MCIMX6UL-CM-P3

Schematics DevBoard

Table of Content

Revision History

Rev. Code	Date	By		Description
A	2015-02-28	Javen	1	Revision A release
B	2015-06-12	Javen	1	OSC issue: Add R518,R515,R513,Q501,Y503,r516,r517
			2	VDD_ARM_SOC_IN voltage: Change R706 to 215K, R707 to 147K, R708 to 1.5M Change R513,R517 to DCDC_3V3
			3	DDR3 write leveling issue: exchang DDR3 DRAM_DATA3 and DRAM_DATA11
			4	Add R519 for backup
C	2015-07-07	Javen	1	FCC update: Add C423,C415,R413,C414,C420,C417,C421,C416,C422,C418
			2	VDD_HIGH_IN power consumption update: Change R513 from 10K to 1M Change R513,R517 to DCDC_3V3
	2015-07-14	Javen	3	Add R520 for OSC vih Change R510,C505 connection for OSC backup
A	2015-07-24	ChenWenhua	1	The changes based on MCIMX6UL-CM Version C
			2	Replce discrete power with PF3000 Adding Li-cell charger circuit Reserve PF3000/3001 compatible design
B	2015-10-08	ChenWenhua	1	Change C705,C706,C801,R792 to DNP.
			2	Add R810,R811,R812,R813

1. Unless Otherwise Specified:

   All resistors are in ohms, 10%, 1/8 Watt,0603
   All capacitors are in uF, 20%, 50V,0603
   All voltages are DC
   All polarized capacitors are aluminum electrolytic

2. Interrupted lines coded with the same letter or letter combinations are electrically connected.

3. Device type number is for reference only. The number varies with the manufacturer.

4. Special signal usage:
   _B Denotes - Active-Low Signal
   <> or [] Denotes - Vectored Signals

5. Interpret diagram in accordance with American National Standards Institute specifications, current revision, with the exception of logic block symbology.

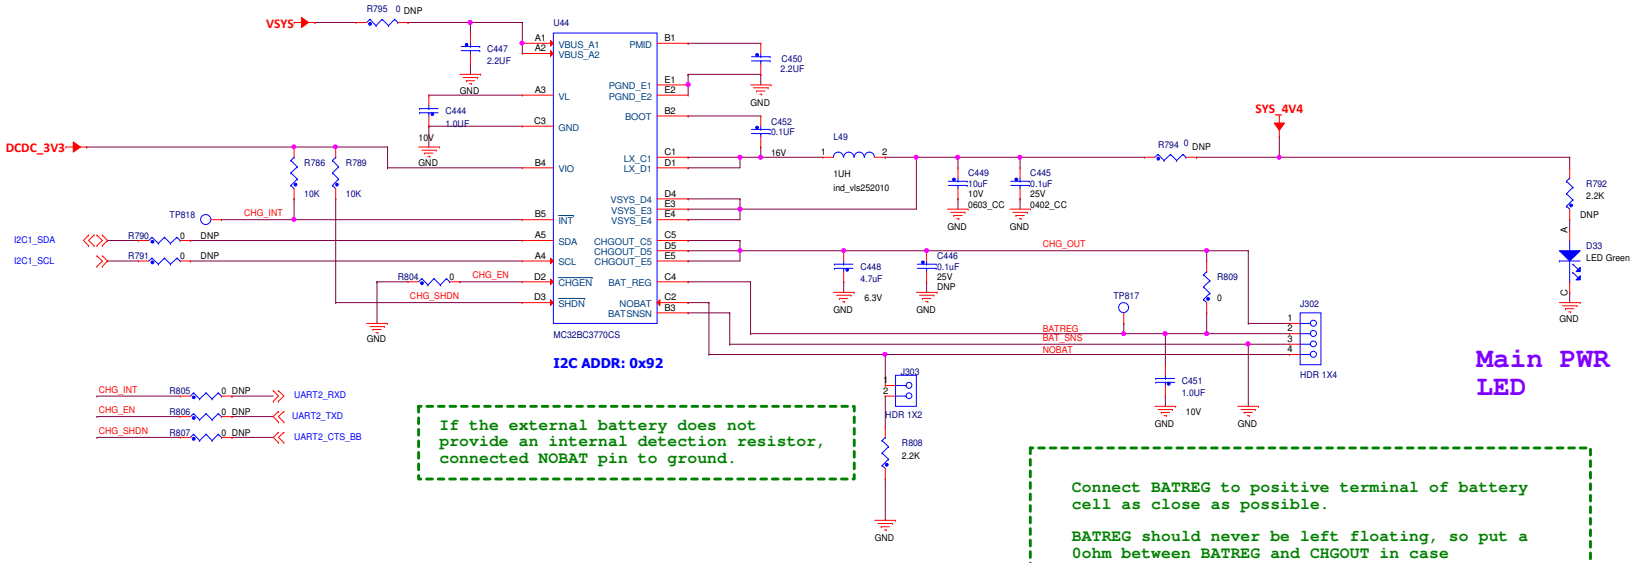
Lithium Charger



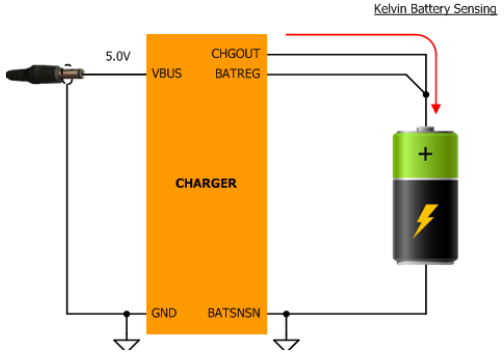
I2C ADDR: 0x92

Main PWR LED

If the external battery does not provide an internal detection resistor, connected NOBAT pin to ground.

Connect BATREG to positive terminal of battery cell as close as possible.

BATREG should never be left floating, so put a 0ohm between BATREG and CHGOUT in case BATREG isn't connected to battery external.



Note:
For non-battery operated applications, when the input supply voltage exceeds 4.5 V, the front-end LDO can be activated by populating the external PMOS pass FET Q701 and connecting the VPWR pin to the main supply.

In a battery operated application, BC3770 input is connected directly to the adapter. In this case, the PMOS pass FET Q701 should not be populated and VPWR pin should be grounded externally.

freescale

NOTE:

All pins using ~reset as harden :

PAD	Default State	Simulation Value
UART3_TX_DATA	Output Buffer(LOW) during reset --> Output keeper + Input enable after reset done	0 in real silicon
LCD_DATA00~LCD_DATA23	100K pull down + input enable during reset --> Output keeper + Input enable after reset done (this is boot option, we don't need change)	0 in real silicon

PAD	Default State	Signal Path	PAD Simulation Value
UART3_TX_DATA	Output Buffer(LOW) during reset --> Output keeper + Input enable after reset done	sjc.ipt_jta_active --> PAD	0 in real silicon
		(note : sjc.ipt_jta_active also connected to snvs_hp.sec_vio_in_1. This is security related, we don't plan to change it.)	ALT7

All pins using ~src.en_system_clk as harden :

PAD	Default State	Simulation Value
GPIO1_IO03	100K pull down + input enable during reset --> Output keeper + Input enable after reset done	0 in real silicon

PAD	Default State	Signal Path	PAD Simulation Value
GPIO1_IO03	100K pull down + input enable during reset --> Output keeper + Input enable after reset done	PAD --> ccmsrcmix. src_tester_ack	0 in real silicon
		This is the requirement of TE test	ALT7

All pins using snvs_hp.snvs_sec_vio_in_5_en as harden :

PAD	Default State	Simulation Value
CSI_PIXCLK	Output keeper + Input enable (snvs_sec_vio_in_5_en is 1'b0 in normal state, so harden is not triggerd in normal state). snvs_sec_vio_in_5_en is controlled by SNVS register. It can be disable or enable.	X (0 or 1 in real silicon)
