPiX_TESTREG)

The Test Control Register (ECSPiX_TESTREG) provides software a mechanism to internally connect the receive and transmit devices of the ECSPiX, and monitor the contents of the receive and transmit FIFOs.

Address: Base address + 20h offset

ECSPiX_TESTREG field descriptions

Field	Description
31 LBC	Loop Back Control. This bit is used in Master mode only. When this bit is set, the ECSPI connects the transmitter and receiver sections internally, and the data shifted out from the most-significant bit of the shift register is looped back into the least-significant bit of the Shift register. In this way, a self-test of the complete transmit/receive path can be made. The output pins are not affected, and the input pins are ignored. 0 Not connected. 1 Transmitter and receiver sections internally connected for Loopback.
30–28 -	This field is reserved. Reserved, all bits should be ignored.
27–15 -	This field is reserved. Reserved
14–8 RXCNT	RXFIFO Counter. This field indicates the number of words in the RXFIFO.
7 -	This field is reserved. Reserved
TXCNT	TXFIFO Counter. This field indicates the number of words in the TXFIFO.

22.7.10 Message Data Register (ECSPiX_MSGDATA)

The Message Data Register (ECSPI_MSGDATA) forms the top word of the 16 x 32 MSG Data FIFO. Only word-size accesses are allowed for this register. Reads to this register return zero, and writes to this register store data in the MSG Data FIFO.

Address: Base address + 40h offset

ECSPiX_MSGDATA field descriptions

Field	Description
ECSPI_MSGDATA	ECSPI_MSGDATA holds the top word of MSG Data FIFO. The MSG Data FIFO is advanced for each write of this register. The data read is zero. The data written to this register is stored in the MSG Data FIFO.

Chapter 23

External Interface Module (EIM)

23.1 Overview

The EIM handles the interface to devices external to the chip, including generation of chip selects, clock and control for external peripherals and memory. It provides asynchronous access to devices with SRAM-like interface and synchronous access to devices with NOR-Flash-like or PSRAM-like interface.

Overview

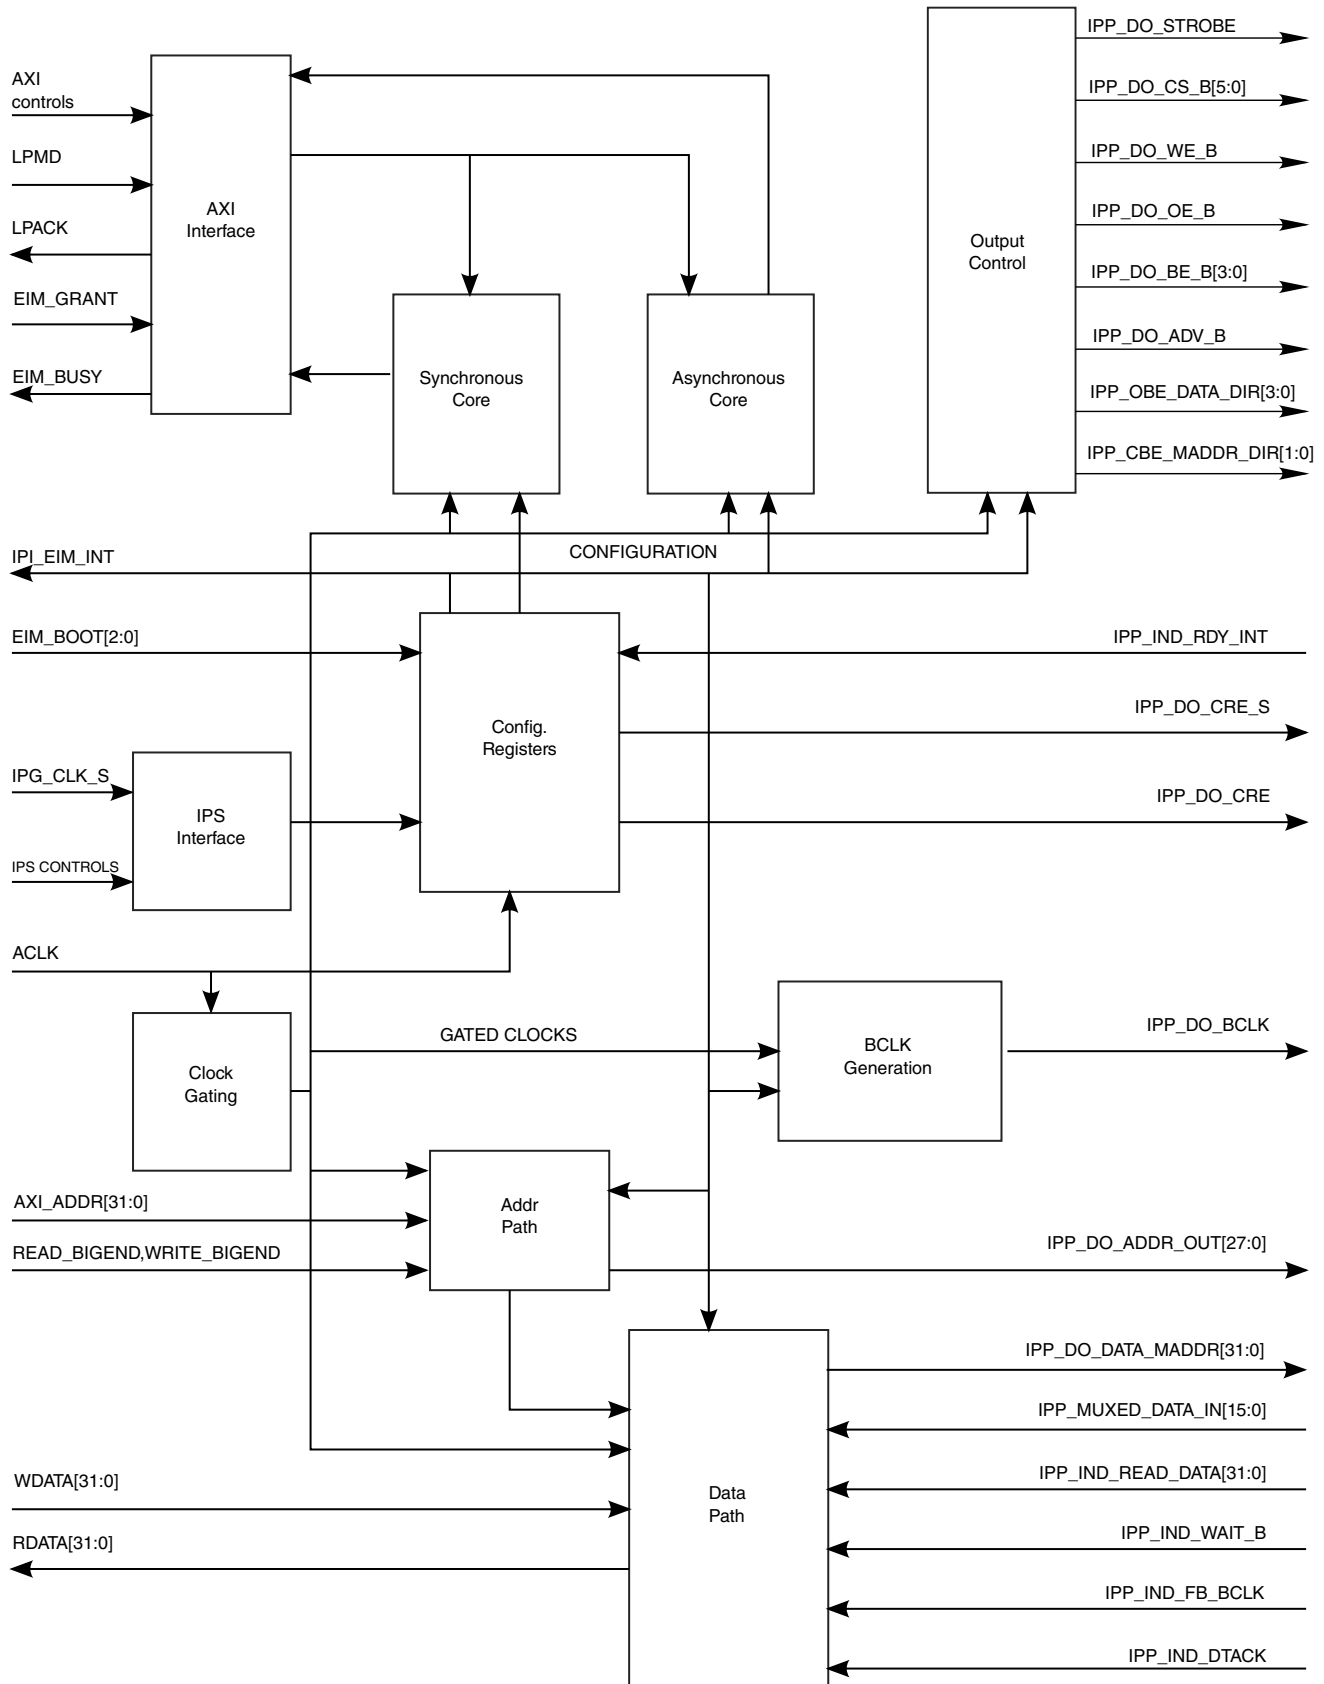

Figure 23-1. EIM Diagram

23.1.1 Features

- Six chip selects for external devices
 - Flexible address decoding. Each chip select memory space determined separately, according to VIA port configuration (see [Chip Select Memory Map](#)). Configurable Chip Select 0 base address (by VIA)
 - Individual select signal for each one of the memory space defined. Up to 6 memory spaces may be defined and programmed individually.
 - 26-bit external address bus, max memory size can be 128 MByte (1 Gigabit).
- Selectable Write Protection for each Chip Select
- Support for multiplexed address / data bus operation x16 and x32 port size
- Programmable Data Port Size for each Chip Select (x8, x16 and x32)
- Programmable Wait-State generator for each Chip Select, for write and read accesses separately
- Asynchronous accesses with programmable setup and hold times for control signals
- Support for Asynchronous page mode accesses (x16 and x32 port size)
- Support continuous Burst Clock which can be used as reference clock for FPGA
- Independent synchronous Memory Burst Read Mode support for NOR-Flash and PSRAM memories (x16 and x32 port size)
- Independent synchronous Memory Burst Write Mode support for PSRAM and NOR-Flash like memories (CellularRAM™ from Micron, Infineon, and Cypress, OneNAND™ and utRAM™ from Samsung, and COSMORAM™ from Toshiba)
- Support of NAND-Flash devices with NOR-Flash like interface - MDOC™ (M-Systems), OneNAND™ (Samsung)
- Independent programmable variable/fix Latency support for read and write synchronous (burst) mode
- Support for Big Endian and Little Endian operation modes per access
- ARM AXI slave interface. One ID at a time support.
- External Interrupt support, RDY_INT signal function as external interrupt
- Boot from external device support according to boot signals, using RDY_INT signal
 - RDY signal support assertion after reset for MDOC™ (M-Systems) device
 - INT signal support assertion after reset for OneNAND™ (Samsung) device

23.1.2 Modes of Operation

The EIM has the following modes of operation:

- Asynchronous Mode
- Asynchronous Page Mode
- Multiplexed Address/Data mode

Overview

- Burst Clock Mode
- Low Power Modes
- Boot Mode

See details in the [EIM Operational Modes](#).

23.1.2.1 Asynchronous Mode

This is a non-burst mode that is used for SRAM access. In this mode, a single data is read/written with each access (asserted address).

All controls' timings are controlled by preset values in Chip Select Configuration Registers.

23.1.2.2 Asynchronous Page Read Mode

Setting the APR bit causes the EIM to perform memory burst accesses by emulating page mode operation.

The external address asserts for each piece of data. The initial access timing is according to RWSC field, and the next address assertions timing is according to PAT field. When APR bit is set, RCSN OEN, RADVN and RBEN fields are ignored for burst access to the external device.

The page size can be set via the BL field to 2, 4, 8, 16, or 32 words (the word size is determined by the DSZ field).

23.1.2.3 Multiplexed Address/Data Mode

In this mode, multiplexing addresses and data bits on the same pins is supported for synchronous/asynchronous accesses to x8/x16/ x32 data width memory devices.

For more information about the pins that drive data/address in 8/16/32 non-muxed mode and 16/32 muxed mode, see the following table.

Table 23-1. EIM multiplexing

Setup	Non Multiplexed Address/Data Mode							Multiplexed Address/ Data mode	
	8 Bit				16 Bit		32 Bit	16 Bit	32 Bit
	MUM = 0, DSZ = 100	MUM = 0, DSZ = 101	MUM = 0, DSZ = 110	MUM = 0, DSZ = 111	MUM = 0, DSZ = 001	MUM = 0, DSZ = 010	MUM = 0, DSZ = 011	MUM = 1, DSZ = 001	MUM = 1, DSZ = 011

D[23:16], EIM_EB2	-	-	EIM_D[23:16]	-	-	EIM_D[23:16]	EIM_D[23:16]	-	EIM_D[7:0]
D[31:24], EIM_EB3	-	-	-	EIM_D[31:24]	-	EIM_D[31:24]	EIM_D[31:24]	-	EIM_D[15:8]

23.1.2.4 Burst Clock Mode

The controller has the ability to support burst synchronous operations in various frequencies, depending on the frequency of the input clock supplied by the system (EIM clock).

The EIM clock can be divided by one, two, three or four, and its frequency can be changed according to the requirements. Variable and fix latency are supported for this mode, according to the external device requirements.

- Synchronous read mode. This is a burst mode, which is used for reading from Flash/PSRAM memory devices. In this mode, after address assertion a burst of sequential data can be read. Data exchange is carried out according to BCLK being generated by EIM. An access is delayed according to external WAIT_B signal assertion (signal from the memory device).
- Synchronous write mode. A burst mode used for accessing external devices, which support synchronous write type of access (PSRAM protocol). In this mode, after address assertion a burst of sequential data can be written to the external device. Access may be delayed according to WAIT_B signal assertion (signal from the memory device) before first piece of data arrived to the external device.

NOTE

Maximum frequency of the EIM main clock is 133Mhz. It may be reduced by the system for special cases of external devices,

which demand a different frequency than integer division of the 133MHz clock.

23.1.2.5 Low Power Modes

The input clock is gated by ACT_CS bits. When all the ACT_CS are negated (all CS disabled) the internal clock is turned off; awready/wready & arready signal are de-asserted and the master can't access the EIM.

23.1.2.6 Boot Mode

It is possible to perform a boot operation from external device located on CS0. The configuration of the relevant bits are done with boot mode signals according to the external device parameters (for example, port size and protocol assertion).

See [System Boot](#) for more details.

23.2 External Signals

The following table describes the external signals of EIM:

Table 23-2. EIM External Signals

Signal	Description	Pad	Mode	Direction

	behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.			
EIM_EB3_B	Byte Enable. These active-low output signals indicate valid data bytes for the current access. They may be configured to assert for write cycles only. EIM_EB[3] corresponds to DATA_OUT[31:24]. For asynchronous write accesses, behavior is affected by the WBEA and WBEN fields of the EIM_CS1WCR1-EIM_CS5WCR1 Registers. On synchronous or asynchronous read accesses, these signals are always asserted at the start of the access and negated at end of the access.	LCD1_DATA07	ALT1	O
EIM_LBA_B	Address Valid. This active-low output signal is asserted during burst mode accesses to cause the external burst capable device to load a new starting burst address. Assertion of LBA indicates that a valid address is present on the address bus. Its behavior is affected by the SWR, SRD, BCD, and BCS fields of the EIM_CSxGCR1 registers, the RADVA and RADVN fields of the EIM_CSxRCR1 registers, and the WADVA and WADVN fields of the EIM_CSxWCR1 registers. In asynchronous mode, LBA length is affected by the RADVA, WADVA, RADVN, and WADVN fields. Minimum length of LBA signal in all modes is one EIM clock cycle.	NAND_CEO_B	ALT6	O
EIM_OE	Output Enable. This active-low output signal indicates the bus access is a read and enables external devices to drive the data bus with read data. Its behavior is affected by the OEA and OEN bit fields in the Chip Select Configuration Registers.	NAND_CE1_B	ALT6	O
EIM_RW	Memory Write Enable. This active-low output signal indicates the bus access is a write and enables	NAND_RE_B	ALT6	O

Table continues on the next page...

Table 23-2. EIM External Signals (continued)

Signal	Description	Pad	Mode	Direction
	external devices to sample the data bus. Its behavior is affected by the WEA and WEN bit fields in the Chip Select Configuration Registers.			
EIM_WAIT	<p>Ready/Busy/Wait signal. This activelow input signal is asserted by external burst capable devices which support fixed or variable latency of data. It is serviced in synchronous mode only (EIM_CSxGCR1[SWR, SRD] =1). WAIT will have a pull up resistor in pad. The signal indicates whether the External device is ready for data transaction or not. Busy cycles (or wait cycles) of the external device can occur at the start of a Burst access or at page boundary crossover.</p> <p>NOTE: For burst devices, WAIT output should be configured to change one cycle before data is ready (before delay).</p> <p>NOTE: Some External devices may not use this input signal for ready state indication (fix latency without WAIT signal monitoring). For these devices EIM should be configured accordingly (see RFL, WFL, and PSZ field descriptions).</p> <p>NOTE: This is same as what is shown in IP_IND_WAIT_B</p>	NAND_WE_B	ALT6	I

23.2.1 Other Important Block I/O Signals Internal to the SoC

The following table provides a description of other signals which are internal to the that are important to understand the function of EIM.

Name	I/O	Description
EIM_FB_BCLK	Input	Burst Clock Feedback. This block input is used to sample read data during high transfer speeds. The signal provides feedback from the I/O pad of the BCLK output pin and tends to align more closely with data from the external memory device.

Table continues on the next page...

Clocks

Name	I/O	Description
EIM_BOOT	Input	EIM Boot Configuration. These block inputs determine the reset state of DSZ[1:0] and MUM.
ACLK	Input	AXI clock, maximum frequency 133 Mhz
IPG_CLK_S	Input	EIM module IPG clock
RST_B	Input	Active low HW reset
EIM_WARM_RESET	Input	Warm Reset. If this signal is asserted the rst_b will reset only the internal FF and state machine while S/W registers will keep their current state. This signal is active high signal.

23.3 Clocks

The following table describes the clock sources for EIM. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 23-4. EIM Clocks

Clock name	Clock Root	Description
aclk	aclk_eim_slow_clk_root	EIM clock (main)
aclk_slow	aclk_eim_slow_clk_root	EIM clock (slow)
ipg_clk_s	ipg_clk_root	Peripheral access clock
aclk_exsc	aclk_eim_slow_clk_root	EIM clock (external device)

- **ACLK:** EIM clock (main clock, AXI clock) with a Max frequency of 133Mhz. Can be gated externally when there is no active AXI access.
- **ACLK_SLOW:** EIM all time running ACLK. Used for flip-flops that must be active even when EIM is in low power down mode to provide clock for lpack/lpmd registers, IP registers and IP to AXI sync registers.
- **IPG_CLK_S:** IPG clock for IP accesses. IP registers are activated by ACLK_SLOW clock.
- **ACLK_EXSC:** Clock created from EIM clock for External device usage. Integer division by 1, 2, 3 and 4 of the clock can be use with BCD bit field configuration, according to external devices demands. EIM clock frequency may be reduced for lower frequency support which cannot be achieved via BCD bit field.

23.4 Chip Select Memory Map

Table 23-5. EIM Chip Select Memory Map

Address	Space Size	Use	Access
EIM_NFC_BASE/ACT_CS/ADDRS0 inputs	128MB	CS0 memory region	R/W
ACT_CS/ADDRS1 inputs	128MB	CS1 memory region	R/W
ACT_CS/ADDRS2 inputs	128MB	CS2 memory region	R/W
ACT_CS/ADDRS3 inputs	128MB	CS3 memory region	R/W

23.5 Functional Description

This section provides the functional description for the EIM.

23.5.1 Continuous BCLK

EIM module can be programmed to provide a continuous BCLK in synchronous mode as the reference clock of PPGA. In this case, an internal DLL(Delay-locked Loop) is used to synchronize the internal clock which is used to sample read data from the I/O pad, with the feedback BCLK from PAD. The DLL compares the phase difference of internal clock to the feedback BCLK and will lock up when the delay of Reference Delay Line equals to the phase difference. After the lock up of Reference Delay Chain , DLL will copy the Master Delay Chain's value to Slave Delay Chain automatically. The Slave Delay Chain is used to delay the internal clock. If continuous BCLK is not selected, DLL should not be enabled.

When using an continuous BCLK in synchronous mode, BCD MUST be set to 0, otherwise will cause malfunction of EIM.

To let EIM work properly under continuous BCLK MODE, the initialization must follow below procedure. The initialize procedure should be done before any access to EIM. If it is not possible to do so, e.g. device booted up from EIM, the initialize flow should be done after performing a reset of EIM.

The recommended initialize flow is as follow

1. Disable EIM clock by clearing bit 4 of EIM_WIAR Register.
2. Select Continuous BCLK by setting bit 3 of EIM_WCR Register.
3. Enable DLL by setting bit 0 of EIM_DCR Register.
4. Enable EIM clock by setting bit 4 of EIM_WIAR Register.
5. Reset DLL by toggling bit 1 of EIM_DCR Register(1->0->1).
6. Wait for DLL lock (Both bit 0 and bit 1 of EIM_DSR Register are asserted).

After initialization, EIM can be programmed to various access timing, but BCD MUST be kept to 0.

DLL Upadte Interval and inital value can be set by write EIM_DCR Register in corresponding bit field.

Also DLL provides manual adjustment to delay. An extra offset can be added to internal delay line, which can be used when DLL have some kind of predicable error. OVERRIDE bit field of EIM_DCR register will override reference DLL locked value and use a direct value for delay.

Note: During initialization, BCLK frequence and duty cycle are not guaranteed.

23.5.2 Bus Sizing Configuration

The EIM supports byte, half word and word operands allowing access to x8, x16, x32 ports. It can be address/data multiplexed in x16, x32 ports. The port size is programmable via the DSZ bit field in the corresponding Chip Select Configuration Register. An 8-bit port can reside in each one of the bytes of the data bus. A 16-bit port can reside on the lower 16 bits of the data bus, DATA_IN/OUT[15:0] or on the higher 16 bits of the data bus, DATA_IN/OUT[31:16].

In the case of a multi-cycle transfer, the lower two address bits (ADDR[1:0]) are incremented appropriately. The EIM address bus is configured according to DSZ bit field and AUS bits. There is either one bit (for x16 port size) or two bits (for x32 port size) right shift of the address bits (only when AUS=0) and no bit shift when AUS = 1 or DSZ[2] = 1.

The EIM has a data multiplexer which takes the four bytes of the AXI data bus and routes them to their required positions to properly interface to memory.

NOTE

A word access to or from a x16 port requires two external bus cycles to complete the transfer.

A word access to or from a x8 port requires four external bus cycles to complete the transfer.

23.5.2.1 8 BIT PORT SUPPORT

EIM has limited support for mot68000 & intel 386 protocols.

23.5.2.1.1 MOTOROLA 68000

EIM has limited support for mot68000 protocol. Only basic read or write asynchronous operations are supported.

The following operations are not supported:

- Read modify write
- Sync access
- All special accesses (ARM platform space, bus arbitration, bus control, bus error & reset operations)
- FC outputs

23.5.2.1.2 INTEL 386

EIM has limited support for intel 386 protocol. Only basic read or write async non-pipelined operations are supported.

The following operations are not supported:

- Other bus cycles (interrupt, halt & refresh)
- Bus lock
- M/IO, DC, LBA, NA, REFRESH & BS8 signals

23.5.3 EIM Operational Modes

Listed here are the main operational modes for EIM selected by control bit fields settings.

For details, see the bit field descriptions of SWR / SRD / MUM. All modes are supported in with 8-, 16- or 32-bit port configuration, according to DSZ bit field.

Table 23-6. EIM Operation Modes Field Settings

Control bit fields			Brief mode description
MUM	SRD	SWR	
0	0	0	Asynchronous write / Asynchronous read for APR=0 / Asynchronous page read for APR=1, none multiplexed
		1	Synchronous write/ Asynchronous read or APR=0 / Asynchronous page read for APR=1,none multiplexed
	1	0	Asynchronous write/Synchronous read none multiplexed
		1	Synchronous write/read none multiplexed
1	0	0	Asynchronous write/read multiplexed
		1	Synchronous write/ Asynchronous read multiplexed
	1	0	Asynchronous write/Synchronous read multiplexed

Table continues on the next page...

Table 23-6. EIM Operation Modes Field Settings (continued)

Control bit fields			Brief mode description
MUM	SRD	SWR	
		1	Synchronous write/read multiplexed

23.5.4 Burst Mode (Synchronous) Memory Operation

This mode is enabled for read or write access. Bit SWR sets the burst mode for write operations at the corresponding chip select and bit SRD sets it for read operation.

When this mode is set, the controller attempts to translate the Master burst accesses to memory burst accesses, being limited by the memory burst length, predefined by BL value, or memory and Master WRAP/INCR boundary crossing non-matching. Only the first address accessed is put by the controller on the external address bus in a memory burst sequence.

EIM may translate from some Master sequential accesses to one or several memory bursts, but not from two Master individual accesses to one memory burst.

For the first access in a memory burst sequence, the EIM asserts \overline{ADV} , causing the external burst device to latch the starting burst address; then toggle the burst clock (BCLK) for a predefined number of cycles in order to latch the first unit of data. Subsequent accessed data units can then be burst in fewer clock cycles, realizing an overall increase in bus bandwidth.

NOTE

The BCLK signal toggles only when burst access is executed toward the external device (BCM=1'b0 for normal mode use). It runs with a 50% duty cycle until the end of access is reached. When access is terminated, BCLK stops toggling.

Memory burst accesses are terminated by the EIM whenever it detects the following:

- The specific burst length has executed completely (end of access)
- Write access - missing data in write buffer (Master is delaying the data transfer toward the EIM)
- Next sequential access crosses boundary with unequal condition (wrap/increment, burst length) on the Master and memory
- Current memory burst length reached

23.5.5 Burst Clock Divisor (BCD)

In some cases, it may be necessary to slow the external bus in relation to the internal bus to allow accesses to burst devices that have a maximum operating frequency less than the operating frequency of the internal bus.

The internal bus frequency can be divided by one, two, three or four for presentation on the external bus in burst mode operation.

BCLK can only be set to integer divisions of the incoming clock frequency. To get a specific frequency on BCLK, configure the divider to change the incoming EIM clock accordingly.

By programming the BCD bit field to various values, two signals on the external bus are affected; \overline{ADV} and BCLK. The \overline{ADV} signal is asserted according to RADVA or WADVA bit fields programming, and is negated according to the formula mentioned in RADVN and WADVN bit fields description. The BCLK signal runs with a 50% duty cycle until the end of access is reached.

If BCM = 1, the BCLK runs at frequency according to GBCD bit field settings on every async memory access, regardless of the SWR and SRD bits configuration. Caution should be exercised when using BCM bit; GBCD bit field should be updated once and should not change when BCLK is toggling. The BCM bit is used mainly for system debug mode. It has no functional use of the EIM in normal mode.

23.5.6 Burst Clock Start (BCS)

In an effort to allow greater flexibility in achieving the minimum number of wait states on burst accesses, you can determine when you want the BCLK to start toggling after the start of access. This allows the BCLK to be skewed from point of data capture on the EIM clock by any number of EIM clock cycles.

Care must be exercised when setting BCS bit field in conjunction with the BCD and RWSC/WWSC bit fields. See the external timing diagrams in [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=1](#) and [Burst \(Synchronous Mode\) Read Memory Accesses Timing Diagram - BCD=0](#) for examples of how to use the BCS, BCD and RWSC/WWSC bit fields together.

23.5.7 Multiplexed Address/Data Mode Support

The control bit MUM allows support memory with multiplexed address/data bus both in asynchronous and in synchronous modes.

Caution should be exercised for using OEA/WEA & ADH bit fields. They should be configured according to the external device requirements, as it determines the time point of end of address phase and start of data phase.

23.5.8 Mixed Master/Memory Burst Modes Support

To provide mixed sequential/wrap accesses with different length, EIM interprets burst signal and generate additional \overline{ADV} signals whenever there appear unequal address or burst boundary crossing condition.

BL bit field is used to notify EIM about current memory burst and wrap condition for properly external address generation. In case of non-matching boundaries in both the memory and Master access, EIM starts a new memory burst access by updating address from Master on address bus and generating \overline{ADV} signal.

23.5.9 AXI (Master) Bus Cycles Support

The EIM uses an ARM AXI slave interface. It has a 32-bit bus and supports one access (one ID) at a time. No out of order or parallel accesses are supported.

The following AXI protocol signals are not supported:

- AWLOCK
- AWCACHE
- ARLOCK
- ARCACHE

ARID bus is sampled when:

- new read access is valid on the read address channel and is reflected on the RID bus output toward the master.

AWID bus is sampled when:

- new write access is valid on the write address channel and is reflected on the WID/BID bus output toward the master.

ARPROT and AWPROT signal are partially used. ARPROT[0] and AWPROT[0] bits are used for normal/privileged access detection. ARPROT[2:1] and AWPROT[2:1] are not used.

When sampling a valid access on both of the address channels, the read access will be performed first while write access is pending. After last data transfer completed, the pending write will be executed.

A new access may be executed one cycle after sampling a valid access on the read or write address channels, assuming there is no current access (back to back) which can cause a recovery or end of access penalty cycles, for write access, also assuming data is in write buffer for fast execution.

NOTE

- Only 32-bit word size accesses are supported for burst mode accesses.
- Only 8-bit (1 byte), 16-bit (2 byte) and 32-bit (4 byte) word size supported for single access.
- Maximum number of burst length is 16.
- According to AXI protocol, burst access should not cross 4 KB blocks. In case EIM gets an access that crosses the 4 KB, memory address calculation is invalid.

AXI transfers shown in the table below are also supported. These AXI cycles will be translated into the necessary cycles on the memory side. For example, for optimal operation in case ARM cache is configured to 8 beat burst with wrap, a synchronous flash and cellular RAM memory should be configured in 16 word wrap burst mode when using a 16-bit data port, and in 8 word wrap burst mode when using a 32-bit data port. EIM uses BL bit field to support different memory configurations. The controller splits the transaction when needed in some cases. See [Table 23-8](#).

Table 23-7. AXI Burst Cycles Supported

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
1	1	INCR	Single transfer
1	2	INCR	Single transfer
1	4	INCR	Single transfer
2	4	WRAP	2-beat wrapping burst
4	4	WRAP	4-beat wrapping burst
8	4	WRAP	8-beat wrapping burst
16	4	WRAP	16-beat wrapping burst
2	4	INCR	2-beat incrementing burst
3	4	INCR	3-beat incrementing burst
4	4	INCR	4-beat incrementing burst
5	4	INCR	5-beat incrementing burst
6	4	INCR	6-beat incrementing burst

Table continues on the next page...

Table 23-7. AXI Burst Cycles Supported (continued)

Burst Length - Number of data transfers	Burst size - Bytes in transfer	Burst type	Description
7	4	INCR	7-beat incrementing burst
8	4	INCR	8-beat incrementing burst
9	4	INCR	9-beat incrementing burst
10	4	INCR	10-beat incrementing burst
11	4	INCR	11-beat incrementing burst
12	4	INCR	12-beat incrementing burst
13	4	INCR	13-beat incrementing burst
14	4	INCR	14-beat incrementing burst
15	4	INCR	15-beat incrementing burst
16	4	INCR	16-beat incrementing burst

Table 23-8. AXI to Memory Burst Splits Number

AXI Burst Type	Memory Burst Type Config.	# of accesses to X8 Memory Port size	# of accesses to X16 Memory Port size	# of accesses to X32 Memory Port size

	WRAP16	2 or 3	2	1 or 2
WRAP8 Aligned Addr.	WRAP16	2	1	1
	Cont.	1	1	1
WRAP8 Unaligned Addr.	WRAP16	2 or 3	1	2
	Cont.	2	2	2

23.5.10 WAIT_B Signal, RWSC and WWSC bit fields Usage

Most of the external devices supporting burst mode for write or read accesses provide a signal which indicates data is valid on the memory bus (a.k.a. handshake mode). For this mode, RFL and WFL bits should be cleared and RWSC/ WWSC bit fields indicate when the controller should start sampling this signal from the external device or, in other words, how many BCLK cycles should be masked.

For devices which do not use this signal or have a fixed latency ability, the RFL and WFL bits may be set for internal calculation regarding BCLK cycles penalty until data is valid (memory initial access time). For this mode, RWSC/ WWSC indicates when the data is ready for sampling by the controller (read access) or the external device (write access). There is separation between read and write accesses wait-state control. For read access, RWSC bit field is valid and WWSC bit field is ignored; for write access, WWSC is valid and RWSC is ignored.

23.5.11 IPS Register Interface

Access to the registers of the EIM, read or write, is made with IPS protocol signals. The system should avoid changing the registers while master/memory transaction is valid, as this can cause an unknown behavior of the controller.

Register access size is 32-bit as the register size definition, other size of access (byte or half word) is not supported.

23.5.12 MRS Set for PSRAM

Memory registers of PSRAM devices can be configured according to external signal, which indicates whether the access is to a memory array or memory register domain.

When the CRE bit is set, the following transactions to the external device will assert the CRE signal. The polarity of this signal is determined by the CREP bit for active low or active high assertion of the signal.

23.5.13 EIM Access Termination

EIM is monitoring the corresponding CSx control signal every time variable latency access or dtack access is performed toward the external device.

In variable latency accesses, the Watchdog Timer (WDOG-1) counts BCLK cycles. If it reaches the `wdog_limit` (according to the `WDOG_LIMIT` bit field in the `WCR`) before the device signals can drive/sample new data, the controller will terminate the access and generate an error response transfer toward the Master.

In `dtack` access, WDOG-1 counts `ACLK` cycles instead of `BCLK` and it reaches the `wdog_limit` before the device asserts the `dtack` signal, the controller will terminate the access and generate an error response transfer toward the Master.

WDOG-1 can be disabled by `WDOG_EN` bit in the `WCR`.

23.5.14 Error Conditions

The following conditions cause an error (AXI error or IPS error) response signal:

- AXI errors
 - Access to a disabled chip select - access to a mapped chip select address space where the `CSEN` bit in the corresponding chip select Configuration Register is clear
 - Access to a non mapped address - access to an address that is not mapped to any CS.
 - User access to a supervisor-protected chip select address space (the `SP` bit in the corresponding chip select Configuration Register is set)
 - User access in fixed mode access
 - User performs write access to write protected chip select
 - First write data ID and write address ID do not match. (No data is written to the memory.)
 - First Write Data ID and write address ID match but one or more of the other Write data IDs does not match the First Write data ID (data is written to memory according)
 - Access duration to external device from `CSx` signal assertion is 128/256/512/1024 cycles (access is terminated by the controller) - This error can be disabled by software.
- IPS errors
 - User read or write access to a reserved/non-valid address in the EIM Configuration Register

23.5.15 DTACK Mode

In `DTACK` mode, the EIM uses `DTACK` signal as an indication of when to end the access.

DTACK is an asynchronous edge/level sensitive signal. DTACK polarity is configurable by the DAP bit in CsxGCR2 (default value is 0).

In this case, EIM begins the access and after a few cycles (according DAPS field) and waits until DTACK (after synchronization) becomes asserted, then samples the data in read access and completes the current data access (see [Figure 23-15](#), [Figure 23-16](#) & [Figure 23-17](#)).

If more than one data is needed, CS will be negated between access (CSREC field is not zero) and the AXI burst access will be split into single accesses (see [Figure 23-19](#)).

23.5.16 RDY_INT Signal as Interrupt

The EIM has an external interrupt support. When INTEN bit in the WCR is set, signal RDY_INT is used as interrupt; its status is being reflected by INT bit and output signal.

It is cleared by writing one to the INT bit. When INTEN is cleared, the interrupt is disabled. This interrupt is a level interrupt and its polarity can be configured by the INTPOL bit in the WCR.

23.5.17 RDY_INT Signal as Ready After Reset Indication

This feature is used for boot propose from external devices based on NANDFlash array memory with NORFlash interface.

When ERRST bit is set, RDY_INT signal is monitored to determine ready after reset of the external device located on CS0.

The monitoring is taking place when CS0 is accessed for the first time. The access will be pending until assertion of the signal is detected. When detection occurs, ERRST bit is self-cleared and pending access is executed to the external device on CS0.

23.5.18 EIM_GRANT / EIM_BUSY Handshake Description

Prior to executing command to one of the external device (chip select), EIM assert EIM_BUSY signal (1'b1) and checks the EIM_GRANT signal status.

If EIM_GRANT signal is high, it indicates external data bus is not used by other slaves (NAND Flash Controller) and EIM may start to execute the access. If EIM_GRANT is low, EIM waits until it is set (1'b1) before executing the access.

EIM keeps EIM_BUSY signal set until it completes the access toward the external device.

Once EIM_GRANT signal is set, it can not be reset until EIM_BUSY signal is cleared by EIM.

NOTE

In 16-bit Muxed EIM doesn't use the data bus, therefore there is no sharing of the data bus with NFC. EIM doesn't wait for EIM_GRANT signal from NFC and doesn't assert the EIM_BUSY signal.

23.5.19 LPMD / LPACK Handshake Description

These signals are used for frequency and/or voltage change, and for entering low power mode during normal operation of the EIM. Before any change can take place, the controller and all the relevant external devices should be in idle state, which means no access or data transfer is in process.

LPMD input signal is asserted once EIM detects the assertion of LPMD, all ready signals of the AXI channels are negated, and EIM is not sampling new accesses. It finishes all the ongoing accesses and already pending ones. When EIM is in idle state, the LPACK output signal is asserted. EIM will stay in idle state and the LPACK signal will stay asserted until the LPMD signal is negated.

23.5.20 Endianness

Big and Little endianness are supported by the controller according to the following table.

Table 23-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0

Endian mode	AXI access	AXI address [1:0]	Port size and used bits								
			Word port				Half word port		Byte port		
			[31:24]	[23:16]	[15:8]	[7:0]	External address [0]	[31:24] ([15:8])	[23:16] ([7:0])	External address [1:0]	[31:24] ([23:16]) ([15:8]) ([7:0])
Big	Word	0	0xB3	0xB2	0xB1	0xB0	0	0xB3	0xB2	0	0xB3
										1	0xB2
							1	0xB1	0xB0	2	0xB1
										3	0xB0

Table continues on the next page...

Table 23-9. EIM Out/in Data in Case AXI Out/in Data is 0xB3B2B1B0 (continued)

		2		0xB2			1		0xB2	2	0xB2	
			0xB3					0xB3		3	0xB3	

23.5.21 Strobe Signal Use

The strobe signal is toggling according to address/data valid condition on the external bus for read and write accesses, and for both synchronous and asynchronous modes.

At any time point when address/data is valid on the external bus, the strobe signal will generate a positive edge, which can be used to sample the external data and control signal.

NOTE

Strobe signal for read data is active (RL + 1) cycles after data on external bus is valid.

23.6 Initialization Information

23.6.1 Booting from EIM

EIM is ready to work with CS0 after the hardware reset, but it has been configured for very slow access (for boot purposes), with additional setup and hold time.

Other CSs are disabled by hardware reset. Therefore, all CSs must be properly initialized before use in writing values to the corresponding chip select configuration registers.

DSZ[1:0] and MUM fields are set according to EIM_BOOT [2:0] block inputs.

23.7 Typical Application

Application note uses following functions to illustrate EIM and memory accesses:

- WR16(address, data) is a 16 bit write access
- WR32(address, data) is a 32 bit write access
- RD16(address, data) is a 16 bit read access
- RD32(address, data) is a 32 bit read access
- WR_I(address, data, delta, counter) is a write data sequence, there $data(i+1) = data(i) + delta$
- COMMAND_SEQUENCE
- CHECK_STATUS

NOTE

COMMAND_SEQUENCE and CHECK_STATUS are described in [AMD Flash Utility](#), [Intel Sibley Flash Utility](#), [MDOC Device Utility](#), [Samsung OneNAND Utility](#), and [Spansion Flash Utility](#).

All addresses are byte addresses. "CS0" is a Chip Select 0 base address. "EIM_" is a prefix of EIM's registers. 'h' is a prefix of hexadecimal constant. "///" is a comment beginning. csba[cs] is a dimension of CS base addresses. "addr" means an address offset in current CS address space. Examples use CS0 address space, but it may apply to any CS except for boot mode functionality.

Configuration examples were verified with the memory models listed below and may require some adjustments for other family members.

23.7.1 Access to Intel Sibley Flash

The following configurations are intended to Sibley family muxed and non-muxed devices.

23.7.1.1 Intel Sibley Flash Asynchronous Mode Configuration

- WR32('EIM_CS0GCR1,'h00210081);
- WR32('EIM_CS0RCR1,'h0e020000);
- WR32('EIM_CS0RCR2,'h00000000);
- WR32('EIM_CS0WCR1,'h0704a040);

23.7.1.2 Intel Sibley Flash Synchronous Mode Configuration

Configuration used for 133 MHz synchronous access to flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h5903<<1), 'h0060);
WR16('CS0+('h5903<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h50214225);           // 133 MHz
WR32('EIM_CS0RCR1, 'h0c000000);         // 12 cycles on memory
```

Configuration used for 66 MHz synchronous access to muxed flash:

```
// Set memory to synchronous read mode
WR16('CS0+('h3103<<1), 'h0060);
WR16('CS0+('h3103<<1), 'h0003);
WR16('CS0+('h0000<<1), 'h00ff);
-----
// Set EIM configuration to synchronous timing
WR32('EIM_CS0GCR1, 'h5021122d);           // 66 MHz
WR32('EIM_CS0RCR1, 'h07000000);         // 7cycles on memory
```

23.7.1.3 Intel Sibley Flash Utility

```
// Single data word programming to addr
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
WR16('CS0+addr, 'h0041);
WR16('CS0+addr, data);
WR16('CS0+caddr, 'h0070);           // Read Status command
while('CS0+data[7] == 0)           // Wait / Polling
    RD16('CS0+addr, data);         // Read status
RD16('CS0+addr, data);             // Read status
WR16('CS0+'h0000, 'h00ff);
// Write buffer programming
WR16('CS0+addr, 'h0060);           // Unlock
WR16('CS0+addr, 'h00d0);
data = 0;
```

Typical Application

```
WR16('CS0+addr, 'h0070); // Read Status command
while(data[7] == 0) // Wait
    RD16('CS0+addr, data); // Read status
WR16('CS0+'h0000, 'h00ff);
WR16('CS0+addr, 'h00e9); // Write Buffer command
WR16('CS0+addr, 255); // Word counter (<256)
for(i=0; i<'h200; i = i + 'h40)
    WR_I('CS0+addr+i, data+((i>2)*'h0010_0001), 'h0010_0001, 16); // Data
WR16('CS0+addr, 'h00d0); // Write Confirm command
data = 0;
while(data[7] == 0) // Wait
    RD16('CS0+addr, data); // Read status
RD16('CS0+addr, data); // Read status
WR16('CS0+'h0000, 'h00ff);
```

23.7.2 Access to MDOC Device

The following configurations are intended to MDOC H3 device.

23.7.2.1 MDOC Device Boot

To boot from the MDOC device the ERRST bit should be configured to 1, so that EIM will hold the first read access to CS0 until the MDOC asserts the RDY signal.

23.7.2.2 MDOC Device Asynchronous Mode Configuration

```
// Non-muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);
// Muxed mode
WR32('EIM_CS0GCR1, 'h00410081);
WR32('EIM_CS0RCR1, 'h0e121010);
WR32('EIM_CS0RCR2, 'h00000000);
WR32('EIM_CS0WCR1, 'h12092492);
```

23.7.2.3 MDOC Device Utility

```
// Read Manufacturer ID and Device ID
RE16('CS0+'h9400, 'h4833);
RE16('CS0+'h9422, 'hb7cc);
```

23.7.3 Access to Micron PSRAM

The following configurations are intended to mt45w4mw16bfb_706.

23.7.3.1 Micron PSRAM Asynchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0b040040);
// 32 bit memory
WR32('EIM_CS0GCR1,'h403304b1);
WR32('EIM_CS0RCR1,'h0f010000);
WR32('EIM_CS0RCR2,'h00000008);
WR32('EIM_CS0WCR1,'h0f040040);
```

23.7.3.2 Micron PSRAM Synchronous Mode Configuration

```
// 16 bit memory
WR32('EIM_CS0GCR1,'h403104b1);
WR32('EIM_CS0WCR1,'h0b040000);
WR16('CS0+('h85947<<1),'h0040); // memory configuration
WR32('EIM_CS0GCR1,'h4021_5487); // fixed latency memory wrap 4
WR32('EIM_CS0RCR1,'h04000000);

WR32('EIM_CS0WCR1,'h04000000);
```

23.7.4 Access to Samsung OneNAND

Mentioned below are the configurations intended for Samsung OneNAND muxed and non-muxed devices.

23.7.4.1 Samsung OneNAND Boot

There are two ways to boot from Samsung OneNAND. In the first way, the ERRST bit is set to 0 and the user has to poll the interrupt status in the OneNAND interrupt register (or set interrupt handler there). In the second way, the ERRST bit is set to 1 and the user should enable the device interrupt output before the first read from CS0 access is issued.

Load sectors 2,3 to DataRAM, page 0 done in the next example:

- WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
- WR16('CS0+('hF100<<1),'h0); // block[8:0] address
- WR16('CS0+('hF107<<1),'h2); // sector[1:0] and page[7:2] addresses
- WR16('CS0+('hF200<<1),'h802); // buffer[11:8] address and counter[1:0]

Typical Application

- WR16('CS0+('hF101<<1),'h0); // DDP choose
- WR16('CS0+('hF220<<1),'h0); // Set command

23.7.4.2 Samsung OneNAND Asynchronous Mode Configuration

```
// Non-muxed memory
WR32('EIM_CS0GCR1,'h00410081);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
// Muxed memory
WR32('EIM_CS0GCR1,'h00410089);
WR32('EIM_CS0RCR1,'h0b010000);
WR32('EIM_CS0RCR2,'h00000000);
WR32('EIM_CS0WCR1,'h0c092480);
```

23.7.4.3 Samsung OneNAND Synchronous Mode Configuration

Set memory and EIM to synchronous read mode is shown in the next example:

```
WR16('CS0+('hF221<<1),'hc0e0); // Synchronous read, 4 clk latency
WR32('EIM_CS0GCR1,'h50412405); // 44 MHz (non-muxed)
WR32('EIM_CS0RCR1,'h05010000);
```

The muxed Samsung OneNAND supports synchronous write, too:

```
// Set memory & EIM to synchronous read and write mode
WR16('CS0+('hF221<<1),'hc0f2); // Sync. read and write, 4 clk latency
WR32('EIM_CS0GCR1,'h5041240f); // 44 MHz
WR32('EIM_CS0RCR1,'h05010000);
WR32('EIM_CS0WCR1,'h05040000);
```

23.7.4.4 Samsung OneNAND Utility

The following utility algorithms are used on the Samsung OneNAND:

```
// Unlock Block command
WR16('CS0+('hF100<<1),'h0); // DFS
WR16('CS0+('hF100<<1),'h0); // DBS
WR16('CS0+('hF24c<<1),'h2); // SBA - block number (2)
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
WR16('CS0+('hF220<<1),'h23); // Unlock command
data = 'h0;
while(!(data &'h0004)) // Polling
    RD32('WIAR, data); // Read status
// Erase block command
WR16('CS0+('hF100<<1),'h2); // DFS and block ([8:0]) address
WR16('CS0+('hF101<<1),'h0); // DBS
WR16('CS0+('hF241<<1),'h0); // Clear interrupt status
WR16('CS0+('hF220<<1),'h94); // Erase command
data = 'h0;
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
// Program page command
WR16('CS0+('hF100<<1),'h2); // DFS and block[8:0] address
WR16('CS0+('hF107<<1),'h0); // sector[1:0] and page[7:2] addresses
```

```

WR16 ('CS0+('hF200<<1), 'h800);           // buffer[11:8] address and counter[1:0]
WR16 ('CS0+('hF241<<1), 'h0);           // Clear interrupt status
WR16 ('CS0+('hF220<<1), 'h80);           // Program command
data = 'h0;
while (!(data &'h0004))                   // Wait
    RD32 ('WIAR, data); // Read status

```

23.7.5 Access to Samsung UtRAM

Below mentioned configurations are intended for Samsung UtRAM.

23.7.5.1 Samsung UtRAM Asynchronous Mode Configuration

```

WR32 ('EIM_CS0GCR1, 'h400104b1);
WR32 ('EIM_CS0RCR1, 'h0a010000);
WR32 ('EIM_CS0RCR2, 'h00000008);
WR32 ('EIM_CS0WCR1, 'h0b040040);

```

23.7.5.2 Samsung UtRAM Synchronous Mode Configuration

```

RD16 ('CS0+('hff_ffff<<1), data);           // command sequence
RD16 ('CS0+('hff_ffff<<1), data);
RD16 ('CS0+('hff_ffff<<1), data);
RD16 ('CS0+('hff_feff<<1), data);
RD16 ('CS0+('h00_82a0<<1), data);           // memory sync. configuration
WR32 ('EIM_CS0GCR1, 'h4021_53b7);           // fixed latency memory wrap 32
WR32 ('EIM_CS0RCR1, 'h0500_0000);
WR32 ('EIM_CS0WCR1, 'h0300_0000);

```

23.7.6 Access to Spansion Flash

Below mentioned configurations are intended for Spansion Flash.

23.7.6.1 Spansion Flash Asynchronous Mode Configuration

```

WR32 ('EIM_CS0GCR1, 'h00410081);
WR32 ('EIM_CS0RCR1, 'h0a018000);
WR32 ('EIM_CS0RCR2, 'h00000000);
WR32 ('EIM_CS0WCR1, 'h0704a240);
WR16 ('CS0+('hF220<<1), 'h94);           // Erase command
data = 'h0;
while (!(data &'h0004))                   // Wait
    RD32 ('WIAR, data); // Read status
// Program page command
WR16 ('CS0+('hF100<<1), 'h2);           // DFS and block[8:0] address
WR16 ('CS0+('hF107<<1), 'h0);           // sector[1:0] and page[7:2] addresses
WR16 ('CS0+('hF200<<1), 'h800);           // buffer[11:8] address and counter[1:0]
WR16 ('CS0+('hF241<<1), 'h0);           // Clear interrupt status
WR16 ('CS0+('hF220<<1), 'h80);           // Program command
data = 'h0;

```

Typical Application

```
while(!(data &'h0004)) // Wait
    RD32('WIAR, data); // Read status
```

23.7.6.2 Spansion Flash Synchronous Mode Configuration

```
WR16('CS0+('h0555<<1),'h00aa); // command sequence
WR16('CS0+('h02aa<<1),'h0055);
WR16('CS0+('h0555<<1),'hd0);
WR16('CS0+('h0000<<1),'hle4); // memory sync. configuration
WR32('EIM_CS0GCR1,'h50411325); // 66 MHz
WR32('EIM_CS0RCR1,'h05000000); // 5 cycles on memory
```

23.7.6.3 Spansion Flash Utility

```
// Single word programming
COMMAND_SEQUENCE(cs,16,'ha0); // single word programming
WR16('CS0+addr, data);
CHECK_STATUS('CS0+addr,data,16,1,errst);
// Write buffer programming
COMMAND_SEQUENCE(0,16,'h25); // write buffer programming
WR16('CS0+addr,'h001f); // counter-1
WR_I('CS0+addr, data, 'h0010_0001, 16); // data
WR16('CS0+addr,'h0029); // write buffer to flash
CHECK_STATUS('CS0+addr+'h3e,data[31:16]+'h00f0,16,1,errst);
```

There `COMMAND_SEQUENCE` and `CHECK_STATUS` are next functions:

```
task COMMAND_SEQUENCE;
    input [2:0] cs;
    input [7:0] port_size;
    input [31:0] code;
begin
    if(port_size == 16)
        begin
            WR16(csba[cs]+('h0555<<1),'h00aa);
            WR16(csba[cs]+('h02aa<<1),'h0055);
            WR16(csba[cs]+('h0555<<1),code);
        end
    else
        begin
            WR32(csba[cs]+('h0555<<2),'h00aa);
            WR32(csba[cs]+('h02aa<<2),'h0055);
            WR32(csba[cs]+('h0555<<2),code);
        end
end
endtask
task CHECK_STATUS;
    input [31:0] addr;
    input [31:0] edata;
    input [7:0] port_size;
    input [7:0] opcode;
    output [7:0] errst;
    reg [31:0] data;
    reg [31:0] data3;
begin
    errst = 0;
    data = 0;
    data3 = 0;
while(!(data == edata) && !errst) // Wait operation
begin: BR_EN
    RD16(addr, data); // Read status
    if(data[7] != edata[7])
```

```

begin
  if(data[5] == 1)
    begin
      RD16(addr, data3);
      RD16(addr, data);
      if(data[6] != data3[6])
        begin
          $display("CHECK_STATUS: Error timeout on single data program");
          errst = 1;
          disable BR_EN;
        end
      end
    end
  else
    begin
      if(opcode == 2)
        if(data[1] == 1)
          begin
            RD16(addr, data3);
            if(port_size == 32)
              RD32(addr, data);
            else
              RD16(addr, data);
            if(data[1] == 1 && data != edata)
              begin
                $display("CHECK_STATUS: Error on write buffer");
                errst =3;
                disable BR_EN;
              end
            end
          end
        end
      end
    end
  else
    begin
      RD16(addr, data3);
      if(port_size == 32)
        RD32(addr, data);
      else
        begin
          RD16(addr, data);
          edata[31:16] = 16'h0;
        end
      end
      if(data != edata)
        begin
          $display("CHECK_STATUS: Error in data write on single data program");
          errst =2;
          disable BR_EN;
        end
      end
    end
  end
end
endtask

```

23.7.7 8 bit support

This section details the pin connections for Intel mode and Motorola mode.

Intel Mode - For intel mode use the following connection:

Table 23-10. Intel Mode pin connections

23.9 EIM Memory Map/Register Definition

The EIM includes 33 user-accessible 32-bit registers. The the EIM Configuration Register (EIM_WCR) contains control bits that configure the EIM for certain operation modes.

The 160 bits used to control Individual Chip Select are divided into five registers:

- Chip Select n General Configuration Register 1 (EIM_CSnGCR1)
- Chip Select n General Configuration Register 2 (EIM_CSnGCR2)
- Chip Select n Read Configuration Register 1 (EIM_CSnRCR1)
- Chip Select n Read Configuration Register 2 (EIM_CSnRCR2)
- Chip Select n Write Configuration Register (EIM_CSnWCR)

In addition there are 3 general registers: EIM_WCR, EIM_WIAR & EIM_EAR.

NOTE

- All EIM registers are sampled by IPG_CLK_S, therefore IPG_CLK_S must be active when accessing through IP bus.
- Read access from all registers (except EIM_WIAR & EIM_EAR) will generate one IPG_XFR_WAIT cycle.
- Read access from EIM_WIAR & EIM_EAR will generate six IPG_XFR_WAIT cycles.
- Write access to all registers (except EIM_EAR) will generate three IPG_XFR_WAIT cycles.
- Write access to EIM_EAR will generate six IPG_XFR_WAIT cycles.

EIM_CS n GCR1 field descriptions

Field	Description
31–28 PSZ	<p>Page Size. This bit field indicates memory page size in words (word is defined by the DSZ field). PSZ is used when fix latency mode is applied, WFL=1 for sync. write accesses, RFL=1 for sync. Read accesses. When working in fix latency mode WAIT signal from the external device is not being monitored, PSZ is used to determine if page boundary is reached and renewal of access is preformed. This bit field is ignored when sync. Mode is disabled or fix latency mode is not being used for write or read access separately.</p> <p>It can be valid for both access type, read or write, or only for one type, according to configuration. PSZ is cleared by a hardware reset.</p> <p>0000 8 words page size 0001 16 words page size 0010 32 words page size 0011 64 words page size 0100 128 words page size 0101 256 words page size 0110 512 words page size 0111 1024 (1k) words page size 1000 2048 (2k) words page size 1001 - 1111 Reserved</p>
27 WP	<p>Write Protect. This bit prevents writes to the address range defined by the corresponding chip select. WP is cleared by a hardware reset.</p> <p>0 Writes are allowed in the memory range defined by chip. 1 Writes are prohibited. All attempts to write to an address mapped by this chip select result in a error response and no assertion of the chip select output.</p>
26–24 GBC	<p>Gap Between Chip Selects. This bit field, according to the settings shown below, determines the minimum time between end of access to the current chip select and start of access to different chip select. GBC is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 minimum of 0 EIM clock cycles before next access from different chip select (async. mode only) 001 minimum of 1 EIM clock cycles before next access from different chip select 010 minimum of 2 EIM clock cycles before next access from different chip select 111 minimum of 7 EIM clock cycles before next access from different chip select</p>
23 AUS	<p>Address UnShifted. This bit indicates an unshifted mode for address assertion for the relevant chip select accesses. AUS bit is cleared by hardware reset.</p> <p>0 Address shifted according to port size (DSZ config.) 1 Address unshifted</p>
22–20 CSREC	<p>CS Recovery. This bit field, according to the settings shown below, determines the minimum pulse width of CS, OE, and WE control signals before executing a new back to back access to the same chip select. CSREC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0GCR1, CSREC[2:0] is 0b110. For EIM_CS1GCR1 - EIM_CS5GCR, the reset value is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles minimum width of CS, OE and WE signals (read async. mode only) 001 1 EIM clock cycles minimum width of CS, OE and WE signals</p>

Table continues on the next page...

EIM_CS n GCR1 field descriptions (continued)

Field	Description
	010 2 EIM clock cycles minimum width of CS, OE and WE signals 111 7 EIM clock cycles minimum width of CS, OE and WE signals
19 SP	Supervisor Protect. This bit prevents accesses to the address range defined by the corresponding chip select when the access is attempted in the User mode. SP is cleared by a hardware reset. 0 User mode accesses are allowed in the memory range defined by chip select. 1 User mode accesses are prohibited. All attempts to access an address mapped by this chip select in User mode results in an error response and no assertion of the chip select output.
18–16 DSZ	Data Port Size. This bit field defines the width of an external device's data port as shown below. NOTE: Only async. access supported for 8 bit port. NOTE: The reset value for EIM_CS0GCR1, DSZ[2] = 0, DSZ[1:0] = EIM_BOOT[1:0]. For EIM_CS1GCR1 - EIM_CS5GCR1, the reset value is 0b001. 000 Reserved. 001 16 bit port resides on DATA[15:0] 010 16 bit port resides on DATA[31:16] 011 32 bit port resides on DATA[31:0] 100 8 bit port resides on DATA[7:0] 101 8 bit port resides on DATA[15:8] 110 8 bit port resides on DATA[23:16] 111 8 bit port resides on DATA[31:24]
15–14 BCS	Burst Clock Start. When SRD=1 or SWR=1, this bit field determines the number of EIM clock cycles delay from start of access before the first rising edge of BCLK is generated. When BCD=0 value of BCS=0 results in a half clock delay after the start of access. For other values of BCD a one clock delay after the start of access is applied, not an immediate assertion. BCS is cleared by a hardware reset. 00 0 EIM clock cycle additional delay 01 1 EIM clock cycle additional delay 10 2 EIM clock cycle additional delay 11 3 EIM clock cycle additional delay
13–12 BCD	Burst Clock Divisor. This bit field contains the value used to program the burst clock divisor for BCLK generation. It is used to divide the internal EIMbus frequency. BCD is cleared by a hardware reset. NOTE: For other than the mentioned below frequency such as 104 MHz, EIM clock (input clock) should be adjust accordingly. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
11 WC	Write Continuous. The WI bit indicates that write access to the memory are always continuous accesses regardless of the BL field value. WI is cleared by hardware reset. 0 Write access burst length occurs according to BL value. 1 Write access burst length is continuous.
10–8 BL	Burst Length. The BL bit field indicates memory burst length in words (word is defined by the DSZ field) and should be properly initialized for mixed wrap/increment accesses support. Continuous BL value corresponds to continuous burst length setting of the external memory device. For fix memory burst size,

EIM_CS*n*GCR1 field descriptions (continued)

Field	Description
	<p>type is always wrap. In case not matching wrap boundaries in both the memory (BL field) and Master access on the current address, EIM update address on the external device address bus and regenerates the access.</p> <p>BL is cleared by a hardware reset.</p> <p>When APR=1, Page Read Mode is applied, BL determine the number of words within the read page burst. BL is cleared by a hardware reset for EIM_CS0GCR1 - EIM_CS5GCR1.</p> <p>000 4 words Memory wrap burst length (read page burst size when APR = 1) 001 8 words Memory wrap burst length (read page burst size when APR = 1) 010 16 words Memory wrap burst length (read page burst size when APR = 1) 011 32 words Memory wrap burst length (read page burst size when APR = 1) 100 Continuous burst length (2 words read page burst size when APR = 1) 101 Reserved 110 Reserved 111 Reserved</p>
7 CREP	<p>Configuration Register Enable Polarity. This bit indicates CRE memory pin assertion state, active-low or active-high, while executing a memory register set command to the external device (PSRAM memory type). CREP is set by a hardware reset.</p> <p>NOTE: Whenever PSRAM is connected the CREP value must be correct also for accesses where CRE is disabled.</p> <p>For Non-PSRAM memory CREP value should be 1.</p> <p>0 CRE signal is active low 1 CRE signal is active high</p>
6 CRE	<p>Configuration Register Enable. This bit indicates CRE memory pin state while executing a memory register set command to PSRAM external device. CRE is cleared by a hardware reset.</p> <p>0 CRE signal use is disable 1 CRE signal use is enable</p>
5 RFL	<p>Read Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start sampling data according to RWSC field, it only valid in synchronous mode. RFL is cleared by a hardware reset.</p> <p>When RFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device.</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)</p>
4 WFL	<p>Write Fix Latency. This bit field determine if the controller is monitoring the WAIT signal from the External device connected to the chip select (handshake mode - fix or variable data latency) or if it start data transfer according to WWSC field, it only valid in synchronous mode. WFL is cleared by a hardware reset.</p> <p>When WFL=1 Burst access is terminated on page boundary and resume on the following page according to BL bit field configuration, because WAIT signal is not monitored from the external device</p> <p>0 the External device WAIT signal is being monitored, and it reflect the external data bus state 1 the state of the External devices is determined internally (Fix latency mode only)</p>
3 MUM	<p>Multiplexed Mode. This bit determines the address/data multiplexed mode for asynchronous and synchronous accesses for 8 bit, 16 bit or 32 bit devices (DSZ config. dependent).</p>

Table continues on the next page...

EIM_CS n GCR1 field descriptions (continued)

Field	Description
	<p>NOTE: The reset value for EIM_CS0GCR1[MUM] = EIM_BOOT[2]. For EIM_CS1GCR1 - EIM_CS5GCR1 the reset value is 0.</p> <p>0 Multiplexed Mode disable 1 Multiplexed Mode enable</p>
2 SRD	<p>Synchronous Read Data. This bit field determine the read accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SRD is cleared by a hardware reset.</p> <p>NOTE: Sync. accesses supported only for 16/32 bit port.</p> <p>0 read accesses are in Asynchronous mode 1 read accesses are in Synchronous mode</p>
1 SWR	<p>Synchronous Write Data. This bit field determine the write accesses mode to the External device of the chip select. The External device should be configured to the same mode as this bit implicates. SWR is cleared by a hardware reset.</p> <p>NOTE: Sync. accesses supported only for 16/32 bit port.</p> <p>0 write accesses are in Asynchronous mode 1 write accesses are in Synchronous mode</p>
0 CSEN	<p>CS Enable. This bit controls the operation of the chip select pin. CSEN is set by a hardware reset for CSGCR0 to allow external boot operation. CSEN is cleared by a hardware reset to CSGCR1-CSGCR5.</p> <p>NOTE: Reset value for EIM_CS0GCR1 for CSEN is 1. For EIM_CS1GCR1-CS1GCR5 reset value is 0.</p> <p>0 Chip select function is disabled; attempts to access an address mapped by this chip select results in an error respond and no assertion of the chip select output 1 Chip select is enabled, and is asserted when presented with a valid access.</p>

23.9.2 Chip Select n General Configuration Register 2 (EIM_CSnGCR2)

Address: 21B_8000h base + 4h offset + (24d × i), where i=0d to 5d

EIM_CSnGCR2 field descriptions

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 MUX16_BYP_ GRANT	Muxed 16 bypass grant. This bit when asserted causes EIM to bypass the grant/ack. arbitration with NFC (only for 16 bit muxed mode accesses). 0 EIM waits for grant before driving a 16 bit muxed mode access to the memory. 1 EIM ignores the grant signal and immediately drives a 16 bit muxed mode access to the memory.
11–10 Reserved	This read-only field is reserved and always has the value 0.
9 DAP	Data Acknowledge Polarity. This bit indicates DTACK memory pin assertion state, active-low or active-high, while executing an async access using DTACK signal from the external device. DAP is cleared by a hardware reset. 0 DTACK signal is active high 1 DTACK signal is active low
8 DAE	Data Acknowledge Enable. This bit indicates external device is using DTACK pin as strobe/terminator of an async. access. DTACK signal may be used only in asynchronous single read (APR=0) or write accesses. DTACK poling start point is set by DAPS bit field. polarity of DTACK is set by DAP bit field. DAE is cleared by a hardware reset. 0 DTACK signal use is disable 1 DTACK signal use is enable
7–4 DAPS	Data Acknowledge Poling Start. This bit field determine the starting point of DTACK input signal polling. DAPS is used only in asynchronous single read or write accesses.

Table continues on the next page...

EIM_CS_nGCR2 field descriptions (continued)

Field	Description
	<p>NOTE: Since DTACK is an async. signal the start point of DTACK signal polling is at least 3 cycles after the start of access.</p> <p>DAPS is cleared by a hardware reset.</p> <p>Example settings:</p> <p>0000 3 EIM clk cycle between start of access and first \overline{DTACK} check</p> <p>0001 4 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>0010 5 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>0111 10 EIM clk cycles between start of access and first \overline{DTACK} check</p> <p>1011 14 EIM clk cycles between start of access and first DTACK check</p> <p>1111 18 EIM clk cycles between start of access and first DTACK check</p>
3–2 Reserved	This read-only field is reserved and always has the value 0.
ADH	<p>Address hold time - This bit field determine the address hold time after ADV negation when mum = 1 (muxed mode).</p> <p>When mum = 0 this bit has no effect. For read accesses the field determines when the pads direction will be switched.</p> <p>NOTE: Reset value for EIM_CS0GCR2 for ADH is 10. For EIM_CS1GCR2-EIM_CS5GCR2 reset value is 00.</p> <p>00 0 cycle after ADV negation</p> <p>01 1 cycle after ADV negation</p> <p>10 2 cycle after ADV negation</p> <p>11 Reserved</p>

23.9.3 Chip Select n Read Configuration Register 1 (EIM_CS_nRCR1)

Address: 21B_8000h base + 8h offset + (24d × i), where i=0d to 5d

EIM_CS_nRCR1 field descriptions

Field	Description
31–30 Reserved	This read-only field is reserved and always has the value 0.

Table continues on the next page...

EIM_CS*n*RCR1 field descriptions (continued)

Field	Description
29–24 RWSC	<p>Read Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous read access to the external device connected to the chip select.</p> <p>When SRD=1 and RFL=0, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the controller can start sample data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SRD=1 and RFL=1, RWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SRD=0, RFL bit is ignored, RWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>RWSC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0RCR1, RWSC[5:0] = 0b011100. For CG1RCR1 - CS1RCR5 the reset value is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved 000001 RWSC value is 1 000010 RWSC value is 2 111101 RWSC value is 61 111110 RWSC value is 62 111111 RWSC value is 63</p>
23 Reserved	This read-only field is reserved and always has the value 0.
22–20 RADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous read modes according to the settings shown below. RADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion</p>
19 RAL	Read ADV Low. This bit field determine ADV signal negation time. When RAL=1, RADVN bit field is ignored and ADV signal will stay asserted until end of access. When RAL=0 negation of ADV signal is according to RADVN bit field configuration.
18–16 RADVN	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during read accesses.</p> <p>When SRD=1 (synchronous read mode), ADV negation occurs according to the following formula: (RADVN + RADVA + BCD + BCS + 1) EIM clock cycles from start of access.</p> <p>When asynchronous read mode is applied (SRD=0) and RAL=0 ADV negation occurs according to the following formula: (RADVN + RADVA + 1) EIM clock cycles from start of access. RADVN is cleared by a hardware reset.</p> <p>NOTE: the reset value for EIM_CS0RCR1[RADVN] = 2. For EIM_CS1RCR1 - EIM_CS5RCR1, the reset value is 0b000.</p> <p>NOTE: This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time with the end of access user should RAL bit.</p>

Table continues on the next page...

EIM_CS n RRCR1 field descriptions (continued)

Field	Description
15 Reserved	This read-only field is reserved and always has the value 0.
14–12 OEA	<p>OE Assertion. This bit field determines when OE signal are asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. OEA is cleared by a hardware reset.</p> <p>In muxed mode OE assertion occurs (OEA + RADVN + RADVA + ADH + 1) EIM clock cycles from start of access.</p> <p>NOTE: The reset value for EIM_CS0RRCR1[OEA] is 0b000 if EIM_BOOT[2] = 0. If EIM_BOOT[2] is 1, the reset value for EIM_CS0RRCR1 is 0b010. The reset value of this field for EIM_CS1RRCR1 - EIM_CS5RRCR1 is 0b000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and OE assertion 001 1 EIM clock cycles between beginning of access and OE assertion 010 2 EIM clock cycles between beginning of access and OE assertion 111 7 EIM clock cycles between beginning of access and OE assertion</p>
11 Reserved	This read-only field is reserved and always has the value 0.
10–8 OEN	<p>OE Negation. This bit field determines when OE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. OEN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and OE negation 001 1 EIM clock cycles between end of access and OE negation 010 2 EIM clock cycles between end of access and OE negation 111 7 EIM clock cycles between end of access and OE negation</p>
7 Reserved	This read-only field is reserved and always has the value 0.
6–4 RCSA	<p>Read CS Assertion. This bit field determines when CS signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of read access and CS assertion 001 1 EIM clock cycles between beginning of read access and CS assertion 010 2 EIM clock cycles between beginning of read access and CS assertion 111 7 EIM clock cycles between beginning of read access and CS assertion</p>
3 Reserved	This read-only field is reserved and always has the value 0.
RCSN	<p>Read CS Negation. This bit field determines when CS signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR = 0), according to the settings shown below. This bit field is ignored when SRD=1. RCSN is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation</p>

23.9.4 Chip Select n Read Configuration Register 2 (EIM_CS n RCR2)

Address: 21B_8000h base + Ch offset + (24d × i), where i=0d to 5d

EIM_CS n RCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 APR	Asynchronous Page Read. This bit field determine the asynchronous read mode to the external device. When APR=0, the async. read access is done as single word (where word is defined by the DSZ field). when APR=1, the async. read access executed as page read. page size is according to BL field config., RCSN,RBEN,OEN and RADVN are being ignored. APR is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. NOTE: SRD=0 and MUM=0 must apply when APR=1
14–12 PAT	Page Access Time. This bit field is used in Asynchronous Page Read mode only (APR=1). the initial access is set by RWSC as in regular asynchronous mode. the consecutive address assertions width determine by PAT field according to the settings shown below. when APR=0 this field is ignored. PAT is cleared by a hardware reset for EIM_CS1GCR1 - EIM_CS5GCR1. 000 Address width is 2 EIM clock cycles 001 Address width is 3 EIM clock cycles 010 Address width is 4 EIM clock cycles 011 Address width is 5 EIM clock cycles 100 Address width is 6 EIM clock cycles 101 Address width is 7 EIM clock cycles 110 Address width is 8 EIM clock cycles 111 Address width is 9 EIM clock cycles
11–10 Reserved	This read-only field is reserved and always has the value 0.
9–8 RL	Read Latency. This bit field indicates cycle latency when executing a synchronous read operation. The fields holds the feedback clock loop delay in aclk cycle units. This field is cleared by a hardware reset. 00 Feedback clock loop delay is up to 1 cycle for BCD = 0 or 1.5 cycles for BCD != 0 01 Feedback clock loop delay is up to 2 cycles for BCD = 0 or 2.5 cycles for BCD != 0

Table continues on the next page...

EIM_CS_nR_{CR2} field descriptions (continued)

Field	Description
	10 Feedback clock loop delay is up to 3 cycles for BCD = 0 or 3.5 cycles for BCD != 0 11 Feedback clock loop delay is up to 4 cycles for BCD = 0 or 4.5 cycles for BCD != 0
7 Reserved	This read-only field is reserved and always has the value 0.
6-4 RBEA	Read BE Assertion. This bit field determines when BE signal is asserted during read cycles (synchronous or asynchronous mode), according to the settings shown below. RBEA is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between beginning of read access and BE assertion 001 1 EIM clock cycles between beginning of read access and BE assertion 010 2 EIM clock cycles between beginning of read access and BE assertion 111 7 EIM clock cycles between beginning of read access and BE assertion
3 RBE	Read BE enable. This bit field determines if BE will be asserted during read access. 0 - BE are disabled during read access. 1- BE are enable during read access according to value of RBEA & RBEN bit fields.
RBEN	Read BE Negation. This bit field determines when BE signal is negated during read cycles in asynchronous single mode only (SRD=0 & APR=0), according to the settings shown below. This bit field is ignored when SRD=1. RBEN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and BE negation 001 1 EIM clock cycles between end of read access and BE negation 010 2 EIM clock cycles between end of read access and BE negation 111 7 EIM clock cycles between end of read access and BE negation

23.9.5 Chip Select n Write Configuration Register 1 (EIM_CS_nWCR1)

Address: 21B_8000h base + 10h offset + (24d × i), where i=0d to 5d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

EIM_CS n WCR1 field descriptions

Field	Description
31 WAL	Write ADV Low. This bit field determine ADV signal negation time in write accesses. When WAL=1, WADV n bit field is ignored and ADV signal will stay asserted until end of access. When WAL=0 negation of ADV signal is according to WADV n bit field configuration.
30 WBED	Write Byte Enable Disable. When asserted this bit prevent from IPP_DO_BE_B[x] to be asserted during write accesses. This bit is cleared by hardware reset.
29–24 WWSC	<p>Write Wait State Control. This bit field programs the number of wait-states, according to the settings shown below, for synchronous or asynchronous write access to the external device connected to the chip select.</p> <p>When SWR=1 and WFL=0, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, before the memory can sample the first data. Since WAIT signal can be asserted one cycle before the first data can be sampled, the controller starts evaluating the WAIT signal state one cycle before, this is referred as handshake mode or variable latency mode.</p> <p>When SWR=1 and WFL=1, WWSC indicates the number of burst clock (BCLK) cycles from the start of an access, until the external device is ready for data transfer, this is referred as fix latency mode.</p> <p>When SWR=0, WFL bit is ignored, WWSC indicates the asynchronous access length and the number of EIM clock cycles from the start of access until the external device is ready for data transfer.</p> <p>WWSC is cleared by a hardware reset.</p> <p>NOTE: The reset value for EIM_CS0WCR1, WWSC[5:0] = 0b011100. For EIM_CS1WCR1 - EIM_CS5WCR1, the reset value of this field is 0b000000.</p> <p>Example settings:</p> <p>000000 Reserved 000001 WWSC value is 1 000010 WWSC value is 2 000011 WWSC value is 3 111111 WWSC value is 63</p>
23–21 WADVA	<p>ADV Assertion. This bit field determines when ADV signal is asserted for synchronous or asynchronous write modes according to the settings shown below. WADVA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and ADV assertion 001 1 EIM clock cycles between beginning of access and ADV assertion 010 2 EIM clock cycles between beginning of access and ADV assertion 111 7 EIM clock cycles between beginning of access and ADV assertion</p>
20–18 WADV n	<p>ADV Negation. This bit field determines when ADV signal to memory is negated during write accesses.</p> <p>When SWR=1 (synchronous write mode), ADV negation occurs according to the following formula: (WADVn + WADVA + BCD + BCS + 1) EIM clock cycles.</p> <p>When asynchronous read mode is applied (SWR=0) ADV negation occurs according to the following formula: (WADVn + WADVA + 1) EIM clock cycles.</p> <p>NOTE: Reset value for EIM_CS0WCR for WADVn is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>NOTE: This field should be configured so ADV negation will occur before the end of access. For ADV negation at the same time as the end of access, S/W should set the WAL bit.</p>
17–15 WBEA	BE Assertion. This bit field determines when BE signal is asserted during write cycles in async. mode only (SWR=0), according to the settings shown below. BEA is cleared by a hardware reset.

Table continues on the next page...

EIM_CS n WCR1 field descriptions (continued)

Field	Description
	<p>NOTE: Reset value for EIM_CS0WCR for WBEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and BE assertion 001 1 EIM clock cycles between beginning of access and BE assertion 010 2 EIM clock cycles between beginning of access and BE assertion 111 7 EIM clock cycles between beginning of access and BE assertion</p>
14–12 WBEN	<p>BE[3:0] Negation. This bit field determines when BE[3:0] bus signal is negated during write cycles in async. mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. BEN is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WBEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between end of access and WE negation 001 1 EIM clock cycles between end of access and WE negation 010 2 EIM clock cycles between end of access and WE negation 111 7 EIM clock cycles between end of access and WE negation</p>
11–9 WEA	<p>WE Assertion. This bit field determines when WE signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below. This bit field is ignored when executing a read access to the external device. WEA is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WEA is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion 001 1 EIM clock cycles between beginning of access and WE assertion 010 2 EIM clock cycles between beginning of access and WE assertion 111 7 EIMclock cycles between beginning of access and WE assertion</p>
8–6 WEN	<p>WE Negation. This bit field determines when WE signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WEN is cleared by a hardware reset.</p> <p>NOTE: Reset value for EIM_CS0WCR for WEN is 2. For EIM_CS1WCR - EIM_CS5WCR reset value is 000.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of access and WE assertion 001 1 EIM clock cycles between beginning of access and WE assertion 010 2 EIM clock cycles between beginning of access and WE assertion 111 7 EIM clock cycles between beginning of access and WE assertion</p>
5–3 WCSA	<p>Write CS Assertion. This bit field determines when CS signal is asserted during write cycles (synchronous or asynchronous mode), according to the settings shown below.this bit field is ignored when executing a read access to the external device. WCSA is cleared by a hardware reset.</p> <p>Example settings:</p> <p>000 0 EIM clock cycles between beginning of write access and CS assertion</p>

Table continues on the next page...

EIM_CS n WCR1 field descriptions (continued)

Field	Description
	001 1 EIM clock cycles between beginning of write access and CS assertion 010 2 EIM clock cycles between beginning of write access and CS assertion 111 7 EIM clock cycles between beginning of write access and CS assertion
WCSN	Write CS Negation. This bit field determines when CS signal is negated during write cycles in asynchronous mode only (SWR=0), according to the settings shown below. This bit field is ignored when SWR=1. WCSN is cleared by a hardware reset. Example settings: 000 0 EIM clock cycles between end of read access and CS negation 001 1 EIM clock cycles between end of read access and CS negation 010 2 EIM clock cycles between end of read access and CS negation 111 7 EIM clock cycles between end of read access and CS negation

23.9.6 Chip Select n Write Configuration Register 2 (EIM_CS n WCR2)

Address: 21B_8000h base + 14h offset + (24d × i), where i=0d to 5d

Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
Hardware Reset	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0

EIM_WCR field descriptions

Field	Description
31–12 Reserved	Reserved This read-only field is reserved and always has the value 0.
11 FRUN_ACLK_EN	Free run ACLK enable
10–9 WDOG_LIMIT	Memory Watch Dog (Wdog) cycle limit. This bit field determines the number of BCLK cycles (ACLK cycles in dtack mode) before the wdog counter terminates the access and send an error response to the master. 00 128 BCLK cycles 01 256 BCLK cycles 10 512 BCLK cycles 11 1024 BCLK cycles
8 WDOG_EN	Memory WDog enable. This bit controls the operation of the wdog counter that terminates the EIM access. 0 Memory WDog is Disabled 1 Memory WDog is Enabled

Table continues on the next page...

EIM_WCR field descriptions (continued)

Field	Description
7–6 Reserved	This read-only field is reserved and always has the value 0.
5 INTPOL	Interrupt Polarity. This bit field determines the polarity of the external device interrupt. 0 External interrupt polarity is active low 1 External interrupt polarity is active high
4 INTEN	Interrupt Enable. When this bit is set the External signal RDY_INT as active interrupt. When interrupt occurs, INT bit at the WCR will be set and t EIM_EXT_INT signal will be asserted correspondingly. This bit is cleared by a hardware reset. 0 External interrupt Disable 1 External interrupt Enable
3 CONT_BCLK_SEL	Continuous BCLK select When this bit is set BCLK pin output continuous clock. Otherwise, BCLK will output clock only when nesserary. 0 BCLK When nesserary 1 BCLK Continuous
2–1 GBCD	General Burst Clock Divisor. When BCM bit is set, this bit field contains the value used to program the burst clock divisor for Continuous BCLK generation. The other BCD bit fields for each chip select are ignored. It is used to divide the internal AXI bus frequency. When BCM=0 GBCD bit field has no influence. GBCD is cleared by a hardware reset. 00 Divide EIM clock by 1 01 Divide EIM clock by 2 10 Divide EIM clock by 3 11 Divide EIM clock by 4
0 BCM	Burst Clock Mode. This bit selects the burst clock mode of operation. It is used for system debug mode. BCM is cleared by a hardware reset. NOTE: The BCLK frequency in this mode is according to GBCD bit field. NOTE: The BCLK phase is opposite to the EIM clock in this mode if GBCD is 0. NOTE: This bit should be used only in async. accesses. No sync access can be executed if this bit is set. NOTE: When this bit is set bcd field shouldn't be configured to 0. 0 The burst clock runs only when accessing a chip select range with the SWR/SRD bits set. When the burst clock is not running it remains in a logic 0 state. When the burst clock is running it is configured by the BCD and BCS bit fields in the chip select Configuration Register. 1 The burst clock runs whenever ACLK is active (independent of chip select configuration)

23.9.8 DLL Control Register (EIM_DCR)

Address: 21B_8000h base + 94h offset = 21B_8094h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DLL_CTRL_REF_UPDATE_INT				DLL_CTRL_SLV_UPDATE_INT				DLL_CTRL_REF_INITIAL_VAL							
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_CTRL_SLV_OVERRIDE_VAL								DLL_CTRL_SLV_OVERRIDE	DLL_CTRL_GATE_UPDATE	DLL_CTRL_SLV_OFFSET		DLL_CTRL_SLV_OFFSET_DEC	DLL_CTRL_SLV_FORCE_UPD	DLL_CTRL_RESET	DLL_CTRL_ENABLE
W											DLL_CTRL_SLV_OFFSET					
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_DCR field descriptions

Field	Description
31–28 DLL_CTRL_REF_UPDATE_INT	Reference DLL Update Interval DLL control loop update interval. The interval cycle is (2 + REF_UPDATE_INT) * ref_clock. By default, the DLL control loop shall update every two ref_clock cycles. It should be noted that increasing the reference delay-line update interval reduces the ability of the DLL to adjust to fast changes in conditions that may effect the delay (such as voltage and temperature)
27–23 DLL_CTRL_SLV_UPDATE_INT	Slave DLL Update Interval If default 0 is used, it means 256 cycles of ref_clock. A value of 0x0f results in 15 cycles and so on. Note that software can always cause an update of the slave-delay line using the SLV_FORCE_UPDATE register. Note that the slave delay line will also update automatically when the reference DLL transitions to a locked state (from an un-locked state).
22–16 DLL_CTRL_REF_INITIAL_VAL	This field is used to select the initial value of reference chain before DLL enabled. It's recommended to set the initial value close to the locked value to accelerate the locking.
15–9 DLL_CTRL_SLV_OVERRIDE_VAL	When SLV_OVERRIDE=1 This field is used to select 1 of 128 physical taps manually. A value of 0 selects tap 1, and a value of 0x7f selects tap 128.
8 DLL_CTRL_SLV_OVERRIDE	Set this bit to 1 to Enable manual override for slave delay chain using SLV_OVERRIDE_VAL; to set 0 to disable manual override. This feature does not require the DLL to be enabled using the ENABLE bit. In fact to reduce power, if SLV_OVERRIDE is used, it is recommended to disable the DLL with ENABLE=0

Table continues on the next page...

EIM_DCR field descriptions (continued)

Field	Description
7 DLL_CTRL_ GATE_UPDATE	Set this bit to 1 to force DLL not update from now on. Since when clock exists, glitches might appear during update. This bit is used by software if we met such kind of condition. Set it to 0 to let DLL update automatically
6-4 DLL_CTRL_ SLV_OFFSET	OFFSET value for DLL_CTRL_SLV_SEL
3 DLL_CTRL_ SLV_OFFSET_ DEC	Slave Chain Offset Decrease Decrease(or increase) the value defined by DLL_CTRL_SLV_OFFSET when calculating DLL_STS_SLV_SEL 0 DLL_STS_SLV_SEL = DLL_STS_REF_SEL + DLL_CTRL_SLV_OFFSET 1 DLL_STS_SLV_SEL = DLL_STS_REF_SEL - DLL_CTRL_SLV_OFFSET
2 DLL_CTRL_ SLV_FORCE_ UPD	Setting this bit to 1, forces the slave delay line to update to the DLL calibrated value immediately. The slave delay line shall update automatically based on the SLV_UPDATE_INT interval or when a DLL lock condition is sensed. Subsequent forcing of the slave-line update can only occur if SLV_FORCE_UP is set back to 0 and then asserted again (edge triggered). Be sure to use it when EIM is idle.
1 DLL_CTRL_ RESET	DLL Reset Bit Setting this bit to 1 force a reset on DLL. This will cause the DLL to lose lock and re-lock. This signal is used by the DLL as edge-sensitive, so in order to create a subsequent reset, RESET must be taken low and then asserted again
0 DLL_CTRL_ ENABLE	Set this bit to 1 to enable the DLL and delay chain; otherwise; set to 0 to bypasses DLL. Note that using the slave delay line override feature with SLV_OVERRIDE and SLV_OVERRIDE_VAL, the DLL does not need to be enabled

23.9.9 DLL Status Register (EIM_DSR)

Address: 21B_8000h base + 98h offset = 21B_8098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded area]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DLL_STS_REF_SEL								DLL_STS_SLV_SEL						DLL_STS_REF_LOCK	DLL_STS_SLV_LOCK
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

EIM_DSR field descriptions

Field	Description
31–16 Reserved	Reserved This read-only field is reserved and always has the value 0.
15–9 DLL_STS_REF_SEL	Reference delay line select taps. Be noted this is encoded by 7 bits for 127taps.
8–2 DLL_STS_SLV_SEL	Slave delay line select status. This is the instant value generated from reference chain. Since only when ref_lock is detected can the reference chain get updated, this value should be the right value next be update to the slave line when reference is locked.
1 DLL_STS_REF_LOCK	Reference DLL lock status. This signifies that the DLL has detected and locked to feedback BCLK, allowing the slave delay-line to perform programmed clock delays
0 DLL_STS_SLV_LOCK	Slave delay-line lock status. This signifies that a valid delay has been set to the slave-delay line and that the slave-delay line is implementing the programmed delay value

23.9.10 EIM IP Access Register (EIM_WIAR)

Address: 21B_8000h base + 9Ch offset = 21B_809Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								ACLK_EN	ERRST	INT	IPS_ACK	IPS_REQ			
W	[Shaded]								ACLK_EN	ERRST	INT	IPS_ACK	IPS_REQ			
Reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

EIM_WIAR field descriptions

Field	Description
31–5 Reserved	This read-only field is reserved and always has the value 0.
4 ACLK_EN	ACLK enable. This bit gates the ACLK for the EIM except from FFs that get ipg_aclk_s. After reset ACLK is enabled. 0 ACLK is disabled 1 ACLK is enabled

Table continues on the next page...

EIM_WIAR field descriptions (continued)

Field	Description
3 ERRST	<p>READY After Reset. This bit controls the initial ready/busy status for external devices on CS0 immediately after hardware reset. This is a sticky bit which is cleared once the RDY_INT signal is asserted by the external device.</p> <p>When ERRST = 1 the first fetch access from EIM to the external device located on CS0 will be pending until RDY_INT signal indicates that the external device is ready, then EIM will execute the access.</p> <p>NOTE: Reset value for ERRST is EIM_BOOT[4].</p> <p>0 RDY_INT After Reset Disable 1 RDY_INT After Reset Enable</p>
2 INT	<p>Interrupt. This bit indicates interrupt assertion by an external device according to RDY_INT signal. When polling this bit, INT=0 indicates interrupt not occurred and INT=1 indicates assertion of the external device interrupt. This bit is cleared by a hardware reset.</p>
1 IPS_ACK	<p>IPS ACK. The EIM is ready for ips access. There is no active AXI access and no new AXI access is accepted till this bit is cleared. This bit is cleared by the master after it completes the ips accesses.</p> <p>0 Master cannot access ips. 1 Master can access ips.</p>
0 IPS_REQ	<p>IPS request. The Master requests to access one of the IPS registers. During such access the EIM should not perform any AXI/memory accesses. The EIM finishes the AXI accesses that already starts and asserts the IPS_ACK bit.</p> <p>0 No Master requests ips access 1 Master requests ips access</p>

23.9.11 Error Address Register (EIM_EAR)

Address: 21B_8000h base + A0h offset = 21B_80A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

EIM_EAR field descriptions

Field	Description
Error_ADDR	Error Address. This bit field holds the AXI address of the last access that caused error. This register is read only register.

Chapter 24

10/100/1000-Mbps Ethernet MAC (ENET)

24.1 Introduction

The MAC-NET core, in conjunction with a 10/100/1000 MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

24.2 Overview

The core implements a triple speed 10/100/1000 Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100 Mbit/s Ethernet LANs and full-duplex gigabit Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable 10/100/1000 Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

24.2.1 Features

The MAC-NET core includes the following features.

24.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100 Mbit/s and gigabit operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Supports gigabit full-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
 - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
 - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
 - a 2-bit Reduced MII (RMII) operating at 50 MHz.
 - a (double data rate) 4-bit Reduced GMII (RGMII) operating at 125 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
 - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
 - Pause quanta used to form pause frames — dynamically programmable
 - Pause frame generation additionally controllable by user application offering flexible traffic flow control
 - Optional forwarding of received pause frames to the user application
 - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission

- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)
- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors
- Interrupt coalescing reduces the number of interrupts generated by the MAC, reducing CPU loading
- Traffic-shaping bandwidth distribution supports credit-based and round-robin-based policies. Either policy can be combined with time-based shaping.
- AVB (Audio Video Bridging, IEEE 802.1Qav) features:
 - Credit-based bandwidth distribution policy can be combined with time-based shaping
 - AVB endpoint talker and listener support
 - Support for arbitration between different priority traffic (for example, AVB class A, AVB class B, and non-AVB)

24.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols

- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers
- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodified/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

24.2.1.3 IEEE 1588 features

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

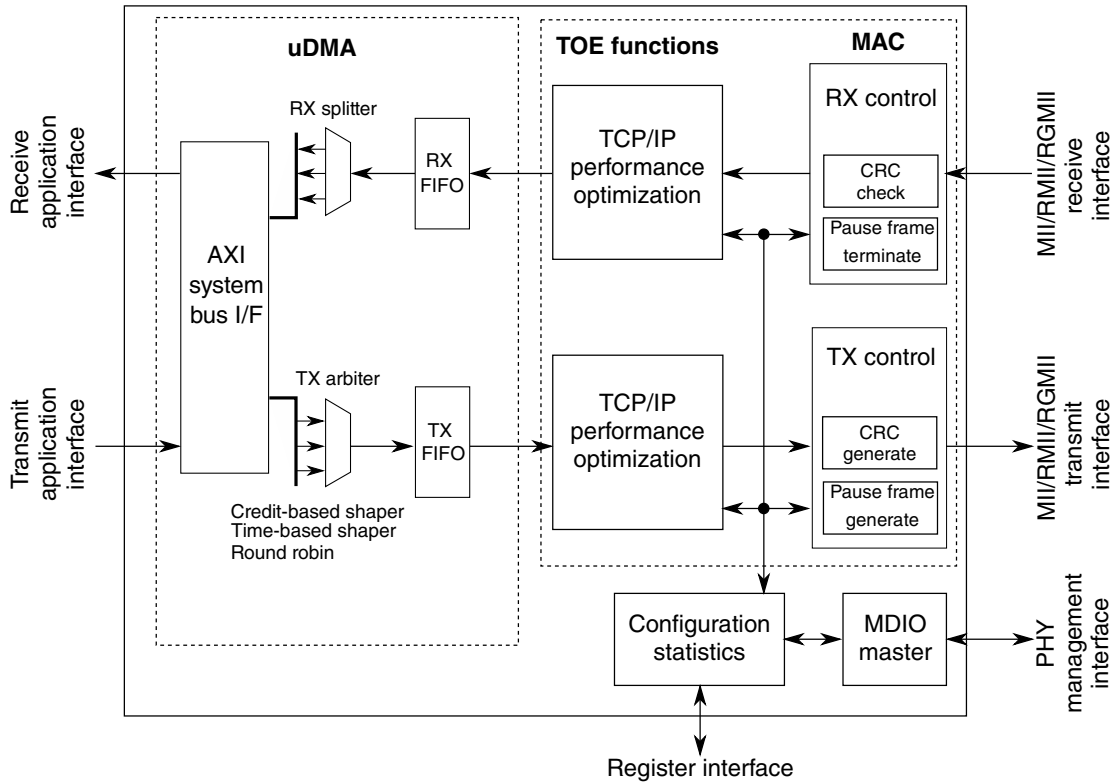

Figure 24-1. Ethernet MAC-NET core block diagram

24.3 External Signals

The table found here describes the external signals of ENET.

Table 24-1. ENET1 External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the	MII / RMII / RGMII	SD3_DATA7	ALT6	IO

Table 24-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
	corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_1588_EVENT0_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA6	ALT6	IO
ENET1_1588_EVENT1_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD1_DATA0	ALT6	IO
ENET1_1588_EVENT1_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD1_DATA1	ALT6	IO

	detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.				
ENET1_COL	Asserted upon detection of a collision and remains asserted while the collision persists. This signal is not defined for full duplex mode.	MII	ENET1_COL	ALT0	IO
ENET1_CRS	Carrier sense. When asserted, indicates transmit or receive medium is not idle. In RMII mode, this signal is present on the ENET_RX_EN pin.	MII	ENET1_CRS	ALT0	IO
ENET1_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII / RMII	ENET1_MDC	ALT0	IO
			ENET2_COL	ALT1	
			GPIO1_IO04	ALT2	
ENET1_MDIO	Transfers control information between the external PHY and the media access controller. Data is synchronous to MDC. This signal is an input after reset.	MII / RMII	ENET1_MDIO	ALT0	IO
			ENET2_CRS	ALT1	
			GPIO1_IO05	ALT2	
ENET1_REF_CLK1	In RMII mode, this signal is the reference clock for receive, transmit, and the control interface.	RMII	ENET1_TX_CLK	ALT1	IO
			GPIO1_IO05	ALT4	
ENET1_REF_CLK_25M	25 MHz Reference Clock	-	ENET1_RX_CLK	ALT1	IO
			GPIO1_IO03	ALT2	
ENET1_RGMII_RXC	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	RGMII	RGMII1_RXC	ALT0	IO
ENET1_RGMII_TXC	Serial output Ethernet data. Only valid during TX_EN assertion.	RGMII	RGMII1_TXC	ALT0	IO
ENET1_RX_CLK	In MII mode, provides a timing reference for RX_EN, RX_DATA[3:0], and RX_ER. In RGMII mode, provides a timing reference for RX_DATA[3:0] and RX_CTL.	MII	ENET1_RX_CLK	ALT0	IO

Table continues on the next page...

Table 24-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET1_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMI11_RD0	ALT0	IO
ENET1_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RMII / RGMII	RGMI11_RD1	ALT0	IO
ENET1_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMI11_RD2	ALT0	IO
ENET1_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII / RGMII	RGMI11_RD3	ALT0	IO
ENET1_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal. In RGMII mode, contains RXDV on the rising edge of RX_CLK, and a logical derivative of RX_EV and RX_ER (RX_EV XOR RX_ER) on the falling edge of RX_CLK.	MII / RMII / RGMII	RGMI11_RX_CTL	ALT0	IO
ENET1_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII / RMII	RGMI11_RXC	ALT1	IO
ENET1_TX_CLK	Input clock, which provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER.	MII	ENET1_TX_CLK	ALT0	IO
ENET1_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMI11_TD0	ALT0	IO
ENET1_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RMII / RGMII	RGMI11_TD1	ALT0	IO
ENET1_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMI11_TD2	ALT0	IO
ENET1_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII / RGMII	RGMI11_TD3	ALT0	IO
ENET1_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode,	MII / RMII / RGMII	RGMI11_TX_CTL	ALT0	IO

Table continues on the next page...

Table 24-1. ENET1 External Signals (continued)

Signal	Description	Mode	Pad	Alt Mode	Direction
	contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL.				
ENET1_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII	RGMI11_TXC	ALT1	IO

Table 24-2. ENET2 External Signals

Signal	Description	Mode	Pad	Alt Mode	Direction
ENET2_1588_EVENT0_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA4	ALT6	IO
ENET2_1588_EVENT0_OUT	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII / RMII / RGMII	SD3_DATA5	ALT6	IO

ENET2_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame. In RGMII mode, contains TX_EN on the rising edge of TX_CTL, and a logical derivative of TX_EN and TX_ER (TX_EN XOR TX_ER) on the falling edge of TX_CTL.	MII / RMII / RGMII	RGMI2_TX_CTL	ALT0	IO
ENET2_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII	RGMI2_TXC	ALT1	IO

24.4 Clocks

The table found here describes the clock sources for ENET.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 24-3. ENET Clocks

Clock name	Clock Root	Description
ipg_clk	enet_clk_root	Module clock
ipg_clk_mac0	enet_clk_root	MAC peripheral clock
ipg_clk_mac0_s	ipg_clk_root	MAC peripheral access clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_time	enet_clk_root	Peripheral clock
mac0_rxmem_clk	enet_clk_root	MAC receive memory clock
mac0_txmem_clk	enet_clk_root	MAC transmit memory clock

NOTE

The ENET module requires enet_clk_root to be 133 MHz or greater.

24.5 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read to allow future extension. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

Table 24-4. Register map summary

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

ENET memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_8164	Transmit Buffer Descriptor Ring 1 Start Register (ENET1_TDSR1)	32	R/W	0000_0000h	24.5.22/ 1074
218_8168	Maximum Receive Buffer Size Register - Ring 1 (ENET1_MRBR1)	32	R/W	0000_0000h	24.5.23/ 1075
218_816C	Receive Descriptor Ring 2 Start Register (ENET1_RDSR2)	32	R/W	0000_0000h	24.5.24/ 1076
218_8170	Transmit Buffer Descriptor Ring 2 Start Register (ENET1_TDSR2)	32	R/W	0000_0000h	24.5.25/ 1076
218_8174	Maximum Receive Buffer Size Register - Ring 2 (ENET1_MRBR2)	32	R/W	0000_0000h	24.5.26/ 1077
218_8180	Receive Descriptor Ring 0 Start Register (ENET1_RDSR)	32	R/W	0000_0000h	24.5.27/ 1078
218_8184	Transmit Buffer Descriptor Ring 0 Start Register (ENET1_TDSR)	32	R/W	0000_0000h	24.5.28/ 1079
218_8188	Maximum Receive Buffer Size Register - Ring 0 (ENET1_MRBR)	32	R/W	0000_0000h	24.5.29/ 1079
218_8190	Receive FIFO Section Full Threshold (ENET1_RSFL)	32	R/W	0000_0000h	24.5.30/ 1080
218_8194	Receive FIFO Section Empty Threshold (ENET1_RSEM)	32	R/W	0000_0000h	24.5.31/ 1081
218_8198	Receive FIFO Almost Empty Threshold (ENET1_RAEM)	32	R/W	0000_0004h	24.5.32/ 1081
218_819C	Receive FIFO Almost Full Threshold (ENET1_RAFL)	32	R/W	0000_0004h	24.5.33/ 1082
218_81A0	Transmit FIFO Section Empty Threshold (ENET1_TSEM)	32	R/W	0000_0000h	24.5.34/ 1082
218_81A4	Transmit FIFO Almost Empty Threshold (ENET1_TAEM)	32	R/W	0000_0004h	24.5.35/ 1083
218_81A8	Transmit FIFO Almost Full Threshold (ENET1_TAFL)	32	R/W	0000_0008h	24.5.36/ 1083
218_81AC	Transmit Inter-Packet Gap (ENET1_TIPG)	32	R/W	0000_000Ch	24.5.37/ 1084
218_81B0	Frame Truncation Length (ENET1_FTRL)	32	R/W	0000_07FFh	24.5.38/ 1084
218_81C0	Transmit Accelerator Function Configuration (ENET1_TACC)	32	R/W	0000_0000h	24.5.39/ 1085
218_81C4	Receive Accelerator Function Configuration (ENET1_RACC)	32	R/W	0000_0000h	24.5.40/ 1086
218_81C8	Receive Classification Match Register for Class n (ENET1_RCMR1)	32	R/W	0000_0000h	24.5.41/ 1087
218_81CC	Receive Classification Match Register for Class n (ENET1_RCMR2)	32	R/W	0000_0000h	24.5.41/ 1087
218_81D8	DMA Class Based Configuration (ENET1_DMA1CFG)	32	R/W	0000_0000h	24.5.42/ 1088

Table continues on the next page...

ENET memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_81DC	DMA Class Based Configuration (ENET1_DMA2CFG)	32	R/W	0000_0000h	24.5.42/ 1088
218_81E0	Receive Descriptor Active Register - Ring 1 (ENET1_RDAR1)	32	R/W	0000_0000h	24.5.43/ 1090
218_81E4	Transmit Descriptor Active Register - Ring 1 (ENET1_TDAR1)	32	R/W	0000_0000h	24.5.44/ 1091
218_81E8	Receive Descriptor Active Register - Ring 2 (ENET1_RDAR2)	32	R/W	0000_0000h	24.5.45/ 1092
218_81EC	Transmit Descriptor Active Register - Ring 2 (ENET1_TDAR2)	32	R/W	0000_0000h	24.5.46/ 1093
218_81F0	QOS Scheme (ENET1_QOS)	32	R/W	0000_0000h	24.5.47/ 1093
218_8200	Reserved Statistic Register (ENET1_RMON_T_DROP)	32	R	0000_0000h	24.5.48/ 1095
218_8204	Tx Packet Count Statistic Register (ENET1_RMON_T_PACKETS)	32	R	0000_0000h	24.5.49/ 1095
218_8208	Tx Broadcast Packets Statistic Register (ENET1_RMON_T_BC_PKT)	32	R	0000_0000h	24.5.50/ 1096
218_820C	Tx Multicast Packets Statistic Register (ENET1_RMON_T_MC_PKT)	32	R	0000_0000h	24.5.51/ 1096
218_8210	Tx Packets with CRC/Align Error Statistic Register (ENET1_RMON_T_CRC_ALIGN)	32	R	0000_0000h	24.5.52/ 1097
218_8214	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET1_RMON_T_UNDERSIZE)	32	R	0000_0000h	24.5.53/ 1097
218_8218	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET1_RMON_T_OVERSIZE)	32	R	0000_0000h	24.5.54/ 1098
218_821C	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET1_RMON_T_FRAG)	32	R	0000_0000h	24.5.55/ 1098
218_8220	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET1_RMON_T_JAB)	32	R	0000_0000h	24.5.56/ 1099
218_8224	Tx Collision Count Statistic Register (ENET1_RMON_T_COL)	32	R	0000_0000h	24.5.57/ 1099
218_8228	Tx 64-Byte Packets Statistic Register (ENET1_RMON_T_P64)	32	R	0000_0000h	24.5.58/ 1100
218_822C	Tx 65- to 127-byte Packets Statistic Register (ENET1_RMON_T_P65TO127)	32	R	0000_0000h	24.5.59/ 1100
218_8230	Tx 128- to 255-byte Packets Statistic Register (ENET1_RMON_T_P128TO255)	32	R	0000_0000h	24.5.60/ 1101
218_8234	Tx 256- to 511-byte Packets Statistic Register (ENET1_RMON_T_P256TO511)	32	R	0000_0000h	24.5.61/ 1101
218_8238	Tx 512- to 1023-byte Packets Statistic Register (ENET1_RMON_T_P512TO1023)	32	R	0000_0000h	24.5.62/ 1102
218_823C	Tx 1024- to 2047-byte Packets Statistic Register (ENET1_RMON_T_P1024TO2047)	32	R	0000_0000h	24.5.63/ 1102

Table continues on the next page...

ENET memory map (continued)

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
218_8240	Tx Packets Greater Than 2048 Bytes Statistic Register (ENET1_RMON_T_P_GTE2048)	32	R	0000_0000h	24.5.64/ 1103
218_8244	Tx Octets Statistic Register (ENET1_RMON_T_OCTETS)	32	R	0000_0000h	24.5.65/ 1103
218_8248	IEEE_T_DROP Reserved Statistic Register (ENET1_IEEE_T_DROP)	32	R	0000_0000h	24.5.66/ 1103
218_824C	Frames Transmitted OK Statistic Register (ENET1_IEEE_T_FRAME_OK)	32	R	0000_0000h	24.5.67/ 1104
218_8250	Frames Transmitted with Single Collision Statistic Register (ENET1_IEEE_T_1COL)	32	R	0000_0000h	24.5.68/ 1104
218_8254	Frames Transmitted with Multiple Collisions Statistic Register (ENET1_IEEE_T_MCOL)	32	R	0000_0000h	24.5.69/ 1105
218_8258	Frames Transmitted after Deferral Delay Statistic Register (ENET1_IEEE_T_DEF)	32	R	0000_0000h	24.5.70/ 1105
218_825C	Frames Transmitted with Late Collision Statistic Register (ENET1_IEEE_T_LCOL)	32	R	0000_0000h	24.5.71/ 1106
218_8260	Frames Transmitted with Excessive Collisions Statistic Register (ENET1_IEEE_T_EXCOL)	32	R	0000_0000h	24.5.72/ 1106
218_8264	Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET1_IEEE_T_MACERR)	32	R	0000_0000h	24.5.73/ 1107
218_8268	Frames Transmitted with Carrier Sense Error Statistic Register (ENET1_IEEE_T_CSERR)	32	R	0000_0000h	24.5.74/ 1107
218_826C	ENET1_IEEE_T_SQE	32	R (reads 0)	0000_0000h	24.5.75/ 1107
218_8270	Flow Control Pause Frames Transmitted Statistic Register (ENET1_IEEE_T_FDXFC)	32	R	0000_0000h	24.5.76/ 1108
218_8274	Octet Count for Frames Transmitted w/o Error Statistic Register (ENET1_IEEE_T_OCTETS_OK)	32	R	0000_0000h	24.5.77/ 1108
218_8284	Rx Packet Count Statistic Register (ENET1_RMON_R_PACKETS)	32	R	0000_0000h	24.5.78/ 1109
218_8288	Rx Broadcast Packets Statistic Register (ENET1_RMON_R_BC_PKT)	32	R	0000_0000h	24.5.79/ 1109
218_828C	Rx Multicast Packets Statistic Register (ENET1_RMON_R_MC_PKT)	32	R	0000_0000h	24.5.80/ 1110
218_8290	Rx Packets with CRC/Align Error Statistic Register (ENET1_RMON_R_CRC_ALIGN)	32	R	0000_0000h	24.5.81/ 1110
218_8294	Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET1_RMON_R_UNDERSIZE)	32	R	0000_0000h	24.5.82/ 1111
218_8298	Rx Packets Greater Than MAX_FL and Good CRC Statistic Register (ENET1_RMON_R_OVERSIZE)	32	R	0000_0000h	24.5.83/ 1111
218_829C	Rx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET1_RMON_R_FRAG)	32	R	0000_0000h	24.5.84/ 1112
218_82A0	Rx Packets Greater Than MAX_FL Bytes and Bad CRC Statistic Register (ENET1_RMON_R_JAB)	32	R	0000_0000h	24.5.85/ 1112

Table continues on the next page...

24.5.1 Interrupt Event Register (ENETx_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

ENETx_EIR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.

Table continues on the next page...

ENETx_EIR field descriptions (continued)

Field	Description
2 BABT	Babbling Transmit Error Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
3 GRA	Graceful Stop Complete This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop. NOTE: The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
4 TXF	Transmit Frame Interrupt Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
5 TXB	Transmit Buffer Interrupt Indicates a transmit buffer descriptor has been updated.
6 RXF	Receive Frame Interrupt Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
7 RXB	Receive Buffer Interrupt Indicates a receive buffer descriptor is not the last in the frame has been updated.
8 MII	MII Interrupt. Indicates that the MII has completed the data transfer requested.
9 EBERR	Ethernet Bus Error Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
10 LC	Late Collision Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
11 RL	Collision Retry Limit Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
12 UN	Transmit FIFO Underrun Indicates the transmit FIFO became empty before the complete frame was transmitted. A bad CRC is appended to the frame fragment and the remainder of the frame is discarded.
13 PLR	Payload Receive Error Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
14 WAKEUP	Node Wakeup Request Indication Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.

Table continues on the next page...

ENETx_EIR field descriptions (continued)

Field	Description
15 TS_AVAIL	Transmit Timestamp Available Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
16 TS_TIMER	Timestamp Timer The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
17 RXFLUSH_2	RX DMA Ring 2 flush indication. This ring's RX frame has been flushed due to either RDAR2[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_2] is enabled.
18 RXFLUSH_1	RX DMA Ring 1 flush indication. This ring's RX frame has been flushed due to either RDAR1[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_1] is enabled.
19 RXFLUSH_0	RX DMA Ring 0 flush indication. . This ring's RX frame has been flushed due to either RDAR[RDAR] or RxBD[E] being clear and only if QOS[RXFLUSH_0] is enabled.
20–22 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24 TXF2	Transmit frame interrupt, class 2 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 2).
25 TXB2	Transmit buffer interrupt, class 2 This field indicates that a transmit buffer descriptor has been updated (ring/class 2).
26 RXF2	Receive frame interrupt, class 2 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 2).
27 RXB2	Receive buffer interrupt, class 2 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 2).
28 TXF1	Transmit frame interrupt, class 1 This bit indicates that a frame has been transmitted and the last corresponding buffer descriptor has been updated (ring/class 1).
29 TXB1	Transmit buffer interrupt, class 1 This field indicates that a transmit buffer descriptor has been updated (ring/class 1).
30 RXF1	Receive frame interrupt, class 1 This field indicates that a frame has been received and the last corresponding buffer descriptor has been updated (ring/class 1).
31 RXB1	Receive buffer interrupt, class 1 This field indicates that a receive buffer descriptor, that not the last in the frame, has been updated (ring/class 1).

24.5.2 Interrupt Mask Register (ENETx_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

ENETx_EIMR field descriptions

Field	Description
0 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
1 BABR	BABR Interrupt Mask Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
2 BABT	BABT Interrupt Mask Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared. 0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
3 GRA	GRA Interrupt Mask

Table continues on the next page...

ENETx_EIMR field descriptions (continued)

Field	Description
	<p>Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p> <p>0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.</p>
4 TXF	<p>TXF Interrupt Mask</p> <p>Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p> <p>0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.</p>
5 TXB	<p>TXB Interrupt Mask</p> <p>Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p> <p>0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.</p>
6 RXF	<p>RXF Interrupt Mask</p> <p>Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
7 RXB	<p>RXB Interrupt Mask</p> <p>Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
8 MII	<p>MII Interrupt Mask</p> <p>Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
9 EBERR	<p>EBERR Interrupt Mask</p> <p>Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
10 LC	<p>LC Interrupt Mask</p> <p>Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The</p>

ENETx_EIMR field descriptions (continued)

Field	Description
	corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
11 RL	RL Interrupt Mask Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
12 UN	UN Interrupt Mask Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
13 PLR	PLR Interrupt Mask Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14 WAKEUP	WAKEUP Interrupt Mask Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_AVAIL	TS_AVAIL Interrupt Mask Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
16 TS_TIMER	TS_TIMER Interrupt Mask Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
17 RXFLUSH_2	Corresponds to interrupt source EIR[RXFLUSH_2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
18 RXFLUSH_1	Corresponds to interrupt source EIR[RXFLUSH_1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
19 RXFLUSH_0	Corresponds to interrupt source EIR[RXFLUSH_0] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXFLUSH_0] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
20–22 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

Table continues on the next page...

ENETx_EIMR field descriptions (continued)

Field	Description
23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24 TXF2	Transmit frame interrupt, class 2 Corresponds to interrupt source EIR[TXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
25 TXB2	Transmit buffer interrupt, class 2 Corresponds to interrupt source EIR[TXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
26 RXF2	Receive frame interrupt, class 2 Corresponds to interrupt source EIR[RXF2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
27 RXB2	Receive buffer interrupt, class 2 Corresponds to interrupt source EIR[RXB2] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB2] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
28 TXF1	Transmit frame interrupt, class 1 Corresponds to interrupt source EIR[TXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
29 TXB1	Transmit buffer interrupt, class 1 Corresponds to interrupt source EIR[TXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[TXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
30 RXF1	Receive frame interrupt, class 1 Corresponds to interrupt source EIR[RXF1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXF1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
31 RXB1	Receive buffer interrupt, class 1 Corresponds to interrupt source EIR[RXB1] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. EIR[RXB1] reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

24.5.3 Receive Descriptor Active Register - Ring 0 (ENETx_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring 0 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: Base address + 10h offset

ENETx_RDAR field descriptions

Field	Description
0–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 RDAR	Receive Descriptor Active Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
8–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

24.5.4 Transmit Descriptor Active Register - Ring 0 (ENETx_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring 0 has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: Base address + 14h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	
R	0						TDAR	0

ENETx_TDAR field descriptions

Field	Description
0–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TDAR	Transmit Descriptor Active Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
8–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

24.5.5 Ethernet Control Register (ENETx_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: Base address + 24h offset

ENETx_ECR field descriptions

Field	Description
0–19 Reserved	This field is reserved. This field must be set to 7_0000h.
20 SVLANDBL	S-VLAN double tag If enabled, S-VLAN detection requires a double-tagged frame to define a frame as being a VLAN frame. The following rules apply: <ul style="list-style-type: none"> • If the first tag is the S-VLAN type, it must be followed by a second tag with the C-VLAN type to declare the frame as VLAN frame. • If the first tag is the S-VLAN type but no 2nd tag follows, it is not considered a VLAN frame but instead treated as an untagged frame. • If the first tag is the C-VLAN type, it is considered a VLAN frame as normal.

Table continues on the next page...

ENETx_ECR field descriptions (continued)

Field	Description
	NOTE: VLANUSE2ND can be used to determine from which tag the data should be extracted. This applies only if SVLAN_EN = 1, ignored otherwise.
21 VLANUSE2ND	VLAN use second tag 0 Always extract data from the first VLAN tag if it exists. 1 When a double-tagged frame is detected, the data of the second tag is extracted for further processing. A double-tagged frame is defined as: <ul style="list-style-type: none"> • The first tag can be a C-VLAN or a S-VLAN (if SVLAN_ENA = 1) • The second tag must be a C-VLAN
22 SVLANEN	S-VLAN enable Enable additional detection of S-VLAN tag according to IEEE802.1Q. 0 Only the EtherType 0x8100 will be considered for VLAN detection. 1 The EtherType 0x88a8 will be considered in addition to 0x8100 (C-VLAN) to identify a VLAN frame in receive. When a VLAN frame is identified, the two bytes following the VLAN type are extracted and used by the classification match comparators, RCMRn.
23 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. NOTE: This field must be written to 1 after reset. 0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.
24 Reserved	This field is reserved. This field must be set to zero.
25 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode. 0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
26 SPEED	Selects between 10/100 and 1000 Mbps modes of operation. 0 10/100 Mbps mode 1 1000 Mbps mode
27 EN1588	EN1588 Enable Enables enhanced functionality of the MAC. 0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
28 SLEEP	Sleep Mode Enable 0 Normal operating mode. 1 Sleep mode.
29 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection.

Table continues on the next page...

ENETx_ECR field descriptions (continued)

Field	Description
	<p>NOTE: MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection.</p> <p>0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.</p>
30 ETHEREN	<p>Ethernet Enable</p> <p>Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.</p> <p>Hardware clears this field under the following conditions:</p> <ul style="list-style-type: none"> • RESET is set by software • An error condition causes the EBERR field to set. <p>NOTE:</p> <ul style="list-style-type: none"> • ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only <i>after</i> all other ENET-related registers have been configured. • If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts. <p>0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.</p>
31 RESET	<p>Ethernet MAC Reset</p> <p>When this field is set, it clears the ETHEREN field.</p>

24.5.6 MII Management Frame Register (ENETx_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: Base address + 40h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_MMFR field descriptions

Field	Description
0–1 ST	Start Of Frame Delimiter See Table 24-435 (Clause 22) or Table 24-437 (Clause 45) for correct value.
2–3 OP	Operation Code See Table 24-435 (Clause 22) or Table 24-437 (Clause 45) for correct value.
4–8 PA	PHY Address See Table 24-435 (Clause 22) or Table 24-437 (Clause 45) for correct value.
9–13 RA	Register Address See Table 24-435 (Clause 22) or Table 24-437 (Clause 45) for correct value.
14–15 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
16–31 DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

24.5.7 MII Speed Control Register (ENETx_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

If the internal module clock is 25 MHz, programming MII_SPEED to 0x4 results in an MDC as given in the following equation:

$$25 \text{ MHz} / ((4 + 1) \times 2) = 2.5 \text{ MHz}$$

The following table shows the optimum values for MII_SPEED as a function of internal module clock frequency.

Table 24-144. Programming Examples for MSCR

Internal MAC clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz

Table continues on the next page...

Table 24-144. Programming Examples for MSCR (continued)

Internal MAC clock frequency	MSCR [MII_SPEED]	MDC frequency
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: Base address + 44h offset

Bit	0	1	2	3	4	5	6	7		8	9	10	11	12	13	14	15	
R	0

R	0					HOLDTIME			DIS_	MII_SPEED						0		
W									PRE									
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0	0

ENETx_MSCR field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–23 HOLDTIME	Hold time On MDIO Output IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased. 000 1 internal module clock cycle 001 2 internal module clock cycles 010 3 internal module clock cycles 111 8 internal module clock cycles
24 DIS_PRE	Disable Preamble Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it. 0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
25–30 MII_SPEED	MII Speed Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of: $1/((MII_SPEED + 1) \times 2)$ of the internal module clock frequency
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

24.5.8 MIB Control Register (ENETx_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB_DIS field resets to 1.

Address: Base address + 64h offset

ENETx_MIBC field descriptions

Field	Description
0 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.
1 MIB_IDLE	MIB Idle

Table continues on the next page...

ENETx_MIBC field descriptions (continued)

Field	Description
	0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
2 MIB_CLEAR	MIB Clear NOTE: This field is not self-clearing. To clear the MIB counters set and then clear this field. 0 See note above. 1 All statistics counters are reset to 0.
3–31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

24.5.9 Receive Control Register (ENETx_RCR)

Address: Base address + 84h offset

ENETx_RCR field descriptions

Field	Description
0 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
1 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLC] field.
2–15 MAX_FL	Maximum Frame Length Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
16 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame. 0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
17 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. NOTE: If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed. 0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
18 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded. 0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
19 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames. 0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
20–21 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
22 RMII_10T	Enables 10-Mbps mode of the RMII or RGMII . 0 100 Mbps operation. 1 10 Mbps operation.

Table continues on the next page...

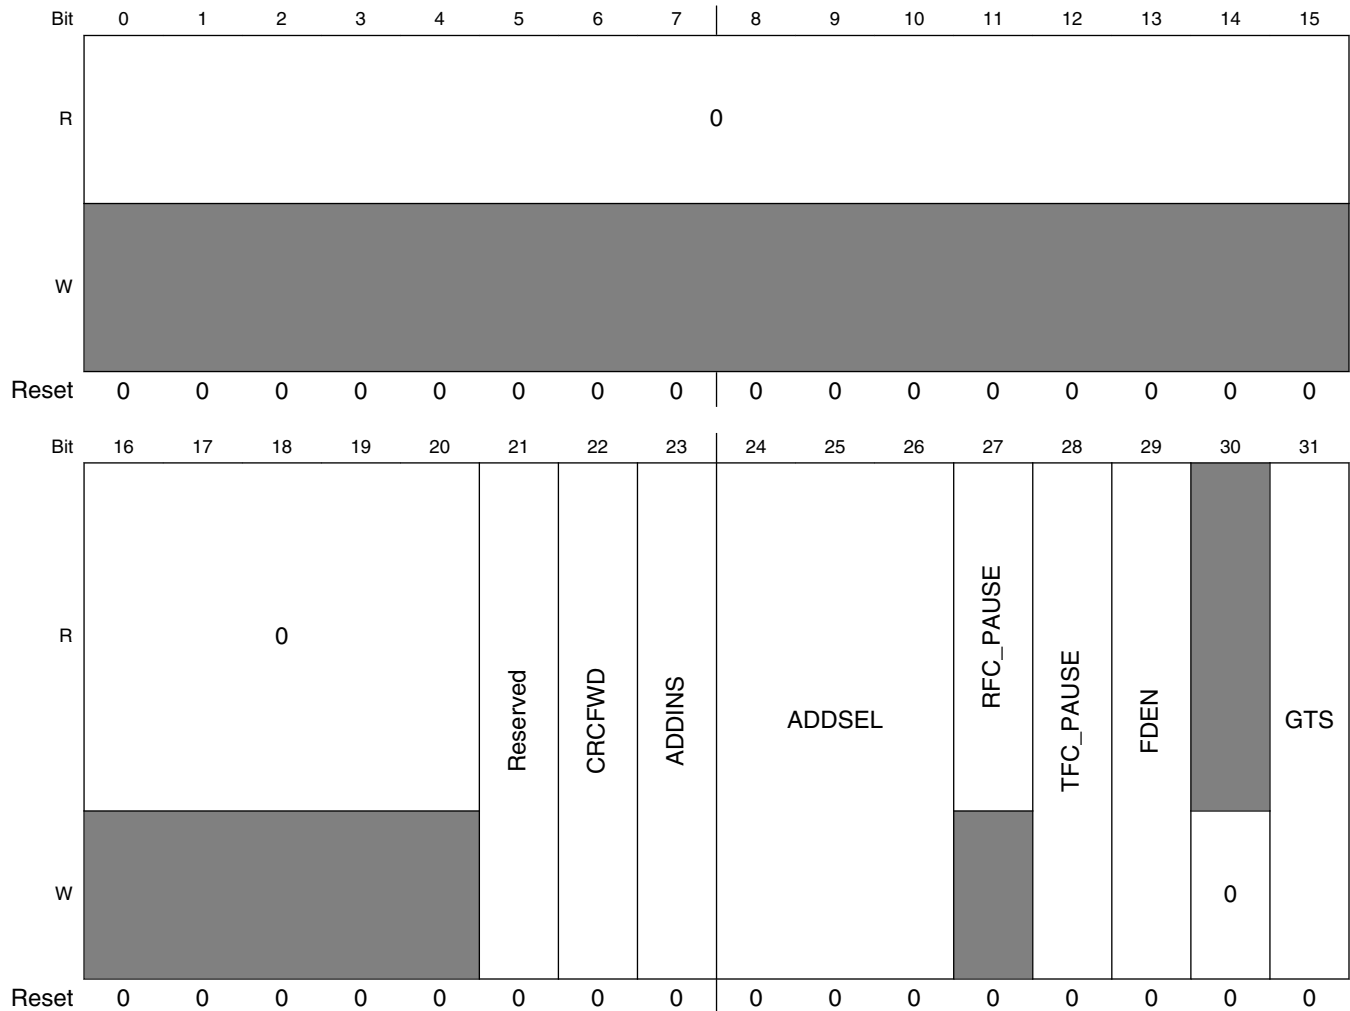

ENETx_RCR field descriptions (continued)

Field	Description
23 RMII_MODE	<p>RMII Mode Enable</p> <p>Specifies whether the MAC is configured for MII mode or RMII operation , when ECR[SPEED] is cleared .</p> <p>NOTE: Do not set both RCR[RGMIEN] and RCR[RMII_MODE].</p> <p>0 MAC configured for MII mode. 1 MAC configured for RMII operation.</p>
24 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
25 RGMII_EN	<p>RGMII Mode Enable</p> <p>NOTE: Do not set both RCR[RGMIEN] and RCR[RMII_MODE].</p> <p>0 MAC configured for non-RGMII operation 1 MAC configured for RGMII operation. If ECR[SPEED] is set, the MAC is in RGMII 1000 Mbps mode. If ECR[SPEED] is cleared, the MAC is in RGMII 10/100 Mbps mode.</p>
26 FCE	<p>Flow Control Enable</p> <p>If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.</p>
27 BC_REJ	<p>Broadcast Frame Reject</p> <p>If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.</p>
28 PROM	<p>Promiscuous Mode</p> <p>All frames are accepted regardless of address matching.</p> <p>0 Disabled. 1 Enabled.</p>
29 MII_MODE	<p>Media Independent Interface Mode</p> <p>This field must always be set.</p> <p>0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.</p>
30 DRT	<p>Disable Receive On Transmit</p> <p>0 Receive path operates independently of transmit. Used for full-duplex or to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. Normally used for half-duplex mode.</p>
31 LOOP	<p>Internal Loopback</p> <p>This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0.</p> <p>0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.</p>

24.5.10 Transmit Control Register (ENETx_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: Base address + C4h offset

ENETx_TCR field descriptions

Field	Description
0–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21 Reserved	This field is reserved. This field is read/write and must be set to 0.
22 CRCFWD	Forward Frame From Application With CRC 0 TxBD[TC] controls whether the frame has a CRC from the application. 1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.

Table continues on the next page...

ENETx_TCR field descriptions (continued)

Field	Description
23 ADDINS	Set MAC Address On Transmit 0 The source MAC address is not modified by the MAC. 1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.
24–26 ADDSEL	Source MAC Address Select On Transmit If ADDINS is set, indicates the MAC address that overwrites the source MAC address. 000 Node MAC address programmed on PADDR1/2 registers. 100 Reserved. 101 Reserved. 110 Reserved.
27 RFC_PAUSE	Receive Frame Control Pause This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.
28 TFC_PAUSE	Transmit Frame Control Pause Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame. 0 No PAUSE frame transmitted. 1 The MAC stops transmission of data frames after the current transmission is complete.
29 FDEN	Full-Duplex Enable If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.
30 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
31 GTS	Graceful Transmit Stop When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.

24.5.11 Physical Address Lower Register (ENETx_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: Base address + E4h offset

ENETx_PALR field descriptions

Field	Description
0–31 PADDR1	Pause Address Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

24.5.12 Physical Address Upper Register (ENETx_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: Base address + E8h offset

ENETx_PAUR field descriptions

Field	Description
0–15 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
16–31 TYPE	Type Field In PAUSE Frames These fields have a constant value of 0x8808.

24.5.13 Opcode/Pause Duration Register (ENETx_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: Base address + ECh offset

ENETx_OPD field descriptions

Field	Description
0–15 OPCODE	Opcode Field In PAUSE Frames These fields have a constant value of 0x0001.
16–31 PAUSE_DUR	Pause Duration Pause duration field used in PAUSE frames.

24.5.14 Transmit Interrupt Coalescing Register (ENETx_TXICn)

See [Interrupt coalescence](#) for more information.

Address: Base address + F0h offset + (4d × i), where i=0d to 2d

ENETx_TXICn field descriptions

Field	Description
0 ICEN	Interrupt Coalescing Enable

Table continues on the next page...

ENETx_TXICn field descriptions (continued)

Field	Description
	0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.
1 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
2–3 Reserved	This field must be set to 0. This field is reserved.
4–11 ICFT	Interrupt coalescing frame count threshold This value determines the number of frames needed to be transmitted for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
12–15 Reserved	This field must be set to 0. This field is reserved.
16–31 ICTT	Interrupt coalescing timer threshold Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after transmitting a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame transmission defined by ICFT and starts again upon transmission of the next first frame. Must be greater than zero to avoid unpredictable behavior.

24.5.15 Receive Interrupt Coalescing Register (ENETx_RXICn)

See [Interrupt coalescence](#) for more information.

Address: Base address + 100h offset + (4d × i), where i=0d to 2d

ENETx_RXICn field descriptions

Field	Description
0 ICEN	Interrupt Coalescing Enable 0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.

Table continues on the next page...

ENETx_RXICn field descriptions (continued)

Field	Description
1 ICCS	Interrupt Coalescing Timer Clock Source Select 0 Use MII/GMII TX clocks. 1 Use ENET system clock.
2-3 Reserved	This field must be set to 0. This field is reserved.
4-11 ICFT	Interrupt coalescing frame count threshold This value determines the number of frames needed to be received for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
12-15 Reserved	This field must be set to 0. This field is reserved.
16-31 ICTT	Interrupt coalescing timer threshold Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after receiving a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame reception defined by ICFT and starts again upon reception of the next first frame. Must be greater than zero to avoid unpredictable behavior.

24.5.16 Descriptor Individual Upper Address Register (ENETx_IAUR)

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: Base address + 118h offset

ENETx_IAUR field descriptions

Field	Description
0-31 IADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR1 contains hash index bit 63. Bit 0 of IADDR1 contains hash index bit 32.

24.5.17 Descriptor Individual Lower Address Register (ENETx_IALR)

IALR contains the lower 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the DA field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: Base address + 11Ch offset

ENETx_IALR field descriptions

Field	Description
0–31 IADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0.

24.5.18 Descriptor Group Upper Address Register (ENETx_GAUR)

GAUR contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: Base address + 120h offset

ENETx_GAUR field descriptions

Field	Description
0–31 GADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32.

24.5.19 Descriptor Group Lower Address Register (ENETx_GALR)

GALR contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: Base address + 124h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_GALR field descriptions

Field	Description
0–31 GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

24.5.20 Transmit FIFO Watermark Register (ENETx_TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR_FWD is set to '0', the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR_FWD to '1'. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

Address: Base address + 144h offset

**ENETx_TFWR field descriptions**

Field	Description
0–22 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 STRFWD	Store And Forward Enable 0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
24–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
26–31 TFWR	Transmit FIFO Write If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins. NOTE: If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given. 000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. 111111 4032 bytes written.

24.5.21 Receive Descriptor Ring 1 Start Register (ENETx_RDSR1)

RDSR1 points to the beginning of circular receive buffer descriptor queue 1 in external memory. This pointer must be 64-bit aligned (bits 29–31 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

NOTE

This register must be initialized prior to operation.

Address: Base address + 160h offset

24.5.23 Maximum Receive Buffer Size Register - Ring 1 (ENETx_MRBR1)

MRBR1 is a user-programmable register that dictates the maximum size of all ring-1 receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- To allow one maximum size frame per buffer, MRBR1 must be set to RCR[MAX_FL] or larger.
- R_BUF_SIZE is concatenated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To properly align the buffer, MRBR1 must be evenly divisible by 64. To ensure this, set the lower two bits of R_BUF_SIZE to zero. The lower four bits are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR1 greater than or equal to 256 bytes.

NOTE

This register must be initialized before operation.

Address: Base address + 168h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_RSEM field descriptions

Field	Description
0–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
11–15 STAT_SECTION_EMPTY	RX Status FIFO Section Empty Threshold Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
16–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22–31 RX_SECTION_EMPTY	Value Of The Receive FIFO Section Empty Threshold Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued. A value of 0 disables automatic pause frame generation. When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client. NOTE: The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.

24.5.32 Receive FIFO Almost Empty Threshold (ENETx_RAEM)

Address: Base address + 198h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	
R	0																					RX_ALMOST_EMPTY											
W	0																					0											
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

ENETx_RAEM field descriptions

Field	Description
0–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

ENETx_RAEM field descriptions (continued)

Field	Description
22–31 RX_ALMOST_EMPTY	Value Of The Receive FIFO Almost Empty Threshold Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.

24.5.33 Receive FIFO Almost Full Threshold (ENETx_RAFL)

Address: Base address + 19Ch offset

ENETx_RAFL field descriptions

Field	Description
0–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22–31 RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

24.5.34 Transmit FIFO Section Empty Threshold (ENETx_TSEM)

Address: Base address + 1A0h offset

ENETx_TSEM field descriptions

Field	Description
0–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

ENETx_TSEM field descriptions (continued)

Field	Description
22–31 TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold Value, in 64-bit words, of the transmit FIFO section empty threshold. See Transmit FIFO for more information.

24.5.35 Transmit FIFO Almost Empty Threshold (ENETx_TAEM)

Address: Base address + 1A4h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_FTRL field descriptions

Field	Description
0–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18–31 TRUNC_FL	Frame Truncation Length

Table continues on the next page...

ENETx_FTRL field descriptions (continued)

Field	Description
	Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL]. NOTE: Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

24.5.39 Transmit Accelerator Function Configuration (ENETx_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

Address: Base address + 1C0h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	[Reserved]															
W	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	[Reserved]											PROCHK	IPCHK	[Reserved]	SHIFT16	
W	0													0		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_TACC field descriptions

Field	Description
0–26 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
27 PROCHK	Enables insertion of protocol checksum. 0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
28 IPCHK	Enables insertion of IP header checksum. 0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.

Table continues on the next page...

ENETx_TACC field descriptions (continued)

Field	Description
29–30 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
31 SHIFT16	TX FIFO Shift-16 0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

24.5.40 Receive Accelerator Function Configuration (ENETx_RACC)

Address: Base address + 1C4h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	[Reserved]															
W	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	[Reserved]								SHIFT16	LINEDIS	[Reserved]			PRODIS	IPDIS	PADREM
W	0								SHIFT16	LINEDIS	0			PRODIS	IPDIS	PADREM
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_RACC field descriptions

Field	Description
0–23 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
24 SHIFT16	RX FIFO Shift-16 When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary. NOTE: This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received. 0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
25 LINEDIS	Enable Discard Of Frames With MAC Layer Errors

Table continues on the next page...

ENETx_RACC field descriptions (continued)

Field	Description
	0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
26–28 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
29 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum 0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
30 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum 0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
31 PADREM	Enable Padding Removal For Short IP Frames 0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

24.5.41 Receive Classification Match Register for Class n (ENETx_RCMRn)

This match register allows specifying up to four priorities, which are tested (OR'ed) simultaneously. The match detection uses the extracted VLAN field according to the rules for VLAN detection configured through the ECR register. If both match registers, RCMR1 and RCMR2, report a match at the same time, only the class 1 match is indicated as the final result.

Address: Base address + 1C8h offset + (4d × i), where i=0d to 1d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0															MATCHEN
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	0	CMP3			0	CMP2			0	CMP1			0	CMP0		
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_RCMRn field descriptions

Field	Description
0–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15 MATCHEN	Match Enable NOTE: A comparison is done only on incoming VLAN frames. If no VLAN frame is received no match will occur. If both match registers have overlapping compare values and hence can match both on the same frame, only class 1 will be indicated and the class 2 match is ignored. 0 Disabled (default): no compares will occur and the classification indicator for this class will never assert. 1 The register contents are valid and a comparison with all compare values is done when a VLAN frame is received.
16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17–19 CMP3	Compare 3 Fourth value to compare against. If unused it must be set to the same value as CMP0.
20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
21–23 CMP2	Compare 2 Third value to compare against. If unused it must be set to the same value as CMP0.
24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
25–27 CMP1	Compare 1 Second value to compare against. If unused it must be set to the same value as CMP0.
28 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
29–31 CMP0	Compare 0 A three-bit value that will be compared with the frame's VLAN priority field (if a VLAN frame is received). All four compare values, CMP0..3, will be used in parallel. If any of the values match, a match for the class is reported (if MATCHEN is 1). NOTE: To implement a single priority match, all four compare values must be set to the same value.

24.5.42 DMA Class Based Configuration (ENETx_DMAnCFG)

The DMA class based configuration registers are used to configure the DMA controller interface to support the additional class 1 (buffer descriptor ring 1) and class 2 (buffer descriptor ring 2) traffic and define configuration options such as bandwidth allocation as needed.

NOTE

The registers are cleared when ECR[ETHEREN] becomes 0.

Address: Base address + 1D8h offset + (4d × i), where i=0d to 1d

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
R	0							Reserved							CALC_NOIPG	DMA_CLASS_EN
W	[Shaded]							Reserved								
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R	IDLE_SLOPE															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_DMAnCFG field descriptions

Field	Description
0–7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8–13 Reserved	This field is reserved. NOTE: Write only zeroes to this field.
14 CALC_NOIPG	Calculate no IPG Disable inclusion of IPG bytes for bandwidth calculations. 0 The traffic shaper function should consider 12 octets of IPG in addition to the frame data transferred for a frame when doing bandwidth calculations. This is the default. 1 Addition of 12 bytes for the IPG should be omitted when calculating the bandwidth (for traffic shaping, when writing a frame into the transmit FIFO, the shaper will usually consider 12 bytes of IPG for every frame as part of the bandwidth allocated by the frame. This addition can be suppressed, meaning short frames will become more bandwidth than large frames due to the relation of data to IPG overhead).
15 DMA_CLASS_EN	DMA class enable 0 The DMA controller's channel for the class is not used. NOTE: Disabling the DMA controller of a class also requires disabling the class match comparator for the class (see registers RCMRn). When class 1 and class 2 queues are disabled then their frames will be placed in queue 0. 1 Enable the DMA controller to support the corresponding descriptor ring for this class of traffic.
16–31 IDLE_SLOPE	Idle slope

Table continues on the next page...

ENETx_DMAnCFG field descriptions (continued)

Field	Description
	<p>16-bit value to define the per class idle slope setting used by the credit based shaper defining allocated bandwidth for the class. This value is used to calculate the BW (bandwidth) fraction, given by the equation, BW fraction = 1/(1+512/IDLE_SLOPE).</p> <p>Idle slope is restricted to certain values. For values less than 128, idle slope = 2^n, where n = 0, 1, 2, ...6. For values equal to or greater than 128, idle slope = 128xm, where m = 1, 2, 3, ...12.</p> <p>Example 1. BW fraction = 0.20 = 1/(1+(512/128)); therefore idleslope = 128.</p> <p>Example 2. BW fraction = 0.33 = 1/(1+(512/256)); therefore idleslope = 256.</p> <p>Example 3. BW fraction = 0.75 = 1/(1+(512/1536)); therefore idleslope = 1536.</p> <p>NOTE: For AVB applications, the BW fraction of class 1 and class 2 combined must not exceed .75.</p>

24.5.43 Receive Descriptor Active Register - Ring 1 (ENETx_RDAR1)

RDAR1 is a command register, written by the user, to indicate that the receive descriptor ring 1 has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: Base address + 1E0h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

ENETx_RMON_T_PACKETS field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Packet count Transmit packet count

24.5.50 Tx Broadcast Packets Statistic Register (ENETx_RMON_T_BC_PKT)

RMON Tx Broadcast Packets

Address: Base address + 208h offset

ENETx_RMON_T_BC_PKT field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Broadcast packets

24.5.51 Tx Multicast Packets Statistic Register (ENETx_RMON_T_MC_PKT)

Address: Base address + 20Ch offset

ENETx_RMON_T_MC_PKT field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Multicast packets

24.5.52 Tx Packets with CRC/Align Error Statistic Register (ENETx_RMON_T_CRC_ALIGN)

Address: Base address + 210h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_RMON_T_UNDERSIZE field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Number of transmit packets less than 64 bytes with good CRC

24.5.54 Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENETx_RMON_T_OVERSIZE)

Address: Base address + 218h offset

ENETx_RMON_T_OVERSIZE field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Number of transmit packets greater than MAX_FL bytes with good CRC

24.5.55 Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENETx_RMON_T_FRAG)

Address: Base address + 21Ch offset

ENETx_RMON_T_FRAG field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 TXPKTS	Number of packets less than 64 bytes with bad CRC

24.5.56 Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENETx_RMON_T_JAB)

Address: Base address + 220h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_IEEE_T_DROP field descriptions

Field	Description
0–31 Reserved	This read-only field always has the value 0. This field is reserved.

24.5.67 Frames Transmitted OK Statistic Register (ENETx_IEEE_T_FRAME_OK)

Address: Base address + 24Ch offset

ENETx_IEEE_T_FRAME_OK field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted OK NOTE: Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

24.5.68 Frames Transmitted with Single Collision Statistic Register (ENETx_IEEE_T_1COL)

Address: Base address + 250h offset

ENETx_IEEE_T_1COL field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with one collision

24.5.69 Frames Transmitted with Multiple Collisions Statistic Register (ENETx_IEEE_T_MCOL)

Address: Base address + 254h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	
R	0															COUNT																	
W	[Shaded]

W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_T_DEF field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with deferral delay

24.5.71 Frames Transmitted with Late Collision Statistic Register (ENETx_IEEE_T_LCOL)

Address: Base address + 25Ch offset

ENETx_IEEE_T_LCOL field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with late collision

24.5.72 Frames Transmitted with Excessive Collisions Statistic Register (ENETx_IEEE_T_EXCOL)

Address: Base address + 260h offset

ENETx_IEEE_T_EXCOL field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with excessive collisions

24.5.73 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENETx_IEEE_T_MACERR)

Address: Base address + 264h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_IEEE_T_MACERR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with transmit FIFO underrun

24.5.74 Frames Transmitted with Carrier Sense Error Statistic Register (ENETx_IEEE_T_CSERR)

Address: Base address + 268h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	
R	0															COUNT																	
W	[Shaded]																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ENETx_IEEE_T_CSERR field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with carrier sense error

24.5.75 ENETx_IEEE_T_SQE

Address: Base address + 26Ch offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_IEEE_T_SQE field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of frames transmitted with SQE error NOTE: Counter not implemented (always reads zero) as no SQE information is available.

24.5.76 Flow Control Pause Frames Transmitted Statistic Register (ENETx_IEEE_T_FDXFC)

Address: Base address + 270h offset

ENETx_IEEE_T_FDXFC field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of flow-control pause frames transmitted

24.5.77 Octet Count for Frames Transmitted w/o Error Statistic Register (ENETx_IEEE_T_OCTETS_OK)

Address: Base address + 274h offset

ENETx_IEEE_T_OCTETS_OK field descriptions

Field	Description
0–31 COUNT	Octet count for frames transmitted without error NOTE Counts total octets (includes header and FCS fields).

24.5.78 Rx Packet Count Statistic Register (ENETx_RMON_R_PACKETS)

Address: Base address + 284h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31	
R	0															COUNT																	
W	[Shaded]

ENETx_RMON_R_BC_PKT field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of receive broadcast packets

24.5.80 Rx Multicast Packets Statistic Register (ENETx_RMON_R_MC_PKT)

Address: Base address + 28Ch offset

ENETx_RMON_R_MC_PKT field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of receive multicast packets

24.5.81 Rx Packets with CRC/Align Error Statistic Register (ENETx_RMON_R_CRC_ALIGN)

Address: Base address + 290h offset

ENETx_RMON_R_CRC_ALIGN field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of receive packets with CRC or align error

24.5.82 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENETx_RMON_R_UNDERSIZE)

Address: Base address + 294h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31

ENETx_IEEE_R_FDXFC field descriptions

Field	Description
0–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16–31 COUNT	Number of flow-control pause frames received

24.5.101 Octet Count for Frames Received without Error Statistic Register (ENETx_IEEE_R_OCTETS_OK)

Address: Base address + 2E0h offset

ENETx_IEEE_R_OCTETS_OK field descriptions

Field	Description
0–31 COUNT	Number of octets for frames received without error NOTE: Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

24.5.102 Adjustable Timer Control Register (ENETx_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

Address: Base address + 400h offset

ENETx_ATCR field descriptions

Field	Description
0–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
18 SLAVE	Enable Timer Slave Mode 0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
19 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20 CAPTURE	Capture Timer Value This field automatically clears to 0 after the command completes. NOTE: To ensure that the correct time value is read from the ATVR register, a minimum amount of time must elapse from issuing this command to reading the ATVR register. This minimum time is defined by the greater of either six register clock cycles or six 1588/timestamp clock cycles. 0 No effect. 1 The current time is captured and can be read from the ATVR register.
21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
22 RESTART	Reset Timer Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. NOTE: The Reset Timer command requires at least 6 clock cycles of either the register clock or the 1588/timestamp clock, whichever is greater, to complete.
23 Reserved	This field is reserved.
24 PINPER	Enables event signal output assertion on period event. NOTE: Not all devices contain the event signal output. See the chip configuration details. 0 Disable. 1 Enable.
25 Reserved	This field is reserved.
26 Reserved	This field is reserved. NOTE: This field must be written always with one.
27 PEREN	Enable Periodical Event 0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit. NOTE: Not all devices contain the event signal output. See the chip configuration details.

Table continues on the next page...

ENETx_ATCR field descriptions (continued)

Field	Description
28 OFFRST	Reset Timer On Offset Event 0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.
29 OFFEN	Enable One-Shot Offset Event 0 Disable. 1 The timer can be reset to zero when the given offset time is reached (offset event). The field is cleared when the offset event is reached, so no further event occurs until the field is set again. The timer offset value must be set before setting this field.
30 Reserved	This field is reserved.
31 EN	Enable Timer 0 The timer stops at the current value. 1 The timer starts incrementing.

24.5.103 Timer Value Register (ENETx_ATVR)

Address: Base address + 404h offset

ENETx_ATVR field descriptions

Field	Description
0–31 ATIME	A write sets the timer. A read returns the last captured value. To read the current value, issue a capture command (i.e., set ATCR[CAPTURE]) prior to reading this register.

24.5.104 Timer Offset Register (ENETx_ATOFF)

Address: Base address + 408h offset

ENETx_ATOFF field descriptions

Field	Description
0–31 OFFSET	Offset value for one-shot event generation. When the timer reaches the value, an event can be generated to reset the counter. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds.

24.5.105 Timer Period Register (ENETx_ATPER)

Address: Base address + 40Ch offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24	25	26	27	28	29	30	31
R																																
W																																
Reset	0	0	1	1	1	0	1	1	1	0	0	1	1	0	1	0	1	1	0	0	1	0	1	0	0	0	0	0	0	0	0	0

ENETx_ATPER field descriptions

Field	Description
0–31 PERIOD	Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10^9) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock <code>ts_clk</code> , hence implementing a true 1 second counter.

24.5.106 Timer Correction Register (ENETx_ATCOR)

Address: Base address + 410h offset

Bit	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

ENETx_ATCOR field descriptions

Field	Description
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1–31 COR	Correction Counter Wrap-Around Value Defines after how many timer clock cycles (<code>ts_clk</code>) the correction counter should be reset and trigger a correction increment on the timer. The amount of correction is defined in <code>ATINC[INC_CORR]</code> . A value of 0 disables the correction counter and no corrections occur. NOTE: This value is given in clock cycles, not in nanoseconds as all other values.

24.5.107 Time-Stamping Clock Period Register (ENETx_ATINC)

Address: Base address + 414h offset

Bit	0	1	2	3	4	5	6	7		8	9	10	11	12	13	14	15

ENETx_TCCRn field descriptions

Field	Description
0–31 TCC	<p>Timer Capture Compare</p> <p>This register is double buffered between the module clock and 1588 clock domains.</p> <p>When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag.</p> <p>The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow.</p> <p>When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.</p>

24.6 Functional description

This section provides a complete functional description of the MAC-NET core.

24.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)
- Extension field is defined only for Gigabit Ethernet half-duplex implementations and is not supported by the MAC core

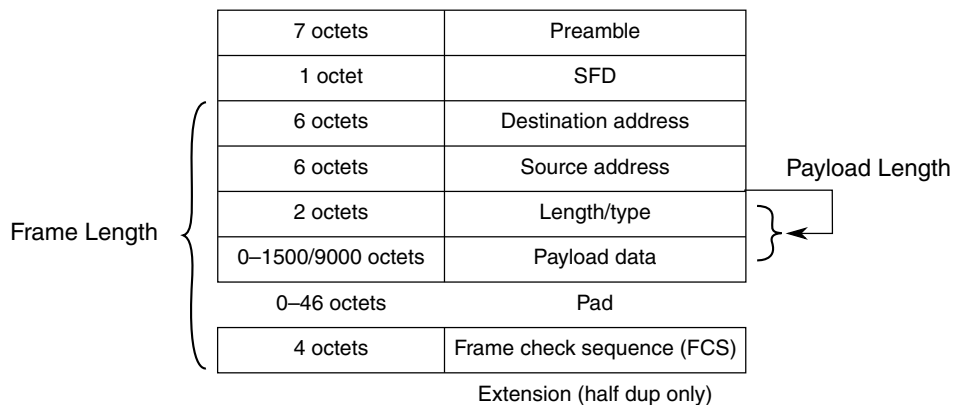

Figure 24-389. MAC frame format overview

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

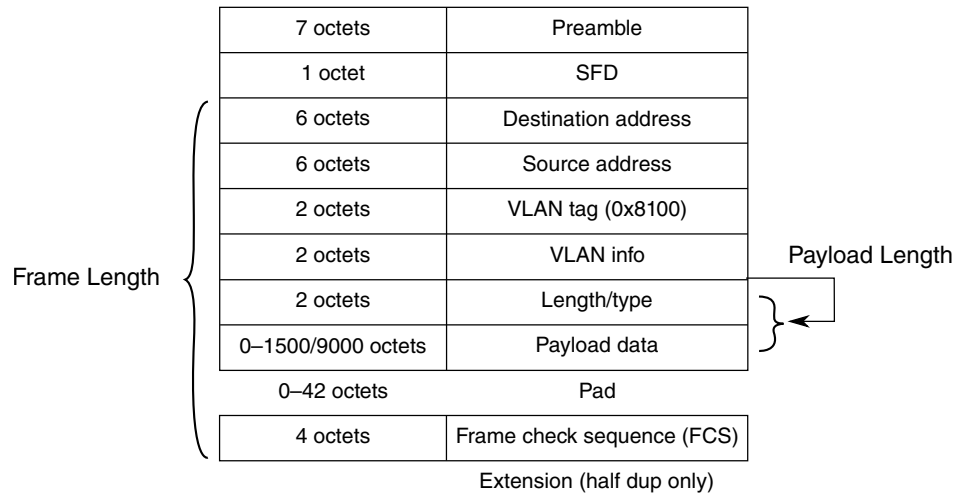

Figure 24-390. VLAN-tagged MAC frame format overview

Table 24-398. MAC frame definition

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. <ul style="list-style-type: none"> If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame. If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in MAC address check .

Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

24.6.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

Table 24-399. Pause Frame Format (Values in Hex)

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27–68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see [Full-duplex flow control operation](#) for details).

24.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in [Magic packet detection](#).

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

24.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

24.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

Table 24-400. Ethernet type value examples

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

24.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

Table 24-401. IPv4 header format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Version				IHL				TOS				Length																			
Fragment ID								Flags				Fragment offset																			
TTL				Protocol				Header checksum																							
Source address																															
Destination address																															
Options																															

Table 24-402. IPv4 header fields

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

24.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

Figure 24-391. IPv6 header format

Table 24-403. IPv6 header fields

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

24.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

Table 24-404. ICMP header format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Type								Code								Checksum															
ICMP message data																															

Table 24-405. IP header fields

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

24.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

Table 24-406. UDP header format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source port												Destination port																			
Length												Checksum																			

Table 24-407. UDP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

24.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

Table 24-408. TCP header format

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Options																															

Table 24-409. TCP header fields

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5

Table continues on the next page...

Table 24-409. TCP header fields (continued)

Field name	Description
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

24.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

24.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

24.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

[Table 24-410](#) shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

Table 24-410. UDP/IP multicast domains

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

Table 24-411. UDP port numbers

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

24.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

Table 24-412. PTPv2 multicast domains

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

24.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

24.6.3.2.1 PTPv1 header

Table 24-413. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							

Table continues on the next page...

Table 24-413. Common PTPv1 message header (continued)

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in [Table 24-414](#) :

Table 24-414. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

24.6.3.2.2 PTPv2 header

Table 24-415. Common PTPv2 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

Table 24-416. PTPv2 message type identification

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

Table 24-417. PTPv2 message flags field definitions

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

24.6.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing

- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

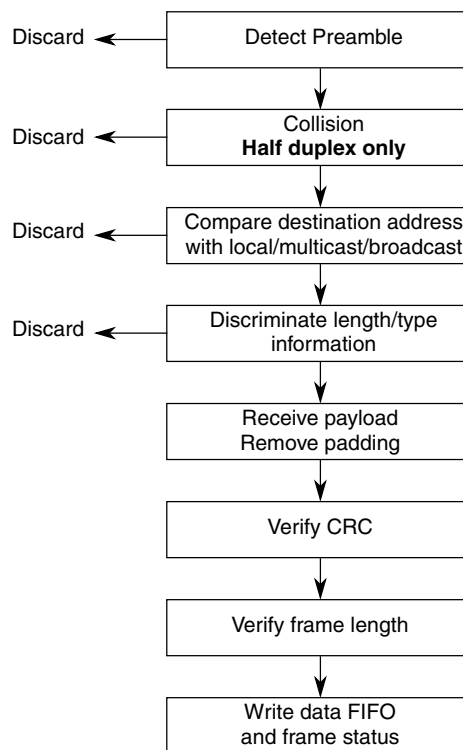

Figure 24-392. MAC receive flow

24.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

24.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100 Mbps operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

24.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

24.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled ($\text{RCR}[\text{PROM}] = 1$) no address checking is performed and all unicast frames are accepted.

24.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in $\text{ENET}_n_GAUR/GALR$ (group address hash match) or $\text{ENET}_n_IAUR/IALR$ (individual address hash match).

- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects ENET n _GAUR (msb = 1) or ENET n _GALR (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled (ENET n _RCR[PROM] = 1) all unicast and multicast frames are accepted regardless of ENET n _GAUR/GALR and ENET n _IAUR/IALR settings.

24.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if BC_REJ is cleared or ENET n _RCR[PROM] is set. If PROM is cleared when ENET n _RCR[BC_REJ] is set, all broadcast frames are rejected.

Table 24-418. Broadcast address reject programming

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

24.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes, RxBD[M] indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled (RCR[PROM] = 1), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when BC_REJ is set
- A unicast is received that does not match either:
 - Node address (PALR[PADDR1] and PAUR[PADDR2])
 - Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

24.6.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

24.6.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET_n_FTRL[TRUNC_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

24.6.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBBD[NO]) indicates that the current frame is VLAN tagged.

24.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET n _RCR[FCE] is cleared and are forwarded to the client interface when ENET n _RCR[PAUFWD] is set.

24.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET n _RCR[CRCFWD] is cleared and ENET n _RCR[PADEN] is set.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $$FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the x^{31} term as right-most bit of the first octet. The CRC bits are thus received in the following order: $x^{31}, x^{30}, \dots, x^1, x^0$.

If a CRC error is detected, the frame is marked invalid and RxBBD[CR] is set.

24.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of `ENETn_RCR[PADEN]`.

Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

24.6.4.10 Frame classification (AVB)

To support protocols such as Audio Video Bridging (AVB, IEEE 802.1Qav), normal traffic is separated from time-sensitive traffic immediately at the application interface to allow storing them in different queues for further processing. For every frame received, a classification based on VLAN priority can be performed. When a frame is received, and it contains a VLAN tag, the priority is compared against the values set in the classification match registers (see [Receive Classification Match Register for Class n \(ENET_RCMR_n\)](#)) and the following figure.

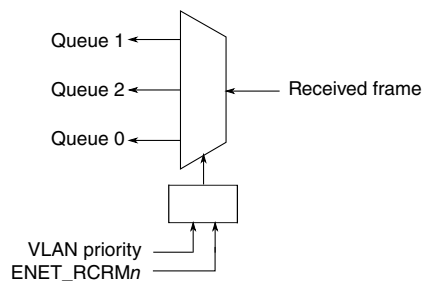

Figure 24-393. AVB frame classification

24.6.4.11 Receive flushing

RX flushing prevents frames in the RX FIFO from being blocked. Blocking can occur if the frame at the head of the RX FIFO cannot be forwarded because the ring it is associated with cannot accept it. This situation occurs when either the ring's RxB_D[EMPTY] is not set or ENET_RDAR_n is not set. When RX flushing is enabled, via [QOS Scheme \(ENET_QOS\)](#), the blocking frame will be flushed (discarded).

24.6.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if ENET_n_TCR[TFC_PAUSE] is set with ENET_n_OPD[PAUSE_DUR] set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if TFC_PAUSE is set with PAUSE_DUR cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

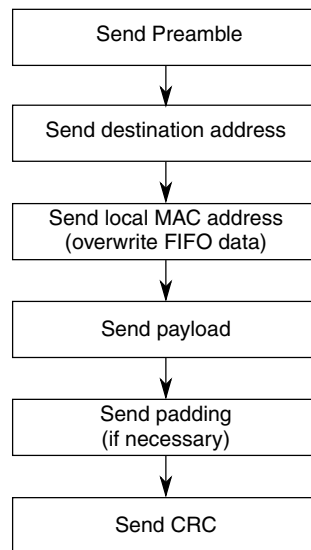

Figure 24-394. Frame transmit overview

24.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC (TxBD[TC] = 1), the user application is responsible for providing frames with a minimum length of 64 octets.

24.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields (ENET n _TCR[ADDINS] = 1)
- Transparently forwarded to the Ethernet line (ENET n _TCR[ADDINS] = 0)

24.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the FCS field so that the x^{31} term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order: x^{31} , x^{30} , ..., x^1 , x^0 .

24.6.5.4 Inter-packet gap (IPG)

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in ENET n _TIPG) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS/GMII_CRS de-assertion.

24.6.5.5 Collision detection and handling — half-duplex operation only

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets TxBD[LCE].

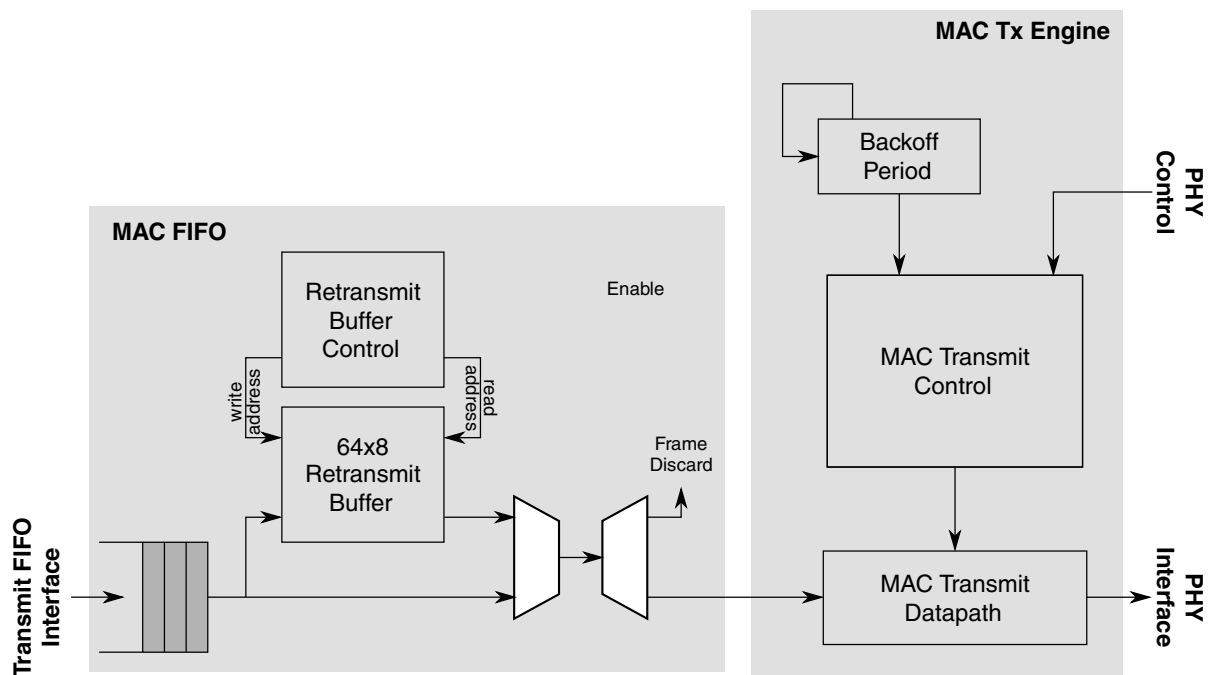

Figure 24-395. Packet re-transmit overview

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the n^{th} re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$; where n is the number of retransmissions and $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by $N = 10$ as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET n _EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

24.6.5.6 Rate limiting / traffic shaping support

The MAC-NET supports two methods to optimize frame traffic for either time-sensitive AVB frames (Class A and Class B) or best-effort non-AVB frames:

- Round-robin scheme
- Credit-based traffic shaping

To ensure that sufficient bandwidth is allocated for the AVB frames, the credit-based shaper must be used. Either method can be combined with a time-based shaper to ensure that a frame is always transmitted in its correct time slot.

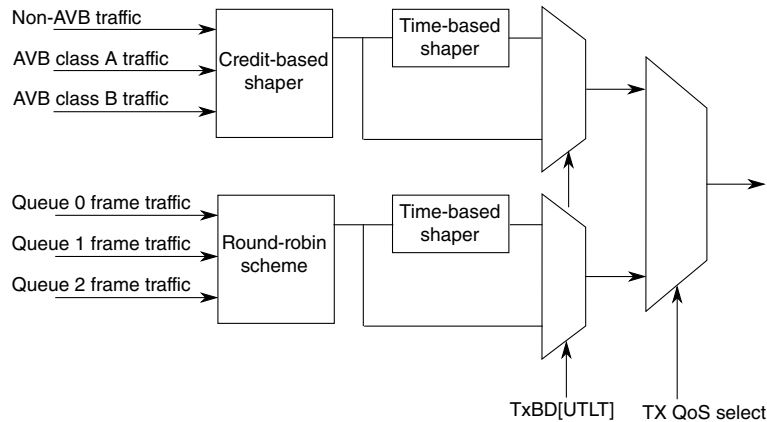

Figure 24-396. Transmit arbitration schemes

24.6.5.6.1 Round-robin policy

In the round-robin QoS scheme, each queue is given an equal opportunity to transmit one frame. For example, if queue n has a frame to transmit, the queue transmits its frame. After queue n has transmitted its frame, or if queue n does not have a frame to transmit, queue $n+1$ is then allowed to transmit its frame, and so on.

24.6.5.6.2 Credit-based shaper

The AVB credit based shaper acts independently, per class, to control the bandwidth distribution between normal traffic and time-sensitive traffic with respect to the total link bandwidth available. As per the IEEE 802.1Q, the maximum bandwidth distribution that can be allocated for the time-sensitive frames is 75%. The following example uses 70% for AVB frames and 30% for non-AVB frames:

Table 24-419. Bandwidth allocation example

AVB Class A	50%
AVB Class B	20%

Table continues on the next page...

Table 24-419. Bandwidth allocation example (continued)

non-AVB frames	30%
Total	100%

See [DMA Class Based Configuration \(ENET_DMA \$n\$ CFG\)](#) for information on how to allocate bandwidth. The following figure shows how frame traffic is controlled within the MAC-NET core.

24.6.5.6.3 Time-based shaper

The time-based shaper enables the user to specify when a frame can be transmitted. It is always used in combination with either the round-robin scheme or the credit-based shaper. Use of the time-based shaper can ensure that frames are always transmitted in the correct time slot.

24.6.5.6.3.1 Time-based shaper example

Time-based shaping involves the following procedure:

1. Read the current value of the timer. See [Timer Value Register \(ENET_ATVR\)](#) and [Adjustable Timer Control Register \(ENET_ATCR\)](#).
2. Calculate the frame launch time and write this value to the TLT field of the frame's TxBD. See [Enhanced transmit buffer descriptor](#).
3. Instruct the ENET to use the TLT by setting TxBD[UTLT].

The frame will be fetched and transmitted only if TxBD[TLT] is less than the current value of the timer. In other words, the timer must be past, that is, be greater than, the transmit launch time before the frame will be fetched and transmitted.

The transmit launch time must not be greater than the current value of ENET_ATVR + (0.5 × ENET_ATPER). This means the application can not prepare frames with launch times beyond ENET_ATVR + (0.5 × ENET_ATPER). Because ENET_ATVR wraps, calculate TLT using the equation

$$(ENET_ATVR + (0.5 \times ENET_ATPER)) \text{ mod } ENET_ATPER$$

For example, if ENET_ATPER is set to the recommended value of 1,000,000,000 ns (one second), then the user must not prepare future frames with launch times greater than (500,000,000 + ENET_ATVR).

As a specific example, if the current value of ENET_ATVR is 100,000, then you can prepare the following frames:

1. Frame 1 TxBD[TLT] = 100,000ns + 125,000ns
2. Frame 2 TxBD[TLT] = 100,000ns + 250,000ns

3. And so on

24.6.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

24.6.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if `ENETn_RCR[FCE]` is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets `ENETn_TCR[RFC_PAUSE]`.

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets `RFC_PAUSE` to zero.

If `ENETn_RCR[FCE]` cleared, the MAC ignores received pause frames.

Optionally and independent of `ENETn_RCR[FCE]`, pause frames are forwarded to the client interface if `PAUFWD` is set.

24.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET n _TCR[TFC_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET n _OPD[PAUSE_DUR].

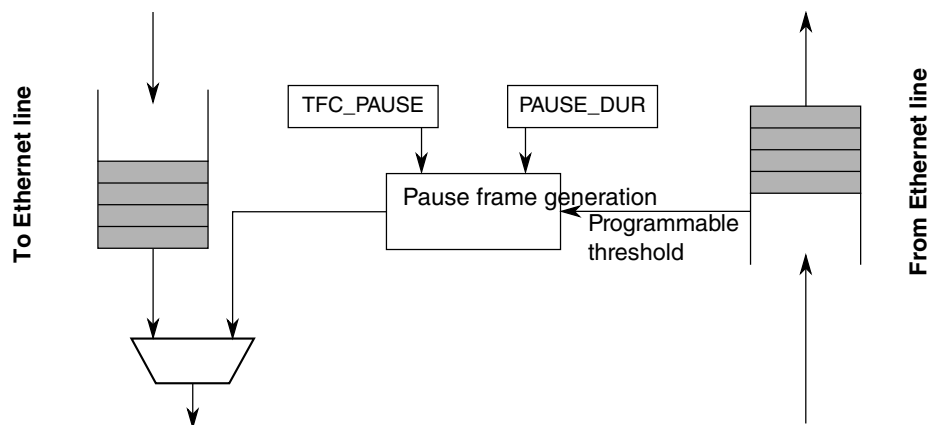

Figure 24-397. Pause frame generation overview

Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

24.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

24.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET n _ECR[SLEEP]. At the same time ENET n _ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, when the processor is in Stop mode, Sleep mode is entered, without affecting the ENET n _ECR register bits.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

24.6.7.2 Magic packet detection

The core is designed to detect magic packets (see [Magic packets](#)) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

24.6.7.3 Wakeup

When a magic packet is detected, indicated by $ENETn_EIR[WAKEUP]$, $ENETn_ECR[SLEEP]$ should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks $ENETn_ECR[MAGICEN]$, disabling magic packet detection.

24.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

24.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

Table 24-420. IPv4 pseudo-header for checksum calculation

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address

Zero				Protocol				TCP/UDP length																							

Table 24-421. IPv6 pseudo-header for checksum calculation

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
TCP/UDP length																															
Zero												Next header																			

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

24.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

24.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET $_n$ _TACC and ENET $_n$ _RACC registers.

When enabled, the valid frame data is arranged as shown in [Table 24-422](#).

Table 24-422. 64-bit interface data structure with SHIFT16 enabled

63	56	55	48	47	40	39	32	31	24	23	16	15	8	7	0
----	----	----	----	----	----	----	----	----	----	----	----	----	---	---	---

Table continues on the next page...

Table 24-422. 64-bit interface data structure with SHIFT16 enabled (continued)

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

24.6.8.3.1 Receive processing

When `ENETn_RACC[SHIFT16]` is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

24.6.8.3.2 Transmit processing

When `ENETn_TACC[SHIFT16]` is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

24.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (`ENETn_RSFL` cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
 - The frame has an invalid payload length
 - Frame length is greater than `MAX_FL`
 - Frame received with a CRC-32 error
 - Frame truncated due to receive FIFO overflow
 - Frame is corrupted as PHY signaled an error (`RX_ERR` asserted during reception)

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET n _RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

24.6.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxBDFRAG) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxBDPayload checksum].

Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

24.6.8.6 IPv6 support

The following sections describe the IPv6 support.

24.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see [32-bit Ethernet payload alignment](#)).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

24.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

24.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

24.6.9.1 Hardware reset

To reset the Ethernet module, set ENET n _ECR[RESET].

24.6.9.2 Soft reset

When ENET n _ECR[ETHER_EN] is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting GMII/TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

24.6.9.3 Hardware freeze

When the processor enters debug mode and ECR[DBGEN] is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII/GMII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

24.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing ETHER_EN is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

24.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET n _TCR[GTS] is set by software.
- ENET n _TCR[TFC_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see [Sleep mode](#)).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

24.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see [Magic packet detection](#)). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII/GMII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
 - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
 - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

Note

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

24.6.9.4.3 Graceful stop interrupt (GRA)

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

24.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set `ENETn_ECR[EN1588]` to enable 1588 support.

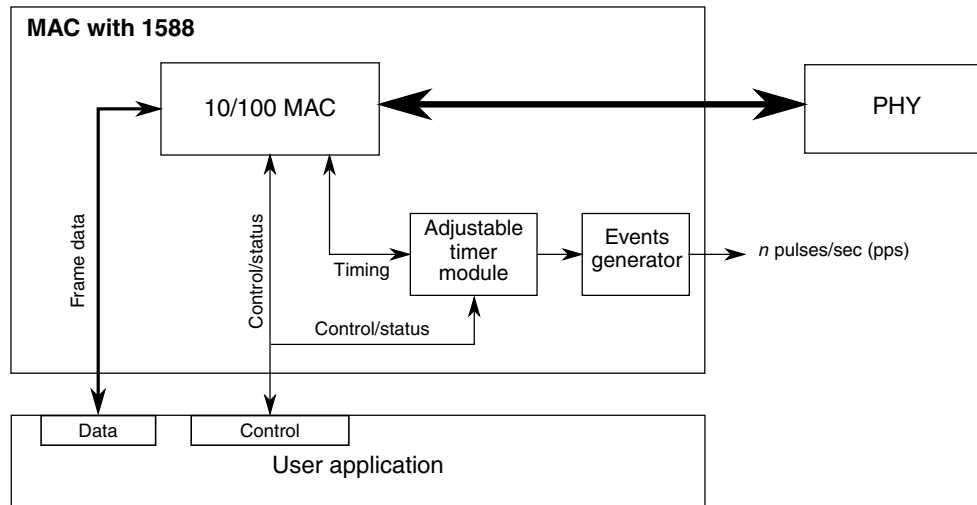

Figure 24-398. IEEE 1588 functions overview

24.6.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to $(1 \times 10^9) - 1$. The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

24.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

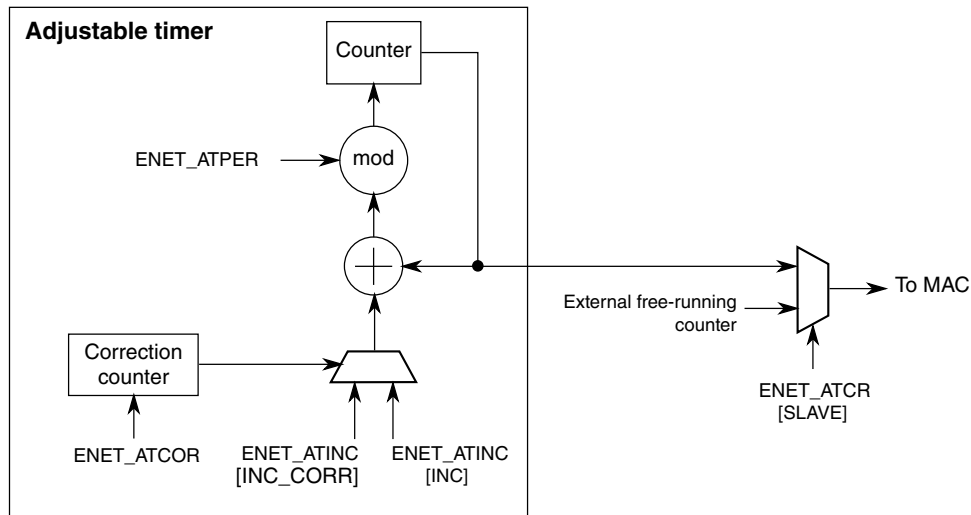

Figure 24-399. Adjustable timer implementation detail

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in $ENETn_ATINC$. The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in $ENETn_ATPER$, defines the modulo when the counter wraps. In a typical implementation, the period is set to 1×10^9 so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value $(Current + Inc - (1 \times 10^9))$, assuming the period is set to 1×10^9 .

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in $ENETn_ATCOR$, it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in $ENETn_ATINC$. To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode ($ENETn_ATCR[SLAVE] = 1$), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET n _ATINC[INC] to the value of the master, since it is used for internal comparisons.

24.6.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET n _ATSTMP. ENET n _EIR[TS_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET n _EIR[TS_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET n _ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

24.6.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBBD[1588 timestamp]. This is done for all received frames.

24.6.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to $(1 \times 10^9) - 1$. In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at 1×10^9 .

24.6.10.5 Input Capture and Output Compare

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

24.6.10.5.1 Input capture

The $TCCR_n$ capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the 1588_TMR_n signals. An event will cause the corresponding $TCSR_n[TF]$ timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the $TCSR_n[TIE]$ field, an interrupt can be generated.

24.6.10.5.2 Output compare

The $TCCR_n$ compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the $TCCR_n$ register, the corresponding flag, $TCSR_n[TF]$, is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by $TCSR_n[TIE]$, will be generated. The corresponding 1588_TMR_n output signal will be asserted according to $TCSR_n[TMODE]$.

24.6.10.5.3 DMA requests

A DMA request can be enabled by setting $TCSR_n[TDRE]$. The corresponding DMA request is generated when the $TCSR_n[TF]$ timer flag is set. When the DMA has completed, the corresponding $TCSR_n[TF]$ flag is cleared.

24.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

Functional description

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 1024 words.

24.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

Table 24-423. Receive FIFO thresholds definition

Register	Description
ENET n _RSFL [RX_SECTION_F ULL]	<p>When the FIFO level reaches the ENETn_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENETn_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again.</p> <p>If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted.</p> <p>To enable store and forward on the receive path, clear ENETn_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO.</p> <p>When programming a non-zero value to ENETn_RSFL (cut-through operation) it should be greater than ENETn_RAEM.</p>
ENET n _RAEM [RX_ALMOST_E MPTY]	<p>When the FIFO level reaches the ENETn_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application).</p> <p>It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO.</p> <p>Set ENETn_RAEM to a minimum of six.</p>
ENET n _RAFL [RX_ALMOST_F ULL]	<p>When the FIFO level approaches the maximum and there is no more space remaining for at least ENETn_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow.</p> <p>The corresponding error status is set when the frame is delivered to the application.</p> <p>Set ENETn_RAFL to a minimum of 4.</p>
ENET n _RSEM [RX_SECTION_E MPTY]	<p>When the FIFO level reaches the ENETn_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client.</p> <p>When the FIFO level goes below the value programmed in ENETn_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client.</p> <p>Clearing ENETn_RSEM disables any pause frame generation.</p>

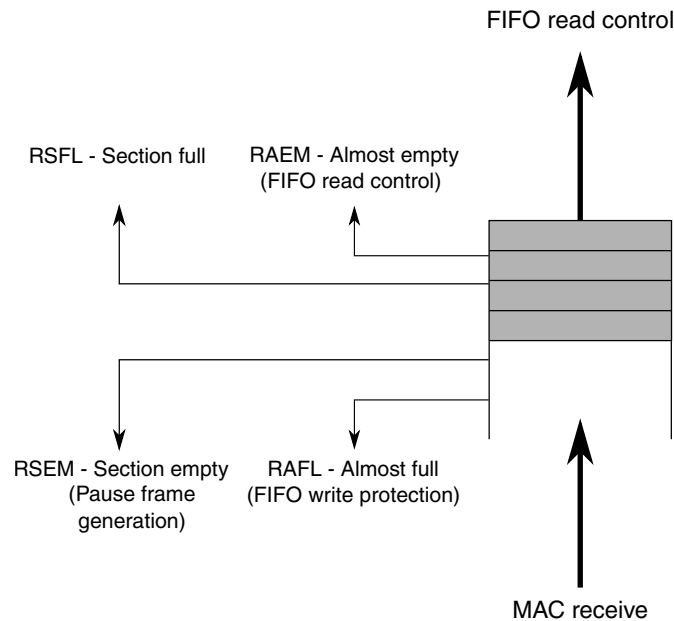

Figure 24-400. Receive FIFO overview

24.6.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 24-424. Transmit FIFO thresholds definition

Register	Description
ENET n _TAEM [TX_ALMOST_EMPTY]	When the FIFO level reaches the ENET n _TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET n _TAEM to a minimum of 4.
ENET n _TAFL [TX_ALMOST_FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET n _TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an GMII/MII error indication. Set ENET n _TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET n _TSEM [TX_SECTION_EMPTY]	When the FIFO level reaches the ENET n _TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET n _TSEM is 0, the signal is never deasserted.
ENET n _TFWR	When the FIFO level reaches the ENET n _TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

Table 24-424. Transmit FIFO thresholds definition

Register	Description
	<p>If a complete frame has a size smaller than the ENET$_n$_TFWR threshold, the MAC also transmits the frame to the line.</p> <p>To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.</p>

Figure 24-401. Transmit FIFO overview

24.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET $_n$ _RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET $_n$ _RCR register fields:

Table 24-425. Loopback options

Register field	Description
LOOP	<p>Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces.</p> <p>In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s)</p>

Figure 24-402. Loopback options

24.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous Freescale devices, legacy FEC buffer descriptors are available. To enable legacy support, clear ENETn_ECR[1588EN].

NOTE

- Legacy buffer descriptors are used in single-ring mode, that is, when DMA_nCFG[DMA_CLASS_EN] are zero. In multi-ring mode, legacy TxBDs are used only with the round-robin scheme.
- The legacy buffer descriptor tables show the byte order for little-endian chips. [DBSWP](#) must be set to 1 after reset to enable little-endian mode.

24.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. [Table 24-429](#) contains the descriptions for each field.

Table 24-426. Legacy FEC receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

Offset + 4	Tx Data Buffer Pointer — low halfword															
Offset + 6	Tx Data Buffer Pointer — high halfword															

1. This field is not supported by the uDMA.

24.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET_n_ECR[1588EN].

NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. [DBSWP](#) must be set to 1 after reset to enable little-endian mode.

24.6.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. [Table 24-429](#) contains the descriptions for each field.

Table 24-428. Enhanced uDMA receive buffer descriptor (RxBd)

Table 24-429. Receive buffer descriptor field definitions

Word	Field	Description
Offset + 0	0–15 Data Length	Data length. Written by the MAC. Data length is the number of octets written by the MAC into this BD's data buffer if L is cleared (the value is equal to EMRBR), or the length of the frame including CRC if L is set. It is written by the MAC once as the BD is closed.
Offset + 2	0 E	Empty. Written by the MAC (= 0) and user (= 1). 0 The data buffer associated with this BD is filled with received data, or data reception has aborted due to an error condition. The status and length fields have been updated as required. 1 The data buffer associated with this BD is empty, or reception is currently in progress.
Offset + 2	2 RO1	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	2 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location. 1 The next buffer descriptor is found at the location defined in ENET _n _RDSR.
Offset + 2	3 RO2	Receive software ownership. This field is reserved for use by software. This read/write field is not modified by hardware, nor does its value affect hardware.
Offset + 2	4 L	Last in frame. Written by the uDMA. 0 The buffer is not the last in a frame. 1 The buffer is the last in a frame.
Offset + 2	5–6	Reserved, must be cleared.
Offset + 2	7 M	Miss. Written by the MAC. This field is set by the MAC for frames accepted in promiscuous mode, but flagged as a miss by the internal address recognition. Therefore, while in promiscuous mode, you can use the this field to quickly determine whether the frame was destined to this station. This field is valid only if the L and PROM bits are set. 0 The frame was received because of an address recognition hit.

Table continues on the next page...

Table 24-429. Receive buffer descriptor field definitions (continued)

Word	Field	Description
		1 The frame was received because of promiscuous mode. The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	8 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	9 MC	Set if the DA is multicast and not BC.
Offset + 2	10 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	11 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	12	Reserved, must be cleared.
Offset + 2	13 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	14 OV	Overflow. Written by the MAC. A receive FIFO overflow occurred during frame reception. If this field is set, the other status fields, M, LG, NO, CR, and CL, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	15 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	0–15 Data buffer pointer low	Receive data buffer pointer, low halfword
Offset + 6	0–15 Data buffer pointer high	Receive data buffer pointer, high halfword ¹
Offset + 8	0–2 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + 8	3–9	Reserved, must be cleared.
Offset + 8	10 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	11 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	12	Reserved, must be cleared.
Offset + 8	13 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.

Table continues on the next page...

Table 24-429. Receive buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	14 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	15 FRAG	IPv4 Fragment. This is an accelerator option. This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + A	0 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	1–4	Reserved, must be cleared.
Offset + A	5 PE	PHY Error. This field is written by the uDMA. Set to "1" when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	6 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	7 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	8 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the <i>dma_int_rxb / dma_int_rxfevent</i> .
Offset + A	9–15	Reserved, must be cleared.
Offset + C	0–15 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + E	0–4 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: <ul style="list-style-type: none"> • ICMP/IP: 6 (5 IP header, 1 ICMP header) • UDP/IP: 7 (5 IP header, 2 UDP header) • TCP/IP: 10 (5 IP header, 5 TCP header) This field is only valid if the L field is set.
Offset + E	5–7	Reserved, must be cleared.
Offset + E	8–15 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	0–15	Reserved, must be cleared.
Offset + 12	0 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	1–15	Reserved, must be cleared.
Offset + 14	0–15	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		

Table continues on the next page...

Table 24-429. Receive buffer descriptor field definitions (continued)

Word	Field	Description
	1588 timestamp	
Offset + 18 – Offset + 1E	0–15	Reserved, must be cleared.

1. The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

24.6.14.2 Enhanced transmit buffer descriptor

Table 24-431. Enhanced transmit buffer descriptor field definitions

Word	Field	Description
Offset + 0	0–15 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	0 R	Ready. Written by the MAC and you.

Table continues on the next page...

Table 24-431. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
		0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 2	1 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	2 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 2	3 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	4 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame
Offset + 2	5 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 2	6 ABC	Append bad CRC. Note: This field is not supported by the uDMA and is ignored.
Offset + 2	7–15	Reserved, must be cleared.
Offset + 4	0–15 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	0–15 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. NOTE: For optimal performance, make the transmit buffer pointer evenly divisible by 64.
Offset + 8	0 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	1	Reserved, must be cleared.
Offset + 8	2 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	3 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.

Table continues on the next page...

Table 24-431. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
Offset + 8	4 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	5 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	6 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	7 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type than a timestamp frame. This field is valid only when the L field is set.
Offset + 8	8–15	Reserved, must be cleared.
Offset + A	0	Reserved, must be cleared.
Offset + A	1 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	2 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	3 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	4 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	5–6	Reserved, must be cleared.
Offset + A	7 UTLT	Use transmit launch time. If set to 1, TLT high and low values are used to determine if frame can be transmitted. This field must only be set in the <i>first</i> BD of a frame. TLT is always used in combination with either the round-robin scheme or the credit-based shaper. TLT can be used with a single BD queue. However, at least one DMA class, <code>DMAnCFG[DMA_CLASS_EN]</code> must be enabled. For example, to use TLT with only queue 0, enable one of the <code>DMAnCFG[DMA_CLASS_EN]</code> fields and clear both TDAR1 and TDAR2. Although this enables multi-queue, only the single queue 0 is used.
Offset + A	8–11 FTYPE	Type of frame to be transmitted. If a credit-based scheme is used, this field must match the BD ring queue. 0x0 – Non-AVB. Corresponds to ENET_TDSR. 0x1 – AVB Class A. Corresponds to ENET_TDSR1. 0x2 – AVB Class B. Corresponds to ENET_TDSR2.

Table continues on the next page...

Table 24-431. Enhanced transmit buffer descriptor field definitions (continued)

Word	Field	Description
		All other values are reserved.
Offset + A	12–15	Reserved, must be cleared.
Offset + C	0–15 TLT low	Transmit launch time low. Low two bytes of time value that specifies when frame can be transmitted.
Offset + E	0–15 TLT high	Transmit launch time high. High two bytes of time value that specifies when frame can be transmitted.
Offset + 10	0–15	Reserved, must be cleared.
Offset + 12	0 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	1–15	Reserved, must be cleared.
Offset + 14	0–15	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16	1588 timestamp	
Offset + 18–Offset + 1E	0–15	Reserved, must be cleared.

24.6.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

24.6.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

Table 24-432. FIFO interface data structure

	63	56 55	48 47	40 39	32 31	24 23	16 15	8 7	0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	
...	...								

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

Functional description

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

Note

On transmit, if `ENETn_TCR[ADDINS]` is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the `ENETn_PAUR` and `ENETn_PALR` registers.

Table 24-433. FIFO interface frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

Table 24-434. FIFO interface VLAN frame format

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

Note

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

24.6.15.2 Data structure examples

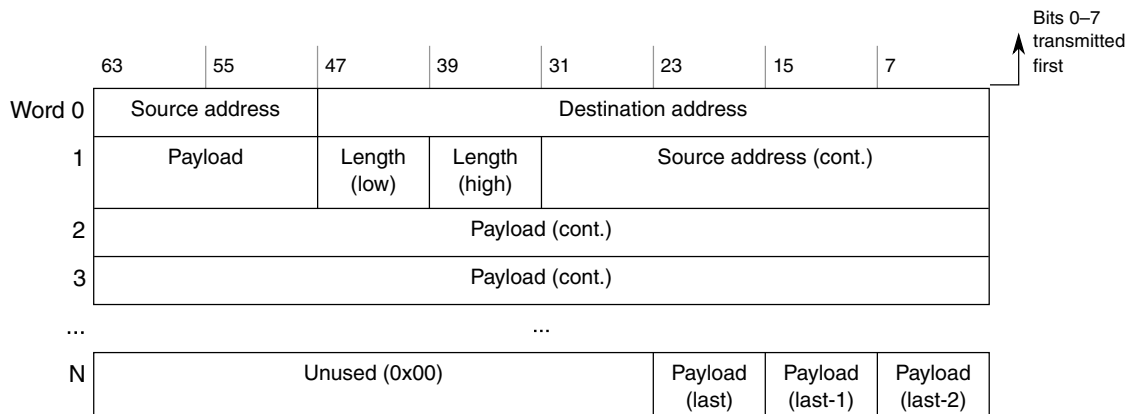

Figure 24-403. Normal Ethernet frame 64-bit mapping example

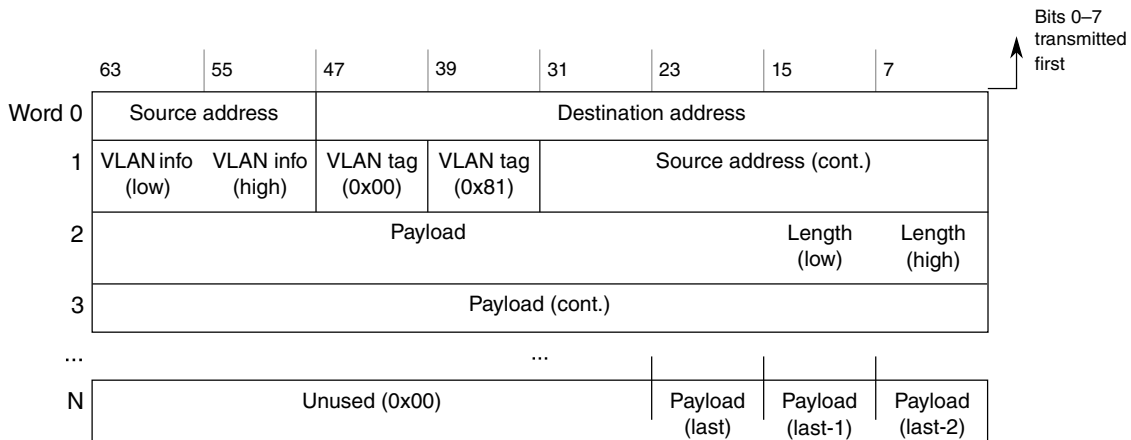

Figure 24-404. VLAN-tagged frame 64-bit mapping example

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

24.6.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See [Enhanced buffer descriptors](#) for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxB[ME] is also set with the last data of the frame.

24.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

24.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII_TXER) (1 in [Figure 24-405](#)) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

Figure 24-405. Transmit FIFO underflow protection

24.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurrence.

Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET n _ECR[ETHER_EN], to clear the FIFOs and prepare for normal operation again.

24.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

Figure 24-406. Receive FIFO overflow protection

24.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

24.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

Table 24-435. MDIO clause 22 frame structure

ST	OP	PHYADR	REGADR	TA	DATA
----	----	--------	--------	----	------

Table 24-436. MDIO frame field descriptions

Field	Description
ST (2 bits)	Start indication field, programmed with ENET $_n$ _MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET $_n$ _MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET $_n$ _MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET $_n$ _MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET $_n$ _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data (16 bits)	Data, set by ENET $_n$ _MMFR[DATA]. Written to or read from the PHY

24.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

Table 24-437. MDIO clause 45 frame structure

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA
----	----	-------	-------	----	-----------

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

Table 24-438. MDIO clause 45 frame field descriptions

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET n _MMFR[OP]. See Table 24-439 for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET n _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
ADDR/DATA	16-bit address (for address write) or data, set by ENET n _MMFR[DATA], written to or read from the PHY.

Table 24-439. MDIO Clause 45 Transactions

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

24.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock divided by the value programmed in ENET $_n$ _MSCR[MII_SPEED].

24.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENET $_n$ _MMFR) according to the description provided in MII Management Frame Register (ENET $_n$ _MMFR).

To check when the programmed access completes, read the ENET $_n$ _EIR[MII] field.

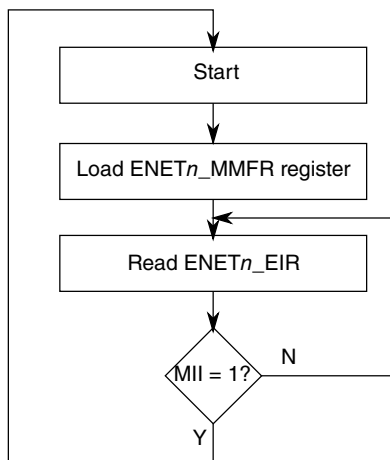

Figure 24-407. MDIO access overview

24.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets
- RGMII 10/100/1000 by way of interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	ECR[SLEEP]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMIEN]
MII - 10 Mbit/s	0	—	0	0
MII - 100 Mbit/s	0	—	0	0
RMII - 10 Mbit/s	0	1	1	0

Table continues on the next page...

Functional description

Mode	ECR[SLEEP]	RCR[RMII_10T]	RCR[RMII_MODE]	RCR[RGMII_EN]
RMII - 100 Mbit/s	0	0	1	0
RGMII - 10 Mbit/s	0	1	0	1
RGMII - 100 Mbit/s	0	0	0	1
RGMII - 1000 Mbit/s	1	—	0	1

24.6.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

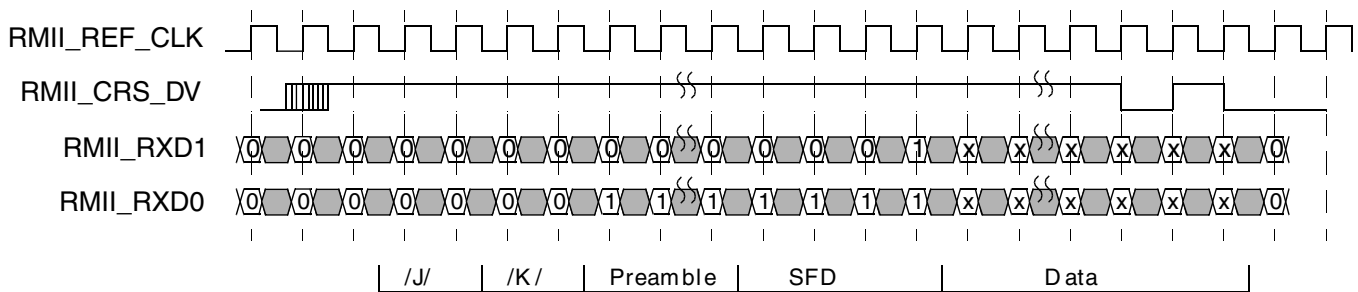

Figure 24-408. RMII receive operation

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

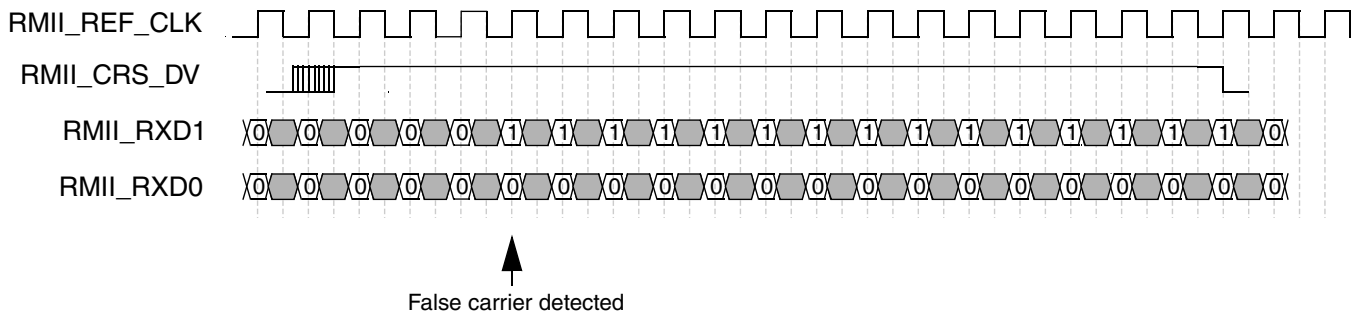

Figure 24-409. RMII receive operation with false carrier

In RMII transmit mode, TXD[1:0] provides valid data for each REF_CLK period while TXEN is asserted.

Figure 24-410. RMIITransmit operation

24.6.18.2 RGMII interface

In RGMII modes, the data and control information is multiplexed by taking advantage of both edges of the reference clocks.

The data signals contain the lower four data bits on the rising edge and the upper four bits on the falling edge. The control signals are multiplexed into a single clock cycle using the same technique.

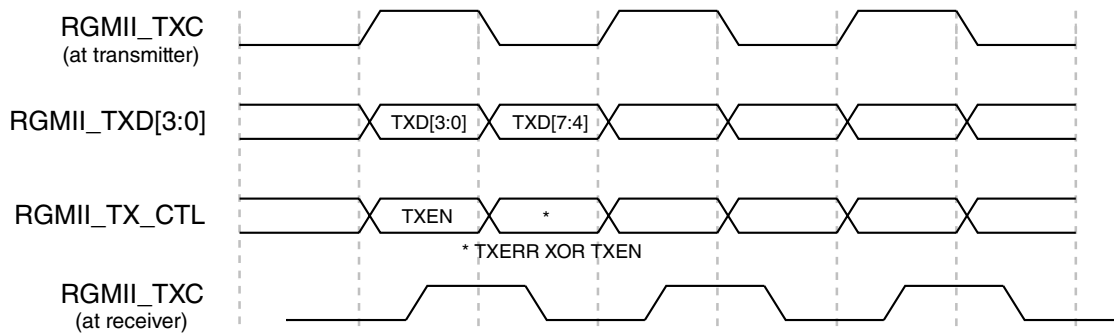

Figure 24-411. RGMII transmit operation

Figure 24-412. RGMII receive operation

24.6.18.3 MII Interface — transmit

On transmit, all data transfers are synchronous to MII_TXCLK rising edge. The MII data enable signal MII_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII_TXD[3:0] bus.

Between frames, MII_TXEN remains deasserted.

Figure 24-413. MII transmit operation

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII_TXER error signal for one clock cycle at any time during the packet transfer.

Figure 24-414. MII transmit operation — errored frame

24.6.18.3.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See [Collision detection in half-duplex mode](#) for details)

Figure 24-415. MII transmit operation — transmission with collision

24.6.18.4 MII interface — receive

On receive, all signals are sampled on the MII_RXCLK rising edge. The MII data enable signal, MII_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII_RXD[3:0] bus.

Between frames, MII_RXDV remains deasserted.

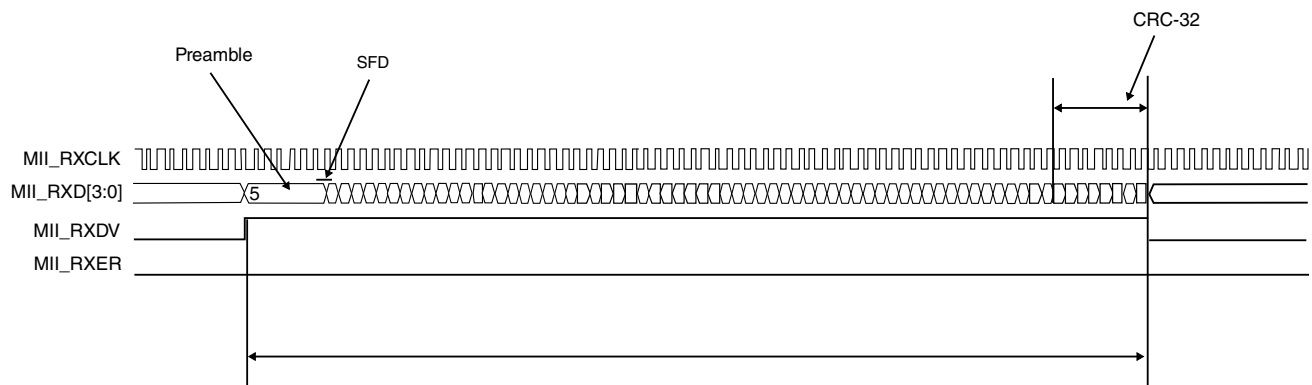

Figure 24-416. MII receive operation

Functional description

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII_RXER, for at least one clock cycle at any time during the packet transfer.

Figure 24-417. MII receive operation — errored frame

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

24.6.19 AVB configuration

The following steps give an example of how to initialize the ENET module for AVB.

1. Set up ENET_QOS:
 - Set TX_SCHEME to 000b, credit-based scheme.
 - Set RX_FLUSH0 to 1, enable RX flush for ring 0.
2. Set up TX BD ring and RX BD ring for each queue, 0-2.
 - Program ENET_MRBR, ENET_TDSR, and ENET_RDSR.
 - Program ENET_MRBR1, ENET_TDSR1, and ENET_RDSR1.
 - Program ENET_MRBR2, ENET_TDSR2, and ENET_RDSR2.
 - Program each TX and RX BD ring queue for all classes used in memory.

NOTE

If using credit-based scheme, ensure that enhanced transmit buffer descriptor FTYPE field matches BD ring queue, for example:

- FTYPE = 0h corresponds to ENET_TDSR
- FTYPE = 1h corresponds to ENET_TDSR1
- FTYPE = 2h corresponds to ENET_TDSR2

3. Program ENET_DMA1CFG and ENET_DMA2CFG for class 1 and class 2 corresponding to BD ring queue 1 and 2. DMA_CLASS_EN must be set to one for

that class to be enabled. See [DMA Class Based Configuration \(ENET_DMA \$n\$ CFG\)](#) for information on how to program IDLE_SLOPE.

4. Program ENET_RCMR1 and ENET_RCMR2 for class 1 and class 2 matching for receive.

NOTE

Even if a match occurs, if ENET_DMA n CFG[DMA_CLASS_EN] is zero for the corresponding class, the RX frame will be automatically forwarded to BD ring queue 0.

5. Program the other ENET registers according to application requirements.
6. Program ENET_RDAR, ENET_RDAR1, ENET_RDAR2, ENET_TDAR, ENET_TDAR1, and ENET_TDAR2 to 0100_0000h according to the classes used.
7. Set ENET_ECR[ETHEREN] to one.

24.6.20 Interrupt coalescence

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing for each queue, these registers are available with the same control and configuration fields.

- [Transmit Interrupt Coalescing Register \(ENET_TXIC \$n\$ \)](#) where $n=0,1,2$ for queue/class 0,1,2.
- [Receive Interrupt Coalescing Register \(ENET_RXIC \$n\$ \)](#) where $n=0,1,2$ for queue/class 0,1,2.

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

24.6.20.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
 - Set the INT bit in the enhanced received buffer descriptor to one.
 - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the RXB, RXB1, and RXB2 fields in the EIMR register.
- Clear the TXB, TXB1, and TXB2 fields in the EIMR register.

24.6.20.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC n and TXIC n registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

NOTE

The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

24.6.20.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC n and TXIC n registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

Chapter 25

Enhanced Periodic Interrupt Timer (EPIT)

25.1 Overview

EPIT is a 32-bit set-and-forget timer that is capable of providing precise interrupts at regular intervals with minimal processor intervention. EPIT begins counting after it is enabled by software.

The following figure shows the EPIT block diagram.

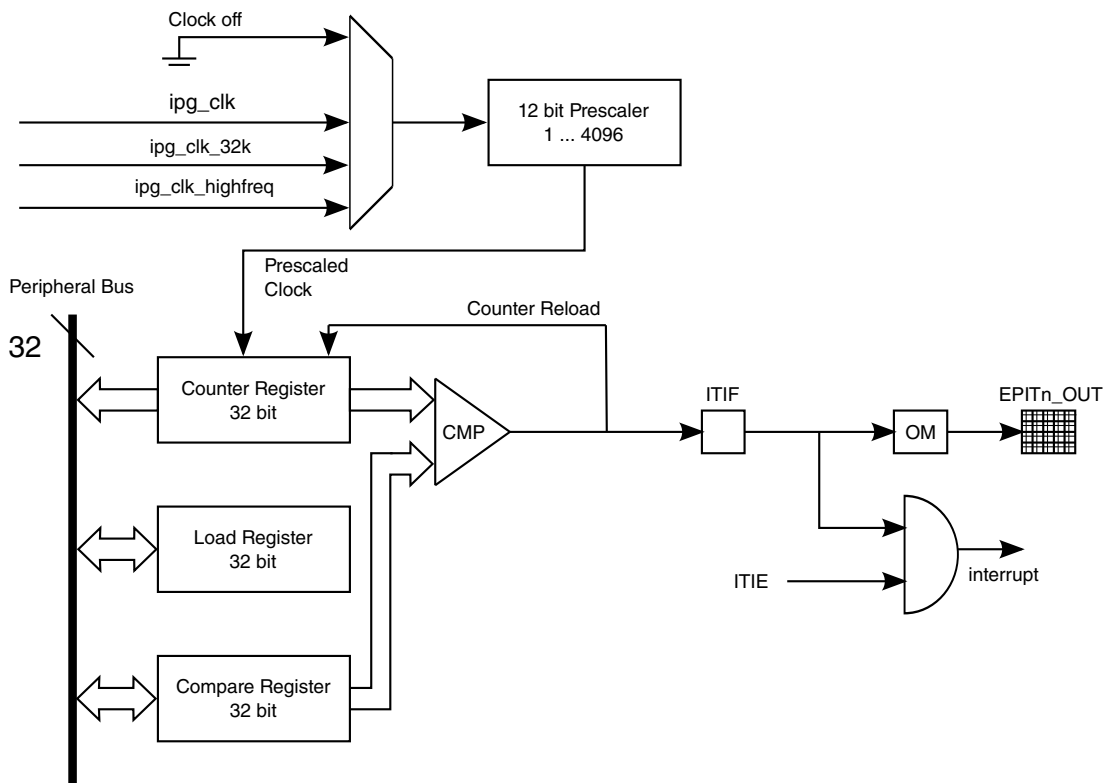

Figure 25-1. EPIT block diagram

25.1.1 EPIT features

EPIT has the following key features:

- 32-bit down counter with clock source selection
- 12-bit prescaler for division of input clock frequency
- Counter value that can be programmed on the fly
- Can be programmed to be active during low-power and debug modes
- Interrupt generation when counter reaches the compare value

25.1.2 EPIT modes and operations

EPIT supports the following modes: set-and-forget and free running. See the following sections for more information.

- [Operating in set-and-forget mode](#)
- [Operating in free-running mode](#)

See [Operations](#) for a description of the operations that EPIT supports.

25.2 External signals

The following table describes EPIT's I/O signals.

Table 25-1. EPIT External Signals

Signal	Description	Pad	Mode	Direction
EPIT1_OUT	Output 1 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	ENET1_MDIO	ALT4	O
EPIT2_OUT	Output 2 pin at chip boundary for indicating the occurrence of an output compare event through a specified transition.	ENET1_MDC	ALT4	O

25.3 Clocks

The table found here describes the clock sources for EPIT.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 25-2. EPIT Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

The clock that feeds the prescaler can be selected from among the following sources:

- **High-frequency reference clock (ipg_clk_highfreq)**

This clock is provided by the Clock Control Module (CCM). This clock remains on during low-power mode when the peripheral clock is turned off, allowing EPIT to use this clock in low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version.

- **Low-frequency reference clock (ipg_clk_32k)**

This 32 kHz reference clock is provided by the CCM. This clock remains on in low-power mode when the peripheral clock is turned off, so EPIT can use this clock during low-power mode. In normal mode, the CCM synchronizes this clock to ahb_clk; in low-power mode, CCM switches to an unsynchronized version. This clock is derived from the external 32kHz crystal.

- **Peripheral clock (ipg_clk)**

This is the peripheral clock (PER Clock) which is provided (and optionally gated) by the CCM. This clock is typically used in normal operations. In low-power modes, if the EPIT is programmed to be disabled (via STOPEN or WAITEN), then the peripheral clock can be switched off.

The clock input source is determined by the CLKSRC field in the control register. The clock input to the prescaler can also be disabled by setting CLKSRC to 0b00. **This field value should only be changed after first disabling the EPIT by clearing the EN bit in the EPIT_EPITCR.** For other programming requirements that apply while changing clock source, refer section [Change of Clock Source](#).

The PRESCALER field in the control register is used to select the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value between 1 and 4096. A change in the value of the PRESCALER field is immediately reflected on its output clock frequency. The following figure shows the timing for a change in the prescaler value.

Figure 25-2. Prescaler Value Change Diagram

25.4 Functional Description

This section provides a complete functional description of the block.

25.4.1 Operating modes

EPIT can operate in either set-and-forget or free-running mode. Use EPIT_CR[RLD] to select the desired mode.

25.4.1.1 Operating in set-and-forget mode

To select this mode of operation, set the RLD bit in the control register (EPIT_CR).

In this mode, the counter obtains its data from the load register (EPIT_LR); it cannot be written to directly from the block data bus. Whenever the counter reaches zero, the value in EPIT_LR is loaded into the counter. This value is then decremented to zero.

To directly initialize the counter instead of waiting for the count to reach zero, set the EPIT counter overwrite enable bit (EPIT_CR[IOVW]) and write to EPIT_LR with the required initialization value.

25.4.1.2 Operating in free-running mode

To select this mode of operation, clear the RLD bit.

In this mode, the counter rolls over from 0000 0000h to FFFF FFFFh without reloading from the modulus register. After rolling over, the counter continues counting down.

To directly initialize the counter, set the EPIT counter overwrite enable bit (EPIT_EPITCL[IOVW]) and write to EPIT_EPITLR with the required initialization value.

25.4.2 Operations

EPIT has a single 32-bit down counter, which starts counting when the block is enabled by software.

The start value of the counter is loaded from the EPIT load register, which can be written to at any time by the processor. The value in the compare register determines the time that the interrupt occurs.

When EPIT is disabled (EN = 0), both the main counter and the prescaler counter freeze their count at their current count values. When EPIT is re-enabled (EN = 1), the ENMOD bit, which is a RW bit, decides the counter value:

- If ENMOD is set, the main counter is loaded with the load value (If RLD = 1)/ FFFF FFFFh (If RLD = 0) and the prescaler counter is reset (000h).
- If ENMOD is cleared, both main counter and prescaler counter restart counting from their frozen values.

If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both the main counter and the prescaler counter start counting from their frozen values regardless of the ENMOD bit.

A hardware reset resets all EPIT registers to their respective reset values. There is a software reset which has the same effect on all registers except for the EN, ENMOD, STOPEN and WAITEN bits in the control register. The state of these bits are not affected by software reset. A software reset can be asserted even when the EPIT is disabled.

25.4.3 Compare Event

When the programmed value of EPIT_EPITCMPR matches the value in EPIT_EPITCNR a compare status flag is set, and an interrupt is generated if the OCIEN bit is set in the control register.

Functional Description

The compare output pin is set, cleared, toggled, or not affected at all depending on the setting of the output mode (OM) bits in the control register. If an interrupt is required at rollover (when the counter value reaches 0x0000_0000 and the new value is loaded) then the compare register value should be set equal to the load register value in set-and-forget mode, or equal to 0xFFFF_FFFF in free-running mode.

The following figure shows the timing for a compare event and interrupt.

Figure 25-3. Compare Event and Interrupt Timing Diagram

EPIT will generate a compare event in the next count if the EPITx_CNR from the previous count equals the new EPITx_CMPR configured before re-enabling the EPIT in the next count. Even in case a new start counter value was updated in EPITx_LR before re-enabling the EPIT for the next round. To avoid this, configure the EPITx_CMPR to previous EPITx_CNR+1. Or, in set and forget mode, configure EPITx_LR with IOVW=1, before disabling EPIT. Also can do an extra disable/enable iteration to clear OCIF and update EPITx_CNR.

25.4.3.1 Counter Value Overwrite

The EPIT counter value can be overwritten to acquire a desired value at any point of time. The procedure for this is to set the IOVW bit in the control register and then write the desired value into the load register.

This results in the load register acquiring that value and also the counter being overwritten with it. If the EPIT is running the counter resumes counting from the overwritten value.

25.4.3.2 Low-Power Mode Behavior

The EPIT timer's behavior in low-power modes depends on which clock source is being used.

If the selected clock source is available and the corresponding low-power enable bit is set, then the EPIT continues to function in the low-power mode. If the EPIT is programmed to be disabled in a low-power mode (STOP/WAIT), then main counter and the prescaler counter freeze at the current count values when the EPIT enters low-power mode. When the EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit.

25.4.3.3 Debug Mode Behavior

In debug mode, the user has the option to run or halt the EPIT timers. If the DBGGEN bit is reset in the EPIT Control Register, the timer is halted.

When debug mode is exited, the timer operation reverts to what it was prior to entering debug mode.

25.5 Initialization/ Application Information

25.5.1 Change of Clock Source

The CLKSRC field in EPIT_EPITCR determines the clock source. This field value should be changed only after disabling the EPIT (EN = 0).

Below is the software sequence which must be followed while changing clock source.

1. Disable the EPIT - set EN=0 in EPIT_EPITCR.
2. Disable EPIT output - program OM=00 in the EPIT_EPITCR.
3. Disable EPIT interrupts.
4. Program CLKSRC to desired clock source in EPIT_EPITCR.
5. Clear the EPIT status register (EPIT_EPITSR), that is, write "1" to clear (w1c).
6. Set ENMOD= 1 in the EPIT_EPITCR, to bring the EPIT Counter to defined state (EPIT_EPITLR value or 0xFFFF_FFFF).
7. Enable EPIT - set (EN=1) in the EPIT_EPITCR
8. Enable the EPIT interrupts.

25.6 EPIT Memory Map/Register Definition

The EPIT includes five user-accessible 32-bit registers. The following table summarizes these registers and their addresses.

Peripheral bus write access to the EPIT control register (EPITCR) and the EPIT load register (EPITLR) results in one cycle of wait state, while other valid peripheral bus accesses are with 0 wait state.

EPIT memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
20D_0000	Control register (EPIT1_CR)	32	R/W	0000_0000h	25.6.1/1200
20D_0004	Status register (EPIT1_SR)	32	R/W	0000_0000h	25.6.2/1203
20D_0008	Load register (EPIT1_LR)	32	R/W	FFFF_FFFFh	25.6.3/1203
20D_000C	Compare register (EPIT1_CMPCR)	32	R/W	0000_0000h	25.6.4/1204
20D_0010	Counter register (EPIT1_CNR)	32	R	FFFF_FFFFh	25.6.5/1204
20D_4000	Control register (EPIT2_CR)	32	R/W	0000_0000h	25.6.1/1200
20D_4004	Status register (EPIT2_SR)	32	R/W	0000_0000h	25.6.2/1203
20D_4008	Load register (EPIT2_LR)	32	R/W	FFFF_FFFFh	25.6.3/1203
20D_400C	Compare register (EPIT2_CMPCR)	32	R/W	0000_0000h	25.6.4/1204
20D_4010	Counter register (EPIT2_CNR)	32	R	FFFF_FFFFh	25.6.5/1204

25.6.1 Control register (EPITx_CR)

The EPIT control register (EPIT_CR) is used to configure the operating settings of the EPIT. It contains the clock division prescaler value and also the interrupt enable bit. Additionally, it contains other control bits which are described below.

Peripheral Bus Write access to EPIT Control Register (EPIT_CR) results in one cycle of the wait state, while other valid peripheral bus accesses are with 0 wait state.

Address: Base address + 0h offset

EPITx_CR field descriptions

Field	Description
31–26 Reserved	This read-only field is reserved and always has the value 0.
25–24 CLKSRC	Select clock source These bits determine which clock input is to be selected for running the counter. This field value should only be changed when the EPIT is disabled by clearing the EN bit in this register. For other programming requirements while changing clock source, refer to Change of Clock Source . 00 Clock is off 01 Peripheral clock 10 High-frequency reference clock 11 Low-frequency reference clock
23–22 OM	EPIT output mode. This bit field determines the mode of EPIT output on the output pin. 00 EPIT output is disconnected from pad 01 Toggle output pin 10 Clear output pin 11 Set output pin
21 STOPEN	EPIT stop mode enable. This read/write control bit enables the operation of the EPIT during stop mode. This bit is reset by a hardware reset and unaffected by software reset. 0 EPIT is disabled in stop mode 1 EPIT is enabled in stop mode
20 Reserved	This read-only field is reserved and always has the value 0.
19 WAITEN	This read/write control bit enables the operation of the EPIT during wait mode. This bit is reset by a hardware reset. A software reset does not affect this bit. 0 EPIT is disabled in wait mode 1 EPIT is enabled in wait mode
18 DBGEN	This bit is used to keep the EPIT functional in debug mode. When this bit is cleared, the input clock is gated off in debug mode. This bit is reset by hardware reset. A software reset does not affect this bit. 0 Inactive in debug mode 1 Active in debug mode
17 IOVW	EPIT counter overwrite enable. This bit controls the counter data when the modulus register is written. When this bit is set, all writes to the load register overwrites the counter contents and the counter starts subsequently counting down from the programmed value. 0 Write to load register does not result in counter value being overwritten. 1 Write to load register results in immediate overwriting of counter value.

Table continues on the next page...

EPITx_CR field descriptions (continued)

Field	Description
16 SWR	<p>Software reset. The EPIT is reset when this bit is set to 1. It is a self clearing bit. This bit is set when the block is in reset state and is cleared when the reset procedure is over. Setting this bit resets all the registers to their reset values, except for the EN, ENMOD, STOPEN, WAITEN and DBGEN bits in this control register</p> <p>0 EPIT is out of reset 1 EPIT is undergoing reset</p>
15–4 PRESCALAR	<p>Counter clock prescaler value. This bit field determines the prescaler value by which the clock is divided before it goes to the counter</p> <p>0x000 Divide by 1 0x001 Divide by 2... 0xFFFF Divide by 4096</p>
3 RLD	<p>Counter reload control.</p> <p>This bit is cleared by hardware reset. It decides the counter functionality, whether to run in free-running mode or set-and-forget mode.</p> <p>0 When the counter reaches zero it rolls over to 0xFFFF_FFFF (free-running mode) 1 When the counter reaches zero it reloads from the modulus register (set-and-forget mode)</p>
2 OCIEN	<p>Output compare interrupt enable.</p> <p>This bit enables the generation of interrupt on occurrence of compare event.</p> <p>0 Compare interrupt disabled 1 Compare interrupt enabled</p>
1 ENMOD	<p>EPIT enable mode.</p> <p>When EPIT is disabled (EN=0), both main counter and prescaler counter freeze their count at current count values. ENMOD bit is a r/w bit that determines the counter value when the EPIT is enabled again by setting EN bit. If ENMOD bit is set, then main counter is loaded with the load value (If RLD=1)/ 0xFFFF_FFFF (If RLD=0) and prescaler counter is reset, when EPIT is enabled (EN=1). If ENMOD is programmed to 0 then both main counter and prescaler counter restart counting from their frozen values when EPIT is enabled (EN=1). If EPIT is programmed to be disabled in a low-power mode (STOP/WAIT/DEBUG), then both the main counter and the prescaler counter freeze at their current count values when EPIT enters low-power mode. When EPIT exits the low-power mode, both main counter and prescaler counter start counting from their frozen values irrespective of the ENMOD bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 Counter starts counting from the value it had when it was disabled. 1 Counter starts count from load value (RLD=1) or 0xFFFF_FFFF (If RLD=0)</p>
0 EN	<p>This bit enables the EPIT. EPIT counter and prescaler value when EPIT is enabled (EN = 1), is dependent upon ENMOD and RLD bit as described for ENMOD bit. It is recommended that all registers be properly programmed before setting this bit. This bit is reset by a hardware reset. A software reset does not affect this bit.</p> <p>0 EPIT is disabled 1 EPIT is enabled</p>

25.6.2 Status register (EPITx_SR)

The EPIT status register (EPIT_SR) has a single status bit for the output compare event. The bit is a write 1 to clear bit.

Address: Base address + 4h offset

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	0															OCIF	
W																w1c	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

EPITx_SR field descriptions

Field	Description
31–1 Reserved	This read-only field is reserved and always has the value 0.
0 OCIF	Output compare interrupt flag. This bit is the interrupt flag that is set when the content of counter equals the content of the compare register (EPIT_CMPR). The bit is a write 1 to clear bit. 0 Compare event has not occurred 1 Compare event occurred

25.6.3 Load register (EPITx_LR)

The EPIT load register (EPIT_LR) contains the value that is to be loaded into the counter when EPIT counter reaches zero if the RLD bit in EPIT_CR is set. If the IOVW bit in the EPIT_CR is set then a write to this register overwrites the value of the EPIT counter register in addition to updating this registers value. This overwrite feature is active even if the RLD bit is not set.

Address: Base address + 8h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	LOAD

Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

EPITx_LR field descriptions

Field	Description
LOAD	Load value. Value that is loaded into the counter at the start of each count cycle.

25.6.4 Compare register (EPITx_CMPR)

The EPIT compare register (EPIT_CMPR) holds the value that determines when a compare event is generated.

Address: Base address + Ch offset

EPITx_CMPR field descriptions

Field	Description
COMPARE	Compare Value. When the counter value equals this bit field value a compare event is generated.

25.6.5 Counter register (EPITx_CNR)

The EPIT counter register (EPIT_CNR) contains the current count value and can be read at any time without disturbing the counter. This is a read-only register and any attempt to write into it generates a transfer error. But if the IOVW bit in EPIT_CR is set, the value of this register can be overwritten with a write to EPIT_LR. This change is reflected when this register is subsequently read.

Address: Base address + 10h offset

EPITx_CNR field descriptions

Field	Description
COUNT	Counter value. This contains the current value of the counter.

Chapter 26

Enhanced Serial Audio Interface (ESAI)

26.1 Overview

The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, Sony/Phillips Digital Interface (SPDIF) transceivers, and other DSPs.

The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. It is a superset of the 56300 Family ESSI peripheral and of the 56000 Family SAI peripheral.

All serial transfers in the module are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is similar in that it is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available.

The following figure shows the ESAI block diagram.

Figure 26-1. ESAI Block Diagram

26.1.1 Features

- Independent (asynchronous mode) or shared (synchronous mode) transmit and receive sections with separate or shared internal/external clocks and frame syncs, operating in Master or Slave mode.
- Up to six transmitters and four receivers with TX2_RX3, TX3_RX2, TX4_RX1, and TX5_RX0 pins shared by transmitters 2 to 5 and receivers 0 to 3. TX0 AND TX1 pins are used by transmitters 0 and 1 only.
- Programmable data interface modes such as I2S, LSB aligned, MSB aligned
- Programmable word length (8, 12, 16, 20 or 24bits)
- Flexible selection between system clock or external oscillator as input clock source, programmable internal clock divider and frame sync generation
- AC97 support
- Time Slot Mask Registers for reduced ARM platform overhead (for both Transmit and Receive)
- 128-word Transmit FIFO shared by six transmitters
- 128-word Receive FIFO shared by four receivers

26.1.2 Modes of Operation

ESAI has three basic operating modes and many data/operation formats.

ESAI operating mode are selected by the ESAI control registers (ESAI_TCCR, ESAI_TCR, ESAI_RCCR, ESAI_RCR, and ESAI_SAICR). The main operating modes are described in the following section.

26.1.2.1 Normal/Network/On-Demand Mode Selection

Selecting between the normal mode and network mode is accomplished by clearing or setting the TMOD0-TMOD1 bits in the ESAI_TCR register for the transmitter section, as well as in the RMOD0-RMOD1 bits in the ESAI_RCR register for the receiver section.

For normal mode, the ESAI functions with one data word of I/O per frame (per enabled transmitter or receiver). The normal mode is typically used to transfer data to or from a single device.

For the network mode, 2 to 32 time slots per frame may be selected. During each frame, 0 to 32 data words of I/O may be received or transmitted. In either case, the transfers are periodic. The frame sync signal indicates the first time slot in the frame. Network mode is typically used in time division multiplexed (TDM) networks of codecs, DSPs with multiple words per frame, or multi-channel devices.

Selecting the network mode and setting the frame rate divider to zero (DC=00000) selects the on-demand mode. This special case does not generate a periodic frame sync. A frame sync pulse is generated only when data is available to transmit. The on-demand mode requires that the transmit frame sync be internal (output) and the receive frame sync be external (input). Therefore, for simplex operation, the synchronous mode could be used; however, for full-duplex operation, the asynchronous mode must be used. Data transmission that is data driven is enabled by writing data into each TX. Although the ESAI is double buffered, only one word can be written to each TX, even if the transmit shift register is empty. The receive and transmit interrupts function as usual using TDE and RDF; however, transmit underruns are impossible for on-demand transmission and are disabled.

26.1.2.2 Synchronous/Asynchronous Operating Modes

The transmit and receive sections of the ESAI may be synchronous or asynchronous, that is, the transmitter and receiver sections may use common clock and synchronization signals (synchronous operating mode), or they may have their own separate clock and sync signals (asynchronous operating mode).

The SYN bit in the ESAI_SAICR register selects synchronous or asynchronous operation. Because the ESAI is designed to operate either synchronously or asynchronously, separate receive and transmit interrupts are provided.

When SYN is cleared, the ESAI transmitter and receiver clocks and frame sync sources are independent. If SYN is set, the ESAI transmitter and receiver clocks and frame sync come from the transmitter section (either external or internal sources).

Data clock and frame sync signals can be generated internally by the ARM Core or may be obtained from external sources. If internally generated, the ESAI clock generator is used to derive high frequency clock, bit clock and frame sync signals from the ARM Core internal system clock.

26.1.2.3 Frame Sync Selection

The frame sync can be either a bit-long or word-long signal.

The transmitter frame format is defined by the TFSL bit in the ESAI_TCR register. The receiver frame format is defined by the RFSL bit in the ESAI_RCR register.

1. In the word-long frame sync format, the frame sync signal is asserted during the entire word data transfer period. This frame sync length is compatible with codecs, SPI serial peripherals, serial A/D and D/A converters, shift registers and telecommunication PCM serial I/O.
2. In the bit-long frame sync format, the frame sync signal is asserted for one bit clock immediately before the data transfer period. This frame sync length is compatible with Intel and National components, codecs and telecommunication PCM serial I/O.

The relative timing of the word length frame sync as referred to the data word is specified by the TFSR bit in the ESAI_TCR register for the transmitter section and by the RFSR bit in the ESAI_RCR register for the receive section. The word length frame sync may be generated (or expected) with the first bit of the data word, or with the last bit of the previous word. TFSR and RFSR are ignored when a bit length frame sync is selected.

Polarity of the frame sync signal may be defined as positive (asserted high) or negative (asserted low). The TFSP bit in the ESAI_TCCR register specifies the polarity of the frame sync for the transmitter section. The RFSP bit in the ESAI_RCCR register specifies the polarity of the frame sync for the receiver section.

The ESAI receiver looks for a receive frame sync leading edge (trailing edge if RFSP is set) only when the previous frame is completed. If the frame sync goes high before the frame is completed (or before the last bit of the frame is received in the case of a bit frame sync or a word length frame sync with RFSR set), the current frame sync is not recognized, and the receiver is internally disabled until the next frame sync. Frames do not have to be adjacent, that is, a new frame sync does not have to immediately follow the previous frame. Gaps of arbitrary periods can occur between frames. Enabled transmitters are tri-stated during these gaps.

When operating in the synchronous mode (SYN=1), all clocks including the frame sync are generated by the transmitter section.

26.1.2.4 Shift Direction Selection

Some data formats, such as those used by codecs, specify MSB first while other data formats, such as the AES-EBU digital audio interface, specify LSB first.

The MSB/LSB first selection is made by programming RSHFD bit in the ESAI_RCR register for the receiver section and by programming the TSHFD bit in the ESAI_TCR register for the transmitter section.

26.2 External Signals

Three to twelve pins are required for operation, depending on the operating mode selected and the number of transmitters and receivers enabled.

The TX0 and TX1 pins are used by transmitters 0 and 1 only. The TX2_RX3, TX3_RX2, TX4_RX1, and TX5_RX0 pins are shared by transmitters 2 to 5 with receivers 0 to 3. The actual mode of operation is selected under software control. All transmitters operate fully synchronized under control of the same transmitter clock signals. All receivers operate fully synchronized under control of the same receiver clock signals.

The following table describes the external signals of ESAI:

Table 26-1. ESAI External Signals

Signal	Description	Pad	Mode	Direction
ESAI_RX_CLK	RX serial bit clock for the ESAI interface. The direction can be programmed.	CSI_DATA02	ALT1	IO
		NAND_DATA00	ALT4	
		QSPI1B_DATA1	ALT3	
ESAI_RX_FS	RX frame sync signal for the ESAI interface.	CSI_DATA03	ALT1	IO
		NAND_DATA01	ALT4	
		QSPI1B_DATA0	ALT3	
ESAI_RX_HF_CLK	RX high frequency clock for the ESAI interface.	CSI_PIXCLK	ALT1	IO
		NAND_DATA03	ALT4	
		QSPI1B_SCLK	ALT3	
ESAI_TX0	Used for transmitting data from the ESAI_TX0 serial transmit shift register	CSI_HSYNC	ALT1	IO
		NAND_CE1_B	ALT4	
		QSPI1A_DATA3	ALT3	
ESAI_TX1	Used for transmitting data from the ESAI_TX1 serial transmit shift register	CSI_DATA04	ALT1	IO
		NAND_READY_B	ALT4	
		QSPI1A_DATA1	ALT3	
ESAI_TX2_RX3	Used as TX2 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin Used as the RX3 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin	CSI_DATA06	ALT1	IO
		NAND_CLE	ALT4	
		QSPI1A_SCLK	ALT3	
ESAI_TX3_RX2	Used as TX3 for transmitting data from the ESAI_TX3 serial transmit shift register when programmed as a transmitter pin	CSI_DATA07	ALT1	IO
		NAND_ALE	ALT4	
		QSPI1A_SS0_B	ALT3	

Table continues on the next page...

**Table 26-1. ESAI External Signals
(continued)**

Signal	Description	Pad	Mode	Direction
	Used as the RX2 signal for receiving serial data to the ESAI_RX2 serial receive shift register when programmed as a receiver pin			
ESAI_TX4_RX1	Used as TX4 for transmitting data from the ESAI_TX4 serial transmit shift register when programmed as a transmitter pin Used as the RX1 signal for receiving serial data to the ESAI_RX1 serial receive shift register when programmed as a receiver pin	CSI_DATA05	ALT1	IO
		NAND_WP_B	ALT4	
		QSPI1A_DATA0	ALT3	
ESAI_TX5_RX0	Used as TX5 for transmitting data from the ESAI_TX5 serial transmit shift register when programmed as a transmitter pin Used as the RX0 signal for receiving serial data to the ESAI_RX0 serial receive shift register when programmed as a receiver pin	CSI_VSYNC	ALT1	IO

		NAND_DATA02	ALT4	
		QSPI1B_SS0_B	ALT3	

26.2.1 Serial Transmit 0 Data Pin

TX0 is used for transmitting data from the ESAI_TX0 serial transmit shift register.

TX0 is an output when data is being transmitted from the ESAI_TX0 shift register. In the on-demand mode with an internally generated bit clock, the TX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX0 may be programmed as a disconnected pin (PC11) when the ESAI TX0 function is not being used. (See [Table 26-48](#).)

26.2.2 Serial Transmit 1 Data Pin

TX1 is used for transmitting data from the ESAI_TX1 serial transmit shift register.

TX1 is an output when data is being transmitted from the ESAI_TX1 shift register. In the on-demand mode with an internally generated bit clock, the TX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX1 may be programmed as a disconnected pin (PC10) when the ESAI TX1 function is not being used. (See [Table 26-48](#).)

26.2.3 Serial Transmit 2/Receive 3 Data Pin

TX2_RX3 is used as the TX2 for transmitting data from the ESAI_TX2 serial transmit shift register when programmed as a transmitter pin, or as the RX3 signal for receiving serial data to the ESAI_RX3 serial receive shift register when programmed as a receiver pin.

TX2_RX3 is an input when data is being received by the ESAI_RX3 shift register. TX2_RX3 is an output when data is being transmitted from the ESAI_TX2 shift register. In the on-demand mode with an internally generated bit clock, the TX2_RX3 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX2_RX3 may be programmed as a disconnected pin (PC9) when the ESAI TX2 and RX3 functions are not being used. (See [Table 26-48](#).)

26.2.4 Serial Transmit 3/Receive 2 Data Pin

TX3_RX2 is used as the TX3 signal for transmitting data from the ESAI_TX3 serial transmit shift register when programmed as a transmitter pin, or as the RX2 signal for receiving serial data to the ESAI_RX2 serial receive shift register when programmed as a receiver pin.

TX3_RX2 is an input when data is being received by the ESAI_RX2 shift register. TX3_RX2 is an output when data is being transmitted from the ESAI_TX3 shift register. In the on-demand mode with an internally generated bit clock, the TX3_RX2 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX3_RX2 may be programmed as a disconnected pin (PC8) when the ESAI TX3 and RX2 functions are not being used. (See [Table 26-48](#).)

26.2.5 Serial Transmit 4/Receive 1 Data Pin

TX4_RX1 is used as the TX4 signal for transmitting data from the ESAI_TX4 serial transmit shift register when programmed as transmitter pin, or as the RX1 signal for receiving serial data to the RX1 serial receive shift register when programmed as a receiver pin.

TX4_RX1 is an input when data is being received by the ESAI_RX1 shift register. TX4_RX1 is an output when data is being transmitted from the ESAI_TX4 shift register. In the on-demand mode with an internally generated bit clock, the TX4_RX1 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX4_RX1 may be programmed as a disconnected pin (PC7) when the ESAI TX4 and RX1 functions are not being used. (See [Table 26-48](#).)

26.2.6 Serial Transmit 5/Receive 0 Data Pin

TX5_RX0 is used as the TX5 signal for transmitting data from the ESAI_TX5 serial transmit shift register when programmed as transmitter pin, or as the RX0 signal for receiving serial data to the ESAI_RX0 serial shift register when programmed as a receiver pin.

TX5_RX0 is an input when data is being received by the ESAI_RX0 shift register. TX5_RX0 is an output when data is being transmitted from the ESAI_TX5 shift register. In the on-demand mode with an internally generated bit clock, the TX5_RX0 pin becomes high impedance for a full clock period after the last data bit has been transmitted, assuming another data word does not follow immediately. If a data word follows immediately, there is no high-impedance interval.

TX5_RX0 may be programmed as a disconnected pin (PC6) when the ESAI TX5 and RX0 functions are not being used. (See [Table 26-48](#).)

26.2.7 Receiver Serial Clock

SCKR is a bidirectional pin providing the receivers serial bit clock for the ESAI interface.

The direction of this pin is determined by the RCKD bit in the ESAI_RCCR register. The SCKR operates as a clock input or output used by all the enabled receivers in the asynchronous mode (SYN = 0), or as serial flag 0 pin in the synchronous mode (SYN = 1).

When this pin is configured as serial flag pin, its direction is determined by the RCKD bit in the ESAI_RCCR register. When configured as the output flag OF0, this pin reflects the value of the OF0 bit in the ESAI_SAICR register, and the data in the OF0 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When this pin is configured as the input flag IF0, the data value at the pin is stored in the IF0 bit in the ESAI_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

SCKR may be programmed as a disconnected pin (PC0) when the ESAI SCKR function is not being used. (See [Table 26-48](#).)

NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal `ipg_clk_esai` ESAI system clock, the external ESAI serial clock frequency cannot exceed 1/4 of the `ipg_clk_esai` and each external ESAI serial clock phase must exceed the minimum of $2 \times 1/\text{ipg_clk_esai}$.

For SCKR pin mode definitions, see [Table 26-39](#).

The table below provides a list of asynchronous-mode receiver clock sources. For more information about EXTAL/ESAI clocking control bits (ERI, ERO), refer to [ESAI Control Register \(ESAI_ECR\)](#).

Table 26-2. Receiver Clock Sources (Asynchronous Mode Only)

RHCKD	RFSD	RCKD	ERI	ERO	Receiver Bit Clock Source	OUTPUTS		
0	0	0	N/A	N/A	SCKR	-	-	-
0	0	1	N/A	N/A	HCKR	-	-	SCKR

Table continues on the next page...

1	1	1	1	1	EXTAL	HCKR	FSR	SCKR

EXTAL is the on-chip clock source other than ipg_clk_esai ESAI system clock, and it is from esai_clk_root in CCM.

26.2.8 Transmitter Serial Clock

SCKT is a bidirectional pin providing the transmitters serial bit clock for the ESAI interface.

The direction of this pin is determined by the TCKD bit in the ESAI_TCCR register. The SCKT is a clock input or output used by all the enabled transmitters in the asynchronous mode (SYN = 0) or by all the enabled transmitters and receivers in the synchronous mode (SYN = 1).

The following table provides a list of asynchronous-mode transmitter clock sources.

Table 26-3. Transmitter Clock Sources (Asynchronous Mode Only)

THCKD	TFSD	TCKD	ETI	ETO	Transmitter Bit Clock Source	OUTPUTS		
0	0	0	N/A	N/A	SCKT	-	-	-
0	0	1	N/A	N/A	HCKT	-	-	SCKT
0	1	0	N/A	N/A	SCKT	-	FST	-
0	1	1	N/A	N/A	HCKT	-	FST	SCKT
1	0	0	0	0	SCKT	HCKT	-	-
1	0	0	0	1	SCKT	HCKT	-	-
1	0	0	1	0	SCKT	HCKT	-	-

1	0	1	0	0	Fsys ¹	HCKT	-	SCKT
1	0	1	0	1	Fsys	HCKT	-	SCKT
1	0	1	1	0	EXTAL ²	HCKT	-	SCKT
1	0	1	1	1	EXTAL	HCKT	-	SCKT
1	1	0	0	0	SCKR	HCKT	FST	-
1	1	0	0	1	SCKR	HCKT	FST	-
1	1	0	1	0	SCKR	HCKT	FST	-
1	1	0	1	1	SCKR	HCKT	FST	-
1	1	1	0	0	Fsys	HCKT	FST	SCKT
1	1	1	0	1	Fsys	HCKT	FST	SCKT
1	1	1	1	0	EXTAL	HCKT	FST	SCKT
1	1	1	1	1	EXTAL	HCKT	FST	SCKT

EXTAL is the on-chip clock sources other than ipg_clk_esai ESAI system clock, and it is from esai_clk_root in CCM

SCKT may be programmed as a disconnected pin (PC3) when the ESAI SCKT function is not being used. (See [Table 26-48](#).)

For more information about EXTAL/ESAI clocking control bits (ETI, ETO), see [ESAI Control Register \(ESAI_ECR\)](#).

NOTE

Although the external ESAI serial clocks can be independent of and asynchronous to the internal ipg_clk_esai ESAI system clock, the external ESAI serial clock frequency cannot exceed 1/4 of the ipg_clk_esai and each external ESAI serial clock phase must exceed the minimum of $2 \times 1/\text{ipg_clk_esai}$.

26.2.9 Frame Sync for Receiver

FSR is a bidirectional pin providing the receivers frame sync signal for the ESAI interface. The direction of this pin is determined by the RFSD bit in ESAI_RCR register.

In the asynchronous mode (SYN=0), the FSR pin operates as the frame sync input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as either the serial flag 1 pin (TEBE=0), or as the transmitter external buffer enable control (TEBE=1, RFSD=1). For FSR pin mode definitions, see [Table 26-40](#); for receiver clock signals, see [Table 26-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RFSD bit in the ESAI_RCCR register. When configured as the output flag OF1, this pin reflects the value of the OF1 bit in the ESAI_SAICR register, and the data in the OF1 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF1, the data value at the pin is stored in the IF1 bit in the ESAI_SAISR register, synchronized by the frame sync in normal mode or the slot in network mode.

FSR may be programmed as a disconnected pin (PC1) when the ESAI FSR function is not being used. (See [Table 26-48](#).)

26.2.10 Frame Sync for Transmitter

FST is a bidirectional pin providing the frame sync for both the transmitters and receivers in the synchronous mode (SYN=1) and for the transmitters only in asynchronous mode (SYN=0) (see [Table 26-3](#)). The direction of this pin is determined by the TFSD bit in the ESAI_TCCR register. When configured as an output, this pin is the internally generated frame sync signal. When configured as an input, this pin receives an external frame sync signal for the transmitters (and the receivers in synchronous mode).

FST may be programmed as a disconnected pin (PC4) when the ESAI FST function is not being used. (See [Table 26-48](#).)

26.2.11 High Frequency Clock for Transmitter

HCKT is a bidirectional pin providing the transmitters high frequency clock for the ESAI interface.

The direction of this pin is determined by the THCKD bit in the ESAI_TCCR register. In the asynchronous mode (SYN=0), the HCKT pin operates as the high frequency clock input or output used by all enabled transmitters. In the synchronous mode (SYN=1), it

operates as the high frequency clock input or output used by all enabled transmitters and receivers. When programmed as input this pin is used as an alternative high frequency clock source to the ESAI transmitter rather than the ARM Core main clock. When programmed as output it can serve as a high frequency sample clock (to external DACs for example) or as an additional system clock (see [Table 26-3](#)).

HCKT may be programmed as a disconnected pin (PC5) when the ESAI HCKT function is not being used. (See [Table 26-48](#).)

26.2.12 High Frequency Clock for Receiver

HCKR is a bidirectional pin providing the receivers high frequency clock for the ESAI interface.

The direction of this pin is determined by the RHCKD bit in the ESAI_RCCR register. In the asynchronous mode (SYN=0), the HCKR pin operates as the high frequency clock input or output used by all the enabled receivers. In the synchronous mode (SYN=1), it operates as the serial flag 2 pin. For HCKR pin mode definitions, see [Table 26-41](#); for receiver clock signals, see [Table 26-2](#).

When this pin is configured as serial flag pin, its direction is determined by the RHCKD bit in the ESAI_RCCR register. When configured as the output flag OF2, this pin reflects the value of the OF2 bit in the ESAI_SAICR register, and the data in the OF2 bit shows up at the pin synchronized to the frame sync being used by the transmitter and receiver sections. When configured as the input flag IF2, the data value at the pin is stored in the IF2 bit in the ESAI_SAIRS register, synchronized by the frame sync in normal mode or the slot in network mode.

HCKR may be programmed as a disconnected pin (PC2) when the ESAI HCKR function is not being used. (See [Table 26-48](#).)

26.2.13 Serial I/O Flags

Three ESAI pins (FSR, SCKR and HCKR) are available as serial I/O flags when the ESAI is operating in the synchronous mode (SYN=1).

Their operation is controlled by RCKD, RFSD, TEBE bits in the ESAI_RCR, ESAI_RCCR and ESAI_SAICR registers. The output data bits (OF2, OF1 and OF0) and the input data bits (IF2, IF1 and IF0) are double buffered to/from the HCKR, FSR and SCKR pins. Double buffering the flags keeps them in sync with the TX and RX data lines.

Each flag can be separately programmed. Flag 0 (SCKR pin) direction is selected by RCKD, RCKD=1 for output and RCKD=0 for input. Flag 1 (FSR pin) is enabled when the pin is not configured as external transmitter buffer enable (TEBE=0) and its direction is selected by RFSD, RFSD=1 for output and RFSD=0 for input. Flag 2 (HCKR pin) direction is selected by RHCKD, RHCKD=1 for output and RHCKD=0 for input.

When programmed as input flags, the SCKR, FSR and HCKR logic values, respectively, are latched at the same time as the first bit of the receive data word is sampled. Because the input was latched, the signal on the input flag pin (SCKR, FSR or HCKR) can change without affecting the input flag until the first bit of the next receive data word. When the received data words are transferred to the receive data registers, the input flag latched values are then transferred to the IF0, IF1 and IF2 bits in the SAISR register, where they may be read by software.

When programmed as output flags, the SCKR, FSR and HCKR logic values are driven by the contents of the OF0, OF1 and OF2 bits in the ESAI_SAICR register respectively, and they are driven when the transmit data registers are transferred to the transmit shift registers. The value on SCKR, FSR and HCKR is stable from the time the first bit of the transmit data word is transmitted until the first bit of the next transmit data word is transmitted. Software may change the OF0-OF2 values thus controlling the SCKR, FSR and HCKR pin values for each transmitted word. The normal sequence for setting output flags when transmitting data is as follows: wait for TDE (transmitter empty) to be set; first write the flags, and then write the transmit data to the transmit registers. OF0, OF1, and OF2 are double buffered so that the flag states appear on the pins when the transmit data is transferred to the transmit shift register, that is, the flags are synchronous with the data.

26.3 Clocks

The table found here describes the clock sources for ESAI.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 26-4. ESAI Clocks

Clock name	Clock Root	Description
extal_clk	esai_clk_root	ESAI system clock
ipg_clk_esai	ahb_clk_root	Bus clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_clk	ahb_clk_root	Mem clock

26.4 Functional Description

This section provides a complete functional description of the block.

26.4.1 ESAI After Reset

Hardware or software reset clears the port control register bits and the port direction control register bits, which configure all ESAI I/O pins as disconnected and both ESAI FIFOs are also in reset state.

The ESAI is in personal reset state while all ESAI pins are programmed as disconnected, and it is active only if at least one of the ESAI I/O pins is programmed as an ESAI pin.

26.4.2 ESAI Interrupt Requests

The ESAI can generate eight different interrupt requests

(ordered from the highest to the lowest priority):

1. ESAI Receive Data with Exception Status

Occurs when the receive exception interrupt is enabled (REIE=1 in the RCR register), at least one of the enabled receive data registers is full (RDF=1) and a receiver overrun error has occurred (ROE=1 in the SAISR register). ROE is cleared by first reading the SAISR and then reading all the enabled receive data registers.

2. ESAI Receive Even Data

Occurs when the receive even slot data interrupt is enabled (REDIE=1), at least one of the enabled receive data registers is full (RDF=1), the data is from an even slot (REDF=1) and no exception has occurred (ROE=0 or REIE=0).

Reading all enabled receiver data registers clears RDF and REDF.

3. ESAI Receive Data

Occurs when the receive interrupt is enabled (RIE=1), at least one of the enabled receive data registers is full (RDF=1), no exception has occurred (ROE=0 or REIE=0) and no even slot interrupt has occurred (REDF=0 or REDIE=0). Reading all enabled receiver data registers clears RDF.

4. ESAI Receive Last Slot Interrupt

Occurs, if enabled (RLIE=1), after the last slot of the frame ended (in network mode only) regardless of the receive mask register setting. The receive last slot interrupt may be used for resetting the receive mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the receive last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum receive last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

5. **ESAI Transmit Data with Exception Status**

Occurs when the transmit exception interrupt is enabled (TEIE=1), at least one transmit data register of the enabled transmitters is empty (TDE=1) and a transmitter underrun error has occurred (TUE=1). TUE is cleared by first reading the SAISR and then writing to all the enabled transmit data registers, or to the TSR register.

6. **ESAI Transmit Last Slot Interrupt**

Occurs, if enabled (TLIE=1), at the start of the last slot of the frame in network mode regardless of the transmit mask register setting. The transmit last slot interrupt may be used for resetting the transmit mask slot register, reconfiguring the DMA channels and reassigning data memory pointers. Using the transmit last slot interrupt guarantees that the previous frame was serviced with the previous setting and the new frame is serviced with the new setting without synchronization problems. Note that the maximum transmit last slot interrupt service time should not exceed N-1 ESAI bits service time (where N is the number of bits in a slot).

7. **ESAI Transmit Even Data**

Occurs when the transmit even slot data interrupt is enabled (TEDIE=1), at least one of the enabled transmit data registers is empty (TDE=1), the slot is an even slot (TEDE=1) and no exception has occurred (TUE=0 or TEIE=0). Writing to all the TX registers of the enabled transmitters or to TSR clears this interrupt request.

8. **ESAI Transmit Data**

Occurs when the transmit interrupt is enabled (TIE=1), at least one of the enabled transmit data registers is empty (TDE=1), no exception has occurred (TUE=0 or TEIE=0) and no even slot interrupt has occurred (TEDE=0 or TEDIE=0). Writing to all the TX registers of the enabled transmitters, or to the TSR clears this interrupt request.

26.4.3 ESAI DMA Requests from the FIFOs

The ESAI can generate two different DMA requests:

1. ESAI Transmit FIFO Empty - Asserts when the number of empty slots in the ESAI transmit FIFO exceeds the threshold programmed in the ESAI Transmit FIFO Configuration Register (TF CR). Automatically negates when the number of empty slots is less than the threshold programmed in the ESAI Transmit FIFO Configuration Register.
2. ESAI Receive FIFO Full - Asserts when the number of data words in the ESAI receive FIFO exceeds the threshold programmed in the ESAI Receive FIFO Configuration Register (RF CR). Automatically negates when the number of words is less than the threshold programmed in the ESAI Receive FIFO Configuration Register.

26.4.4 ESAI Transmit and Receive Shift Registers

26.4.4.1 ESAI Transmit Shift Registers

The transmit shift registers contain the data being transmitted (Figure 26-2 and Figure 26-3).

Data is shifted out to the serial transmit data pins by the selected (internal/external) bit clock when the associated frame sync I/O is asserted.

The number of bits shifted out before the shift registers are considered empty and may be written to again can be 8, 12, 16, 20, 24 or 32 bits (determined by the slot length control bits in the TCR register). Data is shifted out of these registers MSB first if TSHFD=0 and LSB first if TSHFD=1.

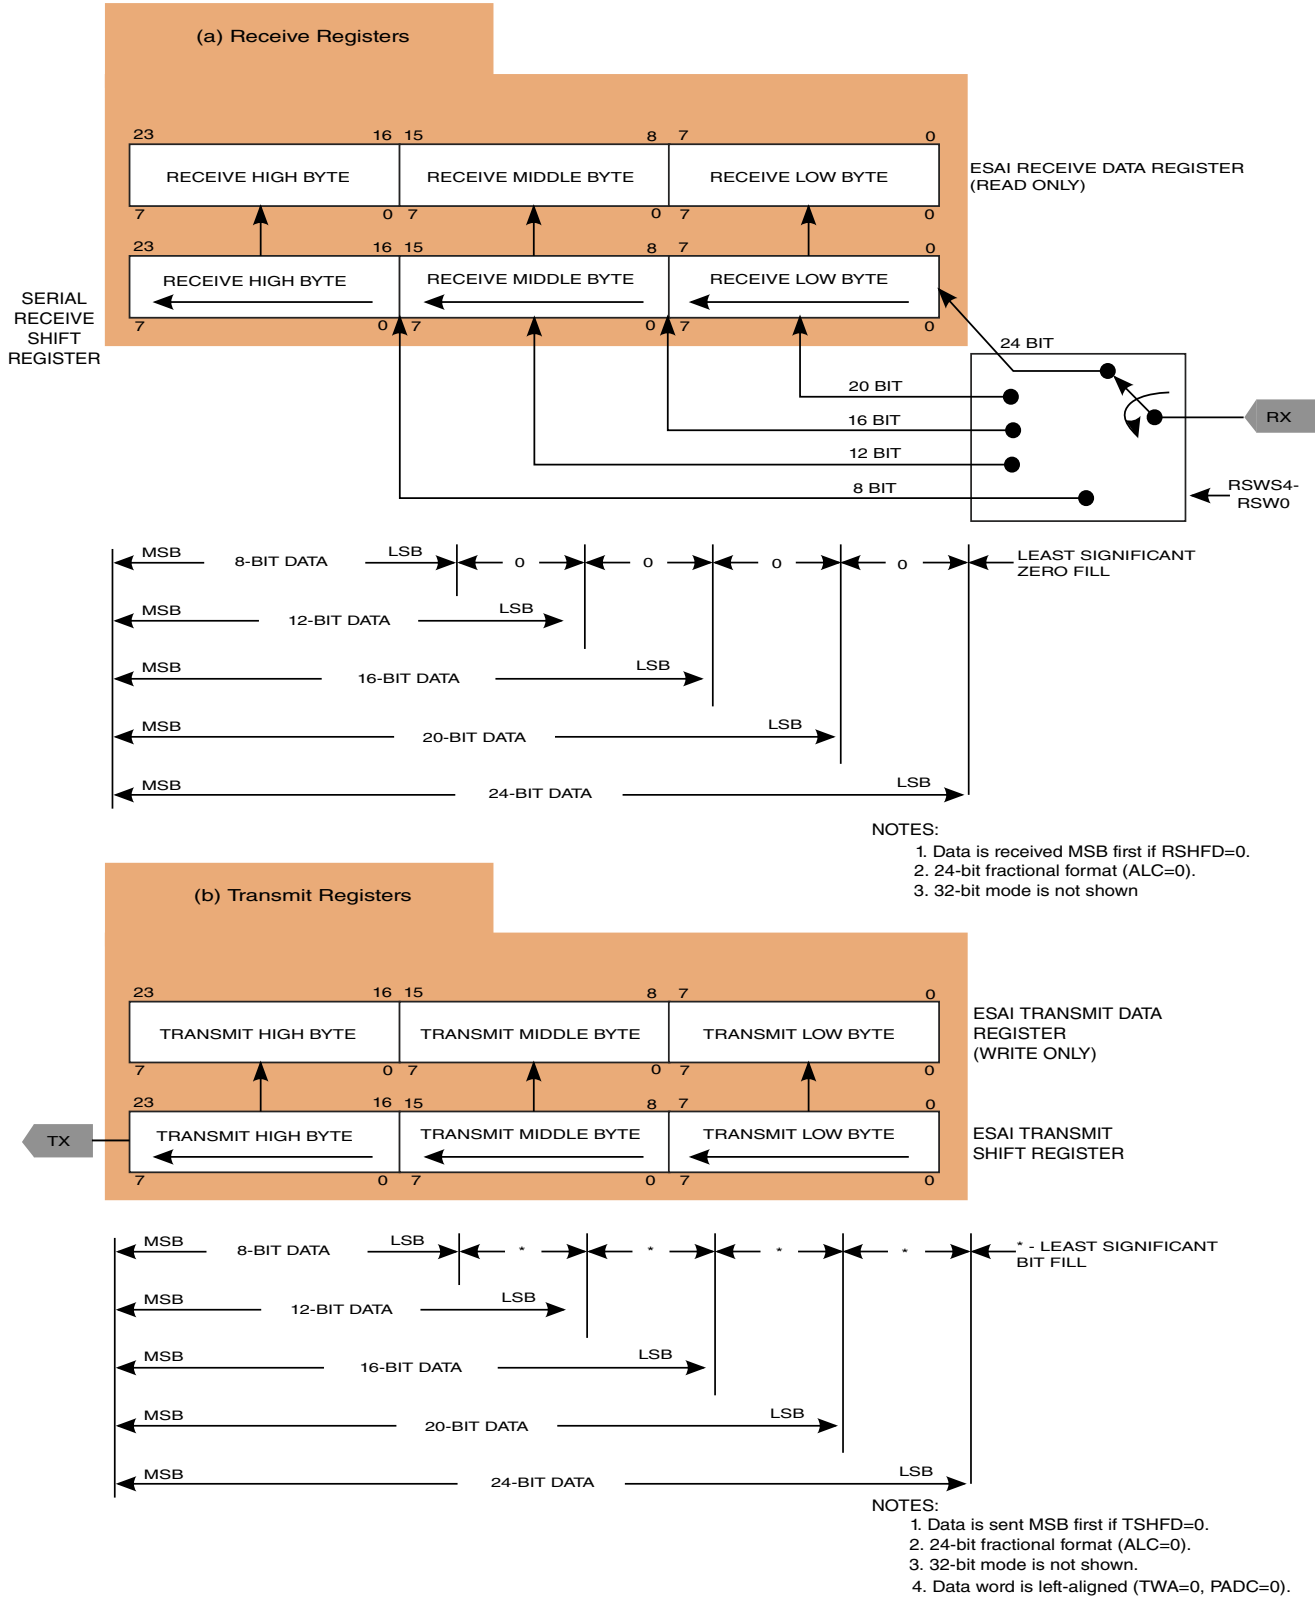

Figure 26-2. ESAI Data Path Programming Model ([R/T]SHFD=0)

Functional Description

Figure 26-3. ESAI Data Path Programming Model ([R/T]SHFD=1)

26.4.4.2 ESAI Receive Shift Registers

The receive shift registers (Figure 26-2 and Figure 26-3) receive the incoming data from the serial receive data pins. Data is shifted in by the selected (internal/external) bit clock when the associated frame sync I/O is asserted. Data is assumed to be received MSB first if RSHFD=0 and LSB first if RSHFD=1. Data is transferred to the ESAI receive data registers after 8, 12, 16, 20, 24, or 32 serial clock cycles were counted, depending on the slot length control bits in the ESAI_RCR register.

26.5 Initialization Information

26.5.1 ESAI Initialization

The correct way to initialize the ESAI is as follows:

1. Enable the ESAI logic clock by asserting bit 0 of ESAI Control Register (ESAI_ECR[0]).
2. Hardware, software, ESAI individual reset. Note that asserting bit 1 of ESAI Control Register only reset the ESAI core logic, including configuration registers, but not the ESAI FIFOs.
3. Reset ESAI FIFOs by asserting bit 1 of ESAI_TFCR and ESAI_RFCR.
4. Program ESAI control and time slot registers. (The transmit/receive enable bits of TCR/RCR should not be set.)
5. Program ESAI FIFOs via TFCR and RFCR. (Enable Transmit/Receive FIFO, enable transmitters/receivers, transmit initialization and set Transmit FIFO/Receive FIFO watermark.)
6. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR
7. Remove ESAI personal reset by configuring ESAI_PCRC and ESAI_PRRC.
8. Enabled Transmitters/Receivers in ESAI_TCR/ESAI_RCR.

During program execution, all ESAI pins may be defined disconnected, causing the ESAI to stop serial activity and enter the individual reset state.

All status bits of the interface are set to their reset state however, the control bits are not affected. This procedure allows the programmer to reset the ESAI separately from the other internal peripherals. During individual reset, internal DMA accesses to the data registers of the ESAI are not valid and data read is undefined.

The programmer must use an individual ESAI reset when changing the ESAI control registers (except for TEIE, REIE, TLIE, RLIE, TIE, RIE, TE0-TE5, RE0-RE3) to ensure proper operation of the interface.

NOTE

If the ESAI receiver section is already operating with some of the receivers and enabling additional receivers on the fly, that is, without first putting the ESAI receiver in the personal reset state by setting their REx control bits, it will result in erroneous data being received as the first data word for the newly enabled receivers.

26.5.2 ESAI Initialization Examples

26.5.2.1 Initializing the ESAI using Personal Reset

1. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI_ECR[0]).
2. The ESAI should be in its personal reset state (ESAI_PCRC = 0x000 and ESAI_PRRC = 0x000). In the personal reset state, both the transmitter and receiver sections of the ESAI are simultaneously reset. The TPR bit in the ESAI_TCR register may be used to reset just the transmitter section. The RPR bit in the ESAI_RCR register may be used to reset just the receiver section.
3. Configure the control registers (ESAI_TCCR, ESAI_TCR, ESAI_RCCR, ESAI_RCR) and ESAI FIFOs configuration Registers (ESAI_TFCR, ESAI_RFCR) according to the operating mode, but do not enable transmitters (TE5-TE0 = 0x0) or receivers (RE3-RE0 = 0x0). It is possible to set the interrupt enable bits which are in use during the operation (no interrupt occurs).
4. Enable the ESAI by setting the ESAI_PCRC and ESAI_PRRC register bits according to pins which are in use during operation.
5. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR. This step is needed even if DMA is used to service the transmitters.
6. Enable the transmitters and receivers.
7. From now on ESAI can be serviced either by polling, interrupts, or DMA.

Operation proceeds as follows:

- For internally generated clock and frame sync, these signals are active immediately after ESAI is enabled (step 4 above).

- Data is received only when one of the receive enable (REx) bits is set and after the occurrence of frame sync signal (either internally or externally generated).
- Data is transmitted only when the transmitter enable (TE_x) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE_x bit is set until the frame sync occurs.

26.5.2.2 Initializing the ESAI Transmitter Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register(ESAI_ECR[0])
3. The transmitter section should be in its individual reset state (TPR = 1) and also reset the ESAI Transmit FIFO (ESAI_TFCR[1] = 1).
4. Configure the control registers ESAI_TCCR and ESAI_TCR according to the operating mode, configure the Transmit FIFO Configuration Register (bring transmit FIFO out of reset, enable Transmit FIFO, enable transmitters, transmit initialization and set watermark). Make sure to clear the transmitter enable bits (TE0-TE5). TPR must remain set.
5. Take the transmitter section out of the individual reset state by clearing TPR.
6. Write initial words to ESAI Transmit Data Register (ESAI_ETDR), at least one word per enabled transmitter slot but as many as desired. For example 4 channels with 2 slot-per-channel are enabled, then 8 words need to be written into ESAI_ETDR
7. Enable the transmitters by setting their TE bits.
8. Data is transmitted only when the transmitter enable (TE_x) bit is set and after the occurrence of frame sync signal (either internally or externally generated). The transmitter outputs remain tri-stated after TE_x bit is set until the frame sync occurs.
9. From now on the transmitters are operating and can be serviced either by polling, interrupts, or DMA.

26.5.2.3 Initializing the ESAI Receiver Section

1. It is assumed that the ESAI is operational; that is, at least one pin is defined as an ESAI pin.
2. Enable the ESAI logic clock by setting bit 0 of ESAI Control Register (ESAI_ECR[0])
3. The receiver section should be in its individual reset state (RPR = 1) and also reset the ESAI Receive FIFO (ESAI_RFCR[1] = 1).
4. Configure the control registers ESAI_RCCR and ESAI_RCR according to the operating mode, configure the Receive FIFO Configuration Register (bring receive

ESAI Memory Map/Register Definition

FIFO out of reset, enable Receive FIFO, receivers, and set watermark). Making sure to clear the receiver enable bits (RE0-RE3). RPR must remain set.

5. Take the receiver section out of the individual reset state by clearing RPR.
6. Enable the receivers by setting their RE bits.
7. From now on the receivers are operating and can be serviced either by polling, interrupts, or DMA.

26.6 ESAI Memory Map/Register Definition

ESAI memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

ESAI_ETDR field descriptions

Field	Description
ETDR	ESAI Transmit Data Register. Writing to this register stores the data written into the ESAI Transmit FIFO. Writing to this register when the Transmit FIFO is full causes the data written to be lost (the existing data within the FIFO is not overwritten). When multiple ESAI transmitters are enabled, the data for each transmitter must be interleaved from lowest transmitter to highest transmitter (for example, if transmitters 0, 2 and 3 are enabled then data must be written as follows: transmitter #0, transmitter #2, transmitter #3, transmitter #0, transmitter #2, transmitter #3, transmitter #0, etc). Data within the ESAI Transmit FIFO is passed to the ESAI transmit shifter registers as defined by the Transmit Word Alignment configuration bits.

26.6.2 ESAI Receive Data Register (ESAI_ERDR)

Address: 202_4000h base + 4h offset = 202_4004h

ESAI_ERDR field descriptions

Field	Description
ERDR	ESAI Receive Data Register. Reading this register returns the data within the ESAI Receive FIFO. Reading this register when the Receive FIFO is empty returns the last valid data word. When multiple ESAI receivers are enabled, the data for each receiver is interleaved from lowest receiver to highest receiver (for example, if receivers 0, 2 and 3 are enabled then data is returned as follows: receiver #0, receiver #2, receiver #3, receiver #0, receiver #2, receiver #3, receiver #0, etc). Data is passed from the ESAI receive shift registers to the ESAI Receive FIFO as defined by the Receiver Word Alignment configuration bits either zero or sign-extended based on the Receive Extension control bit.

26.6.3 ESAI Control Register (ESAI_ECR)

Address: 202_4000h base + 8h offset = 202_4008h

ESAI_ECR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 ETI	EXTAL Transmitter In. Mux EXTAL in place of the High Frequency Transmitter Clock input pin. HCKT can still be used to drive a divided down EXTAL or as GPIO. 0 HCKT pin has normal function. 1 EXTAL muxed into HCKT input.
18 ETO	EXTAL Transmitter Out. Drive the EXTAL input on the High Frequency Transmitter Clock pin. 0 HCKT pin has normal function. 1 EXTAL driven onto HCKT pin.
17 ERI	EXTAL Receiver In. Mux EXTAL in place of the High Frequency Receiver Clock input pin. HCKR can still be used to drive a divided down EXTAL or as GPIO. 0 HCKR pin has normal function. 1 EXTAL muxed into HCKR input.
16 ERO	EXTAL Receiver Out. Drive the EXTAL input on the High Frequency Receiver Clock pin. 0 HCKR pin has normal function. 1 EXTAL driven onto HCKR pin.
15–2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
1 ERST	ESAI Reset. Reset the ESAI core logic (including configuration registers) but not the ESAI FIFOs. 0 ESAI not reset. 1 ESAI reset.
0 ESAIEN	ESAI Enable. Enables/disables the ESAI logic clock. Enable the ESAI before reading or writing other ESAI registers. 0 ESAI disabled. 1 ESAI enabled.

26.6.4 ESAI Status Register (ESAI_ESR)

Address: 202_4000h base + Ch offset = 202_400Ch

ESAI_ESR field descriptions

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 TINIT	Transmit Initialization. Indicates that the Transmit FIFO is writing the first word for each enabled transmitter into the Transmit Data Registers. This bit sets when the Transmit FIFO is enabled (provided Transmit Initialization is enabled) and clears after the Transmit Data Registers have been initialized. The Transmit Enable bits in the Transmit Control Register should not be set until this flag has cleared. 0 Transmitter has finished initializing the Transmit Data Registers (or Transmit FIFO is not enabled or Transmit Initialization is not enabled). 1 Transmitter has not finished initializing the Transmit Data Registers.
9 RFF	Receive FIFO Full. Indicates that the number of data words in the Receive FIFO has equaled or exceeded the Receive FIFO Watermark. This flag also drives the ESAI Receiver DMA request line. ESAI FIFO DMA requests see ESAI DMA Requests from the FIFOs . 0 Number of words in Receive FIFO less than Receive FIFO watermark. 1 Number of words in Receive FIFO is equal to or greater than Receive FIFO watermark.
8 TFE	Transmit FIFO Empty. Indicates that the number of empty slots in the Transmit FIFO has met or exceeded the Transmit FIFO Watermark. This flag also drives the ESAI Transmitter DMA request line. ESAI FIFO DMA request see ESAI DMA Requests from the FIFOs . 0 Number of empty slots in Transmit FIFO less than Transmit FIFO watermark. 1 Number of empty slots in Transmit FIFO is equal to or greater than Transmit FIFO watermark.
7 TLS	Transmit Last Slot. Reading this register when TLS is set will negate the Transmit Last Slot interrupt. 0 TLS is not the highest priority active interrupt. 1 TLS is the highest priority active interrupt.
6 TDE	Transmit Data Exception. 0 TDE is not the highest priority active interrupt. 1 TDE is the highest priority active interrupt.
5 TED	Transmit Even Data. 0 TED is not the highest priority active interrupt. 1 TED is the highest priority active interrupt.
4 TD	Transmit Data. 0 TD is not the highest priority active interrupt. 1 TD is the highest priority active interrupt.
3 RLS	Receive Last Slot. Reading this register when RLS is set will negate the Receive Last Slot interrupt. 0 RLS is not the highest priority active interrupt. 1 RLS is the highest priority active interrupt.
2 RDE	Receive Data Exception. 0 RDE is not the highest priority active interrupt. 1 RDE is the highest priority active interrupt.
1 RED	Receive Even Data. 0 RED is not the highest priority active interrupt. 1 RED is the highest priority active interrupt.

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ESAI_TFCR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 TIEN	Transmitter Initialization Enable. Enables the initialization of the Transmit Data Registers when the Transmitter FIFO is enabled. TIEN=1 is recommended. 0 Transmit Data Registers are not initialized from the FIFO once the Transmit FIFO is enabled. Software must manually initialize the Transmit Data Registers separately. 1 Transmit Data Registers are initialized from the FIFO once the Transmit FIFO is enabled.
18–16 TWA[2:0]	Transmit Word Alignment. Configures the alignment of the data written into the ESAI Transmit Data Register and then passed to the relevant 24 bit Transmit shift register. 000 MSB of data is bit 31. Data bits 7-0 are ignored when passed to transmit shift register. 001 MSB of data is bit 27. Data bits 3-0 are ignored when passed to transmit shift register. 010 MSB of data is bit 23. 011 MSB of data is bit 19. Bottom 4 bits of transmit shift register are zeroed. 100 MSB of data is bit 15. Bottom 8 bits of transmit shift register are zeroed. 101 MSB of data is bit 11. Bottom 12 bits of transmit shift register are zeroed. 110 MSB of data is bit 7. Bottom 16 bits of transmit shift register are zeroed. 111 MSB of data is bit 3. Bottom 20 bits of transmit shift register are zeroed.
15–8 TFWM[7:0]	Transmit FIFO Watermark. These bits configure the threshold at which the Transmit FIFO Empty flag will set. The TFE is set when the number of empty slots in the Transmit FIFO equal or exceed the selected threshold.
7 TE5	Transmitter #5 FIFO Enable. This bit enables transmitter #5 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled.

Table continues on the next page...

ESAI_TFCR field descriptions (continued)

Field	Description
	0 Transmitter #5 is not using the Transmit FIFO. 1 Transmitter #5 is using the Transmit FIFO.
6 TE4	Transmitter #4 FIFO Enable. This bit enables transmitter #4 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. 0 Transmitter #4 is not using the Transmit FIFO. 1 Transmitter #4 is using the Transmit FIFO.
5 TE3	Transmitter #3 FIFO Enable. This bit enables transmitter #3 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. 0 Transmitter #3 is not using the Transmit FIFO. 1 Transmitter #3 is using the Transmit FIFO.
4 TE2	Transmitter #2 FIFO Enable. This bit enables transmitter #2 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. 0 Transmitter #2 is not using the Transmit FIFO. 1 Transmitter #2 is using the Transmit FIFO.
3 TE1	Transmitter #1 FIFO Enable. This bit enables transmitter #1 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. 0 Transmitter #1 is not using the Transmit FIFO. 1 Transmitter #1 is using the Transmit FIFO.
2 TE0	Transmitter #0 FIFO Enable. This bit enables transmitter #0 to use the Transmit FIFO. Do not change this bit when the Transmitter FIFO is enabled. 0 Transmitter #0 is not using the Transmit FIFO. 1 Transmitter #0 is using the Transmit FIFO.
1 TFR	Transmit FIFO Reset. This bit resets the Transmit FIFO pointers. 0 Transmit FIFO not reset. 1 Transmit FIFO reset.
0 TFE	Transmit FIFO Enable. This bit enables the use of the Transmit FIFO. 0 Transmit FIFO disabled. 1 Transmit FIFO enabled.

26.6.6 Transmit FIFO Status Register (ESAI_TFSR)

Address: 202_4000h base + 14h offset = 202_4014h

ESAI_RFCR field descriptions

Field	Description
31–20 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
19 REXT	Receive Extension. Enables the receive data to be returned sign extended when the Receive Word Alignment is configured to return data where the MSB is not aligned with bit 31. 0 Receive data is zero extended. 1 Receive data is sign extended.
18–16 RWA[2:0]	Receive Word Alignment. Configures the alignment of the data passed from the relevant 24 bit Receive shift register and read out the ESAI Receive Data Register. 000 MSB of data is at bit 31. Data bits 7-0 are zeroed. 001 MSB of data is at bit 27. Data bits 3-0 are zeroed. 010 MSB of data is at bit 23. 011 MSB of data is at bit 19. Data bits 3-0 from receive shift register are ignored. 100 MSB of data is at bit 15. Data bits 7-0 from receive shift register are ignored. 101 MSB of data is at bit 11. Data bits 11-0 from receive shift register are ignored. 110 MSB of data is at bit 7. Data bits 15-0 from receive shift register are ignored. 111 MSB of data is at bit 3. Data bits 19-0 from receive shift register are ignored.
15–8 RFWM[7:0]	Receive FIFO Watermark. These bits configure the threshold at which the Receive FIFO Full flag will set. The RFF is set when the number of words in the Receive FIFO equal or exceed the selected threshold. It can be set to a non-zero value.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
5 RE3	Receiver #3 FIFO Enable. This bit enables receiver #3 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled. 0 Receiver #3 is not using the Receive FIFO. 1 Receiver #3 is using the Receive FIFO.
4 RE2	Receiver #2 FIFO Enable. This bit enables receiver #2 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled. 0 Receiver #2 is not using the Receive FIFO. 1 Receiver #2 is using the Receive FIFO.

Table continues on the next page...

ESAI_RFCR field descriptions (continued)

Field	Description
3 RE1	Receiver #1 FIFO Enable. This bit enables receiver #1 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled. 0 Receiver #1 is not using the Receive FIFO. 1 Receiver #1 is using the Receive FIFO.
2 RE0	Receiver #0 FIFO Enable. This bit enables receiver #0 to use the Receive FIFO. Do not change this bit when the Receiver FIFO is enabled. 0 Receiver #0 is not using the Receive FIFO. 1 Receiver #0 is using the Receive FIFO.
1 RFR	Receive FIFO Reset. This bit resets the Receive FIFO pointers. 0 Receive FIFO not reset. 1 Receive FIFO reset.
0 RFE	Receive FIFO Enable. This bit enables the use of the Receive FIFO. 0 Receive FIFO disabled. 1 Receive FIFO enabled.

26.6.8 Receive FIFO Status Register (ESAI_RFSR)

Address: 202_4000h base + 1Ch offset = 202_401Ch

ESAI_RFSR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–12 NRFI[1:0]	Next Receiver FIFO In. Indicates which Receiver Data Register the Receive FIFO will load next. This will usually equal the lowest enabled receiver, unless the receive FIFO is full. 00 Receiver #0 returns next word to the Receive FIFO. 01 Receiver #1 returns next word to the Receive FIFO. 10 Receiver #2 returns next word to the Receive FIFO. 11 Receiver #3 returns next word to the Receive FIFO.

Table continues on the next page...

ESAI_RFSR field descriptions (continued)

Field	Description
11–10 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
9–8 NRFO[1:0]	Next Receiver FIFO Out. Indicates which receiver returns the top word of the Receive FIFO. 00 Receiver #0 returns next word from the Receive FIFO. 01 Receiver #1 returns next word from the Receive FIFO. 10 Receiver #2 returns next word from the Receive FIFO. 11 Receiver #3 returns next word from the Receive FIFO.
RFCNT[7:0]	Receive FIFO Counter. These bits indicate the number of data words stored in the Receive FIFO.

26.6.9 Transmit Data Register n (ESAI_TXn)

ESAI_TX5, ESAI_TX4, ESAI_TX3, ESAI_TX2, ESAI_TX1 and ESAI_TX0 are 32-bit write-only registers. Data to be transmitted is written into these registers and is automatically transferred to the transmit shift registers (Figure 26-2 and Figure 26-3). The data written (8, 12, 16, 20, or 24 bits) should occupy the most significant portion of the TXn according to the ALC control bit setting. The unused bits (least significant portion and the 8 most significant bits when ALC=1) of the TXn are don't care bits. The Core is interrupted whenever the TXn becomes empty if the transmit data register empty interrupt has been enabled.

Address: 202_4000h base + 80h offset + (4d × i), where i=0d to 5d

ESAI_TXn field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXn[23:0]	Stores the data to be transmitted and is automatically transferred to the transmit shift registers. See ESAI Transmit Shift Registers .

26.6.10 ESAI Transmit Slot Register (ESAI_TSR)

Address: 202_4000h base + 98h offset = 202_4098h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								0																							
W									TSR[23:0]																							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

ESAI_TSR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TSR[23:0]	The write-only Transmit Slot Register (ESAI_TSR) is effectively a null data register that is used when the data is not to be transmitted in the available transmit time slot. The transmit data pins of all the enabled transmitters are in the high-impedance state for the respective time slot where TSR has been written. The Transmitter External Buffer Enable pin (FSR pin when SYN=1, TEBE=1, RFSD=1) disables the external buffers during the slot when the ESAI_TSR register has been written.

26.6.11 Receive Data Register n (ESAI_RXn)

ESAI_RX3, ESAI_RX2, ESAI_RX1, and ESAI_RX0 are 32-bit read-only registers that accept data from the receive shift registers when they become full (Figure 26-2 and Figure 26-3). The data occupies the most significant portion of the receive data registers, according to the ALC control bit setting. The unused bits (least significant portion and 8 most significant bits when ALC=1) read as zeros. The Core is interrupted whenever RXn becomes full if the associated interrupt is enabled.

Address: 202_4000h base + A0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESAI_RXn field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RXn[23:0]	Accept data from the receive shift registers when they become full See ESAI Receive Shift Registers

26.6.12 Serial Audio Interface Status Register (ESAI_SAISR)

The Status Register (ESAI_SAISR) is a read-only status register used by the ARM Core to read the status and serial input flags of the ESAI.

Address: 202_4000h base + CCh offset = 202_40CCh

ESAI_SAISR field descriptions

Field	Description
31–18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 TODFE	ESAI_SAISR Transmit Odd-Data Register Empty. When set, TODFE indicates that the enabled transmitter data registers became empty at the beginning of an odd time slot. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TODFE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TODFE is cleared when the Core writes to all the transmit data registers of the

Table continues on the next page...

ESAI_SAISR field descriptions (continued)

Field	Description
	enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TODFE is set. Hardware, software, ESAI individual reset clear TODFE.
16 TEDE	ESAI_SAISR Transmit Even-Data Register Empty. When set, TEDE indicates that the enabled transmitter data registers became empty at the beginning of an even time slot. Even time slots are all even-numbered slots (0, 2, 4, 6, etc.). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. This flag is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TEDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TEDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TEDE is set. Hardware, software, ESAI individual reset clear TEDE.
15 TDE	ESAI_SAISR Transmit Data Register Empty. TDE is set when the contents of the transmit data register of all the enabled transmitters are transferred to the transmit shift registers; it is also set for a TSR disabled time slot period in network mode (as if data were being transmitted after the TSR was written). When set, TDE indicates that data should be written to all the TX registers of the enabled transmitters or to the transmit slot register (ESAI_TSR). TDE is cleared when the Core writes to all the transmit data registers of the enabled transmitters, or when the Core writes to the TSR to disable transmission of the next time slot. If TIE is set, an ESAI transmit data interrupt request is issued when TDE is set. Hardware, software, ESAI individual reset clear TDE.
14 TUE	ESAI_SAISR Transmit Underrun Error Flag. TUE is set when at least one of the enabled serial transmit shift registers is empty (no new data to be transmitted) and a transmit time slot occurs. When a transmit underrun error occurs, the previous data (which is still present in the TX registers that were not written) is retransmitted. If TEIE is set, an ESAI transmit data with exception (underrun error) interrupt request is issued when TUE is set. Hardware, software, ESAI individual reset clear TUE. TUE is also cleared by reading the ESAI_SAISR with TUE set, followed by writing to all the enabled transmit data registers or to ESAI_TSR.
13 TFS	ESAI_SAISR Transmit Frame Sync Flag. When set, TFS indicates that a transmit frame sync occurred in the current time slot. TFS is set at the start of the first time slot in the frame and cleared during all other time slots. Data written to a transmit data register during the time slot when TFS is set is transmitted (in network mode), if the transmitter is enabled, during the second time slot in the frame. TFS is useful in network mode to identify the start of a frame. TFS is cleared by hardware, software, ESAI individual reset. TFS is valid only if at least one transmitter is enabled, that is, one or more of TE0, TE1, TE2, TE3, TE4 and TE5 are set. (In normal mode, TFS always reads as a one when transmitting data because there is only one time slot per frame - the "frame sync" time slot)
12–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 RODF	ESAI_SAISR Receive Odd-Data Register Full. When set, RODF indicates that the received data in the receive data registers of the enabled receivers have arrived during an odd time slot when operating in the network mode. Odd time slots are all odd-numbered slots (1, 3, 5, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. RODF is set when the contents of the receive shift registers are transferred to the receive data registers. RODF is cleared when the Core reads all the enabled receive data registers or cleared by hardware, software, ESAI individual resets.
9 REDF	ESAI_SAISR Receive Even-Data Register Full. When set, REDF indicates that the received data in the receive data registers of the enabled receivers have arrived during an even time slot when operating in the network mode. Even time slots are all even-numbered slots (0, 2, 4, 6, and so on). Time slots are numbered from zero to N-1, where N is the number of time slots in the frame. The zero time slot is considered even. REDF is set when the contents of the receive shift registers are transferred to the receive data registers. REDF is cleared when the Core reads all the enabled receive data registers or

Table continues on the next page...

ESAI_SAISR field descriptions (continued)

Field	Description
	cleared by hardware, software, ESAI individual resets. If REDIE is set, an ESAI receive even slot data interrupt request is issued when REDF is set.
8 RDF	ESAI_SAISR Receive Data Register Full. RDF is set when the contents of the receive shift register of an enabled receiver is transferred to the respective receive data register. RDF is cleared when the Core reads the receive data register of all enabled receivers or cleared by hardware, software, ESAI individual reset. If RIE is set, an ESAI receive data interrupt request is issued when RDF is set.
7 ROE	ESAI_SAISR Receive Overrun Error Flag. The ROE flag is set when the serial receive shift register of an enabled receiver is full and ready to transfer to its receiver data register (RXn) and the register is already full (RDF=1). If REIE is set, an ESAI receive data with exception (overrun error) interrupt request is issued when ROE is set. Hardware, software, ESAI individual reset clear ROE. ROE is also cleared by reading the SAISR with ROE set, followed by reading all the enabled receive data registers.
6 RFS	ESAI_SAISR Receive Frame Sync Flag. When set, RFS indicates that a receive frame sync occurred during reception of the words in the receiver data registers. This indicates that the data words are from the first slot in the frame. When RFS is clear and a word is received, it indicates (only in the network mode) that the frame sync did not occur during reception of that word. RFS is cleared by hardware, software, ESAI individual reset. RFS is valid only if at least one of the receivers is enabled (REx=1). (In normal mode, RFS always reads as a one when reading data because there is only one time slot per frame - the "frame sync" time slot)
5-3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 IF2	ESAI_SAISR Serial Input Flag 2. The IF2 bit is enabled only when the HCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RHCKD=0, indicating that HCKR is an input flag and the synchronous mode is selected. Data present on the HCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF2 bit is updated with this data when the receive shift registers are transferred into the receiver data registers. IF2 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF2.
1 IF1	ESAI_SAISR Serial Inout Flag 1. The IF1 bit is enabled only when the FSR pin is defined as ESAI in the Port Control Register, SYN =1, RFSD=0 and TEBE=0, indicating that FSR is an input flag and the synchronous mode is selected. Data present on the FSR pin is latched during reception of the first received data bit after frame sync is detected. The IF1 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF1 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF1.
0 IF0	ESAI_SAISR Serial Input Flag 0. The IF0 bit is enabled only when the SCKR pin is defined as ESAI in the Port Control Register, SYN=1 and RCKD=0, indicating that SCKR is an input flag and the synchronous mode is selected. Data present on the SCKR pin is latched during reception of the first received data bit after frame sync is detected. The IF0 bit is updated with this data when the receiver shift registers are transferred into the receiver data registers. IF0 reads as a zero when it is not enabled. Hardware, software, ESAI individual reset clear IF0.

26.6.13 Serial Audio Interface Control Register (ESAI_SAICR)

The read/write Common Control Register (ESAI_SAICR) contains control bits for functions that affect both the receive and transmit sections of the ESAI.

ESAI_SAICR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 ALC	ESAI_SAICR Alignment Control. The ESAI is designed for 24-bit fractional data, thus shorter data words are left aligned to the MSB (bit 23). Some applications use 16-bit fractional data. In those cases, shorter data words may be left aligned to bit 15. The Alignment Control (ALC) bit supports these applications. If ALC is set, transmitted and received words are left aligned to bit 15 in the transmit and receive shift registers. If ALC is cleared, transmitted and received word are left aligned to bit 23 in the transmit and receive shift registers. While ALC is set, 20-bit and 24-bit words may not be used, and word length control should specify 8-, 12-, or 16-bit words; otherwise, results are unpredictable.
7 TEBE	ESAI_SAICR Transmit External Buffer Enable. The Transmitter External Buffer Enable (TEBE) bit controls the function of the FSR pin when in the synchronous mode. If the ESAI is configured for operation in the synchronous mode (SYN=1), and TEBE is set while FSR pin is configured as an output (RFSD=1), the FSR pin functions as the transmitter external buffer enable control to enable the use of an external buffers on the transmitter outputs. If TEBE is cleared, the FSR pin functions as the serial I/O flag 1. See Port C Control Register for a summary of the effects of TEBE on the FSR pin.
6 SYN	ESAI_SAICR Synchronous Mode Selection. The Synchronous Mode Selection (SYN) bit controls whether the receiver and transmitter sections of the ESAI operate synchronously or asynchronously with respect to each other (see Port C Control Register). When SYN is cleared, the asynchronous mode is chosen and independent clock and frame sync signals are used for the transmit and receive sections. When SYN is set, the synchronous mode is chosen and the transmit and receive sections use common clock and frame sync signals. When in the synchronous mode (SYN=1), the transmit and receive sections use the transmitter section clock generator as the source of the clock and frame sync for both sections. Also, the receiver clock pins SCKR, FSR and HCKR now operate as I/O flags. Refer to Table 26-39 , Table 26-40 , and Table 26-41 for the effects of SYN on the receiver clock pins.
5–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 OF2	ESAI_SAICR Serial Output Flag 2. The Serial Output Flag 2 (OF2) is a data bit used to hold data to be send to the OF2 pin. When the ESAI is in the synchronous clock mode (SYN=1), the HCKR pin is configured as the ESAI flag 2. If the receiver high frequency clock direction bit (RHCKD) is set, the HCKR pin is the output flag OF2, and data present in the OF2 bit is written to the OF2 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.
1 OF1	ESAI_SAICR Serial Output Flag 1. The Serial Output Flag 1 (OF1) is a data bit used to hold data to be send to the OF1 pin. When the ESAI is in the synchronous clock mode (SYN=1), the FSR pin is configured as the ESAI flag 1. If the receiver frame sync direction bit (RFSD) is set and the TEBE bit is cleared, the FSR pin is the output flag OF1, and data present in the OF1 bit is written to the OF1 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

Table continues on the next page...

ESAI_SAICR field descriptions (continued)

Field	Description
0 OF0	ESAI_SAICR Serial Output Flag 0. The Serial Output Flag 0 (OF0) is a data bit used to hold data to be sent to the OF0 pin. When the ESAI is in the synchronous clock mode (SYN=1), the SCKR pin is configured as the ESAI flag 0. If the receiver serial clock direction bit (RCKD) is set, the SCKR pin is the output flag OF0, and data present in the OF0 bit is written to the OF0 pin at the beginning of the frame in normal mode or at the beginning of the next time slot in network mode.

26.6.14 Transmit Control Register (ESAI_TCR)

The read/write Transmit Control Register (ESAI_TCR) controls the ESAI transmitter section. Interrupt enable bits for the transmitter section are provided in this control register. Operating modes are also selected in this register.

Table 26-30. Transmit Network Mode Selection

TMOD1	TMOD0	TDC4-TDC0	Transmitter Network Mode

ESAI_TCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 TLIE	ESAI_TCR Transmit Last Slot Interrupt Enable. TLIE enables an interrupt at the beginning of last slot of a frame in network mode. When TLIE is set the Core is interrupted at the start of the last slot in a frame in network mode regardless of the transmit mask register setting. When TLIE is cleared the transmit last slot interrupt is disabled. TLIE is disabled when TDC[4:0]=0x00000 (on-demand mode). The use of the transmit last slot interrupt is described in ESAI Interrupt Requests .
22 TIE	ESAI_TCR Transmit Interrupt Enable. The Core is interrupted when TIE and the TDE flag in the ESAI_SAISR status register are set. When TIE is cleared, this interrupt is disabled. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears TDE, thus clearing the interrupt. Transmit interrupts with exception have higher priority than normal transmit data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
21 TEDIE	ESAI_TCR Transmit Even Slot Data Interrupt Enable. The TEDIE control bit is used to enable the transmit even slot data interrupts. If TEDIE is set, the transmit even slot data interrupts are enabled. If TEDIE is cleared, the transmit even slot data interrupts are disabled. A transmit even slot data interrupt request is generated if TEDIE is set and the TEDE status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot in the frame is marked by the frame sync signal and is considered to be even. Writing data to all the data registers of the enabled transmitters or to ESAI_TSR clears the TEDE flag, thus servicing the interrupt. Transmit interrupts with exception have higher priority than transmit even slot data interrupts, therefore if exception occurs (TUE is set) and TEIE is set, the ESAI requests an ESAI transmit data with exception interrupt from the interrupt controller.
20 TEIE	ESAI_TCR Transmit Exception Interrupt Enable. When TEIE is set, the Core is interrupted when both TDE and TUE in the ESAI_SAISR status register are set. When TEIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by writing to all the data registers of the enabled transmitters clears TUE, thus clearing the pending interrupt.
19 TPR	ESAI_TCR Transmit Section Personal Reset. The TPR control bit is used to put the transmitter section of the ESAI in the personal reset state. The receiver section is not affected. When TPR is cleared, the transmitter section may operate normally. When TPR is set, the transmitter section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The transmitter data pins are tri-stated while in the personal reset state; if a stable logic level is desired, the transmitter data pins should be defined as GPIO outputs, or external pull-up or pull-down resistors should be used. The

Table continues on the next page...

ESAI_TCR field descriptions (continued)

Field	Description
	transmitter clock outputs drive zeroes while in the personal reset state. Note that to leave the personal reset state by clearing TPR, the procedure described in ESAI Initialization Examples should be followed.
18 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
17 PADC	ESAI_TCR Transmit Zero Padding Control. When PADC is cleared, zero padding is disabled. When PADC is set, zero padding is enabled. PADC, in conjunction with the TWA control bit, determines the way that padding is done for operating modes where the word length is less than the slot length. See the TWA bit description in bit 7 for more details. Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule: If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted. If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.
16 TFSR	ESAI_TCR Transmit Frame Sync Relative Timing. TFSR determines the relative timing of the transmit frame sync signal as referred to the serial data lines, for a word length frame sync only (TFSL=0). When TFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When TFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 TFSL	ESAI_TCR Transmit Frame Sync Length. The TFSL bit selects the length of frame sync to be generated or recognized. If TFSL is cleared, a word-length frame sync is selected. If TFSL is set, a 1-bit clock period frame sync is selected. See Figure 1-21 for examples of frame length selection.
14–10 TSWS[14:10]	ESAI_TCR Tx Slot and Word Length Select (TSWS4-TSWS0). The TSWS4-TSWS0 bits are used to select the length of the slot and the length of the data words being transferred through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in Table 26-31 . See also the ESAI data path programming model in Figure 26-2 and Figure 26-3 .
9–8 TMOD[9:8]	ESAI_TCR Transmit Network Mode Control (TMOD1-TMOD0). The TMOD1 and TMOD0 bits are used to define the network mode of ESAI transmitters, as shown in Table 26-31 . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in Figure 26-29 . In network mode, it is possible to transfer a word for every time slot, as shown in Figure 26-29 . For further details, refer to Modes of Operation In order to comply with AC-97 specifications, TSWS4-TSWS0 should be set to 00011 (20-bit slot, 20-bit word length), TFSL and TFSR should be cleared, and TDC4-TDC0 should be set to 0x0C (13 words in frame). If TMOD[1:0]=0b11 and the above recommendations are followed, the first slot and word will be 16 bits long, and the next 12 slots and words will be 20 bits long, as required by the AC97 protocol.
7 TWA	ESAI_TCR Transmit Word Alignment Control. The Transmitter Word Alignment Control (TWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If TWA is cleared, the data word is left-aligned in the slot frame during transmission. If TWA is set, the data word is right-aligned in the slot frame during transmission. Because the data word is shorter than the slot length, the data word is extended until achieving the slot length, according to the following rule: If the data word is left-aligned (TWA=0), and zero padding is disabled (PADC=0), the last data bit is repeated after the data word has been transmitted. If zero padding is enabled (PADC=1), zeroes are transmitted after the data word has been transmitted. If the data word is right-aligned (TWA=1), and zero padding is disabled (PADC=0), the first data bit is repeated before the transmission of the data word. If zero padding is enabled (PADC=1), zeroes are transmitted before the transmission of the data word.

ESAI_TCR field descriptions (continued)

Field	Description
6 TSHFD	ESAI_TCR Transmit Shift Direction. The TSHFD bit causes the transmit shift registers to shift data out MSB first when TSHFD equals zero or LSB first when TSHFD equals one (see Figure 26-2 and Figure 26-3).
5 TE5	<p>ESAI_TCR ESAI Transmit 5 Enable. TE5 enables the transfer of data from ESAI_TX5 to the transmit shift register #5. When TE5 is set and a frame sync is detected, the transmit #5 portion of the ESAI is enabled for that frame. When TE5 is cleared, the transmitter #5 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX5 when TE5 is cleared but the data is not transferred to the transmit shift register #5.</p> <p>The SDO5/SDI0 pin is the data input pin for ESAI_RX0 if TE5 is cleared and RE0 in the ESAI_RCR register is set. If both RE0 and TE5 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE0 and TE5 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE5 and setting it again disables the transmitter #5 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO5/SDI0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE5 can be left enabled.</p>
4 TE4	<p>ESAI_TCR ESAI Transmit 4 Enable. TE4 enables the transfer of data from ESAI_TX4 to the transmit shift register #4. When TE4 is set and a frame sync is detected, the transmit #4 portion of the ESAI is enabled for that frame. When TE4 is cleared, the transmitter #4 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX4 when TE4 is cleared but the data is not transferred to the transmit shift register #4.</p> <p>The SDO4/SDI1 pin is the data input pin for ESAI_RX1 if TE4 is cleared and RE1 in the RCR register is set. If both RE1 and TE4 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE1 and TE4 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE4 and setting it again disables the transmitter #4 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO4/SDI1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE4 can be left enabled.</p>
3 TE3	<p>ESAI_TCR ESAI Transmit 3 Enable. TE3 enables the transfer of data from ESAI_TX3 to the transmit shift register #3. When TE3 is set and a frame sync is detected, the transmit #3 portion of the ESAI is enabled for that frame. When TE3 is cleared, the transmitter #3 is disabled after completing transmission of data currently in the ESAI transmit shift register. Data can be written to ESAI_TX3 when TE3 is cleared but the data is not transferred to the transmit shift register #3.</p> <p>The SDO3/SDI2 pin is the data input pin for ESAI_RX2 if TE3 is cleared and RE2 in the ESAI_RCR register is set. If both RE2 and TE3 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE2 and TE3 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE3 and setting it again disables the transmitter #3 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO3/SDI2 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE3 can be left enabled.</p>
2 TE2	ESAI_TCR ESAI Transmit 2 Enable. TE2 enables the transfer of data from ESAI_TX2 to the transmit shift register #2. When TE2 is set and a frame sync is detected, the transmit #2 portion of the ESAI is enabled for that frame. When TE2 is cleared, the transmitter #2 is disabled after completing transmission of data

ESAI_TCR field descriptions (continued)

Field	Description
	<p>currently in the ESAI transmit shift register. Data can be written to ESAI_TX2 when TE2 is cleared but the data is not transferred to the transmit shift register #2.</p> <p>The SDO2/SDI3 pin is the data input pin for ESAI_RX3 if TE2 is cleared and RE3 in the ESAI_RCR register is set. If both RE3 and TE2 are cleared, the transmitter and receiver are disabled, and the pin is tri-stated. Both RE3 and TE2 should not be set at the same time.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE2 and setting it again disables the transmitter #2 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO2/SDI3 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE2 can be left enabled.</p>
<p>1 TE1</p>	<p>ESAI_TCR ESAI Transmit 1 Enable. TE1 enables the transfer of data from TX1 to the transmit shift register #1. When TE1 is set and a frame sync is detected, the transmit #1 portion of the ESAI is enabled for that frame. When TE1 is cleared, the transmitter #1 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO1 output is tri-stated, and any data present in TX1 is not transmitted, that is, data can be written to TX1 with TE1 cleared, but data is not transferred to the transmit shift register #1.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE1 and setting it again disables the transmitter #1 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO1 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE1 can be left enabled.</p>
<p>0 TE0</p>	<p>ESAI_TCR ESAI Transmit 0 Enable. TE0 enables the transfer of data from ESAI_TX0 to the transmit shift register #0. When TE0 is set and a frame sync is detected, the transmit #0 portion of the ESAI is enabled for that frame. When TE0 is cleared, the transmitter #0 is disabled after completing transmission of data currently in the ESAI transmit shift register. The SDO0 output is tri-stated, and any data present in ESAI_TX0 is not transmitted, that is, data can be written to ESAI_TX0 with TE0 cleared, but data is not transferred to the transmit shift register #0.</p> <p>The normal mode transmit enable sequence is to write data to one or more transmit data registers before setting TEx. The normal transmit disable sequence is to clear TEx, TIE and TEIE after TDE equals one.</p> <p>In the network mode, the operation of clearing TE0 and setting it again disables the transmitter #0 after completing transmission of the current data word until the beginning of the next frame. During that time period, the SDO0 pin remains in the high-impedance state. The on-demand mode transmit enable sequence can be the same as the normal mode, or TE0 can be left enabled.</p>

26.6.15 Transmit Clock Control Register (ESAI_TCCR)

The read/write Transmitter Clock Control Register (ESAI_TCCR) controls the ESAI transmitter clock generator bit and frame sync rates, the bit clock and high frequency clock sources and the directions of the HCKT, FST and SCKT signals. In the synchronous mode (SYN=1), the bit clock defined for the transmitter determines the receiver bit clock as well. ESAI_TCCR also controls the number of words per frame for the serial data. Hardware and software reset clear all the bits of the ESAI_TCCR register.

Care should be taken in asynchronous mode whenever the frame sync clock (FSR, FST) is not sourced directly from its associated bit clock (SCKR, SCKT). Proper phase relationships must be maintained between these clocks in order to guarantee proper operation of the ESAI.

NOTE

ARM Core clock is ipg_clk_esai in block ESAI which is from CCM's ahb_clk_root.

Figure 26-32. ESAI Clock Generator Functional Block Diagram

NOTE

1. ETI, ETO, ERI and ERO bit descriptions are covered in [ESAI Control Register \(ESAI_ECR\)](#).
2. Fsys is the ESAI system 133 MHz clock.
3. EXTAL is the on-chip clock sources other than ESAI system 133MHz clock.

ESAI_TCCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 THCKD	ESAI_TCCR Transmit High Frequency Clock Direction. THCKD controls the direction of the HCKT pin. When THCKD is cleared, HCKT is an input; when THCKD is set, HCKT is an output (see Table 26-3).
22 TFSD	ESAI_TCCR Transmit Frame Sync Signal Direction. TFSD controls the direction of the FST pin. When TFSD is cleared, FST is an input; when TFSD is set, FST is an output (see Table 26-3).
21 TCKD	ESAI_TCCR Transmit Clock Source Direction. The Transmitter Clock Source Direction (TCKD) bit selects the source of the clock signal used to clock the transmit shift registers in the asynchronous mode (SYN=0) and the transmit shift registers and the receive shift registers in the synchronous mode (SYN=1). When TCKD is set, the internal clock source becomes the bit clock for the transmit shift registers and word length divider and is the output on the SCKT pin. When TCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKT pin, and an external clock source may drive this pin (see Table 26-3).
20 THCKP	ESAI_TCCR Transmit High Frequency Clock Polarity The Transmitter High Frequency Clock Polarity (THCKP) bit controls the polarity of the HCKT. 0 - Normal polarity 1 - Inverted polarity
19 TFSP	ESAI_TCCR Transmit Frame Sync Polarity. The Transmitter Frame Sync Polarity (TFSP) bit determines the polarity of the transmit frame sync signal. When TFSP is cleared, the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When TFSP is set, the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin.
18 TCKP	ESAI_TCCR Transmit Clock Polarity. The Transmitter Clock Polarity (TCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If TCKP is cleared the data and the frame sync are clocked out on the rising edge of the transmit bit clock and latched in on the falling edge of the transmit bit clock. If TCKP is set the falling edge of the transmit clock is used to clock the data out and frame sync and the rising edge of the transmit clock is used to latch the data and frame sync in.
17–14 TFP[3:0]	ESAI_TCCR Tx High Frequency Clock Divider. The TFP3-TFP0 bits control the divide ratio of the transmitter high frequency clock to the transmitter serial bit clock when the source of the high frequency clock and the bit clock is the internal ARM Core clock. When the HCKT input is being driven from an external high frequency clock, the TFP3-TFP0 bits specify an additional division ratio in the clock divider chain. Table 26-33 shows the specification for the divide ratio. Figure 26-32 shows the ESAI high frequency clock generator functional diagram.

Table continues on the next page...

ESAI_TCCR field descriptions (continued)

Field	Description
13–9 TDC[4:0]	<p>ESAI_TCCR Tx Frame Rate Divider Control. The TDC4-TDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the transmitter frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (TDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (TDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (TDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of 1 (TDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (TFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in Figure 26-33</p>
8 TPSR	<p>ESAI_TCCR Transmit Prescaler Range. The TPSR bit controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When TPSR is set, the fixed prescaler is bypassed. When TPSR is cleared, the fixed divide-by-eight prescaler is operational (see Figure 26-32). The maximum internally generated bit clock frequency is $F_{sys}/4$; the minimum internally generated bit clock frequency is $F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536$. (Do not use the combination TPSR=1, TPM7-TPM0=0x00, and TFP3-TFP0=0x0 which causes synchronization problems when using the internal ARM Core clock as source (TCKD=1 or THCKD=1))</p>
TPM[7:0]	<p>ESAI_TCCR Transmit Prescale Modulus Select. The TPM7-TPM0 bits specify the divide ratio of the prescale divider in the ESAI transmitter clock generator. A divide ratio from 1 to 256 (TPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the transmit serial bit clock (SCKT) pin. The bit clock output is also available internally for use as the bit clock to shift the transmit and receive shift registers. The ESAI transmit clock generator functional diagram is shown in Figure 26-32.</p>

26.6.16 Receive Control Register (ESAI_RCR)

The read/write Receive Control Register (ESAI_RCR) controls the ESAI receiver section. Interrupt enable bits for the receivers are provided in this control register. The receivers are enabled in this register (0,1,2 or 3 receivers can be enabled) if the input data pin is not used by a transmitter. Operating modes are also selected in this register.

Table 26-35. ESAI Receive Network Mode Selection

RMOD1	RMOD0	RDC4-RDC0	Receiver Network Mode

ESAI_RCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RLIE	ESAI_RCR Receive Last Slot Interrupt Enable. RLIE enables an interrupt after the last slot of a frame ended in network mode only. When RLIE is set the Core is interrupted after the last slot in a frame ended regardless of the receive mask register setting. When RLIE is cleared the receive last slot interrupt is disabled. Hardware and software reset clear RLIE. RLIE is disabled when RDC[4:0]=00000 (on-demand mode). The use of the receive last slot interrupt is described in ESAI Interrupt Requests .
22 RIE	ESAI_RCR Receive Interrupt Enable. The Core is interrupted when RIE and the RDF flag in the ESAI_SAISR status register are set. When RIE is cleared, this interrupt is disabled. Reading the receive data registers of the enabled receivers clears RDF, thus clearing the interrupt. Receive interrupts with exception have higher priority than normal receive data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
21 REDIE	ESAI_RCR Receive Even Slot Data Interrupt Enable. The REDIE control bit is used to enable the receive even slot data interrupts. If REDIE is set, the receive even slot data interrupts are enabled. If REDIE is cleared, the receive even slot data interrupts are disabled. A receive even slot data interrupt request is generated if REDIE is set and the REDF status flag in the ESAI_SAISR status register is set. Even time slots are all even-numbered time slots (0, 2, 4, etc.) when operating in network mode. The zero time slot is marked by the frame sync signal and is considered to be even. Reading all the data registers of the enabled receivers clears the REDF flag, thus servicing the interrupt. Receive interrupts with exception have higher priority than receive even slot data interrupts, therefore if exception occurs (ROE is set) and REIE is set, the ESAI requests an ESAI receive data with exception interrupt from the interrupt controller.
20 REIE	ESAI_RCR Receive Exception Interrupt Enable. When REIE is set, the Core is interrupted when both RDF and ROE in the ESAI_SAISR status register are set. When REIE is cleared, this interrupt is disabled. Reading the ESAI_SAISR status register followed by reading the enabled receivers data registers clears ROE, thus clearing the pending interrupt.
19 RPR	ESAI_RCR Receiver Section Personal Reset. The RPR control bit is used to put the receiver section of the ESAI in the personal reset state. The transmitter section is not affected. When RPR is cleared, the receiver section may operate normally. When RPR is set, the receiver section enters the personal reset state immediately. When in the personal reset state, the status bits are reset to the same state as after hardware reset. The control bits are not affected by the personal reset state. The receiver data pins are disconnected while in the personal reset state.

Table continues on the next page...

ESAI_RCR field descriptions (continued)

Field	Description
	NOTE: To leave the personal reset state by clearing RPR, the procedure described in ESAI Initialization Examples should be followed.
18–17 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
16 RFSR	ESAI_RCR Receiver Frame Sync Relative Timing. RFSR determines the relative timing of the receive frame sync signal as referred to the serial data lines, for a word length frame sync only. When RFSR is cleared the word length frame sync occurs together with the first bit of the data word of the first slot. When RFSR is set the word length frame sync starts one serial clock cycle earlier, that is, together with the last bit of the previous data word.
15 RFSL	ESAI_RCR Receiver Frame Sync Length. The RFSL bit selects the length of the receive frame sync to be generated or recognized. If RFSL is cleared, a word-length frame sync is selected. If RFSL is set, a 1-bit clock period frame sync is selected. Refer to Figure 26-30 for examples of frame length selection.
14–10 RSWS[4:0]	ESAI_RCR Receiver Slot and Word Select. The RSWS4-RSWS0 bits are used to select the length of the slot and the length of the data words being received through the ESAI. The word length must be equal to or shorter than the slot length. The possible combinations are shown in Table 26-36 . See also the ESAI data path programming model in Figure 26-2 and Figure 26-3 .
9–8 RMOD[1:0]	ESAI_RCR Receiver Network Mode Control. The RMOD1 and RMOD0 bits are used to define the network mode of the ESAI receivers, as shown in Table 26-35 . In the normal mode, the frame rate divider determines the word transfer rate - one word is transferred per frame sync during the frame sync time slot, as shown in Figure 26-29 . In network mode, it is possible to transfer a word for every time slot, as shown in Figure 26-29 . For more details, see Modes of Operation . In order to comply with AC-97 specifications, RSWS4-RSWS0 should be set to 0x00011 (20-bit slot, 20-bit word); RFSL and RFSR should be cleared, and RDC4-RDC0 should be set to 0x0C (13 words in frame).
7 RWA	ESAI_RCR Receiver Word Alignment Control. The Receiver Word Alignment Control (RWA) bit defines the alignment of the data word in relation to the slot. This is relevant for the cases where the word length is shorter than the slot length. If RWA is cleared, the data word is assumed to be left-aligned in the slot frame. If RWA is set, the data word is assumed to be right-aligned in the slot frame. If the data word is shorter than the slot length, the data bits which are not in the data word field are ignored. For data word lengths of less than 24 bits, the data word is right-extended with zeroes before being stored in the receive data registers.
6 RSHFD	ESAI_RCR Receiver Shift Direction. The RSHFD bit causes the receiver shift registers to shift data in MSB first when RSHFD is cleared or LSB first when RSHFD is set (see Figure 26-2 and Figure 26-3).
5–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
3 RE3	ESAI_RCR ESAI Receiver 3 Enable. When RE3 is set and TE2 is cleared, the ESAI receiver 3 is enabled and samples data at the SDO2/SDI3 pin. ESAI_TX2 and ESAI_RX3 should not be enabled at the same time (RE3=1 and TE2=1). When RE3 is cleared, receiver 3 is disabled by inhibiting data transfer into ESAI_RX3. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX3 data register. If RE3 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX3 will be invalid and must be discarded.
2 RE2	ESAI_RCR ESAI Receiver 2 Enable. When RE2 is set and TE3 is cleared, the ESAI receiver 2 is enabled and samples data at the SDO3/SDI2 pin. ESAI_TX3 and ESAI_RX2 should not be enabled at the same time (RE2=1 and TE3=1). When RE2 is cleared, receiver 2 is disabled by inhibiting data transfer into ESAI_RX2. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX2 data register. If RE2 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX2 will be invalid and must be discarded.

Table continues on the next page...

ESAI_RCR field descriptions (continued)

Field	Description
1 RE1	ESAI_RCR ESAI Receiver 1 Enable. When RE1 is set and TE4 is cleared, the ESAI receiver 1 is enabled and samples data at the SDO4/SDI1 pin. ESAI_TX4 and ESAI_RX1 should not be enabled at the same time (RE1=1 and TE4=1). When RE1 is cleared, receiver 1 is disabled by inhibiting data transfer into ESAI_RX1. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX1 data register. If RE1 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX1 will be invalid and must be discarded.
0 RE0	ESAI_RCR ESAI Receiver 0 Enable. When RE0 is set and TE5 is cleared, the ESAI receiver 0 is enabled and samples data at the SDO5/SDI0 pin. ESAI_TX5 and ESAI_RX0 should not be enabled at the same time (RE0=1 and TE5=1). When RE0 is cleared, receiver 0 is disabled by inhibiting data transfer into ESAI_RX0. If this bit is cleared while receiving a data word, the remainder of the word is shifted in and transferred to the ESAI_RX0 data register. If RE0 is set while some of the other receivers are already in operation, the first data word received in ESAI_RX0 will be invalid and must be discarded.

26.6.17 Receive Clock Control Register (ESAI_RCCR)

The read/write Receiver Clock Control Register (ESAI_RCCR) controls the ESAI receiver clock generator bit and frame sync rates, word length, and number of words per frame for the serial data. The ESAI_RCCR control bits are described in the following paragraphs.

NOTE

ARM Core clock is ipg_clk_esai in block ESAI which is from CCM's ahb_clk_root.

ESAI_RCCR field descriptions

Field	Description
31–24 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
23 RHCKD	<p>ESAI_RCCR Receiver High Frequency Clock Direction. The Receiver High Frequency Clock Direction (RHCKD) bit selects the source of the receiver high frequency clock when in the asynchronous mode (SYN=0) and the IF2/OF2 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RHCKD is set, the internal clock generator becomes the source of the receiver high frequency clock and is the output on the HCKR pin. In the asynchronous mode, when RHCKD is cleared, the receiver high frequency clock source is external; the internal clock generator is disconnected from the HCKR pin, and an external clock source may drive this pin.</p> <p>When RHCKD is cleared, HCKR is an input; when RHCKD is set, HCKR is an output.</p> <p>In the synchronous mode when RHCKD is set, the HCKR pin becomes the OF2 output flag. If RHCKD is cleared, the HCKR pin becomes the IF2 input flag. Refer to Table 26-2 and Table 26-41.</p>
22 RFSD	<p>ESAI_RCCR Receiver Frame Sync Signal Direction. The Receiver Frame Sync Signal Direction (RFSD) bit selects the source of the receiver frame sync signal when in the asynchronous mode (SYN=0) and the IF1/OF1/Transmitter Buffer Enable flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RFSD is set, the internal clock generator becomes the source of the receiver frame sync and is the output on the FSR pin. In the asynchronous mode, when RFSD is cleared, the receiver frame sync source is external; the internal clock generator is disconnected from the FSR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RFSD is set, the FSR pin becomes the OF1 output flag or the Transmitter Buffer Enable, according to the TEBE control bit. If RFSD is cleared, the FSR pin becomes the IF1 input flag. Refer to Table 26-2 and Table 26-40.</p>
21 RCKD	<p>ESAI_RCCR Receiver Clock Source Direction. The Receiver Clock Source Direction (RCKD) bit selects the source of the clock signal used to clock the receive shift register in the asynchronous mode (SYN=0) and the IF0/OF0 flag direction in the synchronous mode (SYN=1).</p> <p>In the asynchronous mode, when RCKD is set, the internal clock source becomes the bit clock for the receive shift registers and word length divider and is the output on the SCKR pin. In the asynchronous mode when RCKD is cleared, the clock source is external; the internal clock generator is disconnected from the SCKR pin, and an external clock source may drive this pin.</p> <p>In the synchronous mode when RCKD is set, the SCKR pin becomes the OF0 output flag. If RCKD is cleared, the SCKR pin becomes the IF0 input flag. Refer to Table 26-2 and Table 26-39.</p>
20 RHCKP	ESAI_RCCR Receiver High Frequency Clock Polarity. The Receiver High Frequency Clock Polarity (RHCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RHCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive high frequency bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RHCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in.
19 RFSP	ESAI_RCCR Receiver Frame Sync Polarity. The Receiver Frame Sync Polarity (RFSP) determines the polarity of the receive frame sync signal. When RFSP is cleared the frame sync signal polarity is positive, that is, the frame start is indicated by a high level on the frame sync pin. When RFSP is set the frame sync signal polarity is negative, that is, the frame start is indicated by a low level on the frame sync pin.
18 RCKP	The Receiver Clock Polarity (RCKP) bit controls on which bit clock edge data and frame sync are clocked out and latched in. If RCKP is cleared the data and the frame sync are clocked out on the rising edge of the receive bit clock and the frame sync is latched in on the falling edge of the receive bit clock. If RCKP is set the falling edge of the receive clock is used to clock the data and frame sync out and the rising edge of the receive clock is used to latch the frame sync in.
17–14 RFP[3:0]	ESAI_RCCR Rx High Frequency Clock Divider. The RFP3-RFP0 bits control the divide ratio of the receiver high frequency clock to the receiver serial bit clock when the source of the receiver high frequency clock and the bit clock is the internal Arm Core clock. When the HCKR input is being driven

Table continues on the next page...

ESAI_RCCR field descriptions (continued)

Field	Description
	from an external high frequency clock, the RFP3-RFP0 bits specify an additional division ration in the clock divider chain. Table 26-38 provides the specification of the divide ratio. Figure 26-32 shows the ESAI high frequency generator functional diagram.
13–9 RDC[4:0]	<p>ESAI_RCCR Rx Frame Rate Divider Control. The RDC4-RDC0 bits control the divide ratio for the programmable frame rate dividers used to generate the receiver frame clocks.</p> <p>In network mode, this ratio may be interpreted as the number of words per frame minus one. The divide ratio may range from 2 to 32 (RDC[4:0]=0x00001 to 0x11111) for network mode. A divide ratio of one (RDC[4:0]=0x00000) in network mode is a special case (on-demand mode).</p> <p>In normal mode, this ratio determines the word transfer rate. The divide ratio may range from 1 to 32 (RDC[4:0]=0x00000 to 0x11111) for normal mode. In normal mode, a divide ratio of one (RDC[4:0]=0x00000) provides continuous periodic data word transfers. A bit-length frame sync (RFSL=1) must be used in this case.</p> <p>The ESAI frame sync generator functional diagram is shown in Figure 26-33.</p>
8 RPSR	ESAI_RCCR Receiver Prescaler Range. The RPSR controls a fixed divide-by-eight prescaler in series with the variable prescaler. This bit is used to extend the range of the prescaler for those cases where a slower bit clock is desired. When RPSR is set, the fixed prescaler is bypassed. When RPSR is cleared, the fixed divide-by-eight prescaler is operational (see Figure 26-32). The maximum internally generated bit clock frequency is $F_{sys}/4$, the minimum internally generated bit clock frequency is $F_{sys}/(2 \times 8 \times 256 \times 16) = F_{sys}/65536$. (Do not use the combination RPSR=1 and RPM7-RPM0 =0x00, which causes synchronization problems when using the internal Core clock as source (RHCKD=1 or RCKD=1))
RPM[7:0]	ESAI_RCCR Receiver Prescale Modulus Select. The RPM7-RPM0 bits specify the divide ratio of the prescale divider in the ESAI receiver clock generator. A divide ratio from 1 to 256 (RPM[7:0]=0x00 to 0xFF) may be selected. The bit clock output is available at the receiver serial bit clock (SCKR) pin. The bit clock output is also available internally for use as the bit clock to shift the receive shift registers. The ESAI receive clock generator functional diagram is shown in Figure 26-32 .

26.6.18 Transmit Slot Mask Register A (ESAI_TSMA)

The Transmit Slot Mask Register A together with Transmit Slot Mask Register B (ESAI_TSMA and ESAI_TSMB) are two read/write registers used by the transmitters in network mode to determine for each slot whether to transmit a data word and generate a transmitter empty condition (TDE=1), or to tri-state the transmitter data pins. Fields ESAI_TSMA [TS[15:0]] and ESAI_TSMB [TS[31:16]] are concatenated to form the 32-bit field TS[31:0]. Bit number *n* in TS[31:0] is the enable/disable control bit for transmission in slot number *n*.

Address: 202_4000h base + E4h offset = 202_40E4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

ESAI_TSMA field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TS[15:0]	<p>When bit number N in ESAI_TSMA is cleared, all the transmit data pins of the enabled transmitters are tri-stated during transmit time slot number N. The data is still transferred from the transmit data registers to the transmit shift registers but neither the TDE nor the TUE flags are set. This means that during a disabled slot, no transmitter empty interrupt is generated. The Core is interrupted only for enabled slots. Data that is written to the transmit data registers when servicing this request is transmitted in the next enabled transmit time slot.</p> <p>When bit number N in ESAI_TSMA register is set, the transmit sequence is as usual: data is transferred from the TX registers to the shift registers and transmitted during slot number N, and the TDE flag is set.</p> <p>Using the slot mask in ESAI_TSMA does not conflict with using TSR. Even if a slot is enabled in ESAI_TSMA, the user may choose to write to TSR instead of writing to the transmit data registers TXn. This causes all the transmit data pins of the enabled transmitters to be tri-stated during the next slot.</p> <p>Data written to the ESAI_TSMA affects the next frame transmission. The frame being transmitted is not affected by this data and would comply to the last ESAI_TSMA setting. Data read from ESAI_TSMA returns the last written data.</p> <p>After hardware or software reset, the ESAI_TSMA register is preset to 0x0000FFFF, which means that all 16 possible slots are enabled for data transmission.</p> <p>When operating in normal mode, bit 0 of the ESAI_TSMA register must be set, otherwise no output is generated.</p>

26.6.19 Transmit Slot Mask Register B (ESAI_TSMB)

The Transmit Slot Mask Register B together with Transmit Slot Mask Register A (ESAI_TSMA and ESAI_TSMB) are two read/write registers used by the transmitters in network mode to determine for each slot whether to transmit a data word and generate a transmitter empty condition (TDE=1), or to tri-state the transmitter data pins. Fields ESAI_TSMA [TS[15:0]] and ESAI_TSMB [TS[31:16]] are concatenated to form the 32-bit field TS[31:0]. Bit number n in TS[31:0] is the enable/disable control bit for transmission in slot number n.

ESAI_TSMB field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TS[31:16]	<p>When bit number N in ESAI_TSMB is cleared, all the transmit data pins of the enabled transmitters are tri-stated during transmit time slot number N. The data is still transferred from the transmit data registers to the transmit shift registers but neither the TDE nor the TUE flags are set. This means that during a disabled slot, no transmitter empty interrupt is generated. The Core is interrupted only for enabled slots. Data that is written to the transmit data registers when servicing this request is transmitted in the next enabled transmit time slot.</p> <p>When bit number N in ESAI_TSMB register is set, the transmit sequence is as usual: data is transferred from the TX registers to the shift registers and transmitted during slot number N, and the TDE flag is set.</p> <p>Using the slot mask in ESAI_TSMB does not conflict with using TSR. Even if a slot is enabled in TSMB, the user may chose to write to TSR instead of writing to the transmit data registers TXn. This causes all the transmit data pins of the enabled transmitters to be tri-stated during the next slot.</p> <p>Data written to the ESAI_TSMB affects the next frame transmission. The frame being transmitted is not affected by this data and would comply to the last ESAI_TSMB setting. Data read from ESAI_TSMB returns the last written data.</p> <p>After hardware or software reset, the ESAI_TSMB register is preset to 0x0000FFFF, which means that all 16 possible slots are enabled for data transmission.</p>

26.6.20 Receive Slot Mask Register A (ESAI_RSMA)

The Receive Slot Mask Register A together with Receive Slot Mask Register B (ESAI_RSMA and ESAI_RSMB) are two read/write registers used by the receiver in network mode to determine for each slot whether to receive a data word and generate a receiver full condition (RDF=1), or to ignore the received data. Fields ESAI_RSMA [RS[15:0]] and ESAI_RSMB [RS31:16]] are concatenated to form the 32-bit field RS[31:0]. Bit number n in RS[31:0] is an enable/disable control bit for receiving data in slot number n.

ESAI_RSMB field descriptions (continued)

Field	Description
	Data written to the ESAI_RSMB affects the next received frame. The frame being received is not affected by this data and would comply to the last ESAI_RSMB setting. Data read from ESAI_RSMB returns the last written data. After hardware or software reset, the ESAI_RSMB register is preset to 0x0000FFFF, which means that all 16 possible slots are enabled for data reception.

26.6.22 Port C Direction Register (ESAI_PRRC)

There are two registers to control the ESAI personal reset status: Port C Direction Register (ESAI_PRRC) and Port C Control Register (ESAI_PCRC).

The read/write 32-bit Port C Direction Register (ESAI_PRRC) in conjunction with the Port C Control Register (ESAI_PCRC) controls the functionality of the ESAI personal reset state. [Table 26-48](#) provides the port pin configurations. Hardware and software reset clear all ESAI_PRRC bits.

Chapter 27

Flexible Controller Area Network (FLEXCAN)

27.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported.

27.1.1 Block Diagram

A general block diagram is shown in the figure below, which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

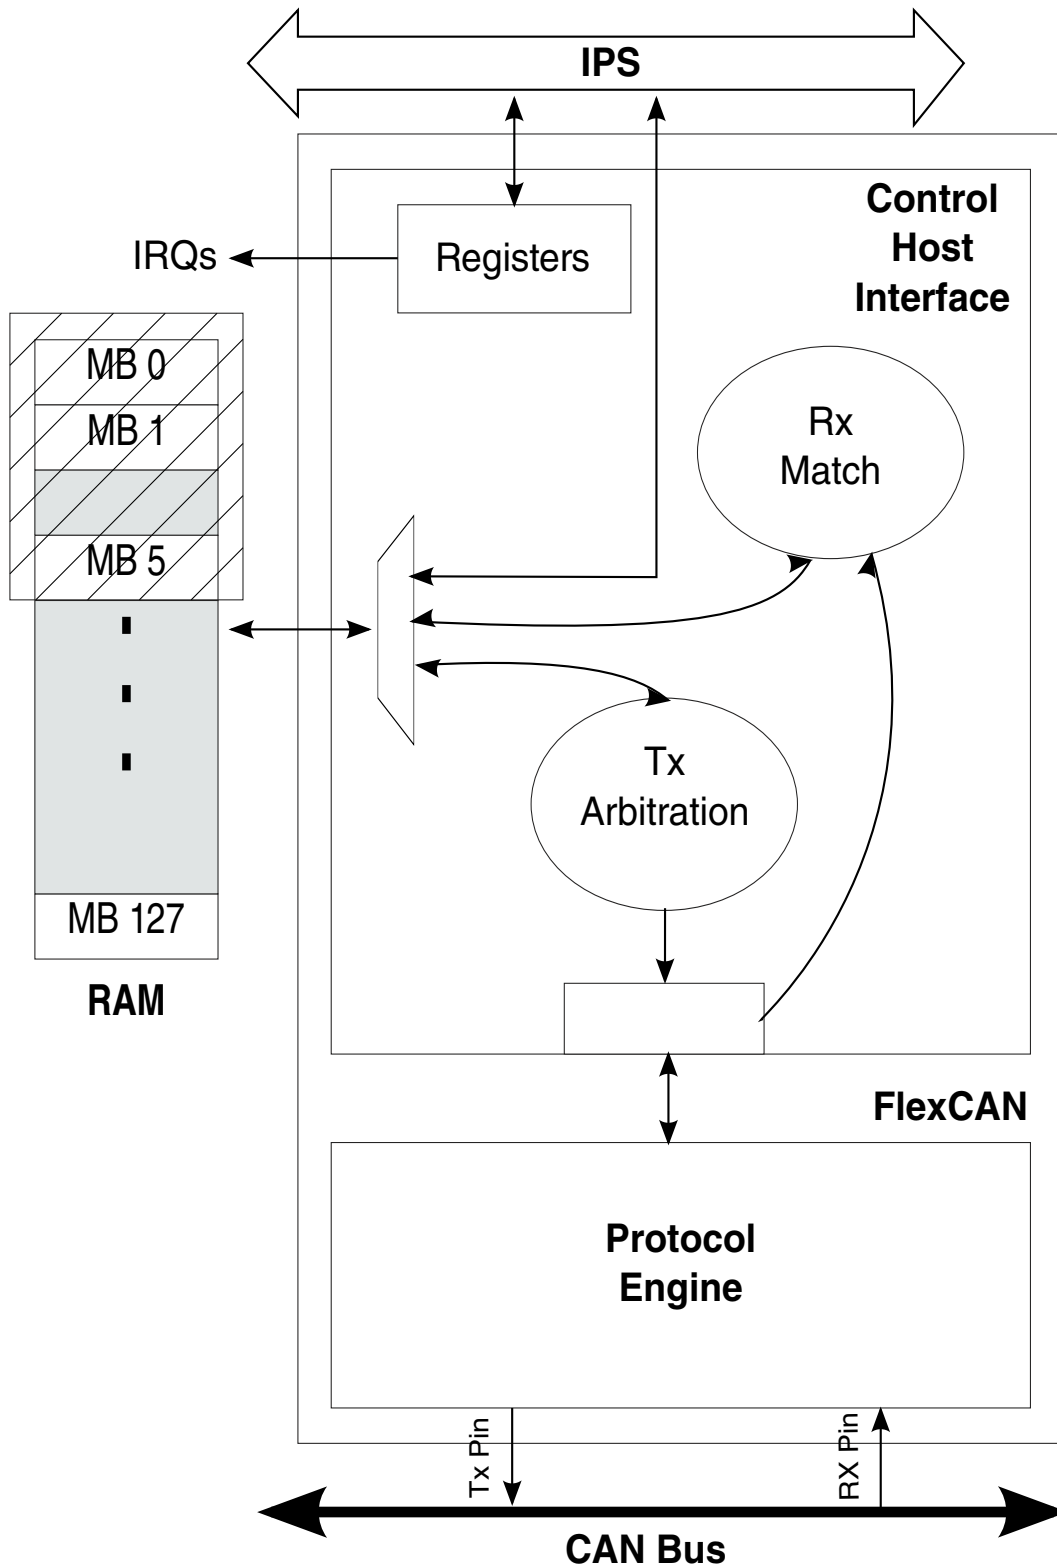

Figure 27-1. FLEXCAN Block Diagram

27.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
 - Standard data and remote frames
 - Extended data and remote frames
 - Zero to eight bytes data length
 - Programmable bit rate up to 1 Mb/sec
 - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

27.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ_ACK bit in the MCR Register is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See [Freeze Mode](#) for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See [Module Disable Mode](#) for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at ARM level and the LPM_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the ARM that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See [Stop Mode](#) for more information.

27.2 External Signals

The FLEXCAN module has two I/O signals.

Table 27-1. FLEXCAN External Signals

Signal	Description	Pad	Mode	Direction
CAN1_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	KEY_ROW2	ALT3	I
		QSPI1A_SS1_B	ALT1	
		SD3_DATA7	ALT1	
CAN1_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	KEY_COL2	ALT3	O
		QSPI1B_DQS	ALT1	
		SD3_DATA5	ALT1	
CAN2_RX	FLEXCAN receive pin. This pin is the receive pin from the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	KEY_ROW3	ALT3	I
		QSPI1B_SS1_B	ALT1	
		SD3_DATA4	ALT1	
CAN2_TX	FLEXCAN transmit pin. This pin is the transmit pin to the CAN bus transceiver. Dominant state is represented by logic level '0'. Recessive state is represented by logic level '1'.	KEY_COL3	ALT3	O
		QSPI1A_DQS	ALT1	
		SD3_DATA6	ALT1	

27.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 27-2. FLEXCAN Clocks

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_chi	ipg_clk_root	CHI clock
ipg_clk_pe	can_clk_root	Protocol Engine clock
ipg_clk_pe_nogate	can_clk_root	Protocol Engine clock (no gating)
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_ram_CLK	ipg_clk_root	RAM clock

27.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C

The Message Buffer structure used by the FLEXCAN module is represented in the figure found here.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

Table 27-3. Message Buffer Structure

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0					CODE					S R R	I D E	R T R	DLC				TIME STAMP															
0x4	PRIO			ID Standard								ID Extended																				
0x8	DATA BYTE 0				DATA BYTE 1				DATA BYTE 2				DATA BYTE 3																			
0xC	DATA BYTE 4				DATA BYTE 5				DATA BYTE 6				DATA BYTE 7																			

CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See [Functional Description](#) for additional information.

Table 27-4. Message Buffer Code for Rx buffers

CODE Description	Rx Code BEFORE receive New Frame	SRV ¹	Rx Code AFTER successful reception ²	RRS ³	Comment
0b0000: INACTIVE- MB is not active.	INACTIVE	-	-	-	MB does not participate in the matching process.
0b0100: EMPTY - MB is active and empty.	EMPTY	-	FULL	-	When a frame is received successfully (after move-in process. Refer to Move-in for details), the CODE field is automatically updated to FULL.
0b0010: FULL - MB is full.	FULL	Yes	FULL	-	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to Matching Process for matching details related to FULL code.
		No	OVERRUN	-	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to Matching Process for details about overrun behavior.
0b0110: OVERRUN - MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	-	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL.
		No	OVERRUN	-	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to Matching Process for details about overrun behavior.
0b1010: RANSWER ⁴ - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	-	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to Matching Process for details. If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
			-	1	This code is ignored during matching and arbitration process. Refer to Matching Process for details.

Table continues on the next page...

Table 27-4. Message Buffer Code for Rx buffers (continued)

CODE Description	Rx Code BEFORE receive New Frame	SRV ¹	Rx Code AFTER successful reception ²	RRS ³	Comment
CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY ⁵	-	FULL OVERRUN	- -	Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE.

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to [Move-in](#) for details)
3. Remote Request Stored bit from CTRL2 register. Refer to [CTRL2](#) for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

Table 27-5. Message Buffer Code for Tx buffers

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE - MB is not active	INACTIVE	-	-	MB does not participate in the arbitration process.
0b1001: ABORT - MB is aborted	ABORT	-	-	MB does not participate in the arbitration process. .
0b1100: DATA - MB is a Tx Data Frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.
0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame	TANSWER	-	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect. The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to Matching Process and Arbitration process for details.

SRR - Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

IDE - ID Extended Bit

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

RTR - Remote Transmission Request

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in [Control 2 Register \(FLEXCAN_CTRL2\)](#) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

DLC - Length of Data in Bytes

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the ARM and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTES are valid as shown in the table below.

TIME STAMP - Free-Running Counter Time Stamp

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

PRIOR - Local priority

This 3-bit field is only used when MCR[LPRIO_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See [Arbitration process](#).

ID - Frame Identifier

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

DATA BYTE 0-7 - Data Field

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE (n) is valid only if *n* is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

Table 27-6. DATA BYTEs validity

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0-1
3	DATA BYTE 0-2
4	DATA BYTE 0-3
5	DATA BYTE 0-4
6	DATA BYTE 0-5
7	DATA BYTE 0-6
8	DATA BYTE 0-7

27.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from \$80 to \$DC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO. [Table 27-7](#) shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. [Table 27-8](#), [Table 27-9](#) and [Table 27-10](#) show the IDAF indexation. [Table 27-11](#) show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See [Rx FIFO](#) for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

-------------------	-------------------	------------------	-----------------

RTR - Remote Frame

This bit specifies whether Remote Request Frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is a Remote Request Frame or not.

1= Remote Frames can be accepted and data frames are rejected

0= Remote Frames are rejected and data frames can be accepted

IDE - Extended Frame

Specifies if either Extended or Standard Format frames are accepted into the FIFO if they match the target ID in Formats A and B. If Format C is chosen the acceptance does not depend on whether the frame is of the Extended or Standard Format.

1= Extended frames can be accepted and standard frames are rejected

0= Extended frames are rejected and standard frames can be accepted

RXIDA - Rx Frame Identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

RXIDB_0, RXIDB_1 - Rx Frame Identifier (Format B)
