Field	Function
	0b - Input capture operation is disabled. 1b - Input capture operation as specified by CAPTCTRLA[EDGAX] is enabled.

## 28.4.28 Capture Compare A Register (SM0CAPTCOMPA - SM3CAPTCOMPA)

### 28.4.28.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCOMPA	36h + (a × 60h)

### 28.4.28.2 Diagram

### 28.4.28.3 Fields

Field	Function
15-8 EDGCNTA	Edge Counter A This read-only field contains the edge counter value for the PWM_A input capture circuitry.
7-0 EDGCMPA	Edge Compare A This read/write field is the compare value associated with the edge counter for the PWM_A input capture circuitry.

## 28.4.29 Capture Control B Register (SM0CAPTCTRLB - SM3CAPTCTRLB)

### 28.4.29.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCTRLB	38h + (a × 60h)

### 28.4.29.2 Diagram

### 28.4.29.3 Fields

Field	Function
15-13 CB1CNT	Capture B1 FIFO Word Count This field reflects the number of words in the Capture B1 FIFO.
12-10 CB0CNT	Capture B0 FIFO Word Count This field reflects the number of words in the Capture B0 FIFO.
9-8 CFBWM	Capture B FIFOs Water Mark This field represents the water mark level for capture B FIFOs. The capture flags, STS[CFB1] and STS[CFB0], won't be set until the word count of the corresponding FIFO is greater than this water mark level.
7 EDGCNTB_EN	Edge Counter B Enable This bit enables the edge counter which counts rising and falling edges on the PWM_B input signal. 0b - Edge counter disabled and held in reset 1b - Edge counter enabled
6 INP_SELB	Input Select B This bit selects between the raw PWM_B input signal and the output of the edge counter/compare circuitry as the source for the input capture circuit.

Table continues on the next page...

## PWM register descriptions

Field	Function
	<p>0b - Raw PWM_B input signal selected as source.</p> <p>1b - Output of edge counter/compare selected as source. Note that when this bitfield is set to 1, the internal edge counter is enabled and the rising and/or falling edges specified by the CAPCTRLB[EDGB0] and CAPCTRLB[EDGB1] fields are ignored. The software must still place a value other than 00 in either or both of the CAPCTRLB[EDGB0] and/or CAPCTRLB[EDGB1] fields in order to enable one or both of the capture registers.</p>
5-4 EDGB1	<p>Edge B 1</p> <p>These bits control the input capture 1 circuitry by determining which input edges cause a capture event.</p> <p>00b - Disabled</p> <p>01b - Capture falling edges</p> <p>10b - Capture rising edges</p> <p>11b - Capture any edge</p>
3-2 EDGB0	<p>Edge B 0</p> <p>These bits control the input capture 0 circuitry by determining which input edges cause a capture event.</p> <p>00b - Disabled</p> <p>01b - Capture falling edges</p> <p>10b - Capture rising edges</p> <p>11b - Capture any edge</p>
1 ONESHOTB	<p>One Shot Mode B</p> <p>This bit selects between free running and one shot mode for the input capture circuitry.</p> <p>0b - Free running mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after CAPCTRLB[ARMB] is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and capture circuit 0 is re-armed. The process continues indefinitely. If only one of the capture circuits is enabled, then captures continue indefinitely on the enabled capture circuit.</p> <p>1b - One shot mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after CAPCTRLB[ARMB] is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and CAPCTRLB[ARMB] is cleared. No further captures will be performed until CAPCTRLB[ARMB] is set again. If only one of the capture circuits is enabled, then a single capture will occur on the enabled capture circuit and CAPCTRLB[ARMB] is then cleared.</p>
0 ARMB	<p>Arm B</p> <p>Setting this bit high starts the input capture process. This bit can be cleared at any time to disable input capture operation. This bit is self-cleared when in one shot mode and one or more of the enabled capture circuits has had a capture event.</p> <p>0b - Input capture operation is disabled.</p> <p>1b - Input capture operation as specified by CAPCTRLB[EDGBx] is enabled.</p>

## 28.4.30 Capture Compare B Register (SM0CAPTCOMP B - SM3CAPTCOMP B)

### 28.4.30.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCOMPb	3Ah + (a × 60h)

### 28.4.30.2 Diagram

### 28.4.30.3 Fields

Field	Function
15-8 EDGCNTB	Edge Counter B This read-only field contains the edge counter value for the PWM_B input capture circuitry.
7-0 EDGCMPB	Edge Compare B This read/write field is the compare value associated with the edge counter for the PWM_B input capture circuitry.

## 28.4.31 Capture Control X Register (SM0CAPTCTRLX - SM3CAPTCTRLX)

### 28.4.31.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCTRLX	3Ch + (a × 60h)

### 28.4.31.2 Diagram

### 28.4.31.3 Fields

Field	Function
15-13 CX1CNT	Capture X1 FIFO Word Count This field reflects the number of words in the Capture X1 FIFO.
12-10 CX0CNT	Capture X0 FIFO Word Count This field reflects the number of words in the Capture X0 FIFO.
9-8 CFXWM	Capture X FIFOs Water Mark This field represents the water mark level for capture X FIFOs. The capture flags, STS[CFX1] and STS[CFX0], won't be set until the word count of the corresponding FIFO is greater than this water mark level.
7 EDGCNTX_EN	Edge Counter X Enable This bit enables the edge counter which counts rising and falling edges on the PWM_X input signal. 0b - Edge counter disabled and held in reset 1b - Edge counter enabled
6 INP_SELX	Input Select X This bit selects between the raw PWM_X input signal and the output of the edge counter/compare circuitry as the source for the input capture circuit. 0b - Raw PWM_X input signal selected as source. 1b - Output of edge counter/compare selected as source. Note that when this bitfield is set to 1, the internal edge counter is enabled and the rising and/or falling edges specified by the CAPTCTRLX[EDGX0] and CAPTCTRLX[EDGX1] fields are ignored. The software must still place a value other than 00 in either or both of the CAPTCTRLX[EDGX0] and/or CAPTCTRLX[EDGX1] fields in order to enable one or both of the capture registers.
5-4 EDGX1	Edge X 1 These bits control the input capture 1 circuitry by determining which input edges cause a capture event. 00b - Disabled 01b - Capture falling edges 10b - Capture rising edges 11b - Capture any edge
3-2 EDGX0	Edge X 0 These bits control the input capture 0 circuitry by determining which input edges cause a capture event. 00b - Disabled

Table continues on the next page...

Field	Function
	01b - Capture falling edges 10b - Capture rising edges 11b - Capture any edge
1 ONESHOTX	One Shot Mode Aux This bit selects between free running and one shot mode for the input capture circuitry.  0b - Free running mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after the ARMX bit is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and capture circuit 0 is re-armed. The process continues indefinitely. If only one of the capture circuits is enabled, then captures continue indefinitely on the enabled capture circuit. 1b - One shot mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after the ARMX bit is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and the ARMX bit is cleared. No further captures will be performed until the ARMX bit is set again. If only one of the capture circuits is enabled, then a single capture will occur on the enabled capture circuit and the ARMX bit is then cleared.
0 ARMX	Arm X Setting this bit high starts the input capture process. This bit can be cleared at any time to disable input capture operation. This bit is self-cleared when in one shot mode and one or more of the enabled capture circuits has had a capture event.  0b - Input capture operation is disabled. 1b - Input capture operation as specified by CAPTCTRLX[EDGXx] is enabled.

### 28.4.32 Capture Compare X Register (SM0CAPTCOMPX - SM3CAPTCOMPX)

#### 28.4.32.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCOMPX	3Eh + (a × 60h)

#### 28.4.32.2 Diagram

### 28.4.32.3 Fields

Field	Function
15-8 EDGCNTX	Edge Counter X This read-only field contains the edge counter value for the PWM_X input capture circuitry.
7-0 EDGCMPTX	Edge Compare X This read/write field is the compare value associated with the edge counter for the PWM_X input capture circuitry.

### 28.4.33 Capture Value 0 Register (SM0CVAL0 - SM3CVAL0)

#### 28.4.33.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL0	40h + (a × 60h)

#### 28.4.33.2 Diagram

#### 28.4.33.3 Fields

Field	Function
15-0 CAPTVAL0	CAPTVAL0 This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLX[EDGX0]. Each capture will increase the value of CAPTCTRLX[CX0CNT] by 1 until the maximum value is reached. Each read of this register will decrease the value of CAPTCTRLX[CX0CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.34 Capture Value 0 Cycle Register (SM0CVAL0CYC - SM3CVAL0CYC)

### 28.4.34.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL0CYC	42h + (a × 60h)

### 28.4.34.2 Diagram

### 28.4.34.3 Fields

Field	Function
15-4 —	RESERVED
3-0 CVAL0CYC	CVAL0CYC This read-only register stores the cycle number corresponding to the value captured in CVAL0. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

## 28.4.35 Capture Value 1 Register (SM0CVAL1 - SM3CVAL1)

### 28.4.35.1 Offset

For a = 0 to 3:

## PWM register descriptions

Register	Offset
SMaCVAL1	44h + (a × 60h)

### 28.4.35.2 Diagram

### 28.4.35.3 Fields

Field	Function
15-0 CAPTVAL1	CAPTVAL1 This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLX[EDGX1]. Each capture increases the value of CAPTCTRLX[CX1CNT] by 1 until the maximum value is reached. Each read of this register decreases the value of CAPTCTRLX[CX1CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.36 Capture Value 1 Cycle Register (SM0CVAL1CYC - SM3CVAL1CYC)

### 28.4.36.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL1CYC	46h + (a × 60h)

### 28.4.36.2 Diagram

### 28.4.36.3 Fields

Field	Function
15-4 —	RESERVED
3-0 CVAL1CYC	CVAL1CYC This read-only register stores the cycle number corresponding to the value captured in CVAL1. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

## 28.4.37 Capture Value 2 Register (SM0CVAL2 - SM3CVAL2)

### 28.4.37.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL2	48h + (a × 60h)

### 28.4.37.2 Diagram

### 28.4.37.3 Fields

Field	Function
15-0 CAPTVAL2	CAPTVAL2 This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLA[EDGA0]. Each capture increases the value of CAPTCTRLA[CA0CNT] by 1 until the maximum value is reached. Each read of this register decreases the value of CAPTCTRLA[CA0CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.38 Capture Value 2 Cycle Register (SM0CVAL2CYC - SM3CVAL2CYC)

### 28.4.38.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL2CYC	4Ah + (a × 60h)

### 28.4.38.2 Diagram

### 28.4.38.3 Fields

Field	Function
15-4 —	RESERVED
3-0 CVAL2CYC	CVAL2CYC This read-only register stores the cycle number corresponding to the value captured in CVAL2. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

## 28.4.39 Capture Value 3 Register (SM0CVAL3 - SM3CVAL3)

### 28.4.39.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL3	4Ch + (a × 60h)

### 28.4.39.2 Diagram

### 28.4.39.3 Fields

Field	Function
15-0	CAPTVAL3
CAPTVAL3	This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLA[EDGA1]. Each capture increases the value of CAPTCTRLA[CA1CNT] by 1 until the maximum value is reached. Each read of this register decreases the value of CAPTCTRLA[CA1CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.40 Capture Value 3 Cycle Register (SM0CVAL3CYC - SM3CVAL3CYC)

### 28.4.40.1 Offset

For a = 0 to 3:

## PWM register descriptions

Register	Offset

### 28.4.40.3 Fields

Field	Function
15-4 —	RESERVED
3-0 CVAL3CYC	CVAL3CYC This read-only register stores the cycle number corresponding to the value captured in CVAL3. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

## 28.4.41 Capture Value 4 Register (SM0CVAL4 - SM3CVAL4)

### 28.4.41.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL4	50h + (a × 60h)

### 28.4.41.2 Diagram

### 28.4.41.3 Fields

Field	Function
15-0 CAPTVAL4	CAPTVAL4 This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLB[EDGB0]. Each capture increases the value of CAPTCTRLB[CB0CNT] by 1 until the maximum value is reached. Each read of this register decreases the value of CAPTCTRLB[CB0CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.42 Capture Value 4 Cycle Register (SM0CVAL4CYC - SM3CVAL4CYC)

### 28.4.42.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL4CYC	52h + (a × 60h)

### 28.4.42.2 Diagram

### 28.4.42.3 Fields

Field	Function
15-4 —	RESERVED
3-0 CVAL4CYC	CVAL4CYC This read-only register stores the cycle number corresponding to the value captured in CVAL4. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

### 28.4.43 Capture Value 5 Register (SM0CVAL5 - SM3CVAL5)

#### 28.4.43.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL5	54h + (a × 60h)

#### 28.4.43.2 Diagram

#### 28.4.43.3 Fields

Field	Function
15-0 CAPTVAL5	CAPTVAL5 This read-only register stores the value captured from the submodule counter. Exactly when this capture occurs is defined by CAPTCTRLB[EDGB1]. Each capture increases the value of CAPTCTRLB[CB1CNT] by 1 until the maximum value is reached. Each read of this register decreases the value of CAPTCTRLB[CB1CNT] by 1 until 0 is reached. This register is not byte accessible.

## 28.4.44 Capture Value 5 Cycle Register (SM0CVAL5CYC - SM3CVAL5CYC)

### 28.4.44.1 Offset

For a = 0 to 3:

Register	Offset
SMaCVAL5CYC	56h + (a × 60h)

### 28.4.44.2 Diagram

Field	Function
15-4 —	RESERVED
3-0 CVAL5CYC	This read-only register stores the cycle number corresponding to the value captured in CVAL5. This register is incremented each time the counter is loaded with the INIT value at the end of a PWM modulo cycle.

## 28.4.45 Output Enable Register (OUTEN)

### 28.4.45.1 Offset

Register	Offset
OUTEN	180h

### 28.4.45.2 Diagram

### 28.4.45.3 Fields

Field	Function
15-12 —	RESERVED
11-8 PWMA_EN	<p>PWM_A Output Enables</p> <p>The four bits of this field enable the PWM_A outputs of submodules 3-0, respectively. These bits should be set to 0 (output disabled) when a PWM_A pin is being used for input capture.</p> <p>0000b - PWM_A output disabled. 0001b - PWM_A output enabled.</p>
7-4 PWMB_EN	<p>PWM_B Output Enables</p> <p>The four bits of this field enable the PWM_B outputs of submodules 3-0, respectively. These bits should be set to 0 (output disabled) when a PWM_B pin is being used for input capture.</p> <p>0000b - PWM_B output disabled. 0001b - PWM_B output enabled.</p>
3-0 PWMX_EN	<p>PWM_X Output Enables</p> <p>The four bits of this field enable the PWM_X outputs of submodules 3-0, respectively. These bits should be set to 0 (output disabled) when a PWM_X pin is being used for input capture or deadtime correction.</p> <p>0000b - PWM_X output disabled. 0001b - PWM_X output enabled.</p>

### 28.4.46 Mask Register (MASK)

## 28.4.46.1 Offset

Register	Offset
MASK	182h

## 28.4.46.2 Function

MASK is double buffered and does not take effect until a FORCE\_OUT event occurs within the appropriate submodule. Reading MASK reads the buffered values and not necessarily the values currently in effect. This double buffering can be overridden by setting the UPDATE\_MASK bits.

## 28.4.46.3 Diagram

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R					MASKA				MASKB				MASKX			
W	UPDATE_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## 28.4.46.4 Fields

Field	Function
15-12 UPDATE_MASK	Update Mask Bits Immediately The four bits mask the PWM_X outputs of submodules 3-0, respectively, The four bits of this field force the MASK* bits to be immediately updated within submodules 3-0, respectively, without waiting for a FORCE_OUT event. These self-clearing bits always read as zero. Software may write to any or all of these bits and may set these bits in the same write operation that updates the MASKA, MASKB, and MASKX fields of this register. 0000b - Normal operation. MASK* bits within the corresponding submodule are not updated until a FORCE_OUT event occurs within the submodule. 0001b - Immediate operation. MASK* bits within the corresponding submodule are updated on the following clock edge after setting this bit.
11-8 MASKA	PWM_A Masks The four bits of this field mask the PWM_A outputs of submodules 3-0, respectively, forcing the output to logic 0 prior to consideration of the output polarity. 0000b - PWM_A output normal. 0001b - PWM_A output masked.
7-4	PWM_B Masks

*Table continues on the next page...*

## PWM register descriptions

Field	Function
MASKB	The four bits of this field mask the PWM_B outputs of submodules 3-0, respectively, forcing the output to logic 0 prior to consideration of the output polarity.  0000b - PWM_B output normal. 0001b - PWM_B output masked.
3-0 MASKX	PWM_X Masks The four bits of this field mask the PWM_X outputs of submodules 3-0, respectively, forcing the output to logic 0 prior to consideration of the output polarity.  0000b - PWM_X output normal. 0001b - PWM_X output masked.

## 28.4.47 Software Controlled Output Register (SWCOUT)

### 28.4.47.1 Offset

Register	Offset
SWCOUT	184h

### 28.4.47.2 Function

These bits are double buffered and do not take effect until a FORCE\_OUT event occurs within the appropriate submodule. Reading these bits reads the buffered value and not necessarily the value currently in effect.

### 28.4.47.3 Diagram

## 28.4.47.4 Fields

Field	Function
15-8 —	RESERVED
7 SM3OUT23	<p>Submodule 3 Software Controlled Output 23</p> <p>This bit is only used when DTSRCSEL[SM3SEL23] is set to 0b10. ## 28.4.49 Master Control Register (MCTRL)

### 28.4.49.1 Offset

Register	Offset
MCTRL	188h

### 28.4.49.2 Function

In every 4-bit field in this register, each bit acts on a separate submodule. Accordingly, the description of every bitfield refers to the effect of an individual bit.

### 28.4.49.3 Diagram

### 28.4.49.4 Fields

Field	Function
15-12 IPOL	<p>Current Polarity</p> <p>The four buffered read/write bits of this field correspond to submodules 3-0, respectively. Each bit selects between PWM23 and PWM45 as the source for the generation of the complementary PWM pair output for the corresponding submodule. MCTRL[IPOL] is ignored in independent mode.</p> <p>MCTRL[IPOL] does not take effect until a FORCE_OUT event takes place in the appropriate submodule. Reading MCTRL[IPOL] reads the buffered value and not necessarily the value currently in effect.</p> <p>0000b - PWM23 is used to generate complementary PWM pair in the corresponding submodule. 0001b - PWM45 is used to generate complementary PWM pair in the corresponding submodule.</p>
11-8 RUN	<p>Run</p> <p>The four read/write bits of this field enable the clocks to the PWM generator of submodules 3-0, respectively. The corresponding MCTRL[RUN] bit must be set for each submodule that is using its input capture functions or is using the local reload as its reload source. When this bit equals zero, the submodule counter is reset. A reset clears this field.</p>

*Table continues on the next page...*

Field	Function
	0000b - PWM generator is disabled in the corresponding submodule. 0001b - PWM generator is enabled in the corresponding submodule.
7-4 CLDOK	Clear Load Okay The 4 bits of CLDOK field correspond to submodules 3-0, respectively. Each write-only bit is used to clear the corresponding bit of MCTRL[LDOK]. Write a 1 to CLDOK to clear the corresponding MCTRL[LDOK] bit. If a reload occurs within a submodule with the corresponding MCTRL[LDOK] bit set at the same time that MCTRL[CLDOK] is written, then the reload in that submodule will not be performed and MCTRL[LDOK] will be cleared. CLDOK bit is self-clearing and always reads as a 0.
3-0 LDOK	Load Okay The 4 bits of LDOK field correspond to submodules 3-0, respectively. Each read/set bit loads CTRL[PRSC] and the INIT, FRACVALx, and VALx registers of the corresponding submodule into a set of buffers. The buffered prescaler divisor, submodule counter modulus value, and PWM pulse width take effect at the next PWM reload if CTRL[LDMOD] is clear or immediately if CTRL[LDMOD] is set. Set the corresponding MCTRL[LDOK] bit by reading it when it is logic zero and then writing a logic one to it. The VALx, FRACVALx, INIT, and CTRL[PRSC] registers of the corresponding submodule cannot be written while the the corresponding MCTRL[LDOK] bit is set.  In Master Reload Mode (CTRL2[RELOAD_SEL]=1), it is only necessary to set the LDOK bit corresponding to submodule0; however, it is recommended to also set the LDOK bit of the slave submodules, to prevent unwanted writes to the registers in the slave submodules.  The MCTRL[LDOK] bit is automatically cleared after the new values are loaded, or it can be manually cleared before a reload by writing a logic 1 to the appropriate MCTRL[CLDOK] bit. LDOK bits cannot be written with a zero. MCTRL[LDOK] can be set in DMA mode when the DMA indicates that it has completed the update of all CTRL[PRSC], INIT, FRACVALx, and VALx registers in the corresponding submodule. Reset clears LDOK field.  0000b - Do not load new values. 0001b - Load prescaler, modulus, and PWM values of the corresponding submodule.

These bits apply to both automatic and manual clearing of a fault condition.</p> <p><b>NOTE:</b> Both FHALF and FFULL can be set so that the fault recovery occurs at the start of a full cycle and at the start of a half cycle (as defined by VAL0). If neither FHALF nor FFULL is set, then no fault recovery is possible.</p> <p>0000b - PWM outputs are not re-enabled at the start of a half cycle.</p> <p>0001b - PWM outputs are re-enabled at the start of a half cycle (as defined by VAL0).</p>
11-8 FFPIN	<p>Filtered Fault Pins</p> <p>These read-only bits reflect the current state of the filtered FAULT<sub>x</sub> pins converted to high polarity. A logic 1 indicates a fault condition exists on the filtered FAULT<sub>x</sub> pin. A reset has no effect on this field.</p>

Table continues on the next page...

Field	Function
7-4 FFULL	<p>Full Cycle</p> <p>These read/write bits are used to control the timing for re-enabling the PWM outputs after a fault condition. These bits apply to both automatic and manual clearing of a fault condition.</p> <p><b>NOTE:</b> Both FHALF and FFULL can be set so that the fault recovery occurs at the start of a full cycle and at the start of a half cycle (as defined by VAL0). If neither FHALF nor FFULL is set, then no fault recovery is possible.</p> <p>0000b - PWM outputs are not re-enabled at the start of a full cycle 0001b - PWM outputs are re-enabled at the start of a full cycle</p>
3-0 FFLAG	<p>Fault Flags</p> <p>These read-only flag is set within two CPU cycles after a transition to active on the FAULTx pin. Clear this bit by writing a logic one to it. A reset clears this field. While the reset value is 0, these bits may be set to 1 by the time they can be read depending on the state of the fault input signals.</p> <p>0000b - No fault on the FAULTx pin. 0001b - Fault on the FAULTx pin.</p>

## 28.4.53 Fault Filter Register (FFILT0)

### 28.4.53.1 Offset

Register	Offset
FFILT0	190h

### 28.4.53.2 Function

The settings in this register are shared among each of the fault input filters within the fault channel.

Input filter considerations include:

- The `FILT_PER` value should be set such that the sampling period is larger than the period of the expected noise. This way a noise spike will only corrupt one sample. The `FILT_CNT` value should be chosen to reduce the probability of noisy samples causing an incorrect transition to be recognized. The probability of an incorrect transition is defined as the probability of an incorrect sample raised to the `FILT_CNT+3` power.
- The values of `FILT_PER` and `FILT_CNT` must also be traded off against the desire for minimal latency in recognizing input transitions. Turning on the input filter (setting `FILT_PER` to a non-zero value) introduces a latency of  $((FILT\_CNT+4) \times FILT\_PER \times IPBus \text{ clock period})$ . Note that even when the filter is enabled, there is a

## PWM register descriptions

combinational path to disable the PWM outputs. This is to ensure rapid response to fault conditions and also to ensure fault response if the PWM module loses its clock. The latency induced by the filter will be seen in the time to set FSTS[FFLAG] and FSTS[FFPIN].

### 28.4.53.3 Diagram

### 28.4.53.4 Fields

Field	Function
15 GSTR	<p>Fault Glitch Stretch Enable</p> <p>This bit is used to enable the fault glitch stretching logic. This logic ensures that narrow fault glitches are stretched to be at least 2 IPBus clock cycles wide. In some cases a narrow fault input can cause problems due to the short PWM output shutdown/re-activation time. The stretching logic ensures that a glitch on the fault input, when the fault filter is disabled, will be registered in the fault flags.</p> <p>0b - Fault input glitch stretching is disabled. 1b - Input fault signals will be stretched to at least 2 IPBus clock cycles.</p>
14-11 —	RESERVED
10-8 FILT_CNT	<p>Fault Filter Count</p> <p>These bits represent the number of consecutive samples that must agree prior to the input filter accepting an input transition. The number of samples is the decimal value of this field plus three: the bitfield value of 0-7 represents 3-10 samples, respectively. The value of FILT_CNT affects the input latency.</p>
7-0 FILT_PER	<p>Fault Filter Period</p> <p>This 8-bit field applies universally to all fault inputs.</p> <p>These bits represent the sampling period (in IPBus clock cycles) of the fault pin input filter. Each input is sampled multiple times at the rate specified by this field. If FILT_PER is 0x00 (default), then the input filter is bypassed. The value of FILT_PER affects the input latency.</p> <p><b>NOTE:</b> When changing values for FILT_PER from one non-zero value to another non-zero value, first write a value of zero to clear the filter.</p>

## 28.4.54 Fault Test Register (FTST0)

### 28.4.54.1 Offset

Register	Offset
FTST0	192h

### 28.4.54.2 Diagram

0 FTEST	Fault Test This read/write bit is used to simulate a fault condition. Setting this bit causes a simulated fault to be sent into all of the fault filters. The condition propagates to the fault flags and possibly the PWM outputs depending on the DISMAPn settings. Clearing this bit removes the simulated fault condition.  0b - No fault 1b - Cause a simulated fault

## 28.4.55 Fault Control 2 Register (FCTRL20)

### 28.4.55.1 Offset

Register	Offset
FCTRL20	194h

### 28.4.55.2 Diagram

### 28.4.55.3 Fields

Field	Function
15-4 —	RESERVED
3-0 NOCOMB	<p>No Combinational Path From Fault Input To PWM Output</p> <p>This read/write field is used to control the combinational path from the fault inputs to the PWM outputs. When these bits are low (default), the corresponding fault inputs have a combinational path to the PWM outputs that are sensitive to these fault inputs (as defined by DISMAP0 and DISMAP1). This combinational path is a safety feature that ensures the output is disabled even if the SOC has a failure of its clocking system. The combinational path also means that a pulse on the fault input can cause a brief disable of the PWM output even if the fault pulse is not wide enough to get through the input filter and be latched in the fault logic. Setting these bits removes the combinational path and uses the filtered and latched fault signals as the fault source to disable the PWM outputs. This eliminates fault glitches from creating PWM output glitches but also increases the latency to respond to a real fault.</p> <p>0000b - There is a combinational link from the fault inputs to the PWM outputs. The fault inputs are combined with the filtered and latched fault signals to disable the PWM outputs.</p> <p>0001b - The direct combinational path from the fault inputs to the PWM outputs is disabled and the filtered and latched fault signals are used to disable the PWM outputs.</p>

## 28.5 Functional Description

### 28.5.1 PWM Capabilities

This section describes some capabilities of the PWM module.

### 28.5.1.1 Center Aligned PWMs

Each submodule has its own timer that is capable of generating PWM signals on two output pins. The edges of each of these signals are controlled independently as shown in [Figure 28-2](#).

**Figure 28-2. Center Aligned Example**

The submodule timers only count in the up direction and then reset to the INIT value. Instead of having a single value that determines pulse width, there are two values that must be specified: the turn on edge and the turn off edge. This double action edge generation not only gives the user control over the pulse width, but over the relative alignment of the signal as well. As a result, there is no need to support separate PWM alignment modes since the PWM alignment mode is inherently a function of the turn on and turn off edge values.

[Figure 28-2](#) also illustrates an additional enhancement to the PWM generation process. When the counter resets, it is reloaded with a user specified value, which may or may not be zero. If the value chosen happens to be the 2's complement of the modulus value, then the PWM generator operates in "signed" mode. This means that if each PWM's turn on and turn off edge values are also the same number but only different in their sign, the "on" portion of the output signal will be centered around a count value of zero. Therefore, only one PWM value needs to be calculated in software and then this value and its negative are provided to the submodule as the turn off and turn on edges respectively.

This technique will result in a pulse width that always consists of an odd number of timer counts. If all PWM signal edge calculations follow this same convention, then the signals will be center aligned with respect to each other, which is the goal. Of course, center alignment between the signals is not restricted to symmetry around the zero count value, as any other number would also work. However, centering on zero provides the greatest range in signed mode and also simplifies the calculations.

### 28.5.1.2 Edge Aligned PWMs

When the turn on edge for each pulse is specified to be the INIT value, then edge aligned operation results, as the following figure shows. Therefore, only the turn off edge value needs to be periodically updated to change the pulse width.

Figure 28-3. Edge Aligned Example (INIT=VAL2=VAL4)

With edge aligned PWMs, another example of the benefits of signed mode can be seen. A common way to drive an H-bridge is to use a technique called "bipolar" PWMs where a 50% duty cycle results in zero volts on the load. Duty cycles less than 50% result in negative load voltages and duty cycles greater than 50% generate positive load voltages. If the module is set to signed mode operation (the INIT and VAL1 values are the same number with opposite signs), then there is a direct proportionality between the PWM turn off edge value and the motor inverter voltage, INCLUDING the sign. So once again,

signed mode of operation simplifies the software interface to the PWM module since no offset calculations are required to translate the output variable control algorithm to the voltage on an H-Bridge load.

### 28.5.1.3 Phase Shifted PWMs

In the previous sections, the benefits of signed mode of operation were discussed in the context of simplifying the required software calculations by eliminating the requirement to bias up signed variables before applying them to the module. However, if numerical biases are applied to the turn on and turn off edges of different PWM signal, the signals will be phase shifted with respect to each other, as the following figure shows. This results in certain advantages when applied to a power stage. For example, when operating a multi-phase inverter at a low modulation index, all of the PWM switching edges from the different phases occur at nearly the same time. This can be troublesome from a noise standpoint, especially if ADC readings of the inverter must be scheduled near those times. Phase shifting the PWM signals can open up timing windows between the switching edges to allow a signal to be sampled by the ADC. However, phase shifting does NOT affect the duty cycle so average load voltage is not affected.

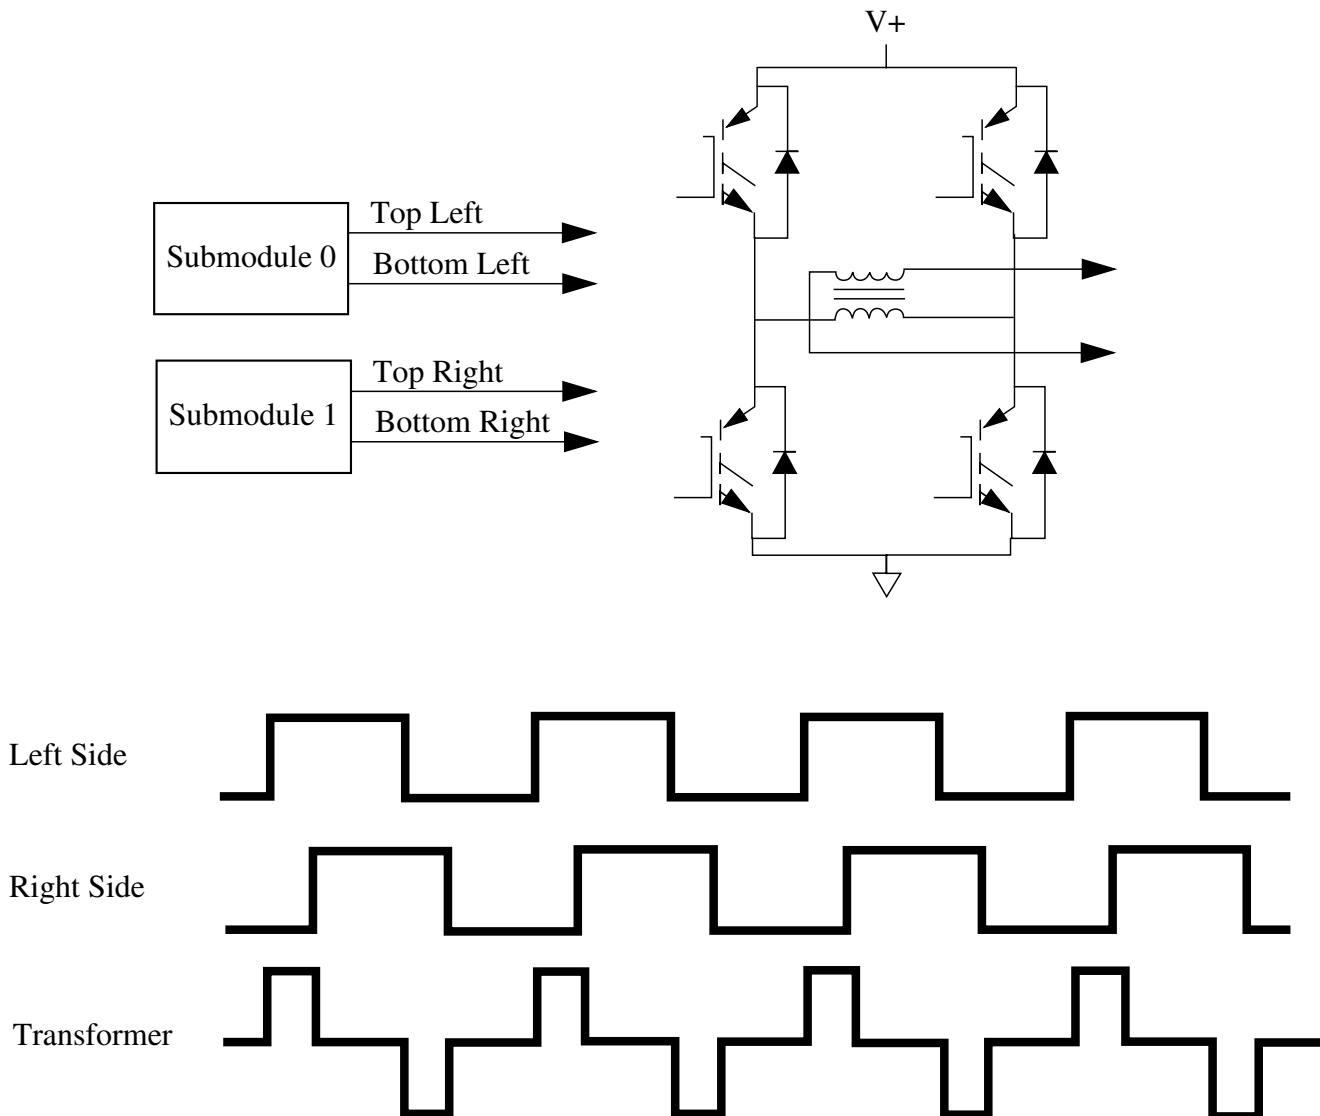

Figure 28-4. Phase Shifted Outputs Example

An additional benefit of phase shifted PWMs appears in [Figure 28-5](#). In this case, an H-Bridge circuit is driven by 4 PWM signals to control the voltage waveform on the primary of a transformer. Both left and right side PWMs are configured to always generate a square wave with 50% duty cycle. This works out nicely for the H-Bridge since no narrow pulse widths are generated reducing the high frequency switching requirements of the transistors. Notice that the square wave on the right side of the H-Bridge is phase shifted compared to the left side of the H-Bridge. As a result, the transformer primary sees the bottom waveform across its terminals. The RMS value of this waveform is directly controlled by the amount of phase shift of the square waves. Regardless of the phase shift, no DC component appears in the load voltage as long as the duty cycle of each square wave remains at 50% making this technique ideally suited for transformer loads. As a result, this topology is frequently used in industrial welders to adjust the amount of energy delivered to the weld arc.

**Figure 28-5. Phase Shifted PWMs Applied to a Transformer Primary**

### 28.5.1.4 Double Switching PWMs

Double switching PWM output is supported to aid in single shunt current measurement and three phase reconstruction. This method support two independent rising edges and two independent falling edges per PWM cycle. The VAL2 and VAL3 registers are used to generate the even channel (labelled as PWM\_A in the figure) while VAL4 and VAL5 are used to generate the odd channel. The two channels are combined using XOR logic (force out logic) as the following figure shows. The DBLPWM signal can be run through the deadtime insertion logic.

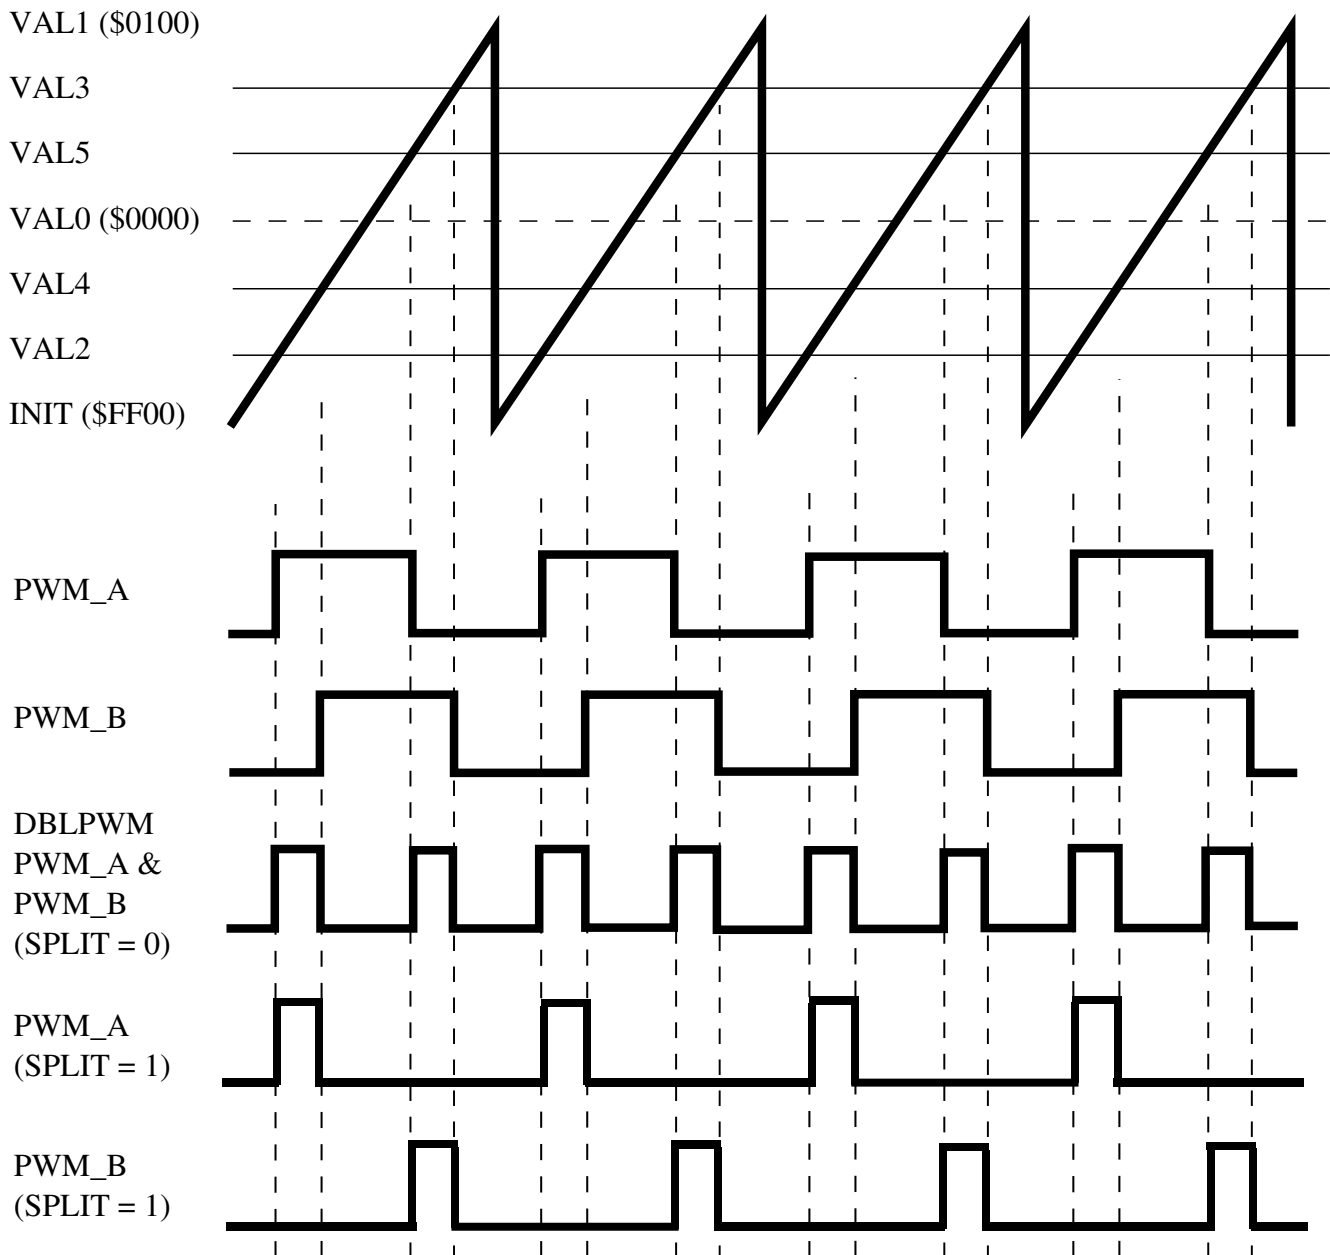

Figure 28-6. Double Switching Output Example

### 28.5.1.5 ADC Triggering

In cases where the timing of the ADC triggering is critical, it must be scheduled as a hardware event instead of software activated. With this PWM module, multiple ADC triggers can be generated in hardware per PWM cycle without the requirement of another timer module. [Figure 28-7](#) shows how this is accomplished. When specifying complementary mode of operation, only two edge comparators are required to generate the output PWM signals for a given submodule. This means that the other comparators are free to perform other functions. In this example, the software does not need to quickly respond after the first conversion to set up other conversions that must occur in the same PWM cycle.

**Figure 28-7. Multiple Output Trigger Generation in Hardware**

Because each submodule has its own timer, it is possible for each submodule to run at a different frequency. One of the options possible with this PWM module is to have one or more submodules running at a lower frequency, but still synchronized to the timer in submodule0. [Figure 28-8](#) shows how this feature can be used to schedule ADC triggers over multiple PWM cycles. A suggested use for this configuration would be to use the lower-frequency submodule to control the sampling frequency of the software control algorithm where multiple ADC triggers can now be scheduled over the entire sampling period. In [Figure 28-8](#), all submodule comparators are shown being used for ADC trigger generation.

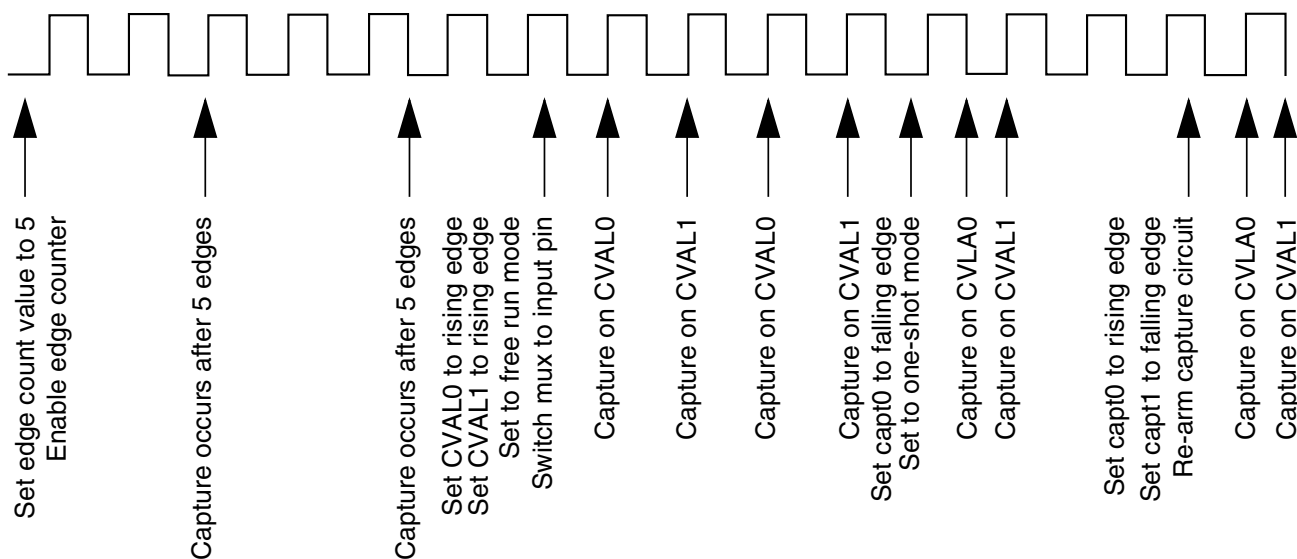

**Figure 28-8. Multiple Output Triggers Over Several PWM Cycles**

### 28.5.1.6 Enhanced Capture Capabilities (E-Capture)

When a PWM pin is not being used for PWM generation, it can be used to perform input captures. Recall that for PWM generation BOTH edges of the PWM signal are specified via separate compare register values. When programmed for input capture, both of these registers work on the same pin to capture multiple edges, toggling from one to the other in either a free running or one-shot fashion. By simply programming the desired edge of each capture circuit, period and pulse width of an input signal can easily be measured without the requirement to re-arm the circuit. In addition, each edge of the input signal can clock an 8 bit counter where the counter output is compared to a user specified value (EDGCMP). When the counter output equals EDGCMP, the value of the submodule timer is captured and the counter is automatically reset. This feature allows the module to count a specified number of edge events and then perform a capture and interrupt. The following figure illustrates some of the functionality of the E-Capture circuit.

## Functional Description

**Figure 28-9. Capture Capabilities of the E-Capture Circuit**

When a submodule is being used for PWM generation, its timer counts up to the modulus value used to specify the PWM frequency and then is re-initialized. Therefore, using this timer for input captures on one of the other pins (for example, PWM\_X) has limited utility since it does not count through all of the numbers and the timer reset represents a discontinuity in the 16 bit number range. However, when measuring a signal that is synchronous to the PWM frequency, the timer modulus range is perfectly suited for the application. Consider the following figure as an example. In this application the output of a PWM power stage is connected to the PWM\_X pin that is configured for free running input captures. Specifically, the CVAL0 capture circuitry is programmed for rising edges and the CVAL1 capture circuitry is set for falling edges. This will result in new load pulse width data being acquired every PWM cycle. To calculate the pulse width, simply subtract the CVAL0 register value from the CVAL1 register value. This measurement is extremely beneficial when performing dead-time distortion correction on a half bridge circuit driving an inductive load. Also, these values can be directly compared to the VALx registers responsible for generating the PWM outputs to obtain a measurement of system propagation delays. For details, refer to the separate discussion of deadtime distortion correction.

During deadtime, load inductance drives voltage with polarity that keeps inductive current flowing through diodes.

**Figure 28-10. Output Pulse Width Measurement Possible with the E-Capture Circuit**

### 28.5.1.7 Synchronous Switching of Multiple Outputs

Before the PWM signals are routed to the output pins, they are processed by a hardware block that permits all submodule outputs to be switched synchronously. This feature can be extremely useful in commutated motor applications where the next commutation state can be laid in ahead of time and then immediately switched to the outputs when the appropriate condition or time is reached. Not only do all the changes occur synchronously on all submodule outputs, but they occur IMMEDIATELY after the trigger event occurs eliminating any interrupt latency.

The synchronous output switching is accomplished via a signal called FORCE\_OUT. This signal originates from the local FORCE bit within the submodule, from submodule0, or from external to the PWM module and, in most cases, is supplied from an external timer channel configured for output compare. In a typical application, software sets up the desired states of the output pins in preparation for the next FORCE\_OUT event. This selection lays dormant until the FORCE\_OUT signal transitions and then all outputs are

switched simultaneously. The signal switching is performed upstream from the deadtime generator so that any abrupt changes that might occur do not violate deadtime on the power stage when in complementary mode.

Figure 28-11 shows a popular application that can benefit from this feature. On a brushless DC motor it is desirable on many cases to spin the motor without need of hall-effect sensor feedback. Instead, the back EMF of the motor phases is monitored and this information is used to schedule the next commutation event. The top waveforms of Figure 28-11 are a simplistic representation of these back EMF signals. Timer compare events (represented by the long vertical lines in the diagram) are scheduled based on the zero crossings of the back-EMF waveforms. The PWM module is configured via software ahead of time with the next state of the PWM pins in anticipation of the compare event. When it happens, the output compare of the timer drives the FORCE\_OUT signal which immediately changes the state of the PWM pins to the next commutation state with no software latency.

Figure 28-11. Sensorless BLDC Commutation Using the Force Out Function

## 28.5.2 Functional Details

This section describes the implementation of various sections of the PWM in greater detail.

The following figure is a high-level block diagram of output PWM generation.

## Functional Description

**Figure 28-12. High-Level Output PWM Generation Block Diagram**

### 28.5.2.1 PWM Clocking

Figure 28-13 shows the logic used to generate the main counter clock. Each submodule can select between three clock signals: the IPBus clock, EXT\_CLK, and AUX\_CLK. The EXT\_CLK goes to all of the submodules. The AUX\_CLK signal is broadcast from submodule0 and can be selected as the clock source by other submodules so that the 8-bit prescaler and MCTRL[RUN] from submodule0 can control all of the submodules.

**Figure 28-13. Clocking Block Diagram for Each PWM Submodule**

To permit lower PWM frequencies, the prescaler produces the PWM clock frequency by dividing the IPBus clock frequency by 1-128. The prescaler bits, CTRL[PRSC], select the prescaler divisor. This prescaler is buffered and will not be used by the PWM generator until MCTRL[LDOK] is set and a new PWM reload cycle begins or CTRL[LDMOD] is set.

### 28.5.2.2 Register Reload Logic

The register reload logic is used to determine when the outer set of registers for all double buffered register pairs will be transferred to the inner set of registers. The register reload event can be scheduled to occur every "n" PWM cycles using CTRL[LDFQ] and CTRL[FULL]. A half cycle reload option is also supported (CTRL[HALF]) where the reload can take place in the middle of a PWM cycle. The half cycle point is defined by the VAL0 register and does not have to be exactly in the middle of the PWM cycle.

As illustrated in [Figure 28-14](#) the reload signal from submodule0 can be broadcast as the Master Reload signal allowing the reload logic from submodule0 to control the reload of registers in other submodules.

Figure 28-14. Register Reload Logic

### 28.5.2.3 Counter Synchronization

In the following figure, the 16 bit counter will count up until its output equals VAL1 which is used to specify the counter modulus value. The resulting compare causes a rising edge to occur on the Local Sync signal which is one of four possible sources used to cause the 16 bit counter to be initialized with INIT. If Local Sync is selected as the counter initialization signal, then VAL1 within the submodule effectively controls the timer period (and thus the PWM frequency generated by that submodule) and everything works on a local level.

**Figure 28-15. Submodule Timer Synchronization**

The Master Sync signal originates as the Local Sync from submodule0. If configured to do so, the timer period of any submodule can be locked to the period of the timer in submodule0.

The PWM\_EXT\_SYNC signal originates on chip or off chip depending on the system architecture. This signal may be selected as the source for counter initialization so that an external source can control the period of all submodules.

If the Master Reload signal is selected as the source for counter initialization, then the period of the counter will be locked to the register reload frequency of submodule0. Since the reload frequency is usually commensurate to the sampling frequency of the software control algorithm, the submodule counter period will therefore equal the sampling period. As a result, this timer can be used to generate output compares or output triggers over the entire sampling period which may consist of several PWM cycles. The Master Reload signal can only originate from submodule0.

The counter can optionally initialize upon the assertion of the FORCE\_OUT signal assuming that CTRL2[FRCEN] is set. As indicated by the preceding figure, this constitutes a second init input into the counter which will cause the counter to initialize regardless of which signal is selected as the counter init signal. The FORCE\_OUT signal is provided mainly for commutated applications. When PWM signals are commutated on an inverter controlling a brushless DC motor, it is necessary to restart the PWM cycle at the beginning of the commutation interval. This action effectively resynchronizes the PWM waveform to the commutation timing. Otherwise, the average voltage applied to a motor winding integrated over the entire commutation interval will be a function of the

timing between the asynchronous commutation event with respect to the PWM cycle. The effect is more critical at higher motor speeds where each commutation interval may consist of only a few PWM cycles. If the counter is not initialized at the start of each commutation interval, the result will be an oscillation caused by the beating between the PWM frequency and the commutation frequency.

### 28.5.2.4 PWM Generation

Figure 28-16 illustrates how PWM generation is accomplished in each submodule. In each case, two comparators and associated VALx registers are utilized for each PWM output signal. One comparator and VALx register are used to control the turn-on edge, while a second comparator and VALx register control the turn-off edge.

Figure 28-16. PWM Generation Hardware

The generation of the Local Sync signal is performed exactly the same way as the other PWM signals in the submodule. While comparator 0 causes a falling edge of the Local Sync signal, comparator 1 generates a rising edge. Comparator 1 is also hardwired to the reload logic to generate the full cycle reload indicator.

If VAL1 is controlling the modulus of the counter and VAL0 is half of the VAL1 register minus the INIT value, then the half cycle reload pulse will occur exactly half way through the timer count period and the Local Sync will have a 50% duty cycle. On the other hand, if the VAL1 and VAL0 registers are not required for register reloading or counter initialization, they can be used to modulate the duty cycle of the Local Sync signal, effectively turning it into an auxiliary PWM signal (PWM\_X) assuming that the PWM\_X pin is not being used for another function such as input capture or deadtime distortion correction. Including the Local Sync signal, each submodule is capable of generating three PWM signals where software has complete control over each edge of each of the signals.

If the comparators and edge value registers are not required for PWM generation, they can also be used for other functions such as output compares, generating output triggers, or generating interrupts at timed intervals.

The 16-bit comparators shown in [Figure 28-16](#) are "equal to" comparators. In addition, if both the set and reset of the flip-flop are asserted, then the flop output goes to 0.

### **28.5.2.5 Output Compare Capabilities**

By using the VALx registers in conjunction with the submodule timer and 16 bit comparators, buffered output compare functionality can be achieved with no additional hardware required. Specifically, the following output compare functions are possible:

- An output compare sets the output high
- An output compare sets the output low
- An output compare generates an interrupt
- An output compare generates an output trigger

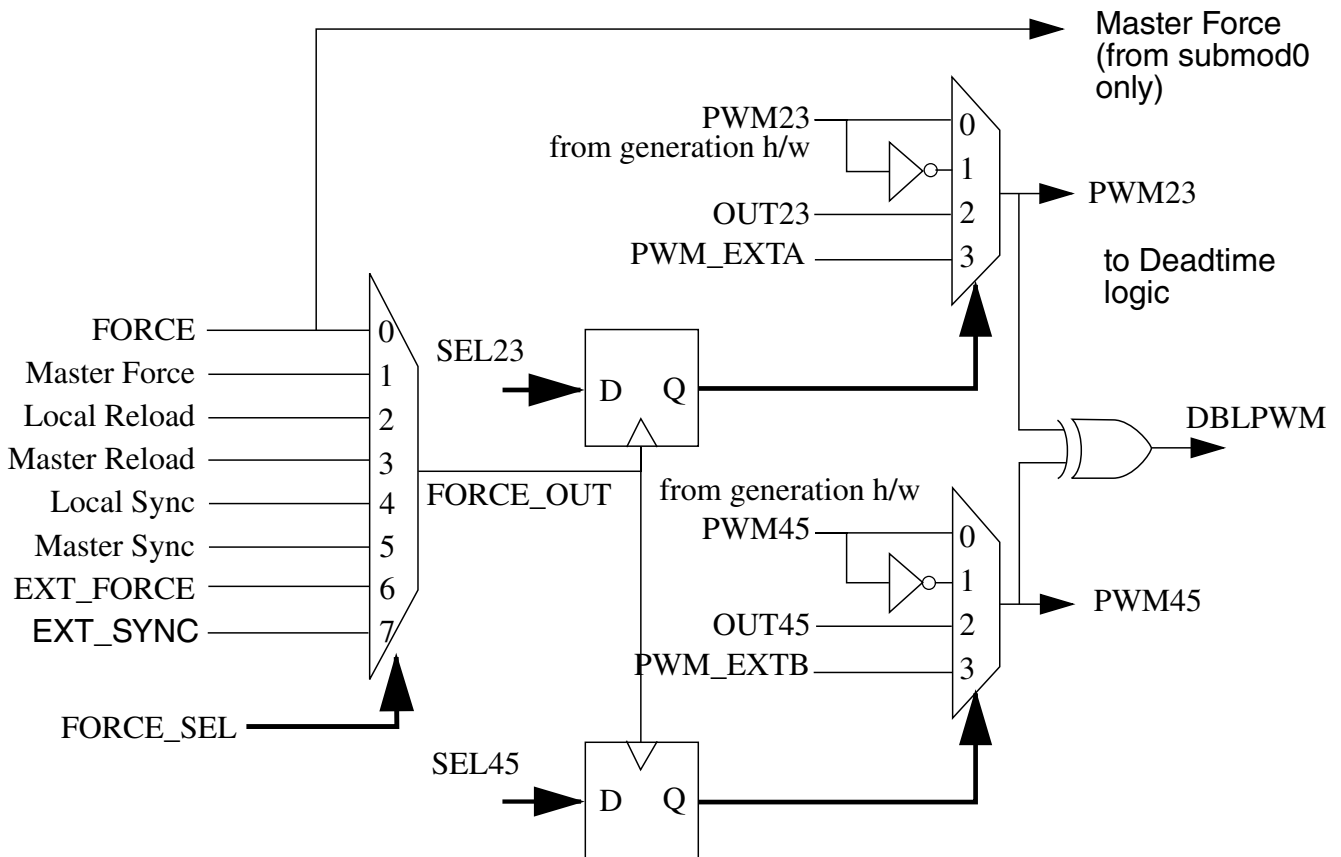

In PWM generation, an output compare is initiated by programming a VALx register for a timer compare, which in turn causes the output of the D flip-flop to either set or reset. For example, if an output compare is desired on the PWM\_A signal that sets it high, VAL2 would be programmed with the counter value where the output compare should take place. However, to prevent the D flip-flop from being reset again after the compare has occurred, the VAL3 register must be programmed to a value outside of the modulus range of the counter. Therefore, a compare that would result in resetting the D flip-flop

output would never occur. Conversely, if an output compare is desired on the PWM\_A signal that sets it low, the VAL3 register is programmed with the appropriate count value and the VAL2 register is programmed with a value outside the counter modulus range. Regardless of whether a high compare or low compare is programmed, an interrupt or output trigger can be generated when the compare event occurs.

### 28.5.2.6 Force Out Logic

For each submodule, software can select between eight signal sources for the FORCE\_OUT signal: local CTRL2[FORCE], the Master Force signal from submodule0, the local Reload signal, the Master Reload signal from submodule0, the Local Sync signal, the Master Sync signal from submodule0, the EXT\_SYNC signal from on- or off-chip, or the EXT\_FORCE signal from on- or off-chip depending on the chip architecture. The local signals are used when the user simply wants to change the signals on the output pins of the submodule without regard for synchronization with other submodules. However, if it is required that all signals on all submodule outputs change at the same time, the Master, EXT\_SYNC, or EXT\_FORCE signals should be selected.

[Figure 28-17](#) illustrates the Force logic. The SEL23 and SEL45 fields each choose from one of four signals that can be supplied to the submodule outputs: the PWM signal, the inverted PWM signal, a binary level specified by software via the OUT23 and OUT45 bits, or the PWM\_EXT\_A or PWM\_EXT\_B alternate external control signals. The selection can be determined ahead of time and, when a FORCE\_OUT event occurs, these values are presented to the signal selection mux that immediately switches the requested signal to the output of the mux for further processing downstream.

**Figure 28-17. Force Out Logic**

The local CTRL2[FORCE] signal of submodule0 can be broadcast as the Master Force signal to other submodules. This feature allows the CTRL2[FORCE] of submodule0 to synchronously update all of the submodule outputs at the same time. The EXT\_FORCE signal originates from outside the PWM module from a source such as a timer or digital comparators in the Analog-to-Digital Converter.

### 28.5.2.7 Independent or Complementary Channel Operation

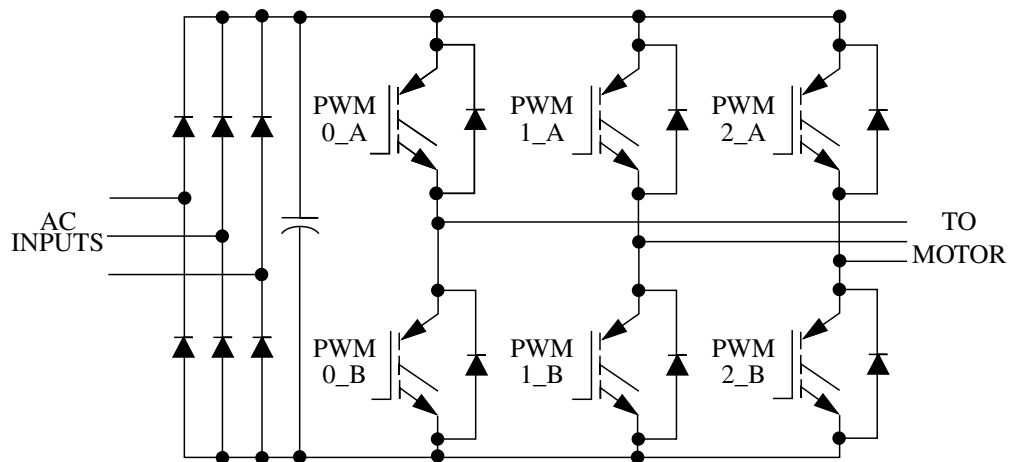

Writing a logic one to CTRL2[INDEP] configures the pair of PWM outputs as two independent PWM channels. Each PWM output is controlled by its own VALx pair operating independently of the other output.

Writing a logic zero to CTRL2[INDEP] configures the PWM output as a pair of complementary channels. The PWM pins are paired as shown in [Figure 28-18](#) in complementary channel operation. Which signal is connected to the output pin (PWM23 or PWM45) is determined by MCTRL[IPOL].

**Figure 28-18. Complementary Channel Pair**

The complementary channel operation is for driving top and bottom transistors in a motor drive circuit, such as the one in [Figure 28-19](#).

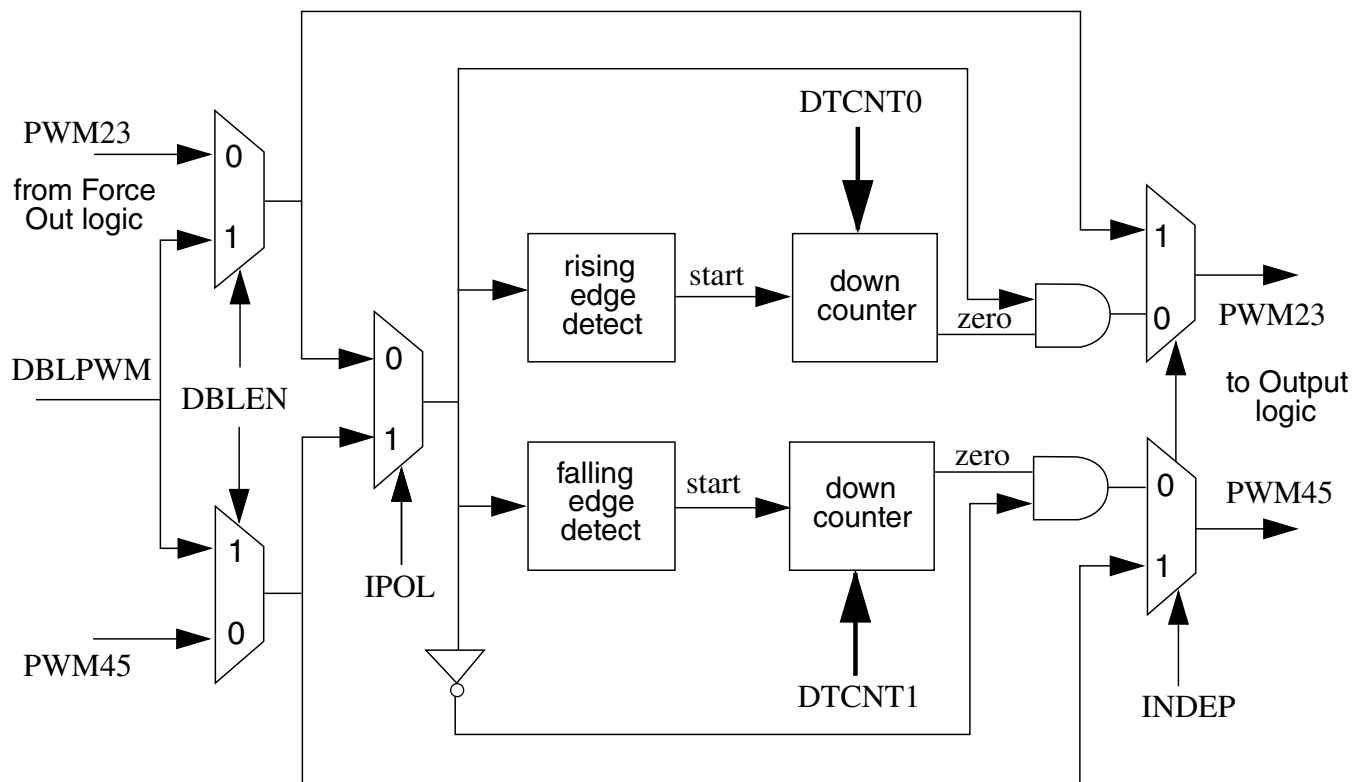

**Figure 28-19. Typical 3 Phase AC Motor Drive**

Complementary operation allows the use of the deadtime insertion feature.

### 28.5.2.8 Deadtime Insertion Logic

The following figure shows the deadtime insertion logic of each submodule which is used to create non-overlapping complementary signals when not in independent mode.

**Figure 28-20. Deadtime Insertion Logic**

While in the complementary mode, a PWM pair can be used to drive top/bottom transistors, as shown in the figure. When the top PWM channel is active, the bottom PWM channel is inactive, and vice versa.

### Note

To avoid short circuiting the DC bus and endangering the transistor, there must be no overlap of conducting intervals between top and bottom transistor. But the transistor's characteristics may make its switching-off time longer than switching-on time. To avoid the conducting overlap of top and bottom transistors, deadtime needs to be inserted in the switching period, as illustrated in the following figure.

The deadtime generators automatically insert software-selectable activation delays into the pair of PWM outputs. The deadtime registers (DTCNT0 and DTCNT1) specify the number of IPBus clock cycles to use for deadtime delay. Every time the deadtime generator inputs change state, deadtime is inserted. Deadtime forces both PWM outputs in the pair to the inactive state.

When deadtime is inserted in complementary PWM signals connected to an inverter driving an inductive load, the PWM waveform on the inverter output will have a different duty cycle than what appears on the output pins of the PWM module. This results in a distortion in the voltage applied to the load. A method of correcting this, adding to or subtracting from the PWM value used, is discussed next.

Figure 28-21. Deadtime Insertion

### 28.5.2.8.1 Top/Bottom Correction

In complementary mode, either the top or the bottom transistor controls the output voltage. However, deadtime has to be inserted to avoid overlap of conducting interval between the top and bottom transistor. Both transistors in complementary mode are off during deadtime, allowing the output voltage to be determined by the current status of load and introduce distortion in the output voltage. See the following figure. On AC induction motors running open-loop, the distortion typically manifests itself as poor low-speed performance, such as torque ripple and rough operation.

**Figure 28-22. Deadtime Distortion**

During deadtime, load inductance distorts output voltage by keeping current flowing through the diodes. This deadtime current flow creates a load voltage that varies with current direction. With a positive current flow, the load voltage during deadtime is equal to the bottom supply, putting the top transistor in control. With a negative current flow, the load voltage during deadtime is equal to the top supply putting the bottom transistor in control.

Remembering that the original PWM pulse widths were shortened by deadtime insertion, the averaged sinusoidal output will be less than the desired value. However, when deadtime is inserted, it creates a distortion in the motor current waveform inverter outputs. This distortion is aggravated by dissimilar turn-on and turn-off delays of each of the transistors. By giving the PWM module information on which transistor is controlling at a given time this distortion can be corrected.

For a typical circuit in complementary channel operation, only one of the transistors will be effective in controlling the output voltage at any given time. This depends on the direction of the motor inverter current for that pair, as the preceding figure shows. To correct distortion one of two different factors must be added to the desired PWM value, depending on whether the top or bottom transistor is controlling the output voltage. Therefore, the software is responsible for calculating both compensated PWM values prior to placing them in the VALx registers. Either the VAL2/VAL3 or the VAL4/VAL5 register pair controls the pulse width at any given time. For a given PWM pair, whether the VAL2/VAL3 or VAL4/VAL5 pair is active depends on either:

- The state of the current status pin, PWMX, for that driver
- The state of the odd/even correction bit, MCTRL[IPOL], for that driver

To correct deadtime distortion, software can decrease or increase the value in the appropriate VALx register.

- In edge-aligned operation, decreasing or increasing the PWM value by a correction value equal to the deadtime typically compensates for deadtime distortion.
- In center-aligned operation, decreasing or increasing the PWM value by a correction value equal to one-half the deadtime typically compensates for deadtime distortion.

### 28.5.2.8.2 Manual Correction

To detect the current status, the voltage on each PWMX pin is sampled twice in a PWM period, at the end of each deadtime. The value is stored in CTRL[DT]. CTRL[DT] is a timing marker especially indicating when to toggle between PWM value registers. Software can then set MCTRL[IPOL] to switch between VAL2/VAL3 and VAL4/VAL5 register pairs according to CTRL[DT] values.

**Figure 28-23. Current-status Sense Scheme for Deadtime Correction**

Both D flip-flops latch low, CTRL[DT] = 00, during deadtime periods if current is large and flowing out of the complementary circuit. See the preceding figure. Both D flip-flops latch the high, CTRL[DT] = 11, during deadtime periods if current is also large and flowing into the complementary circuit.

However, under low-current, the output voltage of the complementary circuit during deadtime is somewhere between the high and low levels. The current cannot free-wheel through the opposition anti-body diode, regardless of polarity, giving additional distortion when the current crosses zero. **Sampled results will be CTRL[DT] = b10. Thus, the best time to change one PWM value register to another is just before the current zero crossing.**

**Figure 28-24. Output Voltage Waveforms**

### 28.5.2.9 Fractional Delay Logic

For applications where more resolution than a single IPBus clock period is needed, the fractional delay logic can be used to achieve fine resolution on the rising and falling edges of the PWM\_A and PWM\_B outputs and fine resolution for the PWM period. Enable the use of the fractional delay logic by setting FRCTRL[FRACx\_EN]. The FRACVALx registers act as a fractional clock cycle addition to the turn on and turn off count specified by the VAL2, VAL3, VAL4, or VAL5 registers. The FRACVAL1 register acts as a fractional increase in the PWM period as defined by VAL1. If FRACVAL1 is programmed to a non-zero value, then the largest value for the VAL1 register is 0xFFFFE for unsigned usage or 0x7FFE for signed usage. This limit is needed in order to avoid counter rollovers when accumulating the fractional additional period.

The results of the fractional delay logic depend on whether or not the PWM submodule has an analog NanoEdge placer block available.

### 28.5.2.9.1 Fractional Delay Logic with NanoEdge Placement Block

Using the NanoEdge placer block requires that the IPBus clock to the PWM be set at a defined frequency. The NanoEdge placer is powered up by setting `FRCTRL[FRAC_PU]`. Enable fine edge control on the various PWM edges by setting `FRCTRL[FRACx_EN]`. The fractional values in the `FRACVALx` registers allow placing the PWM edge or PWM period to a granularity of 1/32 of the IPBus clock period. For example, if you desire the rising edge of the PWMA output to occur at a count of 12.25, then program `VAL2` with `0x000C` and `FRACVAL2` with `0x4000`. Using `FRACVAL1` will adjust the PWM period with the same granularity of 1/32 of a clock period.

If the `FRCTRL[FRAC_PU]` bits in all of the submodules are clear, then the NanoEdge placer is powered down, and alternate clock frequencies can be used without the NanoEdge placement feature.

### 28.5.2.9.2 Fractional Delay Logic without NanoEdge Placement Block

For submodules that are not supported by the NanoEdge placer, the PWM can use dithering to simulate fine edge control. Enable this feature by setting the `FRCTRL[FRAC1_EN]`, `FRCTRL[FRAC23_EN]`, and `FRCTRL[FRAC45_EN]` bits. It is unnecessary to set `FRCTRL[FRAC_PU]`. The PWM period or the PWM edges will dither from the nearest whole number values to achieve an average value that is equivalent to the programmed fractional value. The added cycles are based on the accumulation of the fractional component. For example, if you want the PWM period to be 50.25 clock cycles, then program `VAL1` with `0x0032` and `FRACVAL1` with `0x4000`. The PWM period will be 50 cycles long most of the time, but will occasionally be 51 cycles long to achieve a long-term average of 50.25 cycles.

In submodules that are not supported by a NanoEdge placer, the clock frequency is not required to be any specific value to achieve proper operation.

### 28.5.2.10 Output Logic

The following figure shows the output logic of each submodule including how each PWM output has individual fault disabling, polarity control, and output enable. This allows for maximum flexibility when interfacing to the external circuitry.

The PWM23 and PWM45 signals which are output from the deadtime logic (refer to the figure) are positive true signals. In other words, a high level on these signals should result in the corresponding transistor in the PWM inverter being turned ON. The voltage level required at the PWM output pin to turn the transistor ON or OFF is a function of the logic between the pin and the transistor. Therefore, it is imperative that the user program

OCTRL[POLA] and OCTRL[POLB] before enabling the output pins. A fault condition can result in the PWM output being tristated, forced to a logic 1, or forced to a logic 0 depending on the values programmed into the OCTRL[PWMxFS] fields.

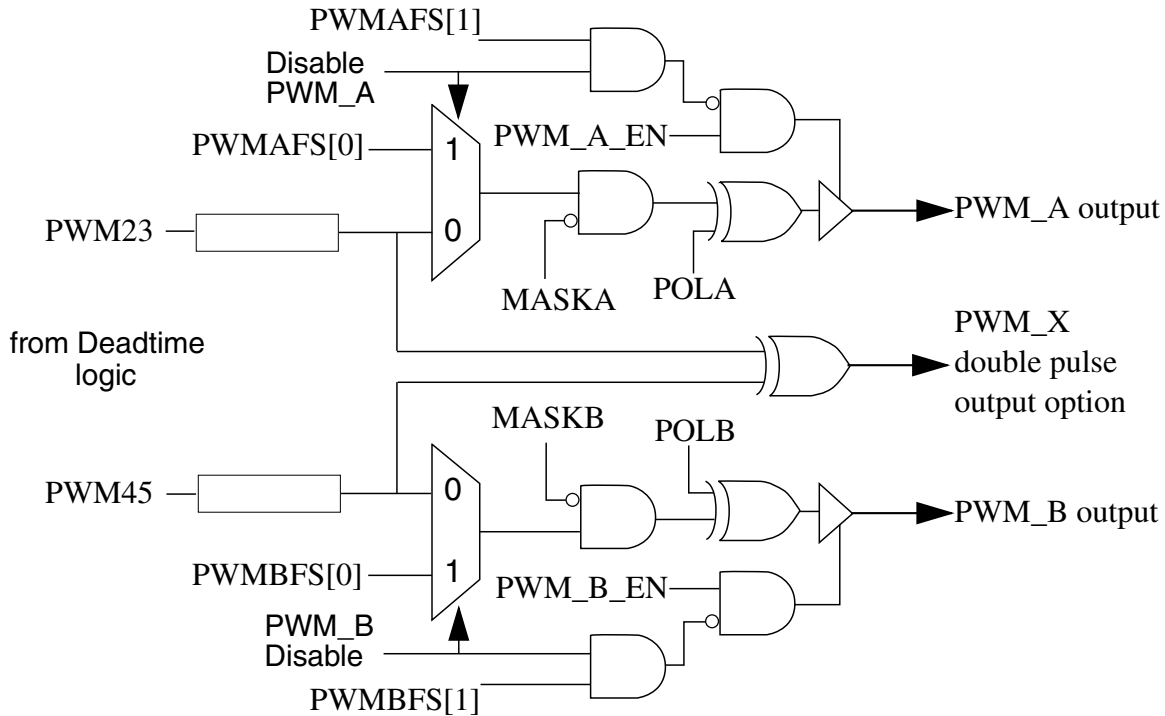

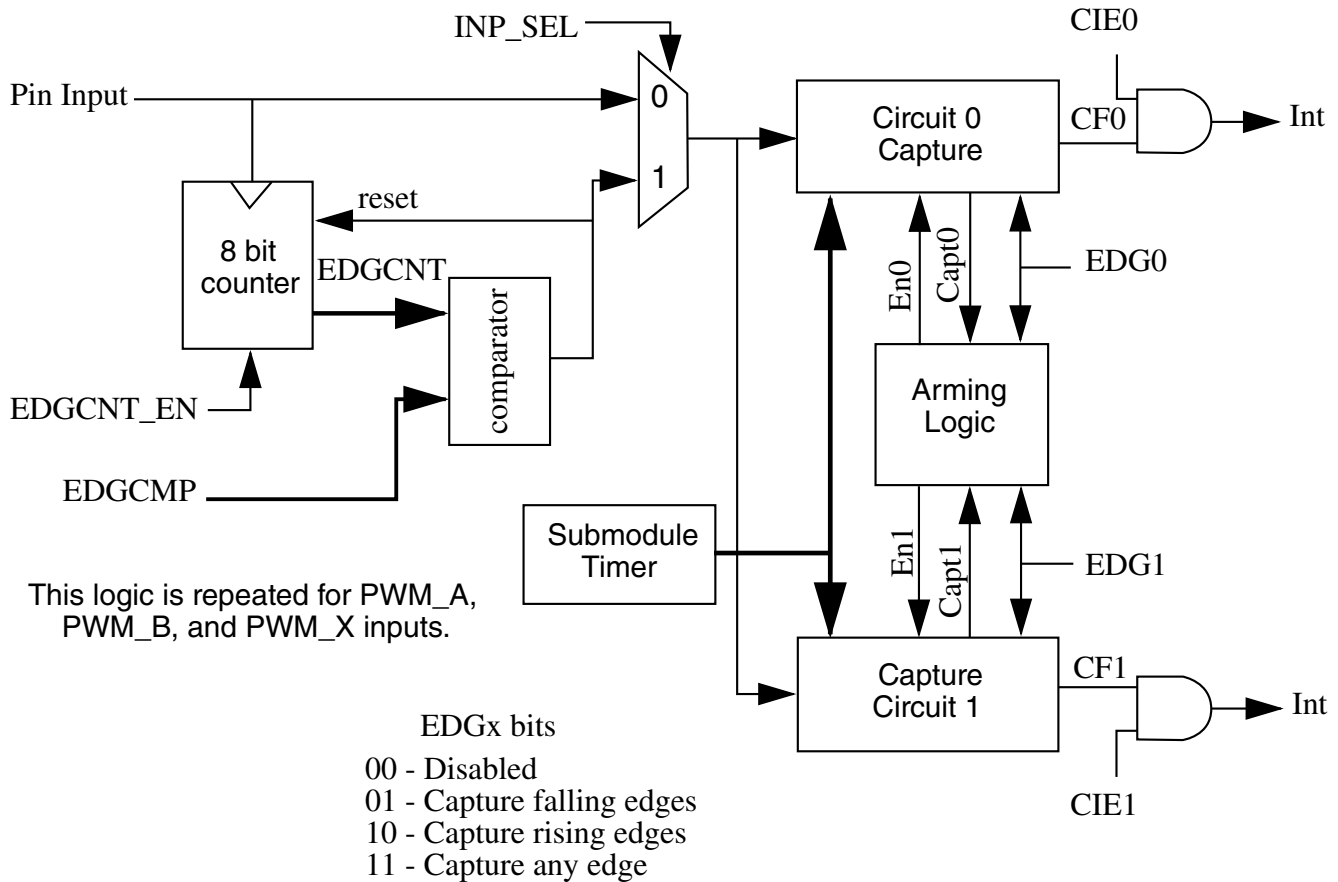

Figure 28-25. Output Logic

### 28.5.2.11 E-Capture

Commensurate with the idea of controlling both edges of an output signal, the Enhanced Capture (E-Capture) logic is designed to measure both edges of an input signal. As a result, when a submodule pin is configured for input capture, the CVALx registers associated with that pin are used to record the edge values.

The following figure is a block diagram of the E-Capture circuit. Upon entering the pin input, the signal is split into two paths. One goes straight to a mux input where software can select to pass the signal directly to the capture logic for processing. The other path connects the signal to an 8 bit counter which counts both the rising and falling edges of the signal. The output of this counter is compared to an 8 bit value that is specified by the user (EDGCMPlx) and when the two values are equal, the comparator generates a pulse that resets the counter. This pulse is also supplied to the mux input where software can select it to be processed by the capture logic. This feature permits the E-Capture circuit to count up to 256 edge events before initiating a capture event. this feature is useful for

dividing down high frequency signals for capture processing so that capture interrupts don't overwhelm the CPU. Also, this feature can be used to simply generate an interrupt after "n" events have been counted.

**Figure 28-26. Enhanced Capture (E-Capture) Logic**

Based on the mode selection, the mux selects either the pin input or the compare output from the count/compare circuit to be processed by the capture logic. The selected signal is routed to two separate capture circuits which work in tandem to capture sequential edges of the signal. The type of edge to be captured by each circuit is determined by  $CAPTCTRLx[EDGx1]$  and  $CAPTCTRLx[EDGx0]$ , whose functionality is listed in the preceding figure. Also, controlling the operation of the capture circuits is the arming logic which allows captures to be performed in a free running (continuous) or one shot fashion. In free running mode, the capture sequences will be performed indefinitely. If both capture circuits are enabled, they will work together in a ping-pong style where a capture event from one circuit leads to the arming of the other and vice versa. In one shot mode, only one capture sequence will be performed. If both capture circuits are enabled, capture circuit 0 is first armed and when a capture event occurs, capture circuit 1 is armed. Once the second capture occurs, further captures are disabled until another capture sequence is initiated. Both capture circuits are also capable of generating an interrupt to the CPU.

### 28.5.2.12 Fault Protection

Fault protection can control any combination of PWM output pins. Faults are generated by a logic one on any of the FAULTx pins. This polarity can be changed via FCTRL[FLVL]. Each FAULTx pin can be mapped arbitrarily to any of the PWM outputs. When fault protection hardware disables PWM outputs, the PWM generator continues to run, only the output pins are forced to logic 0, logic 1, or tristated depending the values of OCTRL[PWMxFS].

The fault decoder disables PWM pins selected by the fault logic and the disable mapping (DISMAPn) registers. The following figure shows an example of the fault disable logic. Each bank of bits in DISMAPn control the mapping for a single PWM pin. See the following table.

The fault protection is enabled even when the PWM module is not enabled; therefore, a fault will be latched in and must be cleared in order to prevent an interrupt when the PWM is enabled.

Figure 28-27. Fault Decoder for PWM\_A

Table 28-2. Fault Mapping

PWM Pin	Controlling Register Bits
PWM_A	DISMAP0[DIS0A] and DISMAP1[DIS1A]
PWM_B	DISMAP0[DIS0B] and DISMAP1[DIS1B]
PWM_X	DISMAP0[DIS0X] and DISMAP1[DIS1X]

### 28.5.2.12.1 Fault Pin Filter

Each fault pin has a programmable filter that can be bypassed. The sampling period of the filter can be adjusted with `FFILT[FILT_PER]`. The number of consecutive samples that must agree before an input transition is recognized can be adjusted using `FFILT[FILT_CNT]`. Setting `FFILT[FILT_PER]` to all 0 disables the input filter for a given `FAULTx` pin.

Upon detecting a logic 0 on the filtered `FAULTx` pin (or a logic 1 if `FCTRL[FLVLx]` is set), the corresponding `FSTS[FFPINx]` and fault flag, `FSTS[FFLAGx]`, bits are set. `FSTS[FFPINx]` remains set as long as the filtered `FAULTx` pin is zero. Clear `FSTS[FFLAGx]` by writing a logic 1 to `FSTS[FFLAGx]`.

If the `FIEx`, `FAULTx` pin interrupt enable bit is set, `FSTS[FFLAGx]` generates a CPU interrupt request. The interrupt request latch remains set until:

- Software clears `FSTS[FFLAGx]` by writing a logic one to the bit
- Software clears the `FIEx` bit by writing a logic zero to it
- A reset occurs

Even with the filter enabled, there is a combinational path from the `FAULTx` inputs to the PWM pins. This logic is also capable of holding a fault condition in the event of loss of clock to the PWM module.

### 28.5.2.12.2 Automatic Fault Clearing

Setting an automatic clearing mode bit, `FCTRL[FAUTOx]`, configures faults from the `FAULTx` pin for automatic clearing.

When `FCTRL[FAUTOx]` is set, disabled PWM pins are enabled when the `FAULTx` pin returns to logic one and a new PWM full or half cycle begins. See the following figure. If `FSTS[FFULLx]` is set, then the disabled PWM pins are enabled at the start of a full cycle. If `FSTS[FHALFx]` is set, then the disabled PWM pins are enabled at the start of a half cycle. Clearing `FSTS[FFLAGx]` does not affect disabled PWM pins when `FCTRL[FAUTOx]` is set.

**Figure 28-28. Automatic Fault Clearing**

### 28.5.2.12.3 Manual Fault Clearing

Clearing the automatic clearing mode bit, `FCTRL[FAUTOx]`, configures faults from the `FAULTx` pin for manual clearing:

- If the fault safety mode bits, `FCTRL[FSAFEx]`, are clear, then PWM pins disabled by the `FAULTx` pins are enabled when:
  - Software clears the corresponding `FSTS[FFLAGx]` flag
  - The pins are enabled when the next PWM full or half cycle begins regardless of the logic level detected by the filter at the `FAULTx` pin. See the first following figure. If `FSTS[FFULLx]` is set, then the disabled PWM pins are enabled at the start of a full cycle. If `FSTS[FHALFx]` is set, then the disabled PWM pins are enabled at the start of a half cycle.
- If the fault safety mode bits, `FCTRL[FSAFEx]`, are set, then PWM pins disabled by the `FAULTx` pins are enabled when:
  - Software clears the corresponding `FSTS[FFLAGx]` flag
  - The filter detects a logic one on the `FAULTx` pin at the start of the next PWM full or half cycle boundary. See the second following figure. If `FSTS[FFULLx]` is set, then the disabled PWM pins are enabled at the start of a full cycle. If `FSTS[FHALFx]` is set, then the disabled PWM pins are enabled at the start of a half cycle.

**Figure 28-29. Manual Fault Clearing (FCTRL[FSAFE]=0)**

**Figure 28-30. Manual Fault Clearing (FCTRL[FSAFE]=1)**

**Note**

Fault protection also applies during software output control when the SEL23 and SEL45 fields are set to select OUT23 and OUT45 bits or PWM\_EXT\_A and PWM\_EXT\_B. Fault clearing still occurs at half PWM cycle boundaries while the PWM generator is engaged, MCTRL[RUN] equals one. But the OUTx bits can control the PWM pins while the PWM generator is off, MCTRL[RUN] equals zero. Thus, fault clearing occurs at IPBus cycles while the PWM generator is off and at the start of PWM cycles when the generator is engaged.

**28.5.2.12.4 Fault Testing**

FTST[FTEST] is used to simulate a fault condition on each of the fault inputs within that fault channel.

**28.5.3 PWM Generator Loading**

### 28.5.3.1 Load Enable

MCTRL[LDOK] enables loading of the following PWM generator parameters:

- The prescaler divisor—from CTRL[PRSC]
- The PWM period and pulse width—from the INIT and VALx registers

MCTRL[LDOK] allows software to finish calculating all of these PWM parameters so they can be synchronously updated. The CTRL[PRSC], INIT, and VALx registers are loaded by software into a set of outer buffers. When MCTRL[LDOK] is set, these values are transferred to an inner set of registers at the beginning of the next PWM reload cycle to be used by the PWM generator. These values can be transferred to the inner set of registers immediately upon setting MCTRL[LDOK] if CTRL[LDMOD] is set. Set MCTRL[LDOK] by reading it when it is a logic zero and then writing a logic one to it. After loading, MCTRL[LDOK] is automatically cleared.

### 28.5.3.2 Load Frequency

CTRL[LDFQ] selects an integral loading frequency of one to 16 PWM reload opportunities. CTRL[LDFQ] takes effect at every PWM reload opportunity, regardless the state of MCTRL[LDOK]. CTRL[HALF] and CTRL[FULL] control reload timing. If CTRL[FULL] is set, a reload opportunity occurs at the end of every PWM cycle when the count equals VAL1. If CTRL[HALF] is set, a reload opportunity occurs at the half cycle when the count equals VAL0. If both CTRL[HALF] and CTRL[FULL] are set, a reload opportunity occurs twice per PWM cycle when the count equals VAL1 and when it equals VAL0.

Figure 28-31. Full Cycle Reload Frequency Change

Figure 28-32. Half Cycle Reload Frequency Change

Figure 28-33. Full and Half Cycle Reload Frequency Change

### 28.5.3.3 Reload Flag

At every reload opportunity the PWM Reload Flag (STS[RF]) is set. Setting STS[RF] happens even if an actual reload is prevented by MCTRL[LDOK]. If the PWM reload interrupt enable bit, INTEN[RIE], is set, the STS[RF] flag generates CPU interrupt requests allowing software to calculate new PWM parameters in real time. When INTEN[RIE] is not set, reloads still occur at the selected reload rate without generating CPU interrupt requests.

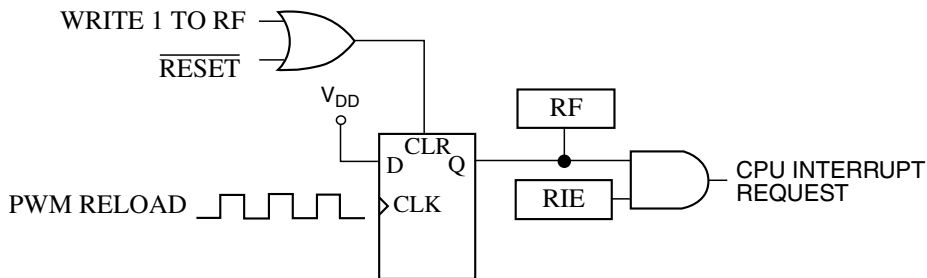

Figure 28-34. PWMF Reload Interrupt Request

### 28.5.3.4 Reload Errors

Whenever one of the VAL<sub>x</sub>, FRACVAL<sub>x</sub>, or CTRL[PRSC] registers is updated, the STS[RUF] flag is set to indicate that the data is not coherent. STS[RUF] will be cleared by a successful reload which consists of the reload signal while MCTRL[LDOK] is set. If STS[RUF] is set and MCTRL[LDOK] is clear when the reload signal occurs, a reload error has taken place and STS[REF] is set. If STS[RUF] is clear when a reload signal asserts, then the data is coherent and no error will be flagged.

### 28.5.3.5 Initialization

Initialize all registers and set MCTRL[LDOK] before setting MCTRL[RUN].

#### Note

Even if MCTRL[LDOK] is not set, setting MCTRL[RUN] also sets the STS[RF] flag. To prevent a CPU interrupt request, clear INTEN[RIE] before setting MCTRL[RUN].

The PWM generator uses the last values loaded if MCTRL[RUN] is cleared and then set while MCTRL[LDOK] equals zero.

When MCTRL[RUN] is cleared:

- The STS[RF] flag and pending CPU interrupt requests are not cleared
- All fault circuitry remains active
- Software/external output control remains active
- Deadtime insertion continues during software/external output control

## 28.6 Resets

All PWM registers are reset to their default values upon any system reset.

The reset forces all registers to their reset states and tri-states the PWM outputs.

## 28.7 Interrupts

Each of the submodules within the eFlexPWM module can generate an interrupt from several sources. The fault logic can also generate interrupts. The interrupt service routine (ISR) must check the related interrupt enables and interrupt flags to determine the actual cause of the interrupt.

**Table 28-3. Interrupt Summary**

Core Interrupt	Interrupt Flag	Interrupt Enable	Name	Description
PWM_CMP0	SM0STS[CMPIE]	SM0INTEN[CMPIE]	Submodule 0 compare interrupt	Compare event has occurred
PWM_CAP0	SM0STS[CFA1], SM0STS[CFA0], SM0STS[CFB1], SM0STS[CFB0], SM0STS[CFX1], SM0STS[CFX0]	SM0INTEN[CFA1IE], SM0INTEN[CFA0IE], SM0INTEN[CFB1IE], SM0INTEN[CFB0IE], SM0INTEN[CFX1IE], SM0INTEN[CFX0IE]	Submodule 0 input capture interrupt	Input capture event has occurred
PWM_RELOAD0	SM0STS[RF]	SM0INTEN[RIE]	Submodule 0 reload interrupt	Reload event has occurred
PWM_CMP1	SM1STS[CMPIE]	SM1INTEN[CMPIE]	Submodule 1 compare interrupt	Compare event has occurred
PWM_CAP1	SM1STS[CFA1], SM1STS[CFA0], SM1STS[CFB1], SM1STS[CFB0], SM1STS[CFX1], SM1STS[CFX0]	SM1INTEN[CFA1IE], SM1INTEN[CFA0IE], SM1INTEN[CFB1IE], SM1INTEN[CFB0IE], SM1INTEN[CFX1IE], SM1INTEN[CFX0IE]	Submodule 1 input capture interrupt	Input capture event has occurred
PWM_RELOAD1	SM1STS[RF]	SM1INTEN[RIE]	Submodule 1 reload interrupt	Reload event has occurred
PWM_CMP2	SM2STS[CMPIE]	SM2INTEN[CMPIE]	Submodule 2 compare interrupt	Compare event has occurred
PWM_CAP2	SM2STS[CFA1], SM2STS[CFA0], SM2STS[CFB1], SM2STS[CFB0], SM2STS[CFX1], SM2STS[CFX0]	SM2INTEN[CFA1IE], SM2INTEN[CFA0IE], SM2INTEN[CFB1IE], SM2INTEN[CFB0IE], SM2INTEN[CFX1IE], SM2INTEN[CFX0IE]	Submodule 2 input capture interrupt	Input capture event has occurred
PWM_RELOAD2	SM2STS[RF]	SM2INTEN[RIE]	Submodule 2 reload interrupt	Reload event has occurred
PWM_CMP3	SM3STS[CMPIE]	SM3INTEN[CMPIE]	Submodule 3 compare interrupt	Compare event has occurred

*Table continues on the next page...*

**Table 28-3. Interrupt Summary (continued)**

Core Interrupt	Interrupt Flag	Interrupt Enable	Name	Description
PWM_CAP3	SM3STS[CFA1], SM3STS[CFA0], SM3STS[CFB1], SM3STS[CFB0], SM3STS[CFX1], SM3STS[CFX0]	SM3INTEN[CFA1IE], SM3INTEN[CFA0IE], SM3INTEN[CFB1IE], SM3INTEN[CFB0IE], SM3INTEN[CFX1IE], SM3INTEN[CFX0IE]	Submodule 3 input capture interrupt	Input capture event has occurred
PWM_RELOAD3	SM3STS[RF]	SM3INTEN[RIE]	Submodule 3 reload interrupt	Reload event has occurred
PWM_RERR	SM0STS[REF]	SM0INTEN[REIE]	Submodule 0 reload error interrupt	Reload error has occurred
	SM1STS[REF]	SM1INTEN[REIE]	Submodule 1 reload error interrupt	
	SM2STS[REF]	SM2INTEN[REIE]	Submodule 2 reload error interrupt	
	SM3STS[REF]	SM3INTEN[REIE]	Submodule 3 reload error interrupt	
PWM_FAULT	FSTS[FFLAG]	FCTRL[FIE]	Fault input interrupt	Fault condition has been detected

## 28.8 DMA

Each submodule can request a DMA read access for its capture FIFOs and a DMA write request for its double buffered VALx registers.

**Table 28-4. DMA Summary**

DMA Request	DMA Enable	Name	Description
Submodule 0 read request	SM0DMAEN[CX0DE]	SM0 Capture FIFO X0 read request	SM0CVAL0 contains a value to be read
	SM0DMAEN[CX1DE]	SM0 Capture FIFO X1 read request	SM0CVAL1 contains a value to be read
	SM0DMAEN[CA0DE]	SM0 Capture FIFO A0 read request	SM0CVAL2 contains a value to be read
	SM0DMAEN[CA1DE]	SM0 Capture FIFO A1 read request	SM0CVAL3 contains a value to be read
	SM0DMAEN[CB0DE]	SM0 Capture FIFO B0 read request	SM0CVAL4 contains a value to be read
	SM0DMAEN[CB1DE]	SM0 Capture FIFO B1 read request	SM0CVAL5 contains a value to be read
	SM0DMAEN[CAPTDE]	SM0 Capture FIFO read request source select	Selects source of submodule0 read DMA request

Table continues on the next page...

Table 28-4. DMA Summary (continued)

DMA Request	DMA Enable	Name	Description
Submodule 0 write request	SM0DMAEN[VALDE]	SM0VALx write request	SM0VALx registers need to be updated
Submodule 1 read request	SM1DMAEN[CX0DE]	SM1 Capture FIFO X0 read request	SM1CVAL0 contains a value to be read
	SM1DMAEN[CX1DE]	SM1 Capture FIFO X1 read request	SM1CVAL1 contains a value to be read
	SM1DMAEN[CA0DE]	SM1 Capture FIFO A0 read request	SM1CVAL2 contains a value to be read
	SM1DMAEN[CA1DE]	SM1 Capture FIFO A1 read request	SM1CVAL3 contains a value to be read
	SM1DMAEN[CB0DE]	SM1 Capture FIFO B0 read request	SM1CVAL4 contains a value to be read
	SM1DMAEN[CB1DE]	SM1 Capture FIFO B1 read request	SM1CVAL5 contains a value to be read
	SM1DMAEN[CAPTDE]	SM1 Capture FIFO read request source select	Selects source of submodule1 read DMA request
Submodule 1 write request	SM1DMAEN[VALDE]	SM1VALx write request	SM1VALx registers need to be updated
Submodule 2 read request	SM2DMAEN[CX0DE]	SM2 Capture FIFO X0 read request	SM2CVAL0 contains a value to be read
	SM2DMAEN[CX1DE]	SM2 Capture FIFO X1 read request	SM2CVAL1 contains a value to be read
	SM2DMAEN[CA0DE]	SM2 Capture FIFO A0 read request	SM2CVAL2 contains a value to be read
	SM2DMAEN[CA1DE]	SM2 Capture FIFO A1 read request	SM2CVAL3 contains a value to be read
	SM2DMAEN[CB0DE]	SM2 Capture FIFO B0 read request	SM2CVAL4 contains a value to be read
	SM2DMAEN[CB1DE]	SM2 Capture FIFO B1 read request	SM2CVAL5 contains a value to be read
	SM2DMAEN[CAPTDE]	SM2 Capture FIFO read request source select	Selects source of submodule2 read DMA request
Submodule 2 write request	SM2DMAEN[VALDE]	SM2VALx write request	SM2VALx registers need to be updated
Submodule 3 read request	SM3DMAEN[CX0DE]	SM3 Capture FIFO X0 read request	SM3CVAL0 contains a value to be read
	SM3DMAEN[CX1DE]	SM3 Capture FIFO X1 read request	SM3CVAL1 contains a value to be read
	SM3DMAEN[CA0DE]	SM3 Capture FIFO A0 read request	SM3CVAL2 contains a value to be read
	SM3DMAEN[CA1DE]	SM3 Capture FIFO A1 read request	SM3CVAL3 contains a value to be read
	SM3DMAEN[CB0DE]	SM3 Capture FIFO B0 read request	SM3CVAL4 contains a value to be read

Table continues on the next page...

**Table 28-4. DMA Summary (continued)**

DMA Request	DMA Enable	Name	Description
	SM3DMAEN[CB1DE]	SM3 Capture FIFO B1 read request	SM3CVAL5 contains a value to be read
	SM3DMAEN[CAPTDE]	SM3 Capture FIFO read request source select	Selects source of submodule3 read DMA request
Submodule 3 write request	SM3DMAEN[VALDE]	SM3VALx write request	SM3VALx registers need to be updated

# Chapter 29

## FlexRAM

### 29.1 Overview

#### 29.1.1 Introduction

This SoC has 512 KB of on-chip RAM which is shared by I-TCM, D-TCM and general purpose On Chip RAM (OCRAM). The FlexRAM is the manager of the big on-chip RAM array.

#### 29.1.2 Features

The FLEXRAM includes the following features:

- Integrated I-TCM and D-TCM RAM controller
  - 64-bit I-TCM interface and 2x 32-bit D-TCM interface.
  - The controller supports up to 512 KB TCM (for both ITCM and DTCM) space.
  - The controller supports two access modes:
    - Fast mode: RAM accesses is expected to be finished in 1-cycle for both read and write.
    - Wait mode: RAM accesses is expected to be finished in 2-cycle. Wait mode for read and write path can be enabled separately.
  - Synchronous interface to the M7 Core,run at the same frequency as the core
  - Automatically clock gating control to reduce power consumption
- Integrated OCRAM controller
  - single SRAM bank controller.
  - support up to 512 KB SRAM size
  - Synchronous to the system bus, runs at the same frequency as bus fabric
- Parameterized RAM Array
  - Support up to 512 KB total memory space
  - Support up to 32 block of 32-bit RAM

- RAM Array portioning
  - RAM size of ITCM, DTCM and OCRAM can be configured from 0 to full RAM Array size separately
  - Step of the RAM size partitioning for ITCM, DTCM and OCRAM is (Total RAM SIZE)/16
  - Flexible RAM bank organization.
- Flexible power mode:
  - Run mode: All RAM banks are powered on
  - Retention mode: Only 1 (Bank0) out of the 16 RAM banks is on while the rest banks are powered off
  - Partial mode: 8 out of the 16 RAM banks (bank8 to bank15) can be powered off dynamically
- Bank8~15 can be disabled with hardware fuse setting. When the fuse is set, total RAM size will be limit to 256 KB
- Generates interrupt upon TCM, OCRAM access out of configured RAM range

### 29.1.3 Block diagram

Figure 29-1. FLEXRAM block diagram

## 29.2 Functional description

FLEXRAM converts AXI and TCM interface signals to RAM interface signals and implements mux control for OCRM, DTCM and ITCM access to on-chip RAM.

### 29.2.1 Interface Conversion

FLEXRAM integrates the OCRM controller which converts AXI master interface signals to RAM interface signals (Please see OCRM section). The OCRM controller can support adding pipeline or wait-state in read/write access by IOMUX GPR.

## Functional description

FLEXRAM also implement TCM controller module to convert DTCM/ITCM interface to RAM interface. TCM read/write access can be extended to 2 cycles by setting TCM\_CTRL register. When DTCM and ITCM access unallocated RAM address, TCM controller can send tcm\_err to DTCM/ITCM interface.

### 29.2.2 RAM Bank Allocation

OCRAM, DTCM and ITCM share 512 KB of on-chip RAM. SW can configure from 0 to 512 KB full RAM array size for OCRAM, DTCM and ITCM by IOMUX GPR16 and GPR17. The RAM size step is 32KB. The allocated RAM bank can be not overlapped for OCRAM, DTCM and ITCM. Table below show an example of a 128KB ITCM, 128KB DTCM and 256KB OCRAM configuration.

**Table 29-1. FLEXRAM Partitioning Example**

	ITCM	DTCM	OCRAM
Bank0	0	0	1
Bank1	0	0	1
Bank2	0	0	1
Bank3	0	0	1
Bank4	1	0	0
Bank5	1	0	0
Bank6	0	1	0
Bank7	0	1	0
Bank8	0	0	1
Bank9	0	0	1
Bank10	0	0	1
Bank11	0	0	1
Bank12	1	0	0
Bank13	1	0	0
Bank14	0	1	0
Bank15	0	1	0

Each RAM bank has 2 bits bank configuration from IOMUX GPR17.

**Table 29-2. RAM Bank configuration**

	RAM Bank Configuration
00	Not used
01	OCRAM
10	DTCM
11	ITCM

### 29.2.3 Low power modes

FLEXRAM has input fuse control signal to control ocram bank8~bank15 interface access. When the fuse bit is programmed, bank8~bank15 can't be accessed again and can be power down.

### 29.2.4 Clocks

The following table describes the clock sources of the FlexRAM module.

**Table 29-3. FlexRAM Clocks**

Clock name	Clock Root	Description
core_clk	arm_clk_root	ARM core clock
axi_clk	axi_clk_root	AXI bus clock
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock for register accesses

### 29.2.5 Reset

FLAMRAM has 2 reset signals. One is used for OCRAM interface and in always on power domain. The other is used for TCM interface and in core power domain.

### 29.2.6 Interrupts

FLEXRAM can generate interrupt in the following cases:

- OCRAM, DTCM or ITCM access the RAM address which is not allocated.

## 29.3 Memory Map and register definition

This section includes the FLEXRAM module memory map and detailed descriptions of all registers.

## 29.3.1 FLEXRAM register descriptions

### 29.3.1.1 FLEXRAM Memory map

FlexRAM base address: 400B\_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	<a href="#">TCM CTRL Register (TCM_CTRL)</a>	32	RW	0000_0000h
10h	<a href="#">Interrupt Status Register (INT_STATUS)</a>	32	W1C	0000_0000h
14h	<a href="#">Interrupt Status Enable Register (INT_STAT_EN)</a>	32	RW	0000_0000h
18h	<a href="#">Interrupt Enable Register (INT_SIG_EN)</a>	32	RW	0000_0000h

### 29.3.1.2 TCM CTRL Register (TCM\_CTRL)

#### 29.3.1.2.1 Offset

Register	Offset
TCM_CTRL	0h

#### 29.3.1.2.2 Function

.

### 29.3.1.2.3 Diagram

### 29.3.1.2.4 Fields

Field	Function
31-3 Reserved	Reserved
2 FORCE_CLK_ON	Force RAM Clock Always On
1 TCM_RWAIT_EN	TCM Read Wait Mode Enable 0b - TCM read fast mode: Read RAM accesses are expected to be finished in 1-cycle. 1b - TCM read wait mode: Read RAM accesses are expected to be finished in 2-cycles.
0 TCM_WWAIT_EN	TCM Write Wait Mode Enable 0b - TCM write fast mode: Write RAM accesses are expected to be finished in 1-cycle. 1b - TCM write wait mode: Write RAM accesses are expected to be finished in 2-cycles.

### 29.3.1.3 Interrupt Status Register (INT\_STATUS)

#### 29.3.1.3.1 Offset

Register	Offset
INT_STATUS	10h

### 29.3.1.3.2 Function

### 29.3.1.3.3 Diagram

### 29.3.1.3.4 Fields

Field	Function
31-6 Reserved	Reserved
5 OCRAM_ERR_STATUS	OCRAM Access Error Status When OCRAM access unallocated address, this bit will be asserted if corresponding status enable bit in INT_STAT_EN register is set. 0b - OCRAM access error does not happen 1b - OCRAM access error happens.
4 DTCM_ERR_ST ATUS	DTCM Access Error Status When DTCM access unallocated address, this bit will be asserted if corresponding status enable bit in INT_STAT_EN register is set. 0b - DTCM access error does not happen 1b - DTCM access error happens.
3 ITCM_ERR_ST ATUS	ITCM Access Error Status When ITCM access unallocated address, this bit will be asserted if corresponding status enable bit in INT_STAT_EN register is set. 0b - ITCM access error does not happen 1b - ITCM access error happens.
2	Reserved

Table continues on the next page...

Field	Function
Reserved2	
1 Reserved1	Reserved
0 Reserved0	Reserved

## 29.3.1.4 Interrupt Status Enable Register (INT\_STAT\_EN)

### 29.3.1.4.1 Offset

Register	Offset
INT_STAT_EN	14h

### 29.3.1.4.2 Function

Setting the bits in this register to 1 enables the corresponding Interrupt Status to be set by the specified event.

### 29.3.1.4.3 Diagram

### 29.3.1.4.4 Fields

Field	Function
31-6 Reserved	Reserved
5 OCRAM_ERR_STAT_EN	OCRAM Access Error Status Enable 0b - Masked 1b - Enabled
4 DTCM_ERR_STAT_EN	DTCM Access Error Status Enable 0b - Masked 1b - Enabled
3 ITCM_ERR_STAT_EN	ITCM Access Error Status Enable 0b - Masked 1b - Enabled
2 Reserved2	Reserved
1 Reserved1	Reserved
0 Reserved0	Reserved

### 29.3.1.5 Interrupt Enable Register (INT\_SIG\_EN)

#### 29.3.1.5.1 Offset

Register	Offset
INT_SIG_EN	18h

#### 29.3.1.5.2 Function

This register is used to select which interrupt status is indicated to the Host System as the interrupt. These status bits all share the same interrupt line. Setting any of these bits to 1 enables interrupt generation. The corresponding Status register bit will generate an interrupt when the corresponding interrupt signal enable bit is set.

### 29.3.1.5.3 Diagram

### 29.3.1.5.4 Fields

Field	Function
31-6 Reserved	Reserved
5 OCRAM_ERR_SIG_EN	OCRAM Access Error Interrupt Enable 0b - Masked 1b - Enabled
4 DTCM_ERR_SIG_EN	DTCM Access Error Interrupt Enable 0b - Masked 1b - Enabled
3 ITCM_ERR_SIG_EN	ITCM Access Error Interrupt Enable 0b - Masked 1b - Enabled
2 Reserved2	Reserved
1 Reserved1	Reserved
0 Reserved0	Reserved

# Chapter 30

## FlexSPI Controller

### 30.1 Chip-specific FlexSPI information

#### NOTE

The soft reset bit (MCR\_SWRESET) should be set, to enable the inverted clock, after setting the SCKBDIFFOPT bit.

#### NOTE

Octal mode is supported by combining SIOA[3:0] and SIOB[3:0], on this device.

#### NOTE

ARM AXIM access to FlexSPI is converted to AHB command access of FlexSPI, on this device.

### 30.2 Introduction

FlexSPI is a flexible SPI (Serial Peripheral Interface) host controller which supports two SPI channels and up to 4 external devices. Each channel supports Single/Dual/Quad/Octal mode data transfer (1/2/4/8 bidirectional data lines).

#### 30.2.1 Features

FlexSPI block supports following features:

- Flexible sequence engine (LUT table) to support various vendor devices
  - Serial NOR Flash or other device with similar SPI protocol as Serial NOR Flash
  - Serial NAND Flash
  - HyperBus device (HyperFlash/HyperRAM)
  - FPGA device

- Flash access mode
  - Single/Dual/Quad/Octal mode
  - SDR/DDR mode
  - Individual/Parallel mode
- Support sampling clock mode:
  - Internal dummy read strobe loopbacked internally
  - Internal dummy read strobe loopbacked from pad
  - SCK clock output loopbacked from pad
  - Flash provided read strobe
- Memory mapped read/write access by AHB Bus
  - AHB RX Buffer implemented to reduce read latency. Total AHB RX Buffer size: 128 \* 64 Bits
  - 16 AHB masters supported with priority for read access
  - 8 flexible and configurable buffers in AHB RX Buffer
  - AHB TX Buffer implemented to buffer all write data from one AHB burst. AHB TX Buffer size: 8 \* 64 Bits
  - All AHB masters share this AHB TX Buffer. No AHB master number limitation for Write Access.
- Software triggered Flash read/write access by IP Bus
  - IP RX FIFO implemented to buffer all read data from External device. FIFO size: 16 \* 64 Bits
  - IP TX FIFO implemented to buffer all Write data to External device. FIFO size: 16 \* 64 Bits
  - DMA support to fill IP TX FIFO
  - DMA support to read IP RX FIFO
  - SCK stopped when reading flash data and IP RX FIFO is full
  - SCK stopped when writing flash data and IP TX FIFO is empty

### **30.2.2 Block diagram**

The block diagram of FlexSPI is indicated in following figure:

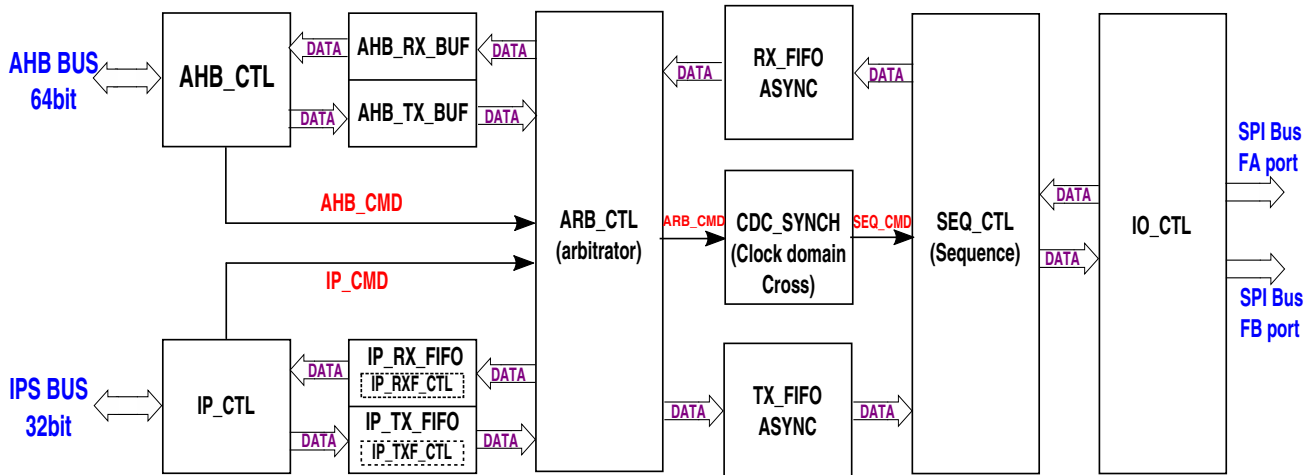

Figure 30-1. FlexSPI block diagram

### 30.2.3 Operation Modes

This section provides information about the modes FlexSPI could be used.

- Module Disable mode

This mode is low power mode in FlexSPI module.

In module disable mode, AHB clock and serial clock domain will be gated off internally, but IPS Bus clock is not gated off. Control and status register read/write access is available except LUT/IP RX FIFO/IP TX FIFO read/write access. Serial Flash Memory access is also not available.

This mode is entered by setting MCR0[MDIS], and exited by clearing MCR0[MDIS].

- Doze mode

This mode is low power mode in SOC system.

When the system requires FlexSPI to enter doze mode and MCR0[DOZEEN] is set, the FlexSPI will wait for all transactions to complete (STS0[ARBIDLE]=0x1) and enter doze mode. In doze mode, the AHB clock and serial clock domain will be gated off internally, but IPS Bus clock is not gated off. Control and status register read/write access is available except LUT/IP RX FIFO/IP TX FIFO read/write access. Serial Flash Memory access is also not available.

This mode is entered by system request, and exited by deasserting this system request.

- Stop mode

This mode is low power mode in SOC system.

When the system requires FlexSPI to enter stop mode , FlexSPI will wait for all transactions to complete (STS0[ARBIDLE]=0x1) and return ACK handshake to system . After ACK handshake returned, the system can gate the AHB Bus clock, IPS Bus clock and serial clock in system level. There is no clock gating action internally.

This mode is entered by system stop mode request. When all command sequences finish, FlexSPI enters stop mode and returns ACK handshake. This mode is exited by deasserting system stop mode request, the ACK handshake is also deasserted immediately.

- Normal mode

In normal mode, all clocks are not gated internally. Normal register access and serial flash memory access is available.

### 30.3 Glossary for FlexSPI module

**Table 30-1. Glossary**

Term	Definition
AHB Command	AHB Command is one or several Serial Flash Memory access command sequences triggered by AHB read/write access to AHB address ranged mapped for Serial Flash Memory.
ASFM_BASE	Base address of AHB address space mapped to Serial Flash Memory.
ARDF_BASE	Base address of AHB address space mapped to IP RX FIFO.
ATDF_BASE	Base address of AHB address space mapped to IP TX FIFO.
Set	Write 1 to register bit to establish logic level one on the bit.
Clear	Write 0 to register bit to establish logic level zero on the bit.
Command Sequence	A command sequence is 4*32 bits sequence code consisting of up to 8 instructions. Command sequence should be programmed in LUT according to Flash command. When a command sequence executed, the chip selection signal becomes asserted. When a command sequence execution finished, the chip selection signal becomes negated.
DDR	Dual data transfer rate for flash access mode Flash receive data on both SCK rise and fall edge and transmit data on both SCK rise and fall edge.
Endianness	Byte Ordering scheme.
Field	Two or more register bits grouped together.
Fill	To add entries to a FIFO by software or hardware.
Instruction Code	16 bits code defining the type of command to be executed on FlexSPI interface.

*Table continues on the next page...*

**Table 30-1. Glossary (continued)**

Term	Definition
IP Command	IP Command is one or several Serial Flash Memory access command sequences triggered by set register bit IPCMD.TRG.
Negated	A signal that is negated is in its inactive state. An active low signal changes from logic level 0 to logic level 1 when negated, and an active high signal changes from logic level 1 to logic level 0.
SDR	Single data transfer rate for flash access mode Flash receive data on SCK rise edge and transmit data on SCK fall edge.
Set	To set a bit or bits means to establish logic level one on the bit or bits.
SFM	Serial Flash Memory
Individual Mode	Access to a single, individual serial flash device at a time.
Parallel Mode	Read/Program Access to two serial flash devices in parallel (Port A and Port B). FlexSPI will split flash program data before transmitting to Flash or merge flash read data before putting into IP RX FIFO or AHB RX Buffer automatically.
Memory Command	Serial access Command for reading/programming/configuring. A memory command may consist one or several command sequences, for each command sequence the Chip selection signal will be asserted and deasserted once.
LUT	Look-up table to preserve command sequence. LUT is programmed by software with command sequences which is used to issue memory commands.

## 30.4 External Signal Description

This section provides the external signal information of the FlexSPI module.

**Table 30-2. External Signal List**

Signal Name	Function	Direction	Description
PCSA1	Peripheral Chip Select Flash A1	O	This signal is the chip select for the serial flash device A1.
PCSA2	Peripheral Chip Select Flash A2	O	This signal is the chip select for the serial flash device A2.
PCSB1	Peripheral Chip Select Flash B1	O	This signal is the chip select for the serial flash device B1.
PCSB2	Peripheral Chip Select Flash B2	O	This signal is the chip select for the serial flash device B2.
SCKA	Serial Clock Flash A	O	This signal is the serial clock output to the serial flash device A.
SCKB	Serial Clock Flash B	O	This signal is the serial clock output to the serial flash device B. <b>NOTE:</b> <ul style="list-style-type: none"> <li>SCKB may be optionally used as SCKA's differential clock output by setting Register Field MCR2.SCKBDIFFOPT=1'b1</li> </ul>
SCK2A	Serial Clock 2 Flash A	O	This signal is the serial clock output 2 to the serial flash device A.

*Table continues on the next page...*

Table 30-2. External Signal List (continued)

Signal Name	Function	Direction	Description
			SCK2A is 90 degree phase shifted clocked from SCKA. Please refer to <a href="#">FlexSPI Input Timing</a> for more detail. <b>NOTE:</b> <ul style="list-style-type: none"> <li>SCK2 feature maybe dropped on SoC level. Please confirm SoC level Pin Mux for more detail.</li> </ul>
SCK2B	Serial Clock 2 Flash B	O	Samilar as SCK2A.
SIOA[7:0]	Serial I/O Flash A	I/O	These signals are the data I/O lines to/from the serial flash device A.
SIOB[7:0]	Serial I/O Flash B	I/O	These signals are the data I/O lines to/from the serial flash device B.
DQSA	Data Strobe signal Flash A	I/O	Data strobe signal for port A. There are three functions for this signal: <ul style="list-style-type: none"> <li>Driven with Read Strobe by external device: Some flash devices provide the Read Strobe signal together with Read data. In this case, this pad may need a <b>pull down</b> resistor if external device drives this pad only when reading flash data.</li> <li>Driven with Latency Information by external device: Certain devices use this pin to indicate the dummy cycles needed (before Program/Read data transfer) such as HyperRAM/HyperFlash.</li> <li>Loopback dummy read strobe: FlexSPI controller provides internal dummy read strobe for flash read data. Higher read frequency can be achieved by looping back this dummy read strobe from pad. This pin can be floated or put some cap loads on board level to compensate SIO/SCK pins load.</li> </ul>
DQSB	Data Strobe signal Flash B	I/O	Similar as DQSA.

## 30.5 Memory Map and register definition

This section includes the FlexSPI module memory map and detailed descriptions of all registers.

### 30.5.1 Register Access

All registers can be accessed with 8-bit, 16-bit, and 32-bit width operations. Never change the setting value of reserved fields in control registers. Changing the value of reserved fields may impact the normal functioning of the controller.

## 30.5.2 FlexSPI register descriptions

### 30.5.2.1 FlexSPI Memory map

FlexSPI base address: 402A\_8000h

Offset	Register	Width (In bits)	Access	Reset value

## 30.5.2.2 Module Control Register 0 (MCR0)

### 30.5.2.2.1 Offset

Register	Offset
MCR0	0h

### 30.5.2.2.2 Diagram

### 30.5.2.2.3 Fields

Field	Function
31-24 AHBGRANTWAIT	<p>Timeout wait cycle for AHB command grant.</p> <p>If AHB Triggered Command is not granted by arbitrator, it will timeout after AHBGRANTTIMEOUT * 1024 AHB Clock cycles. This grant timeout may occur when the pending command sequence is IP triggered and the read/write data size is too large. When an AHB command grant time out occurs, there will be an interrupt generated (INTR[AHBCMDGE]) if this interrupt is enabled (INTEN[AHBCMDGEEN] is set) and AHB command is ignored by arbitrator.</p> <p><b>NOTE:</b> This field is for debug only, please keep default value! It is not allowed to set this field to value 0x0.</p>
23-16 IPGRANTWAIT	<p>Time out wait cycle for IP command grant.</p> <p>If IP Triggered Command is not granted by arbitrator, it will timeout after IPGRANTTIMEOUT * 1024 AHB Clock cycles. This grant timeout maybe occur when pending command sequence is AHB triggered and read/write data size is too large. When IP command grant time out occurs, there will be an interrupt generated (INTR[IPCMDGE]) if this interrupt is enabled (INTEN[IPCMDGEEN] is set 0x1) and IP command is ignored by arbitrator.</p> <p><b>NOTE:</b> This field is for debug only, please keep default value! It is not allowed to set this field to value 0x0.</p>
15 —	Reserved.
14 SCKFREERUNEN	<p>This bit is used to force SCK output free-running. For FPGA applications, external device may use SCK clock as reference clock to its internal PLL. If SCK free-running is enabled, data sampling with loopback clock from SCK pad is not supported (MCR0[RXCLKSRC]=2).</p> <p>0b - Disable. 1b - Enable.</p>
13 COMBINATIONEN	<p>This bit is to support Flash Octal mode access by combining Port A and B Data pins (SIOA[3:0] and SIOB[3:0]).</p> <p><b>NOTE:</b> Combination mode is not supported if Port A and Port B are 8 bit data width. This bit should be set to zero in this case.</p> <p>0b - Disable. 1b - Enable.</p>
12 DOZEEN	<p>Doze mode enable bit</p> <p>0b - Doze mode support disabled. AHB clock and serial clock will not be gated off when there is doze mode request from system. 1b - Doze mode support enabled. AHB clock and serial clock will be gated off when there is doze mode request from system.</p>
11 HSEN	<p>Half Speed Serial Flash access Enable.</p> <p>This bit enables the divide by 2 of the clock to external serial flash devices (SCKA/SCKB) for all commands (for both SDR and DDR mode).</p> <p>0b - Disable divide by 2 of serial flash clock for half speed commands. 1b - Enable divide by 2 of serial flash clock for half speed commands.</p>
10-8 —	Reserved.
7 ATDFEN	<p>Enable AHB bus Write Access to IP TX FIFO.</p> <p>0b - IP TX FIFO should be written by IP Bus. AHB Bus write access to IP TX FIFO memory space will get bus error response.</p>

Table continues on the next page...

## Memory Map and register definition

Field	Function
	1b - IP TX FIFO should be written by AHB Bus. IP Bus write access to IP TX FIFO memory space will be ignored but no bus error response.
6 ARDFEN	Enable AHB bus Read Access to IP RX FIFO. 0b - IP RX FIFO should be read by IP Bus. AHB Bus read access to IP RX FIFO memory space will get bus error response. 1b - IP RX FIFO should be read by AHB Bus. IP Bus read access to IP RX FIFO memory space will always return data zero but no bus error response.
5-4 RXCLKSRC	Sample Clock source selection for Flash Reading Refer <a href="#">RX Clock Source Features</a> for more details 00b - Dummy Read strobe generated by FlexSPI Controller and loopback internally. 01b - Dummy Read strobe generated by FlexSPI Controller and loopback from DQS pad. 10b - Reserved 11b - Flash provided Read strobe and input from DQS pad
3-2 —	Reserved.
1 MDIS	Module Disable When module disabled, AHB/serial clock will be gated off internally to save power. Only register access (except LUT/IP RX FIFO/IP TX FIFO) is allowed.
0 SWRESET	Software Reset This bit is auto-cleared by hardware after software reset done. Configuration registers will not be reset.

### 30.5.2.3 Module Control Register 1 (MCR1)

Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

### 30.5.2.3.3 Fields

Field	Function
31-16 SEQWAIT	Command Sequence Execution will timeout and abort after SEQWAIT * 1024 Serial Root Clock cycles. When sequence execution time out occurs, there will be an interrupt generated (INTR[SEQTIMEOUT]) if this interrupt is enabled (INTEN[SEQTIMEOUTEN] is set 0x1) and AHB command is ignored by arbitrator. <b>NOTE:</b> It is not allowed to set this field to value 0x0.
15-0 AHBBUSWAIT	AHB Read/Write access to Serial Flash Memory space will timeout if not data received from Flash or data not transmitted after AHBBUSWAIT * 1024 ahb clock cycles, AHB Bus will get an error response. When AHB bus time out occurs, there will be an interrupt generated (INTR[AHBBUSTIMEOUT]) if this interrupt is enabled (INTR[AHBBUSTIMEOUT]) is set 0x1) and AHB command is ignored by arbitrator. <b>NOTE:</b> It is not allowed to set this field to value 0x0.

### 30.5.2.4 Module Control Register 2 (MCR2)

#### 30.5.2.4.1 Offset

Register	Offset
MCR2	8h

#### 30.5.2.4.2 Diagram

### 30.5.2.4.3 Fields

Field	Function
31-24 RESUMEWAIT	Wait cycle (in AHB clock cycle) for idle state before suspended command sequence resumed.
23-20 —	Reserved.
19 SCKBDIFFOPT	SCKB pad can be used as SCKA differential clock output (inverted clock to SCKA). In this case, port B flash access is not available. After change the value of this feild, MCR0[SWRESET] should be set. 0b - SCKB pad is used as port B SCK clock output. Port B flash access is available. 1b - SCKB pad is used as port A SCK inverted clock output (Differential clock to SCKA). Port B flash access is not available.
18-17 —	Reserved.
16 —	Reserved.
15 SAMEDEVICEEN	All external devices are same devices (both in types and size) for A1/A2/B1/B2. 0b - In Individual mode, FLSHA1CRx/FLSHA2CRx/FLSHB1CRx/FLSHB2CRx register setting will be applied to Flash A1/A2/B1/B2 seperately. In Parallel mode, FLSHA1CRx register setting will be applied to Flash A1 and B1, FLSHA2CRx register setting will be applied to Flash A2 and B2. FLSHB1CRx/FLSHB2CRx register settings will be ignored. 1b - FLSHA1CR0/FLSHA1CR1/FLSHA1CR2 register settings will be applied to Flash A1/A2/B1/B2. FLSHA2CRx/FLSHB1CRx/FLSHB2CRx will be ignored.
14 CLRLEARNPHASE	The sampling clock phase selection will be reset to phase 0 when this bit is written with 0x1. This bit will be auto-cleared immediately.
13 —	Reserved.
12 —	Reserved.
11 CLRAHBBUOPT	This bit determines whether AHB RX Buffer and AHB TX Buffer will be cleaned automatically when FlexSPI returns STOP mode ACK. Software should set this bit if AHB RX Buffer or AHB TX Buffer will be powered off in STOP mode. Otherwise AHB read access after exiting STOP mode may hit AHB RX Buffer or AHB TX Buffer but their data entries are invalid. 0b - AHB RX/TX Buffer will not be cleaned automatically when FlexSPI return Stop mode ACK. 1b - AHB RX/TX Buffer will be cleaned automatically when FlexSPI return Stop mode ACK.
10-9 —	Reserved.
8-0 —	Reserved.

### 30.5.2.5.3 Fields

Field	Function
31-29 —	Reserved.
28-8 —	Reserved.
7 —	Reserved.
6 READADDROPT	<p>AHB Read Address option bit. This option bit is intend to remove AHB burst start address alignment limitation.</p> <p>When FlexSPI controller is used for FPGA application, there may be requirement that FlexSPI fetchs exactly the byte number as AHB burst. In this case, FPGA device should be designed as non-wordaddressable and this option bit should be set 0.</p> <p>0b - There is AHB read burst start address alignment limitation when flash is accessed in parallel mode or flash is wordaddressable.</p> <p>1b - There is no AHB read burst start address alignment limitation. FlexSPI will fetch more datas than AHB burst required to meet the alignment requirement.</p>
5 PREFETCHEN	<p>AHB Read Prefetch Enable.</p> <p>When AHB read prefetch is enabled, FlexSPI will fetch more flash read data than current AHB burst needed so that the read latency for next AHB read access will be reduced.</p>

Table continues on the next page...

## Memory Map and register definition

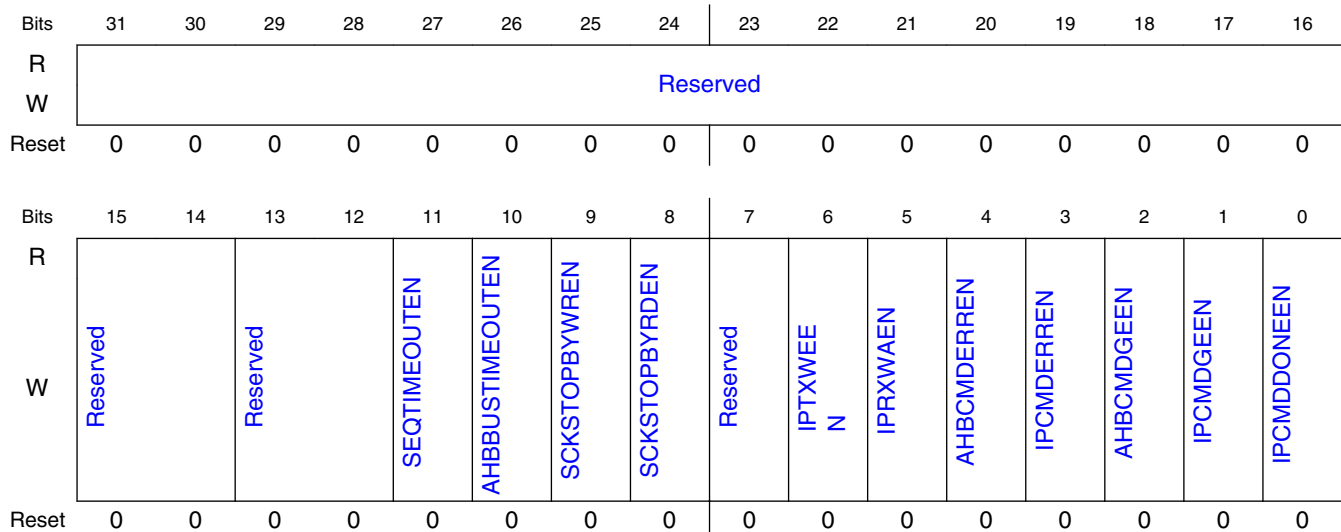

Field	Function
4 BUFFERABLEEN	Enable AHB bus bufferable write access support. This field affects the last beat of AHB write access, refer for more details about AHB bufferable write. 0b - Disabled. For all AHB write access (no matter bufferable or non-bufferable ), FlexSPI will return AHB Bus ready after all data is transmitted to External device and AHB command finished. 1b - Enabled. For AHB bufferable write access, FlexSPI will return AHB Bus ready when the AHB command is granted by arbitrator and will not wait for AHB command finished.
3 CACHABLEEN	Enable AHB bus cachable read access support. 0b - Disabled. When there is AHB bus cachable read access, FlexSPI will not check whether it hit AHB TX Buffer. 1b - Enabled. When there is AHB bus cachable read access, FlexSPI will check whether it hit AHB TX Buffer first.
2-1 —	Reserved.
0 APAREN	Parallel mode enabled for AHB triggered Command (both read and write) . 0b - Flash will be accessed in Individual mode. 1b - Flash will be accessed in Parallel mode.

## 30.5.2.6 Interrupt Enable Register (INTEN)

### 30.5.2.6.1 Offset

Register	Offset
INTEN	10h

### 30.5.2.6.2 Diagram

### 30.5.2.6.3 Fields

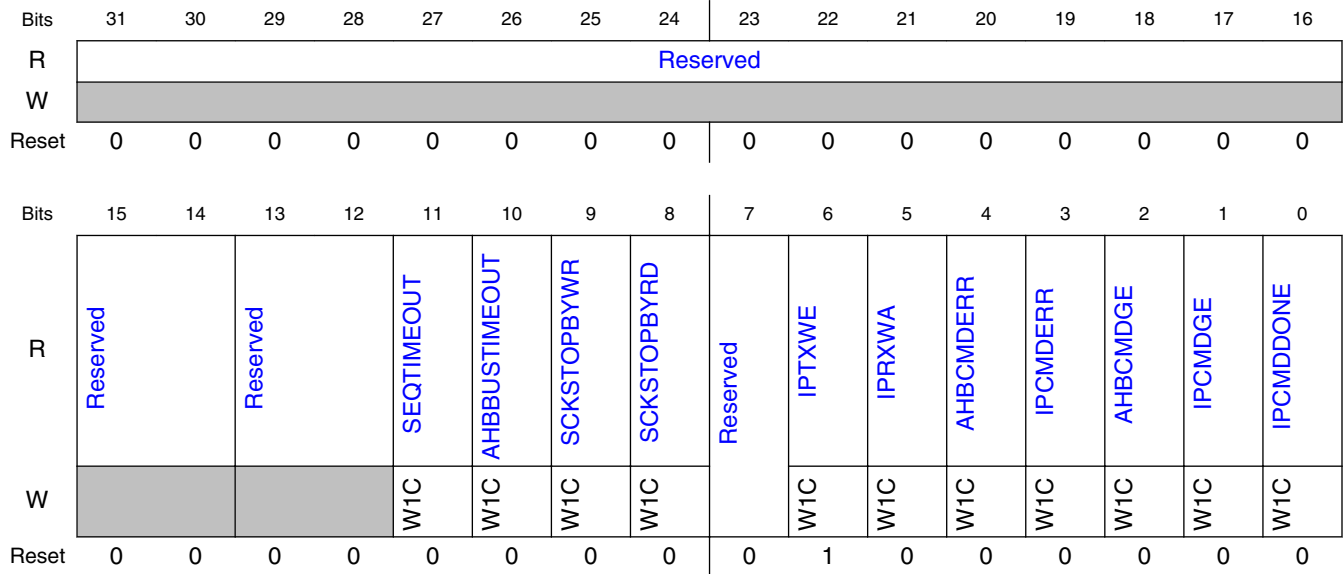

Field	Function
31-14 —	Reserved.
13-12 —	Reserved.
11 SEQTIMEOUTEN	Sequence execution timeout interrupt enable. Refer Interrupts chapter for more details.
10 AHBBUSTIMEOUTEN	AHB Bus timeout interrupt. Refer Interrupts chapter for more details.
9 SCKSTOPBYWREN	SCK is stopped during command sequence because Async TX FIFO empty interrupt enable.
8 SCKSTOPBYRDEN	SCK is stopped during command sequence because Async RX FIFO full interrupt enable.
7 —	Reserved.
6 IPTXWEEN	IP TX FIFO WaterMark empty interrupt enable. IP TX FIFO has no less empty space than WaterMark level interrupt enable.
5 IPRXWAEN	IP RX FIFO WaterMark available interrupt enable. IP RX FIFO has no less valid data than WaterMark level interrupt enable.
4 AHBCMDERREN	AHB triggered Command Sequences Error Detected interrupt enable.
3 IPCMDERREN	IP triggered Command Sequences Error Detected interrupt enable.
2 AHBCMDGEEN	AHB triggered Command Sequences Grant Timeout interrupt enable.
1 IPCMDGEEN	IP triggered Command Sequences Grant Timeout interrupt enable.
0 IPCMDDONEEN	IP triggered Command Sequences Execution finished interrupt enable.

### 30.5.2.7 Interrupt Register (INTR)

### 30.5.2.7.1 Offset

Register	Offset
INTR	14h

### 30.5.2.7.2 Diagram

### 30.5.2.7.3 Fields

Field	Function
31-14 —	Reserved.
13-12 —	Reserved.
11 SEQTIMEOUT	Sequence execution timeout interrupt.
10 AHBBUSTIMEOUT	AHB Bus timeout interrupt.Refer Interrupts chapter for more details.
9 SCKSTOPBYWR	SCK is stopped during command sequence because Async TX FIFO empty interrupt.
8 SCKSTOPBYRD	SCK is stopped during command sequence because Async RX FIFO full interrupt.

Table continues on the next page...

Field	Function
7 —	Reserved.
6 IPTXWE	IP TX FIFO watermark empty interrupt. IP TX FIFO has no less empty space than WaterMark level interrupt.
5 IPRXWA	IP RX FIFO watermark available interrupt. IP RX FIFO has no less valid data than WaterMark level interrupt.
4 AHBCMDERR	AHB triggered Command Sequences Error Detected interrupt. When an error detected for AHB command, this command will be ignored and not executed at all.
3 IPCMDERR	IP triggered Command Sequences Error Detected interrupt. When an error detected for IP command, this command will be ignored and not executed at all.
2 AHBCMDGE	AHB triggered Command Sequences Grant Timeout interrupt.
1 IPCMDGE	IP triggered Command Sequences Grant Timeout interrupt.
0 IPCMDDONE	IP triggered Command Sequences Execution finished interrupt. This interrupt is also generated when there is IPCMDGE or IPCMDERR interrupt generated.

### 30.5.2.8 LUT Key Register (LUTKEY)

#### 30.5.2.8.1 Offset

Register	Offset
LUTKEY	18h

#### 30.5.2.8.2 Function

The LUT Key Register contains the key to lock and unlock LUT. Refer to [Look Up Table](#) for details.

### 30.5.2.8.3 Diagram

### 30.5.2.8.4 Fields

Field	Function
31-0	The Key to lock or unlock LUT.
KEY	The key is 0x5AF05AF0. Read value is always 0x5AF05AF0.

## 30.5.2.9 LUT Control Register (LUTCR)

### 30.5.2.9.1 Offset

Register	Offset
LUTCR	1Ch

### 30.5.2.9.2 Function

The LUT control register is used along with LUTKEY register to lock or unlock LUT. This register has to be written immediately after writing 0x5AF05AF0 to LUTKEY register for the lock or unlock operation to be successful. Refer [Look Up Table](#) for details on locking/unlocking LUT. Setting both the LOCK and UNLOCK bits as "00" or "11" is not allowed.

### 30.5.2.9.3 Diagram

### 30.5.2.9.4 Fields

Field	Function
31-2 —	Reserved.
1 UNLOCK	Unlock LUT
0 LOCK	Lock LUT

## 30.5.2.10 AHB RX Buffer 0 Control Register 0 (AHBRXBUF0CR0)

### 30.5.2.10.1 Offset

Register	Offset
AHBRXBUF0CR0	20h

### 30.5.2.10.2 Diagram

### 30.5.2.10.3 Fields

Field	Function
31 PREFETCHEN	AHB Read Prefetch Enable for current AHB RX Buffer corresponding Master. The prefetch feature is disabled when AHBCR[PREFETCHEN] is set 0. This field allows prefetch disable/enable separately for each master.
30-26 —	Reserved.
25-24 PRIORITY	This priority for AHB Master Read which this AHB RX Buffer is assigned. Refer for more details.
23-20 —	Reserved.
19-16 MSTRID	This AHB RX Buffer is assigned according to AHB Master with ID (MSTR_ID). Please refer to "AHB RX Buffer Management" for AHB RX Buffer allocation.
15-8 —	Reserved.
7-0 BUFSZ	AHB RX Buffer Size in 64 bits.Refer AHB RX Buffer Management for more details.

## 30.5.2.11 AHB RX Buffer 1 Control Register 0 (AHBRXBUF1CR0)

### 30.5.2.11.1 Offset

Register	Offset
AHBRXBUF1CR0	24h

### 30.5.2.11.2 Diagram

### 30.5.2.11.3 Fields

Field	Function
31 PREFETCHEN	AHB Read Prefetch Enable for current AHB RX Buffer corresponding Master. The prefetch feature is disabled when AHBCR[PREFETCHEN] is set 0. This field allows prefetch disable/enable separately for each master.
30-26 —	Reserved.
25-24 PRIORITY	This priority for AHB Master Read which this AHB RX Buffer is assigned. Refer for more details.
23-20 —	Reserved.
19-16 MSTRID	This AHB RX Buffer is assigned according to AHB Master with ID (MSTR_ID). Please refer to "AHB RX Buffer Management" for AHB RX Buffer allocation.
15-8 —	Reserved.
7-0 BUFSZ	AHB RX Buffer Size in 64 bits.Refer AHB RX Buffer Management for more details.

### 30.5.2.12 AHB RX Buffer 2 Control Register 0 (AHBRXBUF2CR0)

### 30.5.2.12.1 Offset

Register	Offset
AHBRXBUF2CR0	28h

### 30.5.2.12.2 Diagram

### 30.5.2.12.3 Fields

Field	Function
31 PREFETCHEN	AHB Read Prefetch Enable for current AHB RX Buffer corresponding Master. The prefetch feature is disabled when AHBCR[PREFETCHEN] is set 0. This field allows prefetch disable/enable separately for each master.
30-26 —	Reserved.
25-24 PRIORITY	This priority for AHB Master Read which this AHB RX Buffer is assigned. Refer for more details.
23-20 —	Reserved.
19-16 MSTRID	This AHB RX Buffer is assigned according to AHB Master with ID (MSTR_ID). Please refer to "AHB RX Buffer Management" for AHB RX Buffer allocation.
15-8 —	Reserved.
7-0 BUFSZ	AHB RX Buffer Size in 64 bits.Refer AHB RX Buffer Management for more details.

### 30.5.2.13 AHB RX Buffer 3 Control Register 0 (AHBRXBUF3CR0)

#### 30.5.2.13.1 Offset

Register	Offset
AHBRXBUF3CR0	2Ch

#### 30.5.2.13.2 Diagram

#### 30.5.2.13.3 Fields

Field	Function
31 PREFETCHEN	AHB Read Prefetch Enable for current AHB RX Buffer corresponding Master. The prefetch feature is disabled when AHBCR[PREFETCHEN] is set 0. This field allows prefetch disable/enable separately for each master.
30-26 —	Reserved.
25-24 PRIORITY	This priority for AHB Master Read which this AHB RX Buffer is assigned. Refer for more details.
23-20 —	Reserved.
19-16 MSTRID	This AHB RX Buffer is assigned according to AHB Master with ID (MSTR_ID). Please refer to "AHB RX Buffer Management" for AHB RX Buffer allocation.
15-8 —	Reserved.
7-0 BUFSZ	AHB RX Buffer Size in 64 bits.Refer AHB RX Buffer Management for more details.

### 30.5.2.14 Flash a Control Register 0 (FLSHA1CR0 - FLSHB2CR0)

#### 30.5.2.14.1 Offset

Register	Offset
FLSHA1CR0	60h
FLSHA2CR0	64h
FLSHB1CR0	68h
FLSHB2CR0	6Ch

#### 30.5.2.14.2 Function

The Flash control register 0 contains Flash size setting. FlexSPI determines which device is accessed with this register setting (Chip Selection).

#### 30.5.2.14.3 Diagram

#### 30.5.2.14.4 Fields

Field	Function
31-23 —	Reserved.
22-0 FLSHSZ	Flash Size in KByte. The max flash size supported for each device is 4 GB. When FLSHSZ setting value is greater than 0x400000, the device flash size would be taken as 4 GB. The max total flash size supported (for all 4 devices) is also 4 GB. If the total flash size is larger than 4 GB, only 4 GB address space is accessible.

### 30.5.2.15 Flash a Control Register 1 (FLSHA1CR1 - FLSHB2CR1)

#### 30.5.2.15.1 Offset

Register	Offset
FLSHA1CR1	70h
FLSHA2CR1	74h
FLSHB1CR1	78h
FLSHB2CR1	7Ch

#### 30.5.2.15.2 Function

The Flash control register 1 contains the setting for FlexSPI to meet Flash device specific timings and Flash internal address space.

#### 30.5.2.15.3 Diagram

#### 30.5.2.15.4 Fields

Field	Function
31-16 CSINTERVAL	<p>This field is used to set the minimum interval between flash device Chip selection deassertion and flash device Chip selection assertion. If external flash has a limitation on the interval between command sequences, this field should be set accordingly. If there is no limitation, set this field with value 0x0.</p> <p>When CSINTERVALUNIT is 0x0, the chip selection invalid interval is: CSINTERVAL * 1 serial clock cycle; When CSINTERVALUNIT is 0x1, the chip selection invalid interval is: CSINTERVAL * 256 serial clock cycle.</p>

Table continues on the next page...

## Memory Map and register definition

Field	Function
	<b>NOTE:</b> The chip selection interval is 2 cycle at least even if CSINTERVAL is less than 2.
15 CSINTERVAL UNIT	CS interval unit 0b - The CS interval unit is 1 serial clock cycle 1b - The CS interval unit is 256 serial clock cycle
14-11 CAS	Column Address Size. When external flash has separate address field for row address and column address, this field should be set to flash column address bit width. FlexSPI will automatically split flash mapped address to Row address and Column address according to CAS field and WA field setting. This bit should be set to 0x0 when external Flash don't support column address. FlexSPI will transmit all flash address bits as Row address. For flash address mapping, please refer to <a href="#">Flash memory map</a> for more detail.
10 WA	Word Addressable. This bit should be set when external Flash is word addressable. If Flash is word addressable, it should be access in terms of 16 bits. At this time, FlexSPI will not transmit Flash address bit 0 to external Flash. For flash address mapping, please refer to <a href="#">Flash memory map</a> for more detail.
9-5 TCSH	Serial Flash CS Hold time. This field is used to meet flash TCSH timing requirement. Serial flash CS Hold time promised by FlexSPI is: TCSH in serial root clock cycles (for both SDR and DDR mode). Please refer to <a href="#">FlexSPI Input Timing</a> for more detail.
4-0 TCSS	Serial Flash CS setup time. This field is used to meet flash TCSS timing requirement. Serial flash CS Setup time promised by FlexSPI is: (TCSS + 1/2) serial root clock cycles (for both SDR and DDR mode). Please refer to <a href="#">FlexSPI Input Timing</a> for more detail.

## 30.5.2.16 Flash a Control Register 2 (FLSHA1CR2 - FLSHB2CR2)

### 30.5.2.16.1 Offset

Register	Offset
FLSHA1CR2	80h
FLSHA2CR2	84h
FLSHB1CR2	88h
FLSHB2CR2	8Ch

### 30.5.2.16.2 Function

Flash Control Register 2 contains setting field for AHB Bus access configuration. If the 4 external device are in different types, AHB read/write command may use different command sequences and AHB bus ready wait time may be also different.

### 30.5.2.16.3 Diagram

### 30.5.2.16.4 Fields

Field	Function
31 CLRINSTRPTR	Clear the instruction pointer which is internally saved pointer by JMP_ON_CS. Refer Programmable Sequence Engine for details. This field is used for AHB Read access to external Flash supporting XIP (Execute-In-Place) mode.
30-28 AWRWAITUNIT	AWRWAIT unit 000b - The AWRWAIT unit is 2 ahb clock cycle 001b - The AWRWAIT unit is 8 ahb clock cycle 010b - The AWRWAIT unit is 32 ahb clock cycle 011b - The AWRWAIT unit is 128 ahb clock cycle 100b - The AWRWAIT unit is 512 ahb clock cycle 101b - The AWRWAIT unit is 2048 ahb clock cycle 110b - The AWRWAIT unit is 8192 ahb clock cycle 111b - The AWRWAIT unit is 32768 ahb clock cycle
27-16 AWRWAIT	For certain devices (such as FPGA), it need some time to write data into internal memory after the command sequences finished on FlexSPI interface. If another Read command sequence comes before previous programming finished internally, the read data may be wrong. This field is used to hold AHB Bus ready for AHB write access to wait the programming finished in external device. Then there will be no AHB read command triggered before the programming finished in external device. The Wait cycle between AHB triggered command sequences finished on FlexSPI interface and AHB return Bus ready: AWRWAIT * AWRWAITUNIT
15-13 AWRSEQNUM	Sequence Number for AHB Write triggered Command. For certain flash devies (E.g HyperFlash/HyperRam/Serial NAND flash), a Flash programming access is done by several command sequences. AHB write Command will trigger (AWRSEQNUM+1) command sequences to external flash every time. FlexSPI execute the sequences in LUT incremently.

Table continues on the next page...

## Memory Map and register definition

Field	Function
	<b>NOTE:</b> <ul style="list-style-type: none"> <li>• Software should make sure the last sequence index never exceed LUT sequence numbers: <math>AWRSEQID+AWRSEQNUM &lt; 16</math></li> <li>• Software need to make sure field AWRSEQNUM and LUT is configured correctly according to external device spec. FlexSPI don't check the sequence and just execute them one by one.</li> </ul>
12 —	Reserved.
11-8 AWRSEQID	Sequence Index for AHB Write triggered Command.
7-5 ARDSEQNUM	Sequence Number for AHB Read triggered Command in LUT. For certain flash devies (E.g HyperFlash/HyperRam/Serial NAND flash), a Flash reading access is done by several command sequences. AHB read Command will trigger (ARDSEQNUM+1) command sequences to external flash every time. FlexSPI execute the sequences in LUT incremently. <b>NOTE:</b> <ul style="list-style-type: none"> <li>• Software should make sure the last sequence index never exceed LUT sequence numbers: <math>ARDSEQID+ARDSEQNUM \leq 16</math></li> <li>• Software need to make sure field ARDSEQNUM and LUT is configured correctly according to external device spec. FlexSPI don't check the sequence and just execute them one by one.</li> </ul>
4 —	Reserved.
3-0 ARDSEQID	Sequence Index for AHB Read triggered Command in LUT.

### 30.5.2.17 Flash Control Register 4 (FLSHCR4)

#### 30.5.2.17.1 Offset

Register	Offset
FLSHCR4	94h

#### 30.5.2.17.2 Function

The flash control register 4 provide the configuration for all external devices.

### 30.5.2.17.3 Diagram

### 30.5.2.17.4 Fields

Field	Function
31-5 —	Reserved.
4 —	Reserved.
3 WMENB	Write mask enable bit for flash device on port B. When write mask function is needed for memory device on port B, this bit must be set. 0b - Write mask is disabled, DQS(RWDS) pin will be un-driven when writing to external device. 1b - Write mask is enabled, DQS(RWDS) pin will be driven by FlexSPI as write mask output when writing to external device.
2 WMENA	Write mask enable bit for flash device on port A. When write mask function is needed for memory device on port A, this bit must be set. 0b - Write mask is disabled, DQS(RWDS) pin will be un-driven when writing to external device. 1b - Write mask is enabled, DQS(RWDS) pin will be driven by FlexSPI as write mask output when writing to external device.
1 —	Reserved.
0 WMOPT1	Write mask option bit 1. This option bit could be used to remove AHB write burst start address alignment limitation. 0b - DQS pin will be used as Write Mask when writing to external device. There is no limitation on AHB write burst start address alignment when flash is accessed in individual mode. 1b - DQS pin will not be used as Write Mask when writing to external device. There is limitation on AHB write burst start address alignment when flash is accessed in individual mode.

### 30.5.2.18 IP Control Register 0 (IPCR0)

### 30.5.2.18.1 Offset

Register	Offset
IPCR0	A0h

### 30.5.2.18.2 Function

The IP control registers provide all the configuration required for IP commands. This register provides the flash start address to be accessed for IP command. FlexSPI will determine the chip select automatically according to this start address.

**NOTE**

- It's not allowed to issue IP command crossing Flash device boundaries. Otherwise there will be IPCMDERR interrupt generated.
- This register should be set before IP command triggered.
- This register setting should not be changed while an IP command is in progress.

### 30.5.2.18.3 Diagram

### 30.5.2.18.4 Fields

Field	Function
31-0 SFAR	Serial Flash Address for IP command.

## 30.5.2.19 IP Control Register 1 (IPCR1)

### 30.5.2.19.1 Offset

Register	Offset
IPCR1	A4h

### 30.5.2.19.2 Function

The IP control registers provide all the configuration required for IP command. This register provides the flash read/program data size, sequence index in LUT, sequence number and individual/parallel mode setting for IP command.

#### NOTE

- This register should be before IP command triggered.
- This register setting should not be changed before IP command finished.

### 30.5.2.19.3 Diagram

### 30.5.2.19.4 Fields

Field	Function
31 IPAREN	Parallel mode Enabled for IP command. 0b - Flash will be accessed in Individual mode. 1b - Flash will be accessed in Parallel mode.
30-27 —	Reserved.
26-24	Sequence Number for IP command: ISEQNUM+1.

*Table continues on the next page...*

## Memory Map and register definition

Field	Function
ISEQNUM	
23-20 —	Reserved.
19-16 ISEQID	Sequence Index in LUT for IP command.
15-0 IDATSZ	Flash Read/Program Data Size (in Bytes) for IP command.

### 30.5.2.20 IP Command Register (IPCMD)

#### 30.5.2.20.1 Offset

Register	Offset
IPCMD	B0h

#### 30.5.2.20.2 Function

This register is used to trigger a IP command to access external flash device. IP command will be executed on FlexSPI interface after granted by arbitrator.

#### 30.5.2.20.3 Diagram

#### 30.5.2.20.4 Fields

Field	Function
31-1	Reserved.

Table continues on the next page...

Field	Function
—	
0 TRG	Setting this bit will trigger an IP Command. <b>NOTE:</b> <ul style="list-style-type: none"> <li>It's not allowed to trigger another IP command before previous IP command is finished on FlexSPI interface. Software need to poll register bit <code>INTR_IP_CMD_DONE</code> or wait for this interrupt in order to wait for IP command finished.</li> </ul>

### 30.5.2.21 IP RX FIFO Control Register (IPRXFCR)

#### 30.5.2.21.1 Offset

Register	Offset
IPRXFCR	B8h

#### 30.5.2.21.2 Function

This register provides the configuration fields for IP RX FIFO management.

#### 30.5.2.21.3 Diagram

#### 30.5.2.21.4 Fields

Field	Function
31-6 —	Reserved.
5-2	Watermark level is $(RXWMRK+1)*64$ Bits.

*Table continues on the next page...*

## Memory Map and register definition

Field	Function
RXWMRK	Interrupt register bit IPRXWA is set when filling level in IP RX FIFO is no less than Watermark level by FlexSPI. There will be a DMA request when the filling level is no less than Watermark level and DMA read is enabled (register bit <b>RXDMAEN</b> is set). There will be an IPRXWA (IP RX FIFO watermark available) interrupt generated when the filling level is no less than Watermark level and IPRXWA interrupt is enabled (register bit <b>INTEN_IPRXWA</b> is set).  <b>NOTE:</b> After write-1-clear to INTR[IPRXWA], read address should be rolled back to start address (memory mapped). If IP RX FIFO is read by IP bus, the read address to IP RX FIFO should roll back to RFDR0; if IP RX FIFO is read by AHB bus, the read address to IP RX FIFO should roll back to ARDF_BASE.
1 RXDMAEN	IP RX FIFO reading by DMA enabled. 0b - IP RX FIFO would be read by processor. 1b - IP RX FIFO would be read by DMA.
0 CLRIPRXF	Clear all valid data entries in IP RX FIFO. The read/write pointers in IP RX FIFO will be reset.

## 30.5.2.22 IP TX FIFO Control Register (IPTXFCR)

### 30.5.2.22.1 Offset

Register	Offset
IPTXFCR	BCh

### 30.5.2.22.2 Function

This register provides the configuration fields for IP TX FIFO management.

### 30.5.2.22.3 Diagram

### 30.5.2.22.4 Fields

Field	Function
31-6 —	Reserved.
5-2 TXWMRK	<p>Watermark level is <math>(TXWMRK+1)*64</math> Bits.</p> <p>Interrupt register bit IPTXWE is set when empty level in IP TX FIFO is no less than Watermark level by FlexSPI. There will be a DMA request when empty level is no less than Watermark level and DMA filling is enable (register bit TXDMAEN is set). There will be an IPTXWE (IP TX FIFO Watermark Empty) interrupt generated when empty level is no less than Watermark level and IPTXWE interrupt is enable (register bit INTEN_IPTXWE is set).</p> <p><b>NOTE:</b></p> <ul style="list-style-type: none"> <li>• The watermark level should be no more than the write window.</li> <li>• The watermark level should be no more than IP TX FIFO size.</li> <li>• The write address to IP RX FIFO should roll back to the start address of write window after pushing IP TX FIFO by writing-one-clear to INTR[IPTXWE].</li> </ul>
1 TXDMAEN	<p>IP TX FIFO filling by DMA enabled.</p> <p>0b - IP TX FIFO would be filled by processor. 1b - IP TX FIFO would be filled by DMA.</p>
0 CLRIPTXF	<p>Clear all valid data entries in IP TX FIFO.</p> <p>The read/write pointers in IP TX FIFO will be reset.</p>

### 30.5.2.23 DLL Control Register 0 (DLLACR - DLLBCR)

#### 30.5.2.23.1 Offset

Register	Offset
DLLACR	C0h
DLLBCR	C4h

#### 30.5.2.23.2 Function

This register provides the configuration fields for Flash A/B sample clock DLL.

### 30.5.2.23.3 Diagram

### 30.5.2.23.4 Fields

Field	Function
31-15 —	Reserved.
14-9 OVRDVAL	Slave clock delay line delay cell number selection override value. When OVRDEN is set 0x1, the delay cell number in DLL is OVRDVAL+1.
8 OVRDEN	Slave clock delay line delay cell number selection override enable.
7 —	Reserved.
6-3 SLVDLYTARGET	The delay target for slave delay line is: ((SLVDLYTARGET+1) * 1/32 * clock cycle of reference clock (serial clock).
2 —	Reserved.
1 DLLRESET	Software could force a reset on DLL by setting this field to 0x1. This will cause the DLL to lose lock and re-calibrate to detect an ref_clock half period phase shift. The reset action is edge triggered, so software need to clear this bit after set this bit (no delay limitation).
0 DLLLEN	DLL calibration enable. When this bit is cleared, DLL calibration is disabled and the delay cell number in slave delay line is always 1. Please note that SLV delay line is overridden when OVRDEN bit is set and this bit field setting is ignored.

## 30.5.2.24 Status Register 0 (STS0)

### 30.5.2.24.1 Offset

Register	Offset
STS0	E0h

### 30.5.2.24.2 Diagram

### 30.5.2.24.3 Fields

Field	Function
31-12 —	Reserved.
11-8 —	Reserved.
7-4 —	Reserved.
3-2 ARBCMDSRC	This status field indicates the trigger source of current command sequence granted by arbitrator. This field value is meaningless when ARB_CTL is not busy (STS0[ARBIDLE]=0x1). 00b - Triggered by AHB read command (triggered by AHB read). 01b - Triggered by AHB write command (triggered by AHB Write). 10b - Triggered by IP command (triggered by setting register bit IPCMD.TRG). 11b - Triggered by suspended command (resumed).
1 ARBIDLE	This status bit indicates the state machine in ARB_CTL is busy and there is command sequence granted by arbitrator and not finished yet on FlexSPI interface. When ARB_CTL state (ARBIDLE=0x1) is idle, there will be no transaction on FlexSPI interface also (SEQIDLE=0x1). So this bit should be polled to wait for FlexSPI controller become idle instead of SEQIDLE.

Table continues on the next page...

## Memory Map and register definition

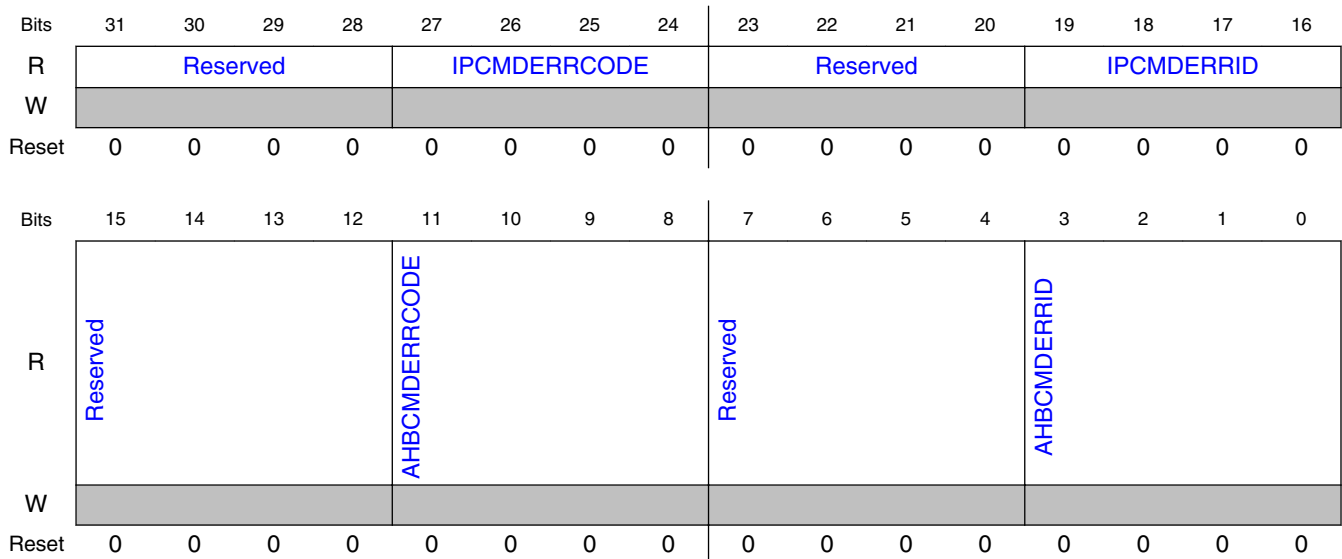

Field	Function
0 SEQIDLE	This status bit indicates the state machine in SEQ_CTL is idle and there is command sequence executing on FlexSPI interface.

### 30.5.2.25 Status Register 1 (STS1)

#### 30.5.2.25.1 Offset

Register	Offset
STS1	E4h

#### 30.5.2.25.2 Diagram

#### 30.5.2.25.3 Fields

Field	Function
31-28 —	Reserved.
27-24 IPCMDERRCODE	Indicates the Error Code when IP command Error detected. This field will be cleared when INTR[IPCMDERR] is write-1-clear(w1c). 0000b - No error. 0010b - IP command with JMP_ON_CS instruction used in the sequence.

Table continues on the next page...

Field	Function
	0011b - There is unknown instruction opcode in the sequence. 0100b - Instruction DUMMY_SDR/DUMMY_RWDS_SDR used in DDR sequence. 0101b - Instruction DUMMY_DDR/DUMMY_RWDS_DDR used in SDR sequence. 0110b - Flash access start address exceed the whole flash address range (A1/A2/B1/B2). 1110b - Sequence execution timeout. 1111b - Flash boundary crossed.
23-20 —	Reserved.
19-16 IPCMDERRID	Indicates the sequence Index when IP command error detected. This field will be cleared when INTR[IPCMDERR] is write-1-clear(w1c).
15-12 —	Reserved.
11-8 AHBCMDERRC ODE	Indicates the Error Code when AHB command Error detected. This field will be cleared when INTR[AHBCMDERR] is write-1-clear(w1c). 0000b - No error. 0010b - AHB Write command with JMP_ON_CS instruction used in the sequence. 0011b - There is unknown instruction opcode in the sequence. 0100b - Instruction DUMMY_SDR/DUMMY_RWDS_SDR used in DDR sequence. 0101b - Instruction DUMMY_DDR/DUMMY_RWDS_DDR used in SDR sequence. 1110b - Sequence execution timeout.
7-4 —	Reserved.
3-0 AHBCMDERRID	Indicates the sequence index when an AHB command error is detected. This field will be cleared when INTR[AHBCMDERR] is write-1-clear(w1c).

### 30.5.2.26 Status Register 2 (STS2)

#### 30.5.2.26.1 Offset

Register	Offset
STS2	E8h

#### 30.5.2.26.2 Function

This register indicates the status of Flash A and B sample clock DLLs.

### 30.5.2.26.3 Diagram

### 30.5.2.26.4 Fields

Field	Function
31-30 —	Reserved.
29-24 BREFSEL	Flash B sample clock reference delay line delay cell number selection.
23-18 BSLVSEL	Flash B sample clock slave delay line delay cell number selection.
17 BREFLOCK	Flash B sample clock reference delay line locked.
16 BSLVLOCK	Flash B sample clock slave delay line locked.
15-14 —	Reserved.
13-8 AREFSEL	Flash A sample clock reference delay line delay cell number selection.
7-2 ASLVSEL	Flash A sample clock slave delay line delay cell number selection .
1 AREFLOCK	Flash A sample clock reference delay line locked.
0 ASLVLOCK	Flash A sample clock slave delay line locked.

## 30.5.2.27 AHB Suspend Status Register (AHBSPNDSTS)

### 30.5.2.27.1 Offset

Register	Offset
AHBSPPNDSTS	ECh

### 30.5.2.27.2 Function

Indicates the status of Suspended AHB Read Prefetch command sequence. When there is IP/AHB command triggered and arbitrator is processing an AHB Read sequence (prefetching more data not for current AHB burst), the prefetch sequence will be suspended and may be resumed when there is no transaction on FlexSPI any more. FlexSPI saves only one AHB prefetch sequence. When a new prefetch sequence is suspended with an active sequence suspended already, previous suspended sequence will be removed and never resumed. Refer [Command Abort and Suspend](#) for more details.

### 30.5.2.27.3 Diagram

### 30.5.2.27.4 Fields

Field	Function
31-16 DATLFT	Left Data size for suspended command sequence (in byte).
15-4	Reserved.

Table continues on the next page...

## Memory Map and register definition

Field	Function
—	
3-1 BUFID	AHB RX BUF ID for suspended command sequence.
0 ACTIVE	Indicates if an AHB read prefetch command sequence has been suspended.

### 30.5.2.28 IP RX FIFO Status Register (IPRXFSTS)

#### 30.5.2.28.1 Offset

Register	Offset
IPRXFSTS	F0h

#### 30.5.2.28.2 Function

This status register indicates the status of IP RX FIFO.

#### 30.5.2.28.3 Diagram

#### 30.5.2.28.4 Fields

Field	Function
31-16 RDCNTR	Total Read Data Counter: RDCNTR * 64 Bits.
15-8 —	Reserved.

Table continues on the next page...

Field	Function
7-0	Fill level of IP RX FIFO.
FILL	Valid Data entries in IP RX FIFO is: FILL * 64 Bits.

### 30.5.2.29 IP TX FIFO Status Register (IPTXFSTS)

#### 30.5.2.29.1 Offset

Register	Offset
IPTXFSTS	F4h

#### 30.5.2.29.2 Function

This status register indicates the status of IP TX FIFO.

#### 30.5.2.29.3 Diagram

#### 30.5.2.29.4 Fields

Field	Function
31-16 WRCNTR	Total Write Data Counter: WRCNTR * 64 Bits.
15-8 —	Reserved.
7-0 FILL	Fill level of IP TX FIFO. Valid Data entries in IP TX FIFO is: FILL * 64 Bits.

### 30.5.2.30 IP RX FIFO Data Register a (RFDR0 - RFDR31)

#### 30.5.2.30.1 Offset

For a = 0 to 31:

Register	Offset
RFDRa	100h + (a × 4h)

#### 30.5.2.30.2 Function

These registers provide read access to IP RX FIFO by IPS bus. The read value is unknown for read access to invalid entries in IP RX FIFO.

#### 30.5.2.30.3 Diagram

#### 30.5.2.30.4 Fields

Field	Function
31-0 RXDATA	RX Data

### 30.5.2.31 IP TX FIFO Data Register a (TFDR0 - TFDR31)

### 30.5.2.31.1 Offset

For a = 0 to 31:

Register	Offset
TFDRa	180h + (a × 4h)

### 30.5.2.31.2 Function

These registers provide write access to IP TX FIFO by IPS bus.

### 30.5.2.31.3 Diagram

### 30.5.2.31.4 Fields

Field	Function
31-0 TXDATA	TX Data

## 30.5.2.32 LUT a (LUT0 - LUT63)

### 30.5.2.32.1 Offset

For a = 0 to 63:

Register	Offset
LUTa	200h + (a × 4h)

### 30.5.2.32.2 Function

The LUT is a look-up-table for command sequences. Software should set the sequence index before triggering an IP command or AHB command. FlexSPI will fetch the command sequence from LUT when IP/AHB command triggered. There are 16 command sequences in LUT. Refer [Look Up Table](#) for more details.

#### NOTE

LUT is implemented as memory, so the reset value is unknown.

### 30.5.2.32.3 Diagram

### 30.5.2.32.4 Fields

Field	Function
31-26 OPCODE1	OPCODE1
25-24 NUM_PADS1	NUM_PADS1
23-16 OPERAND1	OPERAND1
15-10 OPCODE0	OPCODE
9-8 NUM_PADS0	NUM_PADS0
7-0 OPERAND0	OPERAND0

Field	Function
OPERAND0	

## 30.6 AHB Memory Map definition

This section describes FlexSPI module AHB memory map in detail.

### 30.6.1 AHB Memory Map for Serial Flash memory access

Following address range is mapped for AHB read/write access to serial flash memory: 0x60000000 - 0x80000000.

AHB Bus feature supported for Serial Flash memory reading:

- Cachable and Non-Cachable access
- Prefetch Enable/Disable
- Burst size: 8/16/32/64 bits
- All burst type: SINGLE/INCR/WRAP4/INCR4/WRAP8/INCR8/WRAP16/INCR16

AHB Bus feature for Serial Flash memory writing:

- Bufferable and Non-Bufferable access
- Burst size: 8/16/32/64 bits
- All burst type: SINGLE/INCR/WRAP4/INCR4/WRAP8/INCR8/WRAP16/INCR16

Refer [Flash access by AHB Command](#) for more details about AHB access to Serial Flash memory.

### 30.6.2 AHB Memory Map for IP RX FIFO read access

Following address range is mapped for AHB read access to IP RX FIFO: 0x7FC00000 - 0x7FC00080.

AHB Bus feature supported for IP RX FIFO reading:

- Burst size: 8/16/32/64 bits
- All burst type: SINGLE/INCR/WRAP4/INCR4/WRAP8/INCR8/WRAP16/INCR16

Refer [Reading Data from IP RX FIFO](#) for more details about IP RX FIFO reading.

### 30.6.3 AHB Memory Map for IP TX FIFO write access

Following address range is mapped for AHB write access to IP TX FIFO: 0x7F800000 - 0x7F800080.

AHB Bus feature supported for IP TX FIFO writing:

- Burst size: 8/16/32/64 bits
- All burst type: SINGLE/INCR/WRAP4/INCR4/WRAP8/INCR8/WRAP16/INCR16

Refer [Filling Data to IP TX FIFO](#) for more details about IP TX FIFO filling.

## 30.7 Functional description

The following sections describe functional details of the FlexSPI module.

### 30.7.1 Clocks

This section describes clocks and special clocking requirements of the FlexSPI module.

**Table 30-3. Clock Usage**

Clock Name	Description	Comment
serial clock root (ipg_clk_sfck)	Root clock for Serial domain	-
ahb clock (HCLK)	AHB Bus clock	-
ipg clock (ipg_clk)	IPS Bus clock	-
SCK	Output clock on SCK pin	Half clock frequency of serial clock root in DDR mode, and same frequency as serial clock root in SDR mode. Clock output toggles during the whole flash access sequence.
SCK2	Output clock on SCK2 pin	90 degree phase shifted from SCK in DDR mode. No clock output in SDR mode (Clock gated).
DQS_OUT	Dummy Read Strobe output	Same frequency as SCK. Clock output toggles during READ/LEARN instructions.
DQS_IN	Sample clock for RX Data	Same frequency as SCK. Sample clock comes from loopbacked dummy read strobe, loopbacked SCK or Flash provided read strobe.

## 30.7.2 Interrupts

This section describes all the interrupts that the FlexSPI module generates.

- **IP command done interrupt**

When IP command is finished, there will be interrupt generated if INTEN[IPCMDDONEEN] is set to 0x1.

- **IP command grant error interrupt**

When IP command grant timeout (not grant after MCR0[IPGRANTWAIT] \* 1024 ahb clock cycles), there will be interrupt generated if INTEN[IPCMDGEEEN] is set to 0x1.

- **AHB command grant error interrupt**

When AHB command grant timeout (not grant after MCR0[AHBGRANTWAIT] \* 1024 ahb clock cycles), there will be interrupt generated if INTEN[AHBCMDGEEEN] is set to 0x1.

- **IP command error interrupt**

When there is command check error or command execution error for IP command, there will be interrupt generated if INTEN[IPCMDERREN] is set to 0x1. Refer [Overview of Error Flags](#) for more details.

- **AHB command error interrupt**

When there is command check error or command execution error for AHB command, there will be interrupt generated if INTEN[AHBCMDERREN] is set to 0x1. Refer [Overview of Error Flags](#) for more details.

- **IP RX FIFO watermark available interrupt**

When the fill level of IP RX FIFO is no less than watermark level (IPRXFCR[RXWMRK]), there will be interrupt generated if INTEN[IPRXWAEN] is set to 0x1.

- **IP TX FIFO watermark exceed interrupt**

When the empty level of IP TX FIFO is no less than watermark level (IPTXFCR[TXWMRK]), there will be interrupt generated if INTEN[IPRXWAEN] is set to 0x1.

- **Sequence execution timeout interrupt**

When a sequence execution time exceeds the timeout wait time (MCR1[SEQWAIT]), an interrupt will be generated if INTEN[SEQTIMEOUTEN] is set to 0x1. For example, the following Flash read command sequence will last about 8000000 cycle (in serial root clock). If SEQWAIT is set 0xFFFF, there will be sequence timeout interrupt generated.

- Triggered by IP command
  - Flash read data size is 0x1000000 bytes
  - Flash accessed in Single mode and SDR mode,
- **AHB Bus timeout interrupt**

When AHB bus response timeout, there will be interrupt generated if INTEN[AHBBUSTIMEOUTEN] is set to 0x1. A typical case is AHB read sequence is not configured properly in LUT (such as without READ instruction). There will never be data read from external device, then FlexSPI will never hit the read data in AHB RX Buffers for AHB Read command.

- **SCK stopped by write command interrupt**

When IP TX FIFO is empty during write command sequence execution, FlexSPI will stop SCK output clock toggling and wait for write data filling. At this time, this interrupt is generated if enabled by INTEN register.

- **SCK stopped by read command interrupt**

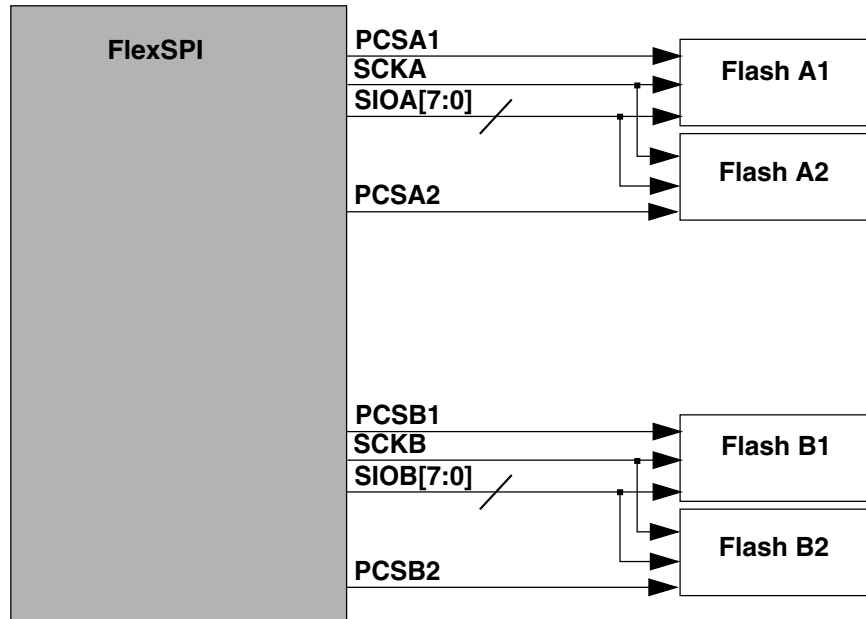

When IP RX FIFO is full during read command sequence execution, FlexSPI will stop SCK output clock toggling and wait for read data read out from IP RX FIFO. At this time, this interrupt is generated if enabled by INTEN register.

### 30.7.3 Flash Connection

There are two Octal SPI interface ports (A port and B port), both of them support octal Flash operation. Each port supports 2 flash devices by providing 2 chip select outputs. So FlexSPI support 4 device at most.

The connection diagram with 4 devices is as following:

**Figure 30-2. Flash connection diagram with four devices**

#### NOTE

- Flash A1 and A2 could be two flash chip package or two flash die on the same package. There is no difference to FlexSPI. Same for Flash B1 and B2
- Flash A1 and B1 could be accessed parallelly in parallel mode. FlexSPI will merge/split the flash read/program data automatically. Same for A2 and B2.
- In parallel mode, A1 and A2 could not be accessed at the same time. Same for B1 and B2.
- In individual mode, A1, A2, B1 and B2 could not be accessed at the same time. But these four device could be accessed seperately.

There is a combination mode to provide octal flash support by combining A port (SIOA[3:0]) and B port (SIOB[3:0]) together. The connection diagram for this combination mode is as following:

Figure 30-3. Flash connection diagram with combination mode

### 30.7.4 Flash Access mode

This section describes flash access mode.

#### 30.7.4.1 SPI clock mode

FlexSPI support only SPI clock mode 0: Clock polarity (CPOL)=0 and Clock Phase (CPHA)=0. SCK will stay at logic low state when SPI bus is idle.

#### 30.7.4.2 Flash Individual mode and Parallel mode

In individual mode, Flash read/write data is received/transmit on port A or port B.

In parallel mode, Flash read/write data is received/transmit on port A and B port parallelly. FlexSPI will merge/split the flash read/program data automatically. Please note that only read/program data is merged/split (READ/WRITE instruction). For other instructions (such as Command/Address/Mode/Data size), same command code/address/mode bits/data size information will be transmit to port A and port B device. For more detail, please refer to [Instruction execution on SPI interface](#).

Individual mode and parallel mode is determined statically by register field IPCR1[IPAREN] (for IP command) or AHBCR[APAREN] (for AHB command).

### 30.7.4.3 SDR mode and DDR mode

In SDR (Single Data transfer Rate) mode, Flash receives data on SCK rise edge and transmit data on SCK fall edge..

In DDR (Dual Data transfer Rate) mode, Flash receives data on both SCK rise and fall edges and transmit data on both SCK rise and fall edges.

SDR and DDR mode is determined by instruction (opcode) in LUT sequence dynamically. There is no static configuration register field setting for SDR and DDR mode. For more details about input and output timing, refer [FlexSPI Input Timing](#) and [FlexSPI Output Timing](#).

### 30.7.4.4 Single, Dual, Quad, Octal mode

In Single mode, flash transmit/receive data on 1 Data pin (SIO0 for transmitting, SIO1 for receiving).

In Dual mode, flash transmit/receive data on 2 Data pin (SIO0~SIO1 for both transmitting and receiving).

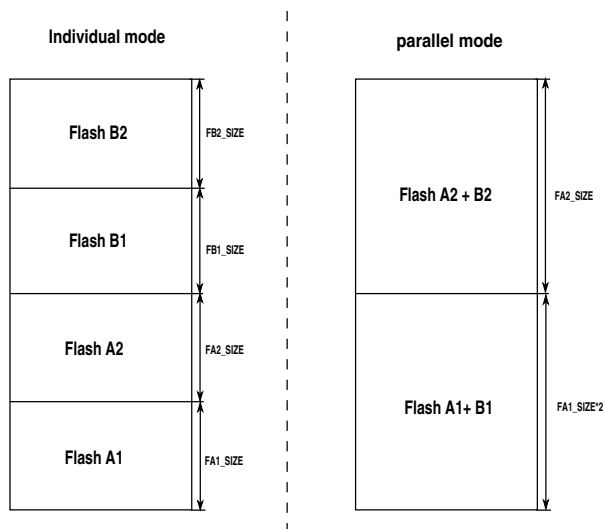

In Quad mode, flash transmit/receive data on 4 Data pin (SIO0~SIO3 for both transmitting and receiving).

In Octal mode, flash transmit/receive data on 8 Data pin (SIO0~SIO7 for both transmitting and receiving).

Single, Dual, Quad and Octal mode is determined by instruction (num\_pads) in LUT sequence dynamically. There is no static configuration register field setting for Single, Dual, Quad and Octal mode.

## 30.7.5 Flash memory map

Flash memory map in individual and parallel mode is as following:

**Figure 30-4. Flash memory map in individual and parallel mode**

Flash memory map in individual mode:

- Flash A1 address range:  $0x00000000 \sim FA1\_SIZE$
- Flash A2 address range:  $FA1\_SIZE \sim (FA1\_SIZE + FA2\_SIZE)$
- Flash B1 address range:  $(FA1\_SIZE + FA2\_SIZE) \sim (FA1\_SIZE + FA2\_SIZE + FB1\_SIZE)$
- Flash B2 address range:  $FA1\_SIZE + FA2\_SIZE + FB1\_SIZE \sim (FA1\_SIZE + FA2\_SIZE + FB1\_SIZE + FB2\_SIZE)$

Flash memory map in parallel mode:

- Flash A1+B1 address range:  $0x00000000 \sim FA1\_SIZE*2$
- Flash A2+B2 address range:  $FA1\_SIZE*2 \sim (FA1\_SIZE*2 + FA2\_SIZE*2)$

### NOTE

- When  $MCR0[SAMEDEVICEEN]$  is set to 0x1,  $FA1\_SIZE/FA2\_SIZE/FB1\_SIZE/FB2\_SIZE = FLSHA1CR0[FLASHSZ] * 1KByte$
- When  $MCR0[SAMEDEVICEEN]$  is set to 0x0,  $FA1\_SIZE = FLSHA1CR0[FLASHSZ] * 1KByte$ ;  $FA2\_SIZE = FLSHA2CR0[FLASHSZ] * 1KByte$ ;  $FB1\_SIZE =$

FLSHB1CR0[FLASHSZ] \* 1KByte; FB2\_SIZE =  
FLSHB2CR0[FLASHSZ] \* 1KByte

- Flash B1/B2 size setting are ignored in parallel mode (FLSHB1CR0.FLASHSZ, FLSHB2CR0.FLASHSZ). To support parallel mode application, Flash B1 should be same device as A1 and Flash B2 should be same device as A2.

### 30.7.6 Flash address sent to Device

Flash access start address is determined by AHB address (AHB command) or IPCR0[SFAR] register (IP command). Refer [Flash access by AHB Command](#) and [Flash access by IP Command](#) for more details.

FlexSPI controller will remove flash base address automatically when sending flash address to devices. Flash address is sent to devices in two part: Row Address and Column Address. For flash devices not supporting Column address, please set register field FLSHxCR1[CAS] to 0. Then all flash address bits will be sent to Flash device as Row address. For flash device supporting word-addressable feature, the last bit of flash address is not needed because flash is read/programmed in terms of 2 bytes. For parallel mode, Flash A1/B1 (or A2/B2) is accessed parallelly, so the flash address sent to flash device should be divided by 2. Following table indicates the relationship of Row/Column Address and flash address (FA)

**Table 30-4. Flash Row/Column Address**

Parallel mode	Word-addressable	Row Address	Column Address	Comment
0	0	FA[31:CAS]	FA[CAS-1:0]	There is no limitation on FA and data size alignment.
0	1	FA[31:CAS+1]	FA[CAS:1]	FA and data size should be 2 byte aligned.
1	0	FA[31:CAS+1]	FA[CAS:1]	FA and data size should be 2 byte aligned.
1	1	FA[31:CAS+2]	FA[CAS+1:2]	FA and data size should be 4 byte aligned.

#### NOTE

- FA is the flash address with flash base address removed.
- If the Row/Column Flash Address bit number to be sent to Flash device defined in Instructions is more than valid Row/Column Flash Address bit number, high position bits

will be supplemented with zero. Refer [Programmable Sequence Engine](#) for more details about Row/Column Address instruction.

When parallel mode enabled or word-addressable flash used, there is limitation on flash start address and data size. This requirement could be met by aligning AHB bus access address (For AHB command) or IP command address IPCR0[SFAR] (For IP command) in software. There are two ways to avoid these limitation in specified case.

1. For **AHB Read Command** only:

When AHBCR[READADDROPT] and AHBCR[PREFETCHEN] are both set to 1, FlexSPI will guarantee flash access start address and data size are 64 bit aligned by hardware.

When AHBCR[READADDROPT] is set to 1, FlexSPI will fetch redundant data to guarantee flash start address aligned with 8 bytes. When prefetch enabled (AHBCR[PREFETCHEN] is set to 1), flash read data size is determined by AHB RX Buffer size which is 64 bit aligned.

2. For **AHB Write Command and Individual mode** only:

By default, FlexSPI will guarantee flash write access start address and data size are 16 bit aligned by using DQS as write mask.

This feature is not applied in parallel mode and should be used only if external device supports write mask feature.

### 30.7.7 Look Up Table

The LUT (Look Up Table) is an internal memory to preserve a number of pre-programmed sequences. Each sequence consists of up to 8 instructions which are executed sequentially. When a flash access is triggered by an IP command or an AHB command, FlexSPI controller will fetch the sequence from LUT according to sequence index/number and execute it to generate a valid flash transaction on SPI interface.

Following figure indicates the structure of LUT, sequence and instruction.

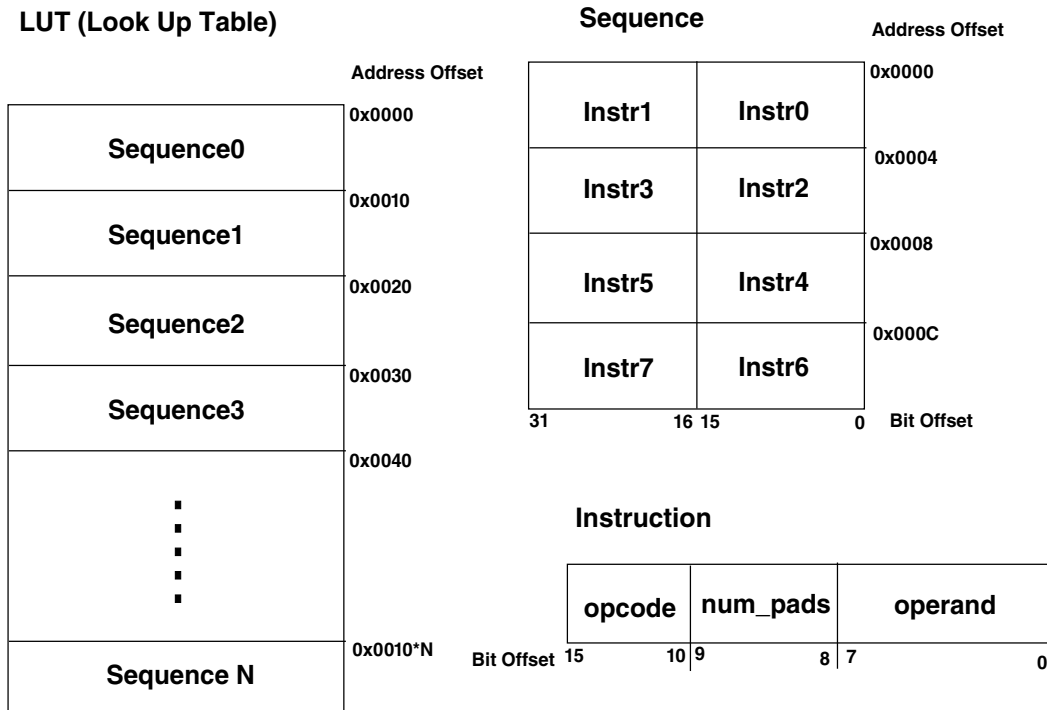

Figure 30-5. LUT and sequence structure

**NOTE**

If the instruction number needed is less than 8 for a flash transaction, STOP instruction should be programmed for the unneeded instructions (instruction code 8'h00).

For IP command and AHB write command, FlexSPI controller always executes from instruction pointer 0; For AHB read command, FlexSPI controller executes from a saved instruction start pointer. FlexSPI controller saves the instruction start pointers separately for each flash device. All these saved instruction pointer are zero before JMP\_ON\_CS instruction executed. When JMP\_ON\_CS instruction executed, the operand in JMP\_ON\_CS instruction will be saved as instruction start pointer. Refer [Execute-In-Place Enhance mode](#) for more details.

The reset value of LUT is unknown because it is implemented as internal memory. LUT should be programmed according to the device connected on board. In order to protect its contents during a code runover the LUT could be locked/unlocked to avoid change by mistake after programmed. The key for locking or unlocking the LUT is **0x5AF05AF0**. The process for locking and un-locking the LUT is as follows:

**Locking the LUT**

1. Write the key (**0x5AF05AF0**) in to the LUT Key Register [LUT Key Register \(LUTKEY\)](#).

- Write 2b01 to the LUT Control Register field LOCK and UNLOCK LUT Key Register (LUTKEY) immediately after above KEY register writing. LUT is not successfully locked if there is any other register write access to FlexSPI between these two write access.

### Unlocking the LUT

- Write the key (0x5AF05AF0) in to the LUT Key Register LUT Key Register (LUTKEY).
- Write 2b10 to the LUT Control Register field LOCK and UNLOCK LUT Key Register (LUTKEY) immediately after above KEY register writing. LUT is not successfully unlocked if there is any other register write access to FlexSPI between these two write access.

The lock status of the LUT can be read from register field LUTCR[LOCK] and LUTCR[UNLOCK].

## 30.7.8 Programmable Sequence Engine

FlexSPI controller implements a programmable sequence engine that execute the sequence from LUT. FlexSPI controller executes the instructions sequentially and generate flash transaction on SPI interface accordingly. Following table is a complete list of supported instructions.

**Table 30-5. Instruction set**

Name	Opcode	Num_pads	Action on SPI interface	Transmit Data	Bits/Bytes/Cycle Number
CMD_SDR/ CMD_DDR	6'h01/ 6'h21	2'h0 - one pad (Single mode) 2'h1 - two pad (Dual mode)	Transmit Command code to Flash	Command code: Operand[7:0]	Bit number: 8
RADDR_SDR/ RADDR_DDR	6'h02/ 6'h22	2'h2 - four pad (Quad mode) 2'h3 - eight pad (Octal mode)	Transmit Row Address to Flash	Row_Address[31:0]	Bit number: operand[7:0]
CADDR_SDR/ CADDR_DDR	6'h03/ 6'h23		Transmit Column Address to Flash	Column_Address[31:0]	Bit number: operand[7:0]
MODE1_SDR/ MODE1_DDR	6'h04/ 6'h24		Transmit Mode bits to Flash	Mode bits: Operand[0]	Bit number: 1
MODE2_SDR/	6'h05/			Mode bits:	Bit number: 2

*Table continues on the next page...*

Table 30-5. Instruction set (continued)

Name	Opcode	Num_pads	Action on SPI interface	Transmit Data	Bits/Bytes/Cycle Number
MODE2_DDR	6'25			Operand[1:0]	
MODE4_SDR/ MODE4_DDR	6'h06/ 6'h26			Mode bits: Operand[3:0]	Bit number: 4
MODE8_SDR/ MODE8_DDR	6'h07/ 6'h27			Mode bits: Operand[7:0]	Bit number: 8
WRITE_SDR/ WRITE_DDR	6'h08/ 6'h28		Transmit Programming Data to Flash	Programming Data in IP TX FIFO or AHB_TX_BUF	Byte number (data size) is determined by AHB burst size and burst type (AHB Command) or IPCR1.DATSZ (IP command). For more detail about flash read/program data size, refer <a href="#">Flash access by AHB Command</a> and <a href="#">Flash access by IP Command</a> .
READ_SDR/ READ_DDR	6'h09/ 6'h29		Receive Read Data from Flash  Read Data is put into AHB_RX_BUF or IP_RX_FIFO.	-	
LEARN_SDR/ LEARN_DDR	6'h0A/ 6'h2A		Receive Read Data or Preamble bit from Flash device  FlexSPI Controller will compare the data line bits with DLPR register to determine a correct sampling clock phase.	-	Byte number: operand[7:0]  Never set operand to zero for LEARN instruction.
DATSZ_SDR/ DATSZ_DDR	6'h0B/ 6'h2B		Transmit Read/Program Data size (byte number) to Flash	Internal Logic  Read/Program data size for current command sequence.	Bit number: operand[7:0]  Please never set operand to zero or larger than 64 for DATSZ instruction.
DUMMY_SDR/ DUMMY_DDR	6'h0C/ 6'h2C		Leave data lines undriven by FlexSPI controller. Provide turnaround cycles from host driving to device driving. num_pads will determine the number of pads in input mode.	-	Dummy cycle number (in serial root clock): Operand[7:0]  <b>Dummy cycle (N) described in Flash device datasheet is in number of SCK cycle and this number may be configurable.</b>  <b>In SDR mode, SCK cycle is same as serial root clock. The operand value should be set as N.</b>  <b>In DDR mode, SCK cycle is double to serial root clock cycle. The operand</b>

Table continues on the next page...

Table 30-5. Instruction set (continued)

Name	Opcode	Num_pads	Action on SPI interface	Transmit Data	Bits/Bytes/Cycle Number
					value should be set as $2*N$ , $2*N-1$ or $2*N+1$ depending on how dummy cycle defined in device datasheet. Please refer to <a href="#">Flash access sequence example</a> and dummy cycle definition on device datasheet.
DUMMY_RWDS_SDR/ DUMMY_RWDS_DDR	6'h0D/ 6'h2D		This instruction is similar as DUMMY_SDR/ DUMMY_DDR instruction. But the dummy cycle number is different.  DQS pins is called "RWDS" in HyperBus specification. Refer <a href="#">Dummy instruction</a> for more details.  <b>Set operand as "Latency count" for HyperBus devices.</b>	-	For read command, dummy cycle number (in serial root clock):  (operand[7:0]*4-1) if RWDS (DQS pin) is high;  (operand[7:0]*2-1) if RWDS (DQS pin) is low;  For write command, dummy cycle number (in serial root clock):  (operand[7:0]*4-2) if RWDS (DQS pin) is high;  (operand[7:0]*2-2) if RWDS (DQS pin) is low;
JMP_ON_CS	6'h1F	Num_pads setting will be ignored.  Always set num_pads to 2'h0.	Stop execution, deassert CS and save operand[7:0] as the instruction start pointer for next sequence.  Normally this instruction is used to support Execute-In-Place enhance mode. Refer <a href="#">Execute-In-Place Enhance mode</a> for more details.  This instruction is only allowed for AHB read command. If this instruction is used in IP command or AHB write command, there will be interrupt status bit set (INTR[PCMDERR] or INTR[AHBCMDERR]).	-	No transaction on SPI interface.
STOP	6'h00		Stop execution, deassert CS. Next command sequence (to the same flash device) will started from instruction pointer 0.	-	

The programmable sequence engine allows the software to configure the FlexSPI LUT according to external serial device connected on board. The flexible structure is easily adaptable to new command/protocol changes from different vendors.

DDR sequence is a flash access sequence that contain DDR instruction which is not DUMMY, it may contain SDR instructions optionally. SDR sequence is a flash access sequence that don't contain any DDR instruction. FlexSPI controller determines instruction SDR or DDR mode by decoding bit 5 of instruction opcode. The output/input timing on FlexSPI is different for SDR and DDR sequences. Especially note that SDR instruction in SDR sequence and DDR sequence is executed differently. Refer [FlexSPI Input Timing](#) and [FlexSPI Output Timing](#) for more details.

### 30.7.8.1 Instruction execution on SPI interface

This section describes the detail of instruction execution on SPI interface. For all instructions transmitting/receiving data bits to/from flash, the bit order in one byte is higher on SIO3 than SIO0; and higher on B port than A port.

#### 1. Command Instruction

Command Instruction (CMD\_SDR/CMD\_DDR) is normally used to transmit command code to external flash device. Command code is the 8 bits operand in instruction. Command code will be send to both B port and A port in parallel mode. Refer [Flash access sequence example](#) for examples.

#### 2. Address Instruction

Address Instructions (RADDR\_SDR/RADDR\_DDR/CADDR\_SDR/CADDR\_DDR) are normally used to send Flash access start address (Row/Column Address) to external flash device. Row/Column Address bits are determined by FlexSPI according to AHB access address or IP command address. Refer [Flash address sent to Device](#) for more details. The bit number is the operand value in instruction code. Row/Column address bits will be send to both B port and A port in parallel mode. Refer [Flash access sequence example](#) for examples.

#### 3. Mode Instruction

Mode Instructions (MODE<sub>x</sub>\_SDR/MODE<sub>x</sub>\_DDR) are normally used to send mode bits to external flash device. Mode bits are the (lower) bits value of the instruction operand. The transition bit number is 1 for MODE1\_SDR/MODE1\_DDR, 2 for MODE2\_SDR/MODE2\_DDR, 4 for MODE4\_SDR/MODE4\_DDR and 8 for MODE8\_SDR/MODE8\_DDR. Note that pad number should be no more than mode bit number. For example, it is not allowed to set num\_pads to 2'b11 (Octal mode) for MODE4\_\* instructions. Mode bits will be send to both B port and A port in parallel mode. Refer [Flash access sequence example](#) for examples.

#### 4. Data Size Instruction

Data Size Instructions (DATSZ\_SDR/DATSZ\_DDR) are used to send program/read data size (byte number) to external device. This instruction is normally used in FPGA application when the memory space in external device acts similar as a FIFO. The device needs data size information to determine how much data will be popped from or pushed into internal FIFO. The bit number is the operation value in the instruction. Data size bits will be send to both B port and A port in parallel mode. Refer [Flash access sequence example](#) for examples.

## 5. Write Instruction

Write Instructions (WRITE\_SDR/WRITE\_DDR) are normally used to send program data to external device. Programming data are fetched from IP TX FIFO (IP Command) or AHB TX Buffer (AHB command). For more details about flash program data size, refer [Flash access by AHB Command](#) and [Flash access by IP Command](#). The byte order for programming date is always from low to high. Odd bytes are send on A port and Even bytes are send on B port in parallel mode. Refer [Flash access sequence example](#) for examples.

## 6. Read Instruction

Read Instructions (READ\_SDR/READ\_DDR) are normally used to receive flash data from external device. Received data will be put into IP RX FIFO (IP Command) or AHB RX Buffer f(AHB command). For more detail about flash read data size, refer [Flash access by AHB Command](#) and [Flash access by IP Command](#). The byte order for reading date is always from low to high. Odd bytes are received from A port and Even bytes are received from B port in parallel mode. Refer [Flash access sequence example](#) for examples.

## 7. Dummy Instruction

Dummy Instructions (DUMMY\_SDR/DUMMY\_DDR/DUMMY\_RWDS\_SDR/DUMMY\_RWDS\_DDR) are used to provide turnaround cycles on SPI interface. During dummy instruction, neither FlexSPI controller nor external device drives SPI interface. Refer [Programmable Sequence Engine](#) for more details about dummy cycle number.

DUMMY\_RWDS\_DDR could be used for HyperBus device which use "RWDS" pin to indicate whether extra latency count needed. DUMMY\_RWDS\_SDR is reserved for future. FlexSPI controller checks DQS pin input level at the 4th cycle after SCK output toggling enabled. DQS pins is called "RWDS" in HyperBus specification. Refer [Flash access sequence example](#) for examples.

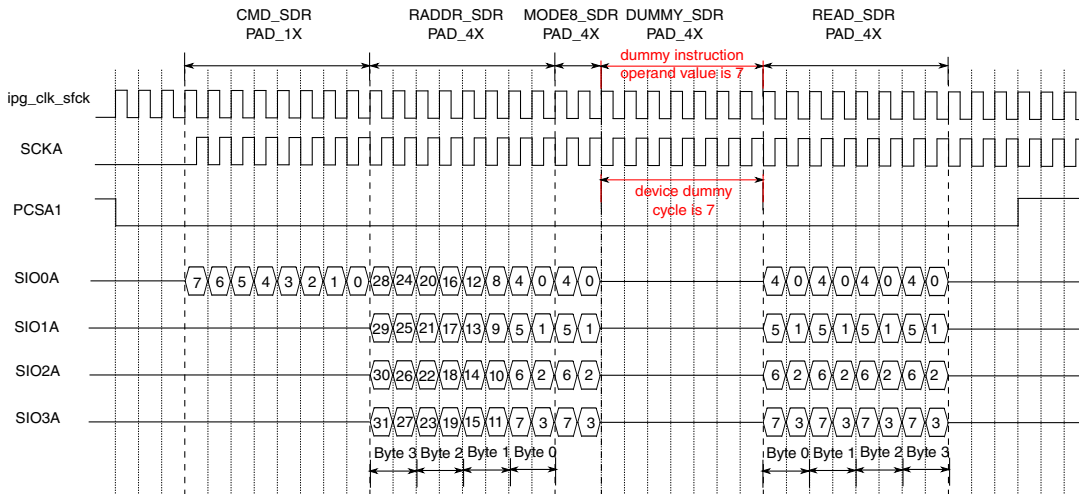

### 30.7.8.2 Flash access sequence example

Following is an example for SDR single I/O Read sequence (Spansion Serial Nor Flash S25FS512S) in individual mode.

**Figure 30-6. Flash access sequence example (SDR Single I/O Read sequence)**

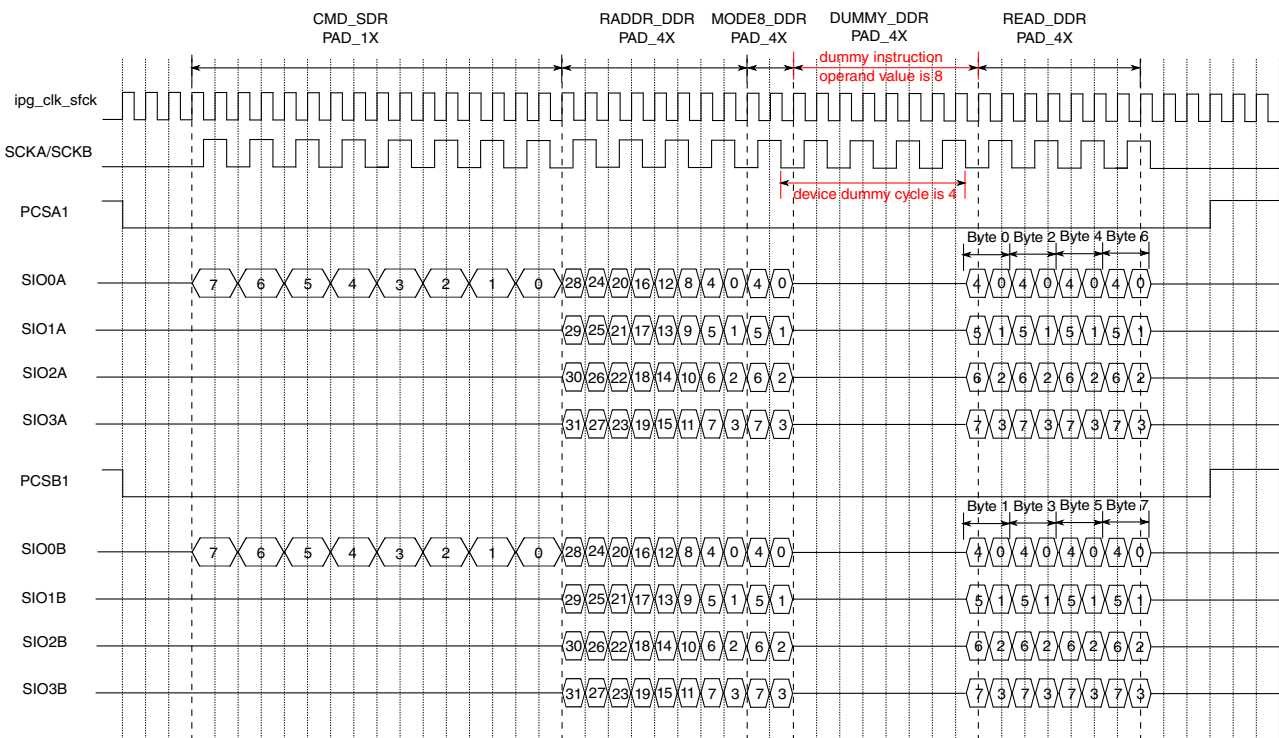

Following is an example for SDR Quad I/O Read sequence (Spansion Serial Nor Flash S25FS512S) in individual mode.

**Figure 30-7. Flash access sequence example (SDR Quad I/O Read sequence)**

Following is an example for DDR Quad I/O Read sequence (Spansion Serial Nor Flash S25FS512S) in parallel mode.

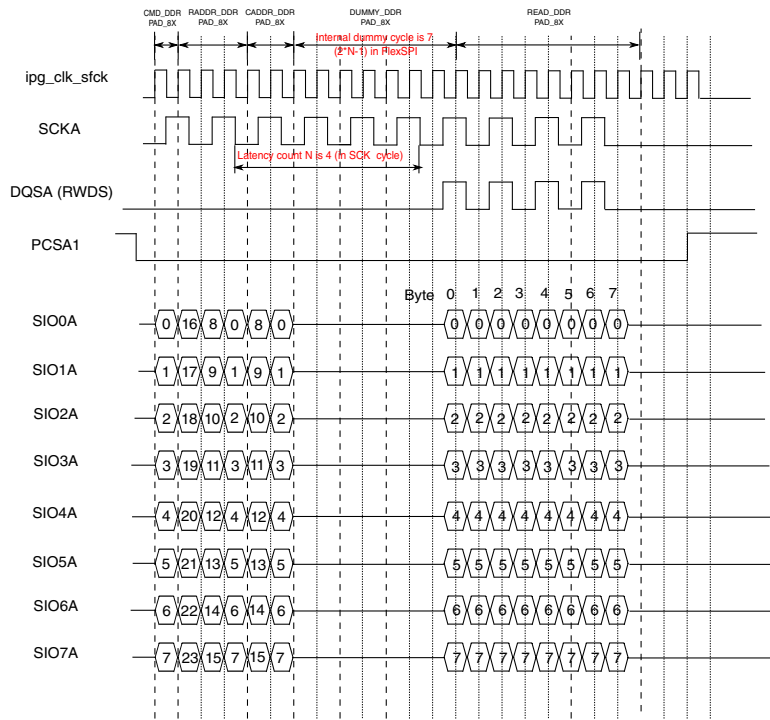

## Functional description

**Figure 30-8. Flash access sequence example (DDR Quad I/O Read sequence)**

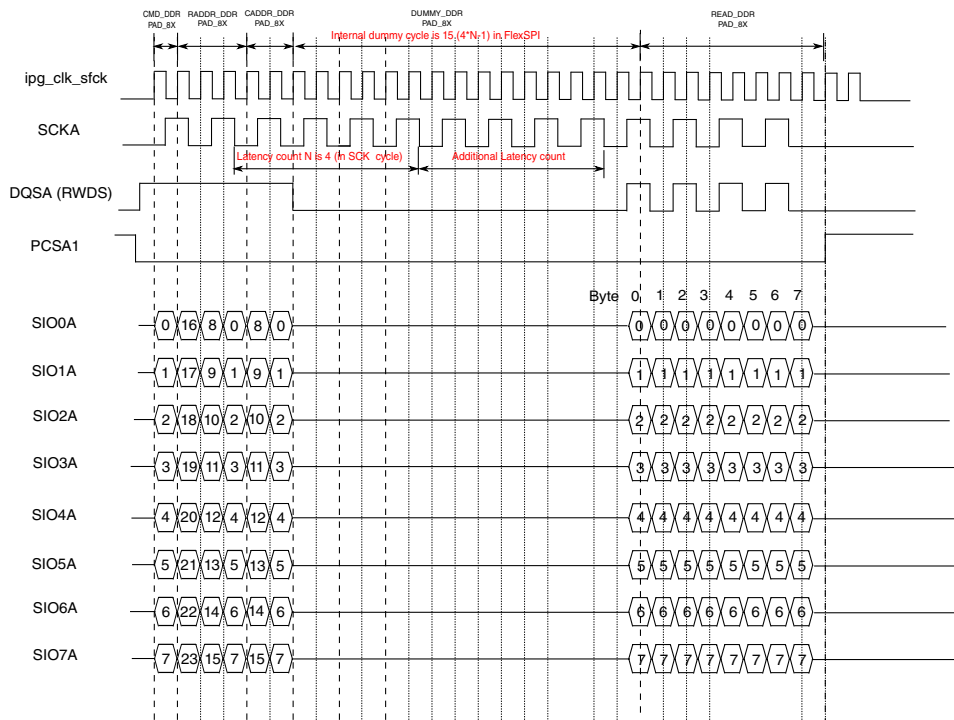

Following is an example indicating Learning instruction (not for a specified flash device) in individual mode.

Following is an example for HyperBus device read transaction (Single latency count) in individual mode.

**Figure 30-9. HyperBus device read transaction with single latency count**

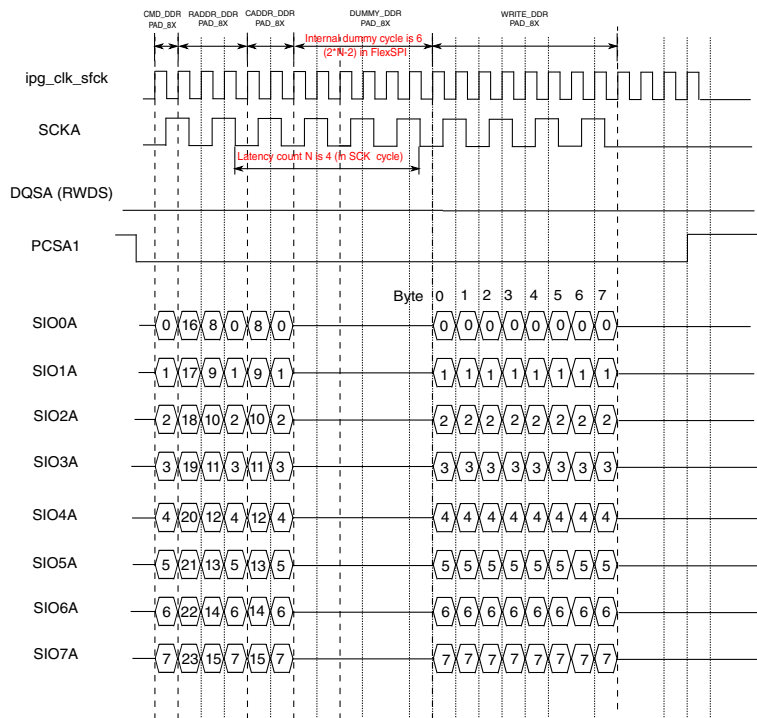

Following is an example for HyperBus device read transaction (Additional latency count) in individual mode.

**Figure 30-10. HyperBus device read transaction with additional latency count**

## Functional description

Following is an example for HyperBus device write transaction (Single latency count) in individual mode.

**Figure 30-11. HyperBus device write transaction with single latency count**

Following is an example for HyperBus device write transaction (Additional latency count) in individual mode.

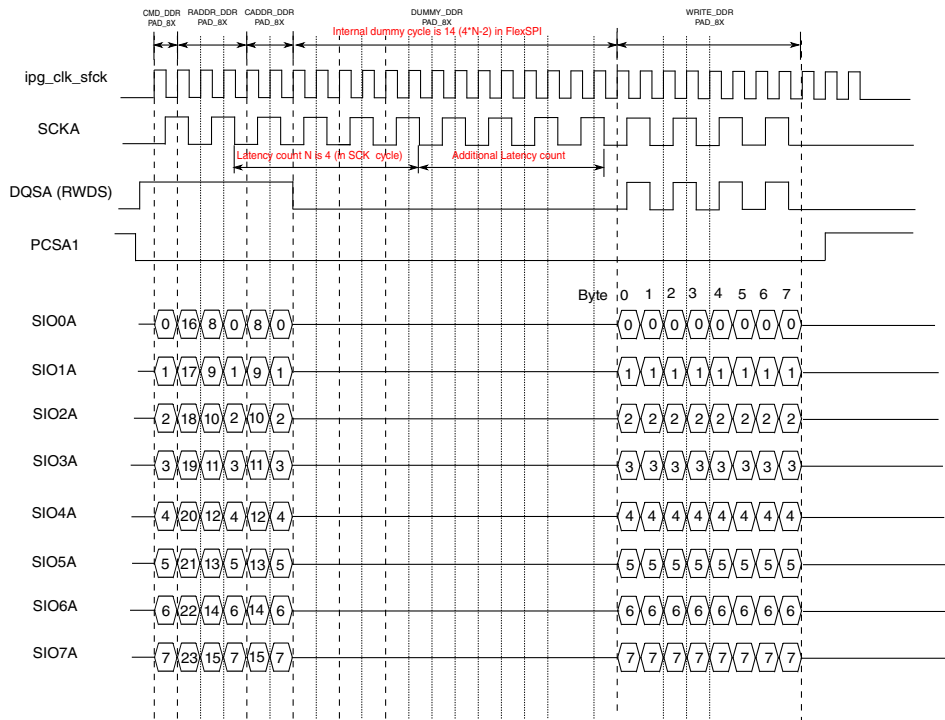

Figure 30-12. HyperBus device write transaction with additional latency count

### 30.7.9 Flash access by IP Command

Flash access could be triggered by IP command in following steps.

- Fill IP TX FIFO with programming data if this is a programming command (programming flash data, flash status registers etc.)
- Set flash access start address (IPCR0), read/program data size, sequence index in LUT and sequence number (IPCR1).
- Trigger flash access command by writing 1 to register bit IPCMD[TRG]
- Polling register bit IPCMDDONE to wait for this IP command finished on FlexSPI interface.

#### NOTE

- IP TX FIFO could be filled before or after writing IPCR0/ IPCR1/IPCMD register. If SFM command is started with IP TX FIFO empty, FlexSPI will stop SCK toggling to wait for TX data ready automatically.
- IPCMD register must be written after writing IPCR0/ IPCR1 register.

- Multiple Command sequences (8 at most) could be issued by one IP command.
- It's not allowed to issue another IP command before previous IP command finished. The behaviour is unknown in this case.

If this is a Reading command to Serial Flash Memory, all reading data from Flash will be put into IP RX FIFO. Software need to read out data from IP RX FIFO by AHB bus or IP Bus. When IP RX FIFO is full and there is more data to be read from Flash device, FlexSPI will stop SCK output clock toggling until IP RX FIFO is not full. Please refer to [SCK stop feature](#) for more detail.

The detail of triggered Serial Flash Command is as following:

- Flash access start address:  
Determined by register field IPCR0.SFAR.
- Flash Chip Select:  
Determined by flash access address and Flash size setting (FLSHxCR0[FLSHSZ]).
- Flash command Sequence Index and Sequence Number:  
The sequences indexed from IPCR1[ISEQID] to (IPCR1[ISEQID] + IPCR1[ISEQNUM]) in LUT will be executed by FlexSPI sequentially.
- Flash Individual/Parallel access mode:  
Determined by IPCR1[IPAREN].
- Flash Read/Program Data Size:
  - If IPCR1[IDATSZ] value is non-zero, flash read/program data size (in byte) is IPCR1[DATSZ].
  - If IPCR1[IDATSZ] value is zero, flash read/program data size (in byte) will be the operand value in the READ/WRITE instruction.

#### **NOTE**

- Software should make sure the last sequence index never exceeds the LUT sequence number (IPCR1[ISEQID] + IPCR1[ISEQNUM] < 16).
- Data size is applied to every command sequence if sequence number is more than one.
- Data size is ignored if there is no WRITE/READ instruction in the command sequence .

IP command request is sent to arbitrator after triggered by software. It is not executed on FlexSPI Interface until granted by arbitrator. Please refer to [Command Arbitration](#) for more details.

### 30.7.9.1 Reading Data from IP RX FIFO

FlexSPI put the read data from external device into IP RX FIFO for IP command. These data could be read out by following two memory space access.

- 100 - 180 (by IPS Bus)
- 7FC00000 - 7FC00080 (by AHB Bus)

If MCR0[ARDFEN] is set to 0x1, read data in IP RX FIFO could only be read out by AHB Bus, IP Bus read access to IP RX FIFO will always return with data zero and no bus error occur.

If MCR0[ARDFEN] is set to 0x0, read data in IP RX FIFO could only be read out by IPS Bus, AHB Bus read access to IP RX FIFO will trigger bus error.

FlexSPI push read data into IP RX FIFO in terms of 64 bits every time it receives 64 bits data from external device. When read data bits number is not 64 bits aligned, FlexSPI will push addition zero bits into IP RX FIFO for the last push.

IP RX FIFO could be read by processor or DMA. Following is the detail flow for processor and DMA reading:

#### 1. Reading by processor

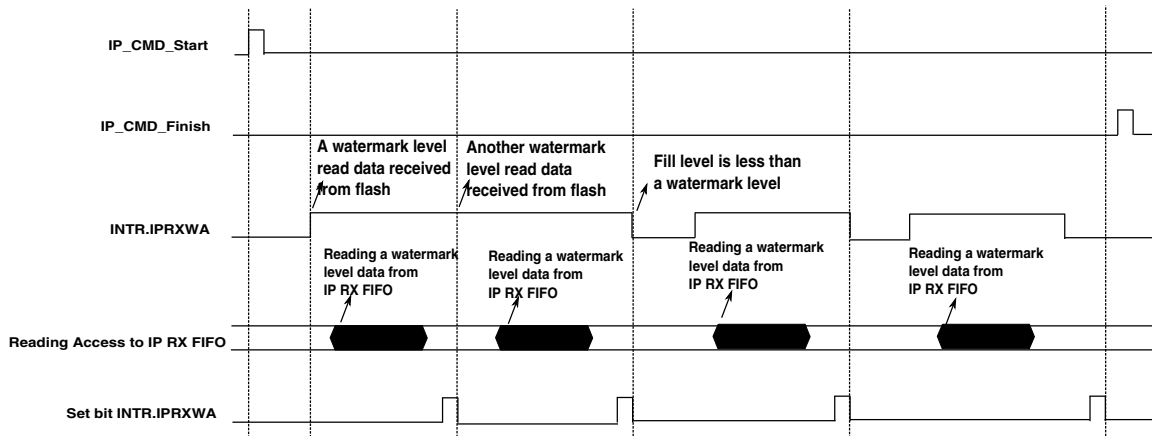

To read by processor, following register settings are needed:

- Set register field IPRXFCR[DMAEN] to 0.
- Set WaterMark level by IPRXFCR[WMRK], watermark level is  $(IPRXFCR[WMRK]+1)*8$  bytes.
- Set register field INTEN[IPRXWA] to enable IP RX FIFO watermark available interrupt (optionally).

Processor needs to poll register INTR[IPRXWA] or wait for IP RX FIFO Watermark Available interrupt before reading IP RX FIFO. This is to make sure there is a watermark level Data filled in IP RX FIFO before reading.

After reading a watermark level datas from IP RX FIFO, software need to set register bit INTR[IPRXWA]. This set action will pop out a watermark level datas from IP RX FIFO.

Following digram indicates the reading flow from IP RX FIFO by processor.

**Figure 30-13. Reading IP RX FIFO by processor**

**NOTE**

- Processor need to read out a watermark level datas from IP RX FIFO each time before set register bit INTR[IPRXWA].
- It's supported that the total flash read/program data size is not multiple of watermark level. In this case, the reading data size from IP RX FIFO will be less than a watermark level for the last time, software should poll IPRXSTS[FILL] field instead of polling INTR[IPRXWA]. After copying all datas from IP RX FIFO and all command sequences to Flash are finished (INTR[IPCMDDONE]=1), software should clear IP RX FIFO by set IPRXFCR[CLRRXF]. Otherwise the reading data will be wrong for the next Reading Command to Flash.
- IP RX FIFO data is not popped out by each reading access to IP RX FIFO, but popped by writing 0x1 to register INTR[IPRXWA] bit.

**2. Reading by DMA**

To read IP RX FIFO by DMA, following setting is needed:

- Set register field IPRXFCR[DMAEN] to 1.
- Set WaterMark level by IPRXFCR[WMRK], watermark level is (IPRXFCR[WMRK]+1)\*8 bytes.
- Set DMA transfer Minor loop size to same watermark level.

**Figure 30-14. Reading from IP RX FIFO by DMA**

### NOTE

- DMA request is generated when the fill level of IP RX FIFO is higher than (or equal) watermark level. This request is not pulse valid but level valid.
- DMA should read out a watermark level datas from IP RX FIFO each time (set minor loop size with the same value as watermark level).
- DMA need to return a Done handshake (pulse valid) to FlexSPI each time it finished reading a watermark level datas.
- IP RX FIFO data is not popped out by each reading access, but popped by DMA done handshake.
- It's not supported that the total read/write data size (Major loop size) is not multiple of watermark level. Because DMA don't know when the data is ready for the last reading. It makes DMA driver too complex to polling IPRXFSTS[FILL] field.

### 30.7.9.2 Filling Data to IP TX FIFO

The programming should be put into IP TX FIFO and then transmit to Flash by FlexSPI. It could be filled by two memory space.

- 0x180 - 0x200 (by IP Bus)
- 7F800000 - 7F800080 (by AHB Bus)

## Functional description

To fill by AHB Bus, need to set MCR0[ATDFEN] to 1, IP Bus write access to IP TX FIFO will be ignored, but no bus error.

To fill by IP Bus, need to set MCR0[ATDFEN] to 0, AHB Bus write access to IP TX FIFO will return Bus Error.

IP TX FIFO is popped with 64 bits data every time FlexSPI fetch data for transmitting. If the programming data size is not multiple of 64 bits, last popped valid bits will be less than 64 bits. But there is no problem because these invalid bits is not transmit to Flash at all.

IP TX FIFO could be filled by processor or DMA.

To fill by processor, need following setting:

- Set register field IPTXFCR[DMAEN] to 0.
- Set WaterMark level by IPTXFCR[WMRK], watermark level is  $(IPTXFCR[WMRK]+1)*8$  bytes.
- Set register field INTEN[IPTXWE] to enable IP TX FIFO watermark empty interrupt (optionally).

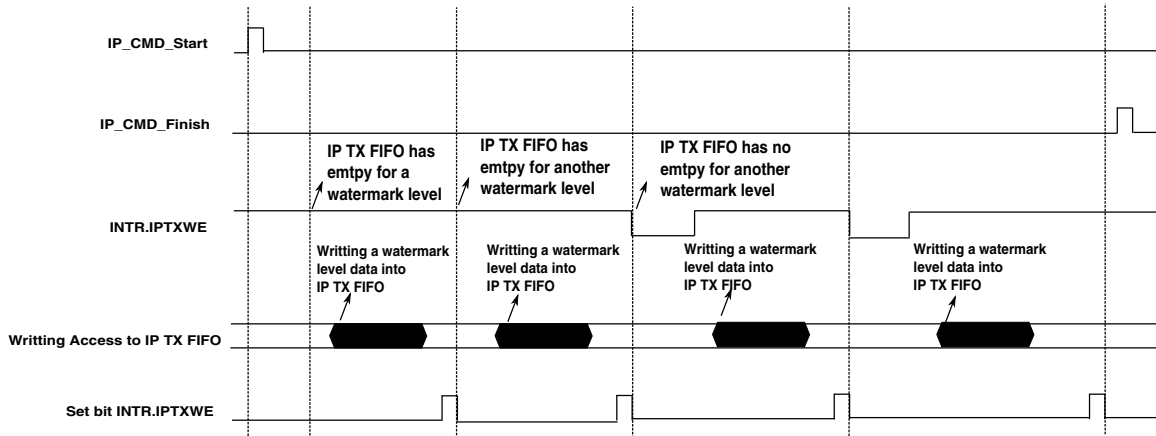

Processor needs to poll register INTR[IPTXWE] or wait for IP TX FIFO Watermark empty interrupt before filling IP TX FIFO. This is to make sure there is enough space for a watermark level Data filling before filling.

After filling a watermark level datas to IP TX FIFO, need to set register bit INTR[IPTXWE]. This will push a watermark level datas into IP TX FIFO (write pointer is incremented).

### NOTE

IP TX FIFO data is not pushed by each write access, only pushed by set INTR[IPTXWE] bit.

Following digram indicates the filling flow to IP TX FIFO by processor.

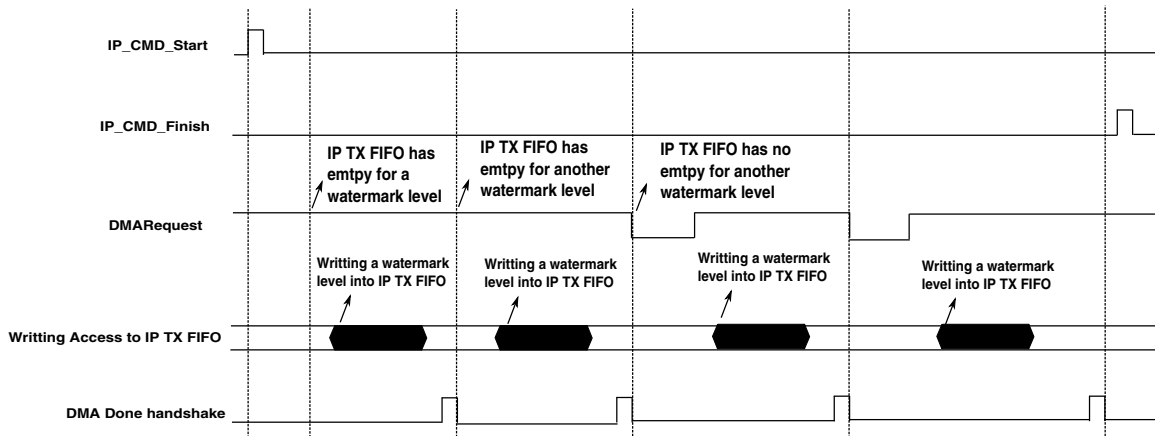

**Figure 30-15. Filling IP TX FIFO by processor**

### NOTE

- Processor need to fill a watermark level datas to IP TX FIFO each time.
- It's allowed that total write data size is not multiple of watermark level. In this case, the writing size will be less than a watermark level for the last time. After filled all datas into IP TX FIFO and all Command Sequences to Flash are finished ( $\text{INTR}[\text{IPCMDDONE}] = 1$ ), processor should clear IP TX FIFO by set  $\text{IPTXFCCR}[\text{CLRRTXF}]$ . Otherwise, the programming data will be wrong for the next programming Command to Flash.

To fill IP TX FIFO by DMA, need following setting:

- Set register field  $\text{IPTXFCCR}[\text{DMAEN}]$  to 1.
- Set WaterMark level by  $\text{IPTXFCCR}[\text{WMRK}]$ , watermark level is  $(\text{IPTXFCCR}[\text{WMRK}] + 1) * 8$  bytes.
- Set DMA transfer Minor loop size to same watermark level.

**Figure 30-16. Filling from IP TX FIFO by DMA**

**NOTE**

- DMA request is generated when there is empty space more than watermark level in IP TX FIFO. This request is not pulse valid but level valid.
- DMA should fill watermark level datas into IP TX FIFO each time (set minor loop size with the same value as watermark level).
- DMA need to return a Done handshake (pulse valid) to FlexSPI each time it finished filling a watermark level datas.
- IP TX FIFO data is not pushed in by each reading access, but pushed by DMA done handshake.
- It's allowed that total program data size (Major loop size) is not multiple of watermark level. After filled all datas into IP TXFIFO and all command sequences to Flash are finished (INTR[IPCMDDONE]=1), need to clear IP TX FIFO by set IPTXFCR[CLRTXF]. Otherwise, the programming data will be wrong for the next programming Command to Flash.

**30.7.10 Flash access by AHB Command**

Flash could be accessed by AHB bus directly on AHB address space: 60000000~0x80000000. This address space is mapped to Serial Flash Memory in FlexSPI. AHB bus access to this address space may trigger Flash access command sequence as needed.

For AHB read access to Serial Flash Memory, FlexSPI will fetch data from flash into AHB RX Buffers and then return the data on AHB Bus. For AHB write access to Serial Flash Memory, FlexSPI will buffer AHB Bus write data into AHB TX Buffer and then transmit to Serial Flash memory.

There is no software configuration or polling need for AHB command except FlexSPI initialization. AHB master access external flash device transparently similar as normal AHB slave.

AHB command is normally used to access serial Flash memory space. IP command should be used to access the control and status registers or other spaces such as OTP in external flash device.

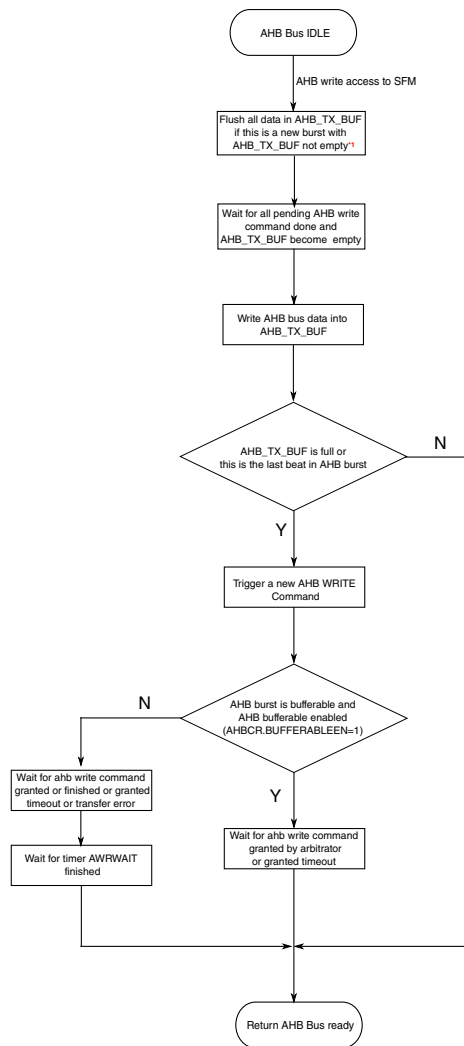

Following section described AHB command for read and write in more detail.

#### **NOTE**

When FlexSPI controller return AHB bus error for SFM access, AHB master should stop following access beats in current burst.

### **30.7.10.1 AHB write access to Flash**

For AHB write access to Flash, FlexSPI will buffer the write data from AHB bus into internal AHB TX Buffer and then transmit them to Flash. FlexSPI only buffers write datas for one AHB burst. Following diagram indicates the hardware operation in response to AHB write access to Flash.

**Figure 30-17. Hardware operation in response to AHB write access to Flash**

FlexSPI triggers new AHB write command in following cases:

- This beat is the last one in current AHB burst (any burst type except INCR).
- AHB TX Buffer is full after buffering current beat data.
- AHB bus becomes IDLE or a new burst comes with AHB TX Buffer not empty.

The detail information about the triggered AHB write command:

- Flash Access Start Address:

Determined by AHB burst address. FlexSPI will record the start address for the data in AHB TX Buffer and this address will be used as flash access start address

- Flash Chip Select:

FlexSPI determined the chip selection by flash access start address and flash size setting.

- Flash Command Sequence Index:

Determined by FLSHxCR2[AWRSEQID].

- Flash Command Sequence Number:

Determined by FLSHxCR2[AWRSEQNUM]. If AWRSEQNUM is not zero, multiple flash access command sequences will be triggered every time for AHB write command. The sequences indexed from AWRSEQID to (AWRSEQID + AWRSEQNUM) in LUT will be executed sequentially.

- Flash access mode (Individual/Parallel):

Determined by AHBCR[APAREN].

- Flash Data Size:

Determined by byte number of buffered data in AHB TX Buffer.

Following examples indicates internal logic for AHB write access to Flash. In these examples, AHB\_TX\_BUF is 64 Bytes (8\*64bits) .

- AHB INCR/64bit/Bufferable burst with address sequence 0x8, 0x10, 0x18, 0x20, ..., 0x50 (10 beat totally):

Two AHB write command will be triggered: the first command with flash start address 0x8 and data size 0x40; the second command with flash start address 0x48 and data size 0x10.

## Functional description

**Figure 30-18. AHB write access (INCR/64bit/Bufferable)**

- AHB WRAP8/64bit/Bufferable burst with address sequence 0x28, 0x30, 0x38, 0x0, 0x8, 0x10, 0x18, 0x20:

One AHB write command will be triggered with flash start address 0x0 and data size 0x40;

**Figure 30-19. AHB write access (WRAP8/64bit/Bufferable)**

- AHB WRAP8/64bit/Non-bufferable burst with address sequence 0x28, 0x30, 0x38, 0x0, 0x8, 0x10, 0x18, 0x20:

One AHB write command will be triggered with flash start address 0x0 and data size 0x40;

## Functional description

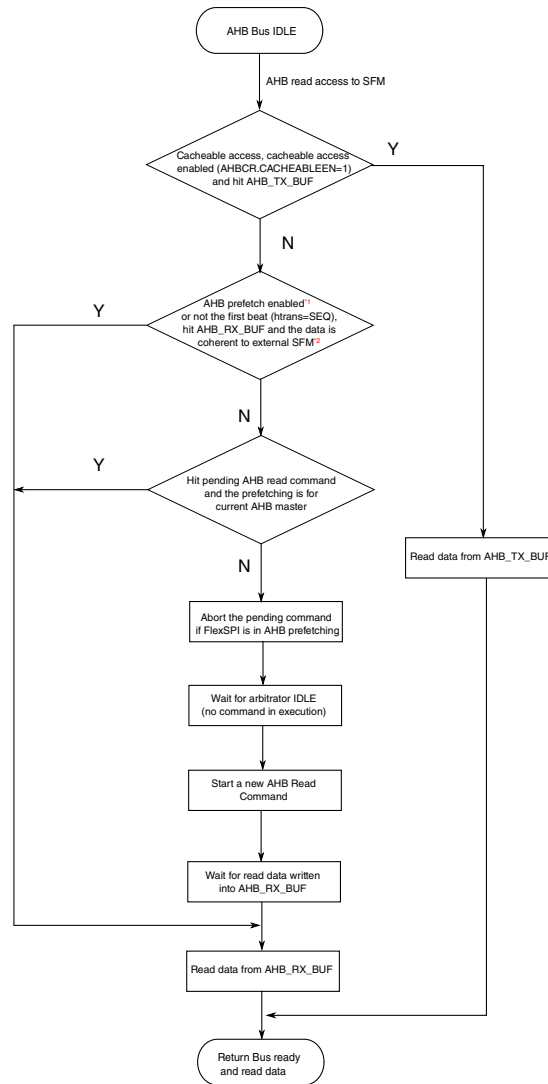

**Figure 30-20. AHB write access (WRAP8/64bit/Non-Bufferable)**

### NOTE

The wrapper burst is not supported if burst data size (in byte) is larger than AHB TX Buffer size (in byte). For example, if AHB\_TX\_BUF is 64 Bytes (8\*64bits), AHB WRAP16 \* 64bit writet burst access is not supported.

### 30.7.10.2 AHB read access to Flash

For AHB read access to Flash, FlexSPI will check whether hit AHB TX Buffer/AHB RX Buffer/pending AHB read command according to the burst access type and register setting. If all these miss, FlexSPI trigger a new AHB read command to fetch data from Flash. Following diagram indicates the hardware operation in response to AHB read access to Flash.

**Figure 30-21. Hardware operation in response to AHB read access to Flash**

The detail information about the triggered AHB read command:

- Flash Access Start Address and Data Size:

Determined by AHB address, burst type and burst size. FlexSPI will fetch read data from the start address for current burst or beat.

**Table 30-6. AHB read command flash start address and data size**

Prefetch Enable	Cross flash boundary	Burst Type	Flash start address [28:0]	Data Size
0	Never cross flash boundary because AHB burst never cross 1K Byte boundary.	SINGLE/INCR4/INCR8/INCR16	hbeat_start_address	(hburst_end_address-hbeat_start_address)
		INCR	hbeat_start_address	byte size of current beat  For INCR burst with prefetch disabled, each beat is handled same as SINGLE burst.
		WRAP4/WRAP8/WRAP16	hburst_start_address	(hburst_end_address-hburst_start_address)
1	No	INCR/SINGLE/INCR4/INCR8/INCR16	hbeat_start_address	ahb_rx_buf_sz
	No	WRAP4/WRAP8/WRAP16	hburst_start_address	ahb_rx_buf_sz
	Yes	INCR/SINGLE/INCR4/INCR8/INCR16	hbeat_start_address	(flash_top_address-hbeat_start_address)
	Yes	WRAP4/WRAP8/WRAP16	hburst_start_address	(flash_top_address-hburst_start_address)

**NOTE**

- hbeat\_start\_address is HADDR input from AHB master for current beat;
- hburst\_start\_address is the lowest address for current burst; hburst\_end\_address is the highest address in current burst plus 1. For example, WRAP4 burst with HADDR 0x8,0xC, 0x0, 0x4

- `ahb_rx_buf_sz` is the buffer size in byte of AHB RX Buffer which is used by current master.
  - `flash_top_address` is the top address of currently accessed flash
- Flash Chip Select:  
FlexSPI determined the chip selection by flash access start address and flash size setting.
  - Flash Command Sequence Index:  
Determined by `FLSHxCR2[ARDSEQID]`.
  - Flash Command Sequence Number:  
Determined by `FLSHxCR2[ARDSEQNUM]`. If `ARDSEQNUM` is not zero, multiple flash access command sequences will be triggered every time for AHB read command. The sequences indexed from `ARDSEQID` to `(ARDSEQID + ARDSEQNUM)` in LUT will be executed sequentially.
  - Flash access mode (Individual/Parallel):  
Determined by `AHBCR[APAREN]`.

#### NOTE

- FlexSPI determines which `ARDSEQNUM/ARDSEQID` fields will be used as sequence ID by flash device chip selection automatically. Refer `MCR2[SAMEDEVICEEN]` for more detail.
- FlexSPI determines which AHB RX Buffer used for current AHB read access by master ID. For more details about the AHB RX buffer ID and AHB master ID mapping, refer [AHB RX Buffer Management](#).
- It is not allowed to allocate AHB RX Buffer less than AHB Burst size. The behaviour is unknown for this case.

### 30.7.10.3 AHB RX Buffer Management

There are 4 buffers (Buffer 0 - Buffer 3) in AHB RX Buffer, which are transparent to AHB masters. FlexSPI fetch flash data and return on AHB Bus automatically. There is no status register polling needed for AHB read access to Serial Flash Memory.

AHB Rx Buffers total size is 1 KBytes . The buffer size is flexibly configurable for each buffer in AHB RX Buffers by register fields

AHBRXBUF0CR0[BUFSZ]~AHBRXBUF6CR0[BUFSZ]. The buffer size for Buffer 0 to Buffer 3 could be set 0. If the buffer size is set to 0x0, the related MSTRID field setting (in same AHBRXBUFxCR0 register) is ignored by FlexSPI. Buffer 3 is used for all AHB masters which is not assigned to Buffer 0 - Buffer 2. Buffer 3 size setting field (AHBRXBUF3CR0.BUFSZ) is ignored by FlexSPI, its buffer size is: AHB RX Buffer total size - sum of (Buffer 0 - Buffer 2 size).

When there is AHB read access to Serial Flash Memory, FlexSPI determine which AHB RX Buffer used as following:

1. If master ID equal AHBRXBUF0CR1[MSTRID] and AHBRXBUF0CR0[BUFSZ] is not zero, Buffer 0 will be used.
2. If master ID equal AHBRXBUF1CR1[MSTRID] and AHBRXBUF1CR0[BUFSZ] is not zero, Buffer 1 will be used.
3. If master ID equal AHBRXBUF2CR1[MSTRID] and AHBRXBUF2CR0[BUFSZ] is not zero, Buffer 2 will be used.
4. If all above case not meet, Buffer 3 will be used

#### **NOTE**

- Software should make sure the buffer size of each buffer is no less than the max burst size of AHB Read access from the master using this buffer. Otherwise the behaviour is undefined.
- It is not supported to assign multiple buffers for single AHB master.
- When AHB read prefetch is enabled (AHBCR[PREFETCH\_EN] is set), the prefetch data size will be determined by buffer size. FlexSPI will fetch data from external Flash with buffer size if no flash boundary across.
- AHB master priority setting (register field AHBRXBUFxCR1[PRIORITY] is used only for the suspending control of AHB prefetching. Refer [Command Abort and Suspend](#).

### **30.7.11 Command Arbitration**

There are four Flash access command sources:

1. AHB Command (triggered by AHB Write access to SFM space)

2. AHB Command (triggered by AHB Read access to SFM space)
3. IP command (triggered by writing IPCMD[TRG])
4. Suspended command (AHB Read prefetch sequence which is suspended)

#### **NOTE**

- An AHB bus access never triggers a write command and a read command at the same time.
- AHB prefetch sequence is an AHB Command sequence triggered by AHB Read access when AHB prefetch is enabled. After all read data fetched for current AHB read burst, FlexSPI will prefetch more data to reduce the read latency for next AHB read access. AHB command for read is never aborted while fetching read data for current AHB read burst. But AHB read command could be aborted by any new IP command or AHB command request when it's prefetching data (not for current read burst).

The granted priority of these 4 command source is as following when Arbitrator is idle (STS0[ARBIDLE]=1):

1. AHB command (Read/Write)
2. IP Command
3. Suspended Command

#### **NOTE**

Suspended command is not granted immediately when arbitrator is idle and no AHB/IP command request. Arbitrator will wait for N AHB clock cycle idle state before resuming the suspended command (N is the register field value in MCR2[RESUMEWAIT]). This intend to avoid AHB prefetch sequence being resumed and suspended frequently.

All command request are not granted if Arbitrator is busy in executing AHB/IP command (not suspended command), and there will AHB/IP Command granted error if the grant is timeout.

If new AHB/IP command request comes while Arbitrator is executing AHB read prefetch sequence, AHB read prefetch sequence will be aborted (but not immediately). Arbitrator will grant AHB/IP command request after AHB read prefetch sequence is aborted on FlexSPI interface and saved all internal data pointers.

### 30.7.11.1 Command Abort and Suspend

This section describes command abort and suspend mechanism.

#### 1. Command Abort

As mentioned above, AHB read prefetch sequence could be aborted if new AHB/IP command request comes.

#### 2. Command Suspend

When AHB read prefetch sequence is aborted on FlexSPI interface, FlexSPI will save this suspended sequence in following cases and resume this sequence if arbitrator is idle for enough time:

- There is no valid suspended command (Register field AHBSPNDSTS[ACTIVE] is 0x0). This is possible if there is no suspended command yet or suspended command is resumed.
- Aborted AHB read prefetch sequence is higher priority than current active suspended sequence. The priority for AHB read Command is set by register field AHBBUF<sub>x</sub>CR1[PRIORITY].

#### NOTE

Original suspended sequence will be ignored and never resumed by FlexSPI.

#### 3. Suspended Command

The suspended command (internal status) turns active when there is any AHB prefetch command aborted and suspended. It turns inactive in following cases:

- Suspended command is resumed by Arbitrator.
- There is a new AHB read command request and it's triggered by AHB master using the same AHB RX Buffer (Buffer ID).

Following is an example indicating command abort/suspend/resume flow:

Figure 30-22. Command Instructions Execution on FlexSPI interface

### 30.7.12 SCK stop feature

FlexSPI will stop SCK output toggling when programming data is not ready for Programming command sequence or there is no space (in internal FIFO) to receive Data for reading command sequence.

There may be certain devices don't support SCK stopped during command sequence (Chip select is valid). SCK stopping could be avoid as following:

- For Flash reading triggered by IP command
  - Never trigger a read command with data size larger than IP RX FIFO size.
  - Internal async FIFO for flash reading should never be full.

FlexSPI pop data from this async FIFO in 64 bits per AHB clock cycle, and receiving data from FlexSPI interface in serial root clock. The receiving speed is determined by Flash access mode (Single/Dual/Quad/Octal mode and Individual/Parallel mode). For example, in Octal mode and parallel mode, FlexSPI receives 16 bits per serial root clock cycle. This async FIFO is never full if AHB clock frequency is higher than 1/4 of serial root clock.

- For Flash programming triggered by IP command
  - Never trigger a program command with data size larger than IP TX FIFO size.
  - Fill all programming data into IP TX FIFO before trigger the IP command.
  - Internal async FIFO for flash programming should be never empty

FlexSPI fetch programming data into this async FIFO in 64 bits per AHB clock cycle, and transmitting data to FlexSPI interface in serial root clock. The transmitting speed is determined by Flash access mode (Single/Dual/Quad/Octal mode and Individual/Parallel mode). For example, in Octal mode and parallel mode, FlexSPI transmits 16 bits per serial root clock cycle. This async FIFO is never empty if AHB clock frequency is higher than 1/4 of serial root clock.

- For Flash reading/programming triggered by AHB command
  - Internal async FIFO for flash reading/programming should never be full/empty. The frequency ratio limitation is same as Flash reading/programming triggered by IP command.

#### NOTE

- FlexSPI never trigger a AHB read command with data size larger than internal AHB RX buffer size.

- FlexSPI never trigger a AHB program command with data size larger than internal AHB TX buffer size.
- All programming data is buffered into AHB TX Buffer before triggering AHB program command in FlexSPI.

### 30.7.13 FlexSPI Output Timing

This section describes the output timing in FlexSPI.

#### 30.7.13.1 Output timing between Data and SCK

This section describes the output timing relationship of Data (on SIOA/SIOB) and SCK. There are three cases for the data output timing:

- **SDR instruction in SDR sequence**

SDR sequence is the sequence which contains only SDR intructions. In this case, all data bits last one serial root clock cycle on FlexSPI interface. Following diagram indicates the relationship of serial root clock, Data and SCK:

**Figure 30-23. SDR instruction in SDR sequence**

- **SDR instruction in DDR sequence**

DDR sequence is a flash access command sequence that contain DDR instruction which is not DUMMY, it may contain SDR instructions optionally. In the case of SDR instruction in DDR sequence, all data bits last two serial root clock cycles on FlexSPI interface. Following diagram indicates the relationship of serial root clock, Data and SCK:

**Figure 30-24. SDR instruction in DDR sequence**

- **DDR instruction in DDR sequence**

In the case of DDR instruction in DDR sequence, all data bits last one serial root clock cycle on FlexSPI interface. Following diagram indicates the relationship of serial root clock, Data and SCK:

**Figure 30-25. DDR instruction in DDR sequence**

### 30.7.13.2 Output timing between Chip selection and SCK

This section describes the output timing relationship of Chip select (on PCSA1/PCSA2/PCSB1/PCSB2) and SCK. The timing relationship is a little different for SDR sequence and DDR sequence.

- **Chip Select timing in SDR sequence**

For SDR sequence, the delay from chip select assertion and the SCK rising edge is  $(FLSH \times CR1[TCSS] + 0.5)$  cycles of serial root clock; The delay from SCK falling edge and chip select deassertion is  $FLSH \times CR1[TCSH]$  cycles of serial root clock. Following diagram indicates the timing relationship between chip selection and SCK:

**Figure 30-26. Chip selection output timing for SDR sequence**

• **Chip Selection timing in DDR sequence**

For DDR sequence, the delay from chip selection assertion and SCK rise edge is **(TCSS+0.5)** cycles of serial root clock; The delay from SCK fall edge and chip selection deassertion is **(TCSH+0.5)** cycles of serial root clock. Following diagram indicates the timing relationship between chip selection and SCK:

**Figure 30-27. Chip selection output timing for DDR sequence**

For certain device (such as FPGA device), there is limitation on the interval between Chip Selection valid. FlexSPI will ensure a delay time between chip selection valid if register field **FLSHxCR1[CSINTERVAL]** is set to non-zero value. The delay time is: **CSINTERVAL\*1024** cycle of serial root clock no matter SDR or DDR sequence. Please set this register field value to zero if there is no this limitation for external device. Following diagram indicates the timing of chip selection interval.

**Figure 30-28. Chip Selection Valid interval**

### 30.7.14 FlexSPI Input Timing

This section describes the input timing of FlexSPI.

### 30.7.14.1 RX Clock Source Features

This section describes the features of each RX clock source.

- **Internal dummy read strobe and loopbacked internally(MCR0.RXCLKSRC==0)**

Supporting legacy device with zero device output hold time.

Saving one pad(DQS pad).

Supporting low frequency clock for boot up usage.

- **Internal dummy read strobe and loopbacked from DQS pad(MCR0.RXCLKSRC==1)**

Supporting higher frequency than mode "MCR0.RXCLKSRC==0".

Supporting device doesn't provide read strobe.

- **Flash provided read strobe(MCR0.RXCLKSRC==3)**

Supporting the highest frequency.

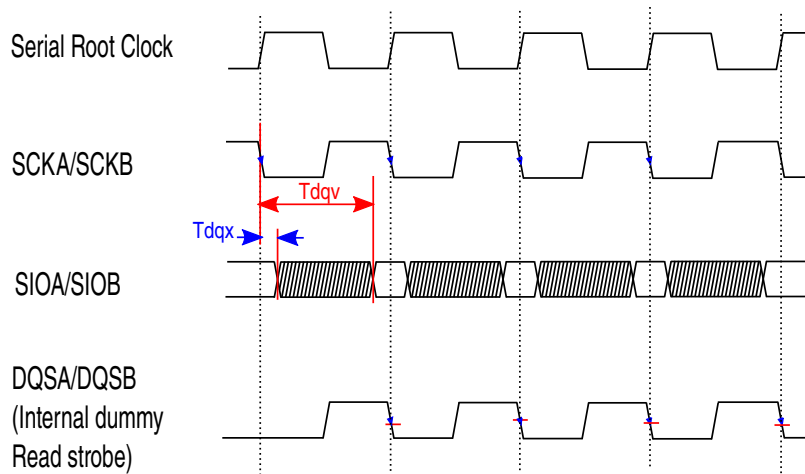

Supporting device provides read strobe.

### 30.7.14.2 Input timing for sampling with dummy read strobe

This section describes the input timing when sampling with internal dummy read strobe (MCR0[RX\_CLK\_SRC] is set to 0x0 or 0x1). The timing is very similar for sampling with dummy read strobe loopback internally and loopback from pad. But it could achieve higher read frequency by sampling with dummy read strobe loopback from DQS pad because it will compensate the delay of SCK output path and Data pin input path. The input timing is different for SDR mode and DDR mode.

- **Input timing for sampling with dummy read strobe in SDR mode**

For SDR Read/Learn instruction, FlexSPI samples input data pins with the falling edge of dummy read strobe. Following diagram indicates the input timing for sampling with dummy read strobe in SDR mode

**Figure 30-29. Input Timing for sampling with dummy read strobe in SDR mode**

- **Input timing for sampling with dummy read strobe in DDR mode**

For DDR Read/Learn instruction, FlexSPI sample input data pins with both rise and fall edge of dummy read strobe. Following diagram indicates the input timing for sampling with dummy read strobe in DDR mode

**Figure 30-30. Input Timing for sampling with dummy read strobe in DDR mode**

### 30.7.14.3 Input timing for sampling with flash provided read strobe

This section describes the input timing when sampling with flash provided read strobe (MCR0[RXCLKSRC] is set to 0x3). The input timing is different for SDR mode and DDR mode.

**NOTE**

There are no known devices that provide read strobe and support SDR mode operation.

There are two kinds of Flash provided read strobe:

- **Flash provide read strobe with SCK2**

For certain flash devices, it provide read strobe with SCK2 and provide read data with SCK. Then read strobe edge is on the center with valid data window. FlexSPI controller should sample read data with read strobe directly (DLL is bypassed), refer [DLL configuration for sampling](#) for more details. Following diagrams indicates the input timing for sampling with flash read strobe in SDR mode and DDR mode:

**Figure 30-31. Input Timing 1 for Flash provided read strobe in SDR mode**

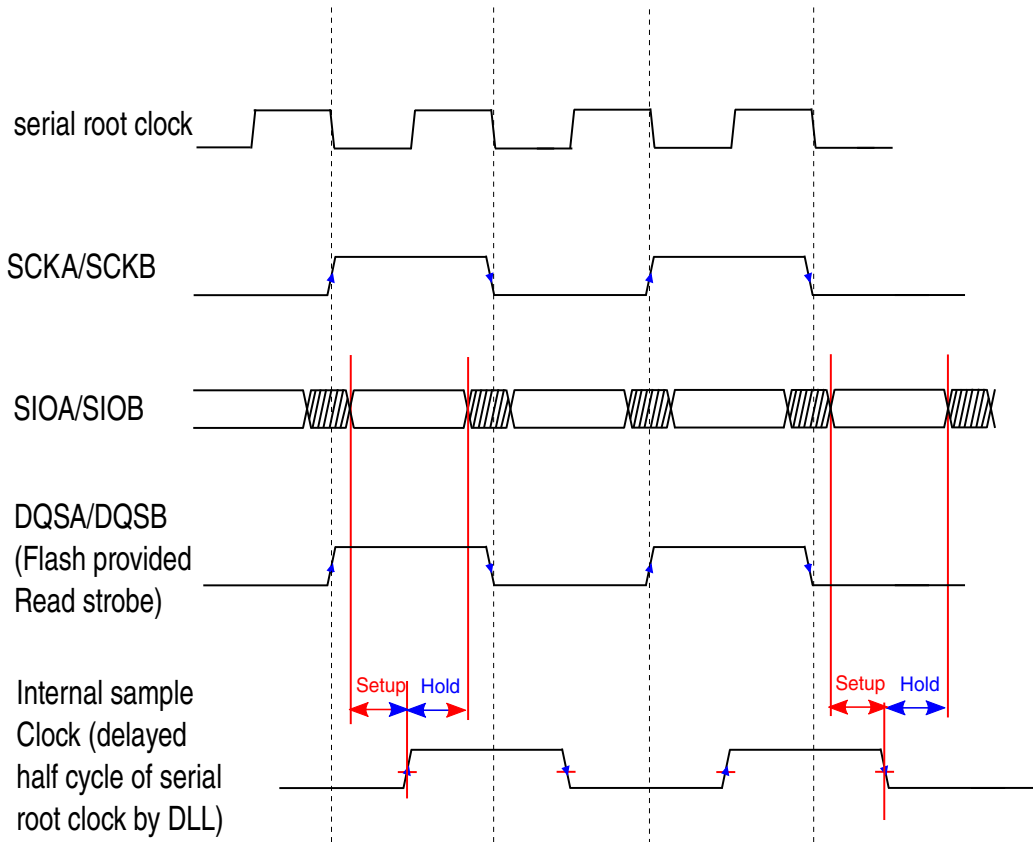

**Figure 30-32. Input Timing 1 for Flash provided read strobe in DDR mode**

- **Flash provide read strobe with SCK**

For certain flash devices, it provides both read data and read strobes with SCK. Then the read strobe edge is aligned with read data change. FlexSPI controller should delay read strobe by half cycle in serial root clock (with DLL) and then sample read data with delayed strobe. Refer [DLL configuration for sampling](#) for more details. Following diagrams indicates the input timing for sampling with flash read strobe in SDR mode and DDR mode:

**Figure 30-33. Input Timing 2 for Flash provided read strobe in SDR mode**

**Figure 30-34. Input Timing 2 for Flash provided read strobe in DDR mode**

### 30.7.14.4 DLL configuration for sampling

The input timing is different for those four sampling clock source. This is handled by setting register DLLxCR differently according to the sampling clock source mode. DLL is a delay line chain, which could be set to a fixed number of delay cells or auto-adjusted to lock on a certain phase delay to the reference clock.

- In following cases, DLLxCR should be set 0x00000100 (1 fixed delay cells in DLL delay chain) :
  - Sampling data with Dummy read strobe loopbacked internally(MCR0[RXCLKSRC]=0x0)
  - Sampling data with Dummy read strobe loopbacked from DQS pad(MCR0[RXCLKSRC]=0x1)
  - Sampling data with Flash provided read strobe (MCR0[RXCLKSRC]=0x3) and flash provides read strobe with SCK2
- When data is sampled with Flash provided read strobe (MCR0[RXCLKSRC]=0x3) and flash provides read strobe with SCK, DLL should be set as following to lock on half cycle of the reference clock (serial root clock)

- SLVDLYTARGET=0xF
- DLEN=0x1
- OVRDEN=0x0
- Other fields in DLLxCR should be kept as reset value (all zero)

### NOTE

If serial root clock is lower than 100 MHz, DLL is unable to lock on half cycle of serial root clock because the delay cell number is limited in delay chain. Then DLL should be configured as following instead:

- OVRDEN=0x1
- OVRDVAL=N; Each delay cell in DLL is about 75 ps~225 ps. The delay of DLL delay chain is (N \* Delay\_cell\_delay), N should be set based on max. DDR frequency that current project supported, N = 21, please notice this is a recommended value. May need to adjust in real application if facing failure.
- Other fields in DLLxCR should be kept as reset value (all zero).

## 30.7.15 Execute-In-Place Enhance mode

FlexSPI always support Execute-In-Place no matter external device provided Execute-In-Place enhanced mode or not. Execute-In-Place is supported by putting program code on External device, then read/execute on external device directly by AHB read access to SFM space. There is no configuration or status polling needed during AHB read access to External device memory and AHB RX buffer is fully transparent to software.

Certain devices provide XIP enhanced mode to improve code execution (XIP). In this mode, there is no need to provide Command code for Read Sequence. It saves many cycles for Command Instructions and greatly improves code execution (XIP). This XIP enhanced mode is entered/exit by a special sequence which is device specified. Please refer to external device datasheet for more detail.

Normally, the XIP enhanced mode is entered by following sequence:

1. Enable XIP enhanced mode in External Flash by IP command
2. Send the first Read Sequence to External Flash device with correct Mode bits.  
Command code is needed in this Read sequence.
3. Send following Read sequences to External Flash device with correct Mode bits.  
Command code is not needed in these Read Sequences. But Mode bits should be sent

according to Flash specified. Otherwise Flash will exit Execute-In-Place Enhanced mode.

The instruction `JMP_ON_CS` in FlexSPI should be used to support external device XIP enhanced mode. This instruction is only allowed in AHB Read command, otherwise there will be `IPCMDERR` or `AHBCDMERR` error interrupt generated if this interrupt is enabled. `JMP_ON_CS` should never be used if device doesn't support XIP enhanced mode. To support XIP enhanced mode, the first instruction in the Read Sequence should be Command instruction and the last valid instruction should be `JMP_ON_CS` (with operand `0x1`).

For the first AHB read Command triggered, FlexSPI will execute the instructions from the instruction pointer 0 in the sequence (which is Command instruction). After this sequence executed FlexSPI will save operand in `JMP_ON_CS` instruction as start pointer for next Command to current device internally. For the following AHB read Command triggered, FlexSPI will execute from instruction pointer `0x1` and Command instruction is bypassed.

Following diagram indicates XIP operation with Flash XIP Enhanced mode:

**Figure 30-35. XIP Enhanced Mode operation**

## 30.8 Application information

This section describes applications supported by the FlexSPI module.

### 30.8.1 FlexSPI Initialization

FlexSPI controller initialization sequence is as following:

- Enable controller clocks (AHB clock/IP Bus clock/Serial root clock) in System level.
- Set `MCR0[MDIS]` to `0x1` (Make sure controller is configured in module stop mode)
- Configure module control registers: `MCR0`, `MCR1`, `MCR2`. (Don't change `MCR0[MDIS]`)
- Configure AHB bus control register (`AHBCR`) and AHB RX Buffer control registers (`AHBRXBUFxCR`) optionally if AHB command will be used

- Configure Flash control registers (FLSHxCR0,FLSHxCR1,FLSHxCR2) according to external device type
- Configure DLL control register (DLLxCR) according to sample clock source selection
- set MCR0[MDIS] to 0x0 (Exit module stop mode)
- Configure LUT as needed (For AHB command or IP command)
- Reset controller optionally (by set MCR0[SWRESET] to 0x1)

External device needs configuration by IP command normally after controller initialization. For example, the device configuration is done by WRITE STATUS command for most serial NOR Flash.

## 30.8.2 Overview of Error Flags

The following table gives an overview of error category, flags and triggered source.

**Table 30-7. Error category and flags in FlexSPI**

Error Category	Triggered Source	Description	Error Flags
Command grant error	AHB write command	Command grant timeout	INTR[AHBCMDGE] will be set AHB bus error response
	AHB read command		INTR[AHBCMDGE] will be set AHB bus error response
	IP command		INTR[IPCMDGE] will be set
Command check error	AHB write comand	<ul style="list-style-type: none"> <li>• AHB write command with JMP_ON_CS instruction used in the sequence</li> <li>• There is unknown instruction opcode in the sequence.</li> <li>• Instruction DUMMY_SDR/ DUMMY_RWDS_SDR used in DDR sequence.</li> <li>• Instruction DUMMY_DDR/ DUMMY_RWDS_DDR used in SDR sequence.</li> </ul>	INTR[AHBCMDERR] will be set Command is not executed when error detected in command check
	AHB read command	<ul style="list-style-type: none"> <li>• There is unknown instruction opcode in the sequence.</li> <li>• Instruction DUMMY_SDR/ DUMMY_RWDS_SDR used in DDR sequence.</li> <li>• Instruction DUMMY_DDR/ DUMMY_RWDS_DDR used in SDR sequence.</li> </ul>	INTR[AHBCMDERR] will be set Command is not executed when error detected in command check

*Table continues on the next page...*

**Table 30-7. Error category and flags in FlexSPI (continued)**

Error Category	Triggered Source	Description	Error Flags
	IP command	<ul style="list-style-type: none"> <li>IP command with JMP_ON_CS instruction used in the sequence</li> <li>There is unknown instruction opcode in the sequence.</li> <li>Instruction DUMMY_SDR/ DUMMY_RWDS_SDR used in DDR sequence.</li> <li>Instruction DUMMY_DDR/ DUMMY_RWDS_DDR used in SDR sequence.</li> <li>Flash boundary across.</li> </ul>	<p>INTR[IPCMDERR] will be set</p> <p>Command is not executed when error detected in command check</p>

**NOTE**

- flash\_top\_address is the top address of currently accessed flash

**30.8.3 Application on Serial NOR Flash device**

This section provides the example sequences for serial NOR flash device (Spansion Flash S25FS128S).

**30.8.3.1 Write Enable command**

The following table shows WRITE ENABLE command sequence.

**Table 30-8. WRITE ENABLE command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0	0x06	command name:WREN
1~7	STOP (0x00)	0x0	0x00	

**30.8.3.2 Write Registers command**

The following table shows Write Registers command sequence.

**Table 30-9. Write Registers command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0x01	command name:WRR
1	WRITE_SDR	0x0 (Single)	0x1 or 0x2	Data size is 1 or 2byte. Byte 0 write data for Status Register 1; Byte 1 write data for Configuration Register 1  This value could be overridden by IPCR1[IDATSZ].
2~7	STOP (0x00)	0x0	0x00	

### 30.8.3.3 Page Program command

The following table shows Page Program command sequence.

**Table 30-10. PAGE PROGRAM command (Spansion serial NOR flash)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0x02 or 0x12	command name: PP or 4PP PP is 3-Byte address mode. 4PP is 4-Byte address mode
1	ADDR_SDR	0x0 (Single)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	WRITE_SDR	0x0 (Single)	Any non-zero value	This operand value could be used as default programming data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
3~7	STOP (0x00)	0x0	0x00	

The following table shows Page Program command sequence (QPI mode).

**Table 30-11. PAGE PROGRAM (QPI mode) command (Spansion serial NOR flash)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x2 (Quad)	0x02 or 0x12	command name: PP or 4PP PP is 3-Byte address mode. 4PP is 4-Byte address mode
1	ADDR_SDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	WRITE_SDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default programming data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
3~7	STOP (0x00)	0x0	0x00	

### 30.8.3.4 Read Status 1 command

The following table shows READ STATUS 1 command sequence.

**Table 30-12. READ STATUS 1 command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0x05	command name:RDSR1
1	READ_SDR	0x0 (Single)	0x1	1 Byte for Status register 1
2~7	STOP (0x00)	0x0	0x00	

### 30.8.3.5 Read command

The following table shows READ command sequence.

**Table 30-13. READ command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0x03 or 0x13	command name:READ or 4READ READ is 3-Byte address mode. 4READ is 4-Byte address mode
1	ADDR_SDR	0x0 (Single)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	READ_SDR	0x0 (Single)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
3~7	STOP (0x00)	0x0	0x00	

### 30.8.3.6 Fast Read command

The following table shows Fast Read command sequence (In case of CR2V[7]=0, CR2V[3:0]=0x8).

**Table 30-14. FAST\_READ command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0x0B or 0x0C	command name:FAST_READ or 4FAST_READ FAST_READ is 3-Byte address mode. 4FAST_READ is 4-Byte address mode

*Table continues on the next page...*

**Table 30-14. FAST\_READ command (continued)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
1	ADDR_SDR	0x0 (Single)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	DUMMY_SDR	0x0 (Single)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
3	READ_SDR	0x0 (Single)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
4~7	STOP (0x00)	0x0	0x00	

### 30.8.3.7 Dual IO Fast Read command

The following table shows Dual IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[3:0]=0x8, Continuous Read mode).

**Table 30-15. Dual IO FAST\_READ command (Continuous Read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xBB or 0xBC	command name:DIOR or 4DIOR DIOR is 3-Byte address mode. 4DIOR is 4-Byte address mode
1	ADDR_SDR	0x1 (Dual)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_SDR	0x1 (Dual)	0xAx	Enter continuous read mode or keep in continuous read mode.
3	DUMMY_SDR	0x1 (Dual)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	READ_SDR	0x1 (Dual)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5	JMP_ON_CS	0x0 (or Dont care)	0x01	The CMD instruction will be bypassed after the first read access.
6~7	STOP (0x00)	0x0	0x00	

The following table shows Dual IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[3:0]=0x8, Non-Continuous Read mode).

**Table 30-16. Dual IO FAST\_READ command (Non-Continuous Read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xBB or 0xBC	command name:DIOR or 4DIOR DIOR is 3-Byte address mode. 4DIOR is 4-Byte address mode
1	ADDR_SDR	0x1 (Dual)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_SDR	0x1 (Dual)	Any value other than 0xAx	Exit continuous read mode or keep in non-continuous read mode.
3	DUMMY_SDR	0x1 (Dual)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	READ_SDR	0x1 (Dual)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5~7	STOP (0x00)	0x0	0x00	

### 30.8.3.8 Quad IO Fast Read command

The following table shows Quad IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[6]=0, CR2V[3:0]=0x8, Non-QPI mode, Non-Continuous read mode).

**Table 30-17. Quad IO FAST\_READ command (Non-QPI mode, Non-Continuous read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xEB or 0xEC	command name:QIOR or 4QIOR QIOR is 3-Byte address mode. 4QIOR is 4-Byte address mode
1	ADDR_SDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_SDR	0x2 (Quad)	Any value other than 0xAx	Exit continuous read mode or keep in non-continuous read mode.
3	DUMMY_SDR	0x2 (Quad)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	READ_SDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5~7	STOP (0x00)	0x0	0x00	

## Application information

The following table shows Quad IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[6]=0, CR2V[3:0]=0x8, Non-QPI mode, Continuous read mode).

**Table 30-18. Quad IO FAST\_READ command (Non-QPI mode, Continuous read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xEB or 0xEC	command name:QIOR or 4QIOR QIOR is 3-Byte address mode. 4QIOR is 4-Byte address mode
1	ADDR_SDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_SDR	0x2 (Quad)	0xA0	Enter continuous read mode or keep in continuous read mode.
3	DUMMY_SDR	0x2 (Quad)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	READ_SDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5	JMP_ON_CS	0x0 (or Dont care)	0x01	The CMD instruction will be bypassed after the first read access.
6~7	STOP (0x00)	0x0	0x00	

The following table shows Quad IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[6]=1, CR2V[3:0]=0x8, QPI mode, Continuous read mode).

**Table 30-19. Quad IO FAST\_READ command (QPI mode, Continuous read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x2 (Quad)	0xEB or 0xEC	command name:QIOR or 4QIOR QIOR is 3-Byte address mode. 4QIOR is 4-Byte address mode
1	ADDR_SDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_SDR	0x2 (Quad)	0xA0	Enter continuous read mode or keep in continuous read mode.
3	DUMMY_SDR	0x2 (Quad)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	READ_SDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5	JMP_ON_CS	0x0 (or Dont care)	0x01	The CMD instruction will be bypassed after the first read access.
6~7	STOP (0x00)	0x0	0x00	

### 30.8.3.9 DDR Quad IO Fast Read command

The following table shows DDR Quad IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[6]=0, CR2V[3:0]=0x8, Non-QPI mode, Non-Continuous read mode).

**Table 30-20. DDR Quad IO FAST\_READ command (Non-QPI mode, Non-Continuous read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xED or 0xEE	command name:QIOR_DDR or 4QIOR_DDR QIOR_DDR is 3-Byte address mode. 4QIOR_DDR is 4-Byte address mode
1	ADDR_DDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_DDR	0x2 (Quad)	Any value other than 0xAx	Exit continuous read mode or keep in non-continuous read mode.
3	DUMMY_DDR	0x2 (Quad)	0x08	Dummy cycle is 8 (in serial root clock) as CR2V[3:0]=0x8.
4	LEARN_DDR	0x2 (Quad)	0x1	DLP (Data Learning Pattern is 8 bits).
5	READ_DDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
6~7	STOP (0x00)	0x0	0x00	

The following table shows DDR Quad IO FAST\_READ command sequence (In case of CR2V[7]=0, CR2V[6]=0, CR2V[3:0]=0x8, Non-QPI mode, Continuous read mode).

**Table 30-21. DDR Quad IO FAST\_READ command (Non-QPI mode, Continuous read mode)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x0 (Single)	0xED or 0xEE	command name:QIOR_DDR or 4QIOR_DDR QIOR_DDR is 3-Byte address mode. 4QIOR_DDR is 4-Byte address mode
1	ADDR_DDR	0x2 (Quad)	0x18 or 0x20	Address bit number (operand value) should be 24 in 3-Byte address mode and 32 in 4-Byte address mode.
2	MODE8_DDR	0x2 (Quad)	0xA0	Enter continuous read mode or keep in continuous read mode.

*Table continues on the next page...*

### 30.8.4.2 HyperRAM

This section provides the example sequences for HyperRAM (Cypress S27KL series).

Read (memory) command sequence is same as HyperFlash. The following table shows Write (memory) command sequence.

**Table 30-27. Write (memory) command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_DDR	0x3 (Octal)	0x20	CA bit 47: (R/W#) = 0x0 CA bit 46: (Target) = 0x0 CA bit 45: (Burst Type) = 0x1 CA bit 44-40: All reserved = 0x0
1	RADDR_DDR	0x3 (Octal)	0x18	Row Address: 24 bits

*Table continues on the next page...*

**Table 30-27. Write (memory) command (continued)**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
2	CADDR_DDR	0x3 (Octal)	0x10	Column Address: (13 zero bits + 3 valid bits)
3	DUMMY_RWDS_D DR	0x3 (Octal)	0x0B	In case of latency count=11
4	WRITE_DDR	0x3 (Octal)	Any non-zero value	This operand value could be used as default write data size if IPCR0.IDATSZ is zero. This value is ignored for AHB command.
5~7	STOP (0x00)	0x0	0x00	

### 30.8.5 Application on Serial NAND Flash device

This section provides the example sequences for serial NAND flash device (Micron Flash MT29 series). The operation to serial NAND flash is quite similar to serial NOR flash.

READ operation sequence is as following:

- Page Read (Transfer the data from the NAND Flash array to the cache register)
- Get Feature to read the status
- Random Data Read

The following table shows Page Read command sequence.

**Table 30-28. Page Read command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x1 (Single)	0x13	Command code: 0x13
1	RADDR_SDR	0x1 (Single)	0x18	Row Address: 24 bit
2-7	STOP (0x0)	0x0	0x00	

The following table shows Get Feature command sequence.

**Table 30-29. Get Feature command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x1 (Single)	0x0F	Command code: 0x0F
1	CMD_SDR	0x1 (Single)	0xC0	Status register address (0xC0)
2	READ_SDR	0x1 (Single)	0x02	2 Byte read data
3-7	STOP (0x0)	0x0	0x00	

The following table shows Random Data Read command sequence.

**Table 30-30. Read From Cache x4 command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x1 (Single)	0x6B	Command code: 0x6B
1	MODE4_SDR	0x1 (Single)	0x0 or 0x1	Software should decode the flash address and set mode bits as 0x1 if plane selection is one, or 0x0 if plane selection is zero.  Plane selection bit is the 18th bit of flash address. If NAND flash size is less than 4Gbit, plane selection will always be zero.
2	CADDR_SDR	0x1 (Single)	0x0C	Column address: 12 bit
3	DUMMY_SDR	0x2 (Quad)	0x08	Dummy cycle number: 8 (serial root clock)
4	READ_SDR	0x2 (Quad)	Any non-zero value	This operand value could be used as default reading data size if IPCR0.IDATSZ is zero.
5-7	STOP (0x0)	0x0	0x00	

Program operation sequence is as folowing:

- Write Enable
- Program Load (Transfer the write data to the cache register)
- Program Execute
- Get Feature to read the status

The following table shows Program Load command sequence.

**Table 30-31. Program Load command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x1 (Single)	0x02	Command code: 0x02
1	MODE4_SDR	0x1 (Single)	0x0 or 0x1	Software should decode the flash address and set mode bits as 0x1 if plane selection is one, or 0x0 if plane selection is zero.  Plane selection bit is the 18th bit of flash address. If NAND flash size is less than 4Gbit, plane selection will always be zero.
2	CADDR_SDR	0x1 (Single)	0x0C	Column address: 12 bit
3	WRITE_SDR	0x1 (Single)	Any non-zero value	This operand value could be used as default write data size if IPCR0.IDATSZ is zero.
4-7	STOP (0x0)	0x0	0x00	

The following table shows Program Execute command sequence.

**Table 30-32. Program Execute command**

Instruction No.	Instruction opcode[5:0]	Instruction num_pads[1:0]	Instruction operand[7:0]	Comment
0	CMD_SDR	0x1 (Single)	0x10	Command code: 0x10
1	RADDR_SDR	0x1 (Single)	0x18	Row Address: 24 bit
2-7	STOP (0x0)	0x0	0x00	

### 30.8.6 Application on FPGA device

FPGA device should be accessed by AHB command. All AHB accesses to FPGA will be transparent to SW driver (no SW intervention). There may be some special requirements from FPGA device.

#### 1. Device type may be different on A1/A2/B1/B2

For this case, clear the MCR2[SAMEDEVICEEN] bit and configure FLSHxCR0 and FLSHxCR1 register separately for up to four external devices.

#### 2. Device needs different wait cycle for Programming.

The AHB write wait cycle number could be set separately for these four external devices (by register field FLSHxCR2[AWRWAIT]). Software could configure the sequences in LUT with different DUMMY instructions (operand will determine dummy cycle). Note that FlexSPI will hold AHB bus ready for this wait time, so AHB Bus performance may become very low when this wait time is very long.

#### 3. Device needs different wait cycle for Reading.

The AHB Read Sequence index and Sequence Number could be set separately for these four external devices (by register field FLSHxCR2[ARDSEQID] and FLSHxCR2[ARDSEQNUM]). Software could configure the sequences in LUT with different DUMMY instruction (operand will determine dummy cycle).

#### 4. Device may be sensitive to read instruction clock cycle number

Device will be sensitive to read instruction clock cycle number if its internal memory is implemented similar as FIFO. For this case, software could send the data size information to external device by DATSZ instruction. FPGA device should decode the data size information and determine how much data bytes should be popped.

#### 5. Device may needs interval time between Chip selection valid

This could be handled by register field `FLSHxCR2[CSINTERVAL]` setting.

#### **6. Device may use SCK as reference clock for its internal PLL**

In this case, SCK should be free-running and clock frequency should be stable. This could be achieved by setting `MCR0[SCKFREERUN_EN]` and use SDR sequence only.

# Chapter 31

## General Power Controller (GPC)

### 31.1 Overview

The General Power Control (GPC) block includes the sub-blocks listed here.

- CPU [Power Gating Control \(PGC\)](#)

Each sub-block has its own IP registers.

GPC determines wake-up IRQ for exiting WAIT/STOP mode (with or without CPU power gating).

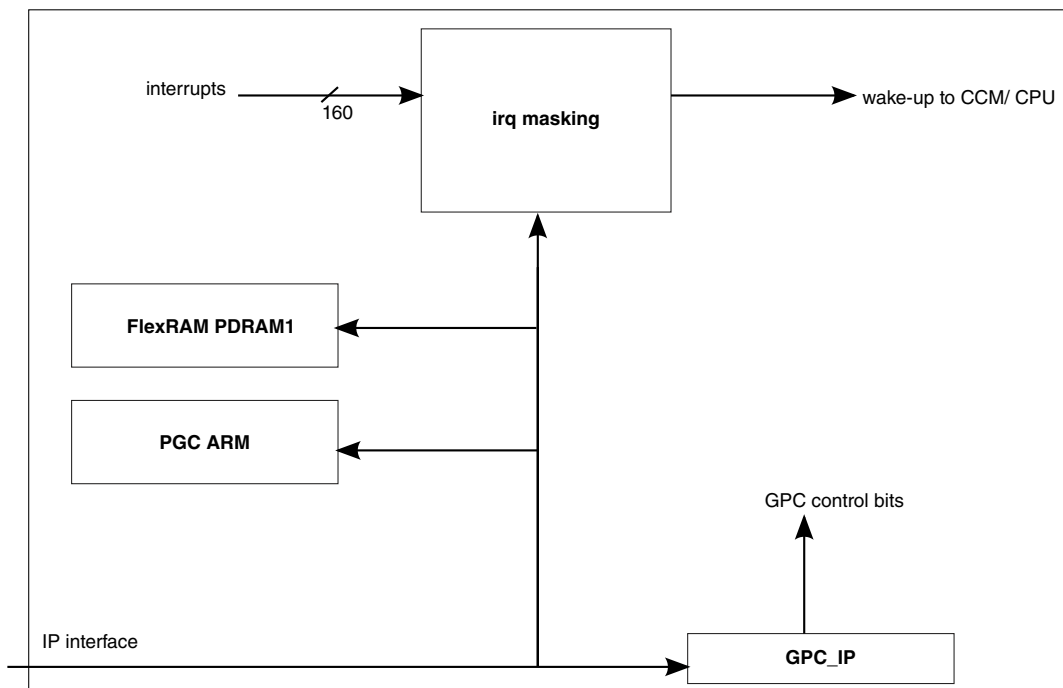

Figure 31-1. GPC Block Diagram

## 31.2 Clocks

The table found here describes the clock sources for GPC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 31-1. GPC Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
pgc_clk	ipg_clk_root	PGC peripheral clock
sys_clk	ipg_clk_root	Module clock

## 31.3 Power Gating Control (PGC)

Power Gating (PGC) is applied to the ARM CPU only in STOP low power mode, after all essential CPU registers data are saved by ARM dormant procedure.

If any of the unmasked interrupts appears, CPU is powered up and clock restore request (exit from STOP mode) is sent to CCM.

### PGC power down sequence:

- CCM sends power down request when the chip is about to enter stop mode. The user should define which modules will be powered down (PGCR registers of corresponding PGC module, bit 0).

### PGC power up sequence:

- One of the power up irq is asserted.
- Power up request is asserted in GPC and in CCM.
- The Power Gated modules are powered up, according to PGC settings of appropriate module.

The Power Gated modules require reset after powering up. The next figure describes GPC-SRC handshake procedure for reset after power gating.

Figure 31-2. GPC-SRC handshake for reset after power gating

### 31.3.1 Overview

The Power Gating Controller (PGC) is a power management component that controls the power-down and power-up sequencing of individual subsystems.

The sequence timing is programmable using the PGC control registers. [Figure 31-3](#) shows PGC as part of the SoC's overall power management scheme.

Figure 31-3. PGC Block Diagram

### 31.3.1.1 Features

Key features of the PGC include:

- Provides the ability to switch off power to a target subsystem.
- Generates power-up and power-down control sequences.
- Provides programmable registers to adjust the timing of the power control signals.

## 31.4 GPC Interrupt Controller (INTC)

The INTC (Interrupt Controller) detects an interrupt and generates the wakeup signal. It supports up to 160 interrupts.

### 31.4.1 Interrupt Controller features

The features of the GPC INTC are listed below.

Features:

- Supports up to 160 interrupts
- Provides an option to mask/unmask each interrupt
- Detects interrupts and generates the wake up signal
- 32-bits IP bus interface
- All registers are byte-accessible

## 31.5 GPC Memory Map/Register Definition

Detailed descriptions of each register can be found below.

**GPC memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
400F_4000	GPC Interface control register (GPC_CNTR)	32	R/W	0052_0000h	<a href="#">31.5.1/1595</a>

### 31.5.7 IRQ status resister 2 (GPC\_ISR2)

ISR2 Register - status of irq [63:32].

Address: 400F\_4000h base + 1Ch offset = 400F\_401Ch

#### GPC\_ISR2 field descriptions

Field	Description
ISR2	IRQ[63:32] status, read only

### 31.5.8 IRQ status resister 3 (GPC\_ISR3)

ISR3 Register - status of irq [95:64].

Address: 400F\_4000h base + 20h offset = 400F\_4020h

#### GPC\_ISR3 field descriptions

Field	Description
ISR3	IRQ[95:64] status, read only

### 31.5.9 IRQ status resister 4 (GPC\_ISR4)

ISR4 Register - status of irq [127:96].

Address: 400F\_4000h base + 24h offset = 400F\_4024h

#### GPC\_ISR4 field descriptions

Field	Description
ISR4	IRQ[127:96] status, read only

### 31.5.10 IRQ masking register 5 (GPC\_IMR5)

IMR5 Register - masking of irq[159:128].

Address: 400F\_4000h base + 34h offset = 400F\_4034h

#### GPC\_IMR5 field descriptions

Field	Description
IMR5	IRQ[159:128] masking bits: 1-irq masked, 0-irq is not masked

### 31.5.11 IRQ status resister 5 (GPC\_ISR5)

ISR5 Register - status of irq [159:128].

Address: 400F\_4000h base + 38h offset = 400F\_4038h

#### GPC\_ISR5 field descriptions

Field	Description
ISR4	IRQ[159:128] status, read only

## 31.6 PGC Memory Map/Register Definition

The PGC registers can be accessed only in supervisor mode.

Attempts to access registers when not in supervisor mode or attempts to access an unimplemented address location might trigger a bus transfer error. (The hardware asserts the signal `ips_xfr_err` if the PGC has been integrated with `resp_sel` tied low.) In this case, software should take appropriate action (such as ignore the error, log the error, or initiate a soft reset).

All PGC registers are byte-accessible.

#### NOTE

The base address of each PGC module instantiation is specified in the GPC module. Absolute address values will be calculated by `[GPC base address] + [PGC CPU/MEGA Offset]`.

#### NOTE

PGC MEGA is used to control the power gate of FlexRAM PDRAM1 domain (bank8-15). PGC CPU is used to control the power gate of PDM7 domain (CM7 CPU). FlexRAM PDRAM0 domain (bank1-7) is further controlled by `GPC_CNTR[PDRAM0_PGE]` bit.

PGC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
400F_4220	PGC Mega Control Register (PGC_MEGA_CTRL)	32	R/W	0000_0000h	<a href="#">31.6.1/1602</a>

# Chapter 32

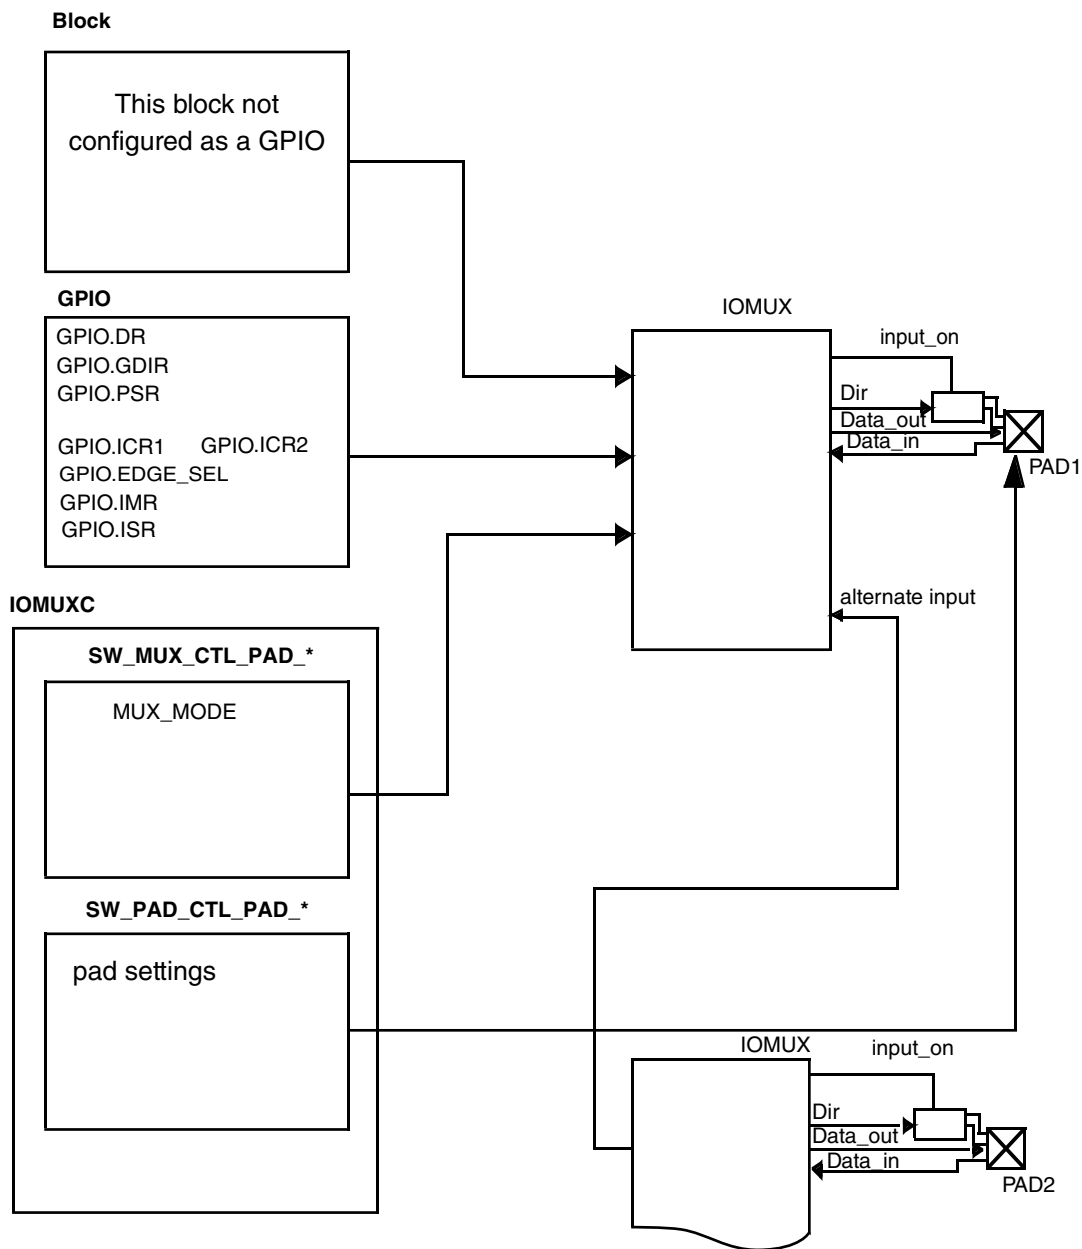

## General Purpose Input/Output (GPIO)

### 32.1 Overview

The GPIO general-purpose input/output peripheral provides dedicated general-purpose pins that can be configured as either inputs or outputs.

When configured as an output, it is possible to write to an internal register to control the state driven on the output pin. When configured as an input, it is possible to detect the state of the input by reading the state of an internal register. In addition, the GPIO peripheral can produce CORE interrupts.

The GPIO is one of the blocks controlling the IOMUX of the chip.

**Figure 32-1. Chip IOMUX Scheme**

The GPIO functionality is provided through eight registers, an edge-detect circuit, and interrupt generation logic.

The eight registers are:

- Data register (GPIO\_DR)
- GPIO direction register (GPIO\_GDIR)
- Pad sample register (GPIO\_PSR)
- Interrupt control registers (GPIO\_ICR1, GPIO\_ICR2)

- Edge select register (GPIO\_EDGE\_SEL)
- Interrupt mask register (GPIO\_IMR)
- Interrupt status register (GPIO\_ISR)

These registers are described in detail in the Register section.

Each GPIO input has a dedicated edge-detect circuit which can be configured through software to detect rising edges, falling edges, logic low-levels or logic high-levels on the input signals. The outputs of the edge detect circuits are optionally masked by setting the corresponding bit in the interrupt mask register (GPIO\_IMR). These qualified outputs are OR'ed together to generate two one-bit interrupt lines:

- Combined interrupt indication for GPIOx signals 0 - 15
- Combined interrupt indication for GPIOx signals 16 - 31

In addition, GPIO1 provides visibility to each of its 8 low order interrupt sources (i.e. GPIO1 interrupt n, for n = 0 – 7). However, individual interrupt indications from other GPIOx are not available.

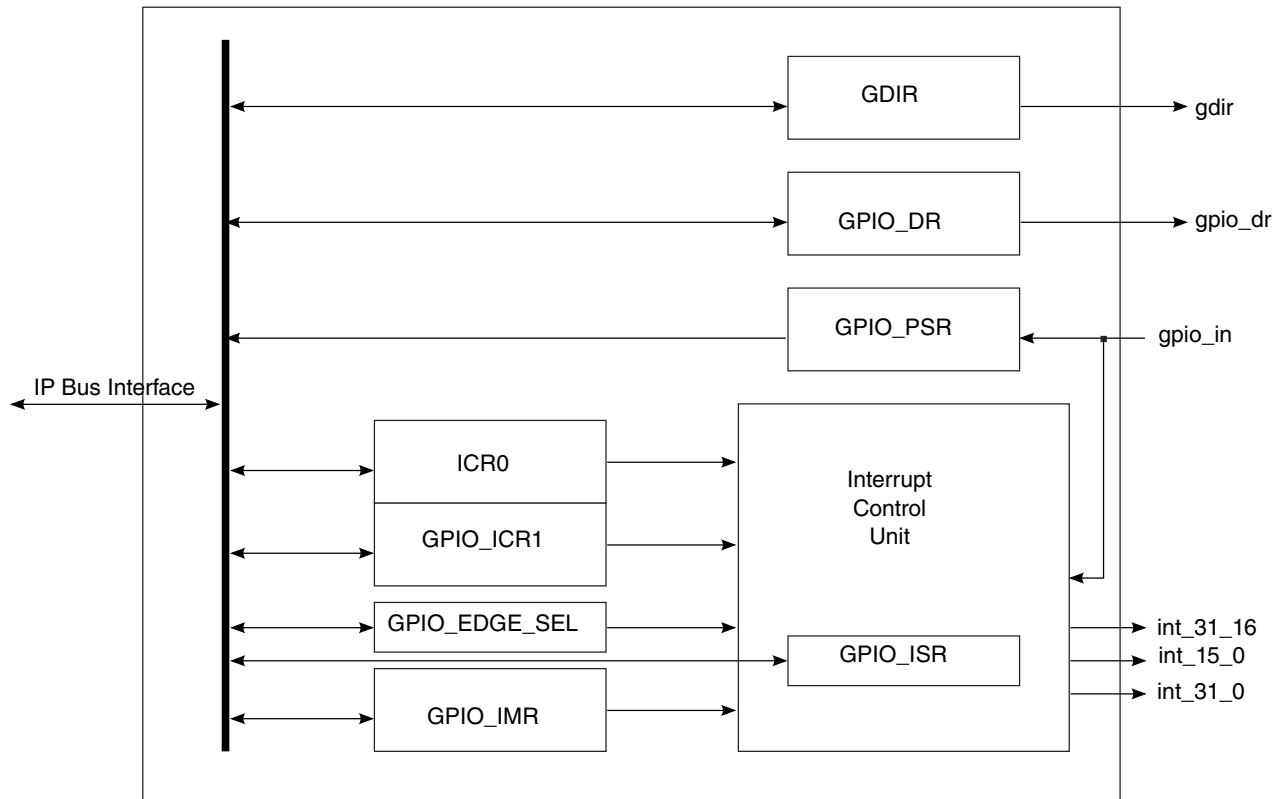

The GPIO edge detection is described further in [Interrupt Control Unit](#).

The GPIO's overall functionality is described further in [GPIO Functional Description](#).

### 32.1.1 Block Diagram

The GPIO subsystem contains multiple GPIO blocks, which can generate and control up to 32 signals for general purpose.

A block diagram of the GPIO is shown in [Figure 32-2](#)

**Figure 32-2. GPIO Block Diagram**

### 32.1.2 Features

The GPIO includes the following features:

- General purpose input/output logic capabilities:
  - Drives specific data to output using the data register (GPIO\_DR)
  - Controls the direction of the signal using the GPIO direction register (GPIO\_GDIR)
  - Enables the core to sample the status of the corresponding inputs by reading the pad sample register (GPIO\_PSR).
- GPIO interrupt capabilities:
  - Supports up to 32 interrupts
  - Identifies interrupt edges
  - Generates three active-high interrupts to the SoC interrupt controller

## 32.2 Clocks

The table found here describes the clock sources for GPIO.

Please see the CCM for clock setting, configuration and gating information.

**Table 32-1. GPIO Clocks**

Clock name	Description
ipg_clk_s	Peripheral access clock

## 32.3 GPIO Functional Description

This section provides a complete functional description of the block.

### 32.3.1 GPIO Function

A GPIO signal can operate as a general-purpose input/output when the IOMUX is set to GPIO mode. Each GPIO signal may be independently configured as either an input or an output using the GPIO direction register (GPIO\_GDIR).

When configured as an output (GPIO\_GDIR bit = 1), the value in the data bit in the GPIO data register (GPIO\_DR) is driven on the corresponding GPIO line. When a signal is configured as an input (GPIO\_GDIR bit = 0), the state of the input can be read from the corresponding GPIO\_PSR bit.

## 32.3.2 GPIO pad structure

Figure 32-3. GPIO pad functional diagram

### 32.3.2.1 Input Driver

Input driver characteristics

- Selectable Schmitt trigger or CMOS input mode
- Keeper structure with buffer at the input receiver output to Core
- Receiver is tri-stated when I/O supply (OVDD) is powered down. (Keeper at receiver output keeps its previous state).

#### 32.3.2.1.1 Schmitt trigger

The anti-jamming functionality of the Schmitt trigger is illustrated below.

Figure 32-4. Schmitt trigger transfer characteristic

Figure 32-5. Receiver output in CMOS and hysteresis

### 32.3.2.1.2 Input keeper

A simple latch to hold the input value when OVDD is powered down, or the first inverter is tri-stated. Input buffer's keeper is always enabled for all the pads.

### 32.3.2.2 Output Driver

Output driver characteristics

- Selectable CMOS or open-drain output type

- Selectable pull-keeper enable signal to enable/disable the pull-up/down and output keeper
- Selectable pull-up resistors of 22K, 47K, 100K and a pull-down resistor of 100KOhm. Unsilicided P+ poly resistor is used to limit resistance variation to within +/- 20%.
- Pull-up, pull-down, and pad keeper are disabled in output mode.
- Seven drive strengths in each operating mode
- Additional 2-bit slew rate control to select between 50, 100, and 200 MHz IO cell operation range with reduced switching noise

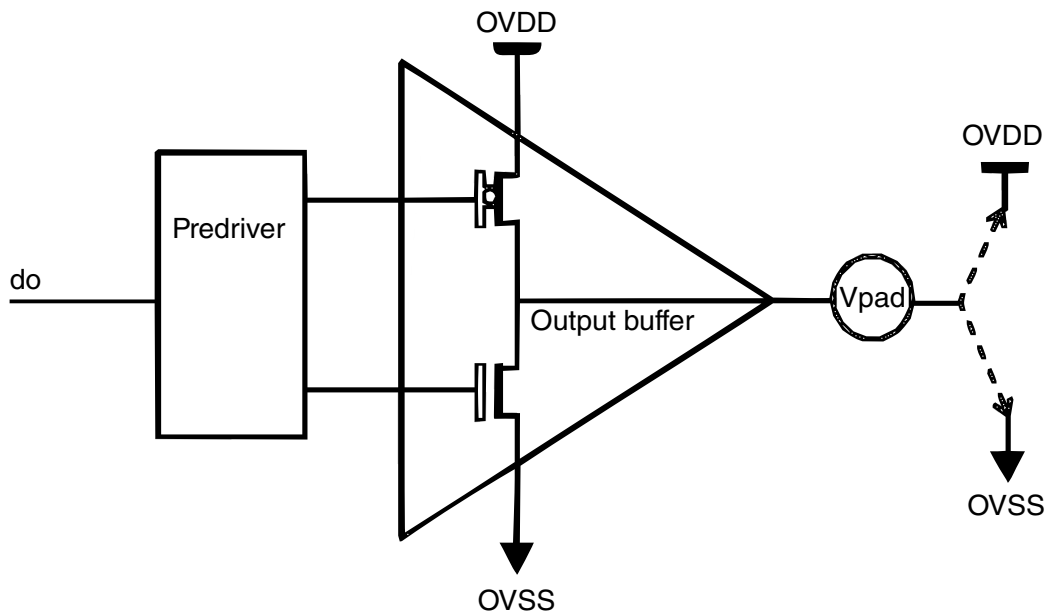

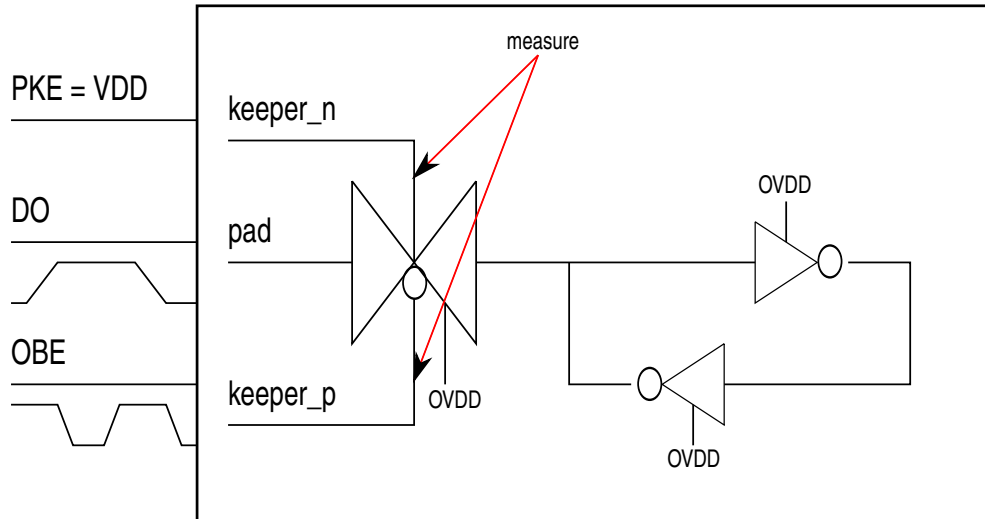

Figure 32-6. Output Driver Functional Diagram

### 32.3.2.2.1 Drive strength

Drive strength selection can be used to make the impedance matched and get better signal integrity.

### 32.3.2.2.2 Output keeper

A simple latch to hold the input value.

**Figure 32-7. Keeper functional diagram**

### 32.3.2.2.3 PU / PD / Keeper Logic

When Keeper is enabled, the pull-up and pull-down are disabled, and the output value of the pad depends on the Keeper. The output keeper is powered by OVDD. When the core VDD is powered down or the first inverter is tri-stated, the pad's state can be kept. Keeper and Pull can't be enabled together.

### 32.3.2.2.4 Open drain

Open drain is a circuit technique which allows multiple devices to communication over a single wire bi-directionally. Open drain drivers usually operate with an external or internal pull-up resistor that holds the signal line high until a device sinks enough current to pull the line low, usually used for a bus with multiple devices.

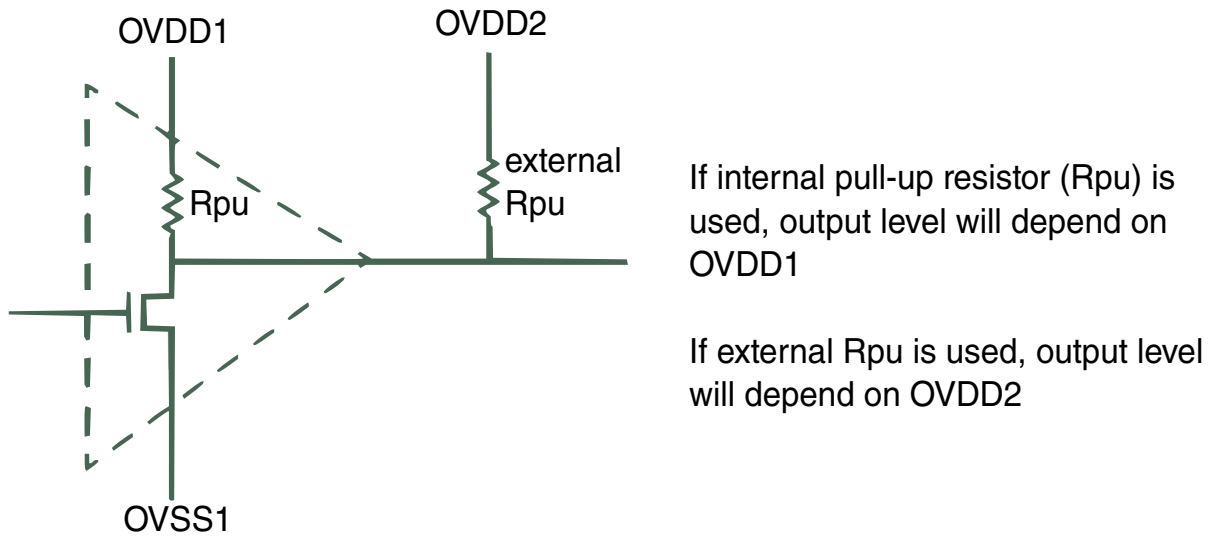

Figure 32-8. Output buffer in open drain mode

### 32.3.3 GPIO Programming

#### 32.3.3.1 GPIO Read Mode

The programming sequence for reading input signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUX Controller (IOMUXC)).
2. Configure GPIO direction register to input (GPIO\_GDIR[GDIR] set to 0b).
3. Read value from data register/pad status register.

A pseudocode description to read [input3:input0] values is as follows:

```
// SET INPUTS TO GPIO MODE.
write sw_mux_ctl<input0><input1><input2><input3>, 32'h00000000
// SET GDIR TO INPUT.
write GDIR[31:4,input3_bit, input2_bit, input1_bit, input0_bit,] 32'hxxxxxxxx0
// READ INPUT VALUE FROM DR.
read DR
// READ INPUT VALUE FROM PSR.
read PSR
```

#### NOTE

While the GPIO direction is set to input (GPIO\_GDIR = 0), a read access to GPIO\_DR does not return GPIO\_DR data. Instead, it returns the GPIO\_PSR data, which is the corresponding input signal value.

### 32.3.3.2 GPIO Write Mode

The programming sequence for driving output signals should be as follows:

1. Configure IOMUX to select GPIO mode (Via IOMUXC), also enable SION if need to read loopback pad value through PSR
2. Configure GPIO direction register to output (GPIO\_GDIR[GDIR] set to 1b).
3. Write value to data register (GPIO\_DR).

A pseudocode description to drive 4'b0101 on [output3:output0] is as follows:

```
// SET PADS TO GPIO MODE VIA IOMUX.
write sw_mux_ctl_pad_<output[0-3]>.mux_mode, <GPIO_MUX_MODE>
// Enable loopback so we can capture pad value into PSR in output mode
write sw_mux_ctl_pad_<output[0-3]>.sion, 1
// SET GDIR=1 TO OUTPUT BITS.
write GDIR[31:4,output3_bit,output2_bit, output1_bit, output0_bit,] 32'hxxxxxxx5
// WRITE OUTPUT VALUE=4'b0101 TO DR.
write DR, 32'hxxxxxxx5
// READ OUTPUT VALUE FROM PSR ONLY.
read_cmp PSR, 32'hxxxxxxx5
```

### 32.3.4 Interrupt Control Unit

In addition to the general-purpose input/output function, the edge-detect logic in the GPIO peripheral reflects whether a transition has occurred on a given GPIO signal that is configured as an input (GDIR bit = 0). The interrupt control registers (GPIO\_ICR1 and GPIO\_ICR2) may be used to independently configure the interrupt condition of each input signal (low-to-high transition, high-to-low transition, low, or high). For information about GPIO\_ICR1 and GPIO\_ICR2 settings, see the Register section.

The interrupt control unit is built of 32 interrupt control subunits, where each subunit handles a single interrupt line.

## 32.4 GPIO Register Descriptions

There are eight 32-bit GPIO registers. All registers are accessible from the IP interface. Only 32-bit access is supported.

The GPIO memory map is shown in the following table.

### 32.4.1 GPIO Memory map

GPIO $n$  base address: 401B\_8000h + (n-1)×4000h, where  $n$  is from 1 to 4.

GPIO5 base address: 400C\_0000h.

Offset	Register	Width (In bits)	Access	Reset value
0h	GPIO data register (DR)	32	RW	0000_0000h
4h	GPIO direction register (GDIR)	32	RW	0000_0000h
8h	GPIO pad status register (PSR)	32	RO	0000_0000h
Ch	GPIO interrupt configuration register1 (ICR1)	32	RW	0000_0000h
10h	GPIO interrupt configuration register2 (ICR2)	32	RW	0000_0000h
14h	GPIO interrupt mask register (IMR)	32	RW	0000_0000h
18h	GPIO interrupt status register (ISR)	32	W1C	0000_0000h
1Ch	GPIO edge select register (EDGE_SEL)	32	RW	0000_0000h
84h	GPIO data register SET (DR_SET)	32	WO	0000_0000h
88h	GPIO data register CLEAR (DR_CLEAR)	32	WO	0000_0000h
8Ch	GPIO data register TOGGLE (DR_TOGGLE)	32	WO	0000_0000h

### 32.4.2 GPIO data register (DR)

#### 32.4.2.1 Offset

Register	Offset
DR	0h

#### 32.4.2.2 Function

The 32-bit GPIO\_DR register stores data that is ready to be driven to the output lines. If the IOMUXC is in GPIO mode and a given GPIO direction bit is set, then the corresponding DR bit is driven to the output. If a given GPIO direction bit is cleared, then a read of GPIO\_DR reflects the value of the corresponding signal. Two wait states are required in read access for synchronization.

The results of a read of a DR bit depends on the IOMUXC input mode settings and the corresponding GDIR bit as follows:

- If GDIR[ $n$ ] is set and IOMUXC input mode is GPIO, then reading DR[ $n$ ] returns the contents of DR[ $n$ ].
- If GDIR[ $n$ ] is cleared and IOMUXC input mode is GPIO, then reading DR[ $n$ ] returns the corresponding input signal's value.
- If GDIR[ $n$ ] is set and IOMUXC input mode is not GPIO, then reading DR[ $n$ ] returns the contents of DR[ $n$ ].
- If GDIR[ $n$ ] is cleared and IOMUXC input mode is not GPIO, then reading DR[ $n$ ] always returns zero.

### 32.4.2.3 Diagram

### 32.4.2.4 Fields

Field	Function
31-0	DR
DR	Data bits. This register defines the value of the GPIO output when the signal is configured as an output (GDIR[ $n$ ]=1). Writes to this register are stored in a register. Reading GPIO_DR returns the value stored in the register if the signal is configured as an output (GDIR[ $n$ ]=1), or the input signal's value if configured as an input (GDIR[ $n$ ]=0).  <b>NOTE:</b> The I/O multiplexer must be configured to GPIO mode for the GPIO_DR value to connect with the signal. Reading the data register with the input path disabled always returns a zero value.

## 32.4.3 GPIO direction register (GDIR)

### 32.4.3.1 Offset

Register	Offset
GDIR	4h

### 32.4.3.2 Function

GPIO\_GDIR functions as direction control when the IOMUXC is in GPIO mode. Each bit specifies the direction of a one-bit signal. The mapping of each DIR bit to a corresponding SoC signal is determined by the SoC's pin assignment and the IOMUX table. For more details consult the IOMUXC chapter.

### 32.4.3.3 Diagram

### 32.4.3.4 Fields

Field	Function
31-0	GDIR
GDIR	<p>GPIO direction bits. Bit n of this register defines the direction of the GPIO[n] signal.</p> <p><b>NOTE:</b> GPIO_GDIR affects only the direction of the I/O signal when the corresponding bit in the I/O MUX is configured for GPIO.</p> <p>0b - GPIO is configured as input.</p> <p>1b - GPIO is configured as output.</p>

## 32.4.4 GPIO pad status register (PSR)

### 32.4.4.1 Offset

Register	Offset
PSR	8h

### 32.4.4.2 Function

GPIO\_PSR is a read-only register. Each bit stores the value of the corresponding input signal (as configured in the IOMUX). This register is clocked with the `ipg_clk_s` clock, meaning that the input signal is sampled only when accessing this location. Two wait states are required any time this register is accessed for synchronization.

### 32.4.4.3 Diagram

### 32.4.4.4 Fields

Field	Function
31-0	PSR
PSR	<p>GPIO pad status bits (status bits). Reading GPIO_PSR returns the state of the corresponding input signal.</p> <p>Settings:</p> <p><b>NOTE:</b> The IOMUXC must be configured to GPIO mode for GPIO_PSR to reflect the state of the corresponding signal.</p>

## 32.4.5 GPIO interrupt configuration register1 (ICR1)

### 32.4.5.1 Offset

Register	Offset
ICR1	Ch

### 32.4.5.2 Function

GPIO\_ICR1 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

### 32.4.5.3 Diagram

### 32.4.5.4 Fields

Field	Function
31-30 ICR15	ICR15 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 15. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive.

Table continues on the next page...

Field	Function
	11b - Interrupt n is falling-edge sensitive.
29-28 ICR14	ICR14 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 14. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive. 11b - Interrupt n is falling-edge sensitive.
27-26 ICR13	ICR13 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 13. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive. 11b - Interrupt n is falling-edge sensitive.
25-24 ICR12	ICR12 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 12. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive. 11b - Interrupt n is falling-edge sensitive.
23-22 ICR11	ICR11 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 11. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive. 11b - Interrupt n is falling-edge sensitive.
21-20 ICR10	ICR10 Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 10. Settings: Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive.

This register controls the active condition of the interrupt function for GPIO interrupt 5.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> </ul>

*Table continues on the next page...*

Field	Function
	11b - Interrupt n is falling-edge sensitive.
9-8 ICR4	<p>ICR4</p> <p>Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 4.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> <li>11b - Interrupt n is falling-edge sensitive.</li> </ul>
7-6 ICR3	<p>ICR3</p> <p>Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 3.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> <li>11b - Interrupt n is falling-edge sensitive.</li> </ul>
5-4 ICR2	<p>ICR2</p> <p>Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 2.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> <li>11b - Interrupt n is falling-edge sensitive.</li> </ul>
3-2 ICR1	<p>ICR1</p> <p>Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 1.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> <li>11b - Interrupt n is falling-edge sensitive.</li> </ul>
1-0 ICR0	<p>ICR0</p> <p>Interrupt configuration 1 fields. This register controls the active condition of the interrupt function for GPIO interrupt 0.</p> <p>Settings:</p> <p>Bits ICRn[1:0] determine the interrupt condition for signal n as follows:</p> <ul style="list-style-type: none"> <li>00b - Interrupt n is low-level sensitive.</li> <li>01b - Interrupt n is high-level sensitive.</li> <li>10b - Interrupt n is rising-edge sensitive.</li> </ul>

## GPIO Register Descriptions

Field	Function
	11b - Interrupt n is falling-edge sensitive.

## 32.4.6 GPIO interrupt configuration register2 (ICR2)

### 32.4.6.1 Offset

Register	Offset
ICR2	10h

### 32.4.6.2 Function

GPIO\_ICR2 contains 16 two-bit fields, where each field specifies the interrupt configuration for a different input signal.

### 32.4.6.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

1-0 ICR16	<p>ICR16</p> <p>Interrupt configuration 2 fields. This register controls the active condition of the interrupt function for GPIO interrupt 16.</p> <p>Settings:</p>

## GPIO Register Descriptions

Field	Function
	Bits ICRn[1:0] determine the interrupt condition for signal n as follows: 00b - Interrupt n is low-level sensitive. 01b - Interrupt n is high-level sensitive. 10b - Interrupt n is rising-edge sensitive. 11b - Interrupt n is falling-edge sensitive.

## 32.4.7 GPIO interrupt mask register (IMR)

### 32.4.7.1 Offset

Register	Offset
IMR	14h

### 32.4.7.2 Function

GPIO\_IMR contains masking bits for each interrupt line.

### 32.4.7.3 Diagram

### 32.4.7.4 Fields

Field	Function
31-0	IMR

Field	Function
IMR	<p>Interrupt Mask bits. This register is used to enable or disable the interrupt function on each of the 32 GPIO signals.</p> <p>Settings:</p> <p>Bit IMR[n] (n=0...31) controls interrupt n as follows:</p> <p>0b - Interrupt n is disabled.</p> <p>1b - Interrupt n is enabled.</p>

## 32.4.8 GPIO interrupt status register (ISR)

### 32.4.8.1 Offset

Register	Offset
ISR	18h

### 32.4.8.2 Function

The GPIO\_ISR functions as an interrupt status indicator. Each bit indicates whether an interrupt condition has been met for the corresponding input signal. When an interrupt condition is met (as determined by the corresponding interrupt condition register field), the corresponding bit in this register is set. Two wait states are required in read access for synchronization. One wait state is required for reset.

### 32.4.8.3 Diagram

### 32.4.8.4 Fields

Field	Function
31-0 ISR	<p>ISR</p> <p>Interrupt status bits - Bit n of this register is asserted (active high) when the active condition (as determined by the corresponding ICR bit) is detected on the GPIO input and is waiting for service. The value of this register is independent of the value in GPIO_IMR.</p> <p>When the active condition has been detected, the corresponding bit remains set until cleared by software. Status flags are cleared by writing a 1 to the corresponding bit position.</p>

### 32.4.9 GPIO edge select register (EDGE\_SEL)

#### 32.4.9.1 Offset

Register	Offset
EDGE_SEL	1Ch

#### 32.4.9.2 Function

GPIO\_EDGE\_SEL may be used to override the ICR registers' configuration. If the GPIO\_EDGE\_SEL bit is set, then a rising edge or falling edge in the corresponding signal generates an interrupt. This register provides backward compatibility. On reset all bits are cleared (ICR is not overridden).

#### 32.4.9.3 Diagram

### 32.4.9.4 Fields

Field	Function
31-0 GPIO_EDGE_SEL	GPIO_EDGE_SEL Edge select. When GPIO_EDGE_SEL[n] is set, the GPIO disregards the ICR[n] setting, and detects any edge on the corresponding input signal.

### 32.4.10 GPIO data register SET (DR\_SET)

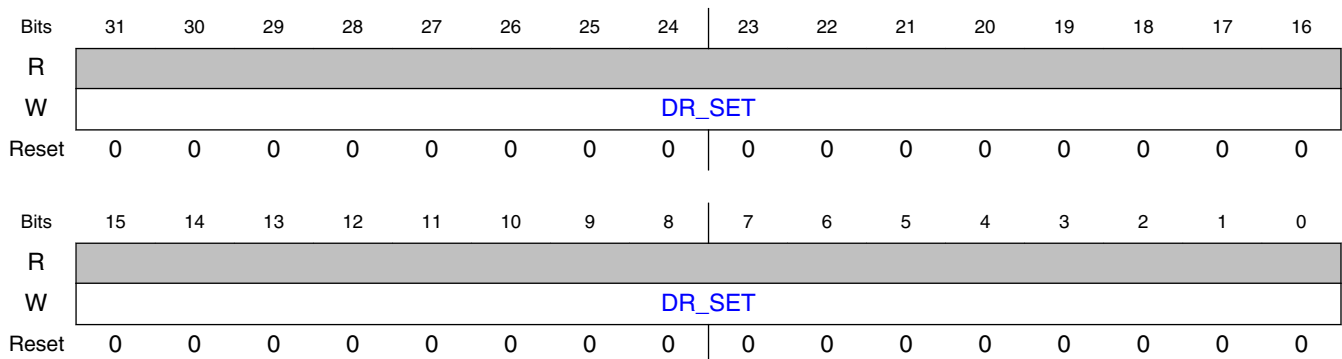

#### 32.4.10.1 Offset

Register	Offset
DR_SET	84h

#### 32.4.10.2 Function

The SET register of GPIO\_DR.

#### 32.4.10.3 Diagram

### 32.4.10.4 Fields

Field	Function
31-0 DR_SET	DR_SET The SET register of GPIO_DR.

### 32.4.11 GPIO data register CLEAR (DR\_CLEAR)

#### 32.4.11.1 Offset

Register	Offset
DR_CLEAR	88h

#### 32.4.11.2 Function

The CLEAR register of GPIO\_DR.

#### 32.4.11.3 Diagram

#### 32.4.11.4 Fields

Field	Function
31-0	DR_CLEAR

Field	Function
DR_CLEAR	The CLEAR register of GPIO_DR.

## 32.4.12 GPIO data register TOGGLE (DR\_TOGGLE)

### 32.4.12.1 Offset

Register	Offset
DR_TOGGLE	8Ch

### 32.4.12.2 Function

The TOGGLE register of GPIO\_DR.

### 32.4.12.3 Diagram

### 32.4.12.4 Fields

Field	Function
31-0	DR_TOGGLE
DR_TOGGLE	The TOGGLE register of GPIO_DR.

---

# Chapter 33

## General Purpose Timer (GPT)

### 33.1 Overview

This chapter describes the General Purpose Timer (GPT) module interface. It is also a reference for software driver programming. The GPT has a 32-bit up-counter. The timer counter value can be captured in a register using an event on an external pin. The capture trigger can be programmed to be a rising or/and falling edge. The GPT can also generate an event on the output compare pins and an interrupt when the timer reaches a programmed value. The GPT has a 12-bit prescaler, which provides a programmable clock frequency derived from multiple clock sources.

Figure 33-1. GPT Block Diagram

Figure 33-2. GPT Counter Clocks Diagram

### 33.1.1 Features

- One 32-bit up-counter with clock source selection, including external clock.
- Two input capture channels with a programmable trigger edge.
- Three output compare channels with a programmable output mode. A "forced compare" feature is also available.
- Can be programmed to be *active* in low power and debug modes.
- Interrupt generation at capture, compare, and rollover events.
- Restart or free-run modes for counter operations.

### 33.1.2 Modes and Operation

The GPT supports the modes described in the indicated sections:

- [Operating Modes](#)
  - [Restart Mode](#)
  - [Free-Run Mode](#)

## 33.2 External Signals

The GPT follows the IP Bus protocol for interfacing with the processor core. The GPT does not have *any interface signals with any other module inside the chip*, except for the clock and reset inputs (from the clock and reset controller module) and for the interrupt signals *to* the processor interrupt handler. There are functional and clock inputs, and functional output signals going outside the chip boundary.

The following table describes all block signals that connect off-chip.

**Table 33-1. GPT External Signals**

Name	Description	Pad	Mode	Direction
GPT1_CLK	Input pin for an external clock that the counter can be operated at.	GPIO_AD_B0_13	ALT1	I
GPT1_CAPTURE1	Input pin for a capture event for Input Capture Channel 1	GPIO_EMC_24	ALT4	I
GPT1_CAPTURE2	Input pin for a capture event for Input Capture Channel 2	GPIO_EMC_23	ALT4	I
GPT1_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1	GPIO_EMC_35	ALT2	O
GPT1_COMPARE2	Output pin that indicates a "compare event" occurrence in Output Compare Channel 2	GPIO_EMC_36	ALT2	O
GPT1_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3	GPIO_EMC_37	ALT2	O
GPT2_CAPTURE1	Input pin for a capture event for Input Capture Channel 1	GPIO_EMC_41	ALT1	I
GPT2_CAPTURE2	Input pin for a capture event for Input Capture Channel 2	GPIO_EMC_40	ALT1	I
GPT2_COMPARE1	Output pin that indicates a "compare event" occurrence in Output Compare Channel 1	GPIO_AD_B0_06	ALT1	O
GPT2_COMPARE2	Output pin that indicates a "compare event" occurrence in	GPIO_AD_B0_07	ALT1	O

*Table continues on the next page...*

**Table 33-1. GPT External Signals (continued)**

Name	Description	Pad	Mode	Direction
	Output Compare Channel 2			
GPT2_COMPARE3	Output pin that indicates a "compare event" occurrence in Output Compare Channel 3	GPIO_AD_B0_08	ALT1	O
GPT2_CLK	Input pin for an external clock that the counter can be operated at.	GPIO_AD_B0_09	ALT7	I

There are six signals (three input, three output) in the GPT module that *can be* connected to the chip pads.

### 33.2.1 External Clock Input

The GPT counter can be operated using an external clock from outside the device, and this is the input pin used for that purpose. The external clock input (GPT\_CLK) is treated as asynchronous to the peripheral clock (ipg\_clk). To ensure proper operations of GPT, the external clock input frequency should be less than 1/4 of frequency of the peripheral clock (ipg\_clk). Hysteresis characteristics on this pad will be required because this is a clock input.

### 33.2.2 Input Capture Trigger Signals

The GPT counter value can be stored in a register, triggered by an event from *outside the device*. A positive or/and negative edge on these signals GPT\_CAPTURE1 , GPT\_CAPTURE2 can trigger this capture event. These signals are treated as asynchronous to the peripheral clock (ipg\_clk). Only those transitions which occur *at least a single clock cycle* (the clock selected to run the counter) *after the previous recorded transition* are guaranteed to trigger a capture event.

### 33.2.3 Output Compare Signals

The output compare signals: GPT\_COMPARE1, GPT\_COMPARE2, GPT\_COMPARE3, indicate that output compare events have gone through a specified transition.

### 33.3 Clocks

The clock that is input to the prescaler can be selected from 4 clock sources. The following table describes the clock sources for GPT. Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

**Table 33-2. GPT Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_highfreq	perclk_clk_root	High-frequency reference clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

- High-Frequency Clock (ipg\_clk\_highfreq)

Provided by the Clock Controller Module (CCM), the High Frequency Clock is intended to be ON in Normal Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the High Frequency Clock *in Normal Power mode*. The CCM is expected to provide this clock *after* synchronizing it to the System Bus Clock (ahb\_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the High Frequency Clock in a Low Power mode.

- Low-Reference Clock (ipg\_clk\_32k)

This 32 kHz Low Reference Clock (provided by the CCM) is intended to be ON in Low Power mode when the Peripheral Clock (ipg\_clk) is turned OFF, thereby enabling the GPT to be operated using the Low Reference Clock in Low Power mode. The CCM is expected to provide the Low Reference Clock *after* synchronizing it to the System Bus Clock (ahb\_clk) in Normal functional mode; the CCM is also expected to switch to the *unsynchronized* version of the Low Reference Clock in a Low Power mode.

- Peripheral Clock (ipg\_clk)

If the Peripheral Clock (ipg\_clk) or the External Clock (GPT\_CLK) is selected (CLKSRC=001 or 011) as Clock Source, then the Peripheral Clock will be ON in normal GPT operations. In Low Power modes, if the GPT is programmed to be disabled (STOPEN or WAITEN or DOZEN=0), then the Peripheral Clock (ipg\_clk) can be switched OFF.

- External Clock (GPT\_CLK)

The External Clock comes from *outside the device* and can be selected to run the GPT counter. The External Clock is treated as *asynchronous to the Peripheral Clock*, (ipg\_clk) and is synchronized to the Peripheral Clock (ipg\_clk), *inside* the module. Therefore, the External Clock frequency is limited to  $< 1/4$  frequency of the Peripheral Clock (ipg\_clk), for proper GPT operations. Note that in Low Power modes, *if* the Peripheral Clock (ipg\_clk) is not available, then the External Clock *cannot be used* to run the counter.

- Crystal Oscillator Clock (ipg\_clk\_24M)

This 24 MHz Crystal Oscillator Clock (provided by the CCM) is intended to be used against frequency change of Peripheral Clock (ipg\_clk) changes to provide a more accurate timer clock for operation system. The CCM is expected to provide the 24 MHz Crystal Oscillator Clock *without* synchronizing it to the System Bus Clock (ahb\_clk) in Normal functional mode. Synchronization is done in GPT module. Before synchronization, the 24 MHz Crystal Oscillator Clock is divided by a 24 MHz clock prescaler, to make sure the clock frequency less than half of System Bus Clock (ahb\_clk).

The clock input source is configured using the clock source field (CLKSRC, in the GPT\_CR control register). The clock input to the prescaler can be disabled by programming the CLKSRC bits (of the GPT\_CR control register) to 000. **The CLKSRC field value should be changed only after disabling the GPT** (by setting the EN bit in the GPT\_CR to 0).

The PRESCALER field selects the divide ratio of the input clock that drives the main counter. The prescaler can divide the input clock by a value (from 1 to 4096) and can be changed *at any time*. A change in the value of the PRESCALER field *immediately affects* the output clock frequency.

**Figure 33-3. Prescaler Value Change Timing Diagram**

## 33.4 Functional Description

This section provides a complete functional description of the GPT.

### 33.4.1 Operating Modes

The GPT counter can be programmed to work in either of two modes: Restart mode or Free-Run mode.

#### 33.4.1.1 Restart Mode

In Restart mode (selectable through the GPT Control Register GPT\_CR), when the counter reaches the compared value, the counter resets and starts again from 0x00000000. The Restart feature is associated only with Compare Channel 1.

Any write access to the Compare register of Channel 1 will reset the GPT counter. This is done to avoid possibly missing a compare event when compare value is changed from a higher value to lower value while counting is proceeding.

For the other two compare channels, when the compare event occurs the counter is *not reset*.

#### 33.4.1.2 Free-Run Mode

In Free-Run mode, when compare events occur for all 3 channels, the counter is *not reset*; instead the counter continues to count until 0xffffffff, and then rolls over (to 0x00000000).

### 33.4.2 Operation

The General Purpose Timer (GPT) has a single counter (GPT\_CNT) that is a 32-bit free-running *up-counter*, which starts counting *after it is enabled by software* (EN=1). The counter's clock source is the output of the prescaler labelled "Prescaler output" in [Figure 33-1](#).

- If the GPT timer is disabled (EN=0), then the Main Counter *and* Prescaler Counter freeze their current count values. The ENMOD bit determines the value of the GPT counter when the EN bit is set and the Counter is enabled again.

- If the ENMOD bit is set (=1), then the Main Counter and Prescaler Counter values are reset to 0, when GPT is enabled (EN=1).
- If ENMOD bit is programmed to 0, then the Main Counter and Prescaler Counter restart counting from their frozen values, when GPT is enabled again (EN=1).
- If GPT is programmed to be disabled in a low power mode (STOP/WAIT), then the Main Counter and Prescaler Counter freeze at their current count values *when* GPT enters low power mode. When GPT exits a low power mode, the Main Counter and Prescaler Counter start counting from their frozen values *regardless* of the ENMOD bit value. Note that the GPT\_CNT can be read *at any time* by the processor, and that *both* Input Capture Channels use the *same* counter (GPT\_CNT).
- A hardware reset resets all the GPT registers to their respective reset values. All registers except the Output Compare Registers (OCR1, OCR2, OCR3) obtain a value of 0x0. The Compare registers are reset to 0xFFFF\_FFFF.
- The software reset (SWR bit in the GPT\_CR control register) resets *all* of the register bits *except* the EN, ENMOD, STOPEN, WAITEN, and DBGEN bits. The state of these bits is not affected by a software reset. Note that a software reset can be given *while the GPT is disabled*.

### 33.4.2.1 Input Capture

There are two Input Capture Channels, and each Input Capture Channel has a dedicated capture pin, capture register and input edge detection/selection logic. Each input capture function has an associated status flag, and can cause the processor to make an interrupt service request.

When a selected edge transition occurs on an Input Capture pin, the contents of the GPT\_CNT is captured on the corresponding capture register and the appropriate interrupt status flag is set. An interrupt request can be generated when the transition is detected *if* its corresponding enable bit is set (in the Interrupt Register). The capture can be programmed to occur on the input pin's rising edge, falling edge, on both rising and falling edges, or the capture can be disabled. The events are synchronized with the clock that was selected to run the counter. Only those transitions that occur at least one clock cycle (clock selected to run the counter) *after* the previous recorded transition will be guaranteed to trigger a capture event. There can be up to one clock cycle of uncertainty in the latching of the input transition. The Input Capture registers can be read *at any time* without affecting their values.

## Functional Description

**Figure 33-4. Input Capture Event Timing**

### 33.4.2.2 Output Compare

The three Output Compare Channels *use the same counter* (GPT\_CNT) as the Input Capture Channels. When the programmed content of an Output Compare register matches the value in GPT\_CNT, an output compare status flag is set and an interrupt is generated (if the corresponding bit is set in the interrupt register). Consequently, the Output Compare timer pin will be set, cleared, toggled, not affected at all or provide an active-low pulse for one input clock period (subject to the restriction on the maximum frequency allowed on the pad) according to the mode bits (that were programmed).

There is also a "forced-compare" feature that allows the software to generate a compare event when required, *without the condition of the counter value that is equal to the compare value*. The action taken as a result of a forced compare is the same as when an output compare match occurs, *except that the status flags are not set and no interrupt can be generated*. Forced channels take programmed action immediately after the write to the force-compare bits. These bits are self-negating and always read as zeros.

Figure 33-5. Output Compare and Interrupt Timing

### 33.4.2.3 Interrupts

There are 6 different interrupts that are generated by the GPT. If the selected clock for running the counter is available, then *all interrupts can be generated in Low Power and Debug modes*.

- Rollover Interrupt

The Rollover Interrupt is generated when the GPT counter reaches 0xffffffff, then resets to 0x00000000 and continues counting. The Rollover Interrupt is enabled by the ROVIE bit in the GPT\_IR register; the associated status bit is the ROV bit in the GPT\_SR register.

- Input Capture Interrupt 1, 2

After a capture event occurs, the associated Input Capture Channel generates an interrupt. The "capture event" interrupts are enabled by the IF2IE and IF1IE bits (in the GPT\_IR register); the associated status bits are IF2 and IF1 (in the GPT\_SR register). The capture of the counter value because of a capture event is *not affected by a pending capture interrupt*. The Capture register is updated with a new counter value when a capture event occurs, regardless of whether that Capture Channels' interrupt has been serviced or not.

- Output Compare Interrupt 1, 2, 3

After a compare event occurs, the associated Output Compare Channel generates an interrupt. The "compare event" interrupts are enabled by the OF3IE, OF2IE, and OF1IE bits (in the GPT\_IR register); the associated status bits are OF3, OF2, and OF1 (in the GPT\_SR register). A "forced compare" does not generate an interrupt.

A *cumulative* interrupt line is also present, which is asserted whenever any of the above interrupts are posted. The cumulative interrupt line has *no* associated enables or status bits.

### 33.4.2.4 Low Power Mode Behavior

In Low Power modes, if the clock from the selected clock source is available (except for the External Clock (GPT\_CLK), which can be used *only if* the Peripheral Clock (ipg\_clk) is available), the counter will continue to run depending on whether the control bit for that mode is set. If the clock is not present or if the corresponding low power bit in the GPT\_CR control register is 0, the Main Counter and the Prescaler Counter freeze at their current values and resume counting (from their frozen values) when the Low Power mode is exited.

### 33.4.2.5 Debug Mode Behavior

In Debug mode, the modules in the device have the option of continuing to run or be halted.

- If the DBGGEN bit is set, then the GPT timer will continue to run in Debug mode.
- If the DBGGEN bit is not set (in the GPT\_CR control register), then the GPT timer is halted.

## 33.5 Initialization/ Application Information

### 33.5.1 Selecting the Clock Source

The CLKSRC field in the GPT\_CR register selects the clock source. The CLKSRC field value should be changed only after disabling the GPT (EN=0).

The software sequence to be followed while changing clock source is:

1. Disable GPT by setting EN=0 in GPT\_CR register.
2. Disable GPT interrupt register (GPT\_IR).

3. Configure Output Mode to unconnected/ disconnected—Write zeros in OM3, OM2, and OM1 in GPT\_CR
4. Disable Input Capture Modes—Write zeros in IM1 and IM2 in GPT\_CR
5. Change clock source CLKSRC to the desired value in GPT\_CR register.
6. Assert the SWR bit in GPT\_CR register.
7. Clear GPT status register (GPT\_SR) (i.e., w1c).
8. Set ENMOD=1 in GPT\_CR register, to bring GPT counter to 0x00000000.
9. Enable GPT (EN=1) in GPT\_CR register.
10. Enable GPT interrupt register (GPT\_IR).

## 33.6 GPT Memory Map/Register Definition

The GPT has 10 user-accessible 32-bit registers, which are used to configure, operate, and monitor the state of the GPT.

An IP bus write access to the GPT Control Register (GPT\_CR) and the GPT Output Compare Register1 (GPT\_OCR1) results in *one cycle of wait state*, while other valid IP bus accesses incur 0 wait states.

Irrespective of the Response Select signal value, a Write access to the GPT Status Registers (Read-only registers GPT\_ICR1, GPT\_ICR2, GPT\_CNT) will generate a bus exception.

- If the Response Select signal is driven Low, then the Read/Write access to the *unimplemented* address space of GPT (*ips\_addr* is greater than or equal to \$BASE + \$028) will generate a bus exception.
- If the Response Select is driven High, then the Read/Write access to the unimplemented address space of GPT will *not* generate any error response (like a bus exception).

R	0															
W	[Shaded]								ROVIE	IF2IE	IF1IE	OF3IE	OF2IE	OF1IE		
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## GPTx\_IR field descriptions

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.
5 ROVIE	Rollover Interrupt Enable. The ROVIE bit controls the Rollover interrupt. 0 Rollover interrupt is disabled. 1 Rollover interrupt enabled.
4 IF2IE	IF2IE Input capture 2 Interrupt Enable IF1IE Input capture 1 Interrupt Enable The IFnIE bit controls the IFnIE Input Capture <i>n</i> Interrupt Enable. 0 IF2IE Input Capture <i>n</i> Interrupt Enable is disabled. 1 IF2IE Input Capture <i>n</i> Interrupt Enable is enabled.

Table continues on the next page...

**GPTx\_IR field descriptions (continued)**

Field	Description
3 IF1IE	See IF2IE
2 OF3IE	OF3IE Output Compare 3 Interrupt Enable OF2IE Output Compare 2 Interrupt Enable OF1IE Output Compare 1 Interrupt Enable The OFnIE bit controls the Output Compare Channel n interrupt. 0 Output Compare Channel n interrupt is disabled. 1 Output Compare Channel n interrupt is enabled.
1 OF2IE	See OF3IE
0 OF1IE	See OF3IE

**33.6.5 GPT Output Compare Register 1 (GPTx\_OCR1)**

The GPT Compare Register 1 (GPT\_OCR1) holds the value that determines when a compare event will be generated on Output Compare Channel 1. Any write access to the Compare register of Channel 1 while in Restart mode (FRR=0) will reset the GPT counter.

An IP Bus Write access to the GPT Output Compare Register1 (GPT\_OCR1) occurs *after* one cycle of wait state; an IP Bus Read access occurs *immediately* (0 wait states).

Address: Base address + 10h offset

**GPTx\_OCR1 field descriptions**

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 1.

### 33.6.6 GPT Output Compare Register 2 (GPTx\_OCR2)

The GPT Compare Register 2 (GPT\_OCR2) holds the value that determines when a compare event will be generated on Output Compare Channel 2.

Address: Base address + 14h offset

#### GPTx\_OCR2 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 2.

### 33.6.7 GPT Output Compare Register 3 (GPTx\_OCR3)

The GPT Compare Register 3 (GPT\_OCR3) holds the value that determines when a compare event will be generated on Output Compare Channel 3.

Address: Base address + 18h offset

#### GPTx\_OCR3 field descriptions

Field	Description
COMP	Compare Value. When the counter value equals the COMP bit field value, a compare event is generated on Output Compare Channel 3.

### 33.6.8 GPT Input Capture Register 1 (GPTx\_ICR1)

The GPT Input Capture Register 1 (GPT\_ICR1) is a read-only register that holds the value *that was in the counter during the last capture event* on Input Capture Channel 1.

Address: Base address + 1Ch offset

**GPTx\_ICR1 field descriptions**

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 1 occurs, the current value of the counter is loaded into GPT Input Capture Register 1.

### 33.6.9 GPT Input Capture Register 2 (GPTx\_ICR2)

The GPT Input capture Register 2 (GPT\_ICR2) is a read-only register which holds the value that was in the counter during the last capture event on input capture channel 2.

Address: Base address + 20h offset

**GPTx\_ICR2 field descriptions**

Field	Description
CAPT	Capture Value. After a capture event on Input Capture Channel 2 occurs, the current value of the counter is loaded into GPT Input Capture Register 2.

### 33.6.10 GPT Counter Register (GPTx\_CNT)

The GPT Counter Register (GPT\_CNT) is the main counter's register. GPT\_CNT is a read-only register and can be read *without affecting the counting process* of the GPT.

Address: Base address + 24h offset

#### GPTx\_CNT field descriptions

Field	Description
COUNT	Counter Value. The COUNT bits show the current count value of the GPT counter.

# Chapter 34

## IOMUX Controller (IOMUXC)

### 34.1 Overview

The IOMUX Controller (IOMUXC), together with the IOMUX, enables the IC to share one pad to several functional blocks. This sharing is done by multiplexing the pad's input and output signals.

Every module requires a specific pad setting (such as pull up or keeper), and for each pad, there are up to 8 muxing options (called ALT modes). The pad settings parameters are controlled by the IOMUXC.

The IOMUX consists only of combinatorial logic combined from several basic IOMUX cells. Each basic IOMUX cell handles only one pad signal's muxing.

[Figure 34-1](#) illustrates the IOMUX/IOMUXC connectivity in the system.

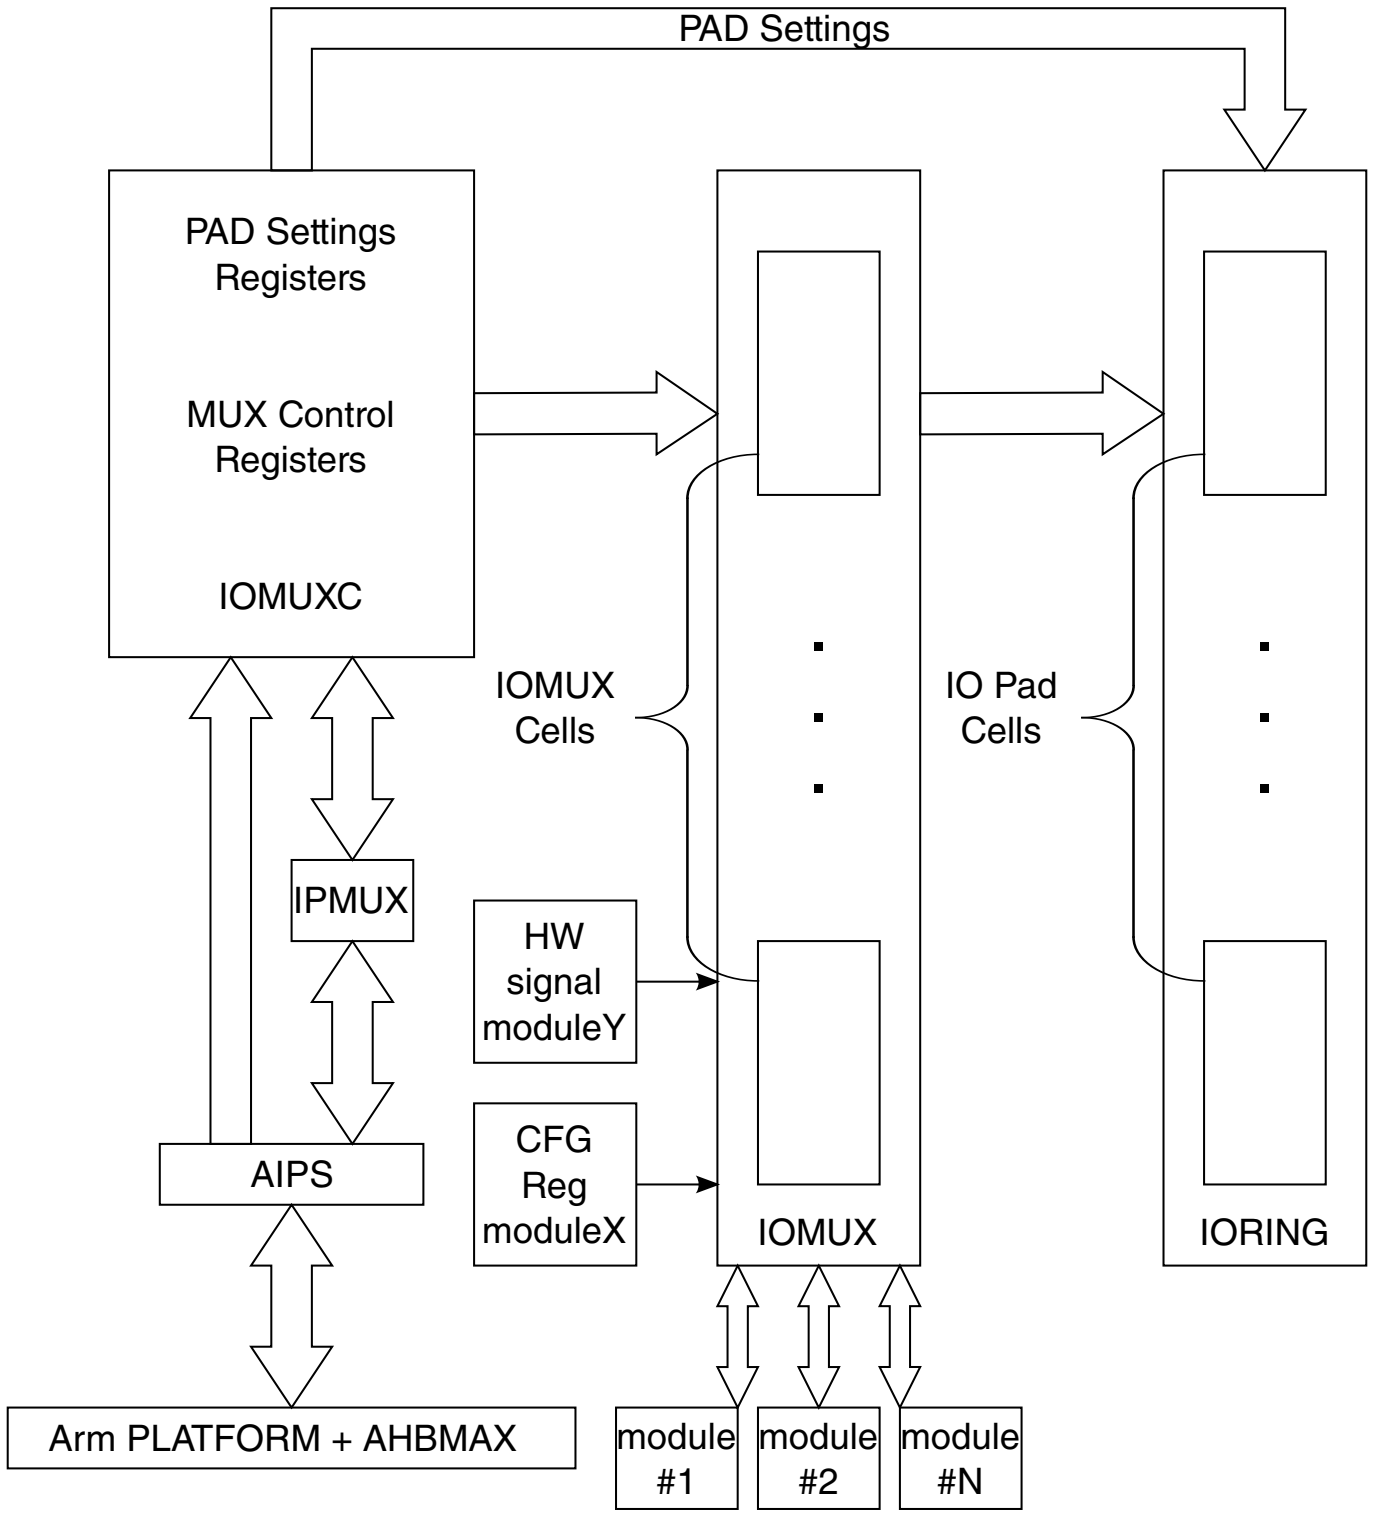

Figure 34-1. IOMUX SoC Level Block Diagram

### 34.1.1 Features

The IOMUXC features are:

- 32-bit software mux control registers (IOMUXC\_SW\_MUX\_CTL\_PAD\_<PAD NAME> or IOMUXC\_SW\_MUX\_CTL\_GRP\_<GROUP NAME>) to configure 1 of 8 alternate (ALT) MUX\_MODE fields of each pad or a predefined group of pads and to enable the forcing of an input path of the pad(s) (SION bit).
- 32-bit software pad control registers (IOMUXC\_SW\_PAD\_CTL\_PAD\_<PAD\_NAME> or IOMUXC\_SW\_PAD\_CTL\_GRP\_<GROUP NAME>) to configure specific pad settings of each pad, or a predefined group of pads.
- 32-bit general purpose registers - 26 (GPR0 to GPR25) 32-bit registers according to SoC requirements for any usage.
- 32-bit input select control registers to control the input path to a module when more than one pad drives this module input.

Each SW MUX/PAD CTL IOMUXC register handles only one pad or one pad's group.

Only the minimum number of registers required by software are implemented by hardware. For example, if only ALT0 and ALT1 modes are used on Pad x then only one bit register will be generated as the MUX\_MODE control field in the software mux control register of Pad x.

The software mux control registers may allow the forcing of pads to become input (input path enabled) regardless of the functional direction driven. This may be useful for loopback and GPIO data capture.

## 34.2 Clocks

The table found here describes the clock sources for IOMUXC.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 34-1. IOMUXC Clocks**

Clock name	Clock Root	Description
ipt_clk_io		IO clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 34.3 Functional description

This section provides a complete functional description of the block.

The IOMUXC consists of two sub-blocks:

- IOMUXC\_REGISTERS includes all of the IOMUXC registers (see [Features](#)).
- IOMUXC\_LOGIC includes all of the IOMUXC combinatorial logic (IP interface controls, address decoder, observability muxes).

The IOMUX consists of a number (about the number of pads in the SoC) of basic iomux\_cell units. If only one functional mode is required for a specific pad, there is no need for IOMUX and the signals can be connected directly from the module to the I/O. The IOMUX cell is required whenever two or more functional modes are required for a specific pad or when one functional mode and the one test mode are required.

The basic iomux\_cell design, which allows two levels of HW signal control (in ALT6 and ALT7 modes - ALT7 gets highest priority) is shown in [Figure 34-2](#).

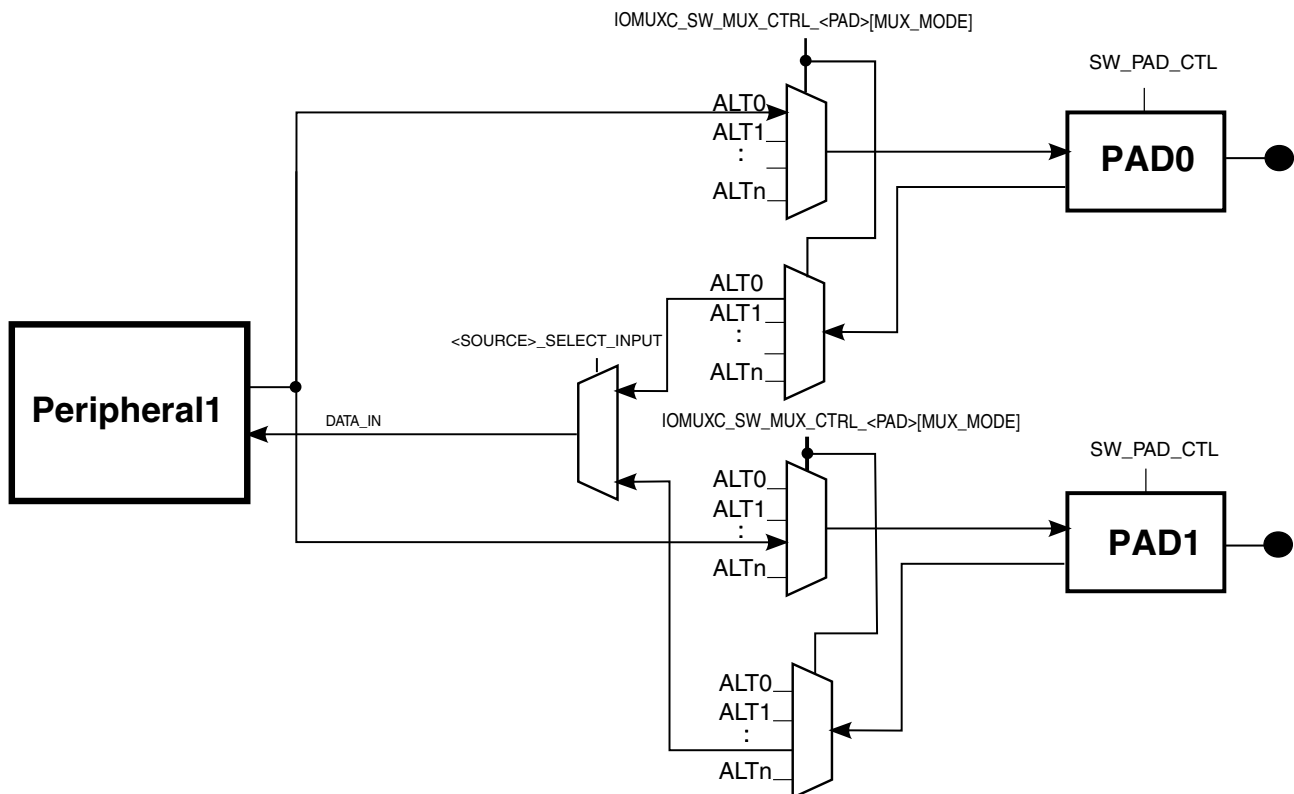

Figure 34-2. IOMUX Cell Block Diagram

### 34.3.1 ALT6 and ALT7 extended muxing modes

The ALT7 and ALT6 extended muxing modes allow any signal in the system (such as fuse, pad input, JTAG, or software register) to override any software configuration and to force the ALT6/ALT7 muxing mode.

It also allows an IOMUX software register to control a group of pads.

### 34.3.2 SW Loopback through SION bit

A limited option exists to override the default pad functionality and force the input path to be active (`ipp_ibe==1'b1`) regardless of the value driven by the corresponding module. This can be done by setting the SION (Software Input On) bit in the IOMUXC\_SW\_MUX\_CTL register (when available) to "1".

Uses include:

- LoopBack - Module x drives the pad and also receives pad value as an input.

### 34.3.3 Daisy chain - multi pads driving same module input pin

In some cases, more than one pad may drive a single module input pin. Such cases require the addition of one more level of IOMUXing; all of these input signals are muxed, and a dedicated software controlled register controls the mux in order to select the required input path.

A module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers).

This means that a module port involved in "daisy chain" requires two software configuration commands, one for selecting the mode for this pad (programmable via the IOMUXC\_SW\_MUX\_CTL\_<PAD> registers) and one for defining it as the input path (via the daisy chain registers). The daisy chain is illustrated in the figure below.

Figure 34-3. Daisy chain illustration

Field	Description
31–25 LOCK_OCRAM_TZ_ADDR	Lock OCRAM_TZ_ADDR field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
24 LOCK_OCRAM_TZ_EN	Lock OCRAM_TZ_EN field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
23–21 -	This field is reserved. Reserved
20 LOCK_DCPKEY_OCOTP_OR_KEYMUX	Lock DCP Key OCOTP/Key MUX selection bit. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)

Table continues on the next page...

## IOMUXC\_GPR\_GPR10 field descriptions (continued)

Field	Description
19 -	This field is reserved. Reserved
18 LOCK_SEC_ ERR_RESP	Lock SEC_ERR_RESP field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
17 LOCK_DBG_EN	Lock DBG_EN field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
16 LOCK_NIDEN	Lock NIDEN field for changes. This is a sticky field, once set it cannot be cleared (only by reset). 0 Field is not locked 1 Field is locked (read access only)
15–9 OCRAM_TZ_ ADDR	OCRAM TrustZone (TZ) start address. This is the start address of the secure memory region within the OCRAM memory space is 4 KB granularity. The start address affects the OCRAM transactions only if OCRAM_TZ_EN bit is set. The OCRAM TZ ENDADDR is not configurable and is set to the end of OCRAM memory space.
8 OCRAM_TZ_EN	OCRAM TrustZone (TZ) enable. 0 The TrustZone feature is disabled. Entire OCRAM space is available for all access types (secure/non-secure/user/supervisor). 1 The TrustZone feature is enabled. Access to address in the range specified by [ENDADDR:STARTADDR] follows the execution mode access policy described in CSU chapter.
7–5 -	This field is reserved. Reserved
4 DCPKEY_ OCOTP_OR_ KEYMUX	DCP Key selection bit. 0 Select key from Key MUX (SNVS/OTPMK). 1 Select key from OCOTP (SW_GP2).
3 -	This field is reserved. Reserved
2 SEC_ERR_ RESP	Security error response enable for all security gaskets (on both AHB and AXI buses) 0 OKEY response 1 SLVError (default)
1 DBG_EN	ARM invasive debug enable 0 Debug turned off. 1 Debug enabled (default).
0 NIDEN	ARM non-secure (non-invasive) debug enable 0 Debug turned off. 1 Debug enabled (default).

R	Reserved												POR_PULL_TYPE		DCDC_STATUS_CAPT_CLR	LPSR_MODE_ENABLE
W	Reserved															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## IOMUXC\_SNVS\_GPR\_GPR3 field descriptions

Field	Description
31–20 -	This field is reserved. Reserved
19 DCDC_STS_ DC_OK	DCDC status OK
18 DCDC_OVER_ VOL	DCDC output over voltage alert
17 DCDC_OVER_ CUR	DCDC output over current alert
16 DCDC_IN_LOW_ VOL	DCDC_IN low voltage detect.
15–4 -	This field is reserved. Reserved
3–2 POR_PULL_ TYPE	POR_B pad control
1 DCDC_ STATUS_CAPT_ CLR	DCDC captured status clear  Write logic 1 to clear the 3 bits of DCDC captured status: DCDC_OVER_VOL, DCDC_OVER_CUR, and DCDC_IN_LOW_VOL.
0 LPSR_MODE_ ENABLE	Set to enable LPSR mode.

## 34.7 IOMUXC Memory Map/Register Definition

## IOMUXC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
401F_8014	SW_MUX_CTL_PAD_GPIO_EMC_00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_00)	32	R/W	0000_0005h	<a href="#">34.7.1/1757</a>

# Chapter 35

## Keypad Port (KPP)

## 35.1 Overview

The Keypad Port (KPP) is a 16-bit peripheral that can be used as a keypad matrix interface or as general purpose input/output (I/O).

The figure below shows the KPP block diagram. The KPP provides interface for the keypad matrix with 2-point contact or 3-point contact keys. The KPP is designed to simplify the software task of scanning a keypad matrix. With appropriate software support, the KPP is capable of detecting, debouncing, and decoding one or multiple keys pressed simultaneously on the keypad.

Figure 35-1. KPP Peripheral Block Diagram

### 35.1.1 Features

The KPP includes these distinctive features:

- Supports up to an 8 x 8 external key pad matrix
- Port pins can be used as general purpose I/O
- Open drain design
- Glitch suppression circuit design
- Multiple-key detection
- Long key-press detection
- Standby key-press detection
- Synchronizer chain clear
- Supports a 2-point and 3-point contact key matrix

### 35.1.2 Modes and Operations

This block supports the following modes:

- Run Mode-This is the normal functional mode in which the KPP can detect any key press event.
- Low Power Mode-The keypad can detect any key press even in low power modes (when there is no MCU clock).

## 35.2 Clocks

The table found here describes the clock sources for KPP.

Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 35-1. KPP Clocks**

Clock name	Clock Root	Description
ipg_clk_32k	ckil_sync_clk_root	Low-frequency reference clock (32 kHz)
ipg_clk_s	ipg_clk_root	Peripheral access clock

## 35.3 External Signals

There are several pins dedicated to the KPP. Keypads of any configuration up to eight rows and eight columns are supported through the software configuration of the peripheral pins. Any pins not used for the keypad are available as general purpose I/O. The registers are configured such that the pins can be treated as an I/O port up to 16 bits wide.

See the table below for the list of external signals.

**Table 35-2. KPP External Signals**

Signal	Description	Pad	Mode	Direction
KPP_ROW0	Row input or output pin, from chip	GPIO_AD_B1_14	ALT7	IO
KPP_COL0	Column input or output pin, from chip	GPIO_AD_B1_15	ALT7	IO
KPP_ROW1	Row input or output pin, from chip	GPIO_AD_B1_12	ALT7	IO
KPP_COL1	Column input or output pin, from chip	GPIO_AD_B1_13	ALT7	IO
KPP_ROW2	Row input or output pin, from chip	GPIO_AD_B1_10	ALT7	IO
KPP_COL2	Column input or output pin, from chip	GPIO_AD_B1_11	ALT7	IO
KPP_ROW3	Row input or output pin, from chip	GPIO_AD_B1_08	ALT7	IO
KPP_COL3	Column input or output pin, from chip	GPIO_AD_B1_09	ALT7	IO
KPP_ROW4	Row input or output pin, from chip	GPIO_AD_B1_06	ALT7	IO
KPP_COL4	Column input or output pin, from chip	GPIO_AD_B1_07	ALT7	IO
KPP_ROW5	Row input or output pin, from chip	GPIO_AD_B1_04	ALT7	IO
KPP_COL5	Column input or output pin, from chip	GPIO_AD_B1_05	ALT7	IO
KPP_ROW6	Row input or output pin, from chip	GPIO_AD_B1_02	ALT7	IO
KPP_COL6	Column input or output pin, from chip	GPIO_AD_B1_03	ALT7	IO
KPP_ROW7	Row input or output pin, from chip	GPIO_AD_B1_00	ALT7	IO
KPP_COL7	Column input or output pin, from chip	GPIO_AD_B1_01	ALT7	IO

### 35.3.1 Input Pins

Any of the 16 pins associated with the KPP can be configured as inputs by writing a "0" to the appropriate bits in the KPP\_KDDR. Additionally, the least significant 8 bits (ROW inputs) corresponding to KPP\_KDDR[KRDD] have internal pull-ups, which are enabled when the pin is used as an input.

### 35.3.2 Output Pins

Any of the 16 pins associated with the KPP can be configured as outputs by writing the appropriate bits in the KPP\_KDDR to a "1". Additionally, the 8 most significant bits (15-8) can be designated as open drain outputs by writing a "1" to the appropriate bits in the KPP\_KPCR. The lower 8 bits (7-0) are always in "totem pole" style, driven when configured as outputs.

See the table below.

**Table 35-3. Keypad Port Column Modes**

KPP_KDDR (15:8)	KPP_KPCR (15:8)	Pin Function
0	x	Input
1	0	Totem-Pole Output
1	1	Open-Drain Output

#### NOTE

Totem pole capability should be provided for column pins. Totem pole configuration helps for a faster discharge of keypad capacitance when all columns need to be quickly brought to a "1" during the scan routine. With this configuration, delay between the scanning of two subsequent columns is reduced.

### 35.3.3 Generation of Transfer Error Signal on Peripheral Bus

If there is an access to an address which is not implemented, then the KPP asserts a transfer error signal on Peripheral Bus.

## 35.4 Functional Description

The Keypad Port (KPP) is designed to simplify the software task of scanning a keypad matrix. With appropriate software support and matrix organization, the KPP is capable of detecting, debouncing, and decoding one or more keys pressed simultaneously on the keypad.

Logic in the KPP is capable of detecting a key press even while the processor is in one of the low power standby modes provided that a low frequency reference clock (`ipg_clk_32k`) is on. The KPP may generate an Arm platform interrupt any time a key press or key release is detected. This interrupt is capable of forcing the processor out of a low power mode.

### 35.4.1 Keypad Matrix Construction

The KPP is designed to interface to a keypad matrix, which shorts the intersecting row and column lines together whenever a key is depressed. The interface is not optimized for any other switch configuration.

### 35.4.2 Keypad Port Configuration

The software must initialize the KPP for the size of the keypad matrix. Pins connected to the keypad columns should be configured as open-drain outputs. Pins connected to the keypad rows should be configured as inputs. On-chip, pull-up resistors should be implemented for active keypad rows.

In addition to enabled row inputs in the Keypad Control register, corresponding interrupt (depress or/and release) must also be enabled to generate an interrupt.

Discrete switches that are not part of the matrix may be connected to any unused row inputs. The second terminal of the discrete switch is connected to ground. The hardware detects closures of these switches without the need for software polling.

### 35.4.3 Keypad Matrix Scanning

Keypad scanning is performed by a software loop that walks a zero across each of the keypad columns, reading the value on the rows at each step. The process is repeated several times in succession, with the results of each pass optionally compared to those

from the previous pass. When several (3 or 4) consecutive scans yield the same key closures, a valid key press has been detected. Software then can decode exactly which switch was depressed and pass the value up to the next higher software layer.

The basic debouncing period, which must be defined in the software routine, may be controlled with an internal timer. The basic period is the period between the scan of two consecutive columns, so the debouncing time between two consecutive scans of the whole matrix shall be the number of columns multiplied by the basic period.

### 35.4.4 Keypad Standby

There is no need for the Arm platform to continually scan the keypad. Between key presses, the keypad can be left in a state that requires no software intervention until the next key press is detected. To place the keypad in a standby state, software should write all column outputs low. Row inputs are left enabled. At this point, the Arm platform can attend to other tasks or revert to a low power standby mode. The KPP will interrupt the Arm platform if any key is pressed.

Upon receiving a keypad interrupt, the Arm platform should set all the column strobes high, and begin a normal keypad scanning routine to determine which key was pressed. It is important that open-drain drivers be used when scanning to prevent a possible DC path between power and ground through two or more switches.

### 35.4.5 Glitch Suppression on Keypad Inputs

A glitch suppression circuit qualifies the keypad inputs to prevent noise from inadvertently interrupting the Arm platform. The circuit is a 4-state synchronizer clocked from a low frequency reference clock (`ipg_clk_32k`) source. This clock must continue to run in any low power mode where the keypad is a wake-up source, as the Arm platform interrupt is generated from the synchronized input. An interrupt is not generated until all four synchronizer stages have latched a valid key assertion. This guarantees the filtering out of any noise less than three clock periods in duration of a low frequency reference clock. Noise filtering of the duration between three to four clock periods cannot be guaranteed. The interrupt output is latched in an S-R latch and remains asserted until cleared by the software. The Set input of the latch is rising-edge clocked. See the figure below.

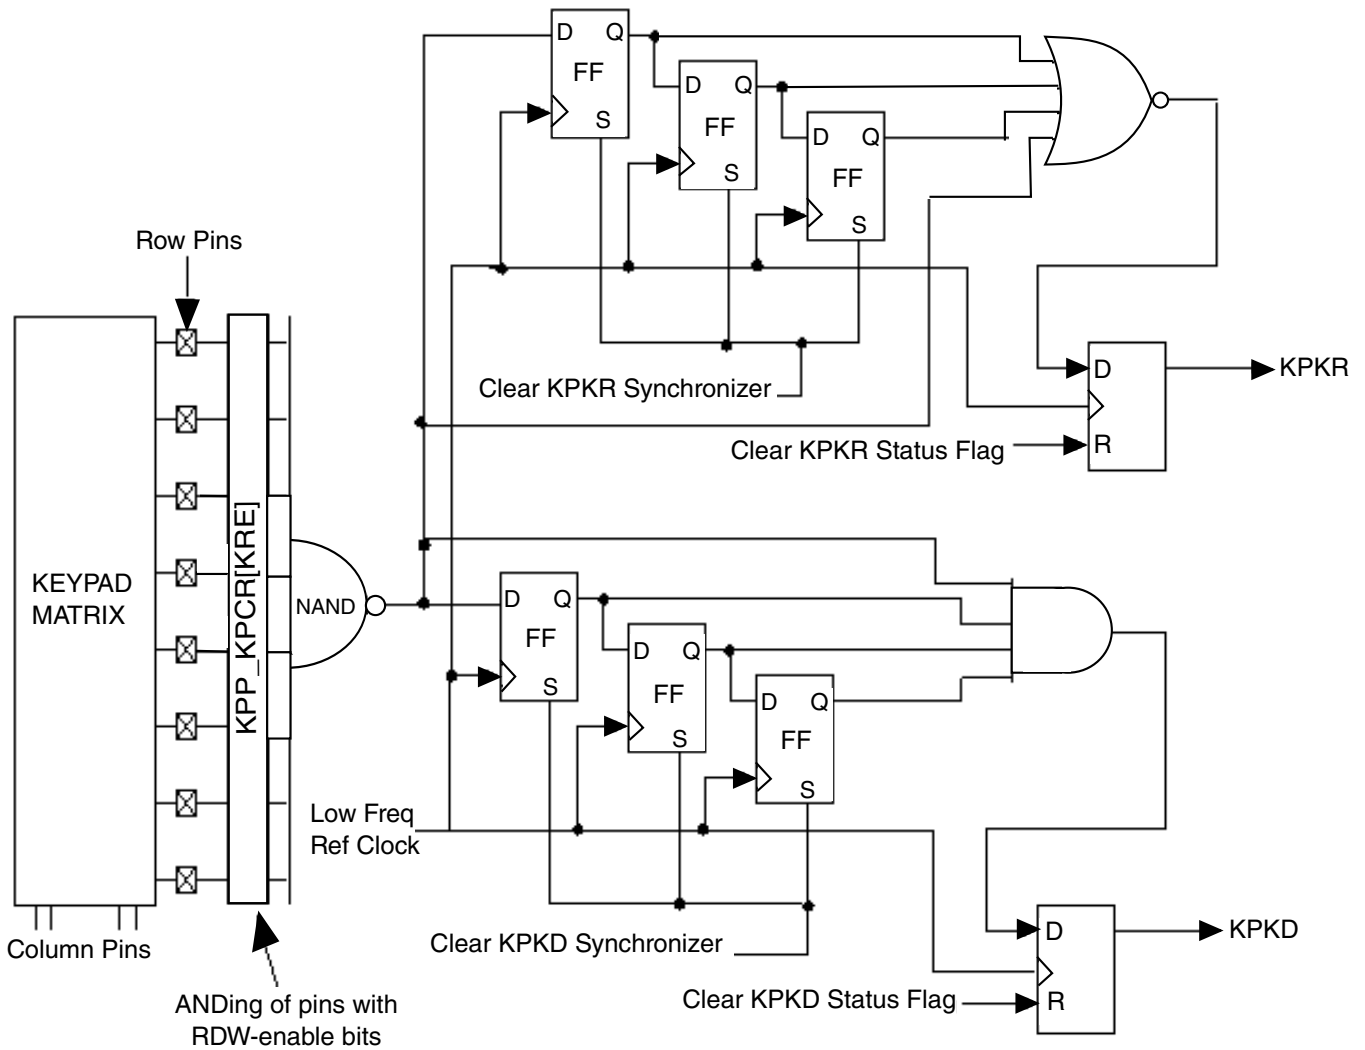

Figure 35-2. Keypad Synchronizer Functional Diagram

### 35.4.6 Multiple Key Closures

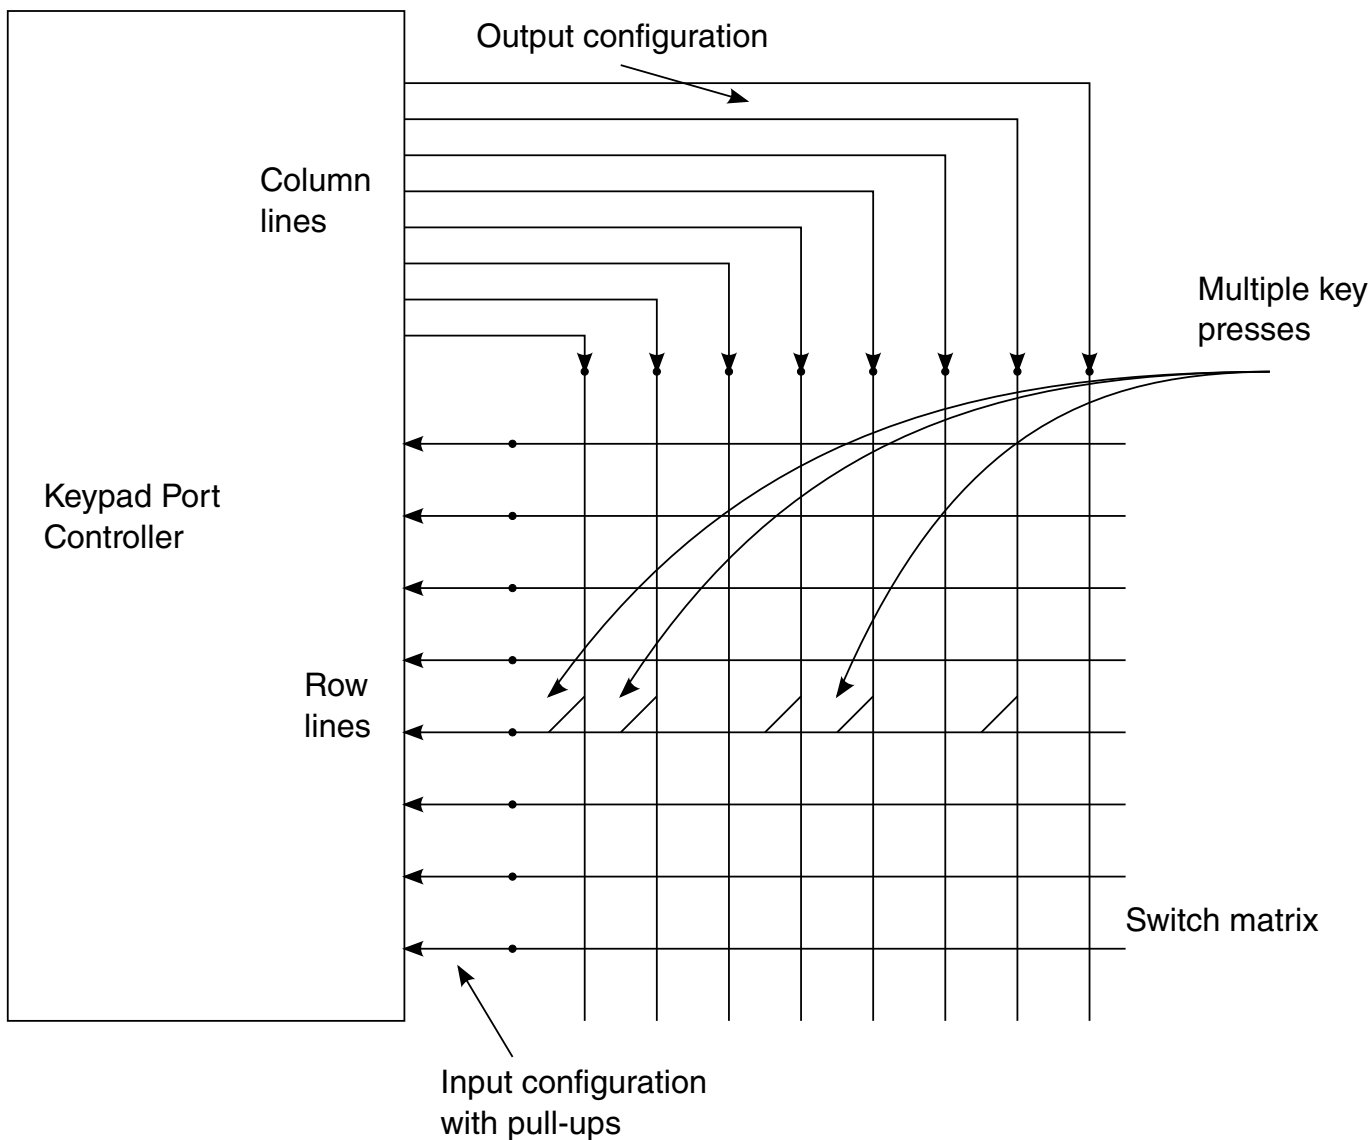

Using the key press and key release interrupts, the software can detect multiple keys or achieve n key rollover. The key scanning routine can be programmed accordingly (See [Initialization/Application Information](#) for more information).

The following figures illustrate the interface of a 2-contact keypad matrix with the KPP controller. With proper enabling of row lines and the performing scan-routine, multiple key presses can be detected. When keys present on the same row are pressed, corresponding row lines (multiple lines) become low when the column is driven low during a scan-routine. By reading the data-register, pressed keys can be detected.

Similarly, when keys present on same row line are pressed, the corresponding row line (only one line) becomes low when logic "0" is driven on the column line during a scan-routine.

**Figure 35-3. Multiple Key Presses on Same Column Line (Simplified View)**

**Figure 35-4. Multiple Key Presses on Same Row Line (Simplified View)**

**NOTE**

An n key rollover is a technique with which the system can recognize the order in which keys are pressed.

**35.4.6.1 Ghost Key Problem and Correction**

The KPP detects if one or multiple keys are pressed or released. In the case where a simple keypad matrix with two-contact switches is used, there is a chance of "ghost" key detection when three or more keys are pressed. This is a limitation imposed by such a keypad matrix.

As seen in [Figure 35-5](#), three keys pressed simultaneously can cause a short between the column currently "scanned" by the software and another column. Depending on the location of the third key pressed, a "ghost" key press may be detected.

However, this can be corrected by using a keypad matrix that provides "ghost" key protection. Such a matrix implements a one-way "diode" at all keypad points between rows and columns. This way, the multiple pressing of three keys will not cause a short at a fourth key (see [Figure 35-6](#)).

**Figure 35-5. Decoding Wrong Three- Key-Presses**

Figure 35-6. Matrix with "Ghost" Key Protections

### 35.4.7 3-Point Contact Keys Support

The KPP supports interfacing to a matrix consisting of 3-point contact keys. As shown in [Figure 35-7](#), two points of such a key are connected to keypad lines, while a third point is connected to ground (low logic).

The keypad lines should be configured as input and a pull-up should be present on these lines. When such a key is pressed, corresponding keypad lines go low and an interrupt is generated. There is no need to perform a scanning routine for identification of pressed key as it can be done by reading the keypad data-register. A limitation with such a matrix is that for every key at least one keypad row line should be used.

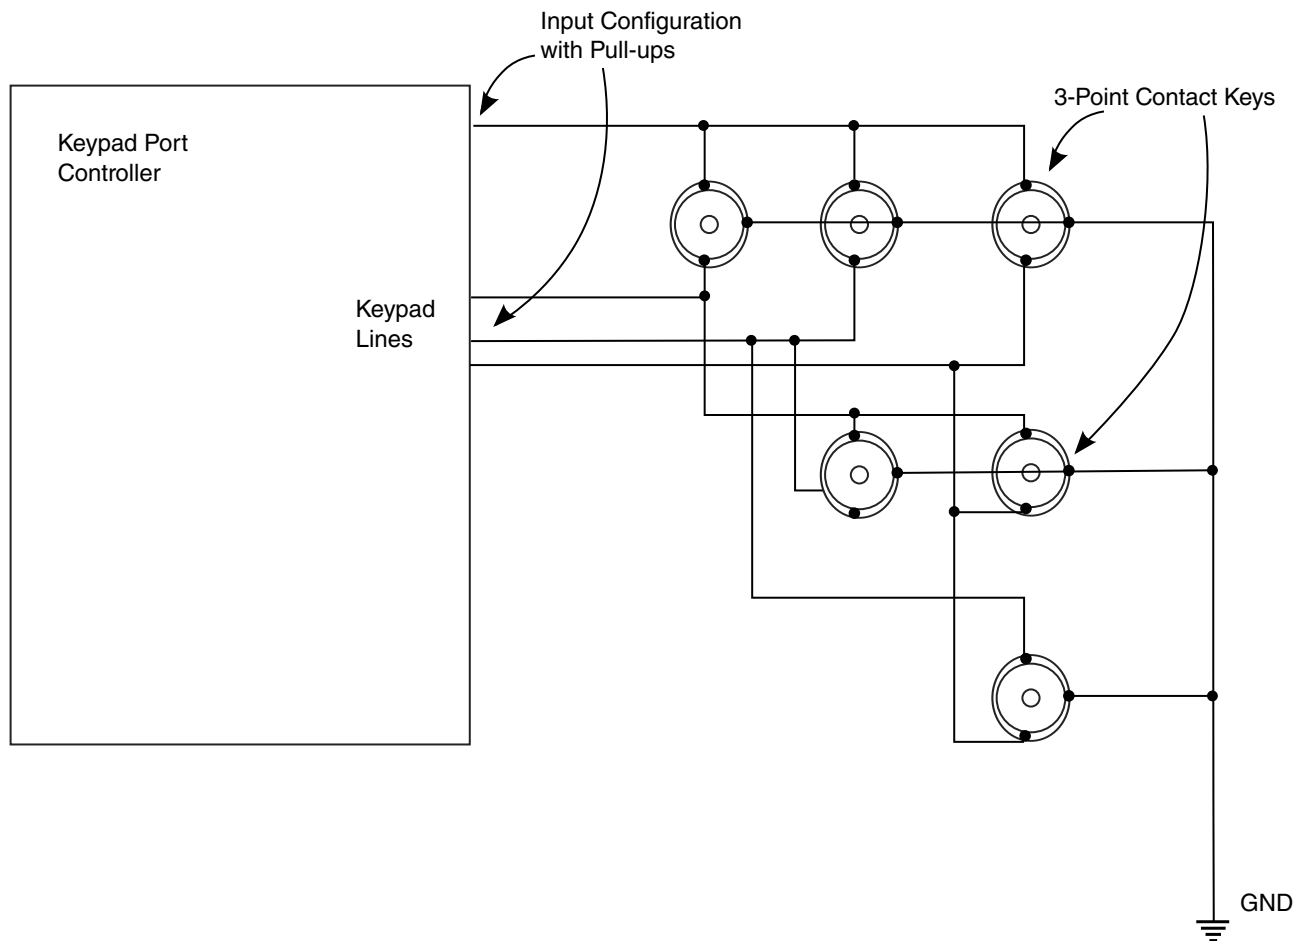

Figure 35-7. KPP Interface with 3-point Contact Key Matrix (Simplified View)

## 35.5 Initialization/Application Information

### 35.5.1 Typical Keypad Configuration and Scanning Sequence

Perform the following steps to configure the keypad:

1. Enable the number of rows in the keypad (KPP\_KPCR[KRE]).
2. Write 0s to KPP\_KPDR[KCD].
3. Configure the keypad columns as open-drain (KPP\_KPCR[KCO]).
4. Configure columns as output (KPP\_KDDR[KCDD]) and rows as input (KPP\_KDDR[KRDD]).
5. Clear the KPKD Status Flag and Synchronizer chain.
6. Set the KDIE control bit, and clear the KRIE control bit (avoid false release events).

7. (The system is now in standby mode, and awaiting a key press.)

### 35.5.2 Key Press Interrupt Scanning Sequence

Perform the following steps to perform a keypad scanning routine:

1. Disable both (depress and release) keypad interrupts.
2. Write 1s to KPP\_KPDR[KCD], setting column data to 1s.
3. Configure columns as totem pole outputs (for quick discharging of keypad capacitance).
4. Configure columns as open-drain.
5. Write a single column to 0, and other columns to 1.
6. Sample row inputs and save data. Multiple key presses can be detected on a single column.
7. Repeat Steps 2-6 for remaining columns.
8. Return all columns to 0 in preparation for standby mode.
9. Clear KPKD and KPKR status bit(s) by writing to a "1"; set the KPKR synchronizer chain by writing a "1" to the KPP\_KRSS register; and clear the KPKD synchronizer chain by writing a "1" to the KDSC register.
10. Re-enable the appropriate keypad interrupt(s) so that the KDIE detects a key hold condition, or the KRIE detects a key-release event.

### 35.5.3 Additional Comments

The order of key press detection can be done in software only. Therefore, the software may need to run the scan routines at very short intervals of time per the application's demands. The reason that such functionality cannot be put in the KPP is that the block is limited by the number of external pins.

For the keys that require a very precise order (such as game keys), individual GPIO pins may be more useful.

## 35.6 KPP Memory Map/Register Definition

The KPP contains four registers.

## KPP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
401F_C000	Keypad Control Register (KPP_KPCR)	16	R/W	0000h	<a href="#">35.6.1/2301</a>
401F_C002	Keypad Status Register (KPP_KPSR)	16	R/W	0400h	<a href="#">35.6.2/2302</a>
401F_C004	Keypad Data Direction Register (KPP_KDDR)	16	R/W	0000h	<a href="#">35.6.3/2303</a>
401F_C006	Keypad Data Register (KPP_KPDR)	16	R/W	0000h	<a href="#">35.6.4/2304</a>

### 35.6.1 Keypad Control Register (KPP\_KPCR)

The Keypad Control Register determines which of the eight possible column strobes are to be open drain when configured as outputs, and which of the eight row sense lines are considered in generating an interrupt to the core.

It is up to the programmer to ensure that pins being used for functions other than the keypad are properly disabled. The KPP\_KPCR register is byte- or half-word-addressable.

Address: 401F\_C000h base + 0h offset = 401F\_C000h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCO								KRE							
Write	KCO								KRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### KPP\_KPCR field descriptions

Field	Description
15–8 KCO	Keypad Column Strobe Open-Drain Enable. Setting a column open-drain enable bit (KCO7-KCO0) disables the pull-up driver on that pin. Clearing the bit allows the pin to drive to the high state. This bit has no effect when the pin is configured as an input.  <b>NOTE:</b> Configuration of external port control logic (for example, IOMUX) should be done properly so that the KPP controls an open-drain enable of the pin.  0 <b>TOTEM_POLE</b> — Column strobe output is totem pole drive. 1 <b>OPEN_DRAIN</b> — Column strobe output is open drain.
KRE	Keypad Row Enable. Setting a row enable control bit in this register enables the corresponding row line to participate in interrupt generation. Likewise, clearing a bit disables that row from being used to generate an interrupt. This register is cleared by a reset, disabling all rows. The row-enable logic is independent of the programmed direction of the pin. Writing a "0" to the data register of the pins configured as outputs will cause a keypad interrupt to be generated if the row enable associated with that bit is set.  0 Row is not included in the keypad key press detect. 1 Row is included in the keypad key press detect.

### 35.6.2 Keypad Status Register (KPP\_KPSR)

The Keypad Status Register reflects the state of the key press detect circuit. The KPP\_KPSR register is byte- or half-word-addressable.

Address: 401F\_C000h base + 2h offset = 401F\_C002h

Bit	15	14	13	12	11	10	9	8
Read	0						KRIE	KDIE
Write	[Shaded]							
Reset	0	0	0	0	0	1	0	0
Bit	7	6	5	4	3	2	1	0
Read	0				0	0	KPKR	KPKD
Write	[Shaded]				KRSS	KDSC	w1c	w1c
Reset	0	0	0	0	0	0	0	0

#### KPP\_KPSR field descriptions

Field	Description
15–10 Reserved	This read-only field is reserved and always has the value 0.
9 KRIE	Keypad Release Interrupt Enable. The software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.  0 No interrupt request is generated when KPKR is set. 1 An interrupt request is generated when KPKR is set.
8 KDIE	Keypad Key Depress Interrupt Enable. Software should ensure that the interrupt for a Key Release event is masked until it has entered the key pressed state, and vice-versa, unless this activity is desired (as might be the case when a repeated interrupt is to be generated). The synchronizer chains are capable of being initialized to detect repeated key presses or releases. If they are not initialized when the corresponding event flag is cleared, false interrupts may be generated for depress (or release) events shorter than the length of the corresponding chain.  0 No interrupt request is generated when KPKD is set. 1 An interrupt request is generated when KPKD is set.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 KRSS	Key Release Synchronizer Set. Self-clear bit. The Key release synchronizer is set by writing a logic one into this bit. Reads return a value of "0".  0 No effect 1 Set bits which sets keypad release synchronizer chain

Table continues on the next page...

## KPP\_KPSR field descriptions (continued)

Field	Description
2 KDSC	<p>Key Depress Synchronizer Clear. Self-clear bit. The Key depress synchronizer is cleared by writing a logic "1" into this bit.</p> <p>Reads return a value of "0".</p> <p>0 No effect 1 Set bits that clear the keypad depress synchronizer chain</p>
1 KPKR	<p>Keypad Key Release. The keypad key release (KPKR) status bit is set when all enabled rows are detected high after synchronization (the KPKR status bit will be set when cleared by a reset). The KPKR bit may be used to generate a maskable key release interrupt. The key release synchronizer may be set high by software after scanning the keypad to ensure a known state. Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by software prior to the system exiting the state it represents.</p> <p>Reset value of register is "0" as long as reset is asserted. However when reset is de-asserted, the value of the register depends upon the external row pins and can become "1".</p> <p>0 No key release detected 1 All keys have been released</p>
0 KPKD	<p>Keypad Key Depress. The keypad key depress (KPKD) status bit is set when one or more enabled rows are detected low after synchronization. The KPKD status bit remains set until cleared by the software. The KPKD bit may be used to generate a maskable key depress interrupt. If desired, the software may clear the key press synchronizer chain to allow a repeated interrupt to be generated while a key remains pressed. In this case, a new interrupt will be generated after the synchronizer delay (4 cycles of the low frequency reference clock (ipg_clk_32k) elapses if a key remains pressed. This functionality can be used to detect a long key press. This allows detection of additional key presses of the same key or other keys.</p> <p>Due to the logic function of the release and depress synchronizer chains, it is possible to see the re-assertion of a status flag (KPKD or KPKR) if it is cleared by the software prior to the system exiting the state it represents.</p> <p>0 No key presses detected 1 A key has been depressed</p>

### 35.6.3 Keypad Data Direction Register (KPP\_KDDR)

The bits in the KPP\_KDDR control the direction of the keypad port pins. The upper eight bits in the register affect the pins designated as column strobes, while the lower eight bits affect the row sense pins. Setting any bit in this register configures the corresponding pin as an output. Clearing any bit in this register configures the corresponding port pin as an input. For the Keypad Row DDR, an internal pull-up is enabled if the corresponding bit is clear. This register is cleared by a reset, configuring all pins as inputs. The KPP\_KDDR register is byte- or half-word addressable.

#### NOTE

When a pin is used as row pin for keypad purposes, all corresponding pull-ups should be enabled at the upper level (for example, IOMUX) when the bit in KRDD is cleared.

## KPP Memory Map/Register Definition

Address: 401F\_C000h base + 4h offset = 401F\_C004h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCDD								KRDD							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### KPP\_KDDR field descriptions

Field	Description
15–8 KCDD	Keypad Column Data Direction Register. Setting a bit configures the corresponding COL $n$ pin as an output (where $n = 7$ through 0).  0 <b>INPUT</b> — COL $n$ pin is configured as an input. 1 <b>OUTPUT</b> — COL $n$ pin is configured as an output.
KRDD	Keypad Row Data Direction. Setting a bit configures the corresponding ROW $n$ pin as an output (where $n = 7$ through 0).  0 <b>INPUT</b> — ROW $n$ pin configured as an input. 1 <b>OUTPUT</b> — ROW $n$ pin configured as an output.

## 35.6.4 Keypad Data Register (KPP\_KPDR)

This 16-bit register is used to access the column and row data. Data written to this register is stored in an internal latch, and for each pin configured as an output, the stored data is driven onto the pin. A read of this register returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.

The KPP\_KPDR register is byte- or half-word addressable. This register is not initialized by a reset. Valid data should be written to this register before any bits are configured as outputs.

Address: 401F\_C000h base + 6h offset = 401F\_C006h

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	KCD								KRD							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### KPP\_KPDR field descriptions

Field	Description
15–8 KCD	Keypad Column Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.  0 Read/Write "0" from/to column ports 1 Read/Write "1" from/to column ports
KRD	Keypad Row Data. A read of these bits returns the value on the pin for those bits configured as inputs. Otherwise, the value read is the value stored in the register.  0 Read/Write "0" from/to row ports 1 Read/Write "1" from/to row ports

# Chapter 36

## Enhanced LCD Interface (eLCDIF)

### 36.1 Overview

The enhanced Liquid Crystal Display Interface (LCDIF) is a general purpose display controller

The LCDIF block supports the following:

- Displays that support moving pictures and require the RGB interface mode (DOTCLK interface).

The LCDIF provides fully programmable functionality to supported interfaces:

- Bus master interface to source frame buffer data for display refresh. This interface can also be used to drive data for "Smart" displays.
- DMA interface to manage data transfers between "Smart" displays and SoC.
- 8/16/18/24 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for DOTCLK LCD interfaces.

### 36.2 Functional Description

[Bus Interface Mechanisms](#) through [Initializing the LCDIF](#), describe the internal pipeline for the LCDIF interfaces. Differences for each mode are then described in separate sections, as follows:

- [DOTCLK Interface](#)

LCDIF pin usage by interface mode is described in [LCDIF Pin Usage by Interface Mode](#).

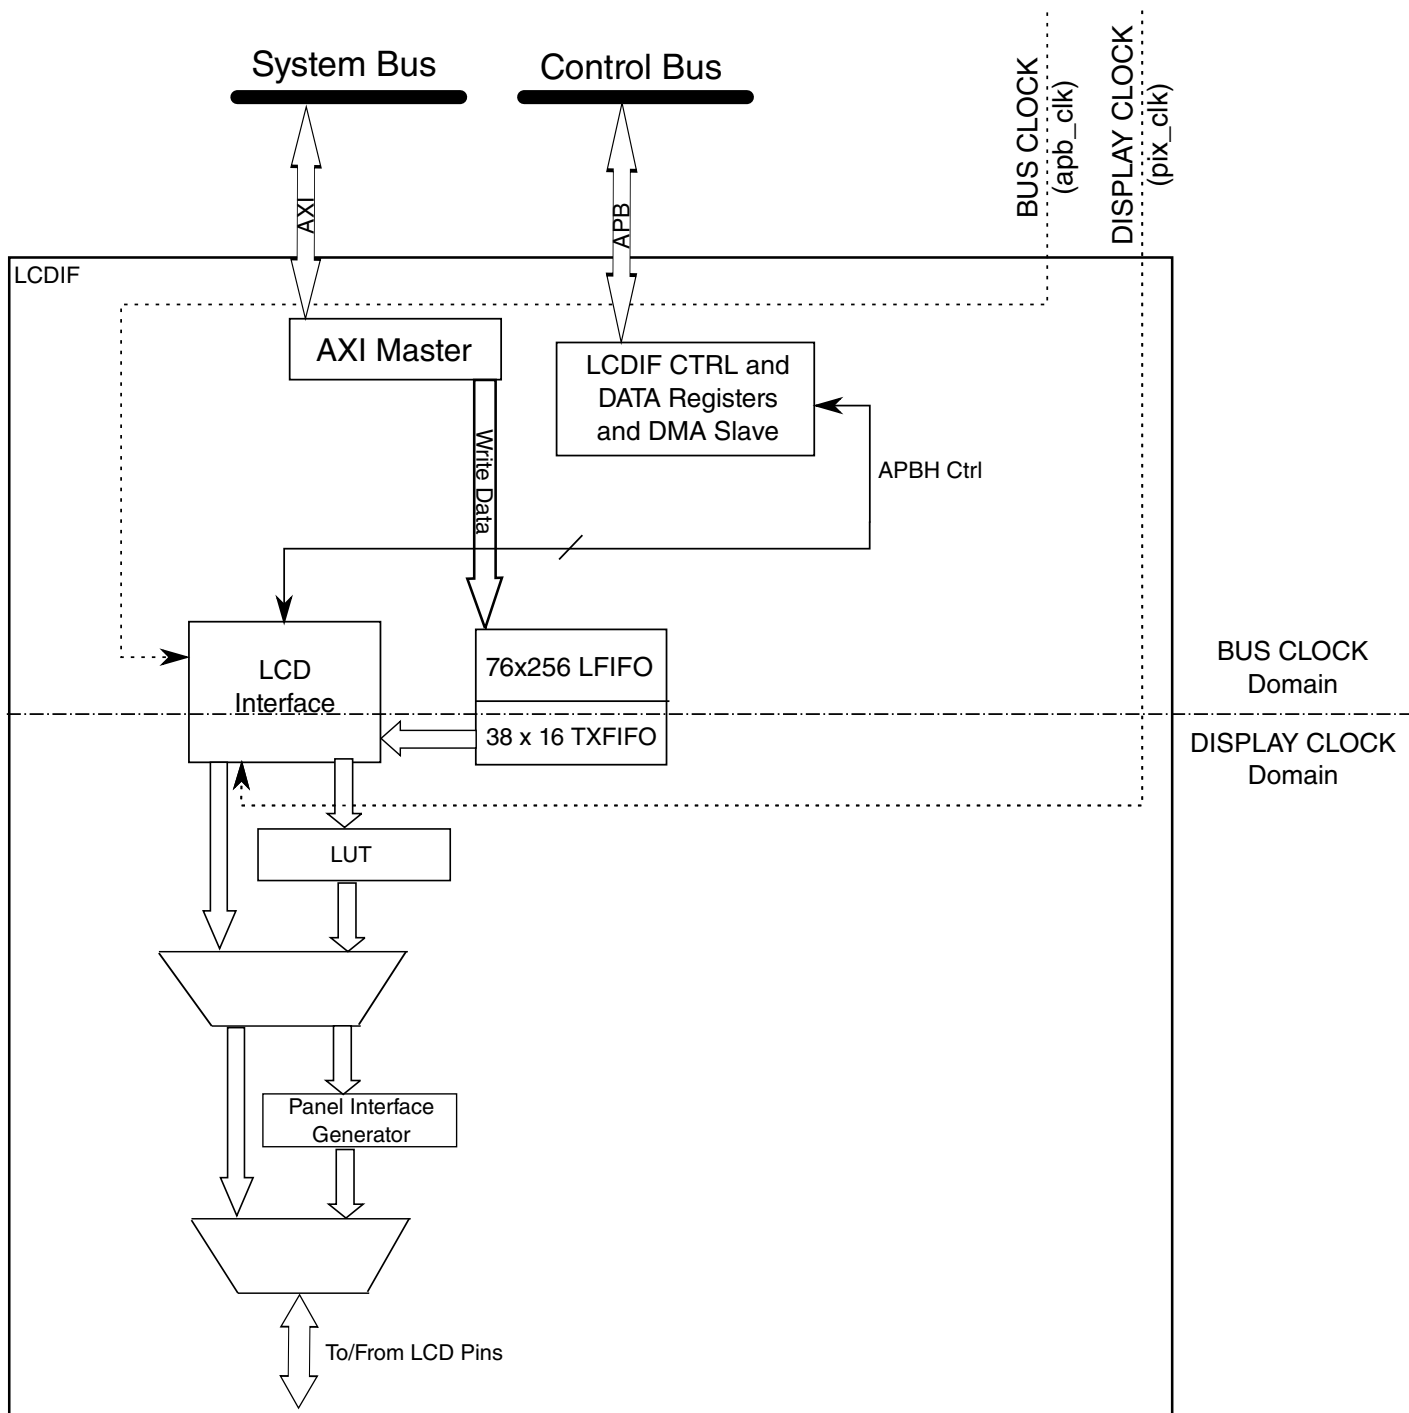

Figure 36-1. Top-Level Block Diagram of LCDIF subsystem

### 36.2.1 Bus Interface Mechanisms

The LCDIF module has memory-mapped control, data and status registers. It provides several interfaces to transfer data between the display and SoC.

The bus master interface is used to initiate the requests to transfer data from external memory to the display. It is completely autonomous, or no CPU intervention is required, to manage the cyclical nature of refreshing standard display types.

The DMA interface requires the SoC integrated APBDMA engine to manage data transfers on behalf of the LCDIF. APBDMA descriptor chains are created to manage control and data flow between the LCDIF and external display. This interface is typically used for "Smart" display types that integrate their own frame buffer and control interface. The APBDMA engine is used to reduce the CPU compute requirements to complete the display solution.

The host CPU executes display drivers to manage the display solution. The following sections describe the system bus interface mechanisms.

### 36.2.1.1 Bus Master Operation in Write/Display Modes

The LCDIF block has a bus master interface that initiates requests for data to drive the display. The LCDIF\_MASTER bit must be set to 1 to enable the bus master interface. Software should program all control registers required to transfer the frame sequence.

The DOTCLK mode is used to refresh the display at the desired refresh rate and resolution, and drive displays that don't integrate a display buffer memory. When the display is refreshed, the LCDIF will automatically update the LCDIF\_CUR\_BUF\_ADDR register with the value in LCDIF\_NEXT\_BUF\_ADDR at the end of current frame and start fetching the next frame from the new address. If the LCDIF\_NEXT\_BUF\_ADDR register was not updated within a frame refresh cycle, LCDIF will keep transmitting the last frame until a new value is programmed into that register.

### 36.2.1.2 System Bus Master Performance

The performance of the LCDIF block can be controlled by changing the burst length and the outstanding cycle issuing capability depending on the memory bandwidth requirements. Two fields in the LCDIF\_CTRL2 register will throttle system memory requests. The LCDIF\_CTRL2\_OUTSTANDING\_REQS field will control how many requests the LCDIF can have in flight on any given clock cycle. This should be programmed based on the expected system bus latency for returned read data. Also, the LCDIF\_CTRL2\_BURST\_LEN\_8 bit will set the number of 64 bit words requested for each LCDIF system bus request to either 8 or 16 QWORDS. Generally, 4 outstanding requests of length 16 will provide enough performance to drive any standard display

resolution. These configuration bits are intended to change the access pattern of the LCDIF to optimize system bus throughput when other system masters will contend for system memory resources.

The LCDIF\_THRES register can also be used to optimize bus throughput and power consumption.

The LCDIF\_THRES\_PANIC value can be used to raise the priority of requests initiated by the LCDIF to alter how the LCDIF requests are arbitrated by the system bus infrastructure. The panic output control signal is raised when the number of 32bpp pixel equivalents in the LFIFO is less than this programmed value. Since the LFIFO is arranged as a 256x64bit quadword FIFO, it contains two 32bpp pixels per quadword, or 512 32bpp pixels total. To set the panic output when 3/4s of the LFIFO is empty, set the LCDIF\_THRES\_PANIC value to  $3/4 * 512$ , or 128. The panic signal output is used to assess higher priority to LCDIF system requests to avoid LCDIF under run errors during periods of high system bandwidth utilization.

The features available with the LCDIF\_THRES register require support from system clocking and dynamic priority control. Refer to the appropriate block documentation to assess the system support for these features.

### **36.2.1.3 DMA Operation in MPU Read Mode**

Data can be transferred between an external display and the SoC using the APBDMA interface. This mode is enabled by setting the LCDIF\_MASTER bit to 0 and is typically used with "Smart" displays. The APBDMA module executes DMA descriptor chains to process the desired data flow sequence. The data can be either frame buffer data or display control data.

### **36.2.2 Write Data Path**

LCDIF supports raster based frame buffers and there is no support for tiled buffers.

There are several options to accommodate endianness of display buffers in memory before the data is processed for the external display. The LCDIF\_CTRL[INPUT\_DATA\_SWIZZLE] field provides the following options for data word multiplexing:

```
00 (0): No swizzle (little-endian)
01 (1): Swap bytes 0 and 3, swap bytes 1 and 2 (big-endian)
10 (2): Swap half-words
11 (3): Swap bytes within each half-word
```

The LCDIF\_CTRL[WORD\_LENGTH] field indicates the input data/pixel format. LCDIF\_TRANSFER\_COUNT register denotes how much data is contained in each frame. The LCDIF\_TRANSFER\_COUNT[H\_COUNT] field indicates the number of pixels per line and LCDIF\_TRANSFER\_COUNT[V\_COUNT] indicates the total number of lines per frame. The LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] field can be used to specify which bytes within the 32-bit word are going to be valid. For example, if the entire 32-bit word is valid, LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] should be set to 0xF, if only lower 3 bytes of each word in the frame buffer are valid, then LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] should be set to 0x7.

The LCDIF\_CTRL[LCD\_DATABUS\_WIDTH] field suggests the width of the bus going to the display controller. There is an option to source all 32 bits of the input word and transfer it to the output I/O display interface. If the LCDIF\_CTRL[LCD\_DATABUS\_WIDTH] is not the same as LCDIF\_CTRL[WORD\_LENGTH], LCDIF will perform RGB to RGB color space conversion. For example, if the input frame has fewer bits per pixel than the display, as in a 16 bpp input frame going to 24 bpp LCD, LCDIF will pad the MSBs of each color to the LSBs of the same color for each pixel. If the input frame has more bits per pixel than the display, for example, 24 bpp input frame going to 16 bpp LCD, LCDIF will drop the LSBs of each color channel to convert to the lower color depth. LCDIF also has the capability to support delta pixel displays by swizzling the R, G and B colors of each pixel in the odd and even lines of the frame separately by programming the LCDIF\_CTRL2[ODD\_LINE\_PATTERN] and the LCDIF\_CTRL2[EVEN\_LINE\_PATTERN] bit fields. This operation occurs after the RGB-to-RGB color space conversion operation.

The following list shows how the different input/output combinations can be obtained:

- LCDIF\_CTRL[WORD\_LENGTH]=1 indicates that the input is 8-bit data. Any combination of LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] is permissible.

Limitation: LCDIF\_TRANSFER\_COUNT[H\_COUNT] must be a multiple of the sum of BYTE\_PACKING\_FORMAT [3], BYTE\_PACKING\_FORMAT [2], BYTE\_PACKING\_FORMAT [1] and BYTE\_PACKING\_FORMAT [0].

LCDIF\_CTRL[LCD\_DATABUS\_WIDTH] must be 1, indicating an 8-bit data bus.

- LCDIF\_CTRL[WORD\_LENGTH]=0 implies the input frame buffer is RGB 16 bits per pixel. LCDIF\_CTRL[DATA\_FORMAT\_16\_BIT] field determines the pixels are RGB 555 or RGB 565.

Limitation: LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] should be 0x3 or 0xC if there is only one pixel per word. If there are two pixels per word, it should be 0xF and LCDIF\_TRANSFER\_COUNT[H\_COUNT] will be restricted to be a multiple of 2 pixels.

## Functional Description

- LCDIF\_CTRL[WORD\_LENGTH]=2 indicates that input frame buffer is RGB 18 bits per pixel, that is, RGB 666. The valid RGB values can be left-aligned or right-aligned within a 32-bit word. The alignment of the valid 18 bits within a word is indicated by the LCDIF\_CTRL[DATA\_FORMAT\_18\_BIT] bit.

Limitation: LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] can be 0x7, 0xE or 0xF. Packed pixels are not supported in this case.

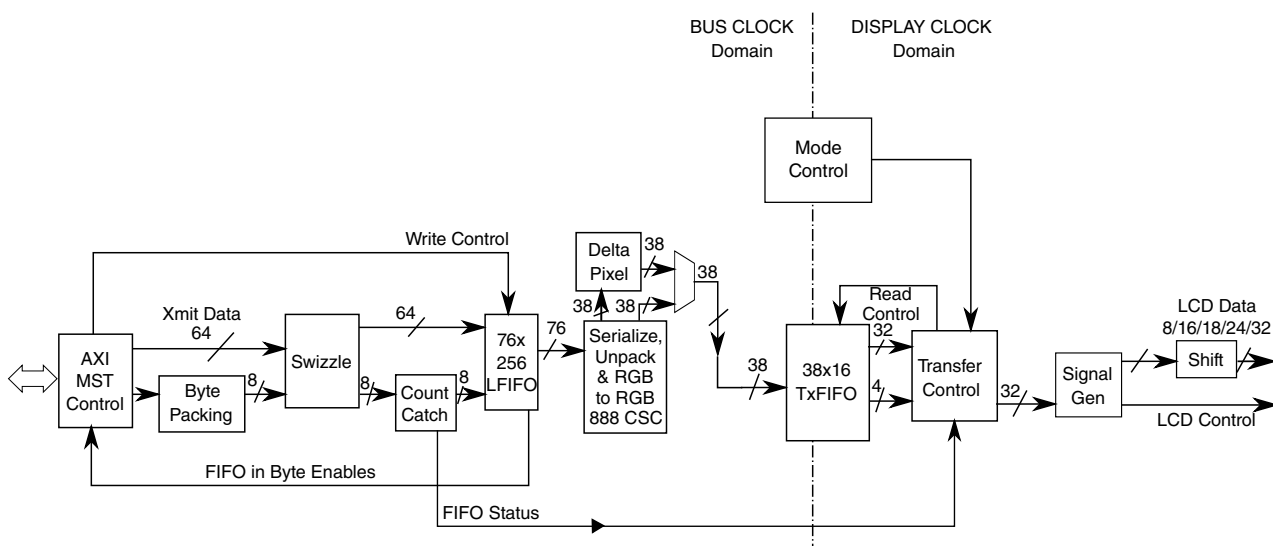

LCDIF\_TRANSFER\_COUNT[H\_COUNT] can be any number.

- LCDIF\_CTRL[WORD\_LENGTH]=3 indicates that the input frame-buffer is RGB 24 bits per pixel (RGB 888). If LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] is 0x7, it indicates that there is only one pixel per 32-bit word and there is no restriction on LCDIF\_TRANSFER\_COUNT[H\_COUNT]. This is also the option that provides 32 bit output depending on the I/O muxing options available. The fourth byte, or bits [31:24], and connected to the I/Os if this muxing is available in the chip package.

Limitation: If LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] is 0xF, it indicates that the pixels are packed, that is, there are 4 pixels in 3 words or 12 bytes and LCDIF\_TRANSFER\_COUNT[H\_COUNT] must be a multiple of 4 pixels.

After the RGB to RGB color space conversions, there is one more opportunity to swizzle the data before sending it out to the display or the encoder. This can be done with the LCDIF\_CTRL[CSC\_DATA\_SWIZZLE] field, and it provides the same options as the LCDIF\_CTRL[INPUT\_DATA\_SWIZZLE] register.

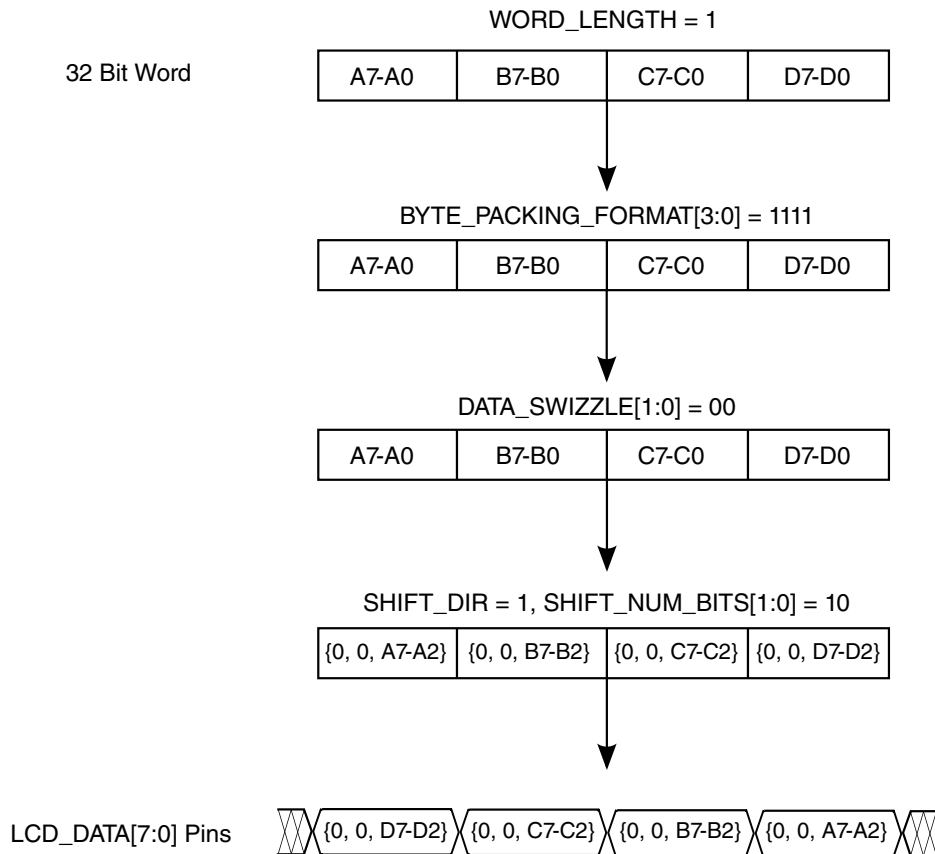

Finally, there is an option to shift the output data before sending it out to the display. This is done based on the LCDIF\_CTRL[SHIFT\_DIR] and LCDIF\_CTRL[SHIFT\_NUM\_BITS] fields.

**Figure 36-2. General Operations in Write Data Path**

The examples in the following figures illustrate some different combinations of register programming for write mode. Assume that the data transferred over the system bus within a 32 bit word is organized as {A7-A0, B7-B0, C7-C0, D7-D0} in 8-bit mode and {A15-A0, B15-B0} in 16-bit mode.

In this example, all 32 bits of the input word are transferred out over an 8 bit display bus. Each byte within the 32 bit word is shifted to the right with zeros appended to bits D[7:6]. The input data bits [7:2] are shifted to the right by 2 bits and presented on the D[5:0].

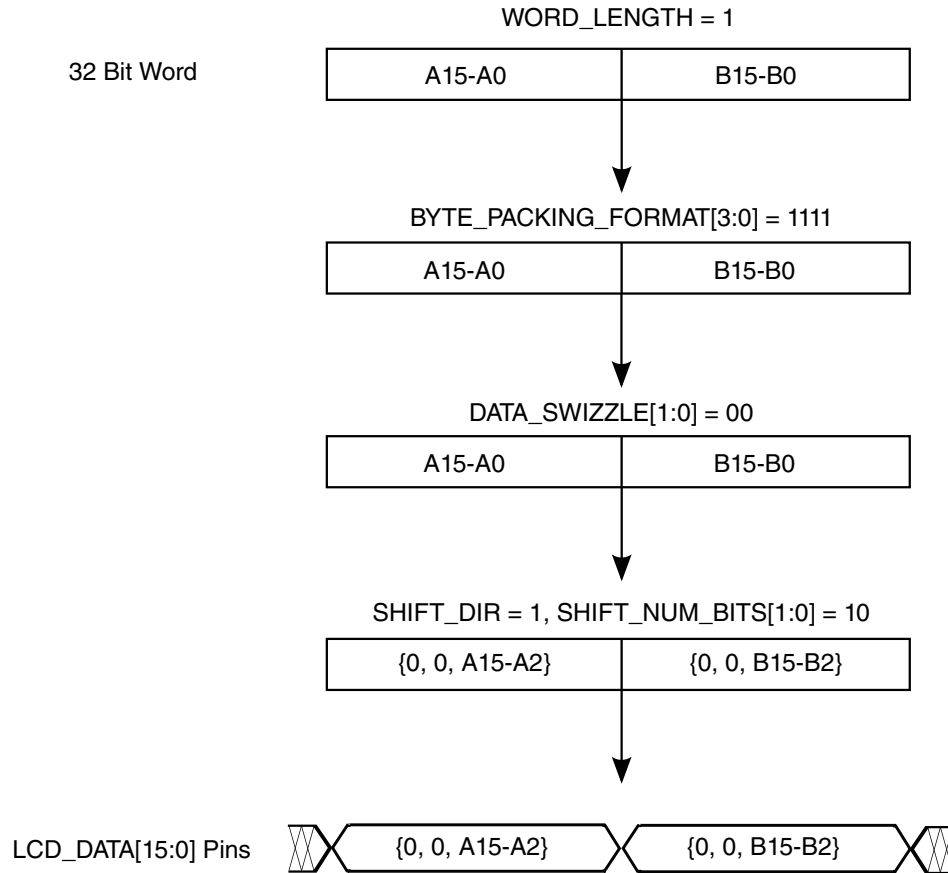

**Figure 36-3. Register programming for write mode**

In this 8 bit display interface example, one byte of the input word is deleted and not transferred over the external 8 bit display interface. This mode could be used to transfer 24bpp pixels over the 8 bit interface. In this case, the 4th unused byte is not transferred.

**Figure 36-4. Register programming for write mode**

The following example uses a 16 bit display interface. Each 16 bit half word is shifted to the right by two bits with zeros appended to the most significant two bits.

**Figure 36-5. Register programming for write mode**

This example indicates how an unpacked frame buffer can be sourced for display. Only a single 16 bit half word within the 32 bit word is transferred out via the 16 display bus.

Figure 36-6. Register programming for write mode

### 36.2.3 LCDIF Interrupts

LCDIF supports a number of interrupts to aid controlling and status reporting of the block.

All the interrupts have individual mask bits for enabling or disabling each of them. They all get funneled through a single interrupt line connected to the interrupt collector (ICOLL).

The following list describes the different interrupts supported by LCDIF:

- Underflow interrupt is asserted when the clock domain crossing FIFO (TXFIFO) becomes empty but the block is in active display portion during that time. Software should take corrective action to make sure that this does not happen.
- In the bus master mode, the overflow interrupt will be asserted if the block has requested more data than it's FIFOs could hold.
- Cur\_frame\_done interrupt occurs at the end of every frame .

## 36.2.4 Initializing the LCDIF

This section describes write modes.

### 36.2.4.1 Write Modes

The following initialization steps are common to all LCDIF write modes of operation before entering any particular mode.

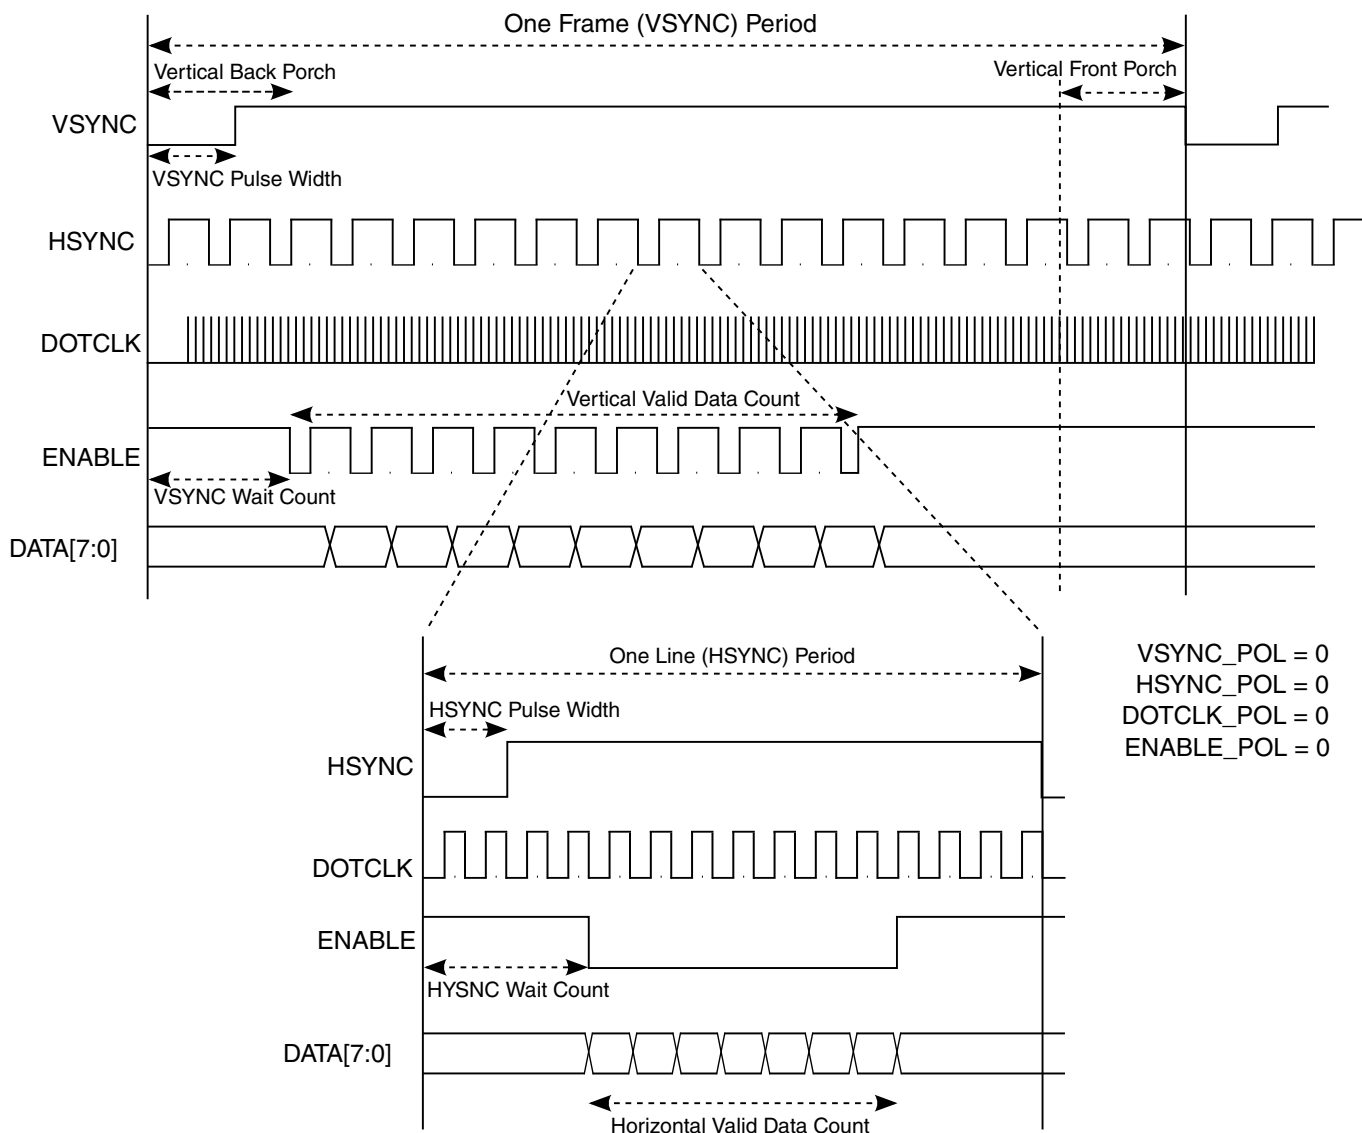

Initialization steps:

1. Configure the external I/Os to correctly interface the external display, when required.
2. Start the DISPLAY CLOCK (pix\_clk) clock and set the appropriate frequency by programming the registers in CCM.
3. Start the BUS CLOCK (apb\_clk) and set the appropriate frequency by programming the registers in CCM.
4. Bring the LCDIF out of soft reset and disable the clock gate bit.
5. Select the transfer mode of operation. The LCDIF\_CTRL[MASTER] bit determines the transfer mode selected. Bus master (LCDIF\_CTRL[MASTER] =1), APBDMA are the transfer modes to select.
6. Set the LCDIF\_CTRL[INPUT\_DATA\_SWIZZLE] according to the endianness of the LCD controller. Also, set the LCDIF\_CTRL[DATA\_SHIFT\_DIR] and LCDIF\_CTRL[SHIFT\_NUM\_BITS] if it is required to shift the data left or right before it is output.
7. Set the LCDIF\_CTRL[WORD\_LENGTH] field appropriately: 0 = 16-bit input, 1 = 8-bit input, 2 = 18-bit input, 3 = 24/32-bit input. Also, select the correct 16/18/24 bit data format with the corresponding fields in LCDIF\_CTRL register.
8. Set the LCDIF\_CTRL1[BYTE\_PACKING\_FORMAT] field according to the input frame.
9. Set the LCDIF\_CTRL[LCD\_DATABUS\_WIDTH] appropriately: 0 = 16-bit output, 1 = 8-bit output, 2 = 18-bit output, 3 = 24/32-bit output.
10. Enable the necessary IRQs.

## 36.2.5 DOTCLK Interface

The DOTCLK interface is another mode used in moving picture displays.

It includes the VSYNC, HSYNC, DOTCLK and (optional) ENABLE signals. The interface is popularly called the RGB interface if the ENABLE signal is present.

**Figure 36-7. DOTCLK protocol with programmable parameters**

The DOTCLK mode writes data at high speed to the LCD, and the display operation is synchronized with the VSYNC, HSYNC, ENABLE and DOTCLK signals. The polarities, periods and pulse-widths of the sync signals are programmable using the LCDIF\_VDCTRL0-4 registers. The units for the VSYNC signal must be number of horizontal lines and can be selected using the VSYNC\_PULSE\_WIDTH\_UNIT and VSYNC\_PERIOD\_UNIT bit fields. The VERTICAL\_WAIT\_CNT is by default given the same unit as the VSYNC\_PERIOD. The DISPLAY CLOCK (pix\_clk) frequency is managed by the CCM.

In DOTCLK mode, LCDIF\_CTRL\_BYPASS\_COUNT bit must be set to 1. To end the current transfer, the software should make the DOTCLK\_MODE bit 0, so that all data that is currently in the LCDIF LFIFO and TXFIFO is transmitted. Once that transfer is complete, the block will automatically clear the RUN bit and issue the cur\_frame\_done interrupt.

### 36.2.5.1 Code Example

The following code shows an example for programming a 320x240 display.

#### NOTE

Setting up the display must be done via SPI.

```
// Note: Common initialization steps in Initializing the LCDIF must also be
// executed along with the following code
BF_CS1 (LCDIF_CTRL, DOTCLK_MODE, 1);
BF_CS1 (LCDIF_CTRL, BYPASS_COUNT, 1); //Always for DOTCLK mode
BF_CS1 (LCDIF_VDCTRL0, VSYNC_OEB, 0); //Vsync is always an output in the DOTCLK mode
BF_CS4 (LCDIF_VDCTRL0, VSYNC_POL, 0, HSYNC_POL, 0, DOTCLK_POL, 0, ENABLE_POL, 0);
BF_CS1 (LCDIF_VDCTRL0, ENABLE_PRESENT, 1);
BF_CS2 (LCDIF_VDCTRL0, VSYNC_PERIOD_UNIT, 1, VSYNC_PULSE_WIDTH_UNIT, 1);
BF_CS1 (LCDIF_VDCTRL0, VSYNC_PULSE_WIDTH, 2);
BF_CS1 (LCDIF_VDCTRL1, VSYNC_PERIOD, 280);
BF_CS2 (LCDIF_VDCTRL2, HSYNC_PULSE_WIDTH, 10, HSYNC_PERIOD, 360); //Assuming
// LCD_DATABUS_WIDTH is 24bit
BF_CS2 (LCDIF_VDCTRL3, VSYNC_ONLY, 0);
BF_CS2 (LCDIF_VDCTRL3, HORIZONTAL_WAIT_CNT, 20, VERTICAL_WAIT_CNT, 20);
BF_CS1 (LCDIF_VDCTRL4, DOTCLK_H_VALID_DATA_CNT, 320); //Note that DOTCLK_V_VALID_DATA_CNT is
//implicitly assumed to be HW_LCDIF_TRANSFER_COUNT_V_COUNT
BF_CS1 (LCDIF_VDCTRL4, SYNC_SIGNALS_ON, 1);
BF_CS1 (LCDIF_CTRL, RUN, 1);
```

To stop the transfer completely, the ideal way is to make DOTCLK\_MODE = 0. In that case, the block will transmit the contents in the FIFO and reset the RUN bit.

### 36.2.6 LUT

The Lookup Table (LUT) is used to expand the 8 bits pixel to 24 bits pixel before output to external displayer. This module is used when input data from memory is 8-bits in width under limited bandwidth system and external displayer has a 24 bits requirement.

There are two 256x24 bits LUT memory in LCDIF module in case of changing LUT during active display. When using LUT function, it should be initialized through single PIO register writing first. Writing data to register HW\_LCDIF\_LUT0\_DATA will trigger storing data to lut0 memory and increase the lut0 memory address HW\_LCDIF\_LUT0\_ADDR automatically. Writing data again to register

HW\_LCDIF\_LUT0\_DATA will store the data to memory and increase the memory address accordingly. The same operation is performed while writing to HW\_LCDIF\_LUT1\_DATA and HW\_LCDIF\_LUT1\_ADDR.

After initialization, HW\_LCDIF\_CUR\_BUF\_ADDR bit 0 determines which LUT is used during active display.

Lastly, when there is active display, it will use the lowest 8 bits LCDIF data as LUT address and output the 24 bits from the lookup table.

### 36.2.7 Panel Interface Generator (Pigeon Mode)

There are several panel interface signal outputs (CLK signal not included), each of them with dedicated timing purpose as default. This is called "Legacy Mode". Pigeon Mode is a timing mode which can be independently enabled on any of the timing signals, with a unified flexible configuration. Signals within pigeon mode can be programmed into any supported signals, and are interchangeable. The following are the legacy timing signals which support pigeon mode:

- PIGEON[00] – LCD\_DATA16
- PIGEON[01] – LCD\_DATA17
- PIGEON[02] – LCD\_DATA18
- PIGEON[03] – LCD\_DATA19
- PIGEON[04] – LCD\_DATA20
- PIGEON[05] – LCD\_DATA21
- PIGEON[06] – LCD\_DATA22
- PIGEON[07] – LCD\_DATA23
- PIGEON[08] – LCD\_ENABLE
- PIGEON[09] – LCD\_HSYNC
- PIGEON[10] – LCD\_VSYNC
- PIGEON[11] – LCD\_CLK

Each pigeon signal has one local counter with a configurable start point and incremental condition. It will be compared to configuration register value for signal assertion/de-assertion control, plus delta offset for data alignment and other options like polarity/logic operation. A detailed running scenario is as follows:

1. Start local counter on the MASK rising edge (reference point/start point)
2. Increment on event selected through INC\_SEL
3. Count and match SET\_CNT: assert signal, reset counter (SET\_CNT==0 means assert immediately on MASK's rising edge)
4. Count and match CLR\_CNT: de-assert signal, stop counter (CLR\_CNT==0 means de-assert on MASK's falling edge)

**NOTE**

When local counter is running, further changes to MASK are not cared unless CLR\_CNT==0

MASK is the start point for local counter created using a combination any of the options (ANDed) from below:

1. STATE\_MASK= (FS|FB|FD|FE) AND (LS|LB|LD|LE)

In this case you have 8 bits to select in which vertical/horizontal state your counter starts ticking. This is the most common use-case because timing signals generally relate to scan states.

For example, for a line timing signal start on Line Begin phase during Frame Begin/ Frame Data lines, use the configuration below:

**Table 36-1. State Mask Combinations**

STATE_MASK	LS	LB=1	LD	LE
FS				
FB=1		X		
FD=1		X		
FE				

2. MASK\_CNT/MASK\_CNT\_SEL (global counter)

Sometimes a more accurate reference point is required, such as "line 20 in a frame", or "line 12 in Frame Begin state" or "pixel 23 in LD phase". For such use-cases, several Global Counters shared by all pigeons are provided. Global counter type (line counter/frame counter/state counter, etc.) is selected using MASK\_CNT\_SEL, when global counter matches the MASK\_CNT value. The pigeon local counter will start ticking.

3. Use another pigeon signal as mask (SIG\_LOGIC=MASK)

For some tightly coupled signals it is possible to use one as a reference to generate another.

INC\_SEL- select local counter tick event

- a. pclk - pixel clk
- b. line - line start pulse
- c. frame - frame start pulse
- d. another - another pigeon signal

## Functional Description

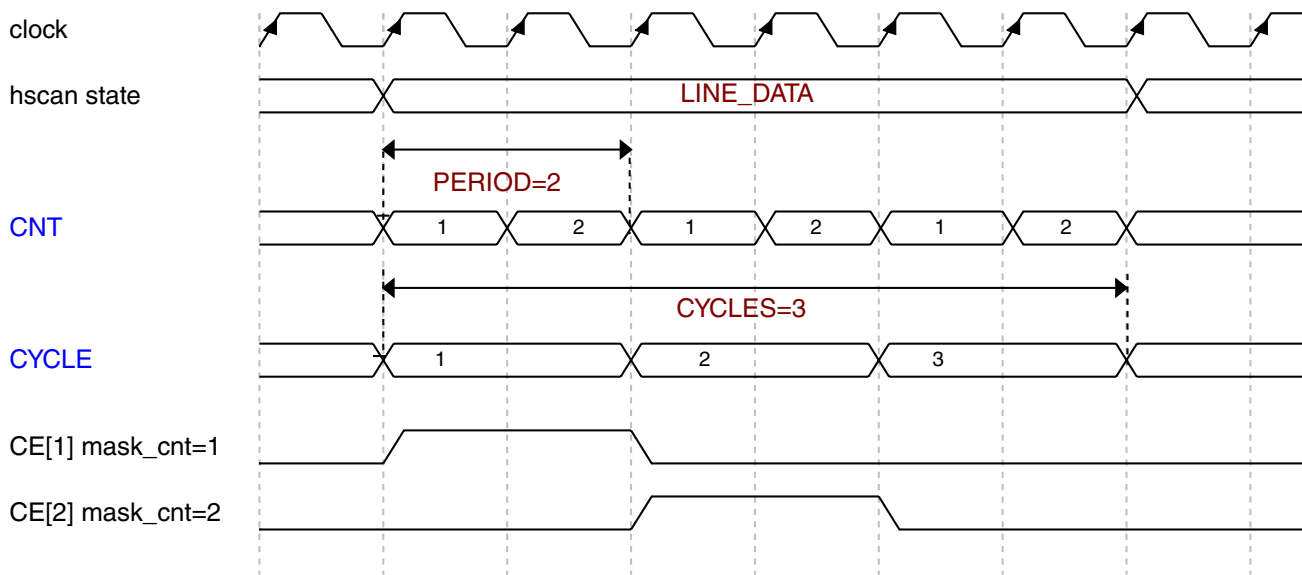

OFFSET- offset on pclk basis: Some signals need to come out slightly earlier or later than programmed. For example, the CE type signal usually aligns with the Line Data phase, but some panels need it as one cycle pulse before Line Data. The user can set OFFSET to a negative value to achieve this.

Global counters (selectable through MASK\_CNT\_SEL):

- HCNT / VCNT : normal pclk counter / line counter
- HSTATE\_CNT / VSTATE\_CNT: similar to above, but reset when state changes
- HSTATE\_CYCLE / VSTATE\_CYCLE: (see figure below for definition of CYCLE/PERIOD/CNT)

Some panels have multiple Gate Drivers/Source Drivers, so Frame Data / Line Data state may be further split to match each driver, and signals such as CE[n] are only valid during part n of Line Data. For such signals, use LCDIF\_PIGEON\_CTRL[\*\_PERIOD] to specify PERIOD where CNT is reset and CYCLE is included. Then the user can select CYCLE as MASK\_CNT to generate mask for CE[n].

- FRAME\_CNT / FRAME\_CYCLE (only for frame-crossing signals): frame cycle counter doesn't have a reset condition; use LCDIF\_PIGEON\_CTRL1[FRAME\_CNT\_CYCLES] to reset it.

**Figure 36-8. Definition of CNT, CYCLE, PERIOD**

The following are register settings for the figure above:

- LCDIF\_PIGEON\_CTRL0[LD\_PERIOD]=2
- MASK\_CNT\_SEL = 1 // HSTATE\_CYCLE

- MASK\_CNT = 1 // CE[1]
- MASK\_CNT = 2 // CE[2]

### 36.2.8 LCDIF Pin Usage by Interface Mode

The following tables detail how the LCDIF level interface pins are used based on the desired mode of operation. The chip level I/Os should also be configured to be consistent with the desired LCDIF operating mode.

#### NOTE

There is an option to internally mux the HSYNC, DOTCLK and ENABLE signals in the DOTCLK mode by setting the MUX\_SYNC\_SIGNALS bit in the VDCTRL0 register.

**Table 36-2. Pin use in DOTCLK Mode**

PIN NAME	8-bit DOTCLK LCD IF	16-bit DOTCLK LCD IF	18-bit DOTCLK LCD IF	24-bit DOTCLK LCD IF

### 36.3 Behavior During Reset

BUS CLOCK (apb\_clk) and DISPLAY CLOCK (pix\_clk) must be running before making any changes to SFTRST or CLKGATE bits.

A soft reset (SFTRST) can take multiple clock periods to complete, so do not set CLKGATE when setting SFTRST.

The reset process gates the clocks automatically.

## 36.4 LCDIF Memory Map/Register Definition

Some of the LCDIF registers (XXX\_SET, XXX\_CLR, and XXX\_TOG) allow direct bit field masking and access.

- When writing 1 to XXX\_SET bit fields, these registers allow setting the masked 1 bit fields, while keeping unchanged all bit fields which remain on 0 logic state.
- When writing 1 to XXX\_CLR bit fields, these registers allow clearing the masked 1 bit fields, while keeping unchanged all other bit fields which remained on 0 logic state.
- When writing 1 to XXX\_TOG bit fields, these registers allow inverting the logic state of all masked 1 bit fields, while they keep unchanged the remaining bit fields which were kept on 0 logic state.

### LCDIF Hardware Register Format Summary

#### LCDIF memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 36.4.1 LCDIF General Control Register (LCDIF\_CTRLn)

The LCD Interface Control Register provides overall control of the LCDIF block. The LCDIF Control Register provides a variety of control functions to the programmer. These functions allow the interface to be very flexible to work with a variety of LCD controllers, and to minimize overhead and increase performance of LCD programming. The register has been organized such that switching between the different LCD modes can be done with minimum PIO writes.

Address: 402B\_8000h base + 0h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**LCDIF\_CTRLn field descriptions**

Field	Description
31 SFTRST	This bit must be set to zero to enable normal operation of the LCDIF. When set to one, it forces a block level reset.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 -	Reserved
28 -	This field is reserved. Reserved

Table continues on the next page...

## LCDIF\_CTRLn field descriptions (continued)

Field	Description
27 -	This field is reserved. Reserved
26 DATA_SHIFT_ DIR	Use this bit to determine the direction of shift of transmit data. 0x0 <b>TXDATA_SHIFT_LEFT</b> — Data to be transmitted is shifted LEFT by SHIFT_NUM_BITS bits. 0x1 <b>TXDATA_SHIFT_RIGHT</b> — Data to be transmitted is shifted RIGHT by SHIFT_NUM_BITS bits.
25–21 SHIFT_NUM_ BITS	The data to be transmitted is shifted left or right by this number of bits.
20 -	This field is reserved. Reserved
19 BYPASS_ COUNT	When this bit is 0, it means that LCDIF will stop the block operation and turn off the RUN bit after the amount of data indicated by the LCDIF_TRANSFER_COUNT register has been transferred out. When this bit is set to 1, the block will continue normal operation indefinitely until it is told to stop. This bit must be 0 in MPU and VSYNC modes, and must be 1 in DOTCLK and DVI modes of operation.
18 -	This field is reserved. Reserved
17 DOTCLK_MODE	Set this bit to 1 to make the hardware go into the DOTCLK mode, i.e. VSYNC/HSYNC/DOTCLK/ENABLE interface mode. ENABLE is optional, selected by the ENABLE_PRESENT bit. Toggle this bit from 1 to 0 to make the hardware go out of DOTCLK mode after completing all data transfer and deasserting the RUN bit.
16 -	This field is reserved. Reserved
15–14 INPUT_DATA_ SWIZZLE	This field specifies how to swap the bytes fetched by the bus master interface. The swizzle function is independent of the WORD_LENGTH bit. The supported swizzle configurations are: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x0 <b>LITTLE_ENDIAN</b> — Little Endian byte ordering (same as NO_SWAP). 0x1 <b>BIG_ENDIAN_SWAP</b> — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 <b>SWAP_ALL_BYTES</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
13–12 CSC_DATA_ SWIZZLE	This field specifies how to swap the bytes after the data has been converted into an internal representation of 24 bits per pixel and before it is transmitted over the LCD interface bus. The data is always transmitted with the least significant byte/hword (half word) first after the swizzle takes place. So, INPUT_DATA_SWIZZLE takes place first on the incoming data, and then CSC_DATA_SWIZZLE is applied. The swizzle function is independent of the WORD_LENGTH or the LCD_DATABUS_WIDTH fields. If RGB_TO_YCRCB422_CSC bit is set, the swizzle occurs on the Y, Cb, Cr values. The supported swizzle configurations are: 0x0 <b>NO_SWAP</b> — No byte swapping.(Little endian) 0x0 <b>LITTLE_ENDIAN</b> — Little Endian byte ordering (same as NO_SWAP). 0x1 <b>BIG_ENDIAN_SWAP</b> — Big Endian swap (swap bytes 0,3 and 1,2). 0x1 <b>SWAP_ALL_BYTES</b> — Swizzle all bytes, swap bytes 0,3 and 1,2 (aka Big Endian). 0x2 <b>HWD_SWAP</b> — Swap half-words. 0x3 <b>HWD_BYTE_SWAP</b> — Swap bytes within each half-word.
11–10 LCD_DATABUS_ WIDTH	LCD Data bus transfer width. 0x0 <b>16_BIT</b> — 16-bit data bus mode.

Table continues on the next page...

## LCDIF\_CTRLn field descriptions (continued)

Field	Description
	0x1 <b>8_BIT</b> — 8-bit data bus mode. 0x2 <b>18_BIT</b> — 18-bit data bus mode. 0x3 <b>24_BIT</b> — 24-bit data bus mode.
9–8 WORD_LENGTH	Input data format. 0x0 <b>16_BIT</b> — Input data is 16 bits per pixel. 0x1 <b>8_BIT</b> — Input data is 8 bits wide. 0x2 <b>18_BIT</b> — Input data is 18 bits per pixel. 0x3 <b>24_BIT</b> — Input data is 24 bits per pixel.
7 -	This field is reserved. Reserved
6 ENABLE_PXP_ HANDSHAKE	If this bit is set and LCDIF_MASTER bit is set, the LCDIF will act as bus master and the handshake mechanism between LCDIF and PXP will be turned on. If LCDIF_MASTER bit is not set, this bit becomes a don't care.
5 MASTER	Set this bit to make the LCDIF act as a bus master. If this bit is reset, the LCDIF will support APBDMA or PIO mode.
4 RSRVD0	This field is reserved. Reserved bits. Write as 0.
3 DATA_ FORMAT_16_ BIT	When this bit is 1 and WORD_LENGTH = 0, it implies that the 16-bit data is in ARGB555 format. When this bit is 0 and WORD_LENGTH = 0, it implies that the 16-bit data is in RGB565 format. When WORD_LENGTH is not 0, this bit does not care.
2 DATA_ FORMAT_18_ BIT	Used only when WORD_LENGTH = 2, i.e. 18-bit. 0x0 <b>LOWER_18_BITS_VALID</b> — Data input to the block is in 18 bpp format, such that lower 18 bits contain RGB 666 and upper 14 bits do not contain any useful data. 0x1 <b>UPPER_18_BITS_VALID</b> — Data input to the block is in 18 bpp format, such that upper 18 bits contain RGB 666 and lower 14 bits do not contain any useful data.
1 DATA_ FORMAT_24_ BIT	Used only when WORD_LENGTH = 3, i.e. 24-bit. Note that this applies to both packed and unpacked 24-bit data. 0x0 <b>ALL_24_BITS_VALID</b> — Data input to the block is in 24 bpp format, such that all RGB 888 data is contained in 24 bits. 0x1 <b>DROP_UPPER_2_BITS_PER_BYTE</b> — Data input to the block is actually RGB 18 bpp, but there is 1 color per byte, hence the upper 2 bits in each byte do not contain any useful data, and should be dropped.
0 RUN	When this bit is set by software, the LCDIF will begin transferring data between the SoC and the display. This bit must remain set until the operation is complete.

### 36.4.2 LCDIF General Control1 Register (LCDIF\_CTRL1n)

The LCDIF Control Register provides overall control of the LCDIF block.

## LCDIF Memory Map/Register Definition

The LCDIF Control1 Register provides additional programming to the LCDIF. It implements some bits which are unlikely to change often in a particular application. It also carries interrupt-related bits which are common across more than one mode of operation.

Address: 402B\_8000h base + 10h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### LCDIF\_CTRL1n field descriptions

Field	Description
31 IMAGE_DATA_SELECT	Command Mode MIPI image data select bit. This bit will control MIPI DSI SYS_ADDR[1]. This bit should only be changed when RUN is 0.
30 CS_OUT_SELECT	This bit is CS0/CS1 valid select signals. When set 0x0, LCDIF_CSn0 output valid, and LCSIF_CSn1 will always output 1. When set to 0x1, LCDIF_CSn1 output valid, and LCSIF_CSn0 will always output 1.
29–28 -	This field is reserved. Reserved bits. Write as 0.
27 -	This field is reserved. Reserved.
26 BM_ERROR_IRQ_EN	This bit is set to enable bus master error interrupt in the LCDIF master mode.
25 BM_ERROR_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. This bit will be set when the LCDIF is in master mode and an error response was returned by the slave.

Table continues on the next page...

## LCDIF\_CTRL1n field descriptions (continued)

Field	Description
	0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
24 RECOVER_ON_ UNDERFLOW	Set this bit to enable the LCDIF block to recover in the next field/frame if there was an underflow in the current field/frame.
23 INTERLACE_ FIELDS	Set this bit if it is required that the LCDIF block fetches odd lines in one field and even lines in the other field. It will work only in LCDIF_MASTER is set to 1.
22 START_ INTERLACE_ FROM_ SECOND_FIELD	The default is to grab the odd lines first and then the even lines. Set this bit if it is required to grab the even lines first and then the odd lines. (Line numbers start from 1, so odd lines are 1,3,5,etc. and even lines are 2,4,6, etc.)
21 FIFO_CLEAR	Set this bit to clear all the data in the latency FIFO (LFIFO), TXFIFO and the RXFIFO.
20 IRQ_ON_ ALTERNATE_ FIELDS	If this bit is set, the LCDIF block will assert the cur_frame_done interrupt only on alternate fields, otherwise it will issue the interrupt on both odd and even field. This bit is mostly relevant if INTERLACE_FIELDS is set.
19–16 BYTE_ PACKING_ FORMAT	This bitfield is used to show which data bytes in a 32-bit word are valid. Default value 0xf indicates that all bytes are valid. For 8-bit transfers, any combination in this bitfield will mean valid data is present in the corresponding bytes. In the 16-bit mode, a 16-bit half-word is valid only if adjacent bits [1:0] or [3:2] or both are 1. A value of 0x0 will mean that none of the bytes are valid and should not be used. For example, set the bit field value to 0x7 if the display data is arranged in the 24-bit unpacked format (A-R-G-B where A value does not have to be transmitted).
15 OVERFLOW_ IRQ_EN	This bit is set to enable an overflow interrupt in the TXFIFO in the write mode.
14 UNDERFLOW_ IRQ_EN	This bit is set to enable an underflow interrupt in the TXFIFO in the write mode.
13 CUR_FRAME_ DONE_IRQ_EN	This bit is set to 1 enable an interrupt every time the hardware enters in the vertical blanking state.
12 VSYNC_EDGE_ IRQ_EN	This bit is set to enable an interrupt every time the hardware encounters the leading VSYNC edge in the VSYNC and DOTCLK modes, or the beginning of every field in DVI mode.
11 OVERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A latency FIFO (LFIFO) overflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected, data samples have been lost.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
10 UNDERFLOW_ IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. A TXFIFO underflow in the write mode (MPU/VSYNC/DOTCLK/DVI mode) was detected. Could produce an error in the DOTCLK / DVI modes.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.

Table continues on the next page...

LCDIF\_CTRL1n field descriptions (continued)

Field	Description
9 CUR_FRAME_DONE_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It indicates that the hardware has completed transmitting the current frame and is in the vertical blanking period in the DOTCLK/DVI modes. In the MPU and VSYNC modes, this IRQ is asserted at the end of the data transfer indicated by LCDIF_TRANSFER_COUNT register.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
8 VSYNC_EDGE_IRQ	This bit is set to indicate that an interrupt is requested by the LCDIF block. This bit is cleared by software by writing a one to its SCT clear address. It is set whenever the leading VSYNC edge is detected in the VSYNC and DOTCLK modes. In the DVI mode, it is asserted every time the block enters a new field.  0x0 <b>NO_REQUEST</b> — No Interrupt Request Pending. 0x1 <b>REQUEST</b> — Interrupt Request Pending.
7-3 RSRVDO	This field is reserved. Reserved bits. Write as 0.
2 -	This field is reserved. Reserved
1 -	This field is reserved. Reserved.
0 -	This field is reserved. Reserved.

36.4.3 LCDIF General Control2 Register (LCDIF\_CTRL2n)

The LCDIF Control Register provides overall control of the LCDIF block.

The LCDIF Control2 Register provides additional programming to the LCDIF. It implements some bits which are unlikely to change often in a particular application.

Address: 402B\_8000h base + 20h offset + (4d × i), where i=0d to 3d

**LCDIF\_CTRL2n field descriptions**

Field	Description
31–24 RSRVD5	This field is reserved. Reserved bits. Write as 0.
23–21 OUTSTANDING_REQS	This bitfield indicates the maximum number of outstanding transactions that LCDIF should request when it is acting as a bus master. Default is 2 outstanding transactions.  0x0 <b>REQ_1</b> — 0x1 <b>REQ_2</b> — 0x2 <b>REQ_4</b> — 0x3 <b>REQ_8</b> — 0x4 <b>REQ_16</b> —
20 BURST_LEN_8	By default, when the LCDIF is in the bus master mode, it will issue AXI bursts of length 16 (except when in packed 24 bpp mode, it will issue bursts of length 15). When this bit is set to 1, the block will issue bursts of length 8 (except when in packed 24 bpp mode, it will issue bursts of length 9). Note that this bitfield is only applicable when LCDIF_MASTER is set to 1.
19 RSRVD4	This field is reserved. Reserved bits. Write as 0.
18–16 ODD_LINE_PATTERN	This field determines the order of the RGB components of each pixel in ODD lines (line numbers 1,3,5,..).  0x0 <b>RGB</b> — 0x1 <b>RBG</b> — 0x2 <b>GBR</b> — 0x3 <b>GRB</b> — 0x4 <b>BRG</b> — 0x5 <b>BGR</b> —
15 RSRVD3	This field is reserved. Reserved bits. Write as 0.
14–12 EVEN_LINE_PATTERN	This field determines the order of the RGB components of each pixel in EVEN lines (line numbers 2,4,6,..).  0x0 <b>RGB</b> — 0x1 <b>RBG</b> — 0x2 <b>GBR</b> — 0x3 <b>GRB</b> — 0x4 <b>BRG</b> — 0x5 <b>BGR</b> —

Table continues on the next page...

**LCDIF\_CTRL2n field descriptions (continued)**

Field	Description
RSRVD0	This field is reserved. Reserved bits. Write as 0.

**36.4.4 LCDIF Horizontal and Vertical Valid Data Count Register (LCDIF\_TRANSFER\_COUNT)**

This register tells the LCDIF how much data will be sent for this frame, or transaction. The total number of words is a product of the V\_COUNT and H\_COUNT fields. The word size is specified by the WORD\_LENGTH field.

This register gives the dimensions of the input frame. For normal operation, but V\_COUNT and H\_COUNT should be non-zero.

Address: 402B\_8000h base + 30h offset = 402B\_8030h

**LCDIF\_TRANSFER\_COUNT field descriptions**

Field	Description
31–16 V_COUNT	Number of horizontal lines per frame which contain valid data. In DOTCLK mode, V_COUNT should be the same as the number of active horizontal lines in a progressive frame.
H_COUNT	Total valid data (pixels) in each horizontal line. The data size is given by the WORD_LENGTH. In 24-bit packed format (WORD_LENGTH=0x3, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 4 pixels. In 16-bit packed format (WORD_LENGTH=0x0, BYTE_PACKING_FORMAT=0xF), the H_COUNT must be a multiple of 2 pixels.

**36.4.5 LCD Interface Current Buffer Address Register (LCDIF\_CUR\_BUF)**

This register indicates the address of the current frame being transmitted by LCDIF.

When the LCDIF is behaving as a master, this address points to the address of the current frame of data being sent out via the LCDIF. When the current frame is done, the LCDIF block will assert the cur\_frame\_done interrupt for software to take action. The block will also copy the LCDIF\_NEXT\_BUF\_ADDR into this bitfield so that the software can program the next frame address into the LCDIF\_NEXT\_BUF\_ADDR bitfield. This address must always be double-word aligned.

Address: 402B\_8000h base + 40h offset = 402B\_8040h

### LCDIF\_CUR\_BUF field descriptions

Field	Description
ADDR	Address of the current frame being transmitted by LCDIF.

## 36.4.6 LCD Interface Next Buffer Address Register (LCDIF\_NEXT\_BUF)

This register indicates the address of next frame that will be transmitted by LCDIF.

When the LCDIF is behaving as a master, this address points to the address of the next frame of data that will be sent out via the LCDIF. It is up to the software to make sure that this register is programmed before the end of the current frame, otherwise it might result in old data going out the LCDIF. This address must always be double-word aligned.

Address: 402B\_8000h base + 50h offset = 402B\_8050h

### LCDIF\_NEXT\_BUF field descriptions

Field	Description
ADDR	Address of the next frame that will be transmitted by LCDIF.

## 36.4.7 LCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF\_VDCTRL0n)

This register is used to control the VSYNC and DOTCLK modes of the LCDIF so as to work with different types of LCDs like moving picture displays and delta pixel displays.

This register gives general programmability to the VSYNC signal including polarity, direction, pulse width, etc.

## LCDIF Memory Map/Register Definition

Address: 402B\_8000h base + 70h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	Reserved			ENABLE_PRESENT	VSYNC_POL	HSYNC_POL	DOTCLK_POL	ENABLE_POL	Reserved			VSYNC_PERIOD_UNIT	VSYNC_PULSE_WIDTH_UNIT	HALF_LINE	HALF_LINE_MODE	VSYNC_PULSE_WIDTH	
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	VSYNC_PULSE_WIDTH																
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

### LCDIF\_VDCTRL0n field descriptions

Field	Description
31–29 RSRVD2	This field is reserved. Reserved bits. Write as 0.
28 ENABLE_PRESENT	Setting this bit to 1 will make the hardware generate the ENABLE signal in the DOTCLK mode, thereby making it the true RGB interface along with the remaining three signals VSYNC, HSYNC and DOTCLK.
27 VSYNC_POL	Default 0 active low during VSYNC_PULSE_WIDTH time and will be high during the rest of the VSYNC period. Set it to 1 to invert the polarity.
26 HSYNC_POL	Default 0 active low during HSYNC_PULSE_WIDTH time and will be high during the rest of the HSYNC period. Set it to 1 to invert the polarity.
25 DOTCLK_POL	Default is data launched at negative edge of DOTCLK and captured at positive edge. Set it to 1 to invert the polarity. Set it to 0 in DVI mode.
24 ENABLE_POL	Default 0 active low during valid data transfer on each horizontal line.
23–22 RSRVD1	This field is reserved. Reserved bits. Write as 0.
21 VSYNC_PERIOD_UNIT	Default 0 for counting VSYNC_PERIOD in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines. DISPLAY CLOCK (pix_clk) cycles should be used in the VSYNC mode, while horizontal line should be used in the DOTCLK mode.
20 VSYNC_PULSE_WIDTH_UNIT	Default 0 for counting VSYNC_PULSE_WIDTH in terms of DISPLAY CLOCK (pix_clk) cycles. Set it to 1 to count in terms of complete horizontal lines.
19 HALF_LINE	Setting this bit to 1 will make the total VSYNC period equal to the VSYNC_PERIOD field plus half the HORIZONTAL_PERIOD field (i.e. VSYNC_PERIOD field plus half horizontal line), otherwise it is just VSYNC_PERIOD. Should be only used in the DOTCLK mode, not in the VSYNC interface mode.
18 HALF_LINE_MODE	When this bit is 0, the first field (VSYNC period) will end in half a horizontal line and the second field will begin with half a horizontal line. When this bit is 1, all fields will end with half a horizontal line, and none will begin with half a horizontal line.

Table continues on the next page...

## LCDIF\_VDCTRL0n field descriptions (continued)

Field	Description
VSYNC_PULSE_WIDTH	Number of units for which VSYNC signal is active. For the DOTCLK mode, the unit is determined by the VSYNC_PULSE_WIDTH_UNIT. If the VSYNC_PULSE_WIDTH_UNIT is 0 for DOTCLK mode, VSYNC_PULSE_WIDTH must be less than HSYNC_PERIOD. For the VSYNC interface mode, it should be in terms of number of DISPLAY CLOCK (pix_clk) cycles only.

### 36.4.8 LCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF\_VDCTRL1)

This register is used to control the VSYNC signal in the VSYNC and DOTCLK modes of the block.

This register determines the period and duty cycle of the VSYNC signal when it is generated in the block.

Address: 402B\_8000h base + 80h offset = 402B\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## LCDIF\_VDCTRL1 field descriptions

Field	Description
VSYNC_PERIOD	Total number of units between two positive or two negative edges of the VSYNC signal. If HALF_LINE is set, it is implicitly calculated to be VSYNC_PERIOD plus half HSYNC_PERIOD.

### 36.4.9 LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF\_VDCTRL2)

This register is used to control the HSYNC signal in the DOTCLK mode of the block.

This register determines the period and duty cycle of the HSYNC signal when it is generated in the block.

Address: 402B\_8000h base + 90h offset = 402B\_8090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**LCDIF\_VDCTRL2 field descriptions**

Field	Description
31–18 HSYNC_PULSE_WIDTH	Number of DISPLAY CLOCK (pix_clk) cycles for which HSYNC signal is active.
HSYNC_PERIOD	Total number of DISPLAY CLOCK (pix_clk) cycles between two positive or two negative edges of the HSYNC signal.

**36.4.10 LCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF\_VDCTRL3)**

This register is used to determine the vertical and horizontal wait counts.

This register determines the back porches of HSYNC and VSYNC signals when they are generated by the block.

Address: 402B\_8000h base + A0h offset = 402B\_80A0h

**LCDIF\_VDCTRL3 field descriptions**

Field	Description
31–30 RSRVDO	This field is reserved. Reserved bits, write as 0.
29 MUX_SYNC_SIGNALS	When this bit is set, the LCDIF block will internally mux HSYNC with LCD_D14, DOTCLK with LCD_D13 and ENABLE with LCD_D12, otherwise these signals will go out on separate pins. This feature can be used to maintain backward compatible with 37xx.
28 VSYNC_ONLY	This bit must be set to 1 in the VSYNC mode of operation, and 0 in the DOTCLK mode of operation.

Table continues on the next page...

## LCDIF\_VDCTRL3 field descriptions (continued)

Field	Description
27–16 HORIZONTAL_WAIT_CNT	In the DOTCLK mode, wait for this number of clocks from falling edge (or rising if HSYNC_POL is 1) of HSYNC signal to account for horizontal back porch plus the number of DOTCLKs before the moving picture information begins.
VERTICAL_WAIT_CNT	In the VSYNC interface mode, wait for this number of DISPLAY CLOCK (pix_clk) cycles from the falling VSYNC edge (or rising if VSYNC_POL is 1) before starting LCD transactions and is applicable only if WAIT_FOR_VSYNC_EDGE is set. Minimum is CMD_SETUP+5. In the DOTCLK mode, it accounts for the vertical back porch lines plus the number of horizontal lines before the moving picture begins. The unit for this parameter is inherently the same as the VSYNC_PERIOD_UNIT.

### 36.4.11 LCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF\_VDCTRL4)

This register is used to control the DOTCLK mode of the block.

This register determines the active data in each horizontal line in the DOTCLK mode. Note that the total number of active horizontal lines in the DOTCLK mode is the same as the V\_COUNT bitfield in the LCDIF\_TRANSFER\_COUNT register.

Address: 402B\_8000h base + B0h offset = 402B\_80B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DOTCLK_DLY_SEL			Reserved											SYNC_SIGNALS_ON	DOTCLK_H_VALID_DATA_CNT
W	DOTCLK_DLY_SEL			Reserved											SYNC_SIGNALS_ON	DOTCLK_H_VALID_DATA_CNT
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DOTCLK_H_VALID_DATA_CNT															
W	DOTCLK_H_VALID_DATA_CNT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### LCDIF\_VDCTRL4 field descriptions

Field	Description
31–29 DOTCLK_DLY_SEL	This bitfield selects the amount of time by which the DOTCLK signal should be delayed before coming out of the LCD_DOTCK pin. 0 = 2ns; 1=4ns;2=6ns;3=8ns. Remaining values are reserved.
28–19 RSRVD0	This field is reserved. Reserved bits, write as 0.

Table continues on the next page...

**LCDIF\_VDCTRL4 field descriptions (continued)**

Field	Description
18 SYNC_ SIGNALS_ON	Set this field to 1 if the LCD controller requires that the VSYNC or VSYNC/HSYNC/DOTCLK control signals should be active at least one frame before the data transfers actually start and remain active at least one frame after the data transfers end. The hardware does not count the number of frames automatically. Rather, the VSYNC edge interrupt can be monitored by software to count the number of frames that have occurred after this bit is set and then the RUN bit can be set to start the data transactions. This bit must always be set in the DOTCLK mode of operation, and it must be set in the VSYNC mode of operation when VSYNC signal is an output.
DOTCLK_H_ VALID_DATA_ CNT	Total number of DISPLAY CLOCK (pix_clk) cycles on each horizontal line that carry valid data in DOTCLK mode.

**36.4.12 Bus Master Error Status Register (LCDIF\_BM\_ERROR\_STAT)**

This register reflects the virtual address at which the AXI master received an error response from the slave.

When the BM\_ERROR\_IRQ is asserted, the address of the bus error is updated in the register.

Address: 402B\_8000h base + 190h offset = 402B\_8190h

**LCDIF\_BM\_ERROR\_STAT field descriptions**

Field	Description
ADDR	Virtual address at which bus master error occurred.

**36.4.13 CRC Status Register (LCDIF\_CRC\_STAT)**

This register reflects the CRC value of each frame sent out by LCDIF. The CRC is done on the final output bus, so the value will be dependent on the LCD\_DATABUS\_WIDTH bitfield even if the input data is the same.

This register will be updated when the CUR\_FRAME\_DONE\_IRQ is asserted.

Address: 402B\_8000h base + 1A0h offset = 402B\_81A0h

**LCDIF\_CRC\_STAT field descriptions**

Field	Description
CRC_VALUE	Calculated CRC value.

**36.4.14 LCD Interface Status Register (LCDIF\_STAT)**

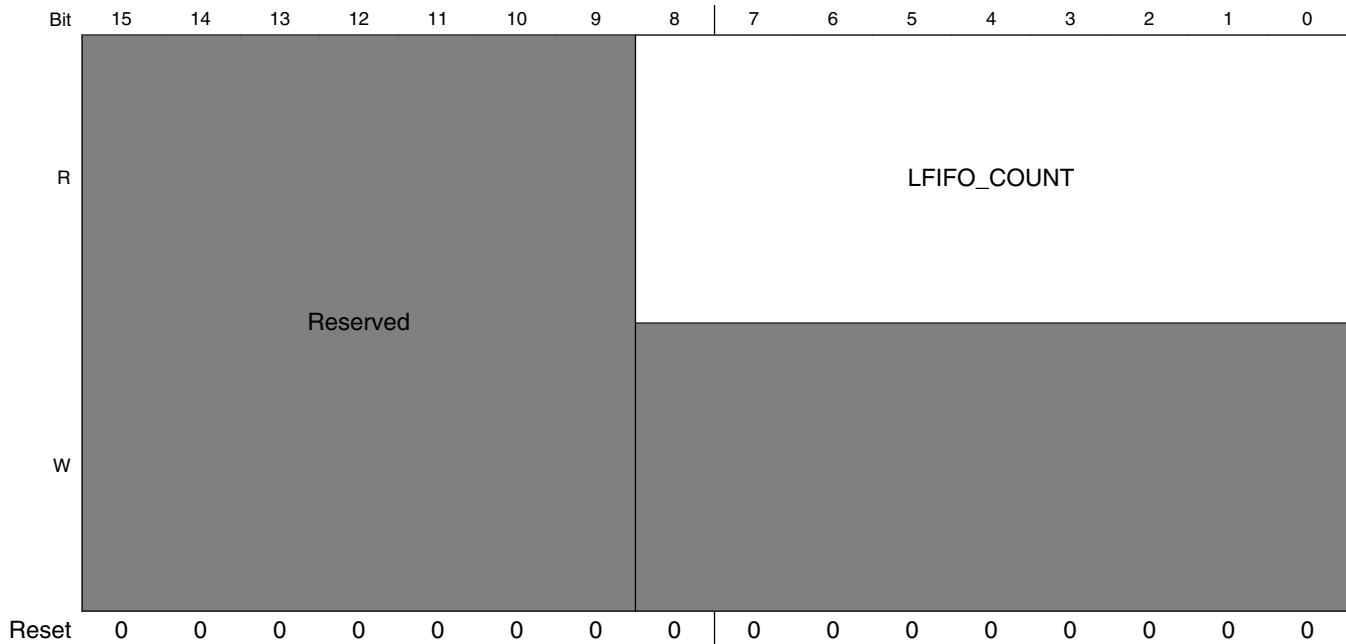

The LCD interface status register can be used to check the current status of the LCDIF block.

The LCD interface status register that contains read only views of some parameters or current state of the block.

Address: 402B\_8000h base + 1B0h offset = 402B\_81B0h

## LCDIF Memory Map/Register Definition

### LCDIF\_STAT field descriptions

Field	Description
31 PRESENT	0: LCDIF not present on this product 1: LCDIF is present.
30 DMA_REQ	Reflects the current state of the DMA Request line for the LCDIF. The DMA Request line toggles for each new request.
29 LFIFO_FULL	Read only view of the signals that indicates LCD LFIFO is full.
28 LFIFO_EMPTY	Read only view of the signals that indicates LCD LFIFO is empty.
27 TXFIFO_FULL	Read only view of the signals that indicates LCD TXFIFO is full.
26 TXFIFO_EMPTY	Read only view of the signals that indicates LCD TXFIFO is empty.
25 -	This field is reserved. Reserved
24–9 RSRVDO	This field is reserved. Reserved bits. Write as 0.
LFIFO_COUNT	Read only view of the current count in Latency buffer (LFIFO).

## 36.4.15 LCDIF Threshold Register (LCDIF\_THRES)

This register is used to activate control signals when the number of pixels reaches the programmed threshold. These control signals, in turn, can be used to manipulate access priority or dynamically change the input clock frequency to meet the required pixel throughput.

## Memory request priority threshold register.

Address: 402B\_8000h base + 200h offset = 402B\_8200h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## LCDIF\_THRES field descriptions

Field	Description
31–25 RSRVD2	This field is reserved. Reserved bits. Write as 0.
24–16 FASTCLOCK	This value should be set to a value of pixels, from 0 to 511. When the number of pixels in the input pixel FIFO is LESS than this value, the fast clock control output will be raised. This signal can be used to reduce the system bus clock frequency to save power during horizontal or vertical blanking intervals. This value should also be programmed to a value that is greater than the "PANIC" threshold value. This will allow a faster clock to recover the number of pixels in the FIFO before a "panic" level is encountered.
15–9 RSRVD1	This field is reserved. Reserved bits. Write as 0.
PANIC	This value should be set to a value of pixels from 0 to 511. When the number of pixels in the input pixel FIFO is less than this value, the internal panic control output will be raised. This signal can be used to raise the access LCDIF's access priority.

### 36.4.16 LCDIF Pigeon Mode Control0 Register (LCDIF\_PIGEONCTRL0n)

This register contains global counter settings for Pigeon Mode also houses general purpose timing adjustment registers

Address: 402B\_8000h base + 380h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R	MASK_CNT				MASK_CNT_SEL				OFFSET				INC_SEL		POL	EN
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### LCDIF\_PIGEONn field descriptions

Field	Description
31–24 STATE_MASK	state_mask = (FSIFBIFDIFE) and (LSILBILDILE) , select any combination of scan states as reference point for local counter to start ticking  0x1 <b>FS</b> — FRAME SYNC 0x2 <b>FB</b> — FRAME BEGIN 0x4 <b>FD</b> — FRAME DATA 0x8 <b>FE</b> — FRAME END 0x10 <b>LS</b> — LINE SYNC 0x20 <b>LB</b> — LINE BEGIN 0x40 <b>LD</b> — LINE DATA 0x80 <b>LE</b> — LINE END
23–12 MASK_CNT	When the global counter selected through MASK_CNT_SEL matches value in this reg, pigeon local counter start ticking. 0=disable
11–8 MASK_CNT_SEL	select global counters as mask condition, use together with MASK_CNT  0x0 <b>HSTATE_CNT</b> — pclk counter within one hscan state 0x1 <b>HSTATE_CYCLE</b> — pclk cycle within one hscan state 0x2 <b>VSTATE_CNT</b> — line counter within one vscan state 0x3 <b>VSTATE_CYCLE</b> — line cycle within one vscan state 0x4 <b>FRAME_CNT</b> — frame counter 0x5 <b>FRAME_CYCLE</b> — frame cycle 0x6 <b>HCNT</b> — horizontal counter (pclk counter within one line ) 0x7 <b>VCNT</b> — vertical counter (line counter within one frame)
7–4 OFFSET	offset on pclk unit. 0=align with data, positive value means delay, minus value mean ahead. Supported range depends on panel mode
3–2 INC_SEL	Event to increment local counter  0x0 <b>PCLK</b> — pclk 0x1 <b>LINE</b> — Line start pulse

Table continues on the next page...

LCDIF\_PIGEON $n$  field descriptions (continued)

Field	Description
	0x2 <b>FRAME</b> — Frame start pulse 0x3 <b>SIG_ANOTHER</b> — Use another signal as tick event
1 POL	Polarity of signal output  0x0 <b>ACTIVE_HIGH</b> — Normal Signal (Active high) 0x1 <b>ACTIVE_LOW</b> — Inverted signal (Active low)
0 EN	Enable pigeon Mode on this signal

### 36.4.20 Panel Interface Signal Generator Register (LCDIF\_PIGEON $n$ )

This register contains parameters for timing signal generation

Address: 402B\_8000h base + 810h offset + (64d × i), where i=0d to 11d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

#### LCDIF\_LUT0\_ADDR field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
ADDR	LUT indexed address pointer. This address into the LUT memory is always four byte aligned for PIO access. The least two significant bits are not used to drive the LUT memory array. For PIO LUT access, when the LUT data register is written, the contents of the LUT at the address specified by this address field will be loaded with a 32-bit DWORD. This address pointer will be incremented after the LUT data is written. This will provide recursive writes to the LUT data register to initialize the entire LUT array with recursive writes to the LUT data register.

### 36.4.24 Lookup Table Data Register. (LCDIF\_LUT0\_DATA)

Address: 402B\_8000h base + B20h offset = 402B\_8B20h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	DATA																															
W	DATA																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### LCDIF\_LUT0\_DATA field descriptions

Field	Description
DATA	Writing this field will load 4 bytes, aligned to four byte boundaries, of data indexed by the ADDR field of the REG_LUT_CTRL register.

### 36.4.25 Lookup Table Control Register. (LCDIF\_LUT1\_ADDR)

Address: 402B\_8000h base + B30h offset = 402B\_8B30h

#### LCDIF\_LUT1\_ADDR field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
ADDR	LUT indexed address pointer. This address into the LUT memory is always four byte aligned for PIO access. The least two significant bits are not used to drive the LUT memory array. For PIO LUT access, when the LUT data register is written, the contents of the LUT at the address specified by this address field will be loaded with a 32-bit DWORD. This address pointer will be incremented after the LUT data is written. This will provide recursive writes to the LUT data register to initialize the entire LUT array with recursive writes to the LUT data register.

### 36.4.26 Lookup Table Data Register. (LCDIF\_LUT1\_DATA)

Address: 402B\_8000h base + B40h offset = 402B\_8B40h

#### LCDIF\_LUT1\_DATA field descriptions

Field	Description
DATA	Writing this field will load 4 bytes, aligned to four byte boundaries, of data indexed by the ADDR field of the REG_LUT_CTRL register.

# Chapter 37

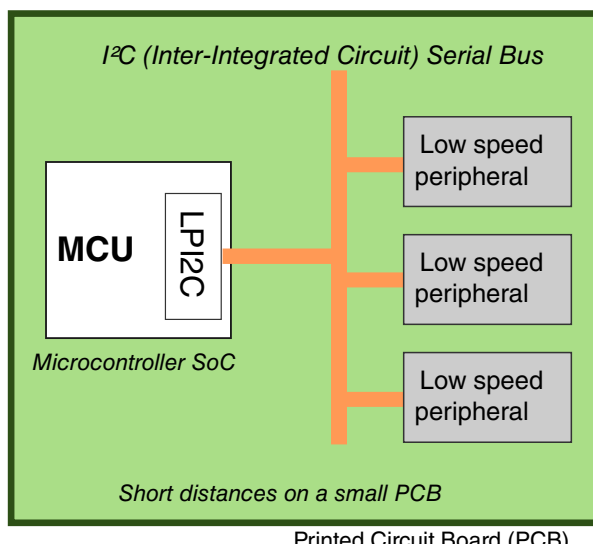

## Low Power Inter-Integrated Circuit (LPI2C)

### 37.1 Chip-specific LPI2C information

#### NOTE

For LPI2C on this device, only LPI2C1 fully supports the 5 wires, while other instances (LPI2C2, ...) have only 2 wires.

### 37.2 Introduction

#### Wikipedia:

I<sup>2</sup>C (Inter-Integrated Circuit), pronounced I-squair is a multi-master, multi-slave, packet switched, synchronous, open-ended, serial computer bus invented by Philips Semiconductor (now NXP Semiconductors). It is typically used for attaching lower-speed peripheral ICs to processors and microcontrollers in short-distance, intra-board communication.

**Figure 37-1. I<sup>2</sup>C bus connects MCU to low speed peripherals on PCB**

The LPI2C is a low power Inter-Integrated Circuit (I<sup>2</sup>C) module that supports an efficient interface to an I<sup>2</sup>C bus as a master and/or as a slave.

- The LPI2C implements logic support for standard-mode, fast-mode, fast-mode plus and ultra-fast modes of operation.

## Introduction

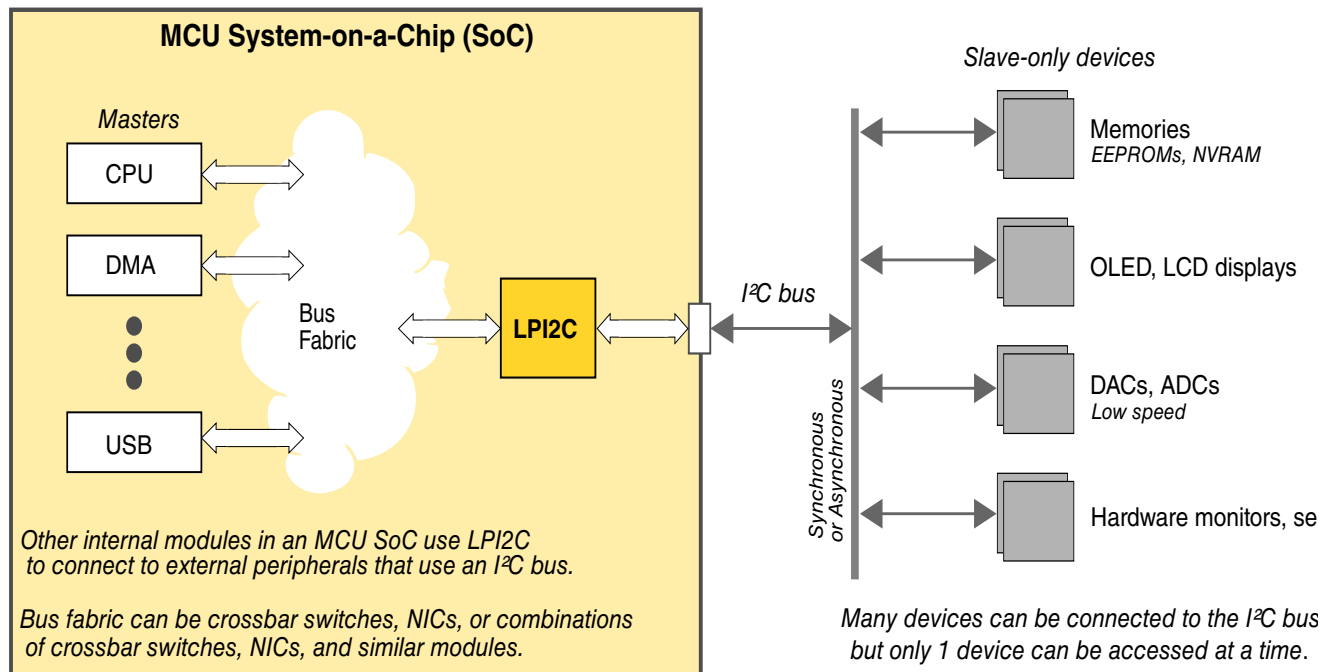

- The LPI2C is designed to use little CPU overhead, with DMA offloading of FIFO register accesses.
- The LPI2C can continue operating in stop modes if an appropriate clock is available.

The LPI2C module also complies with the System Management Bus (SMBus) Specification, version 2. From *Wikipedia: The System Management Bus* (abbreviated to SMBus or SMB) is a single-ended simple two-wire bus for the purpose of lightweight communication.

Modules in an MCU SoC use LPI2C to communicate with external devices over an I<sup>2</sup>C bus.

**Figure 37-2. LPI2C connects masters in MCU to external slaves on PCB**

Other internal modules in an MCU SoC use LPI2C to connect to external peripherals that use an I<sup>2</sup>C bus.

Bus fabric can be crossbar switches, NICs, or combinations of crossbar switches, NICs, and similar modules.

Many devices can be connected to the I<sup>2</sup>C bus but only 1 device can be accessed at a time.

**Figure 37-3. Typical LPI2C connection scheme**

## 37.2.1 Features

The LPI2C supports:

- Standard, Fast, Fast+ and Ultra Fast modes are supported
- High speed mode (HS) in slave mode
- High speed mode (HS) in master mode, if SCL pin implements current source pull-up (device-specific)
- Multi-master support, including synchronization and arbitration. Multi-master means any number of master nodes can be present. Additionally, master and slave roles may be changed between messages (after a STOP is sent).
- Clock stretching: From *Wikipedia*: multiple nodes may be driving the lines simultaneously. If any node is driving the line low, then the line will be low. I2C nodes that are trying to transmit a logical one (i.e., letting the line float high) can detect this condition (line is low), and conclude that another node is active at the same time.
  - When node detection is used on the SCL line, this is called *clock stretching*, and it is used as a flow control mechanism for slaves.
  - When node detection is used on the SDA line, this is called *arbitration*, and it ensures that there is only one transmitter at a time.
- General call, 7-bit and 10-bit addressing
- Software reset, START byte and Device ID (also require software support)

The LPI2C master supports:

- Command/transmit FIFO of 4words.
- Receive FIFO of 4words.
- Command FIFO will wait for idle I2C bus before initiating transfer
- Command FIFO can initiate (repeated) START and STOP conditions and one or more master-receiver transfers
- STOP condition can be generated from command FIFO, or generated automatically when the transmit FIFO is empty
- Host request input to control the start time of an I2C bus transfer
- Flexible receive data match can generate interrupt on data match and/or discard unwanted data
- Flag and optional interrupt to signal Repeated START condition, STOP condition, loss of arbitration, unexpected NACK, and command word errors
- Supports configurable bus idle timeout and pin-stuck-low timeout

The LPI2C slave supports:

- Separate I2C slave registers to minimize software overhead because of master/slave switching

- Support for 7-bit or 10-bit addressing, address range, SMBus alert and general call address
- Transmit data register that supports interrupt or DMA requests
- Receive data register that supports interrupt or DMA requests
- Software-controllable ACK or NACK, with optional clock stretching on ACK/NACK bit
- Configurable clock stretching, to avoid transmit FIFO underrun and receive FIFO overrun errors
- Flag and optional interrupt at end of packet, STOP condition, or bit error detection

## 37.2.2 Block Diagram

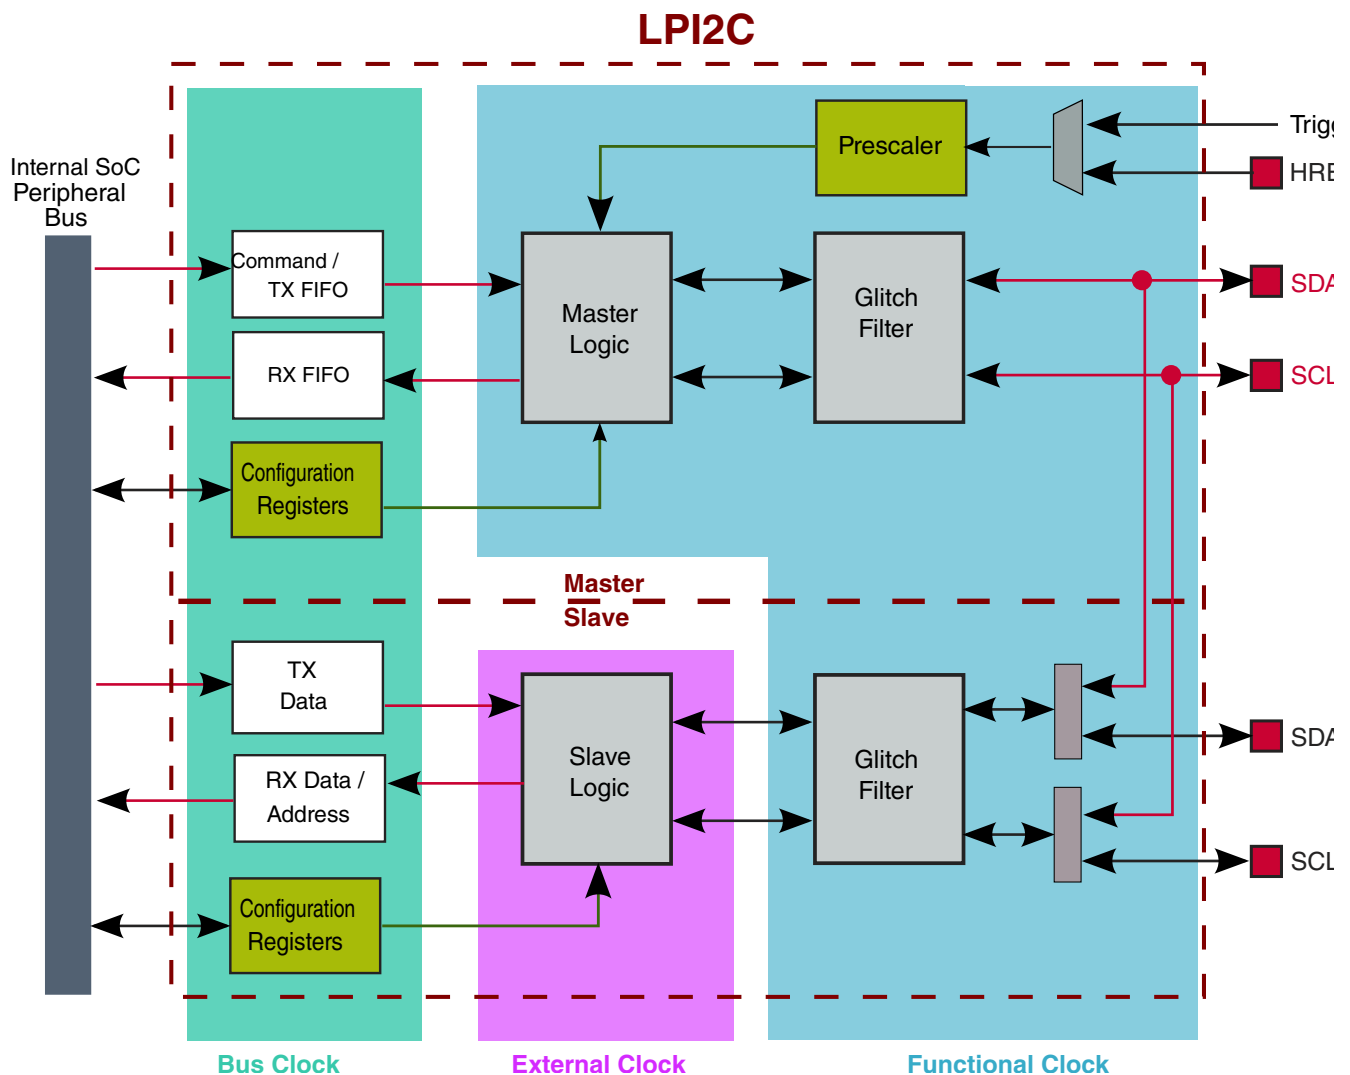

Figure 37-4. LPI2C block diagram

### 37.2.3 Modes of operation

Table 37-1. Chip modes supported by the LPI2C module

Chip mode	LPI2C Operation
Run	Normal operations
Stop	Can continue operating in stop mode if the Doze Enable bit (MCR[DOZEN]) is clear and the LPI2C is using an external or internal clock source that remains operating during stop mode.
Debug	Can continue operating in debug mode if the Debug Enable bit (MCR[DBGE]) is set.

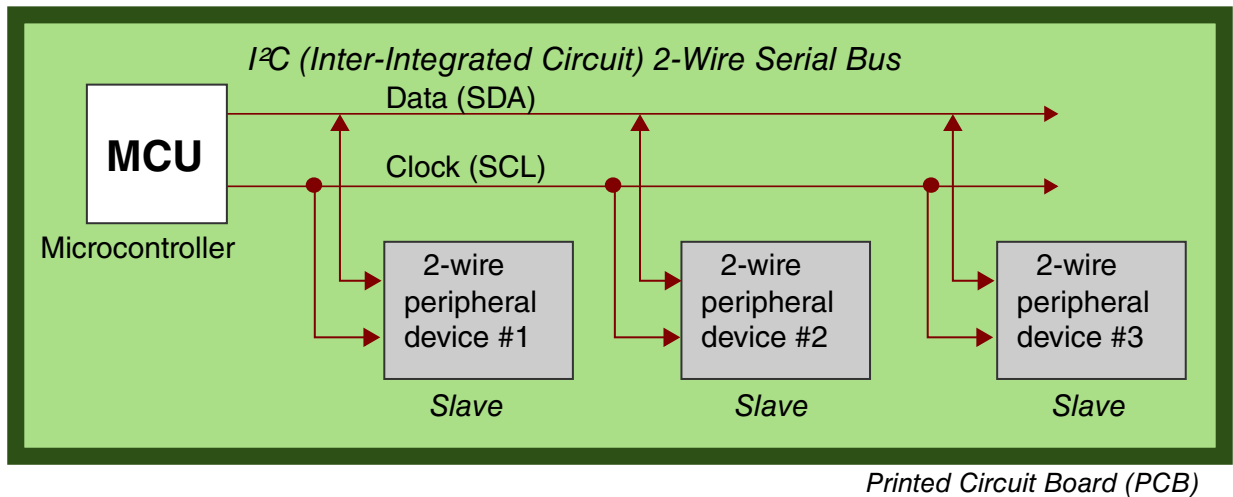

### 37.2.4 Signal Descriptions

Table 37-2. Signals

Signal	Name	2-Wire Scheme	4-Wire Scheme	I/O
SCL	LPI2C clock line	SCL	In 4-wire mode, this is the SCL input pin.	I/O
SDA	LPI2C data line	SDA	In 4-wire mode, this is the SDA input pin.	I/O
HREQ	Host request	If host request is asserted and the I2C bus is idle, then it will initiate an LPI2C master transfer.		I
SCLS	Secondary I2C clock line	Not used	In 4-wire mode, this is the SCLS output pin. If LPI2C master/slave are configured to use separate pins, then this the LPI2C slave SCL pin.	I/O
SDAS	Secondary I2C data line	Not used	In 4-wire mode, this is the SDAS output pin. If LPI2C master/slave are configured to use separate pins, then this the LPI2C slave SDA pin.	I/O

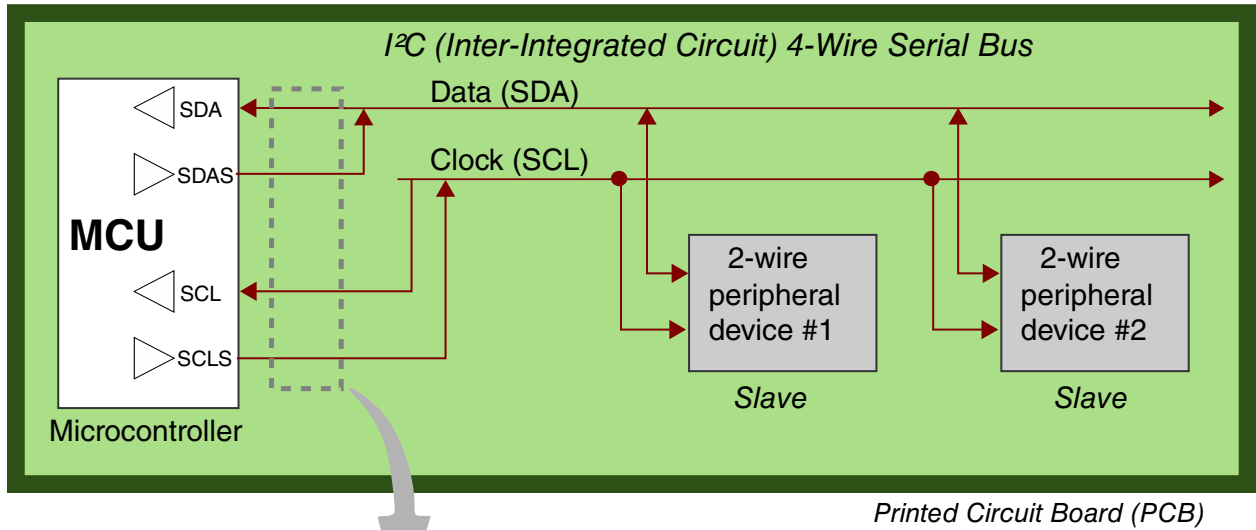

### 37.2.5 Wiring options

LPI2C can be used to implement 2-wire or 4-wire I<sup>2</sup>C serial busses.

**Figure 37-5. 2-Wire scheme**

Some applications can provide a lot of load and noise on the I<sup>2</sup>C bus; to ensure robust I<sup>2</sup>C operations, a 4-wire interface with the MCU can be used, splitting the 2 lines into inputs and outputs. Using a few transistors, resistors and diodes, designers can make their own inexpensive line drivers.

**Figure 37-6. 4-Wire scheme**

## 37.3 Functional description

### 37.3.1 Clocking and Resets

**Table 37-3. Clocks**

LPI2C Functional clock	The LPI2C functional clock is asynchronous to the bus clock and can remain enabled in low power modes to support I2C bus transfers by the LPI2C master. The functional clock is also used by the LPI2C slave to support digital filter and data hold time configurations. The LPI2C master divides the
------------------------	--

*Table continues on the next page...*

**Table 37-3. Clocks (continued)**

	functional clock by a prescaler and the resulting frequency must be at least 8 times faster than the I2C bus bandwidth.
External clock	The LPI2C slave logic is clocked directly from the external pins SCL and SDA (or SCLS and SDAS if master and slave are implemented on separate pins). This allows the LPI2C slave to remain operational, even when the LPI2C functional clock is disabled.  <b>NOTE:</b> The LPI2C slave digital filter must be disabled if the LPI2C functional clock is disabled, and this can affect compliance with some of the timing parameters of the I2C specification, such as the data hold time.
Bus clock	The bus clock is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPI2C master and slave registers.

**Table 37-4. Resets**

Chip reset	The logic and registers for the LPI2C master and slave are reset to their default state on a chip reset.
Software reset	<ul style="list-style-type: none"> <li>The LPI2C master implements a software reset bit in its Control Register. The MCR[RST] will reset all master logic and registers to their default state, except for the MCR itself.</li> <li>The LPI2C slave implements a software reset bit in its Control Register. The SCR[RST] will reset all slave logic and registers to their default state, except for the SCR itself.</li> </ul>
FIFO reset	<ul style="list-style-type: none"> <li>The LPI2C master implements write-only control bits that reset the transmit FIFO (MCR[RTF]) and receive FIFO (MCR[RRF]). After a FIFO is reset, that FIFO is empty.</li> <li>The LPI2C slave implements write-only control bits that reset the transmit data register (SCR[RTF]) and receive data register (SCR[RRF]). After a data register is reset, that data register is empty.</li> </ul>

## 37.3.2 Master Mode

The LPI2C master logic operates independently from the slave logic to perform all master mode transfers on the I2C bus.

### 37.3.2.1 Transmit and Command FIFO commands

The transmit FIFO stores command data to initiate the various I2C operations. The following operations can be initiated through commands in the transmit FIFO:

- START or Repeated START condition with address byte and expecting ACK or NACK.
- Transmit data (this is the default for zero extended byte writes to the transmit FIFO).
- Receive 1-256 bytes of data (can also be configured to discard receive data and not store in receive FIFO).
- STOP condition (can also be configured to send STOP condition when transmit FIFO is empty).

Multiple transmit and receive commands can be inserted between the START condition and STOP condition; transmit and receive commands must not be interleaved (to comply with the I2C specification). The receive data command and the receive data and discard commands can be interleaved, to ensure that only the desired received data is stored in the receive FIFO (or compared with the data match logic).

The LPI2C master will automatically transmit a NACK on the last byte of a receive data command unless the next command in the FIFO is also a receive data command. A NACK is also automatically transmitted if the transmit FIFO is empty when a receive data command completes.

The LPI2C master supports 10-bit addressing through a (repeated) START condition, followed by a transmit data byte containing the second address byte, followed by any number of data bytes with the master-transmit data.

A START or Repeated START condition that is expecting a NACK (for example, HS-mode master code) must be followed by a STOP or (repeated) START condition.

### 37.3.2.2 Master operations

Whenever the LPI2C is enabled, it monitors the I2C bus to detect when the I2C bus is idle (MSR[BBF]). The I2C bus is no longer considered idle if either SCL or SDA are low, and the I2C bus becomes idle if a STOP condition is detected or if a bus idle timeout is detected (as configured by MCFGR2[BUSIDLE]). After the I2C bus is idle, the transmit FIFO is not empty, and the host request is either asserted or disabled, then the LPI2C master will initiate a transfer on the I2C bus. This involves the following steps:

- Wait the bus idle time equal to  $(MCCR0[CLKLO] + 1)$  multiplied by the prescaler (MCFGR1[PRESCALE]).
- Transmit a START condition and address byte using the timing configuration in the Master Clock Configuration Register 0 (MCCR0); if a high speed mode transfer is configured, then the timing configuration from Master Clock Configuration Register 1 (MCCR1) is used instead.
- Perform master-transmit or master-receive transfers, as configured by the transmit FIFO.
- Transmit NACK on the last byte of a master-receive transfer, unless the next command in the transmit FIFO is also a receive data command and the transmit FIFO is not empty.
- Transmit a Repeated START or STOP condition as configured by the transmit FIFO and/or MCFGR1[AUTOSTOP]. A repeated START can change which timing configuration register is used.

When the LPI2C master is disabled (either due to MCR[MEN] being clear or automatically due to mode entry), the LPI2C will continue to empty the transmit FIFO until a STOP condition is transmitted. However, the LPI2C will no longer stall the I2C bus waiting for the transmit or receive FIFO, and after the transmit FIFO is empty, the LPI2C will generate a STOP condition automatically.

The LPI2C master can stall the I2C bus under certain conditions; this will result in SCL pulled low continuously on the first bit of a byte, until the condition is removed:

- LPI2C master is enabled and busy, the transmit FIFO is empty, and MCFGR1[AUTOSTOP] is clear.
- LPI2C master is enabled and receiving data, receive data is not being discarded (due to command or receive data match), and the receive FIFO is full.

### **37.3.2.3 Receive FIFO and Data Matching**

The receive FIFO is used to store receive data during master-receiver transfers. Receive data can also be configured to discard receive data instead of storing in the receive FIFO; this is configured by the command word in the transmit FIFO.

Receive data supports a receive data match function that can match received data against one of two bytes or against a masked data byte. The data match function can also be configured to compare only the first one or two received data words since the last (repeated) START condition. Receive data that is already discarded due to the command word cannot cause the data match to set, and will delay the match on the first received data word until after the discarded data is received. The receiver match function can also be configured to discard all receive data until a data match is detected, using the MCFGR0[RDMO] control bit. When clearing the MCFGR0[RDMO] control bit following a data match, clear MCFGR0[RDMO] before clearing MSR[DMF], to allow all subsequent data to be received.

### **37.3.2.4 Timing Parameters**

The following timing parameters can be configured by the LPI2C master. Parameters are configured separately for high speed mode (MCCR1) and other modes (MCCR0). This allows the high speed mode master code to be sent using the regular timing parameters, and then switch to the high speed mode timing (following a repeated START) until the next STOP condition.

The LPI2C master timing parameters in LPI2C functional clock cycles are configured as follows. They must be configured to meet the I2C timing specification for the required mode.

**Table 37-5. Timing Parameters**

I2C Specification Timing Parameter	I2C Specification Timing Symbol	LPI2C Timing Parameter (LPI2C functional clock cycles)
hold time (repeated) START condition	tHD:STA	(SETHOLD + 1) x (2 ^ PRESCALE)
LOW period of the SCL clock	tLOW	(CLKLO + 1) x (2 ^ PRESCALE)
HIGH period of the SCL clock	tHIGH	(CLKHI + 1 + SCL_LATENCY) x (2 ^ PRESCALE)
setup time for a repeated START condition or STOP condition	tSU:STA, tSU:STO	(SETHOLD + 1 + SCL_LATENCY) x (2 ^ PRESCALE)
data hold time	tHD:DAT	(DATAVD + 1) x (2 ^ PRESCALE)
data setup time	tSU:DAT	(SDA_LATENCY + 1) x (2 ^ PRESCALE)
bus free time between a STOP and START condition	tBUF	(CLKLO + 1 + SDA_LATENCY) x (2 ^ PRESCALE)
data valid time, data valid acknowledge time	tVD:DAT, tVD:ACK	(DATAVD + 1) x (2 ^ PRESCALE)

The latency parameters are defined in the following table, these parameters assume the risetime is less than one LPI2C functional clock cycle. The risetime depends on a number of factors, including the I2C bus loading and external pull-up resistor sizing. A larger risetime will increase the number of cycles that the signal takes to propagate through the synchronizer (and glitch filter), which increases the latency.

**Table 37-6. Synchronization Latency**

Timing Parameter	Timing Definition
SCL_LATENCY	ROUNDDOWN ( (2 + FILTSCL + SCL_RISETIME) / (2 ^ PRESCALE) )
SDA_LATENCY	ROUNDDOWN ( (2 + FILTSDA + SDA_RISETIME) / (2 ^ PRESCALE) )

The following timing restrictions must be enforced to avoid unexpected START or STOP conditions on the I2C bus, or to avoid unexpected START or STOP conditions detected by the LPI2C master. The timing restrictions can be summarized as **SDA cannot change when SCL is high outside of a transmitted (repeated) START or STOP condition.**

**Table 37-7. LPI2C Timing Parameter Restrictions**

Timing Parameter	Minimum	Maximum	Comment
CLKLO	0x03	-	Also: CLKLO x (2 ^ PRESCALE) > SCL_LATENCY
CLKHI	0x01	-	Configure CLKHI to meet the duty cycle requirements in the I2C specification
SETHOLD	0x02	-	

*Table continues on the next page...*

**Table 37-7. LPI2C Timing Parameter Restrictions (continued)**

Timing Parameter	Minimum	Maximum	Comment
DATAVD	0x01	CLKLO - SDA_LATENCY - 1	Configure DATAVD to meet the data hold requirement in the I2C specification
FILTSCL	0x00	$[\text{CLKLO} \times (2^{\wedge} \text{PRESCALE})] - 3$	FILTSCL and FILTSDA are the only parameters not multiplied by $(2^{\wedge} \text{PRESCALE})$
FILTSDA	FILTSCL	$[\text{CLKLO} \times (2^{\wedge} \text{PRESCALE})] - 3$	Configuring FILTSDA greater than FILTSCL can delay the SDA input to compensate for board level skew
BUSIDLE	$(\text{CLKLO} + \text{SETHOLD} + 2) \times 2$	-	Must also be greater than (CLKHI+1)

The timing parameters must be configured to meet the requirements of the I2C specification; this will depend on the mode being supported and the LPI2C functional clock frequency. When switching between two modes using the different clock configuration registers (for example, Fast and HS-mode), the PRESCALE factor must remain constant between the modes. Some example timing configurations are provided below.

**Table 37-8. LPI2C Example Timing Configurations**

I2C Mode	Clock Frequency	Baud Rate <sup>1</sup>	PRESCALE	FILTSCL / FILTSDA	SETHOLD	CLKLO	CLKHI	DATAVD
Fast	8 MHz	400 kbps	0x0	0x0/0x0	0x04	0x0B	0x05	0x02
Fast+	8 MHz	1 Mbps	0x0	0x0/0x0	0x02	0x03	0x01	0x01
Fast	48 MHz	400 kbps	0x0	0x1/0x1	0x1D	0x3E	0x35	0x0F
Fast	48 MHz	400 kbps	0x2	0x1/0x1	0x07	0x11	0x0B	0x03
Fast+	48 MHz	1 Mbps	0x2	0x1/0x1	0x03	0x06	0x04	0x04
HS-mode	48 MHz	3.2 Mbps	0x0	0x0/0x0	0x07	0x08	0x03	0x01
Fast	60 MHz	400 kbps	0x1	0x2/0x2	0x11	0x28	0x1F	0x08
Fast+	60 MHz	1 Mbps	0x1	0x2/0x2	0x07	0x0F	0x0B	0x01
HS-mode	60 MHz	3.33 Mbps	0x1	0x0/0x0	0x04	0x04	0x02	0x01

1. Your specific device may not support all clock frequencies and baud rates; check the module instantiation and system information.

### 37.3.2.5 Error Conditions

The LPI2C master will monitor for errors while it is active, the following conditions will generate an error flag and block a new START condition from being sent, until the flag is cleared by software:

- A START or STOP condition is detected and is not generated by the LPI2C master (sets MSR[ALF]).
- Transmitting data on SDA and different values are being received (sets MSR[ALF]).
- NACK is detected when transmitting data, and MCFGR1[IGNACK] is clear (sets MSR[NDF]).
- NACK is detected and is expecting ACK for the address byte, and MCFGR1[IGNACK] is clear (sets MSR[NDF]).
- ACK is detected and is expecting NACK for the address byte, and MCFGR1[IGNACK] is clear (sets MSR[NDF]).
- Transmit FIFO is requesting to transmit or receive data without a START condition (sets MSR[FEF]).
- SCL (or SDA if MCFGR1[TIMECFG] is set) is low for (MCFGR2[TIMELOW] \* 256) prescaler cycles without a pin transition (sets MSR[PLTF]).

Software must respond to the MSR[PTLF] flag to terminate the existing command either cleanly (by clearing MCR[MEN]), or abruptly (by setting MCR[SWRST]).

The MCFGR2[BUSIDLE] field can be used to force the I2C bus to be considered idle when SCL and SDA remain high for (BUSIDLE+1) prescaler cycles. The I2C bus is normally considered idle when the LPI2C master is first enabled, but when BUSIDLE is configured greater than zero then SCL and/or SDA must be high for (BUSIDLE+1) prescaler cycles before the I2C bus is first considered idle.

### 37.3.2.6 Pin Configuration

- **Open-drain support:** The LPI2C master defaults to open-drain configuration of the SDA and SCL pins. Support for true open drain depends on the specific device, and requires the pins where LPI2C pins are muxed to support true open drain.
- **High Speed mode support:** Support for high speed mode also depends on the specific device, and requires the SCL pin to support the current source pull-up required in the I2C specification.
- **Ultra-Fast mode support:** The LPI2C master also supports the output-only push-pull function required for I2C ultra-fast mode using the SDA and SCL pins. Support for ultra-fast mode also requires the IGNACK bit to be set.
- **Push-pull 2-wire support:** A push-pull 2-wire configuration is also available to the LPI2C master that may support a partial high speed mode, if the LPI2C is the only master and all I2C pins on the bus are at the same voltage. This will configure the SCL pin as push-pull for every clock except the 9th clock pulse, to allow high speed mode compatible slaves to perform clock stretching. In this mode, the SDA pin is tristated for master-receive data bits and master-transmit ACK/NACK bits, and is configured as push-pull at other times. To avoid the risk of contention when SDA is

push-pull, the pin can be configured for open-drain operation, as part of the device-specific configuration.

- **Push-pull 4-wire support:** The push-pull 4-wire configuration separates the SCL input data and output data into separate pins, and separates the SDA input data and output data into separate pins. The SCL/SDA pins are used for input data; the SCLS/SDAS pins are used for output data, with configurable polarity. This simplifies external connections when connecting the LPI2C to the I2C bus through external level shifters or discrete components. When using this 4-wire configuration, the LPI2C master logic and LPI2C slave logic are not able to connect to separate I2C buses.

### 37.3.3 Slave Mode

To perform all slave mode transfers on the I2C bus, the LPI2C slave logic operates independently from the LPI2C master logic.

#### 37.3.3.1 Address Matching

The LPI2C slave can be configured:

- to match one of two addresses, using either 7-bit or 10-bit addressing modes for each address
- to match a range of addresses in either 7-bit or 10-bit addressing modes
- to match the General Call Address, and generate appropriate flags
- to match the SMBus Alert Address, and generate appropriate flags
- to detect the high speed mode master code, and to disable the digital filters and output valid delay time until the next STOP condition is detected

After a valid address is matched, the LPI2C slave will automatically perform slave-transmit or slave-receive transfers until:

- a NACK is detected (unless IGNACK is set)
- a bit error is detected (the LPI2C slave is driving SDA, but a different value is sampled)
- a (repeated) START or STOP condition is detected

#### 37.3.3.2 Transmit and Receive Data

- The Transmit and Receive Data registers are double-buffered and only update during a slave-transmit and slave-receive transfer, respectively.

- The slave address *that was received* can be configured to be read from either the Receive Data register (for example, when using DMA to transfer data), or from the Address Status register.
- The Transmit Data register can be configured to only request data after a slave-transmit transfer is detected, or to request new data whenever the Transmit Data register is empty.
- The Transmit Data register should only be written when the Transmit Data flag is set.
- The Receive Data register should only be read when the Received Data flag is set (or the Address Valid flag is set and RXCFG=1).
- The Address Status register should only be read when the Address Valid flag is set.

### 37.3.3.3 Clock Stretching

The LPI2C slave supports many configurable options for when clock stretching is performed. The following conditions can be configured to perform clock stretching:

- During the 9th clock pulse of the address byte and the Address Valid flag is set.
- During the 9th clock pulse of a slave-transmit transfer and the Transmit Data flag is set.
- During the 9th clock pulse of a slave-receive transfer and the Receive Data flag is set.
- During the 8th clock pulse of an address byte or a slave-receive transfer and the Transmit ACK flag is set. In high speed mode, this is disabled.
- Clock stretching can also be extended for CLKHOLD cycles, to allow additional setup time to sample the SDA pin externally. In high speed mode, this is disabled.

Unless extended by the CLKHOLD configuration, clock stretching will extend for one peripheral bus clock cycle after SDA updates when clock stretching is enabled.

### 37.3.3.4 Timing Parameters

The LPI2C slave can configure the following timing parameters. These parameters are disabled when SCR[FILTEN] is clear, when SCR[FILTDZ] is set in Doze mode, and when LPI2C slave detects high speed mode. When disabled, the LPI2C slave is clocked directly from the I2C bus, and may not satisfy all timing requirements of the I2C specification (such as SDA minimum hold time in Standard/Fast mode).

- SDA data valid time from SCL negation to SDA update
- SCL hold time when clock stretching is enabled to increase setup time when sampling SDA externally

## Functional description

- SCL glitch filter time
- SDA glitch filter time

The I2C slave imposes the following restrictions on the timing parameters.

- FILTSDA must be configured to greater than or equal to FILTSCL (unless compensating for board level skew between SDA and SCL).
- DATAVD must be configured less than the minimum SCL low period.

### 37.3.3.5 Error Conditions

The I2C slave can detect the following error conditions:

- Bit error flag will set when the I2C slave is driving SDA, but samples a different value than what is expected.
- FIFO error flag will set due to a transmit data underrun or a receive data overrun. To eliminate the possibility of underrun and overrun occurring, enable clock stretching.
- FIFO error flag will also set due to an address overrun when RXCFG is set, otherwise an address overrun is not flagged. To eliminate the possibility of overrun occurring, enable clock stretching.

The I2C slave does not implement a timeout due to SCL and/or SDA being stuck low. If this detection is required, then the I2C master logic should be used and so software can reset the I2C slave when this condition is detected.

### 37.3.4 Interrupts and DMA Requests

Depending on the specific device, interrupts and DMA requests can be combined in some ways:

- The I2C master and slave interrupts may be combined
- The I2C master and slave transmit DMA requests may be combined
- The I2C master and slave receive DMA requests may be combined

#### 37.3.4.1 Master mode

The next table lists the master mode sources that can generate I2C master interrupts and I2C master transmit/receive DMA requests.

**Table 37-9. Master Interrupts and DMA Requests**

Master Status Register (MSR)		Description	Can generate		
Flag	Name		Interrupt?	DMA Request?	Low Power Wakeup?
TDF	Transmit Data Flag	Data can be written to Transmit FIFO, as configured by the Transmit FIFO Watermark MFCR[TXWATER]	Y	TX	Y
RDF	Receive Data Flag	Data can be read from the Receive FIFO, as configured by the Receive FIFO Watermark MFCR[RXWATER]	Y	RX	Y
EPF	End Packet Flag	Master has transmitted a Repeated START or STOP condition	Y	N	Y
SDF	STOP Detect Flag	Master has transmitted a STOP condition	Y	N	Y
NDF	NACK Detect Flag	<ul style="list-style-type: none"> <li>During an address byte, the master expected an ACK but detected a NACK</li> <li>During an address byte, the master expected a NACK but detected an ACK</li> <li>During a master-transmitter data byte, the master detected a NACK</li> </ul>	Y	N	Y
ALF	Arbitration Lost Flag	<ul style="list-style-type: none"> <li>The master lost arbitration due to a START/STOP condition detected at the wrong time</li> <li>Or the master was transmitting data but received different data than the data that was transmitted</li> </ul>	Y	N	Y
FEF	FIFO Error Flag	The master is expecting a START condition in the Command FIFO, but the next entry in the Command FIFO is not a START condition	Y	N	Y
PLTF	Pin Low Timeout Flag	Pin low timeout is enabled and SCL (or SDA if configured) is low for longer than the configured timeout	Y	N	Y
DMF	Data Match Flag	The received data matches the configured data match, but the received data is not discarded due to a command FIFO entry	Y	N	Y
MBF	Master Busy Flag	LPI2C master is busy transmitting/receiving data	N	N	N
BBF	Bus Busy Flag	LPI2C master is enabled and activity is detected on I2C bus, but a STOP condition has not been detected and a bus idle timeout (if enabled) has not occurred.	N	N	N

### 37.3.4.2 Slave mode

The next table lists the slave mode sources that can generate LPI2C slave interrupts and the LPI2C slave transmit/receive DMA requests.

Table 37-10. Slave Interrupts and DMA Requests

Slave Status Register (SSR)		Description	Can generate		
Flag	Name		Interrupt?	DMA Request?	Low Power Wakeup?
TDF	Transmit Data Flag	Data can be written to the Slave Transmit Data Register (STDR)	Y	TX	Y
RDF	Receive Data Flag	Data can be read from the Slave Receive Data Register (SRDR)	Y	RX	Y
AVF	Address Valid Flag	Address can be read from the Slave Address Status Register (SASR)	Y	RX	Y
TAF	Transmit ACK Flag	ACK/NACK can be written to the Slave Transmit ACK Register (STAR)	Y	N	Y
RSF	Repeated Start Flag	Slave has detected an address match followed by a Repeated START condition	Y	N	Y
SDF	STOP Detect Flag	Slave has detected an address match followed by a STOP condition	Y	N	Y
BEF	Bit Error Flag	Slave was transmitting data, but received different data than what was transmitted	Y	N	Y
FEF	FIFO Error Flag	<ul style="list-style-type: none"> <li>• Transmit data underrun</li> <li>• Receive data overrun</li> <li>• Address status overrun (when Receive Data Configuration SCFGR1[RXCFG] = 1, )</li> </ul> <p>FEF flag can only set when clock stretching is disabled.</p>	Y	N	Y
AM0F	Address Match 0 Flag	Slave detected an address match with SAMR[ADDR0] field	Y	N	N
AM1F	Address Match 1 Flag	Slave detected an address match with SAMR[ADDR1] field or using an address range	Y	N	N
GCF	General Call Flag	Slave detected an address match with the General Call address	Y	N	N
SARF	SMBus Alert Response Flag	Slave detected an address match with the SMBus Alert address	Y	N	N
SBF	Slave Busy Flag	LPI2C slave is busy receiving an address byte or is transmitting/receiving data	N	N	N
BBF	Bus Busy Flag	LPI2C slave is enabled and a START condition is detected on I2C bus, but a STOP condition has not been detected	N	N	N

### 37.3.5 Peripheral Triggers

The connection of the LPI2C peripheral triggers to other peripherals depend upon the specific device being used.

**Table 37-11. LPI2C Triggers**

Trigger	Description
Master Output Trigger	The LPI2C master generates an output trigger that can be connected to other peripherals on the device. The master output trigger asserts on both a Repeated START or STOP condition, and the master output trigger remains asserted for one cycle of the LPI2C functional clock divided by the prescaler.
Slave Output Trigger	The LPI2C slave generates an output trigger that can be connected to other peripherals on the device. The slave output trigger asserts on both a Repeated START or STOP condition that occurs after a slave address match, and the slave output trigger remains asserted until the next slave SCL pin negation.
Input Trigger	To control the start of a LPI2C bus transfer, the LPI2C input trigger can be selected instead of the HREQ input. The input trigger is synchronized and to be detected, the input trigger must assert for at least 2 cycles of the LPI2C functional clock divided by the PRESCALE configuration. When the LPI2C is busy, the HREQ input (and therefore the input trigger) is ignored.

## 37.4 Memory Map and Registers

### 37.4.1 LPI2C register descriptions

#### 37.4.1.1 LPI2C Memory map

Base address: 403F\_0000 for LPI2C1; 403F\_4000 for LPI2C2; 403F\_8000 for LPI2C3; 403F\_C000 for LPI2C4.

### 37.4.1.8.1 Offset

Register	Offset
MCFGR0	20h

### 37.4.1.8.2 Diagram

### 37.4.1.8.3 Fields

Field	Function
31-10 —	Reserved
9	Receive Data Match Only

Table continues on the next page...

Field	Function
RDMO	When enabled, all received data that does not cause the Data Match Flag (MSR[DMF]) to set is discarded. After the Data Match Flag is set, the RDMO configuration is ignored. When disabling RDMO, clear RDMO before clearing the Data Match Flag, to ensure that no receive data is lost. 0b - Received data is stored in the receive FIFO 1b - Received data is discarded unless the the Data Match Flag (MSR[DMF]) is set
8 CIRFIFO	Circular FIFO Enable When enabled, the transmit FIFO read pointer is saved to a temporary register. The transmit FIFO will be emptied as normal, but after the LPI2C master is idle and the transmit FIFO is empty, then the read pointer value will be restored from the temporary register. This will cause the contents of the transmit FIFO to be cycled through repeatedly. If AUTOSTOP is set, then a STOP condition will be sent whenever the transmit FIFO is empty and the read pointer is restored. 0b - Circular FIFO is disabled 1b - Circular FIFO is enabled
7-3 —	Reserved
2 HRSEL	Host Request Select Selects the source of the host request input. When host request input is enabled, the Host Request Select field should remain static (the Host Request Select should not change). 0b - Host request input is pin HREQ 1b - Host request input is input trigger
1 HRPOL	Host Request Polarity Configures the polarity of the host request input pin. When host request input is enabled, the Host Request Polarity field should remain static (Host Request Polarity should not change). 0b - Active low 1b - Active high
0 HREN	Host Request Enable When enabled, the LPI2C master will only initiate a START condition if the host request input is asserted and the bus is idle. A repeated START is not affected by the host request. 0b - Host request input is disabled 1b - Host request input is enabled

### 37.4.1.12 Master Data Match Register (MDMR)

#### 37.4.1.12.1 Offset

Register	Offset
MDMR	40h

#### 37.4.1.12.2 Function

The MDMR should only be written when the I2C Master is disabled or idle.

#### 37.4.1.12.3 Diagram

### 37.4.1.12.4 Fields

Field	Function
31-24 —	Reserved
23-16 MATCH1	Match 1 Value Compared against the received data when receive data match is enabled.
15-8 —	Reserved
7-0 MATCH0	Match 0 Value Compared against the received data when receive data match is enabled.

### 37.4.1.13 Master Clock Configuration Register 0 (MCCR0)

#### 37.4.1.13.1 Offset

Register	Offset
MCCR0	48h

#### 37.4.1.13.2 Function

The MCCR0 cannot be changed when the I2C master is enabled and is used for standard, fast, fast-mode plus and ultra-fast transfers.

#### 37.4.1.13.3 Diagram

### 37.4.1.13.4 Fields

Field	Function
31-30 —	Reserved
29-24 DATAVD	Data Valid Delay Minimum number of cycles (minus one) that is used as the data hold time for SDA. Must be configured less than the minimum SCL low period.
23-22 —	Reserved
21-16 SETHOLD	Setup Hold Delay Minimum number of cycles (minus one) that is used by the master <ul style="list-style-type: none"> <li>• as the hold time for a START condition</li> <li>• as the setup and hold time for a repeated START condition</li> <li>• as the setup time for a STOP condition</li> </ul> <p>The setup time is extended by the time it takes to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to <math>(2 + \text{FILTSCL}) / 2^{\text{PRESCALE}}</math> cycles.</p>
15-14 —	Reserved
13-8 CLKHI	Clock High Period Minimum number of cycles (minus one) that the SCL clock is driven high by the master. The SCL high time is extended by the time it takes to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to $(2 + \text{FILTSCL}) / 2^{\text{PRESCALE}}$ cycles.
7-6 —	Reserved
5-0 CLKLO	Clock Low Period Minimum number of cycles (minus one) that the SCL clock is driven low by the master. The Clock Low Period value is also used for the minimum bus free time between a STOP and a START condition; this is extended by the time it takes to detect a rising edge on the external SCL pin. Ignoring any additional board delay due to external loading, this time is equal to $(2 + \text{FILTSCL}) / 2^{\text{PRESCALE}}$ cycles.

### 37.4.1.14 Master Clock Configuration Register 1 (MCCR1)

#### 37.4.1.14.1 Offset

Register	Offset
MCCR1	50h

### 37.4.1.14.2 Function

The MCCR1 cannot be changed when the I2C master is enabled and is used for high speed mode transfers. The separate clock configuration for high speed mode allows arbitration to take place in Fast mode (with timing configured by MCCR0), before switching to high speed mode (with timing configured by MCCR1).

### 37.4.1.14.3 Diagram

### 37.4.1.14.4 Fields

18-16 RXCOUNT	Receive FIFO Count Returns the number of words in the receive FIFO.
15-3 —	Reserved
2-0 TXCOUNT	Transmit FIFO Count Returns the number of words in the transmit FIFO.

### 37.4.1.17 Master Transmit Data Register (MTDR)

#### 37.4.1.17.1 Offset

Register	Offset
MTDR	60h

#### 37.4.1.17.2 Function

- An 8-bit write to the CMD field will store the data in the Command FIFO, but does not increment the FIFO write pointer.
- An 8-bit write to the DATA field will zero extend the CMD field, unless the CMD field has been written separately since the last FIFO write; it (the 8-bit write) also increments the FIFO write pointer.
- A 16-bit or 32-bit will write both the CMD and DATA fields and increment the FIFO.

#### 37.4.1.17.3 Diagram

### 37.4.1.17.4 Fields

Field	Function
31-11 —	Reserved
10-8 CMD	Command Data 000b - Transmit DATA[7:0] 001b - Receive (DATA[7:0] + 1) bytes 010b - Generate STOP condition 011b - Receive and discard (DATA[7:0] + 1) bytes 100b - Generate (repeated) START and transmit address in DATA[7:0] 101b - Generate (repeated) START and transmit address in DATA[7:0]. This transfer expects a NACK to be returned. 110b - Generate (repeated) START and transmit address in DATA[7:0] using high speed mode 111b - Generate (repeated) START and transmit address in DATA[7:0] using high speed mode. This transfer expects a NACK to be returned.
7-0 DATA	Transmit Data Performing an 8-bit write to DATA will zero extend the CMD field.

### 37.4.1.18 Master Receive Data Register (MRDR)

#### 37.4.1.18.1 Offset

Register	Offset
MRDR	70h

#### 37.4.1.18.2 Diagram

10-0 RADDR	Received Address The Received Address updates whenever the AMF is set; the AMF is cleared by reading the Slave Address Status register. <ul style="list-style-type: none"> <li>In 7-bit mode, the address byte is store in RADDR[7:0]</li> <li>In 10-bit mode, the first address byte is { 11110, RADDR[10:9], RADDR[0] } and the second address byte is RADDR[8:1]. The R/W bit is therefore always stored in RADDR[0]</li> </ul>

## 37.4.1.27 Slave Transmit ACK Register (STAR)

### 37.4.1.27.1 Offset

Register	Offset
STAR	154h

### 37.4.1.27.2 Function

The Slave Transmit ACK Register can only be written when the ACK SCL Stall bit is set in Slave Configuration Register 1 (SCFGR1[ACKSTALL]).

- The ACKSTALL bit will enable clock stretching during the ACK/NACK bit slot, and during this time, the STAR register can be written by software.
- The logic ensures that the clock stretching continues for at least 1 bus clock cycle after the STAR register is updated.
- This clock stretching time can be extended more using the Clock Hold Time field (SCFGR2[CLKHOLD], Slave Configuration Register 2).

### 37.4.1.27.3 Diagram

### 37.4.1.27.4 Fields

Field	Function
31-1 —	Reserved
0 TXNACK	Transmit NACK After receiving each word, software can transmit either an ACK (logic 0) or a NACK (logic 1); Transmit NACK selects which to use: ACK or NACK. <ul style="list-style-type: none"> <li>• When ACKSTALL is set, a Transmit NACK must be written once for each matching address byte and each received word. ACKSTALL must be set, because that will stall the data transfer until software reads the received word (and decides whether to respond with an ACK or NACK).</li> <li>• To configure the default ACK/NACK, Transmit NACK can also be written when LPI2C Slave is disabled or idle.</li> </ul> 0b - Write a Transmit ACK for each received word 1b - Write a Transmit NACK for each received word

### 37.4.1.28 Slave Transmit Data Register (STDR)

#### 37.4.1.28.1 Offset

Register	Offset
STDR	160h

#### 37.4.1.28.2 Function

Clock stretching (enabled or disabled) affects when the transmit data is transferred. The TXDSTALL bit will enable clock stretching during the 1st data bit of a slave-transmit transfer.

- **If clock stretching is enabled (TXDSTALL=1)**, then the transmit data transfer is stalled until the Slave Transmit register (STDR) is updated. Clock stretching is extended by at least 1 bus clock cycle after the Slave Transmit Data Register (STDR) is updated, and clock stretching can be delayed even more using the Clock Hold Time field (SCFGR2[CLKHOLD], Slave Configuration Register 2).
- **If clock stretching is disabled (TXDSTALL=0)**, then the transmit data should be written before the start of the slave-transmit transfer; otherwise (i.e., if the transmit data is not written before the start of the slave-transmit transfer), the FIFO Error Flag (SSR[FEF]) will be set.

# Chapter 38

## Low Power Serial Peripheral Interface (LPSPI)

### 38.1 Chip-specific LPSPI information

#### NOTE

The "Output Triggers" section is not applicable for this device.

### 38.2 Introduction

#### 38.2.1 Overview

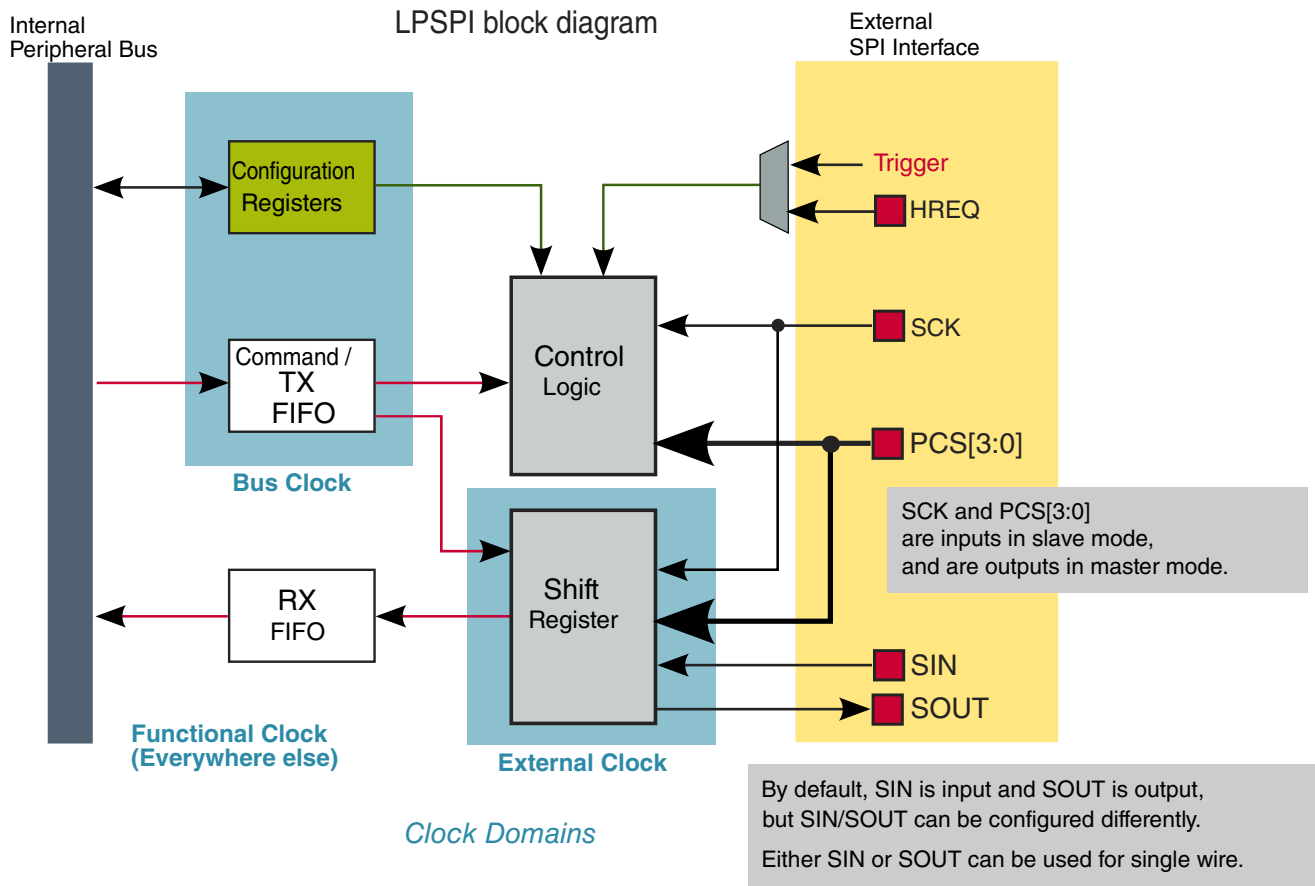

The LPSPI is a low power Serial Peripheral Interface (SPI) module that supports an efficient interface to an SPI bus as a master and/or a slave. The LPSPI can continue operating in stop modes provided an appropriate clock is available and is designed for low CPU overhead with DMA offloading of FIFO register accesses.

#### 38.2.2 Features

The LPSPI supports the following features:

- Word size = 32 bits
- Command/transmit FIFO of 16 words.
- Receive FIFO of 16 words.
- Host request input can be used to control the start time of an SPI bus transfer.

### 38.2.3 Block Diagram

**Figure 38-1. Block Diagram**

### 38.2.4 Modes of operation

The LPSPI module supports the chip modes described in the following table.

**Table 38-1. Chip modes supported by the LPSPI module**

Chip mode	LPSPI Operation
Run	Normal operation
Stop	Can continue operating if the Doze Enable bit (CR[DOZEN]) is clear and the LPSPI is using an external or internal clock source that remains operating during stop mode.
Debug (the core is in Debug/Halted mode)	Can continue operating if the Debug Enable bit (CR[DBGEN]) is set.

## 38.2.5 Signal Descriptions

Signal	Description	I/O
SCK	Serial clock. Input in slave mode, output in master mode.	I/O
PCS[0]	Peripheral Chip Select. Input in slave mode, output in master mode.	I/O
PCS[1] / HREQ	Peripheral Chip Select or Host Request. Host Request pin is selected when HREN=1 and HRSEL=0. Input in either slave mode or when used as Host Request, output in master mode.	I/O
PCS[2] / DATA[2]	Peripheral Chip Select or data pin 2 during quad-data transfers. Input in slave mode, output in master mode, input in quad-data receive transfers, output in quad-data transmit transfers.	I/O
PCS[3] / DATA[3]	Peripheral Chip Select or data pin 3 during quad-data transfers. Input in slave mode, output in master mode, input in quad-data receive transfers, output in quad-data transmit transfers.	I/O
SOUT / DATA[0]	Serial Data Output. Can be configured as serial data input signal. Used as data pin 0 in quad-data and dual-data transfers.	I/O
SIN / DATA[1]	Serial Data Input. Can be configured as serial data output signal. Used as data pin 1 in quad-data and dual-data transfers.	I/O

## 38.3 Functional description

### 38.3.1 Clocking and Resets

#### 38.3.1.1 Functional clock

The LPSPI functional clock is asynchronous to the bus clock and if it remains enabled in low power modes then LPSPI can perform SPI bus transfers and low power wakeups in both master and slave modes. The LPSPI divides the functional clock by a prescaler and the resulting frequency must be at least two times faster than the SPI external clock (LPSPI\_SCK) frequency.

### 38.3.1.2 External clock

The LPSPI shift register is clocked directly by the LPSPI\_SCK clock that is either generated internally in master mode or supplied externally in slave mode.

### 38.3.1.3 Bus clock

The bus clock is only used for bus accesses to the control and configuration registers. The bus clock frequency must be sufficient to support the data bandwidth requirements of the LPSPI registers, including FIFOs.

### 38.3.1.4 Chip reset

The logic and registers for the LPSPI are reset to their default state on a chip reset.

### 38.3.1.5 Software reset

The LPSPI implements a software reset bit in the Control Register. The CR[RST] will reset all logic and registers to their default state, except for the CR itself.

### 38.3.1.6 FIFO reset

The LPSPI implements write-only control bits that resets the transmit/command FIFO (CR[RTF] and receive FIFO (CR[RRF])). A FIFO is empty after being reset.

## 38.3.2 Master Mode

### 38.3.2.1 Transmit and Command FIFO

The transmit and command FIFO is a combined FIFO that includes both transmit data and command words. Command words are stored to the transmit/command FIFO by writing the transmit command register. Transmit data words are stored to the transmit/command FIFO by writing the transmit data register.

When a command word is at the top of the transmit/command FIFO, the following actions can occur:

- If the LPSPI is between frames, the command word is pulled from the FIFO and controls all subsequent transfers.
- If the LPSPI is busy and either the existing CONT bit is clear or the new CONTC value is clear, the SPI frame will complete at the end of the existing word, ignoring the FRAMESZ configuration. The command word is then pulled from the FIFO and controls all subsequent transfers (or until the next update to the command word).
- If the LPSPI is busy and the existing CONT bit is set and the new CONTC value is set, the command word is pulled from the FIFO during the last LPSPI\_SCK pulse of the existing frame (based on FRAMESZ configuration) and the frame continues using the new command value for the rest of the frame (or until the next update to the command word). When CONTC is set, only the lower 24-bits of the command word are updated.

The current state of the existing command word can be read by reading the transmit command register. It requires at least three LPSPI functional clock cycles for the transmit command register to update after it is written (assuming an empty FIFO) and the LPSPI must be enabled (CR[MEN] is set).

Writing the transmit command register does not initiate a SPI bus transfer, unless the TXMSK bit is set. When TXMSK is set, a new command word will not be loaded until the end of the existing frame (based on FRAMESZ configuration) and the TXMSK bit will be cleared at the end of the transfer.

The following table describes the attributes that are controlled by the command word.

**Table 38-2. LPSPI Command Word in Master Mode**

Field	Description	Modify During Transfer
CPOL	Configures polarity of the LPSPI_SCK pin. Any change of CPOL value will cause a transition on the LPSPI_SCK pin.	N
CPHA	Configures clock phase of transfer.	N
PRESCALE	Configures prescaler used to divide the LPSPI functional clock to generate the timing parameters of the SPI bus transfer. Changing PRESCALE in conjunction with PCS allows the LPSPI to connect to different slave devices at different frequencies.	N
PCS	Configures which LPSPI_PCS asserts for the transfer, the polarity of LPSPI_PCS is static and configured by PCSPOL. If PCSCFG is set, then PCS[3:2] should not be selected.	N
LSBF	Configures if LSB (bit 0) or MSB (bit 31 for a 32-bit word) is transmitted/received first.	Y
BYSW	Enables byte swap on each 32-bit word when transmitting and receiving data. Can be useful when interfacing to devices that organize data as big endian.	Y
CONT	Configures for a continuous transfer that keeps PCS asserted between frames (as configured by FRAMESZ). A new command word is required to cause PCS to negate. Also supports changing the command word at frame size boundaries.	Y

*Table continues on the next page...*

**Table 38-2. LPSPI Command Word in Master Mode (continued)**

Field	Description	Modify During Transfer
CONTC	Indicates that this is a new command word for the existing continuous transfer. CONTC bit is ignored when not written to the transmit/command FIFO on a frame boundary.	Y
RXMSK	Masks the receive data and does not store to the receive FIFO or perform receive data matching. Useful for half-duplex transfers or to configure which fields are compared during receive data matching.	Y
TXMSK	Masks the transmit data, so that data is not pulled from transmit FIFO and the output data pin is tristated (unless configured by OUTCFG). Useful for half-duplex transfers.	Y
WIDTH	Configures the number of bits shifted on each LPSPI_SCK pulse. <ul style="list-style-type: none"> <li>1-bit transfers support traditional SPI bus transfers in either half-duplex or full-duplex data formats.</li> <li>2-bit and 4-bit transfers are useful for interfacing to QuadSPI memory devices, and only support half-duplex data formats (at least one of TXMSK or RXMSK must also be set).</li> </ul>	Y
FRAMESZ	Configures the frame size in number of bits equal to (FRAMESZ + 1). <ul style="list-style-type: none"> <li>The minimum frame size is 8 bits.</li> <li>If the frame size is larger than 32 bits, then the frame is divided into multiple words of 32-bits; each word is loaded from the transmit FIFO and stored in the receive FIFO separately.</li> <li>If the size of the frame is not divisible by 32, then the last load of the transmit FIFO and store of the receive FIFO will contain the remainder bits. For example, a 72-bit transfer will consist of 3 words: the 1st and 2nd words are 32-bit, and the 3rd word is 8-bit.</li> <li>The minimum word size is 2 bits; a frame size of 33 bits (or similar) is not supported.</li> </ul>	Y

The LPSPI initiates a SPI bus transfer when data is written to the transmit FIFO, the HREQ pin is asserted (or disabled) and the LPSPI is enabled. The SPI bus transfer uses the attributes configured in the transmit command register and timing parameters from the clock configuration register to perform the transfer. The SPI bus transfer ends once the FRAMESZ configuration is reached, or at the end of a word when a new transmit command word is at the top of the transmit/command FIFO. The HREQ input is only checked the next time the LPSPI goes idle (completes the current transfer and transmit/command register is empty).

The transmit/command FIFO also supports a Circular FIFO feature. This allows the LPSPI master to (periodically) repeat a short data transfer that can fit within the transmit/command FIFO, without requiring additional FIFO accesses. When the circular FIFO is enabled, the current state of the FIFO read pointer is saved and the status flags do not update. Once the transmit/command FIFO is considered empty and the LPSPI is idle, the FIFO read pointer is restored with the saved version, so the contents of the transmit/command FIFO are not permanently pulled from the FIFO while circular FIFO mode is enabled.

### 38.3.2.2 Receive FIFO and Data Match

The receive FIFO is used to store receive data during SPI bus transfers. When RXMSK is set, receive data is discarded instead of storing in the receive FIFO.

The receive data is written to the receive FIFO at the end of the frame. During a multiple word or continuous transfer, the receive data is also written to the receive FIFO at the same time as new transmit data is read from the transmit FIFO. If the transmit FIFO is empty during a continuous transfer, the receive data is only written to the receive FIFO after the transmit FIFO is written or the command register is written to end the frame.

Receive data supports a receive data match function that can match received data against one of two words or against a masked data word. The data match function can also be configured to compare only the first one or two received data words since the start of the frame. Receive data that is already discarded due to RXMSK bit cannot cause the data match to set and will delay the match on first received data word until after all discarded data is received. The receiver match function can also be configured to discard all receive data until a data match is detected, using the CFGR0[RDMO] control bit. When clearing the CFGR0[RDMO] control bit following a data match, clear CFGR0[RDMO] before clearing SR[DMF] to allow all subsequent data to be received.

### 38.3.2.3 Timing Parameters

The following table lists the timing parameters that are used for all SPI bus transfers, these timing parameters are relative to the LPSPI functional clock divided by the PRESCALE configuration. Although the Clock Configuration Register cannot be changed when the LPSPI is busy, the PRESCALE configuration can be altered between transfers using the command register, to support interfacing to different slave devices at different frequencies.

**Table 38-3. LPSPI Timing Parameters**

Field	Description	Min	Max
SCKDIV	Configures the LPSPI_SCK clock period to (SCKDIV+2) cycles. When configured to an odd number of cycles, the first half of the LPSPI_SCK cycle is one cycle longer than the second half.	0 (2 cycles)	255 (257 cycles)
DBT	Configures the minimum delay between PCS negation and the next PCS assertion to	0 (2 cycles)	255 (257 cycles)

*Table continues on the next page...*

**Table 38-3. LPSPI Timing Parameters (continued)**

Field	Description	Min	Max
	(DBT + 2) cycles. When the command word is updated between transfers, there is a minimum of (DBT/2)+1 cycles between the command word update and any change on LPSPI_PCS pins.		
DBT	Configures the delay during a continuous transfer between the last SCK edge of a frame and the first SCK edge of the continuing frame to (DBT + 1) cycles. This is useful where the external slave requires a large delay between different words of a SPI bus transfer.	0 (1 cycle)	255 (256 cycles)
PCSSCK	Configures the minimum delay between PCS assertion and the first SCK edge to (PCSSCK + 1) cycles.	0 (1 cycle)	255 (256 cycles)
SCKPCS	Configures the minimum delay between the last SCK edge and the PCS assertion to (SCKPCS + 1) cycles.	0 (1 cycle)	255 (256 cycles)

### 38.3.2.4 Pin Configuration

The LPSPI\_SIN and LPSPI\_SOUT pins can be configured via the PINCFG configuration to swap directions or even support half-duplex transfers on the same pin.

The OUTCFG configuration can be used to determine if output data pin (eg: LPSPI\_SOUT) will tristate when the LPSPI\_PCS is negated, or if it will simply retain the last value. When configuring for half-duplex transfers using the same data pin in single bit transfer mode, or any transfer in 2-bit and 4-bit transfer modes, then the output data pins must be configured to tristate when LPSPI\_PCS is negated.

The PCSCFG configuration is used to disable LPSPI\_PCS[3:2] functions and to use them for quad-data transfers. This option must be enabled when performing quad-data transfers.

### 38.3.3 Slave Mode

LPSPI slave mode uses the same shift register and logic as the master mode, but does not use the clock configuration register and the transmit command register must remain static during SPI bus transfers.

#### 38.3.3.1 Transmit and Command FIFO

The transmit command register should be initialized before enabling the LPSPI in slave mode, although the command register will not update until after the LPSPI is enabled. Once enabled, the transmit command register should only be changed if the LPSPI is idle. The following table lists how the command register functions in slave mode.

**Table 38-4. LPSPI Command Word in Slave Mode**

Field	Description
CPOL	Configures polarity of the external LPSPI_SCK input.
CPHA	Configures clock phase of transfer.
PRESCALE	Configures LPSPI functional clock prescaler.
PCS	Configures which LPSPI_PCS is used, the polarity of LPSPI_PCS is static and configured by PCSPOL. If PCSCFG is set, then PCS[3:2] should not be selected.
LSBF	Configures if LSB (bit 0) or MSB (bit 31 for a 32-bit word) is transmitted/received first.
BYSW	Enables byte swap on each 32-bit word when transmitting and receiving data. Can be useful when interfacing to devices that organize data as big endian.
CONT	When set, only the first FRAMESZ bits will be transmitted/received by the LPSPI.
CONTC	CONTC bit is reserved in slave mode.
RXMSK	Masks the receive data and does not store to the receive FIFO or perform receive data matching. Useful for half-duplex transfers or to configure which fields are compared during receive data matching.
TXMSK	Masks the transmit data, so that data is not pulled from transmit FIFO and the output data pin is tristated (unless configured by OUTCFG). Useful for half-duplex transfers.
WIDTH	Configures the number of bits shifted on each LPSPI_SCK pulse. <ul style="list-style-type: none"> <li>1-bit transfers support traditional SPI bus transfers in either half-duplex or full-duplex data formats.</li> <li>2-bit and 4-bit transfers are useful for interfacing to QuadSPI memory devices, and only support half-duplex data formats (at least one of TXMSK or RXMSK must also be set).</li> </ul>
FRAMESZ	Configures the frame size in number of bits equal to (FRAMESZ + 1). <ul style="list-style-type: none"> <li>The minimum frame size is 8 bits.</li> <li>If the frame size is larger than 32 bits, then the frame is divided into multiple words of 32-bits; each word is loaded from the transmit FIFO and stored in the receive FIFO separately.</li> <li>If the size of the frame is not divisible by 32, then the last load of the transmit FIFO and store of the receive FIFO will contain the remainder bits. For example, a 72-bit transfer will consist of 3 words: the 1st and 2nd words are 32-bit, and the 3rd word is 8-bit.</li> <li>The minimum word size is 2 bits; a frame size of 33 bits (or similar) is not supported.</li> </ul>

The transmit FIFO must be filled with transmit data before the LPSPI\_PCS input asserts, otherwise the transmit error flag will set.

### 38.3.3.2 Receive FIFO and Data Match

The receive FIFO is used to store receive data during SPI bus transfers. When RXMSK is set, receive data is discarded instead of storing in the receive FIFO.

Receive data supports a receive data match function that can match received data against one of two words or against a masked data word. The data match function can also be configured to compare only the first one or two received data words since the start of the frame. Receive data that is already discarded due to RXMSK bit cannot cause the data match to set and will delay the match on first received data word until after all discarded data is received. The receiver match function can also be configured to discard all receive data until a data match is detected, using the CFGR0[RDMO] control bit. When clearing the CFGR0[RDMO] control bit following a data match, clear CFGR0[RDMO] before clearing SR[DMF] to allow all subsequent data to be received.

### 38.3.3.3 Clocked Interface

The LPSPI supports interfacing to external masters that provide only clock and data pins (LPSPI\_PCS is not required). This requires using CPHA=1, configuring the LPSPI\_PCS input to be always asserted (configure PCSPOL) and setting the AUTOPCS bit. When AUTOPCS is set, a minimum of 4 LPSPI functional clock cycles (divided by PRESCALE configuration) is required between the last LPSPI\_SCK edge of one word and the first LPSPI\_SCK edge of the next word.

## 38.3.4 Interrupts and DMA Requests

The following table illustrates the status flags that can generate the LPSPI interrupt and LPSPI transmit/receive DMA requests.

**Table 38-5. LPSPI Interrupts and DMA Requests**

Flag	Description	Interrupt	DMA Request	Low Power Wakeup
TDF	Data can be written to transmit FIFO, as configured by TXWATER.	Y	TX	Y
RDF	Data can be read from the receive FIFO, as configured by RXWATER.	Y	RX	Y

*Table continues on the next page...*

**Table 38-5. LPSPI Interrupts and DMA Requests (continued)**

Flag	Description	Interrupt	DMA Request	Low Power Wakeup
WCF	Word complete, last bit of word has been sampled.	Y	N	Y
FCF	Frame complete, PCS has negated.	Y	N	Y
TCF	Transfer complete, PCS has negated and transmit/command FIFO is empty.	Y	N	Y
TEF	Transmit error flag, indicates transmit/command FIFO underrun. This bit cannot set in master mode when NOSTALL is clear.	Y	N	Y
REF	Receive error flag, indicates receive FIFO overflow. This bit cannot set in master mode when NOSTALL is clear.	Y	N	Y
DMF	Data match flag, received data has matched the configured data match value.	Y	N	Y
MBF	LPSPI is busy performing a SPI bus transfer.	N	N	N

### 38.3.5 Peripheral Triggers

The connection of the LPSPI peripheral triggers with other peripherals are device specific.

#### 38.3.5.1 Output Triggers

The LPSPI generates two output triggers that can be connected to other peripherals on the device. The frame output trigger asserts at the end of each frame (when PCS negates) and remains asserted until PCS next asserts. The word output trigger asserts at the end of each received word and remains asserted for one LPSPI\_SCK period.

### 38.3.5.2 Input Trigger

The LPSPI input trigger can be selected in place of the LPSPI\_HREQ input to control the start of a LPSPI bus transfer. The input trigger is synchronized and must assert for at least two cycles of the LPSPI functional clock divided by the PRESCALE configuration to be detected. Note that the LPSPI\_HREQ input (and therefore the input trigger) is ignored when the LPSPI is busy.

## 38.4 Memory Map and Registers

### 38.4.1 LPSPI register descriptions

#### 38.4.1.1 LPSPI Memory map

Base address:

- LPSPI1: 4039\_4000h

### 38.4.1.15 Transmit Command Register (TCR)

#### 38.4.1.15.1 Offset

Register	Offset
TCR	60h

#### 38.4.1.15.2 Function

Writes to either the Transmit Command Register or Transmit Data Register will push the data into the transmit FIFO, in the order that the data are written. Command Register writes will be tagged and cause the command register to update, after that entry reaches the top of the FIFO. This allows changes to the command word and the transmit data itself to be interleaved. Changing the command word will cause all subsequent SPI bus transfers to be performed using the new command word.

- **In master mode**, writing a new command word does not initiate a new transfer, unless TXMSK is set. Transfers are initiated by transmit data in the transmit FIFO, or by a new command word (with TXMSK set). Hardware will clear TXMSK when the LPSPI\_PCS negates.
- **In master mode**, if the command word is changed before an existing frame has completed, then the existing frame will terminate and the command word will then update. The command word can be changed during a continuous transfer, if CONTC of the new command word is set and the command word is written on a frame size boundary.
- **In slave mode**, the command word should be changed only when the LPSPI is idle and there is no SPI bus transfer.

**Avoid register reading problems:** Reading the Transmit Command Register will return the current state of the command register. Reading the Transmit Command Register at the same time that the Transmit Command Register is loaded from the transmit FIFO, can return an incorrect Transmit Command Register value. It is recommended:

- to either read the Transmit Command Register when the transmit FIFO is empty,
- or to read the Transmit Command Register more than once and then compare the returned values.

## Low Power Universal Asynchronous Receiver/Transmitter (LPUART)

### 39.1 Introduction

#### 39.1.1 Features

Features of the LPUART module include:

- Full-duplex, standard non-return-to-zero (NRZ) format
- Programmable baud rates (13-bit modulo divider) with configurable oversampling ratio from 4x to 32x
- Transmit and receive baud rate can operate asynchronous to the bus clock:
  - Baud rate can be configured independently of the bus clock frequency
  - Supports operation in Stop modes
- Interrupt, DMA or polled operation:
  - Transmit data register empty and transmission complete
  - Receive data register full
  - Receive overrun, parity error, framing error, and noise error
  - Idle receiver detect
  - Active edge on receive pin
  - Break detect supporting LIN
  - Receive data match
- Hardware parity generation and checking
- Programmable 7-bit, 8-bit, 9-bit or 10-bit character length
- Programmable 1-bit or 2-bit stop bits
- Three receiver wakeup methods:
  - Idle line wakeup
  - Address mark wakeup
  - Receive data match
- Automatic address matching to reduce ISR overhead:

- Address mark matching
- Idle line address matching
- Address match start, address match end
- Optional 13-bit break character generation / 11-bit break character detection
- Configurable idle length detection supporting 1, 2, 4, 8, 16, 32, 64 or 128 idle characters
- Selectable transmitter output and receiver input polarity
- Hardware flow control support for request to send (RTS) and clear to send (CTS) signals
- Selectable IrDA 1.4 return-to-zero-inverted (RZI) format with programmable pulse width
- Independent FIFO structure for transmit and receive
  - Separate configurable watermark for receive and transmit requests
  - Option for receiver to assert request after a configurable number of idle characters if receive FIFO is not empty

## **39.1.2 Modes of operation**

### **39.1.2.1 Stop mode**

The LPUART will remain functional during Stop mode, provided the DOZEEN bit is clear and the asynchronous transmit and receive clock remain enabled. The LPUART can generate an interrupt or DMA request to cause a wakeup from Stop mode.

If the LPUART is disabled in Stop mode, then it can generate a wakeup via the RXEDGIF flag if the receiver detects an active edge.

### **39.1.2.2 Wait mode**

The LPUART can be configured to Stop in Wait modes, when the DOZEEN bit is set. The transmitter and receiver will finish transmitting/receiving the current word.

### **39.1.2.3 Debug mode**

The LPUART remains functional in debug mode.

### 39.1.3 Signal Descriptions

Signal	Description	I/O
TXD	Transmit data. This pin is normally an output, but is an input (tristated) in single wire mode whenever the transmitter is disabled or transmit direction is configured for receive data.	I/O
RXD	Receive data.	I
CTS_B	Clear to send.	I
RTS_B	Request to send.	O

### 39.1.4 Block diagram

The following figure shows the transmitter portion of the LPUART.

**Figure 39-1. LPUART transmitter block diagram**

The following figure shows the receiver portion of the LPUART.

Figure 39-2. LPUART receiver block diagram

## 39.2 Functional description

The LPUART supports full-duplex, asynchronous, NRZ serial communication and comprises a baud rate generator, transmitter, and receiver block. The transmitter and receiver operate independently, although they use the same baud rate generator. The following describes each of the blocks of the LPUART.

### 39.2.1 Baud rate generation

A 13-bit modulus counter in the baud rate generator derive the baud rate for both the receiver and the transmitter. The value from 1 to 8191 written to SBR[12:0] determines the baud clock divisor for the asynchronous LPUART baud clock. The SBR bits are in the LPUART baud rate registers, BDH and BDL. The baud rate clock drives the receiver, while the transmitter is driven by a bit clock which is generated from baud rate clock divided by the over sampling ratio. Depending on the over sampling ratio, the receiver has an acquisition rate of 4 to 32 samples per bit time.

**Figure 39-3. LPUART baud rate generation**

Baud rate generation is subject to two sources of error:

- Integer division of the asynchronous LPUART baud clock may not give the exact target frequency.
- Synchronization with the asynchronous LPUART baud clock can cause phase shift.

The baud rate generation is a free-running counter that continues whenever the transmitter or receiver is enabled. The transmitter bit clock continues whenever the transmitter is enabled, each transmitted character will align to the next edge of the transmit bit clock.

### 39.2.2 Transmitter functional description

This section describes the overall block diagram for the LPUART transmitter, as well as specialized functions for sending break and idle characters.

The transmitter output (TXD) idle state defaults to logic high, CTRL[TXINV] is cleared following reset. The transmitter output is inverted by setting CTRL[TXINV]. The transmitter is enabled by setting the CTRL[TE] bit. This queues a preamble character that is one full character frame of the idle state. The transmitter then remains idle until data is available in the transmit data buffer. Programs store data into the transmit data buffer by writing to the LPUART data register.

The central element of the LPUART transmitter is the transmit shift register that is 9-bit to 13 bits long depending on the setting in the CTRL[M], CTRL[M7], BAUD[M10] and BAUD[SBNS] control bits. For the remainder of this section, assume CTRL[M], CTRL[M7], BAUD[M10] and BAUD[SBNS] are cleared, selecting the normal 8-bit data mode. In 8-bit data mode, the shift register holds a start bit, eight data bits, and a stop bit. When the transmit shift register is available for a new character, the value waiting in the

transmit data register is transferred to the shift register, synchronized with the baud rate clock, and the transmit data register empty (STAT[TDRE]) status flag is set to indicate another character may be written to the transmit data buffer at LPUART\_DATA.

If no new character is waiting in the transmit data buffer after a stop bit is shifted out the TXD pin, the transmitter sets the transmit complete flag and enters an idle mode, with TXD high, waiting for more characters to transmit.

Writing 0 to CTRL[TE] does not immediately disable the transmitter. The current transmit activity in progress must first be completed (that could include a data character, idle character or break character), although the transmitter will not start transmitting another character.

### 39.2.2.1 Send break and queued idle

The LPUART\_CTRL[SBK] bit sends break characters originally used to gain the attention of old teletype receivers. Break characters are a full character time of logic 0, 9-bit to 12-bit times including the start and stop bits. A longer break of 13-bit times can be enabled by setting LPUART\_STAT[BRK13]. Normally, a program would wait for LPUART\_STAT[TDRE] to become set to indicate the last character of a message has moved to the transmit shifter, write 1, and then write 0 to the LPUART\_CTRL[SBK] bit. This action queues a break character to be sent as soon as the shifter is available. If LPUART\_CTRL[SBK] remains 1 when the queued break moves into the shifter, synchronized to the baud rate clock, an additional break character is queued. When the LPUART is the receiving device, a break character is received as 0s in all data bits and a framing error (LPUART\_STAT[FE] = 1) is detected.

A break character can also be transmitted by writing to the LPUART\_DATA register with bit 13 set and the data bits clear. This supports transmitting the break character as part of the normal data stream and also allows the DMA to transmit a break character.

When idle-line wakeup is used, a full character time of idle (logic 1) is needed between messages to wake up any sleeping receivers. Normally, a program would wait for LPUART\_STAT[TDRE] to become set to indicate the last character of a message has moved to the transmit shifter, then write 0 and then write 1 to the LPUART\_CTRL[TE] bit. This action queues an idle character to be sent as soon as the shifter is available. As long as the character in the shifter does not finish while LPUART\_CTRL[TE] is cleared, the LPUART transmitter never actually releases control of the TXD pin.

An idle character can also be transmitted by writing to the LPUART\_DATA register with bit 13 set and the data bits also set. This supports transmitting the idle character as part of the normal data stream and also allows the DMA to transmit a break character.

## Functional description

The length of the break character is affected by the LPUART\_STAT[BRK13], LPUART\_CTRL[M], LPUART\_CTRL[M7], LPUART\_BAUD[M10] and LPUART\_BAUD[SNBS] bits as shown below.

**Table 39-1. Break character length**

BRK13	M	M10	M7	SNBS	Break character length
0	0	0	0	0	10 bit times
0	0	0	0	1	11 bit times
0	0	0	1	0	9 bit times
0	0	0	1	1	10 bit times
0	1	0	X	0	11 bit times
0	1	0	X	1	12 bit times
0	X	1	X	0	12 bit times
0	X	1	X	1	13 bit times
1	0	0	0	0	13 bit times
1	0	0	0	1	13 bit times
1	0	0	1	0	12 bit times
1	0	0	1	1	12 bit times
1	1	0	X	0	14 bit times
1	1	0	X	1	14 bit times
1	X	1	X	0	15 bit times
1	X	1	X	1	15 bit times

### 39.2.2.2 Hardware flow control

The transmitter supports hardware flow control by gating the transmission with the value of CTS\_B. If the clear-to-send operation is enabled, the character is transmitted when CTS\_B is asserted. If CTS\_B is deasserted in the middle of a transmission with characters remaining in the receiver data buffer, the character in the shift register is sent and TXD remains in the mark state until CTS\_B is reasserted. The CTS\_B pin must assert for longer than one bit period to guarantee a new transmission is started when the transmitter is idle with data to send.

If the clear-to-send operation is disabled, the transmitter ignores the state of CTS\_B.

The transmitter's CTS\_B signal can also be enabled even if the same LPUART receiver's RTS\_B signal is disabled.

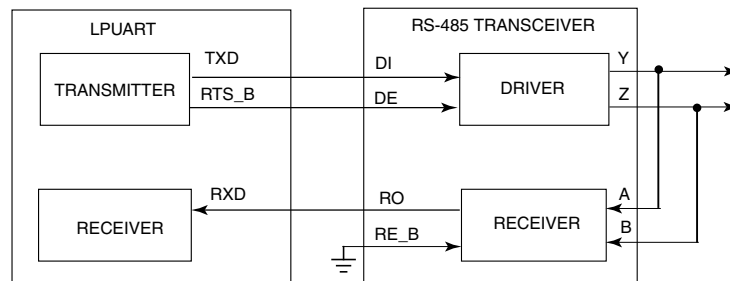

### 39.2.2.3 Transceiver driver enable

The transmitter can use RTS\_B as an enable signal for the driver of an external transceiver. See [Transceiver driver enable using RTS\\_B](#) for details. If the request-to-send operation is enabled, when a character is placed into an empty transmitter data buffer, RTS\_B asserts one bit time before the start bit is transmitted. RTS\_B remains asserted for the whole time that the transmitter data buffer has any characters. RTS\_B deasserts one bit time after all characters in the transmitter data buffer and shift register are completely sent, including the last stop bit. Transmitting a break character also asserts RTS\_B, with the same assertion and deassertion timing as having a character in the transmitter data buffer.

The transmitter's RTS\_B signal asserts only when the transmitter is enabled. However, the transmitter's RTS\_B signal is unaffected by its CTS\_B signal. RTS\_B will remain asserted until the transfer is completed, even if the transmitter is disabled mid-way through a data transfer.

### 39.2.2.4 Transceiver driver enable using RTS\_B

RS-485 is a multiple drop communication protocol in which the LPUART transceiver's driver is 3-stated unless the LPUART is driving. The RTS\_B signal can be used by the transmitter to enable the driver of a transceiver. The polarity of RTS\_B can be matched to the polarity of the transceiver's driver enable signal.

**Figure 39-4. Transceiver driver enable using RTS\_B**

In the figure, the receiver enable signal is asserted. Another option for this connection is to connect RTS\_B to both DE and RE\_B. The transceiver's receiver is disabled while driving. A pullup can pull RXD to a non-floating value during this time. This option can be refined further by operating the LPUART in single wire mode, freeing the RXD pin for other uses.

### 39.2.3 Receiver functional description

In this section, the receiver block diagram is a guide for the overall receiver functional description. Next, the data sampling technique used to reconstruct receiver data is described in more detail. Finally, different variations of the receiver wakeup function are explained.

The receiver input is inverted by setting LPUART\_STAT[RXINV]. The receiver is enabled by setting the LPUART\_CTRL[RE] bit. Character frames consist of a start bit of logic 0, seven to ten data bits (msb or lsb first), and one or two stop bits of logic 1. For information about 7-bit, 9-bit or 10-bit data mode, refer to [Data Modes](#). For the remainder of this discussion, assume the LPUART is configured for normal 8-bit data mode.

After receiving the stop bit into the receive shifter, and provided the receive data register is not already full, the data character is transferred to the receive data register and the receive data register full (LPUART\_STAT[RDRF]) status flag is set. If LPUART\_STAT[RDRF] was already set indicating the receive data register (buffer) was already full, the overrun (OR) status flag is set and the new data is lost. Because the LPUART receiver is double-buffered, the program has one full character time after LPUART\_STAT[RDRF] is set before the data in the receive data buffer must be read to avoid a receiver overrun.

When a program detects that the receive data register is full (LPUART\_STAT[RDRF] = 1), it gets the data from the receive data register by reading LPUART\_DATA. Refer to [Interrupts and status flags](#) for details about flag clearing.

#### 39.2.3.1 Data sampling technique

The LPUART receiver supports a configurable oversampling rate of between  $4\times$  and  $32\times$  of the baud rate clock for sampling. The receiver starts by taking logic level samples at the oversampling rate times the baud rate to search for a falling edge on the RXD serial data input pin. A falling edge is defined as a logic 0 sample after three consecutive logic 1 samples. The oversampling baud rate clock divides the bit time into 4 to 32 segments from 1 to OSR (where OSR is the configured oversampling ratio). When a falling edge is located, three more samples are taken at  $(OSR/2)$ ,  $(OSR/2)+1$ , and  $(OSR/2)+2$  to make sure this was a real start bit and not merely noise. If at least two of these three samples are 0, the receiver assumes it is synchronized to a received character. If another falling edge is detected before the receiver is considered synchronized, the receiver restarts the sampling from the first segment.

The receiver then samples each bit time, including the start and stop bits, at  $(OSR/2)$ ,  $(OSR/2)+1$ , and  $(OSR/2)+2$  to determine the logic level for that bit. The logic level is interpreted to be that of the majority of the samples taken during the bit time. If any sample in any bit time, including the start and stop bits, in a character frame fails to agree with the logic level for that bit, the noise flag (LPUART\_STAT[NF]) is set when the received character is transferred to the receive data buffer.

When the LPUART receiver is configured to sample on both edges of the baud rate clock, the number of segments in each received bit is effectively doubled (from 1 to  $OSR \times 2$ ). The start and data bits are then sampled at  $OSR$ ,  $OSR+1$  and  $OSR+2$ . Sampling on both edges of the clock must be enabled for oversampling rates of  $4\times$  to  $7\times$  and is optional for higher oversampling rates.

The falling edge detection logic continuously looks for falling edges. If an edge is detected, the sample clock is resynchronized to bit times (unless resynchronization has been disabled). This improves the reliability of the receiver in the presence of noise or mismatched baud rates. It does not improve worst case analysis because some characters do not have any extra falling edges anywhere in the character frame.

In the case of a framing error, provided the received character was not a break character, the sampling logic that searches for a falling edge is filled with three logic 1 samples so that a new start bit can be detected almost immediately.

### 39.2.3.2 Receiver wakeup operation

Receiver wakeup and receiver address matching is a hardware mechanism that allows an LPUART receiver to ignore the characters in a message intended for a different receiver.

During receiver wakeup, all receivers evaluate the first character(s) of each message, and as soon as they determine the message is intended for a different receiver, they write logic 1 to the receiver wake up control bit (LPUART\_CTRL[RWU]). When RWU bit and LPUART\_S2[RWUID] bit are set, the status flags associated with the receiver, with the exception of the idle bit, IDLE, are inhibited from setting, thus eliminating the software overhead for handling the unimportant message characters. At the end of a message, or at the beginning of the next message, all receivers automatically force LPUART\_CTRL[RWU] to 0 so all receivers wake up in time to look at the first character(s) of the next message.

During receiver address matching, the address matching is performed in hardware and the LPUART receiver will ignore all characters that do not meet the address match requirements.

Table 39-2. Receiver Wakeup Options

RWU	MA1   MA2	MATCFG	WAKE:RWUID	Receiver Wakeup
0	0	X	X	Normal operation
1	0	00	00	Receiver wakeup on idle line, IDLE flag not set
1	0	00	01	Receiver wakeup on idle line, IDLE flag set
1	0	00	10	Receiver wakeup on address mark
1	1	11	X0	Receiver wakeup on data match
0	1	00	X0	Address mark address match, IDLE flag not set for discarded characters
0	1	00	X1	Address mark address match, IDLE flag set for discarded characters
0	1	01	X0	Idle line address match
0	1	10	X0	Address match on and address match off, IDLE flag not set for discarded characters
0	1	10	X1	Address match on and address match off, IDLE flag set for discarded characters

### 39.2.3.2.1 Idle-line wakeup

When LPUART\_CTRL[WAKE] is cleared, the receiver is configured for idle-line wakeup. In this mode, LPUART\_CTRL[RWU] is cleared automatically when the receiver detects a full character time of the idle-line level. The LPUART\_CTRL[M], LPUART\_CTRL[M7] and LPUART\_BAUD[M10] control bit selects 7-bit to 10-bit data mode and the LPUART\_BAUD[SBNS] bit selects 1-bit or 2-bit stop bit number that determines how many bit times of idle are needed to constitute a full character time, 9 to 13 bit times because of the start and stop bits.

When LPUART\_CTRL[RWU] is one and LPUART\_STAT[RWUID] is zero, the idle condition that wakes up the receiver does not set the LPUART\_STAT[IDLE] flag. The receiver wakes up and waits for the first data character of the next message that sets the LPUART\_STAT[RDRF] flag and generates an interrupt if enabled. When LPUART\_STAT[RWUID] is one, any idle condition sets the LPUART\_STAT[IDLE] flag and generates an interrupt if enabled, regardless of whether LPUART\_CTRL[RWU] is zero or one.

The idle-line type (LPUART\_CTRL[ILT]) control bit selects one of two ways to detect an idle line. When LPUART\_CTRL[ILT] is cleared, the idle bit counter starts after the start bit so the stop bit and any logic 1s at the end of a character count toward the full character time of idle. When LPUART\_CTRL[ILT] is set, the idle bit counter does not start until after the stop bit time, so the idle detection is not affected by the data in the last character of the previous message.

### 39.2.3.2.2 Address-mark wakeup

When LPUART\_CTRL[WAKE] is set, the receiver is configured for address-mark wakeup. In this mode, LPUART\_CTRL[RWU] is cleared automatically when the receiver detects a logic 1 in the most significant bit of the received character. When parity is enabled, the second most significant bit is used for address-mark wakeup.

Address-mark wakeup allows messages to contain idle characters, but requires one bit be reserved for use in address frames. The logic 1 in the most significant bit (or second most significant bit when parity is enabled) of an address frame clears the LPUART\_CTRL[RWU] bit and sets the LPUART\_STAT[RDRF] flag. In this case, the character with the address-mark bit is received even though the receiver was sleeping during most of this character time.

### 39.2.3.2.3 Data match wakeup

When LPUART\_CTRL[RWU] is set and LPUART\_BAUD[MATCFG] equals 11, the receiver is configured for data match wakeup. In this mode, LPUART\_CTRL[RWU] is cleared automatically when the receiver detects a character that matches MATCH[MA1] field when BAUD[MAEN1] is set, or that matches MATCH[MA2] when BAUD[MAEN2] is set.

### 39.2.3.2.4 Address Match operation

Address match operation is enabled when the LPUART\_BAUD[MAEN1] or LPUART\_BAUD[MAEN2] bit is set and LPUART\_BAUD[MATCFG] is equal to 00. In this function, a character received by the RXD pin with a logic 1 in the most significant bit (or second most significant bit when parity is enabled) is considered an address and is compared with the associated MATCH[MA1] or MATCH[MA2] field. The character is only transferred to the receive buffer, and LPUART\_STAT[RDRF] is set, if the comparison matches. All subsequent characters received with a logic 0 in the most significant bit (or second most significant bit when parity is enabled) are considered to be data associated with the address and are transferred to the receive data buffer. If no marked address match occurs then no transfer is made to the receive data buffer, and all following characters with logic zero in the most significant bit (or second most

significant bit when parity is enabled) are also discarded. If both the LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] bits are negated, the receiver operates normally and all data received is transferred to the receive data buffer.

Address match operation functions in the same way for both MATCH[MA1] and MATCH[MA2] fields.

- If only one of LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] is asserted, a marked address is compared only with the associated match register and data is transferred to the receive data buffer only on a match.
- If LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] are asserted, a marked address is compared with both match registers and data is transferred only on a match with either register.

### **39.2.3.2.5 Idle Match operation**

Idle match operation is enabled when the LPUART\_BAUD[MAEN1] or LPUART\_BAUD[MAEN2] bit is set and LPUART\_BAUD[MATCFG] is equal to 01. In this function, the first character received by the RXD pin after an idle line condition is considered an address and is compared with the associated MA1 or MA2 register. The character is only transferred to the receive buffer, and LPUART\_STAT[RDRF] is set, if the comparison matches. All subsequent characters are considered to be data associated with the address and are transferred to the receive data buffer until the next idle line condition is detected. If no address match occurs then no transfer is made to the receive data buffer, and all following frames until the next idle condition are also discarded. If both the LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] bits are negated, the receiver operates normally and all data received is transferred to the receive data buffer.

Idle match operation functions in the same way for both MA1 and MA2 registers.

- If only one of LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] is asserted, the first character after an idle line is compared only with the associated match register and data is transferred to the receive data buffer only on a match.
- If LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] are asserted, the first character after an idle line is compared with both match registers and data is transferred only on a match with either register.

### 39.2.3.2.6 Match On Match Off operation

Match on, match off operation is enabled when both LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] are set and LPUART\_BAUD[MATCFG] is equal to 10. In this function, a character received by the RXD pin that matches MATCH[MA1] is received and transferred to the receive buffer, and LPUART\_STAT[RDRF] is set. All subsequent characters are considered to be data and are also transferred to the receive data buffer, until a character is received that matches MATCH[MA2] register. The character that matches MATCH[MA2] and all following characters are discarded, this continues until another character that matches MATCH[MA1] is received. If both the LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] bits are negated, the receiver operates normally and all data received is transferred to the receive data buffer.

#### NOTE

Match on, match off operation requires both LPUART\_BAUD[MAEN1] and LPUART\_BAUD[MAEN2] to be asserted.

### 39.2.3.3 Hardware flow control

To support hardware flow control, the receiver can be programmed to automatically deassert and assert RTS\_B.

- RTS\_B remains asserted until the transfer is complete, even if the transmitter is disabled midway through a data transfer. See [Transceiver driver enable using RTS\\_B](#) for more details.
- If the receiver request-to-send functionality is enabled, the receiver automatically deasserts RTS\_B if the number of characters in the receiver data register is full or a start bit is detected that will cause the receiver data register to be full.
- The receiver asserts RTS\_B when the number of characters in the receiver data register is not full and has not detected a start bit that will cause the receiver data register to be full. It is not affected if STAT[RDRF] is asserted.
- Even if RTS\_B is deasserted, the receiver continues to receive characters until the receiver data buffer is overrun.
- If the receiver request-to-send functionality is disabled, the receiver RTS\_B remains deasserted.

### 39.2.3.4 Infrared decoder

The infrared decoder converts the received character from the IrDA format to the NRZ format used by the receiver. It also has a OSR oversampling baud rate clock counter that filters noise and indicates when a 1 is received.

#### 39.2.3.4.1 Start bit detection

When STAT[RXINV] is cleared, the first falling edge of the received character corresponds to the start bit. The infrared decoder resets its counter. At this time, the receiver also begins its start bit detection process. After the start bit is detected, the receiver synchronizes its bit times to this start bit time. For the rest of the character reception, the infrared decoder's counter and the receiver's bit time counter count independently from each other.

#### 39.2.3.4.2 Noise filtering

Any further rising edges detected during the first half of the infrared decoder counter are ignored by the decoder. Any pulses less than one oversampling baud clock can be undetected by it regardless of whether it is seen in the first or second half of the count.

#### 39.2.3.4.3 Low-bit detection

During the second half of the decoder count, a rising edge is decoded as a 0, which is sent to the receiver. The decoder counter is also reset.

#### 39.2.3.4.4 High-bit detection

At OSR oversampling baud rate clocks after the previous rising edge, if a rising edge is not seen, then the decoder sends a 1 to the receiver.

If the next bit is a 0, which arrives late, then a low-bit is detected according to [Low-bit detection](#). The value sent to the receiver is changed from 1 to a 0. Then, if a noise pulse occurs outside the receiver's bit time sampling period, then the delay of a 0 is not recorded as noise.

## 39.2.4 Additional LPUART functions

The following sections describe additional LPUART functions.

### 39.2.4.1 Data Modes

The LPUART transmitter and receiver can be configured to operate in 7-bit data mode by setting LPUART\_CTRL[M7], 9-bit data mode by setting the LPUART\_CTRL[M] or 10-bit data mode by setting LPUART\_CTRL[M10]. In 9-bit mode, there is a ninth data bit in 10-bit mode there is a tenth data bit. For the transmit data buffer, these bits are stored in LPUART\_CTRL[T8] and LPUART\_CTRL[T9]. For the receiver, these bits are held in LPUART\_CTRL[R8] and LPUART\_CTRL[R9]. They are also accessible via 16-bit or 32-bit accesses to the LPUART\_DATA register.

For coherent 8-bit writes to the transmit data buffer, write to LPUART\_CTRL[T8] and LPUART\_CTRL[T9] before writing to LPUART\_DATA[7:0]. For 16-bit and 32-bit writes to the LPUART\_DATA register all 10 transmit bits are written to the transmit data buffer at the same time.

If the bit values to be transmitted as the ninth and tenth bit of a new character are the same as for the previous character, it is not necessary to write to LPUART\_CTRL[T8] and LPUART\_CTRL[T9] again. When data is transferred from the transmit data buffer to the transmit shifter, the value in LPUART\_CTRL[T8] and LPUART\_CTRL[T9] is copied at the same time data is transferred from LPUART\_DATA[7:0] to the shifter.

The 9-bit data mode is typically used with parity to allow eight bits of data plus the parity in the ninth bit, or it is used with address-mark wakeup so the ninth data bit can serve as the wakeup bit. The 10-bit data mode is typically used with parity and address-mark wakeup so the ninth data bit can serve as the wakeup bit and the tenth bit as the parity bit. In custom protocols, the ninth and/or tenth bits can also serve as software-controlled markers.

### 39.2.4.2 Idle length

An idle character is a character where the start bit, all data bits and stop bits are in the mark position. The CTRL[ILT] register can be configured to start detecting an idle character from the previous start bit (any data bits and stop bits count towards the idle character detection) or from the previous stop bit.

The number of idle characters that must be received before an idle line condition is detected can also be configured using the CTRL[IDLECFG] field. This field configures the number of idle characters that must be received before the STAT[IDLE] flag is set, the STAT[RAF] flag is cleared and the DATA[IDLINE] flag is set with the next received character.

Idle-line wakeup and idle match operation are also affected by the CTRL[IDLECFG] field. When address match or match on/off operation is enabled, setting the STAT[RWUID] bit will cause any discarded characters to be treated as if they were idle characters.

### **39.2.4.3 Loop mode**

When LPUART\_CTRL[LOOPS] is set, the LPUART\_CTRL[RSRC] bit in the same register chooses between loop mode (LPUART\_CTRL[RSRC] = 0) or single-wire mode (LPUART\_CTRL[RSRC] = 1). Loop mode is sometimes used to check software, independent of connections in the external system, to help isolate system problems. In this mode, the transmitter output is internally connected to the receiver input and the RXD pin is not used by the LPUART.

### **39.2.4.4 Single-wire operation**

When LPUART\_CTRL[LOOPS] is set, the RSRC bit in the same register chooses between loop mode (LPUART\_CTRL[RSRC] = 0) or single-wire mode (LPUART\_CTRL[RSRC] = 1). Single-wire mode implements a half-duplex serial connection. The receiver is internally connected to the transmitter output and to the TXD pin (the RXD pin is not used).

In single-wire mode, the LPUART\_CTRL[TXDIR] bit controls the direction of serial data on the TXD pin. When LPUART\_CTRL[TXDIR] is cleared, the TXD pin is an input to the receiver and the transmitter is temporarily disconnected from the TXD pin so an external device can send serial data to the receiver. When LPUART\_CTRL[TXDIR] is set, the TXD pin is an output driven by the transmitter, the internal loop back connection is disabled, and as a result the receiver cannot receive characters that are sent out by the transmitter.

## **39.2.5 Infrared interface**

The LPUART provides the capability of transmitting narrow pulses to an IR LED and receiving narrow pulses and transforming them to serial bits, which are sent to the LPUART. The IrDA physical layer specification defines a half-duplex infrared communication link for exchanging data. The full standard includes data rates up to 16 Mbits/s. This design covers data rates only between 2.4 kbits/s and 115.2 kbits/s.

The LPUART has an infrared transmit encoder and receive decoder. The LPUART transmits serial bits of data that are encoded by the infrared submodule to transmit a narrow pulse for every zero bit. No pulse is transmitted for every one bit. When receiving data, the IR pulses are detected using an IR photo diode and transformed to CMOS levels by the IR receive decoder, external from the LPUART. The narrow pulses are then stretched by the infrared receive decoder to get back to a serial bit stream to be received by the LPUART. The polarity of transmitted pulses and expected receive pulses can be inverted so that a direct connection can be made to external IrDA transceiver modules that use active high pulses.

The infrared submodule receives its clock sources from the LPUART. One of these two clocks are selected in the infrared submodule to generate either 1/OSR, 2/OSR, 3/OSR, or 4/OSR narrow pulses during transmission.

### 39.2.5.1 Infrared transmit encoder

The infrared transmit encoder converts serial bits of data from transmit shift register to the TXD signal. A narrow pulse is transmitted for a zero bit and no pulse for a one bit. The narrow pulse is sent at the start of the bit with a duration of 1/OSR, 2/OSR, 3/OSR, or 4/OSR of a bit time. A narrow low pulse is transmitted for a zero bit when LPUART\_CTRL[TXINV] is cleared, while a narrow high pulse is transmitted for a zero bit when LPUART\_CTRL[TXINV] is set.

### 39.2.5.2 Infrared receive decoder

The infrared receive block converts data from the RXD signal to the receive shift register. A narrow pulse is expected for each zero received and no pulse is expected for each one received. A narrow low pulse is expected for a zero bit when LPUART\_STAT[RXINV] is cleared, while a narrow high pulse is expected for a zero bit when LPUART\_STAT[RXINV] is set. This receive decoder meets the edge jitter requirement as defined by the IrDA serial infrared physical layer specification.

## 39.2.6 Interrupts and status flags

The LPUART transmitter has two status flags that can optionally generate hardware interrupt requests. Transmit data register empty LPUART\_STAT[TDRE]) indicates when there is room in the transmit data buffer to write another transmit character to LPUART\_DATA. If the transmit interrupt enable LPUART\_CTRL[TIE]) bit is set, a hardware interrupt is requested when LPUART\_STAT[TDRE] is set. Transmit complete

(LPUART\_STAT[TC]) indicates that the transmitter is finished transmitting all data, preamble, and break characters and is idle with TXD at the inactive level. This flag is often used in systems with modems to determine when it is safe to turn off the modem. If the transmit complete interrupt enable (LPUART\_CTRL[TCIE]) bit is set, a hardware interrupt is requested when LPUART\_STAT[TC] is set. Instead of hardware interrupts, software polling may be used to monitor the LPUART\_STAT[TDRE] and LPUART\_STAT[TC] status flags if the corresponding LPUART\_CTRL[TIE] or LPUART\_CTRL[TCIE] local interrupt masks are cleared.

When a program detects that the receive data register is full (LPUART\_STAT[RDRF] = 1), it gets the data from the receive data register by reading LPUART\_DATA. The LPUART\_STAT[RDRF] flag is cleared by reading LPUART\_DATA.

The IDLE status flag includes logic that prevents it from getting set repeatedly when the RXD line remains idle for an extended period of time. IDLE is cleared by writing 1 to the LPUART\_STAT[IDLE] flag. After LPUART\_STAT[IDLE] has been cleared, it cannot become set again until the receiver has received at least one new character and has set LPUART\_STAT[RDRF].

If the associated error was detected in the received character that caused LPUART\_STAT[RDRF] to be set, the error flags - noise flag (LPUART\_STAT[NF]), framing error (LPUART\_STAT[FE]), and parity error flag (LPUART\_STAT[PF]) - are set at the same time as LPUART\_STAT[RDRF]. These flags are not set in overrun cases.

If LPUART\_STAT[RDRF] was already set when a new character is ready to be transferred from the receive shifter to the receive data buffer, the overrun (LPUART\_STAT[OR]) flag is set instead of the data along with any associated NF, FE, or PF condition is lost.

If the received character matches the contents of MATCH[MA1] and/or MATCH[MA2] then the LPUART\_STAT[MA1F] and/or LPUART\_STAT[MA2F] flags are set at the same time that LPUART\_STAT[RDRF] is set.

At any time, an active edge on the RXD serial data input pin causes the LPUART\_STAT[RXEDGIF] flag to set. The LPUART\_STAT[RXEDGIF] flag is cleared by writing a 1 to it. This function depends on the receiver being enabled (LPUART\_CTRL[RE] = 1).

### **39.2.7 Peripheral Triggers**

The connection of the LPUART peripheral triggers with other peripherals are device specific.

### 39.2.7.1 Output Triggers

The LPUART generates three output triggers that can be connected to other peripherals on the device.

- The transmit word trigger asserts at the end of each transmitted word, it negates after one bit period.
- The receive word trigger asserts at the end of each received word that is written to the receive FIFO, for one oversampling clock period.
- The receive idle trigger asserts at when the idle flag would set, for one oversampling clock period.

### 39.2.7.2 Input Trigger

The LPUART supports one peripheral input trigger, that can be configured in one of the following ways.

- The input trigger can be connected in place of the CTS\_B pin input. The input trigger must assert for longer than one bit clock period when the transmitter is idle with data to send to guarantee a new transmission.
- The input trigger can modulate the transmit data output (trigger is logically ANDed with the TXD output). The input trigger is expected to be generated from a PWM source with a period that is less than the bit clock frequency.
- The input trigger can be connected in place of the RXD pin input. The input trigger is expected to be generated from a receive data source, such as analog comparator or external pin.

## 39.3 Register definition

The LPUART includes registers to control baud rate, select LPUART options, report LPUART status, and for transmit/receive data. Access to an address outside the valid memory map will generate a bus error.

### 39.3.1 LPUART register descriptions

### 39.3.1.1 LPUART Memory map

LPUART $n$  base address: 4018\_4000h + (n-1)×4000h, where  $n$  is from 1 to 8.

1-0 TRGSEL	Trigger Select Configures the input trigger usage. This field should only be changed when the transmitter and receiver are both disabled. 00b - Input trigger is disabled. 01b - Input trigger is used instead of RXD pin input. 10b - Input trigger is used instead of CTS_B pin input. 11b - Input trigger is used to modulate the TXD pin output. The TXD pin output (after TXINV configuration) is ANDed with the input trigger.

## 39.3.1.6 LPUART Baud Rate Register (BAUD)

### 39.3.1.6.1 Offset

Register	Offset
BAUD	10h

### 39.3.1.6.2 Diagram

### 39.3.1.6.3 Fields

Field	Function
31 MAEN1	Match Address Mode Enable 1 0b - Normal operation. 1b - Enables automatic address matching or data matching mode for MATCH[MA1].
30 MAEN2	Match Address Mode Enable 2 0b - Normal operation. 1b - Enables automatic address matching or data matching mode for MATCH[MA2].
29 M10	10-bit Mode select The M10 bit causes a tenth bit to be part of the serial transmission. This bit should only be changed when the transmitter and receiver are both disabled. 0b - Receiver and transmitter use 7-bit to 9-bit data characters. 1b - Receiver and transmitter use 10-bit data characters.
28-24 OSR	Oversampling Ratio This field configures the oversampling ratio for the receiver. This field should only be changed when the transmitter and receiver are both disabled. 00000b - Writing 0 to this field will result in an oversampling ratio of 16 00001b - Reserved 00010b - Reserved 00011b - Oversampling ratio of 4, requires BOTHEDGE to be set. 00100b - Oversampling ratio of 5, requires BOTHEDGE to be set. 00101b - Oversampling ratio of 6, requires BOTHEDGE to be set. 00110b - Oversampling ratio of 7, requires BOTHEDGE to be set. 00111b - Oversampling ratio of 8. 01000b - Oversampling ratio of 9. 01001b - Oversampling ratio of 10. 01010b - Oversampling ratio of 11. 01011b - Oversampling ratio of 12. 01100b - Oversampling ratio of 13. 01101b - Oversampling ratio of 14. 01110b - Oversampling ratio of 15. 01111b - Oversampling ratio of 16. 10000b - Oversampling ratio of 17.

Table continues on the next page...

## Register definition

Field	Function
	10001b - Oversampling ratio of 18. 10010b - Oversampling ratio of 19. 10011b - Oversampling ratio of 20. 10100b - Oversampling ratio of 21. 10101b - Oversampling ratio of 22. 10110b - Oversampling ratio of 23. 10111b - Oversampling ratio of 24. 11000b - Oversampling ratio of 25. 11001b - Oversampling ratio of 26. 11010b - Oversampling ratio of 27. 11011b - Oversampling ratio of 28. 11100b - Oversampling ratio of 29. 11101b - Oversampling ratio of 30. 11110b - Oversampling ratio of 31. 11111b - Oversampling ratio of 32.
23 TDMAE	<b>Transmitter DMA Enable</b> TDMAE configures the transmit data register empty flag, LPUART_STAT[TDRE], to generate a DMA request. 0b - DMA request disabled. 1b - DMA request enabled.
22 —	Reserved
21 RDMAE	<b>Receiver Full DMA Enable</b> RDMAE configures the receiver data register full flag, LPUART_STAT[RDRF], to generate a DMA request. 0b - DMA request disabled. 1b - DMA request enabled.
20 —	Reserved
19-18 MATCFG	<b>Match Configuration</b> Configures the match addressing mode used. This field should only be changed when the transmitter and receiver are both disabled. 00b - Address Match Wakeup 01b - Idle Match Wakeup 10b - Match On and Match Off 11b - Enables RWU on Data Match and Match On/Off for transmitter CTS input
17 BOTHEDGE	<b>Both Edge Sampling</b> Enables sampling of the received data on both edges of the baud rate clock, effectively doubling the number of times the receiver samples the input data for a given oversampling ratio. This bit must be set for oversampling ratios between x4 and x7 and is optional for higher oversampling ratios. This bit should only be changed when the receiver is disabled. 0b - Receiver samples input data using the rising edge of the baud rate clock. 1b - Receiver samples input data using the rising and falling edge of the baud rate clock.
16 RESYNCDIS	<b>Resynchronization Disable</b> When set, disables the resynchronization of the received data word when a data one followed by data zero transition is detected. This bit should only be changed when the receiver is disabled. 0b - Resynchronization during received data word is supported 1b - Resynchronization during received data word is disabled
15 LBKDIE	<b>LIN Break Detect Interrupt Enable</b> LBKDIE enables the LIN break detect flag, LBKDIF, to generate interrupt requests.

*Table continues on the next page...*

Field	Function
	0b - Hardware interrupts from LPUART_STAT[LBKDIF] disabled (use polling). 1b - Hardware interrupt requested when LPUART_STAT[LBKDIF] flag is 1.
14 RXEDGIE	RX Input Active Edge Interrupt Enable Enables the receive input active edge, RXEDGIF, to generate interrupt requests. Changing CTRL[LOOP] or CTRL[RSRC] when RXEDGIE is set can cause the RXEDGIF to set. 0b - Hardware interrupts from LPUART_STAT[RXEDGIF] disabled. 1b - Hardware interrupt requested when LPUART_STAT[RXEDGIF] flag is 1.
13 SBNS	Stop Bit Number Select SBNS determines whether data characters are one or two stop bits. This bit should only be changed when the transmitter and receiver are both disabled. 0b - One stop bit. 1b - Two stop bits.
12-0 SBR	Baud Rate Modulo Divisor. The 13 bits in SBR[12:0] set the modulo divide rate for the baud rate generator. When SBR is 1 - 8191, the baud rate equals "baud clock / ((OSR+1) × SBR)". The 13-bit baud rate setting [SBR12:SBR0] must only be updated when the transmitter and receiver are both disabled (LPUART_CTRL[RE] and LPUART_CTRL[TE] are both 0).

### 39.3.1.7 LPUART Status Register (STAT)

#### 39.3.1.7.1 Offset

Register	Offset
STAT	14h

#### 39.3.1.7.2 Diagram

### 39.3.1.7.3 Fields

Field	Function
31 LBKDIF	<p>LIN Break Detect Interrupt Flag</p> <p>LBKDIF is set when the LIN break detect circuitry is enabled and a LIN break character is detected. LBKDIF is cleared by writing a 1 to it.</p> <p>0b - No LIN break character has been detected. 1b - LIN break character has been detected.</p>
30 RXEDGIF	<p>RXD Pin Active Edge Interrupt Flag</p> <p>RXEDGIF is set whenever the receiver is enabled and an active edge, falling if RXINV = 0, rising if RXINV=1, on the RXD pin occurs. RXEDGIF is cleared by writing a 1 to it.</p> <p>0b - No active edge on the receive pin has occurred. 1b - An active edge on the receive pin has occurred.</p>
29 MSBF	<p>MSB First</p> <p>Setting this bit reverses the order of the bits that are transmitted and received on the wire. This bit does not affect the polarity of the bits, the location of the parity bit or the location of the start or stop bits. This bit should only be changed when the transmitter and receiver are both disabled.</p> <p>0b - LSB (bit0) is the first bit that is transmitted following the start bit. Further, the first bit received after the start bit is identified as bit0. 1b - MSB (bit9, bit8, bit7 or bit6) is the first bit that is transmitted following the start bit depending on the setting of CTRL[M], CTRL[PE] and BAUD[M10]. Further, the first bit received after the start bit is identified as bit9, bit8, bit7 or bit6 depending on the setting of CTRL[M] and CTRL[PE].</p>
28 RXINV	<p>Receive Data Inversion</p> <p>Setting this bit reverses the polarity of the received data input. This bit should only be changed when the receiver is disabled.</p> <p><b>NOTE:</b> Setting RXINV inverts the RXD input for all cases: data bits, start and stop bits, break, and idle.</p> <p>0b - Receive data not inverted. 1b - Receive data inverted.</p>
27 RWUID	<p>Receive Wake Up Idle Detect</p> <p>For RWU on idle character, RWUID controls whether the idle character that wakes up the receiver sets the IDLE bit. For address match wakeup, RWUID controls if the IDLE bit is set when the address does not match. This bit should only be changed when the receiver is disabled.</p> <p>0b - During receive standby state (RWU = 1), the IDLE bit does not get set upon detection of an idle character. During address match wakeup, the IDLE bit does not set when an address does not match. 1b - During receive standby state (RWU = 1), the IDLE bit gets set upon detection of an idle character. During address match wakeup, the IDLE bit does set when an address does not match.</p>
26 BRK13	<p>Break Character Generation Length</p> <p>BRK13 selects a longer transmitted break character length. Detection of a framing error is not affected by the state of this bit. This bit should only be changed when the transmitter is disabled. A break character can be sent by setting CTRL[SBK] or by writing the transmit FIFO with DATA[FRETSC] set and DATA[R9T9] clear.</p> <p>0b - Break character is transmitted with length of 9 to 13 bit times. 1b - Break character is transmitted with length of 12 to 15 bit times.</p>
25 LBKDE	<p>LIN Break Detection Enable</p> <p>LBKDE selects a longer break character detection length. While LBKDE is set, receive data is not stored in the receive data buffer.</p> <p>0b - LIN break detect is disabled, normal break character can be detected.</p>

*Table continues on the next page...*

Field	Function
	1b - LIN break detect is enabled. LIN break character is detected at length of 11 bit times (if M = 0) or 12 (if M = 1) or 13 (M10 = 1).
24 RAF	Receiver Active Flag RAF is set when the receiver detects the beginning of a valid start bit, and RAF is cleared automatically when the receiver detects an idle line. 0b - LPUART receiver idle waiting for a start bit. 1b - LPUART receiver active (RXD input not idle).
23 TDRE	Transmit Data Register Empty Flag When the transmit FIFO is enabled, TDRE will set when the number of datawords in the transmit FIFO (LPUART_DATA) is equal to or less than the number indicated by LPUART_WATER[TXWATER]. To clear TDRE, write to the LPUART data register (LPUART_DATA) until the number of words in the transmit FIFO is greater than the number indicated by LPUART_WATER[TXWATER]. When the transmit FIFO is disabled, TDRE will set when the transmit data register (LPUART_DATA) is empty. To clear TDRE, write to the LPUART data register (LPUART_DATA). TDRE is not affected by a character that is in the process of being transmitted, it is updated at the start of each transmitted character. 0b - Transmit data buffer full. 1b - Transmit data buffer empty.
22 TC	Transmission Complete Flag TC is cleared when there is a transmission in progress or when a preamble or break character is loaded. TC is set when the transmit buffer is empty and no data, preamble, or break character is being transmitted. When TC is set, the transmit data output signal becomes idle (logic 1). TC is cleared by writing to LPUART_DATA to transmit new data, queuing a preamble by clearing and then setting LPUART_CTRL[TE], queuing a break character by writing 1 to LPUART_CTRL[SBK]. 0b - Transmitter active (sending data, a preamble, or a break). 1b - Transmitter idle (transmission activity complete).
21 RDRF	Receive Data Register Full Flag When the receive FIFO is enabled, RDRF is set when the number of datawords in the receive buffer is greater than the number indicated by LPUART_WATER[RXWATER]. To clear RDRF, read LPUART_DATA until the number of datawords in the receive data buffer is equal to or less than the number indicated by LPUART_WATER[RXWATER]. When the receive FIFO is disabled, RDRF is set when the receive buffer (LPUART_DATA) is full. To clear RDRF, read the LPUART_DATA register. A character that is in the process of being received does not cause a change in RDRF until the entire character is received. Even if RDRF is set, the character will continue to be received until an overrun condition occurs once the entire character is received. 0b - Receive data buffer empty. 1b - Receive data buffer full.
20 IDLE	Idle Line Flag IDLE is set when the LPUART receive line becomes idle for a full character time after a period of activity. When ILT is cleared, the receiver starts counting idle bit times after the start bit. If the receive character is all 1s, these bit times and the stop bits time count toward the full character time of logic high, 10 to 13 bit times, needed for the receiver to detect an idle line. When ILT is set, the receiver doesn't start counting idle bit times until after the stop bits. The stop bits and any logic high bit times at the end of the previous character do not count toward the full character time of logic high needed for the receiver to detect an idle line. To clear IDLE, write logic 1 to the IDLE flag. After IDLE has been cleared, it cannot become set again until after a new character has been stored in the receive buffer or a LIN break character has set the LBKDIF flag. IDLE is set only once even if the receive line remains idle for an extended period. 0b - No idle line detected. 1b - Idle line was detected.

*Table continues on the next page...*

## Register definition

Field	Function
19 OR	<p>Receiver Overrun Flag</p> <p>OR is set when software fails to prevent the receive data register from overflowing with data. The OR bit is set immediately after the stop bit has been completely received for the dataword that overflows the buffer and all the other error flags (FE, NF, and PF) are prevented from setting. The data in the shift register is lost, but the data already in the LPUART data registers is not affected. If LBKDE is enabled and a LIN Break is detected, the OR field asserts if LBKDIF is not cleared before the next data character is received.</p> <p>While the OR flag is set, no additional data is stored in the data buffer even if sufficient room exists. To clear OR, write logic 1 to the OR flag.</p> <p>0b - No overrun. 1b - Receive overrun (new LPUART data lost).</p>
18 NF	<p>Noise Flag</p> <p>The advanced sampling technique used in the receiver takes three samples in each of the received bits. If any of these samples disagrees with the rest of the samples within any bit time in the frame then noise is detected for that character. NF is set whenever the next character to be read from LPUART_DATA was received with noise detected within the character. To clear NF, write logic one to the NF.</p> <p>0b - No noise detected. 1b - Noise detected in the received character in LPUART_DATA.</p>
17 FE	<p>Framing Error Flag</p> <p>FE is set whenever the next character to be read from LPUART_DATA was received with logic 0 detected where a stop bit was expected. To clear FE, write logic one to the FE.</p> <p>0b - No framing error detected. This does not guarantee the framing is correct. 1b - Framing error.</p>
16 PF	<p>Parity Error Flag</p> <p>PF is set whenever the next character to be read from LPUART_DATA was received when parity is enabled (PE = 1) and the parity bit in the received character does not agree with the expected parity value. To clear PF, write a logic one to the PF.</p> <p>0b - No parity error. 1b - Parity error.</p>
15 MA1F	<p>Match 1 Flag</p> <p>MA1F is set whenever the next character to be read from LPUART_DATA matches MA1. To clear MA1F, write a logic one to the MA1F.</p> <p>0b - Received data is not equal to MA1 1b - Received data is equal to MA1</p>
14 MA2F	<p>Match 2 Flag</p> <p>MA2F is set whenever the next character to be read from LPUART_DATA matches MA2. To clear MA2F, write a logic one to the MA2F.</p> <p>0b - Received data is not equal to MA2 1b - Received data is equal to MA2</p>
13-0 —	Reserved

### 39.3.1.8 LPUART Control Register (CTRL)

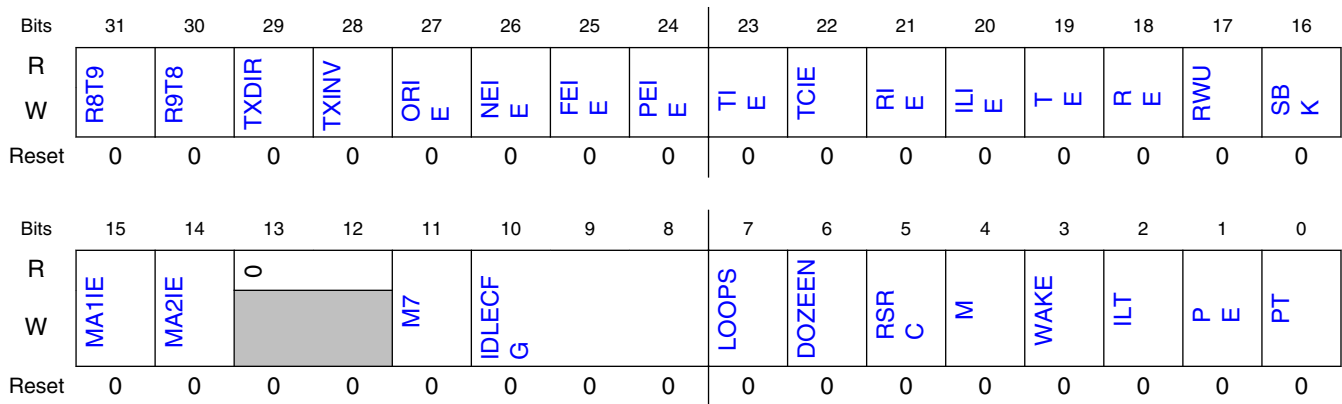

### 39.3.1.8.1 Offset

Register	Offset
CTRL	18h

### 39.3.1.8.2 Function

This read/write register controls various optional features of the LPUART system. This register should only be altered when the transmitter and receiver are both disabled.

### 39.3.1.8.3 Diagram

### 39.3.1.8.4 Fields

Field	Function
31 R8T9	Receive Bit 8 / Transmit Bit 9 R8 is the ninth data bit received when the LPUART is configured for 9-bit or 10-bit data formats. When reading 9-bit or 10-bit data, read R8 before reading LPUART_DATA. T9 is the tenth data bit received when the LPUART is configured for 10-bit data formats. When writing 10-bit data, write T9 before writing LPUART_DATA. If T9 does not need to change from its previous value, such as when it is used to generate address mark or parity, they it need not be written each time LPUART_DATA is written. <b>NOTE:</b> R8 is a read-only bit and T9 is a write-only bit, the value read is different from the value written.
30 R9T8	Receive Bit 9 / Transmit Bit 8 R9 is the tenth data bit received when the LPUART is configured for 10-bit data formats. When reading 10-bit data, read R9 before reading LPUART_DATA T8 is the ninth data bit received when the LPUART is configured for 9-bit or 10-bit data formats. When writing 9-bit or 10-bit data, write T8 before writing LPUART_DATA. If T8 does not need to change from its previous value, such as when it is used to generate address mark or parity, they it need not be written each time LPUART_DATA is written.

Table continues on the next page...

## Register definition

Field	Function
	<b>NOTE:</b> R9 is a read-only bit and T8 is a write-only bit, the value read is different from the value written.
29 TXDIR	TXD Pin Direction in Single-Wire Mode When the LPUART is configured for single-wire half-duplex operation (LOOPS = RSRC = 1), this bit determines the direction of data at the TXD pin. When clearing TXDIR, the transmitter will finish receiving the current character (if any) before the receiver starts receiving data from the TXD pin. 0b - TXD pin is an input in single-wire mode. 1b - TXD pin is an output in single-wire mode.
28 TXINV	Transmit Data Inversion Setting this bit reverses the polarity of the transmitted data output. <b>NOTE:</b> Setting TXINV inverts the TXD output for all cases: data bits, start and stop bits, break, and idle. 0b - Transmit data not inverted. 1b - Transmit data inverted.
27 ORIE	Overrun Interrupt Enable This bit enables the overrun flag (OR) to generate hardware interrupt requests. 0b - OR interrupts disabled; use polling. 1b - Hardware interrupt requested when OR is set.
26 NEIE	Noise Error Interrupt Enable This bit enables the noise flag (NF) to generate hardware interrupt requests. 0b - NF interrupts disabled; use polling. 1b - Hardware interrupt requested when NF is set.
25 FEIE	Framing Error Interrupt Enable This bit enables the framing error flag (FE) to generate hardware interrupt requests. 0b - FE interrupts disabled; use polling. 1b - Hardware interrupt requested when FE is set.
24 PEIE	Parity Error Interrupt Enable This bit enables the parity error flag (PF) to generate hardware interrupt requests. 0b - PF interrupts disabled; use polling. 1b - Hardware interrupt requested when PF is set.
23 TIE	Transmit Interrupt Enable Enables STAT[TDRE] to generate interrupt requests. 0b - Hardware interrupts from TDRE disabled; use polling. 1b - Hardware interrupt requested when TDRE flag is 1.
22 TCIE	Transmission Complete Interrupt Enable for TCIE enables the transmission complete flag, TC, to generate interrupt requests. 0b - Hardware interrupts from TC disabled; use polling. 1b - Hardware interrupt requested when TC flag is 1.
21 RIE	Receiver Interrupt Enable Enables STAT[RDRF] to generate interrupt requests. 0b - Hardware interrupts from RDRF disabled; use polling. 1b - Hardware interrupt requested when RDRF flag is 1.
20 ILIE	Idle Line Interrupt Enable ILIE enables the idle line flag, STAT[IDLE], to generate interrupt requests. 0b - Hardware interrupts from IDLE disabled; use polling. 1b - Hardware interrupt requested when IDLE flag is 1.
19 TE	Transmitter Enable

*Table continues on the next page...*

Field	Function
	<p>Enables the LPUART transmitter. TE can also be used to queue an idle preamble by clearing and then setting TE. When TE is cleared, this register bit will read as 1 until the transmitter has completed the current character and the TXD pin is tristated.</p> <p>A single idle character can also be queued by writing to the transmit FIFO with DATA[FRETSC] set and DATA[R9T9] set.</p> <p>0b - Transmitter disabled. 1b - Transmitter enabled.</p>
18 RE	<p>Receiver Enable</p> <p>Enables the LPUART receiver. When RE is written to 0, this register bit will read as 1 until the receiver finishes receiving the current character (if any).</p> <p>0b - Receiver disabled. 1b - Receiver enabled.</p>
17 RWU	<p>Receiver Wakeup Control</p> <p>This field can be set to place the LPUART receiver in a standby state. RWU automatically clears when an RWU event occurs, that is, an IDLE event when CTRL[WAKE] is clear or an address match when CTRL[WAKE] is set with STAT[RWUID] is clear.</p> <p><b>NOTE:</b> RWU must be set only with CTRL[WAKE] = 0 (wakeup on idle) if the channel is currently not idle. This can be determined by STAT[RAF]. If the flag is set to wake up an IDLE event and the channel is already idle, it is possible that the LPUART will discard data. This is because the data must be received or a LIN break detected after an IDLE is detected before IDLE is allowed to be reasserted.</p> <p>0b - Normal receiver operation. 1b - LPUART receiver in standby waiting for wakeup condition.</p>
16 SBK	<p>Send Break</p> <p>Writing a 1 and then a 0 to SBK queues a break character in the transmit data stream. Additional break characters of 9 to 13 bits, or 12 to 15 bits if LPUART_STAT[BRK13] is set, bit times of logic 0 are queued as long as SBK is set. Depending on the timing of the set and clear of SBK relative to the character currently being transmitted, a second break character may be queued before software clears SBK.</p> <p>A single break character can also be queued by writing to the transmit FIFO with DATA[FRETSC] set and DATA[R9T9] clear.</p> <p>0b - Normal transmitter operation. 1b - Queue break character(s) to be sent.</p>
15 MA1IE	<p>Match 1 Interrupt Enable</p> <p>0b - MA1F interrupt disabled 1b - MA1F interrupt enabled</p>
14 MA2IE	<p>Match 2 Interrupt Enable</p> <p>0b - MA2F interrupt disabled 1b - MA2F interrupt enabled</p>
13-12 —	Reserved
11 M7	<p>7-Bit Mode Select</p> <p>This bit should only be changed when the transmitter and receiver are both disabled.</p> <p>0b - Receiver and transmitter use 8-bit to 10-bit data characters. 1b - Receiver and transmitter use 7-bit data characters.</p>
10-8 IDLECFG	<p>Idle Configuration</p> <p>Configures the number of idle characters that must be received before the IDLE flag is set.</p> <p>000b - 1 idle character 001b - 2 idle characters</p>

Table continues on the next page...

## Register definition

Field	Function
	010b - 4 idle characters 011b - 8 idle characters 100b - 16 idle characters 101b - 32 idle characters 110b - 64 idle characters 111b - 128 idle characters
7 LOOPS	<b>Loop Mode Select</b> When LOOPS is set, the RXD pin is disconnected from the LPUART and the transmitter output is internally connected to the receiver input. The transmitter and the receiver must be enabled to use the loop function. 0b - Normal operation - RXD and TXD use separate pins. 1b - Loop mode or single-wire mode where transmitter outputs are internally connected to receiver input (see RSRC bit).
6 DOZEEN	<b>Doze Enable</b> 0b - LPUART is enabled in Doze mode. 1b - LPUART is disabled in Doze mode.
5 RSRC	<b>Receiver Source Select</b> This field has no meaning or effect unless the LOOPS field is set. When LOOPS is set, the RSRC field determines the source for the receiver shift register input. 0b - Provided LOOPS is set, RSRC is cleared, selects internal loop back mode and the LPUART does not use the RXD pin. 1b - Single-wire LPUART mode where the TXD pin is connected to the transmitter output and receiver input.
4 M	<b>9-Bit or 8-Bit Mode Select</b> 0b - Receiver and transmitter use 8-bit data characters. 1b - Receiver and transmitter use 9-bit data characters.
3 WAKE	<b>Receiver Wakeup Method Select</b> Determines which condition wakes the LPUART when RWU=1: <ul style="list-style-type: none"> <li>Address mark in the bit preceding the stop bit (or bit preceding the parity bit when parity is enabled) of the received data character, or</li> <li>An idle condition on the receive pin input signal.</li> </ul> 0b - Configures RWU for idle-line wakeup. 1b - Configures RWU with address-mark wakeup.
2 ILT	<b>Idle Line Type Select</b> Determines when the receiver starts counting logic 1s as idle character bits. The count begins either after a valid start bit or after the stop bit. If the count begins after the start bit, then a string of logic 1s preceding the stop bit can cause false recognition of an idle character. Beginning the count after the stop bit avoids false idle character recognition, but requires properly synchronized transmissions. <b>NOTE:</b> In case the LPUART is programmed with ILT = 1, a logic 0 is automatically shifted after a received stop bit, therefore resetting the idle count. 0b - Idle character bit count starts after start bit. 1b - Idle character bit count starts after stop bit.
1 PE	<b>Parity Enable</b> Enables hardware parity generation and checking. When parity is enabled, the bit immediately before the stop bit is treated as the parity bit. 0b - No hardware parity generation or checking. 1b - Parity enabled.
0 PT	<b>Parity Type</b>

Field	Function
	Provided parity is enabled (PE = 1), this bit selects even or odd parity. Odd parity means the total number of 1s in the data character, including the parity bit, is odd. Even parity means the total number of 1s in the data character, including the parity bit, is even. 0b - Even parity. 1b - Odd parity.

### 39.3.1.9 LPUART Data Register (DATA)

#### 39.3.1.9.1 Offset

Register	Offset
DATA	1Ch

#### 39.3.1.9.2 Function

#### NOTE

This register is two separate registers. Reads return the contents of the read-only receive data buffer and writes go to the write-only transmit data buffer.

Reads and writes of this register are also involved in the automatic flag clearing mechanisms for some of the LPUART status flags.

#### 39.3.1.9.3 Diagram

**39.3.1.9.4 Fields**

Field	Function
31-16 —	Reserved
15 NOISY	NOISY The current received dataword contained in DATA[R9:R0] was received with noise. 0b - The dataword was received without noise. 1b - The data was received with noise.
14 PARITYE	PARITYE The current received dataword contained in DATA[R9:R0] was received with a parity error. 0b - The dataword was received without a parity error. 1b - The dataword was received with a parity error.
13 FRETSC	Frame Error / Transmit Special Character For reads, indicates the current received dataword contained in DATA[R9:R0] was received with a frame error. For writes, indicates a break or idle character is to be transmitted instead of the contents in DATA[T9:T0]. T9 is used to indicate a break character when 0 and a idle character when 1, the contents of DATA[T8:T0] should be zero. 0b - The dataword was received without a frame error on read, or transmit a normal character on write. 1b - The dataword was received with a frame error, or transmit an idle or break character on transmit.
12 RXEMPT	Receive Buffer Empty Asserts when there is no data in the receive buffer. This field does not take into account data that is in the receive shift register. 0b - Receive buffer contains valid data. 1b - Receive buffer is empty, data returned on read is not valid.
11 IDLINE	Idle Line Indicates the receiver line was idle before receiving the character in DATA[9:0]. Unlike the IDLE flag, this bit can set for the first character received when the receiver is first enabled. 0b - Receiver was not idle before receiving this character. 1b - Receiver was idle before receiving this character.
10 —	Reserved
9 R9T9	R9T9 Read receive data buffer 9 or write transmit data buffer 9.
8 R8T8	R8T8 Read receive data buffer 8 or write transmit data buffer 8.
7 R7T7	R7T7 Read receive data buffer 7 or write transmit data buffer 7.
6 R6T6	R6T6 Read receive data buffer 6 or write transmit data buffer 6.
5 R5T5	R5T5 Read receive data buffer 5 or write transmit data buffer 5.
4 R4T4	R4T4 Read receive data buffer 4 or write transmit data buffer 4.

*Table continues on the next page...*

Field	Function
3 R3T3	R3T3 Read receive data buffer 3 or write transmit data buffer 3.
2 R2T2	R2T2 Read receive data buffer 2 or write transmit data buffer 2.
1 R1T1	R1T1 Read receive data buffer 1 or write transmit data buffer 1.
0 R0T0	R0T0 Read receive data buffer 0 or write transmit data buffer 0.

### 39.3.1.10 LPUART Match Address Register (MATCH)

#### 39.3.1.10.1 Offset

Register	Offset
MATCH	20h

#### 39.3.1.10.2 Diagram

#### 39.3.1.10.3 Fields

Field	Function
31-26 —	Reserved
25-16 MA2	Match Address 2

Table continues on the next page...

## Register definition

Field	Function
	The MA1 and MA2 registers are compared to input data addresses when the most significant bit is set and the associated BAUD[MAEN] bit is set. If a match occurs, the following data is transferred to the data register. If a match fails, the following data is discarded. Software should only write a MA register when the associated BAUD[MAEN] bit is clear.
15-10 —	Reserved
9-0 MA1	Match Address 1 The MA1 and MA2 registers are compared to input data addresses when the most significant bit is set and the associated BAUD[MAEN] bit is set. If a match occurs, the following data is transferred to the data register. If a match fails, the following data is discarded. Software should only write a MA register when the associated BAUD[MAEN] bit is clear.

### 39.3.1.11 LPUART Modem IrDA Register (MODIR)

#### 39.3.1.11.1 Offset

Register	Offset
MODIR	24h

#### 39.3.1.11.2 Function

The MODEM register controls options for setting the modem configuration.

#### 39.3.1.11.3 Diagram

## 39.3.1.11.4 Fields

Field	Function
31-19 —	Reserved
18 IREN	Infrared enable Enables/disables the infrared modulation/demodulation. This bit should only be changed when the transmitter and receiver are both disabled. 0b - IR disabled. 1b - IR enabled.
17-16 TNP	Transmitter narrow pulse Configures whether the LPUART transmits a 1/OSR, 2/OSR, 3/OSR or 4/OSR narrow pulse when IR is enabled. This bit should only be changed when the transmitter and receiver are both disabled.  The IR pulse width should be configured to less than half of the oversampling ratio. Common pulse widths are 3/16, 1/16, 1/32 or 1/4 of the bit length. These can be configured by selecting the appropriate oversample ratio and pulse width.  00b - 1/OSR. 01b - 2/OSR. 10b - 3/OSR. 11b - 4/OSR.
15-10 —	Reserved
9-8 RTSWATER	Receive RTS Configuration Configures the assertion and negation of the RX RTS_B output. The RX RTS_B output negates when the number of empty words in the receive FIFO is greater or equal to RTSWATER. If RTSWATER is configured to zero, RTS_B negates when the receive FIFO is full. For the purpose of RX RTS_B generation, the number of words in the receive FIFO updates when a start bit is detected. This supports additional latency between RTS_B negation and the external transmitter ceasing transmission. If both RX RTS_B and address/data matching is enabled, then RTS_B could assert at the end of a character if there is not a match.  This field should only be changed when the receiver is disabled.
7-6 —	Reserved
5 TXCTSSRC	Transmit CTS Source Configures the source of the CTS input. 0b - CTS input is the CTS_B pin. 1b - CTS input is the inverted Receiver Match result.
4 TXCTSC	Transmit CTS Configuration Configures if the CTS state is checked at the start of each character or only when the transmitter is idle. 0b - CTS input is sampled at the start of each character. 1b - CTS input is sampled when the transmitter is idle.
3 RXRTSE	Receiver request-to-send enable Allows the RTS output to control the CTS input of the transmitting device to prevent receiver overrun. This bit should only be changed when the receiver is disabled.  <b>NOTE:</b> Do not set both RXRTSE and TXRTSE. 0b - The receiver has no effect on RTS.

*Table continues on the next page...*

## Register definition

Field	Function
	1b - RTS is deasserted if the receiver data register is full or a start bit has been detected that would cause the receiver data register to become full. RTS is asserted if the receiver data register is not full and has not detected a start bit that would cause the receiver data register to become full.
2 TXRTSPOL	Transmitter request-to-send polarity Controls the polarity of the transmitter RTS. TXRTSPOL does not affect the polarity of the receiver RTS. RTS will remain negated in the active low state unless TXRTSE is set. This bit should only be changed when the transmitter is disabled. 0b - Transmitter RTS is active low. 1b - Transmitter RTS is active high.
1 TXRTSE	Transmitter request-to-send enable Controls RTS before and after a transmission. This bit should only be changed when the transmitter is disabled. 0b - The transmitter has no effect on RTS. 1b - When a character is placed into an empty transmitter data buffer , RTS asserts one bit time before the start bit is transmitted. RTS deasserts one bit time after all characters in the transmitter data buffer and shift register are completely sent, including the last stop bit.
0 TXCTSE	Transmitter clear-to-send enable TXCTSE controls the operation of the transmitter. TXCTSE can be set independently from the state of TXRTSE and RXRTSE. 0b - CTS has no effect on the transmitter. 1b - Enables clear-to-send operation. The transmitter checks the state of CTS each time it is ready to send a character. If CTS is asserted, the character is sent. If CTS is deasserted, the signal TXD remains in the mark state and transmission is delayed until CTS is asserted. Changes in CTS as a character is being sent do not affect its transmission.

### 39.3.1.12 LPUART FIFO Register (FIFO)

#### 39.3.1.12.1 Offset

Register	Offset
FIFO	28h

#### 39.3.1.12.2 Function

This register provides the ability for the programmer to turn on and off FIFO functionality. It also provides the size of the FIFO that has been implemented. This register may be read at any time. This register must be written only when CTRL[RE] and CTRL[TE] are cleared/not set and when the data buffer/FIFO is empty.

### 39.3.1.12.3 Diagram

### 39.3.1.12.4 Fields

Field	Function
31-24 —	Reserved
23 TXEMPT	Transmit Buffer/FIFO Empty Asserts when there is no data in the Transmit FIFO/buffer. This field does not take into account data that is in the transmit shift register. 0b - Transmit buffer is not empty. 1b - Transmit buffer is empty.
22 RXEMPT	Receive Buffer/FIFO Empty Asserts when there is no data in the receive FIFO/Buffer. This field does not take into account data that is in the receive shift register. 0b - Receive buffer is not empty. 1b - Receive buffer is empty.
21-18 —	Reserved
17 TXOF	Transmitter Buffer Overflow Flag Indicates that more data has been written to the transmit buffer than it can hold. This field will assert regardless of the value of TXOFE. However, an interrupt will be issued to the host only if TXOFE is set. This flag is cleared by writing a 1. 0b - No transmit buffer overflow has occurred since the last time the flag was cleared. 1b - At least one transmit buffer overflow has occurred since the last time the flag was cleared.
16	Receiver Buffer Underflow Flag

Table continues on the next page...

## Register definition

Field	Function
RXUF	Indicates that more data has been read from the receive buffer than was present. This field will assert regardless of the value of RXUFE. However, an interrupt will be issued to the host only if RXUFE is set. This flag is cleared by writing a 1. 0b - No receive buffer underflow has occurred since the last time the flag was cleared. 1b - At least one receive buffer underflow has occurred since the last time the flag was cleared.
15 TXFLUSH	Transmit FIFO/Buffer Flush Writing to this field causes all data that is stored in the transmit FIFO/buffer to be flushed. This does not affect data that is in the transmit shift register. 0b - No flush operation occurs. 1b - All data in the transmit FIFO/Buffer is cleared out.
14 RXFLUSH	Receive FIFO/Buffer Flush Writing to this field causes all data that is stored in the receive FIFO/buffer to be flushed. This does not affect data that is in the receive shift register. 0b - No flush operation occurs. 1b - All data in the receive FIFO/buffer is cleared out.
13 —	Reserved
12-10 RXIDEN	Receiver Idle Empty Enable When set, enables the assertion of RDRF when the receiver is idle for a number of idle characters and the FIFO is not empty. 000b - Disable RDRF assertion due to partially filled FIFO when receiver is idle. 001b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 1 character. 010b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 2 characters. 011b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 4 characters. 100b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 8 characters. 101b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 16 characters. 110b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 32 characters. 111b - Enable RDRF assertion due to partially filled FIFO when receiver is idle for 64 characters.
9 TXOFE	Transmit FIFO Overflow Interrupt Enable When this field is set, the TXOF flag generates an interrupt to the host. 0b - TXOF flag does not generate an interrupt to the host. 1b - TXOF flag generates an interrupt to the host.
8 RXUFE	Receive FIFO Underflow Interrupt Enable When this field is set, the RXUF flag generates an interrupt to the host. 0b - RXUF flag does not generate an interrupt to the host. 1b - RXUF flag generates an interrupt to the host.
7 TXFE	Transmit FIFO Enable When this field is set, the built in FIFO structure for the transmit buffer is enabled. The size of the FIFO structure is indicated by TXFIFOSIZE. If this field is not set, the transmit buffer operates as a FIFO of depth one dataword regardless of the value in TXFIFOSIZE. Both CTRL[TE] and CTRL[RE] must be cleared prior to changing this field. 0b - Transmit FIFO is not enabled. Buffer is depth 1. (Legacy support). 1b - Transmit FIFO is enabled. Buffer is depth indicated by TXFIFOSIZE.
6-4 TXFIFOSIZE	Transmit FIFO. Buffer Depth The maximum number of transmit datawords that can be stored in the transmit buffer. This field is read only. 000b - Transmit FIFO/Buffer depth = 1 dataword. 001b - Transmit FIFO/Buffer depth = 4 datawords. 010b - Transmit FIFO/Buffer depth = 8 datawords. 011b - Transmit FIFO/Buffer depth = 16 datawords.

*Table continues on the next page...*

Field	Function
	100b - Transmit FIFO/Buffer depth = 32 datawords. 101b - Transmit FIFO/Buffer depth = 64 datawords. 110b - Transmit FIFO/Buffer depth = 128 datawords. 111b - Transmit FIFO/Buffer depth = 256 datawords
3  RXFE	Receive FIFO Enable  When this field is set, the built in FIFO structure for the receive buffer is enabled. The size of the FIFO structure is indicated by the RXFIFOSIZE field. If this field is not set, the receive buffer operates as a FIFO of depth one dataword regardless of the value in RXFIFOSIZE. Both CTRL[TE] and CTRL[RE] must be cleared prior to changing this field. 0b - Receive FIFO is not enabled. Buffer is depth 1. (Legacy support) 1b - Receive FIFO is enabled. Buffer is depth indicted by RXFIFOSIZE.
2-0  RXFIFOSIZE	Receive FIFO. Buffer Depth  The maximum number of receive datawords that can be stored in the receive buffer before an overrun occurs. This field is read only. 000b - Receive FIFO/Buffer depth = 1 dataword. 001b - Receive FIFO/Buffer depth = 4 datawords. 010b - Receive FIFO/Buffer depth = 8 datawords. 011b - Receive FIFO/Buffer depth = 16 datawords. 100b - Receive FIFO/Buffer depth = 32 datawords. 101b - Receive FIFO/Buffer depth = 64 datawords. 110b - Receive FIFO/Buffer depth = 128 datawords. 111b - Receive FIFO/Buffer depth = 256 datawords.

### 39.3.1.13 LPUART Watermark Register (WATER)

#### 39.3.1.13.1 Offset

Register	Offset
WATER	2Ch

#### 39.3.1.13.2 Function

This register provides the ability to set a programmable threshold for notification of needing additional transmit data. This register may be read at any time but must be written only when CTRL[TE] is not set.

### 39.3.1.13.3 Diagram

### 39.3.1.13.4 Fields

Field	Function
31-27 —	Reserved
26-24 RXCOUNT	Receive Counter The value in this register indicates the number of datawords that are in the receive FIFO/buffer. If a dataword is being received, that is, in the receive shift register, it is not included in the count. This value may be used in conjunction with FIFO[RXFIFOSIZE] to calculate how much room is left in the receive FIFO/buffer.
23-18 —	Reserved
17-16 RXWATER	Receive Watermark When the number of datawords in the receive FIFO/buffer is greater than the value in this register field, an interrupt or a DMA request is generated. For proper operation, the value in RXWATER must be set to be less than the receive FIFO/buffer size as indicated by FIFO[RXFIFOSIZE] and FIFO[RXFE] and must be greater than 0.
15-11 —	Reserved
10-8 TXCOUNT	Transmit Counter The value in this register indicates the number of datawords that are in the transmit FIFO/buffer. If a dataword is being transmitted, that is, in the transmit shift register, it is not included in the count. This value may be used in conjunction with FIFO[TXFIFOSIZE] to calculate how much room is left in the transmit FIFO/buffer.
7-2 —	Reserved
1-0	Transmit Watermark

Field	Function
TXWATER	When the number of datawords in the transmit FIFO/buffer is equal to or less than the value in this register field, an interrupt or a DMA request is generated. For proper operation, the value in TXWATER must be set to be less than the size of the transmit buffer/FIFO size as indicated by FIFO[TXFIFOSIZE] and FIFO[TXFE].

# Chapter 40

## Medium Quality Sound (MQS)

### 40.1 Overview

Medium quality sound (MQS) is used to generate medium quality audio via a standard GPIO in the pinmux, allowing the user to connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

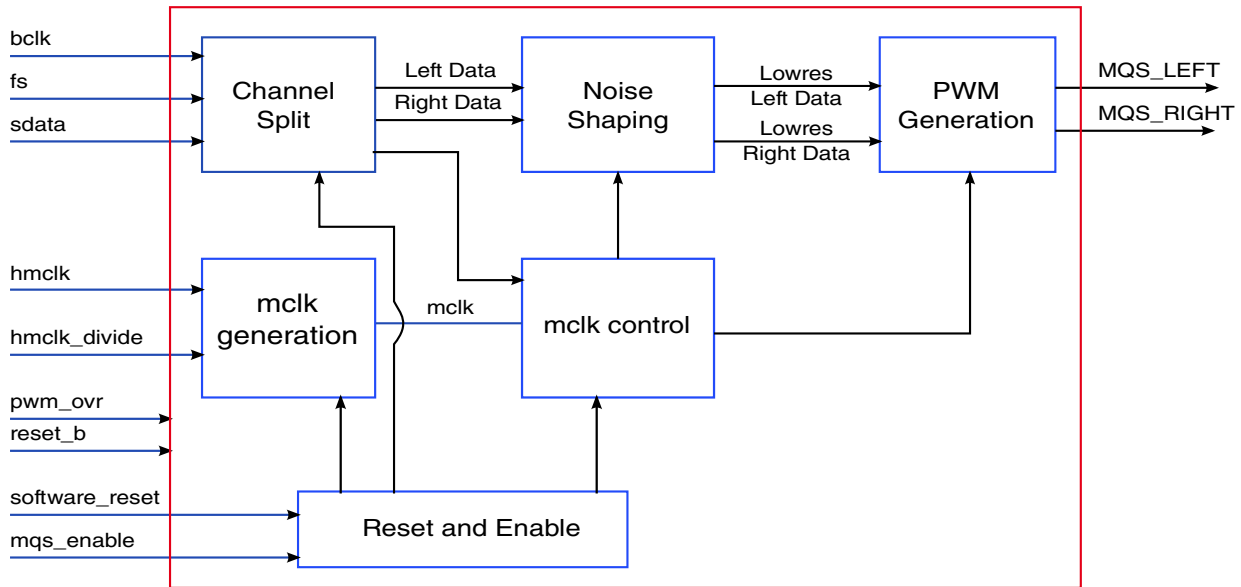

MQS accepts the following inputs:

- 2-channel, LSB-valid 16-bit, MSB shift-out first serial data (sdata)
- Frame sync asserting with the first bit of the frame (fs)
- Bit clock used to shift data out on the positive clock edge (bclk)

The 44 kHz or 48 kHz input signals from SAI3 are in left\_justified format. MQS provides the SNR target as no more than 20 dB for the signals below 10 kHz. The signals above 10 kHz will have worse THD+N values.

MQS provides only simple audio reproduction. No internal pop, click or distortion artifact reduction methods are provided.

#### 40.1.1 Block Diagram

**Figure 40-1. Block Diagram**

MQS has the following sub-modules:

1. Channel Split: Splits the I2S signals into separate left channel and right channel audio data.
2. Noise Shaping: Uses the sigma-delta algorithm to generate low-resolution, very high sampling audio, while the audio sampling rate is increased.
3. PWM generation: Generates the bit stream to the GPIO, which is then used to drive the amplifier and then to drive the external speakers or headphones.
4. mclk generation: Used to generate the master clock (mclk). The frequency of mclk is determined by the final bit duration of PWM generation module.
5. mclk control: Used as a metronome to co-ordinate the different functional blocks working synchronously.
6. Reset and Enable: Used to generate the reset and enable logic to different clock domains.

## 40.2 External Signals

The following table describes the external signals of MQS:

**Table 40-1. MQS External Signals**

Signal	Description	Pad	Mode	Direction
MQS_RIGHT	Right signal output	GPIO_AD_B0_04	ALT1	O
		GPIO_B0_00	ALT2	

*Table continues on the next page...*

Table 40-1. MQS External Signals (continued)

Signal	Description	Pad	Mode	Direction
MQS_LEFT	Left signal output	GPIO_EMC_13	ALT3	O
		GPIO_EMC_14	ALT3	
		GPIO_B0_01	ALT2	
		GPIO_AD_B0_05	ALT1	

### 40.3 Interface Signals

MQS module has the following interface signals.

Signal Name	In/Out	BitWidth	Description	Comments
reset_b	In	1	asynchronous reset	
software_reset	In	1	Software reset	From GPR
mqs_enable	In	1	module enable	From GPR
pwm_ovr	In	1	PWM oversampling ratio1—64, 0--32	From GPR
hmclk	In	1	Maximum bit clock, used to generate the mclk, divider ratio is controlled by mqs_hmclk_divide	Max 66.5MHzTypical 24.576MHz
hmclk_divide	In	8	Divider ration control for mclk from hmclk	From GPR
bclk	In	1	bit clock from I2S signal	
fs	In	1	frame sync clock from I2S signal	
sdata	In	1	serial audio data from I2S signal	

### 40.4 Programming Considerations

MQS has no internal programmable registers. But it does have some programmability from IOMUXC\_GPR2.

Register Bits	Name	Description
IOMUXC_GPR2[26]	MQS_OVERSAMPLE	Used to control the PWM oversampling rate compared with mclk. 1—64,

Table continues on the next page...

## Programming Considerations

Register Bits	Name	Description
		0—32.
IOMUXC_GPR2[25]	MQS_EN	MQS enable. 1—Enable MQS, 0—Disable MQS
IOMUXC_GPR2[24]	MQS_SW_RST	MQS software reset. 1—Enable software reset for MQS 0—Exit software reset for MQS
IOMUXC_GPR2[23:16]	MQS_CLK_DIV[7:0]	Divider ration control for mclk from hmclk. 0—mclk frequency = hmclk frequency; 1—mclk frequency = $\frac{1}{2}$ *hmclk frequency; 2—mclk frequency = $\frac{1}{3}$ *hmclk frequency; ...; n—mclk frequency = $\frac{1}{(n+1)}$ *hmclk frequency

### 40.4.1 Usage Model

Due to the different devices connected to MQS, and different high frequency behaviors of the connected analog circuits, the user needs choose the appropriate MQS\_CLK\_DIV and MQS\_OVERSAMPLE values for the best audible effects.

# Chapter 41

## Network Interconnect Bus System (NIC-301)

### 41.1 Overview

This section provides an overview of the

- NIC-301 (Network Inter-Connect) AXI arbiter IP

The NIC-301 (by ARM Ltd.) is a configurable AXI arbiter between several masters and slaves. The NIC-301 IP is designed so that many configuration options are selected at the hardware design stage, determined by SoC characteristics and needs, while several other configuration options are software-controlled.

This chapter covers in brief the NIC-301 while providing configuration details on the NIC-301 instances used in the chip. For complete details on the NIC-301 design, see the ARM specification, *AMBA® Network Interconnect (NIC-301) Technical Reference Manual, version r2p3*.

#### NOTE

The NIC-301 default settings are configured by NXP's board support package (BSP), and in most cases should not be modified by the customer. The default settings have gone through exhaustive testing during the validation of the part, and have proven to work well for the part's intended target applications. Changes to the default settings may result in a degradation in system performance.

#### 41.1.1 NIC-301 Main Features

Key features of the NIC-301 module include the following:

- Address space memory mapping.

- Programmer's view, for software-configured parameters, via internal "GPV" ports.
- Support for cross-clock domain synchronization.

### 41.1.2 Modes and Operations

The NIC-301 supports a normal functional mode only.

## 41.2 External Signals

There are no external I/O interfaces for NIC-301.

### 41.3 Memory Map and Register Definition

The bus system is composed of five instances: SIM\_M7, SIM\_PER, SIM\_M, SIM\_MAIN and SIM\_EMS. Three of them have GPV registers which are helpful for bus arbitration and performance. For detailed descriptions of these registers, see the ARM document: *DDI0397I\_corelink\_network\_interconnect\_nic301\_r2p3\_trm.pdf*.

#### 1. SIM\_MAIN registers

The SIM\_MAIN GPV base address is  $GPV0\_BASE = 0x41000000$ . The following registers are implemented in this NIC.

Register Name	Port Name	Module Name	Absolute Address	Reset Value	Notes
read_qos	m_a_2	LCD	$GPV0\_BASE + 0x44000 + 0x100$	1	
read_qos	m_a_3	CSI	$GPV0\_BASE + 0x45000 + 0x100$	4	
read_qos	m_a_4	PXP	$GPV0\_BASE + 0x46000 + 0x100$	2	
write_qos	m_a_2	LCD	$GPV0\_BASE + 0x44000 + 0x104$	1	
write_qos	m_a_3	CSI	$GPV0\_BASE + 0x45000 + 0x104$	4	
write_qos	m_a_4	PXP	$GPV0\_BASE + 0x46000 + 0x104$	2	
fn_mod	m_a_2	LCD	$GPV0\_BASE + 0x44000 + 0x108$	0	
fn_mod	m_a_3	CSI	$GPV0\_BASE + 0x45000 + 0x108$	0	

*Table continues on the next page...*

Register Name	Port Name	Module Name	Absolute Address	Reset Value	Notes
fn_mod	m_a_4	PXP	GPV0_BASE + 0x46000 + 0x108	0	

## 2. SIM\_M registers

The SIM\_M GPV base address is GPV1\_BASE = 0x41100000. The following registers are implemented in this NIC.

Register Name	Port Name	Module Name	Absolute Address	Reset Value	Notes
fn_mod2	m_c_0	DCP	GPV1_BASE + 0x42000 + 0x024	0	
fn_mod_ahb	m_c_1	ENET	GPV1_BASE + 0x43000 + 0x028	0	
fn_mod_ahb	m_c_5	TestPort	GPV1_BASE + 0x47000 + 0x028	0	
read_qos	m_c_0	DCP	GPV1_BASE + 0x42000 + 0x100	0	
read_qos	m_c_1	ENET	GPV1_BASE + 0x43000 + 0x100	3	
read_qos	m_c_2	USBO2	GPV1_BASE + 0x44000 + 0x100	1	
read_qos	m_c_3	USDHC1	GPV1_BASE + 0x45000 + 0x100	2	
read_qos	m_c_4	USDHC2	GPV1_BASE + 0x46000 + 0x100	2	
read_qos	m_c_5	TestPort	GPV1_BASE + 0x47000 + 0x100	0	Read-only register.
write_qos	m_c_0	DCP	GPV1_BASE + 0x42000 + 0x104	0	
write_qos	m_c_1	ENET	GPV1_BASE + 0x43000 + 0x104	3	
write_qos	m_c_2	USBO2	GPV1_BASE + 0x44000 + 0x104	1	
write_qos	m_c_3	USDHC1	GPV1_BASE + 0x45000 + 0x104	2	
write_qos	m_c_4	USDHC2	GPV1_BASE + 0x46000 + 0x104	2	
write_qos	m_c_5	TestPort	GPV1_BASE + 0x47000 + 0x104	0	Read-only register.
fn_mod	m_c_0	DCP	GPV1_BASE + 0x42000 + 0x108	0	
fn_mod	m_c_1	ENET	GPV1_BASE + 0x43000 + 0x108	0	
fn_mod	m_c_2	USBO2	GPV1_BASE + 0x44000 + 0x108	0	

Table continues on the next page...

Register Name	Port Name	Module Name	Absolute Address	Reset Value	Notes
fn_mod	m_c_3	USDHC1	GPV1_BASE + 0x45000 + 0x108	0	
fn_mod	m_c_4	USDHC2	GPV1_BASE + 0x46000 + 0x108	0	
fn_mod	m_c_5	TestPort	GPV1_BASE + 0x47000 + 0x108	0	

### 3. SIM\_M7 registers

The SIM\_M7 GPV base address is GPV4\_BASE = 0x41400000. The following registers are implemented in this NIC.

Register Name	Port Name	Module Name	Absolute Address	Reset Value	Notes
fn_mod_ahb	m_b_1	DMA	GPV4_BASE + 0x43000 + 0x028	0	
wr_tidemark	m_b_0	CortexM7	GPV4_BASE + 0x42000 + 0x040	4	WFIFO depth is 4.
read_qos	m_b_0	CortexM7	GPV4_BASE + 0x42000 + 0x100	4	
read_qos	m_b_1	DMA	GPV4_BASE + 0x43000 + 0x100	3	
write_qos	m_b_0	CortexM7	GPV4_BASE + 0x42000 + 0x104	4	
write_qos	m_b_1	DMA	GPV4_BASE + 0x43000 + 0x104	3	
fn_mod	m_b_0	CortexM7	GPV4_BASE + 0x42000 + 0x108	0	
fn_mod	m_b_1	DMA	GPV4_BASE + 0x43000 + 0x108	0	

### 4. IB registers

There are no IB registers implemented in this chip.

### 5. Address region control registers

There are no this type of registers implemented in this chip.

### 6. Peripheral ID registers

The peripheral ID registers are implemented in the SIM\_MAIN, SIM\_M, and SIM\_M7. For more details, please see the ARM document:

*DDI0397I\_corelink\_network\_interconnect\_nic301\_r2p3\_trm.pdf*.

# Chapter 42

## On-Chip OTP Controller (OCOTP\_CTRL)

### 42.1 Overview

This section contains information describing the requirements for the on-chip eFuse OTP controller along with details about the block functionality and implementation.

In this document, the words "eFuse" and "OTP" are interchangeable. OCOTP refers to the hardware block itself.

#### 42.1.1 Features

The OCOTP provides the following features :

- 32-bit word restricted program and read to of eFuse OTP.
- Loading and housing of fuse content into shadow registers.
- Memory-mapped (restricted) access to shadow registers.
- Generation of HWV\_FUSE (hardware visible fuse bus) and the HWV\_REG bus which is made of up of volatile PIO register based "fuses". The HWV\_REG bits come from the SCS (Software Controllable Signals) register.
- Generation of STICKY\_REG which consists of sticky register bits.
- Provides program-protect and read-protect eFuse.
- Provide override and read protection of shadow register.
- CRC32 test for read-lock fuse content.

### 42.2 Clocks

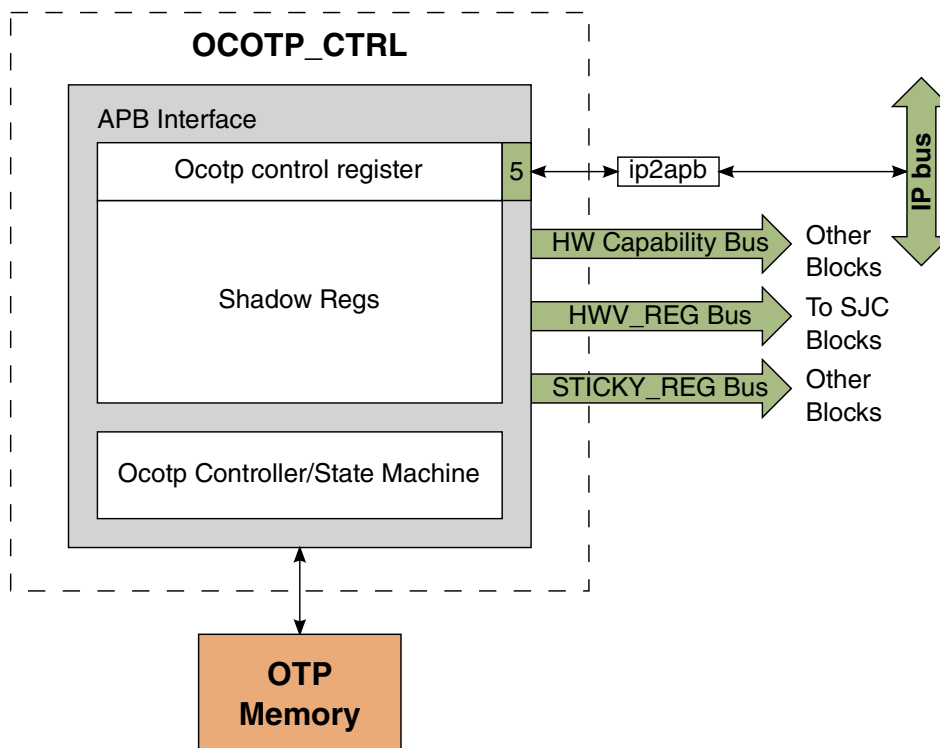

The table found here describes the clock sources for OCOTP. Please see the chip-specific clocking section for clock setting, configuration and gating information.

**Table 42-1. OCOTP Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock

### 42.3 Top-Level Symbol and Functional Overview

The figure below shows the OCOTP system level diagram.

**Figure 42-1. OCOTP System Level Diagram**

#### 42.3.1 Operation

The IP bus interface of the OCOTP has the following functions.

- Configure control registers for programming and reading fuse wordbank.
- Override and read shadow registers.

OCOTP configuration for program and read are performed on 32-bit words for SW convenience. For writes, the 32-bit word reflects the "write-mask". Bit fields with 0 will not be programmed and bit fields with 1 will be programmed. OCOTP will program bit field with 1 in the fuse word one bit by one bit. For reads, OCOTP will read 4 times to get 4 bytes in the fuse word in order.

### 42.3.1.1 Shadow Register Reload

All fuse words in efusebox are shadowed. Therefore, fuse information is available through memory mapped shadow registers. If fuses are subsequently programmed, the shadow registers should be reloaded to keep them coherent with the fuse bank arrays.

The "reload shadows" feature allows the user to force a reload of the shadow registers (including HW\_OCOTP\_LOCK) without having to reset the device. To force a reload, complete the following steps:

1. Set the HW\_OCOTP\_TIMING[STROBE\_READ] field value appropriately.
2. Set the HW\_OCOTP\_TIMING[RELAX] field value appropriately.
3. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write , read or reload must be completed before a new access can be requested.
4. Set the HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] bit. OCOTP will read all the fuses one by one and put it into corresponding shadow register.
5. Wait for HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] to be cleared by the controller.

The controller will automatically clear the HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] bit after the successful completion of the operation.

### 42.3.1.2 Fuse and Shadow register read

All shadow registers are always readable through the APB bus except some secret keys regions. When their corresponding fuse lock bits are set, the shadow registers also become read locked. After read locking, reading from these registers will return 0xBADABADA.

In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software before any new write , read or reload access can be issued. Subsequent reads to unlocked shadow locations will still work successfully however.

To read fuse words directly from fusebox correctly complete the following steps:

1. Program HW\_OCOTP\_TIMING[STROBE\_READ] and HW\_OCOTP\_TIMING[RELAX] fields with timing values to match the current frequency of the ipg\_clk. OTP read will work at maximum bus frequencies as long as the HW\_OCOTP\_TIMING parameters are set correctly.
2. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write, read or reload must be completed before a read access can be requested.
3. Write the requested address to HW\_OCOTP\_CTRL[ADDR].
4. Set HW\_OCOTP\_READ\_CTRL[READ\_FUSE] to 1. OCOTP will auto read the fuse word according to HW\_OCOTP\_CTRL[ADDR] in fusebox. Then put read value into HW\_OCOTP\_READ\_FUSE\_DATA
5. Once complete, the controller will clear BUSY. A read request to a protected or locked region will result in no OTP access and no setting of HW\_OCOTP\_CTRL[BUSY]. In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software before any new access can be issued.
6. Read HW\_OCOTP\_READ\_FUSE\_DATA to get fuse word value. HW\_OCOTP\_READ\_FUSE\_DATA will be 0xBADABADA when HW\_OCOTP\_CTRL[ERROR] is set.

### 42.3.1.3 Fuse and Shadow Register Writes

Shadow register bits can be overridden by software until the corresponding fuse lock bit for the region is set. When the lock shadow bit is set, the shadow registers for that lock region become write locked. The LOCK shadow register also has no shadow or fuse lock bits but it is always read only.

In order to avoid "rogue" code performing erroneous writes to OTP, a special unlocking sequence is required for writes to the fuse banks. To program fuse bank correctly complete the following steps:

1. Program the following fields with timing values to match the frequency of ipg\_clk:
  - HW\_OCOTP\_TIMING[STROBE\_PROG]
  - HW\_OCOTP\_TIMING[RELAX]OTP writes will work at maximum bus frequencies as long as the HW\_OCOTP\_TIMING parameters are set correctly.
2. Check that HW\_OCOTP\_CTRL[BUSY] and HW\_OCOTP\_CTRL[ERROR] are clear. Overlapped accesses are not supported by the controller. Any pending write or reload must be completed before a write access can be requested.
3. Write the requested address to HW\_OCOTP\_CTRL[ADDR] and program the unlock code into HW\_OCOTP\_CTRL[WR\_UNLOCK]. This must be programmed for each

write access. The lock code is documented in the register description. Both the unlock code and address can be written in the same operation. .

4. Write the data to the HW\_OCOTP\_DATA register. This will automatically set HW\_OCOTP\_CTRL[BUSY] and clear HW\_OCOTP\_CTRL[WR\_UNLOCK]. Bit fields with 1's will result in that OTP bit being programmed. Bit fields with 0's will be ignored. At the same time that the write is accepted, the controller makes an internal copy of HW\_OCOTP\_CTRL[ADDR] which cannot be updated until the next write sequence is initiated. This copy guarantees that erroneous writes to HW\_OCOTP\_CTRL[ADDR] will not affect an active write operation. During the write operation, HW\_OCOTP\_DATA cannot be modified.
5. Once complete, the controller will clear BUSY. A write request to a protected or locked region will result in no OTP access and no setting of HW\_OCOTP\_CTRL[BUSY]. In addition HW\_OCOTP\_CTRL[ERROR] will be set. It must be cleared by software before any new write access can be issued.

It should be noted that write latencies to OTP are numbers of 10 micro-seconds per word. Write latencies is based on amount of bit filed which is 1. For example : program half fuse bits in one word need 10 us x 16.

For further details of OTP read/write operations see [eFUSE].

HW\_OCOTP\_CTRL[ERROR] will be set under the following conditions:

- A write is performed to a shadow register during a shadow reload (essentially, while HW\_OCOTP\_CTRL[RELOAD\_SHADOWS] is set. In addition, the contents of the shadow register shall not be updated.
- A write is performed to a shadow register which has been locked.
- A read is performed to from a shadow register which has been read locked.
- A program is performed to a fuse word which has been locked.
- A read is performed to a fuse word which has been read locked.

#### 42.3.1.4 Write Postamble

Due to internal electrical characteristics of the OTP during writes, all OTP operations following a write must be separated by 2 us after the clearing of HW\_OCOTP\_CTRL\_BUSY following the write. This guarantees programming voltages on-chip to reach a steady state when exiting a write sequence. This includes reads, shadow reloads, or other writes.

A recommended software sequence to meet the postamble requirements is as follows:

- Issue the write and poll for BUSY (as per Fuse Shadow Memory Footprint).

- Once BUSY is clear, use HW\_DIGCTL\_MICROSECONDS to wait 2 us.
- Perform the next OTP operation.

### 42.3.2 Fuse Shadow Memory Footprint

The OTP memory footprint shows in the following figure. The registers are grouped by lock region. Their names correspond to the PIO register and fusemap names.

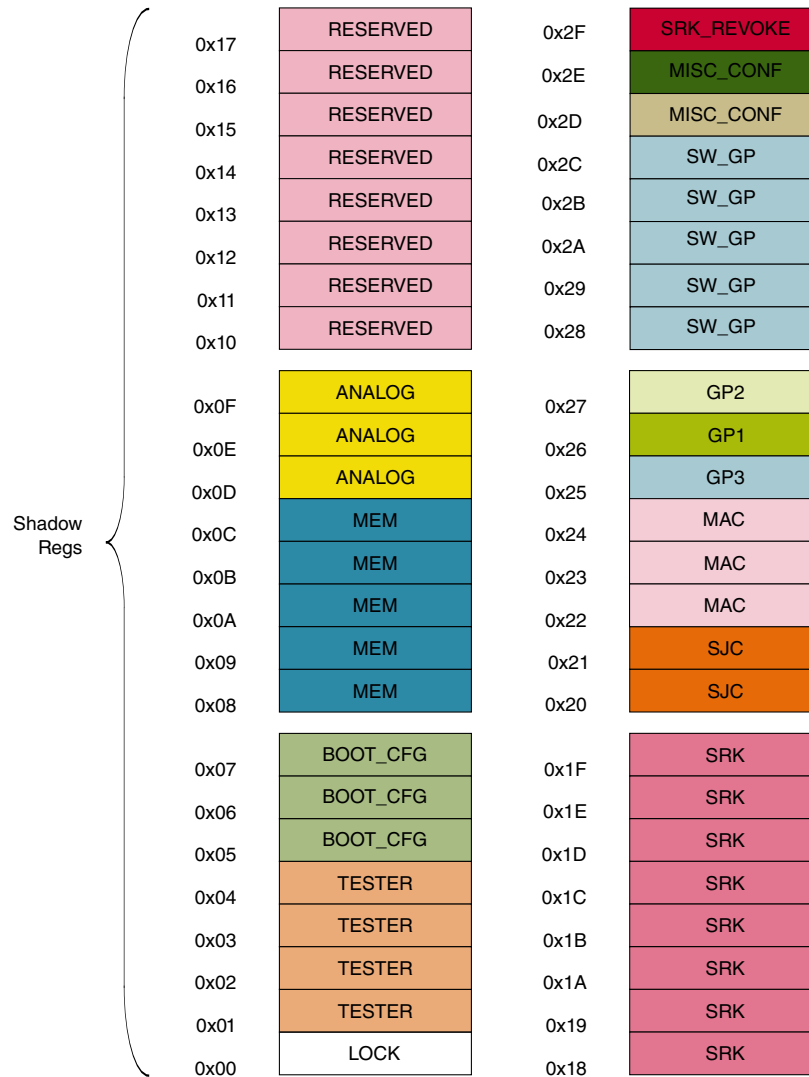

Figure 42-2. OTP Memory Footprint

### 42.3.3 OTP Read/Write Timing Parameters

The timing fields contained in the HW\_OCOTP\_TIMING register that specify counter limit values, which are used to time how long the state machine remains in the various states, as well as specify the STROBE signal timing.

The timing parameters are specified in ipg\_clk cycles. Since the ipg\_clk frequency can be set to a range of values, these parameters must be adjusted with the clock to yield the appropriate delay.

The HW\_OCOTP\_TIMING[RELAX] field specifies how long to remain in states to meet setup and hold timing requirement in fuse spec. This parameter should be set by the following equation:

$$t_{RELAX} = t_{HP\_PG} = (HW\_OCOTP\_TIMING[RELAX]+1)/ipg\_frequency > 16.2ns$$

HW\_OCOTP\_TIMING[RELAX] field is used to create other setup and hold timing delays in addition to tHP\_PG. For all timing to be met, this is the max delay that must be programmed.

Except for setup and hold timing delay, there are 2 timing parameters for STROBE signal pulse width in program and read.

The HW\_OCOTP\_TIMING[STROBE\_PROG] field specifies the period of the STROBE signal for fuse writes and is given in units of ipg\_clk cycles. This value should be specified so that the requirement for the time when the STROBE signal is asserted high is met:  $9000ns < t_{PGM} < 11000ns$  is met. Even though a range is given for tPGM, it is advised in [eFUSE] to program for a value of 10000ns. Therefore, this field should be set according to the following equation:

$$t_{PGM} = ((HW\_OCOTP\_TIMING[STROBE\_PROG]+1) - 2*(HW\_OCOTP\_TIMING[RELAX]+1))/ipg\_frequency = 10000ns.$$

The HW\_OCOTP\_TIMING[STROBE\_READ] field specifies the period of the STROBE signal for fuse reads and is given in units of ipg\_clk cycles. This field should be set according to the following equation:

$$t_{RD} = ((HW\_OCOTP\_TIMING[STROBE\_READ]+1) - 2*(HW\_OCOTP\_TIMING[RELAX]+1))/ipg\_frequency > 40 ns.$$

The figure below illustrates the relationship between the STROBE signal in programming and reading mode, as well as the timing PIO register fields that affect it. The implementation uses one counter to generate the STROBE waveform within one period and a second counter counts the number of cycles to create for programming the designated word.

Figure 42-3. STROBE Signal Creation and Timing

### 42.3.4 Hardware Visible Fuses

The `hwv_fuse` bus emanates from the OCOTP block and goes to various other blocks inside the chip. This bus is made up of the shadow register bits for .

Only a subset of these fuse bits are currently used by the hardware. The fuse bits are initially copied from the banks after reset is deasserted. When all fuse bits are loaded into their shadow registers, the OCOTP asserts the `fuse_latched` output signal.

The `hwv_reg` bus also comes from the OCOTP. Its source is the `HW_OCOTP_SCS` register. This register has 1 defined bit, the `HAB_JDE` bit, that is connected to the SJC block. The SCS bits are intended to be used as volatile fuse bits under software control. Additional bits will be defined as needed in future implementations.

The system-wide reset sequence must be coordinated by the system reset controller, so that the `hwv_fuse` and `hwv_reg` buses are stable and reflect the values of the fuses before they are used by the rest of the system.

### 42.3.5 Behavior During Reset

The OCOTP is always active. The shadow registers automatically load the appropriate OTP contents after reset is deasserted. During this load-time `HW_OCOTP_CTRL_BUSY` is set. The load time is similar to that of a "reload shadow" operation.

### 42.3.6 Secure JTAG control

The JTAG control fuses are used to allow or disallow JTAG access to secured resources.

Three JTAG security levels are envisioned, as shown in the table below.

**Table 42-2. JTAG Security Level Control Bits**

Security Mode	JTAG_SMODE	Description
No Debug	2'b11	The highest security level.
Secure JTAG	2'b01	Limit the JTAG access by using key based authentication mechanism.
JTAG Enable	2'b00	Low Security, all JTAG features are enabled.

## 42.4 Fuse Map

See the Fusemap chapter of this reference manual for more information.

## 42.5 OCOTP Memory Map/Register Definition

The OCOTP Memory Map/Register Definition can be found here.

## 42.5.1.2 OTP Controller Control Register (HW\_OCOTP\_CTRL)

### 42.5.1.2.1 Offset

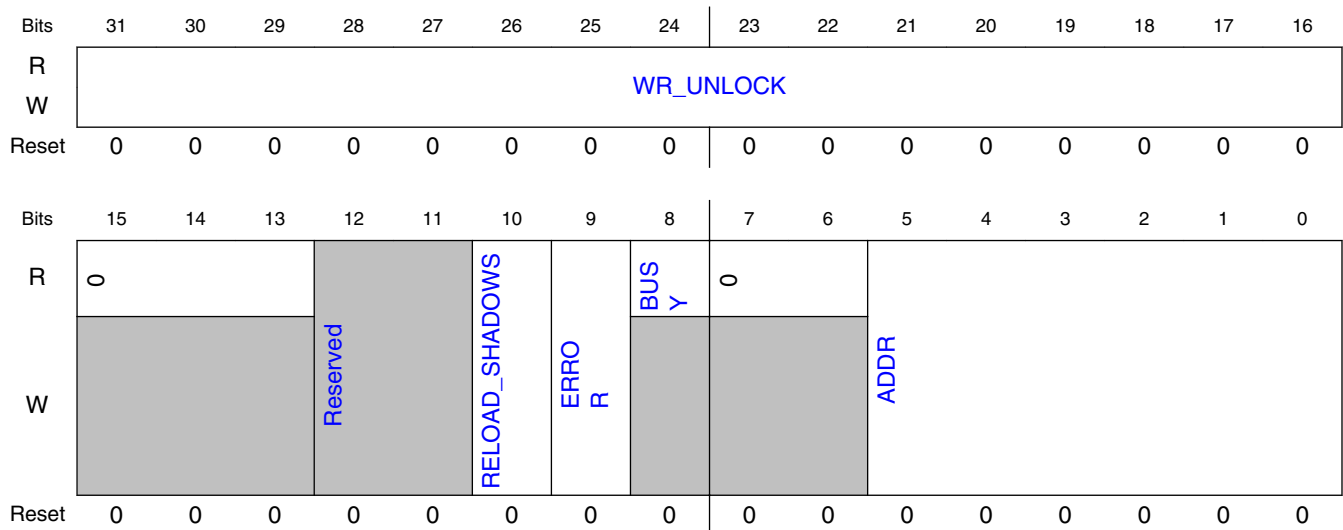

Register	Offset
HW_OCOTP_CTRL	0h

### 42.5.1.2.2 Function

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable

ROM). The control fields such as WR\_UNLOCK, ADDR and BUSY/ERROR may be used in conjunction with the HW\_OCOTP\_DATA register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and HW\_OCOTP\_READ\_CTRL register. Read value is saved in HW\_OCOTP\_READ\_FUSE\_DATA register.

### 42.5.1.2.3 Diagram

### 42.5.1.2.4 Fields

Field	Function
31-16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY).
15-13 —	Reserved
12-11 —	Reserved
10 RELOAD_SHADOWS	Set to force re-loading the shadow registers (HW/SW capability and LOCK). This operation will automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region(OTP or shadow register) is requested. Must be cleared before any further access can be performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or

Table continues on the next page...

Field	Function
BUSY	after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7-6 —	Reserved
5-0 ADDR	OTP write and read access address register. Specifies one of 128 word address locations (0x00 - 0x7f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

### 42.5.1.3 OTP Controller Control Register (HW\_OCOTP\_CTRL\_SET)

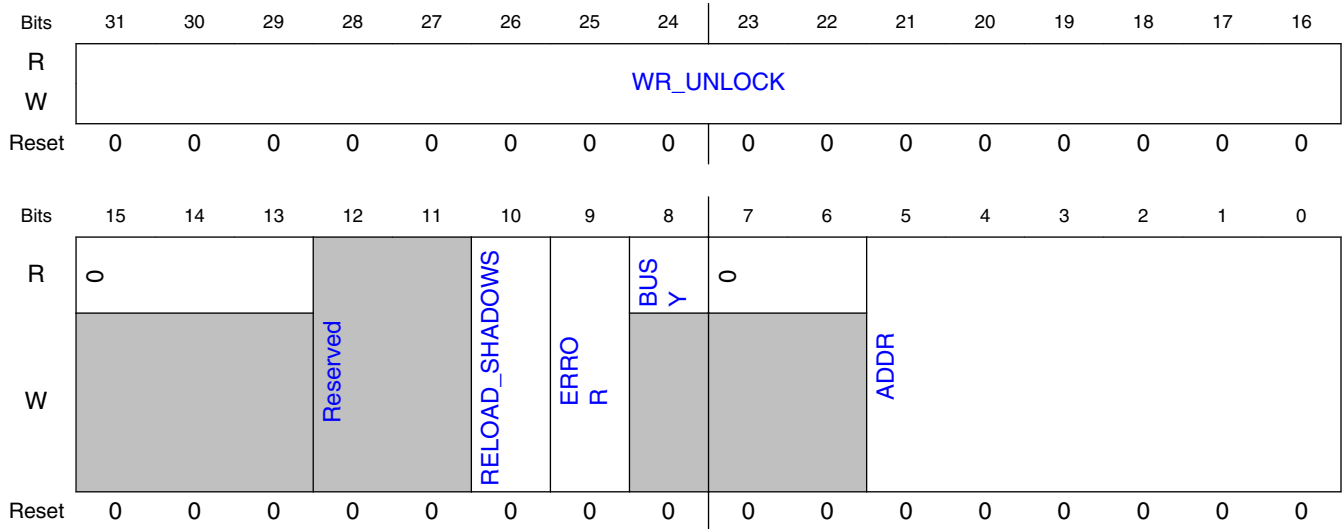

#### 42.5.1.3.1 Offset

Register	Offset
HW_OCOTP_CTRL_SET	4h

#### 42.5.1.3.2 Function

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR\_UNLOCK, ADDR and BUSY/ERROR may be used in conjunction with the HW\_OCOTP\_DATA register to perform write operations. Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and HW\_OCOTP\_READ\_CTRL register. Read value is saved in HW\_OCOTP\_READ\_FUSE\_DATA register.

In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.
7-6 —	Reserved
5-0 ADDR	OTP write and read access address register. Specifies one of 128 word address locations (0x00 - 0x7f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

### 42.5.1.5 OTP Controller Control Register (HW\_OCOTP\_CTRL\_TOG)

#### 42.5.1.5.1 Offset

Register	Offset
HW_OCOTP_CTRL_TOG	Ch

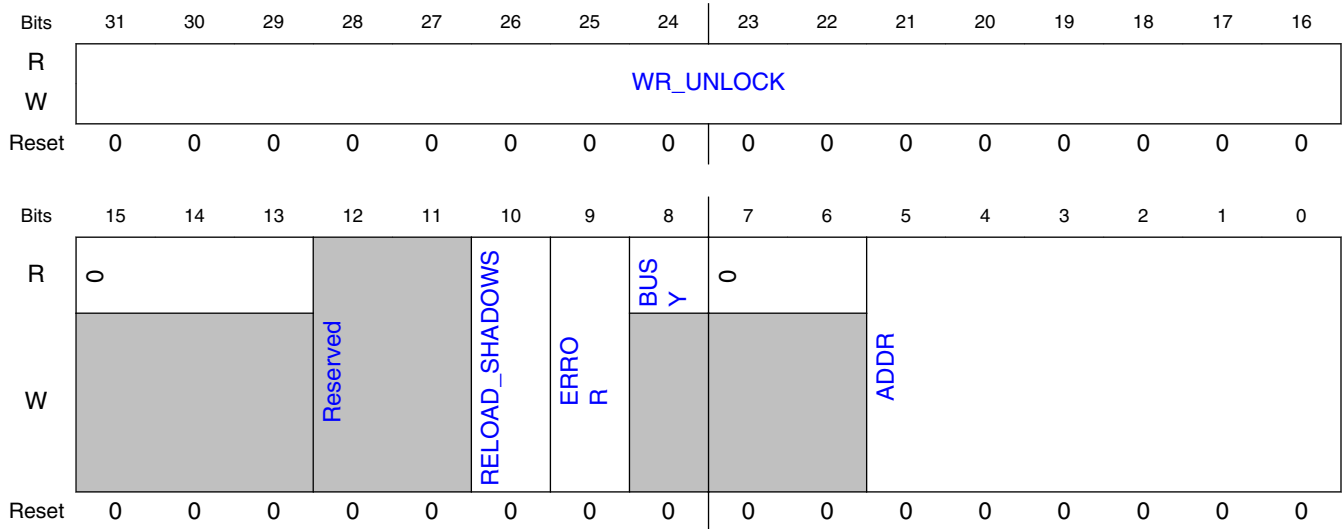

#### 42.5.1.5.2 Function

The OCOTP Control and Status Register provides the necessary software interface for performing read and write operations to the On-Chip OTP (One-Time Programmable ROM). The control fields such as WR\_UNLOCK, ADDR and BUSY/ERROR may be used in conjunction with the HW\_OCOTP\_DATA register to perform write operations.

Read operations to the On-Chip OTP are involving ADDR, BUSY/ERROR bit field and HW\_OCOTP\_READ\_CTRL register. Read value is saved in HW\_OCOTP\_READ\_FUSE\_DATA register.

### 42.5.1.5.3 Diagram

### 42.5.1.5.4 Fields

Field	Function
31-16 WR_UNLOCK	Write 0x3E77 to enable OTP write accesses. NOTE: This register must be unlocked on a write-by-write basis (a write is initiated when HW_OCOTP_DATA is written), so the UNLOCK bitfield must contain the correct key value during all writes to HW_OCOTP_DATA, otherwise a write shall not be initiated. This field is automatically cleared after a successful write completion (clearing of BUSY).
15-13 —	Reserved
12-11 —	Reserved
10 RELOAD_SHADOWS	Set to force re-loading the shadow registers (HW/SW capability and LOCK). This operation will automatically set BUSY. Once the shadow registers have been re-loaded, BUSY and RELOAD_SHADOWS are automatically cleared by the controller.
9 ERROR	Set by the controller when an access to a locked region(OTP or shadow register) is requested. Must be cleared before any further access can be performed. This bit can only be set by the controller. This bit is also set if the Pin interface is active and software requests an access to the OTP. In this instance, the ERROR bit cannot be cleared until the Pin interface access has completed. Reset this bit by writing a one to the SCT clear address space and not by a general write.
8 BUSY	OTP controller status bit. When active, no new write access or read access to OTP(including RELOAD_SHADOWS) can be performed. Cleared by controller when access complete. After reset (or after setting RELOAD_SHADOWS), this bit is set by the controller until the HW/SW and LOCK registers are successfully copied, after which time it is automatically cleared by the controller.

Table continues on the next page...

## OCOTP Memory Map/Register Definition

Field	Function
7-6 —	Reserved
5-0 ADDR	OTP write and read access address register. Specifies one of 128 word address locations (0x00 - 0x7f). If a valid access is accepted by the controller, the controller makes an internal copy of this value. This internal copy will not update until the access is complete.

### 42.5.1.6 OTP Controller Timing Register (HW\_OCOTP\_TIMING)

#### 42.5.1.6.1 Offset

Register	Offset
HW_OCOTP_TIMING	10h

#### 42.5.1.6.2 Function

This register specifies timing parameters for programming and reading the OCOTP fuse array.

#### 42.5.1.6.3 Diagram

#### 42.5.1.6.4 Fields

Field	Function
31-28 —	Reserved

Table continues on the next page...

Field	Function
27-22 WAIT	This count value specifies time interval between auto read and write access in one time program. It is given in number of ipg_clk periods.
21-16 STROBE_READ	This count value specifies the strobe period in one time read OTP. $Trd = ((STROBE\_READ+1) - 2*(RELAX+1)) / ipg\_clk\_freq$ . It is given in number of ipg_clk periods.
15-12 RELAX	This count value specifies the time to add to all default timing parameters other than the Tpgm and Trd. It is given in number of ipg_clk periods.
11-0 STROBE_PROG	This count value specifies the strobe period in one time write OTP. $Tpgm = ((STROBE\_PROG+1) - 2*(RELAX+1)) / ipg\_clk\_freq$ . It is given in number of ipg_clk periods.

## 42.5.1.7 OTP Controller Write Data Register (HW\_OCOTP\_DATA)

### 42.5.1.7.1 Offset

Register	Offset
HW_OCOTP_DATA	20h

### 42.5.1.7.2 Function

This register is used in conjunction with HW\_OCOTP\_CTRL to perform one-time writes to the OTP. Please see the "Software Write Sequence" section for operating details.

### 42.5.1.7.3 Diagram

### 42.5.1.7.4 Fields

Field	Function
31-0 DATA	Used to initiate a write to OTP. Please see the "Software Write Sequence" section for operating details.

## 42.5.1.8 OTP Controller Write Data Register (HW\_OCOTP\_READ\_CTRL)

### 42.5.1.8.1 Offset

Register	Offset
HW_OCOTP_READ_CTRL	30h

### 42.5.1.8.2 Function

This register is used in conjunction with HW\_OCOTP\_CTRL to perform one time read to the OTP. Please see the "Software read Sequence" section for operating details.

### 42.5.1.8.3 Diagram

### 42.5.1.8.4 Fields

Field	Function
31-1	Reserved

Table continues on the next page...

Field	Function
—	
0 READ_FUSE	Used to initiate a read to OTP. Please see the "Software read Sequence" section for operating details.

### 42.5.1.9 OTP Controller Read Data Register (HW\_OCOTP\_READ\_FUSE\_DATA)

#### 42.5.1.9.1 Offset

Register	Offset
HW_OCOTP_READ_FUSE_DATA	40h

#### 42.5.1.9.2 Function

The data read from OTP

#### 42.5.1.9.3 Diagram

#### 42.5.1.9.4 Fields

Field	Function
31-0 DATA	The data read from OTP

### 42.5.1.10 Sticky bit Register (HW\_OCOTP\_SW\_STICKY)

#### 42.5.1.10.1 Offset

Register	Offset
HW_OCOTP_SW_STICKY	50h

#### 42.5.1.10.2 Function

Some sticky bits are used by SW to lock some fuse area , shadow registers and other features.

#### 42.5.1.10.3 Diagram

#### 42.5.1.10.4 Fields

Field	Function
31-5	Reserved
4	Set by ARM during Boot after DTCP is initialized and before test mode entry. * 0 (Default) - JTAG is blocked (subject to other conditions). * 1 - JTAG block is released (subject to other controls). Once this bit is set, it is always high unless a POR is issued.
JTAG_BLOCK_RELEASE	

Table continues on the next page...

Field	Function
3 BLOCK_ROM_PART	Set by ARM during Boot after DTCP is initialized and before test mode entry, if ROM_PART_LOCK=1.* 0 (Default) - Secret part of Boot ROM is not hidden (subject to other conditions).* 1 - Secret part of Boot ROM is hidden.Once this bit is set, it is always high unless a POR is issued.
2 FIELD_RETURN_LOCK	Shadow register write and OTP write lock for FIELD_RETURN region. When set, the writing of this region's shadow register and OTP fuse word are blocked.Once this bit is set, it is always high unless a POR is issued.
1 SRK_REVOKE_LOCK	Shadow register write and OTP write lock for SRK_REVOKE region. When set, the writing of this region's shadow register and OTP fuse word are blocked. Once this bit is set, it is always high unless a POR is issued.
0 BLOCK_DTCP_KEY	Shadow register read and OTP read lock for DTCP_KEY region. It is used to lock shadow register and OTP read for DTCP_KEY in conjunction with dtcp_disable and HDCP_KEY lock fuse bit. Once this bit is set, it is always high unless a POR is issued.

### 42.5.1.11 Software Controllable Signals Register (HW\_OCOTP\_SCS)

#### 42.5.1.11.1 Offset

Register	Offset
HW_OCOTP_SCS	60h

#### 42.5.1.11.2 Function

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their default values after POR.

#### 42.5.1.11.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W	LOCK	SPARE														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W	SPARE															HAB_JD
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 42.5.1.11.4 Fields

Field	Function
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30-1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off).

### 42.5.1.12 Software Controllable Signals Register (HW\_OCOTP\_SCS\_SET)

#### 42.5.1.12.1 Offset

Register	Offset
HW_OCOTP_SCS_SET	64h

#### 42.5.1.12.2 Function

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their default values after POR.

#### 42.5.1.12.3 Diagram

### 42.5.1.12.4 Fields

Field	Function
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30-1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off).

### 42.5.1.13 Software Controllable Signals Register (HW\_OCOTP\_SCS\_CLR)

#### 42.5.1.13.1 Offset

Register	Offset
HW_OCOTP_SCS_CLR	68h

#### 42.5.1.13.2 Function

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their default values after POR.

#### 42.5.1.13.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R																
W	LOCK	SPARE														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																
W	SPARE															HAB_JDE
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 42.5.1.13.4 Fields

Field	Function
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30-1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off).

### 42.5.1.14 Software Controllable Signals Register (HW\_OCOTP\_SCS\_TOG)

#### 42.5.1.14.1 Offset

Register	Offset
HW_OCOTP_SCS_TOG	6Ch

#### 42.5.1.14.2 Function

This register holds volatile configuration values that can be set and locked by trusted software. All values are returned to their default values after POR.

#### 42.5.1.14.3 Diagram

#### 42.5.1.14.4 Fields

Field	Function
31 LOCK	When set, all of the bits in this register are locked and can not be changed through SW programming. This bit is only reset after a POR is issued.
30-1 SPARE	Unallocated read/write bits for implementation specific software use.
0 HAB_JDE	HAB JTAG Debug Enable. This bit is used by the HAB to enable JTAG debugging, assuming that a properlay signed command to do so is found and validated by the HAB. The HAB must lock the register before passing control to the OS whether or not JTAG debugging has been enabled. Once JTAG is enabled by this bit, it can not be disabled unless the system is reset by POR. 0: JTAG debugging is not enabled by the HAB (it may still be enabled by other mechanisms). 1: JTAG debugging is enabled by the HAB (though this signal may be gated off).

#### 42.5.1.15 OTP Controller Version Register (HW\_OCOTP\_VERSION)

##### 42.5.1.15.1 Offset

Register	Offset
HW_OCOTP_VERSION	90h

##### 42.5.1.15.2 Function

This register indicates the RTL version in use.

##### 42.5.1.15.3 Diagram

### 42.5.1.15.4 Fields

Field	Function
31-24 MAJOR	Fixed read-only value reflecting the MAJOR field of the RTL version.
23-16 MINOR	Fixed read-only value reflecting the MINOR field of the RTL version.
15-0 STEP	Fixed read-only value reflecting the stepping of the RTL version.

### 42.5.1.16 OTP Controller Timing Register 2 (HW\_OCOTP\_TIMING2)

#### 42.5.1.16.1 Offset

Register	Offset
HW_OCOTP_TIMING2	100h

#### 42.5.1.16.2 Function

This register specifies timing parameters for programming and reading the OCOTP fuse array.

#### 42.5.1.16.3 Diagram

### 42.5.1.16.4 Fields

Field	Function
31-29 —	Reserved
28-22 RELAX1	This count value specifies time interval between auto read and write access in one time program. It is given in number of ipg_clk periods.
21-16 RELAX_READ	This count value specifies the strobe period in one time read OTP. $Trd = ((STROBE\_READ+1) - 2*(RELAX\_READ+1)) / ipg\_clk\_freq$ . It is given in number of ipg_clk periods.
15-12 —	Reserved
11-0 RELAX_PROG	This count value specifies the strobe period in one time write OTP. $Tpgm = ((STROBE\_PROG+1) - 2*(RELAX\_PROG+1)) / ipg\_clk\_freq$ . It is given in number of ipg_clk periods.

### 42.5.1.17 Value of OTP Bank0 Word0 (Lock controls) (HW\_OCOTP\_LOCK)

#### 42.5.1.17.1 Offset

Register	Offset
HW_OCOTP_LOCK	400h

#### 42.5.1.17.2 Function

Shadowed memory mapped access to OTP Bank 0, word 0 (ADDR = 0x00).

### 42.5.1.17.3 Diagram

### 42.5.1.17.4 Fields

Field	Function
31-28 FIELD_RETURN	Reserved
27-26 GP3	Status of shadow register and OTP write lock for gp3 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
25-24 —	Reserved
23 SW_GP2_RLOCK	Status of shadow register and OTP read lock for sw_gp2 region. When set, the reading of this region's shadow register and OTP fuse word are blocked.
22 MISC_CONF	Status of shadow register and OTP write lock for misc_conf region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
21 SW_GP2_LOCK	Status of shadow register and OTP write lock for sw_gp2 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
20 OTPMK_CRC	Status of shadow register and OTP write lock for otpmk_crc region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
19-18 ANALOG	Status of shadow register and OTP write lock for analog region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

Table continues on the next page...

Field	Function
17 OTPMK_LSB	Status of shadow register read and write, OTP read and write lock for otpmk region (LSB). When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
16 SW_GP1	Status of shadow register and OTP write lock for sw_gp1 region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
15 OTPMK_MSB	Status of shadow register read and write, OTP read and write lock for otpmk region (MSB). When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
14 SRK	Status of shadow register and OTP write lock for srk region. When set, the writing of this region's shadow register and OTP fuse word are blocked.
13-12 GP2	Status of shadow register and OTP write lock for gp2 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
11-10 GP1	Status of shadow register and OTP write lock for gp1 region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
9-8 MAC_ADDR	Status of shadow register and OTP write lock for mac_addr region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
7 —	Reserved
6 SJC_RESP	Status of shadow register read and write, OTP read and write lock for sjc_resp region. When set, the writing of this region's shadow register and OTP fuse word are blocked. The read of this region's shadow register and OTP fuse word are also blocked.
5-4 MEM_TRIM	Status of shadow register and OTP write lock for mem_trim region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
3-2 BOOT_CFG	Status of shadow register and OTP write lock for boot_cfg region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.
1-0 TESTER	Status of shadow register and OTP write lock for tester region. When bit 1 is set, the writing of this region's shadow register is blocked. When bit 0 is set, the writing of this region's OTP fuse word is blocked.

### 42.5.1.18 Value of OTP Bank0 Word1 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG0)

#### 42.5.1.18.1 Offset

Register	Offset
HW_OCOTP_CFG0	410h

### 42.5.1.18.2 Function

Shadowed memory mapped access to OTP Bank 0, word 1 (ADDR = 0x01).

### 42.5.1.18.3 Diagram

### 42.5.1.18.4 Fields

Field	Function
31-0 BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 1 (ADDR = 0x01). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

## 42.5.1.19 Value of OTP Bank0 Word2 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG1)

### 42.5.1.19.1 Offset

Register	Offset
HW_OCOTP_CFG1	420h

### 42.5.1.19.2 Function

shadowed memory mapped access to OTP Bank 0, word 2 (ADDR = 0x02).

### 42.5.1.19.3 Diagram

### 42.5.1.19.4 Fields

Field	Function
31-0 BITS	This register contains 32 bits of the Unique ID and SJC_CHALLENGE field. Reflects value of OTP Bank 0, word 2 (ADDR = 0x02). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

## 42.5.1.20 Value of OTP Bank0 Word3 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG2)

### 42.5.1.20.1 Offset

Register	Offset
HW_OCOTP_CFG2	430h

### 42.5.1.20.2 Function

Shadowed memory mapped access to OTP Bank 0, word 3 (ADDR = 0x03).

### 42.5.1.20.3 Diagram

### 42.5.1.20.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP Bank 0, word 3 (ADDR = 0x03). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

## 42.5.1.21 Value of OTP Bank0 Word4 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG3)

### 42.5.1.21.1 Offset

Register	Offset
HW_OCOTP_CFG3	440h

### 42.5.1.21.2 Function

Non-shadowed memory mapped access to OTP Bank 0, word 4 (ADDR = 0x04).

### 42.5.1.21.3 Diagram

### 42.5.1.21.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP Bank 0, word 4 (ADDR = 0x04). These bits become read-only after the HW_OCOTP_LOCK_TESTER[1] bit is set.

## 42.5.1.22 Value of OTP Bank0 Word5 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG4)

### 42.5.1.22.1 Offset

Register	Offset
HW_OCOTP_CFG4	450h

### 42.5.1.22.2 Function

Shadowed memory mapped access to OTP Bank 0, word 5 (ADDR = 0x05).

### 42.5.1.22.3 Diagram

### 42.5.1.22.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP Bank 0, word 5 (ADDR = 0x05). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

## 42.5.1.23 Value of OTP Bank0 Word6 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG5)

### 42.5.1.23.1 Offset

Register	Offset
HW_OCOTP_CFG5	460h

### 42.5.1.23.2 Function

Shadowed memory mapped access to OTP Bank 0, word 6 (ADDR = 0x06).

### 42.5.1.23.3 Diagram

### 42.5.1.23.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP Bank 0, word 6 (ADDR = 0x06). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

## 42.5.1.24 Value of OTP Bank0 Word7 (Configuration and Manufacturing Info.) (HW\_OCOTP\_CFG6)

### 42.5.1.24.1 Offset

Register	Offset
HW_OCOTP_CFG6	470h

### 42.5.1.24.2 Function

Shadowed memory mapped access to OTP Bank 0, word 7 (ADDR = 0x07).

### 42.5.1.24.3 Diagram

### 42.5.1.24.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP Bank 0, word 7 (ADDR = 0x07). These bits become read-only after the HW_OCOTP_LOCK_BOOT_CFG[1] bit is set.

## 42.5.1.25 Value of OTP Bank1 Word0 (Memory Related Info.) (HW\_OCOTP\_MEM0)

### 42.5.1.25.1 Offset

Register	Offset
HW_OCOTP_MEM0	480h

### 42.5.1.25.2 Function

Shadowed memory mapped access to OTP bank 1, word 0 (ADDR = 0x08).

### 42.5.1.25.3 Diagram

### 42.5.1.25.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 0 (ADDR = 0x08). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

## 42.5.1.26 Value of OTP Bank1 Word1 (Memory Related Info.) (HW\_OCOTP\_MEM1)

### 42.5.1.26.1 Offset

Register	Offset
HW_OCOTP_MEM1	490h

### 42.5.1.26.2 Function

Shadowed memory mapped access to OTP bank 1, word 1 (ADDR = 0x09).

### 42.5.1.26.3 Diagram

### 42.5.1.26.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 1 (ADDR = 0x09). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

### 42.5.1.27 Value of OTP Bank1 Word2 (Memory Related Info.) (HW\_OCOTP\_MEM2)

#### 42.5.1.27.1 Offset

Register	Offset
HW_OCOTP_MEM2	4A0h

#### 42.5.1.27.2 Function

Shadowed memory mapped access to OTP bank 1, word 2 (ADDR = 0x0A).

### 42.5.1.27.3 Diagram

### 42.5.1.27.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 2 (ADDR = 0x0A). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

## 42.5.1.28 Value of OTP Bank1 Word3 (Memory Related Info.) (HW\_OCOTP\_MEM3)

### 42.5.1.28.1 Offset

Register	Offset
HW_OCOTP_MEM3	4B0h

### 42.5.1.28.2 Function

Shadowed memory mapped access to OTP bank 1, word 3 (ADDR = 0x0B).

### 42.5.1.28.3 Diagram

### 42.5.1.28.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 3 (ADDR = 0x0B). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

## 42.5.1.29 Value of OTP Bank1 Word4 (Memory Related Info.) (HW\_OCOTP\_MEM4)

### 42.5.1.29.1 Offset

Register	Offset
HW_OCOTP_MEM4	4C0h

### 42.5.1.29.2 Function

Shadowed memory mapped access to OTP bank 1, word 4 (ADDR = 0x0C).

### 42.5.1.29.3 Diagram

### 42.5.1.29.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 4 (ADDR = 0x0C). These bits become read-only after the HW_OCOTP_LOCK_MEM_TRIM[1] bit is set.

## 42.5.1.30 Value of OTP Bank1 Word5 (Analog Info.) (HW\_OCOTP\_ANA0)

### 42.5.1.30.1 Offset

Register	Offset
HW_OCOTP_ANA0	4D0h

### 42.5.1.30.2 Function

Shadowed memory mapped access to OTP bank 1, word 5 (ADDR = 0x0D).

### 42.5.1.30.3 Diagram

### 42.5.1.30.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 5 (ADDR = 0x0D). These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

## 42.5.1.31 Value of OTP Bank1 Word6 (Analog Info.) (HW\_OCOTP\_ANA1)

### 42.5.1.31.1 Offset

Register	Offset
HW_OCOTP_ANA1	4E0h

### 42.5.1.31.2 Function

Shadowed memory mapped access to OTP bank 1, word 6 (ADDR = 0x0E).

### 42.5.1.31.3 Diagram

### 42.5.1.31.4 Fields

Field	Function
31-0 BITS	Reflects value of OTP bank 1, word 6 (ADDR = 0x0E). These bits become read-only after the HW_OCOTP_LOCK_ANALOG[1] bit is set.

## 42.5.1.32 Value of OTP Bank1 Word7 (Analog Info.) (HW\_OCOTP\_ANA2)

### 42.5.1.32.1 Offset

Register	Offset
HW_OCOTP_ANA2	4F0h

### 42.5.1.32.2 Function

Shadowed memory mapped access to OTP bank 1, word 7 (ADDR = 0x0F).

# Chapter 43

## On-Chip RAM Memory Controller (OCRAM)

### 43.1 Overview

There is 1 OCRAM controller implemented in the chip. One controller is for up to 512 KB on-chip RAM. The size of OCRAM is configured in the FlexRAM module via IOMUXC. For more details, refer to the FlexRAM chapter.

The on-chip RAM block is implemented as a slave module on the 64-bit system AXI bus. Designed as a simple on-chip memory controller, it supports only one AXI port with memory banks. For the AXI port, the read and write transactions are handled by two independent modules. As it is possible to have simultaneous read and write request from the AXI bus, each memory bank has an arbiter with round-robin scheme. After arbitration, the granted read or write access command can then be issued to the memory cell through a read/write MUX.

The memory banks are organized with the lower 2 bits of the address which is the AXI bus address and is 64 bits aligned interleaved. This allows a read access and a write access to be processed at the same time if they are targeted to different memory banks.

Various options are provided for adding a pipeline or wait-states in a read/write access, in order to ensure flexible timing control at both high and low frequencies.

The internal block diagram is shown in the figure below.

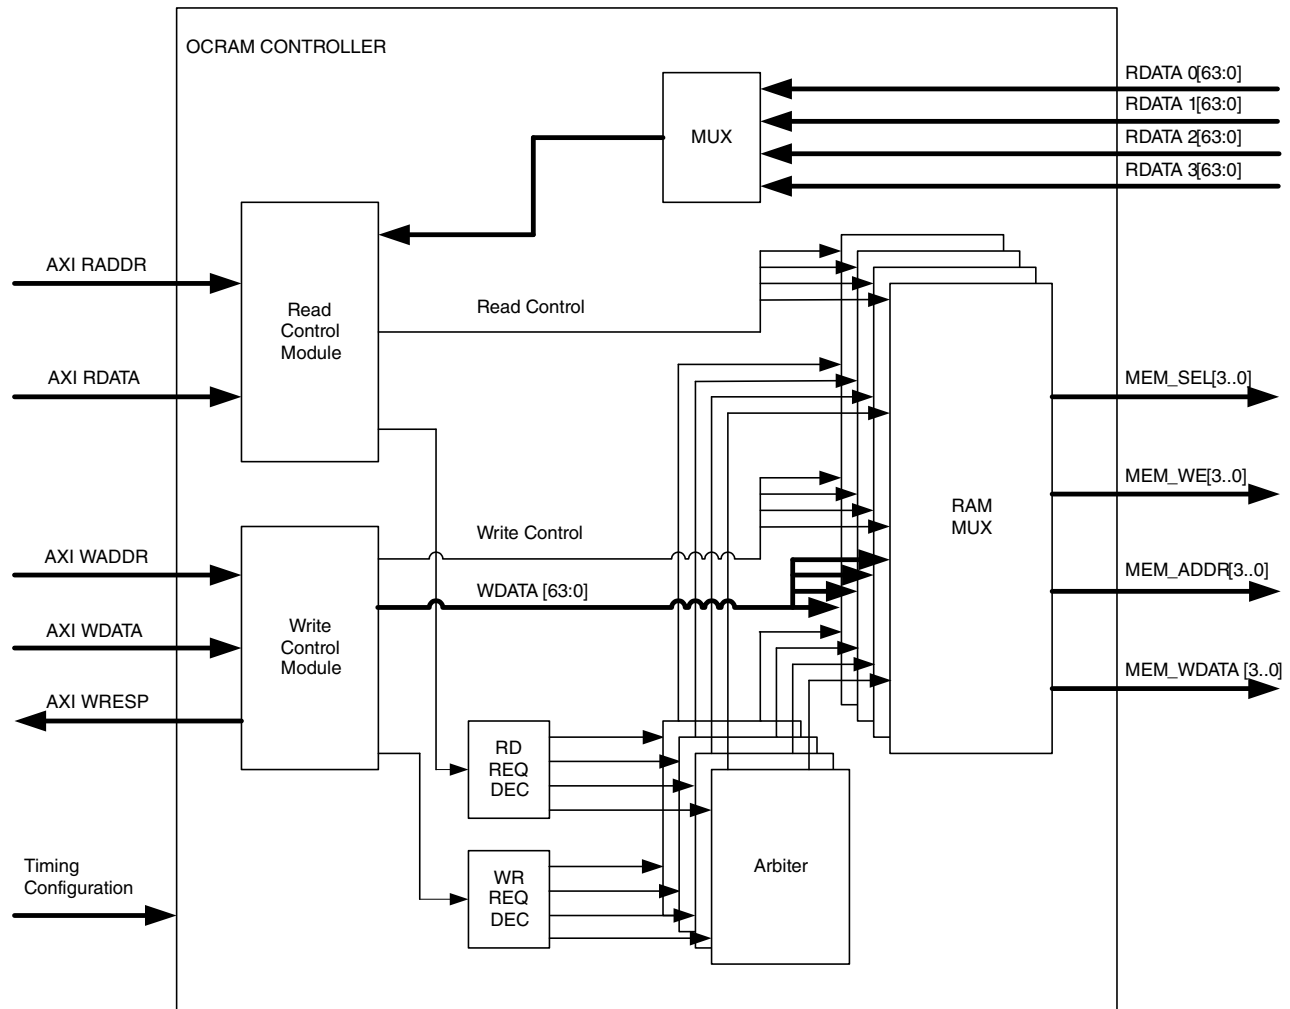

Figure 43-1. On-chip RAM Block Diagram

## 43.2 Basic Functions

### 43.2.1 Read/Write Arbitration

The detailed rules used in arbitration are as follows:

- If there is no granted read or write in the last cycle, and there is only a read request or a write request, the request will be granted.
- If there is no granted read or write in the last cycle, and there are both read or write requests coming in at the same time, the read request will be granted first.

- If a granted read/write transaction has just finished, the write/read request will have the higher priority in the next cycle.
- If the first read/write access request in a transaction is granted, all the data transfer in this burst will be finished before the next arbitration begins, that is, the round-robin arbitration mechanism is based on AXI transaction, not data access.

## 43.3 Advanced Features

This section describes some advanced features designed to avoid timing issues when the on-chip RAM is working at high frequency.

All of the features can be disabled/enabled by programming the corresponding fields of the General Purpose Register (IOMUXC.GPR3) bits [3:0] in the IOMUX chapter.

### 43.3.1 Read Data Wait State

When the wait state is enabled, it will take 2 cycles for each read access (each beat of a read burst).

This can avoid the potential timing problem caused by the longer memory access time at higher frequency.

When this feature is disabled, it only takes 1 clock cycle to finish a read transaction. That is, read data is available in the next cycle of read request becomes valid on the bus.

For the normal OCRAM, the read data wait state is configurable via IOMUXC.GPR3[0].

### 43.3.2 Read Address Pipeline

When this feature is enabled, the read address from the AXI master is delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issues for the read access on the memory cell at high frequency. Enabling this feature can cost, at most, 1 more clock cycle for each AXI read transaction, that is, at most 1 more clock cycle for each read burst with multiple beats of data.

When this feature is disabled, the read address from the AXI master can be accepted by the on-chip RAM without delay, and data can become ready for master at next clock cycle (if no other access and no read data wait).

For the normal OCRAM, the read address pipeline is configurable via IOMUXC.GPR3[1].

### 43.3.3 Write Data Pipeline

When this feature is enabled, the write data from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would cost at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write data from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write address is also ready at this cycle).

For the normal OCRAM, the write data pipeline is configurable via IOMUXC.GPR3[2].

### 43.3.4 Write Address Pipeline

When this feature is enabled, the write address from the AXI master would be delayed 1 cycle before it can be accepted by the on-chip RAM.

This can avoid setup time issue for the write access on the memory cell at high frequency. Enabling this feature would take at most 1 more clock cycle for each AXI write transaction, that is, at most 1 more clock cycle for each write burst with multiple beats of data.

When this feature is disabled, the write address from the AXI master can be accepted by the on-chip RAM without delay, and data can be written to memory at this cycle (if no other access and write data is also ready at this cycle).

For the normal OCRAM, the write address pipeline is configurable via IOMUXC.GPR3[3]

## 43.4 Programmable Registers

There are no programmable registers in this block; however, OCRAM configurable bits can be found in the IOMUX Controller (IOMUXC) general purpose registers found here.

- TrustZone bits: IOMUXC\_GPR10
- WAIT state / Pipeline bits: IOMUXC\_GPR3

# Chapter 44

## Periodic Interrupt Timer (PIT)

### 44.1 Introduction

The PIT module is an array of timers that can be used to raise interrupts and trigger DMA channels.

#### 44.1.1 Block diagram

The following figure shows the block diagram of the PIT module.

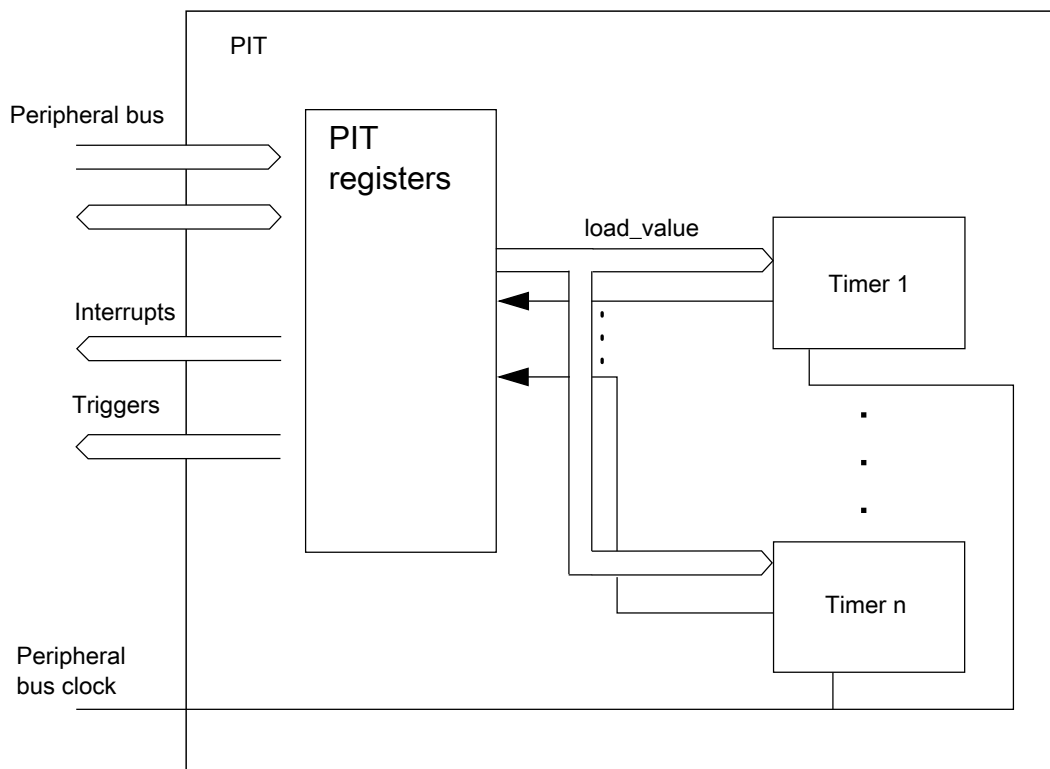

Figure 44-1. Block diagram of the PIT

## 44.1.2 Features

The main features of this block are:

- Ability of timers to generate DMA trigger pulses
- Ability of timers to generate interrupts
- Maskable interrupts
- Independent timeout periods for each timer

## 44.2 Modes of operation

This subsection describes briefly all operating modes supported by the PIT.

- Run Mode  
All functional parts of the PIT are running during normal Run Mode.
- Stop Mode

## 44.3 Signal description

The PIT module has no external pins.

## 44.4 Functional description

This section provides the functional description of the module.

### 44.4.1 General operation

This section gives detailed information on the internal operation of the module. Each timer can be used to generate trigger pulses and interrupts. Each interrupt is available on a separate interrupt line.

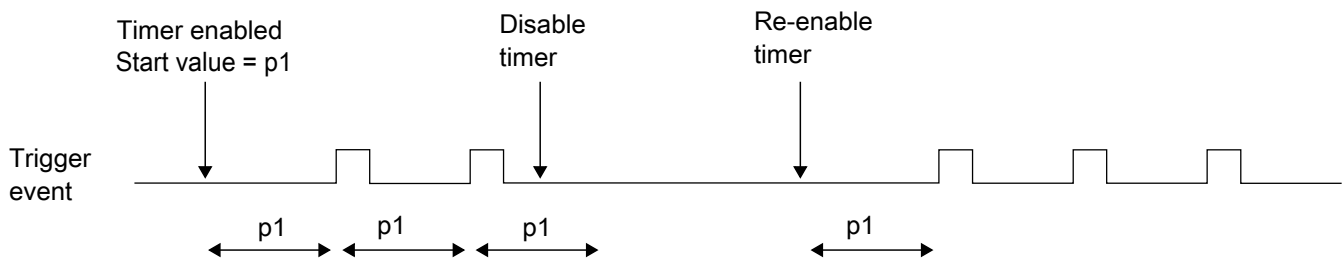

### 44.4.1.1 Timers

The timers generate triggers at periodic intervals, when enabled. The timers load the start values as specified in their LDVAL registers, count down to 0 and then load the respective start value again. Each time a timer reaches 0, it will generate a trigger pulse and set the interrupt flag.

All interrupts can be enabled or masked by setting TCTRLn[TIE]. A new interrupt can be generated only after the previous one is cleared.

If desired, the current counter value of the timer can be read via the CVAL registers.

The counter period can be restarted, by first disabling, and then enabling the timer with TCTRLn[TEN]. See the following figure.

**Figure 44-2. Stopping and starting a timer**

The counter period of a running timer can be modified, by first disabling the timer, setting a new load value, and then enabling the timer again. See the following figure.

**Figure 44-3. Modifying running timer period**

It is also possible to change the counter period without restarting the timer by writing LDVAL with the new load value. This value will then be loaded after the next trigger event. See the following figure.

## Initialization and application information

Figure 44-4. Dynamically setting a new load value

### 44.4.1.2 Debug mode

In Debug mode, the timers will be frozen based on MCR[FRZ]. This is intended to aid software development, allowing the developer to halt the processor, investigate the current state of the system, for example, the timer values, and then continue the operation.

### 44.4.2 Interrupts

All the timers support interrupt generation. See the MCU specification for related vector addresses and priorities.

Timer interrupts can be enabled by setting TCTRLn[TIE]. TFLGn[TIF] are set to 1 when a timeout occurs on the associated timer, and are cleared to 0 by writing a 1 to the corresponding TFLGn[TIF].

### 44.4.3 Chained timers

When a timer has chain mode enabled, it will only count after the previous timer has expired. So if timer n-1 has counted down to 0, counter n will decrement the value by one. This allows to chain some of the timers together to form a longer timer. The first timer (timer 0) cannot be chained to any other timer.

## 44.5 Initialization and application information

In the example configuration:

- The PIT clock has a frequency of 50 MHz.

- Timer 1 creates an interrupt every 5.12 ms.
- Timer 3 creates a trigger event every 30 ms.

The PIT module must be activated by writing a 0 to MCR[MDIS].

The 50 MHz clock frequency equates to a clock period of 20 ns. Timer 1 needs to trigger every  $5.12 \text{ ms}/20 \text{ ns} = 256,000$  cycles and Timer 3 every  $30 \text{ ms}/20 \text{ ns} = 1,500,000$  cycles. The value for the LDVAL register trigger is calculated as:

$\text{LDVAL trigger} = (\text{period} / \text{clock period}) - 1$

This means LDVAL1 and LDVAL3 must be written with 0x0003E7FF and 0x0016E35F respectively.

The interrupt for Timer 1 is enabled by setting TCTRL1[TIE]. The timer is started by writing 1 to TCTRL1[TEN].

Timer 3 shall be used only for triggering. Therefore, Timer 3 is started by writing a 1 to TCTRL3[TEN]. TCTRL3[TIE] stays at 0.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 1
PIT_LDVAL1 = 0x0003E7FF; // setup timer 1 for 256000 cycles
PIT_TCTRL1 = TIE; // enable Timer 1 interrupts
PIT_TCTRL1 |= TEN; // start Timer 1

// Timer 3
PIT_LDVAL3 = 0x0016E35F; // setup timer 3 for 1500000 cycles
PIT_TCTRL3 |= TEN; // start Timer 3
```

## 44.6 Example configuration for chained timers

In the example configuration:

- The PIT clock has a frequency of 100 MHz.
- Timers 1 and 2 are available.
- An interrupt shall be raised every 1 minute.

The PIT module needs to be activated by writing a 0 to MCR[MDIS].

## Example configuration for the lifetime timer

The 100 MHz clock frequency equates to a clock period of 10 ns, so the PIT needs to count for 6000 million cycles, which is more than a single timer can do. So, Timer 1 is set up to trigger every 6 s (600 million cycles). Timer 2 is chained to Timer 1 and programmed to trigger 10 times.

The value for the LDVAL register trigger is calculated as number of cycles-1, so LDVAL1 receives the value 0x23C345FF and LDVAL2 receives the value 0x00000009.

The interrupt for Timer 2 is enabled by setting TCTRL2[TIE], the Chain mode is activated by setting TCTRL2[CHN], and the timer is started by writing a 1 to TCTRL2[TEN]. TCTRL1[TEN] needs to be set, and TCTRL1[CHN] and TCTRL1[TIE] are cleared.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 2
PIT_LDVAL2 = 0x00000009; // setup Timer 2 for 10 counts
PIT_TCTRL2 = TIE; // enable Timer 2 interrupt
PIT_TCTRL2 |= CHN; // chain Timer 2 to Timer 1
PIT_TCTRL2 |= TEN; // start Timer 2

// Timer 1
PIT_LDVAL1 = 0x23C345FF; // setup Timer 1 for 600 000 000 cycles
PIT_TCTRL1 = TEN; // start Timer 1
```

## 44.7 Example configuration for the lifetime timer

To configure the lifetime timer, channels 0 and 1 need to be chained together.

First the PIT module needs to be activated by writing a 0 to the MDIS bit in the CTRL register, then the LDVAL registers need to be set to the maximum value.

The timer is a downcounter.

The following example code matches the described setup:

```
// turn on PIT
PIT_MCR = 0x00;

// Timer 1
PIT_LDVAL1 = 0xFFFFFFFF; // setup timer 1 for maximum counting period
PIT_TCTRL1 = 0x0; // disable timer 1 interrupts
PIT_TCTRL1 |= CHN; // chain timer 1 to timer 0
PIT_TCTRL1 |= TEN; // start timer 1

// Timer 0
```

```
PIT_LDVAL0 = 0xFFFFFFFF; // setup timer 0 for maximum counting period
PIT_TCTRL0 = TEN; // start timer 0
```

To access the lifetime, read first LTMR64H and then LTMR64L.

```
current_uptime = PIT_LTMR64H<<32;
current_uptime = current_uptime + PIT_LTMR64L;
```

## 44.8 PIT Register Descriptions

This section provides a detailed description of all registers accessible in the PIT module.

- Reserved registers will read as 0, writes will have no effect.
- See the chip-specific PIT information for the number of PIT channels used in this MCU.

### 44.8.1 PIT Memory Map

PIT base address: 4008\_4000h

Offset	Register	Width (In bits)	Access	Reset value
0h	PIT Module Control (MCR)	32	RW	00000002h
E0h	PIT Upper Lifetime Timer (LTMR64H)	32	RO	00000000h
E4h	PIT Lower Lifetime Timer (LTMR64L)	32	RO	00000000h
100h	Timer Load Value (LDVAL0)	32	RW	00000000h
104h	Current Timer Value (CVAL0)	32	RO	00000000h
108h	Timer Control (TCTRL0)	32	RW	00000000h
10Ch	Timer Flag (TFLG0)	32	W1C	00000000h
110h	Timer Load Value (LDVAL1)	32	RW	00000000h
114h	Current Timer Value (CVAL1)	32	RO	00000000h
118h	Timer Control (TCTRL1)	32	RW	00000000h
11Ch	Timer Flag (TFLG1)	32	W1C	00000000h
120h	Timer Load Value (LDVAL2)	32	RW	00000000h
124h	Current Timer Value (CVAL2)	32	RO	00000000h
128h	Timer Control (TCTRL2)	32	RW	00000000h
12Ch	Timer Flag (TFLG2)	32	W1C	00000000h
130h	Timer Load Value (LDVAL3)	32	RW	00000000h
134h	Current Timer Value (CVAL3)	32	RO	00000000h
138h	Timer Control (TCTRL3)	32	RW	00000000h
13Ch	Timer Flag (TFLG3)	32	W1C	00000000h

## 44.8.2 PIT Module Control (MCR)

### 44.8.2.1 Address

Register	Offset
MCR	0h

### 44.8.2.2 Function

This register enables or disables the PIT timer clocks and controls the timers when the PIT enters the Debug mode.

Access: User read/write

### 44.8.2.3 Diagram

### 44.8.2.4 Fields

Field	Function
31-3	Reserved
—	
2	Reserved

Table continues on the next page...

Field	Function
—	
1 MDIS	Module Disable - (PIT section) Disables the standard timers. This field must be enabled before any other setup is done. 0b - Clock for standard PIT timers is enabled. 1b - Clock for standard PIT timers is disabled.
0 FRZ	Freeze Allows the timers to be stopped when the device enters the Debug mode. 0b - Timers continue to run in Debug mode. 1b - Timers are stopped in Debug mode.

### 44.8.3 PIT Upper Lifetime Timer (LTMR64H)

#### 44.8.3.1 Address

Register	Offset
LTMR64H	E0h

#### 44.8.3.2 Function

This register is intended for applications that chain timer 0 and timer 1 to build a 64-bit lifetimer.

Access: User read only

#### 44.8.3.3 Diagram

### 44.8.3.4 Fields

Field	Function
31-0	Life Timer value
LTH	Shows the timer value of timer 1. If this register is read at a time t1, LTMR64L shows the value of timer 0 at time t1.

## 44.8.4 PIT Lower Lifetime Timer (LTMR64L)

### 44.8.4.1 Address

Register	Offset
LTMR64L	E4h

### 44.8.4.2 Function

This register is intended for applications that chain timer 0 and timer 1 to build a 64-bit lifetimer.

To use LTMR64H and LTMR64L, timer 0 and timer 1 need to be chained. To obtain the correct value, first read LTMR64H and then LTMR64L. LTMR64H will have the value of CVAL1 at the time of the first access, LTMR64L will have the value of CVAL0 at the time of the first access, therefore the application does not need to worry about carry-over effects of the running counter.

Access: User read only

### 44.8.4.3 Diagram

### 44.8.4.4 Fields

Field	Function
31-0	Life Timer value
LTL	Shows the value of timer 0 at the time LTMR64H was last read. It will only update if LTMR64H is read.

## 44.8.5 Timer Load Value (LDVALa)

### 44.8.5.1 Address

Register	Offset
LDVAL0	100h
LDVAL1	110h
LDVAL2	120h
LDVAL3	130h

### 44.8.5.2 Function

These registers select the timeout period for the timer interrupts. Access: User read/write

### 44.8.5.3 Diagram

### 44.8.5.4 Fields

Field	Function
31-0	Timer Start Value
TSV	Sets the timer start value. The timer will count down until it reaches 0, then it will generate an interrupt and load this register value again. Writing a new value to this register will not restart the timer; instead the value will be loaded after the timer expires. To abort the current cycle and start a timer period with the new value, the timer must be disabled and enabled again.

## 44.8.6 Current Timer Value (CVALa)

### 44.8.6.1 Address

Register	Offset
CVAL0	104h
CVAL1	114h
CVAL2	124h
CVAL3	134h

### 44.8.6.2 Function

These registers indicate the current timer position. Access: User read only

### 44.8.6.3 Diagram

### 44.8.6.4 Fields

Field	Function
31-0	Current Timer Value
TVL	Represents the current timer value, if the timer is enabled. <b>NOTE:</b> <ul style="list-style-type: none"> <li>• If the timer is disabled, do not use this field as its value is unreliable.</li> <li>• The timer uses a downcounter. The timer values are frozen in Debug mode if MCR[FRZ] is set.</li> </ul>

## 44.8.7 Timer Control (TCTRLa)

### 44.8.7.1 Address

Register	Offset
TCTRL0	108h
TCTRL1	118h
TCTRL2	128h
TCTRL3	138h

### 44.8.7.2 Function

These registers contain the control bits for each timer.

Access: User read/write

### 44.8.7.3 Diagram

### 44.8.7.4 Fields

Field	Function
31-3 —	Reserved
2 CHN	Chain Mode When activated, Timer n-1 needs to expire before timer n can decrement by 1. Timer 0 cannot be chained. 0b - Timer is not chained. 1b - Timer is chained to previous timer. For example, for Channel 2, if this field is set, Timer 2 is chained to Timer 1.
1 TIE	Timer Interrupt Enable When an interrupt is pending, or, TFLGn[TIF] is set, enabling the interrupt will immediately cause an interrupt event. To avoid this, the associated TFLGn[TIF] must be cleared first. 0b - Interrupt requests from Timer n are disabled. 1b - Interrupt will be requested whenever TIF is set.
0 TEN	Timer Enable Enables or disables the timer. 0b - Timer n is disabled. 1b - Timer n is enabled.

### 44.8.8 Timer Flag (TFLGa)

### 44.8.8.1 Address

Register	Offset
TFLG0	10Ch
TFLG1	11Ch
TFLG2	12Ch
TFLG3	13Ch

### 44.8.8.2 Function

These registers hold the PIT interrupt flags.

Access: User read/write

### 44.8.8.3 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W																	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	0															TIF	
W																w1c	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

### 44.8.8.4 Fields

Field	Function
31-1 —	Reserved
0 TIF	Timer Interrupt Flag Sets to 1 at the end of the timer period. Writing 1 to this flag clears it. Writing 0 has no effect. If enabled, or, when TCTRLn[TIE] = 1, TIF causes an interrupt request. 0b - Timeout has not yet occurred. 1b - Timeout has occurred.

# Chapter 45

## Power Management Unit (PMU)

### 45.1 Chip-specific PMU information

#### NOTE

The following bitfields are not applicable on this device, and those corresponding bits are **Reserved**:

- in PMU\_REG\_CORE $n$  register: RAMP\_RATE, REG2\_TARG, REG0\_TARG.
- in PMU\_MISC1 $n$  register: IRQ\_DIG\_BO.
- in PMU\_MISC2 $n$  register: REG2\_STEP\_TIME, REG0\_STEP\_TIME, REG2\_OK, REG2\_ENABLE\_BO, REG2\_BO\_STATUS, REG2\_BO\_OFFSET, REG0\_ENABLE\_BO, REG0\_BO\_STATUS.

### 45.2 Overview

The power management unit (PMU) is designed to simplify the external power interface. The power system can be split into the input power sources and their characteristics, the integrated power transforming and controlling elements, and the final load interconnection and requirements.

A typical power system uses the PMU is depicted in the following diagram.

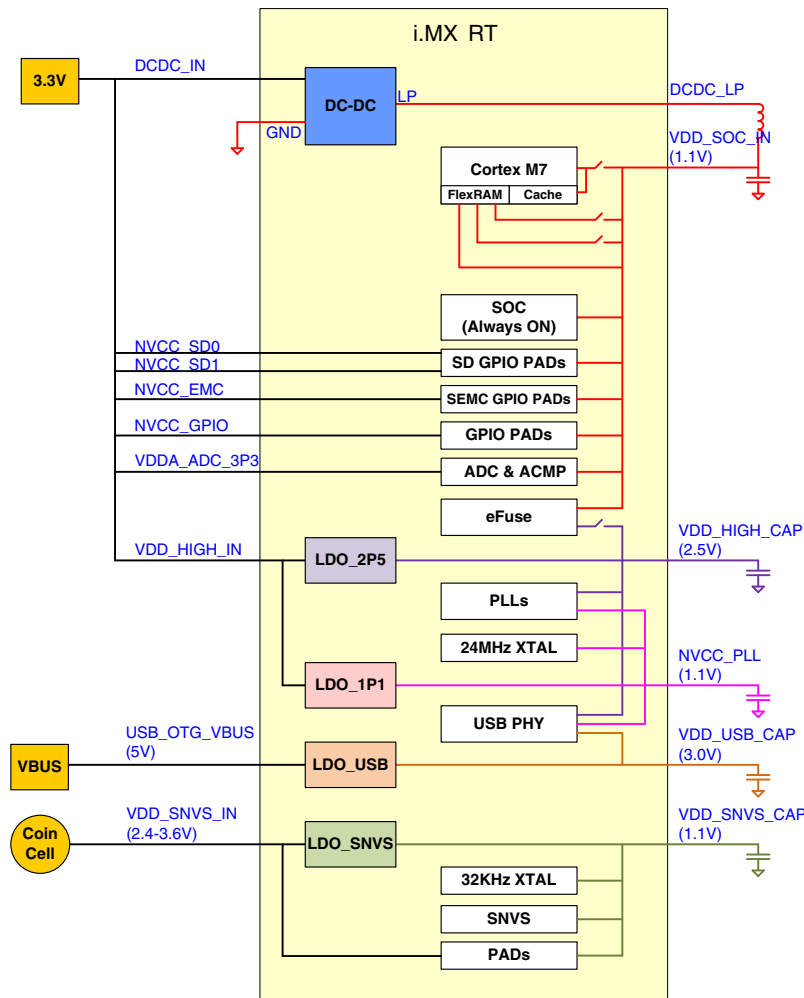

Figure 45-1. Power system overview

Using four LDO regulators, the number of external supplies is greatly reduced. Not counting the backup coin and USB inputs, the number of external supplies is reduced to two. Missing from this external supply total is the number of necessary external supplies to power the desired memory interface; that number varies depending on the type of external memory selected. Other supplies may also be necessary to supply the voltage to the different I/O power segments if their I/O voltages have to be different from what is provided above.

### 45.3 Digital LDO Regulators

The PMU has three digital LDO regulators. They are referred to as "digital" because of the logic loads they drive, not because of their construction. These regulators have three basic modes that are unique to the digital regulators.

- **Power Gate**—The regulation FET is switched off fully, limiting the current draw from the supply. The analog part of the regulator is powered down, limiting the power consumption. The output voltage falls to a level at which the residual leakage of the power FET balances with the leakage of the load. (TARG = 0x00)
- **Analog regulation mode**—The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25mV steps.

These modes allow the regulators to implement voltage scaling and power gating and allow bypass. With the bypass feature, all of the accuracy and control requirements can be shifted to the external supply source if capable and desired.

These digital regulators also feature brownout detection which is helpful when supplies are starting to collapse. The voltage value where brownout is signaled is programmable as an offset from the programmed target voltage. The controls are located in the PMU\_MISC2 register. The core is interrupted on a brownout.

Care must be taken when raising the output voltage of the regulator rapidly. This can cause large currents to flow into the output cap of the regulator up to the limits of the input supply. When the input supply capability is exceeded, this can cause an input supply dip that may affect other regulators on the same supply. Therefore, the rate of voltage change on the output of the regulator should be limited. When powering up the regulator, the integrated current limiter controls the ramp rate. This limiter is only effective when transitioning from the off state of the regulator (bypassed or power gated).

However, in a DVFS situation, the same high rate of change can occur if the target voltage is raised rapidly by software. To limit the rate of change, the hardware controlling the regulator effects a piecewise linear ramp by stepping the output voltage in 25mV steps until the desired output voltage is reached. The slope of the ramp is controlled by the time spent at each 25mV step and is controlled by the step time field in the PMU\_MISC2 register. The same situation is not a problem when the output voltage is dropped as the load pulls down the output cap. As a result, any reduction in the programmed regulator target voltage is immediately effective with the actual supply voltage falling at a rate controlled by the load on the regulator.

## 45.4 Analog LDO Regulators

There are two analog regulators described here.

### 45.4.1 LDO 1P1

The LDO\_1P1 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8 V–3.3 V) to produce a nominal 1.1 V output voltage.

The output of the regulator can be programmed in 25 mV steps from 0.8 V to 1.4 V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken.

Current limiting can be enabled by setting the PMU\_REG\_1P1[ENABLE\_ILIMIT] bit to allow for in-rush current requirements during startup if needed. Active pulldown can also be enabled by setting the PMU\_REG\_1P1[ENABLE\_PULLDOWN] bit for systems requiring this feature.

### 45.4.2 LDO 2P5

The LDO\_2P5 module on the chip implements a programmable linear-regulator function from a higher analog supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage.

The output of the regulator can be programmed in 25mV steps from 2.0V to 2.75V. The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitance, though the actual capacitance required should be determined by the application. A programmable brown-out detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps.

Current-limiting can be enabled by setting the REG\_PMU\_2P5[ENABLE\_ILIMIT] bit to allow for in-rush current requirements during start-up if needed. Active-pulldown can also be enabled by setting the REG\_PMU\_2P5[ENABLE\_PULLDOWN] bit for systems requiring this feature.

### 45.4.3 Low Power Operation

The 1.1 V and 2.5 V LDO includes an alternate, self-biased, low-precision, weak regulator which can be enabled for applications needing to keep the 1.1 V and 2.5 V output voltage alive during low-power modes where the main regulator and its associated global bandgap reference module are disabled.

The output of this weak regulator is not programmable and is a function of its input power supply as well as load current. The low-power mode is enabled by setting high the PMU\_REG\_1P1[ENABLE\_WEAK\_LINREG] and PMU\_REG\_2P5[ENABLE\_WEAK\_LINREG] bit of the regulator. It is recommended that the following sequence be followed to enable this mode:

1. Throttle down the 1.1 V / 2.5 V attached load to its low-power maintain state.
2. Disable the main 1.1 V / 2.5 V regulator driver by clearing the PMU\_REG\_1P1[ENABLE\_LINREG] / PMU\_REG\_2P5[ENABLE\_LINREG] bit.
3. Enable the weak 1.1 V / 2.5 V regulator by setting the PMU\_REG\_1P1[ENABLE\_WEAK\_LINREG] / PMU\_REG\_2P5[ENABLE\_WEAK\_LINREG] bit.

To go back to full-power operation, reverse the steps outlined above. Note that the external decoupling cap is supporting the power supply between steps 2 and 3. Therefore step 3 should happen appropriately in time relative to the discharge of the supporting capacitor.

## 45.5 USB LDO Regulator

The USB\_LDO module on the chip implements a programmable linear-regulator function from the USB VBUS voltages (typically 5 V) to produce a nominal 3.0 V output voltage.

The output of the regulator can be programmed in 25 mV steps, from 2.625V to 3.4 V . The regulator has been designed to be stable with a minimum external low-ESR decoupling capacitor of 4.7  $\mu$ F, though the actual capacitance required should be determined by the application. A programmable brownout detector is included in the regulator which can be used by the system to determine when the load capability of the regulator is being exceeded, so the necessary steps can be taken. This regulator has a built-in power mux which allows the user to choose to run the regulator from either VBUS supply when both are present. If only one of the VBUS voltages is present, then the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets.

Upon attachment of VBUS, this regulator starts up in a low-power, self-preservation mode to prevent over-voltage conditions on the chip. It is expected that the user transition to full regulation by enabling the regulator and disabling the in-rush current limits via its control registers. Upon VBUS removal, it is further expected that the regulator controls are returned to their reset state.

## 45.6 SNVS Regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which powers the real time clock and SNVS blocks.

The SNVS\_LDO is a non-programmable linear-regulator function, producing a nominal 1.1V output voltage.

## 45.7 PMU Memory Map/Register Definition

The register definitions that affect the behavior of the digital LDO regulators follow.

### NOTE

Some of the registers are collections of bits that affect multiple components on the chip. Those that are not pertinent to this chapter have comments in the related register bitfields.

If a full description is desired, please consult the full register programming reference in the related block.

### 45.7.1 Regulator 1P1 Register (PMU\_REG\_1P1n)

This register defines the control and status bits for the 1.1V regulator. This regulator is designed to power the digital portions of the analog cells.

Address: 400D\_8000h base + 110h offset + (4d × i), where i=0d to 3d

**PMU\_REG\_1P1n field descriptions**

Field	Description
31–20 -	This field is reserved.
19 SELREF_ WEAK_LINREG	Selects the source for the reference voltage of the weak 1p1 regulator. 0 Weak-linreg output tracks low-power-bandgap voltage 1 Weak-linreg output tracks VDD_SOC_IN voltage
18 ENABLE_ WEAK_LINREG	Enables the weak 1p1 regulator. This regulator can be used when the main 1p1 regulator is disabled, under low-power conditions.
17 OK_VDD1P1	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD1P1	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples. Choices must be in this range: 0x1b >= output_trg >= 0x04  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x04 0.8V 0x10 1.1V 0x1b 1.375V
7 -	This field is reserved.

Table continues on the next page...

**PMU\_REG\_1P1n field descriptions (continued)**

Field	Description
6-4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_PULLDOWN	Control bit to enable the pull-down circuitry in the regulator
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output.

### 45.7.2 Regulator 3P0 Register (PMU\_REG\_3P0n)

This register defines the control and status bits for the 3.0V regulator powered by the host USB VBUS pin.

Address: 400D\_8000h base + 120h offset + (4d × i), where i=0d to 3d

PMU\_REG\_3P0n field descriptions

Field	Description
31-18 -	This field is reserved.

Table continues on the next page...

## PMU\_REG\_3P0n field descriptions (continued)

Field	Description
17 OK_VDD3P0	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD3P0	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples.  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x00 2.625V 0x0f 3.000V 0x1f 3.400V
7 VBUS_SEL	Select input voltage source for LDO_3P0 from either USB_OTG1_VBUS or USB_OTG2_VBUS. If only one of the two VBUS voltages is present, it is automatically selected.  1 <b>USB_OTG1_VBUS</b> — Utilize VBUS OTG1 power 0 <b>USB_OTG2_VBUS</b> — Utilize VBUS OTG2 power
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may not be relevant because of input supply limitations or load operation.
3 -	Reserved
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output to be set by the programmed target voltage setting and internal bandgap reference.

### 45.7.3 Regulator 2P5 Register (PMU\_REG\_2P5n)

This register defines the control and status bits for the 2.5V regulator.

Address: 400D\_8000h base + 130h offset + (4d × i), where i=0d to 3d

## PMU Memory Map/Register Definition

### PMU\_REG\_2P5n field descriptions

Field	Description
31–19 -	This field is reserved.
18 ENABLE_WEAK_LINREG	Enables the weak 2p5 regulator. This low power regulator is used when the main 2p5 regulator is disabled to keep the 2.5V output roughly at 2.5V. Scales directly with the value of VDDHIGH_IN.
17 OK_VDD2P5	Status bit that signals when the regulator output is ok. 1 = regulator output > brownout target
16 BO_VDD2P5	Status bit that signals when a brownout is detected on the regulator output.
15–13 -	This field is reserved.
12–8 OUTPUT_TRG	Control bits to adjust the regulator output voltage. Each LSB is worth 25mV. Programming examples are detailed below. Other output target voltages may be interpolated from these examples.  <b>NOTE:</b> There may be reduced chip functionality or reliability at the extremes of the programming range.  0x00 2.10V 0x10 2.50V 0x1f 2.875V
7 -	This field is reserved.
6–4 BO_OFFSET	Control bits to adjust the regulator brownout offset voltage in 25mV steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.
3 ENABLE_PULLDOWN	Control bit to enable the pull-down circuitry in the regulator

Table continues on the next page...

## PMU\_REG\_2P5n field descriptions (continued)

Field	Description
2 ENABLE_ILIMIT	Control bit to enable the current-limit circuitry in the regulator.
1 ENABLE_BO	Control bit to enable the brownout circuitry in the regulator.
0 ENABLE_LINREG	Control bit to enable the regulator output.

## 45.7.4 Digital Regulator Core Register (PMU\_REG\_COREn)

This register defines the function of the digital regulators

Address: 400D\_8000h base + 140h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## PMU\_REG\_COREn field descriptions

Field	Description
31–30 -	This field is reserved.
29 FET_ODRIVE	If set, increases the gate drive on power gating FETs to reduce leakage in the off state. Care must be taken to apply this bit only when the input supply voltage to the power FET is less than 1.1V.  <b>NOTE:</b> This bit should only be used in low-power modes where the external input supply voltage is nominally 0.9V.
28–27 RAMP_RATE	Regulator voltage ramp rate.  00 Fast 01 Medium Fast

Table continues on the next page...

**PMU\_REG\_COREn field descriptions (continued)**

Field	Description
	10 Medium Slow 11 Slow
26–23 REG2_ADJ	This bit field defines the adjustment bits to calibrate the target value of Reg2. The adjustment is applied on top on any adjustment applied to the global reference in the misc0 register.  0000 No adjustment 0001 + 0.25% 0010 + 0.50% 0011 + 0.75% 0100 + 1.00% 0101 + 1.25% 0110 + 1.50% 0111 + 1.75% 1000 - 0.25% 1001 - 0.50% 1010 - 0.75% 1011 - 1.00% 1100 - 1.25% 1101 - 1.50% 1110 - 1.75% 1111 - 2.00%
22–18 REG2_TARG	This field defines the target voltage for the SOC power domain. Single-bit increments reflect 25mV core voltage steps. Some steps may not be relevant because of input supply limitations or load operation.  <b>NOTE:</b> This register is capable of programming an over-voltage condition on the device. Consult the datasheet Operating Ranges table for the allowed voltages.  00000 Power gated off 00001 Target core voltage = 0.725V 00010 Target core voltage = 0.750V 00011 Target core voltage = 0.775V ... 10000 Target core voltage = 1.100V ... 11110 Target core voltage = 1.450V 11111 Power FET switched full on. No regulation.
17–14 REG1_ADJ	This bit field defines the adjustment bits to calibrate the target value of Reg1. The adjustment is applied on top on any adjustment applied to the global reference in the misc0 register.  0000 No adjustment 0001 + 0.25% 0010 + 0.50% 0011 + 0.75% 0100 + 1.00% 0101 + 1.25% 0110 + 1.50% 0111 + 1.75% 1000 - 0.25%

00011	Target core voltage = 0.775V
...	
10000	Target core voltage = 1.100V
...	
11110	Target core voltage = 1.450V
11111	Power FET switched full on. No regulation.

## 45.7.5 Miscellaneous Register 0 (PMU\_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 400D\_8000h base + 150h offset + (4d × i), where i=0d to 3d

## PMU Memory Map/Register Definition

### PMU\_MISC0n field descriptions

Field	Description
31 VID_PLL_PREDIV	Predivider for the source clock of the PLL's. 0 Divide by 1 1 Divide by 2
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true.
29 RTC_XTAL_SOURCE	This field indicates which chip source is being used for the rtc clock. 0 Internal ring oscillator 1 RTC_XTAL
28-26 CLKGATE_DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify. <b>NOTE:</b> Not related to PMU.  000 0.5ms 001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms

Table continues on the next page...

PMU\_MISCO<sub>n</sub> field descriptions (continued)

Field	Description
	101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.  <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.  <b>NOTE:</b> Not related to PMU.  0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable.  <b>NOTE:</b> Not related to PMU, Clocking content
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.  <b>NOTE:</b> Not related to PMU, clocking content.
14–13 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.  <b>NOTE:</b> Not related to PMU.  00 <b>NOMINAL</b> — Nominal 01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5% 10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0% 11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%
12 DISCON_HIGH_SNVS	This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.  0 Turn on the switch 1 Turn off the switch
11–10 STOP_MODE_CONFIG	Configure the analog behavior in stop mode.  00 <b>SUSPEND (DSM)</b> — All analog except rtc powered down on stop mode assertion. 01 <b>STANDBY</b> — Analog regulators are ON. 10 <b>STOP (lower power)</b> — Analog regulators are ON. 11 <b>STOP (very lower power)</b> — Analog regulators are OFF.
9–8 -	This field is reserved. Reserved
7 REFTOP_VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable.

Table continues on the next page...

PMU\_MISC0n field descriptions (continued)

Field	Description
6-4 REFTOP_ VBGADJ	000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_ SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap.  <b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit.  0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2-1 -	This field is reserved.
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry.  <b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, pll, and other analog functions on the die.

## 45.7.6 Miscellaneous Register 1 (PMU\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 400D\_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### PMU\_MISC1n field descriptions

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.
30 IRQ_ANA_BO	This status bit is set to one when when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted.
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature.

Table continues on the next page...

PMU\_MISC1n field descriptions (continued)

Field	Description
	<b>NOTE:</b> Not related to PMU, Temperature Monitor content.
28 IRQ_TEMPLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature. <b>NOTE:</b> Not related to PMU, Temperature Monitor content.
27 IRQ_TEMP PANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature. <b>NOTE:</b> Not related to PMU, Temperature Monitor content.
26–18 -	This field is reserved. Reserved
17 PFD_528_AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 LVDSCLK2_IBEN	This enables the LVDS input buffer for anaclk2/2b. Do not enable input and output buffers simultaneously. <b>NOTE:</b> Not related to PMU.
12 LVDSCLK1_IBEN	This enables the LVDS input buffer for anaclk1/1b. Do not enable input and output buffers simultaneously. <b>NOTE:</b> Not related to PMU, Clocking content.
11 LVDSCLK2_OBEN	This enables the LVDS output buffer for anaclk2/2b. Do not enable input and output buffers simultaneously. <b>NOTE:</b> Not related to PMU.
10 LVDSCLK1_OBEN	This enables the LVDS output buffer for anaclk1/1b. Do not enable input and output buffers simultaneously. <b>NOTE:</b> Not related to PMU, clocking content.
9–5 LVDS2_CLK_SEL	This field selects the clk to be routed to anaclk2/2b. <b>NOTE:</b> Not related to PMU.  00000 <b>ARM_PLL</b> — Arm PLL 00001 <b>SYS_PLL</b> — System PLL 00010 <b>PFD4</b> — ref_pfd4_clk == pll2_pfd0_clk 00011 <b>PFD5</b> — ref_pfd5_clk == pll2_pfd1_clk 00100 <b>PFD6</b> — ref_pfd6_clk == pll2_pfd2_clk 00101 <b>PFD7</b> — ref_pfd7_clk == pll2_pfd3_clk 00110 <b>AUDIO_PLL</b> — Audio PLL 00111 <b>VIDEO_PLL</b> — Video PLL

Table continues on the next page...

## PMU\_MISC1n field descriptions (continued)

Field	Description
	01000 <b>MLB_PLL</b> — MLB PLL
	01001 <b>ETHERNET_REF</b> — ethernet ref clock (ENET_PLL)
	01010 <b>PCIE_REF</b> — PCIe ref clock (125M)
	01011 <b>SATA_REF</b> — SATA ref clock (100M)
	01100 <b>USB1_PLL</b> — USB1 PLL clock
	01101 <b>USB2_PLL</b> — USB2 PLL clock
	01110 <b>PFD0</b> — ref_pfd0_clk == pll3_pfd0_clk
	01111 <b>PFD1</b> — ref_pfd1_clk == pll3_pfd1_clk

Table continues on the next page...

PMU\_MISC2n field descriptions (continued)

Field	Description
	10 <b>256_CLOCKS</b> — 256 11 <b>512_CLOCKS</b> — 512
25–24 REG0_STEP_ TIME	Number of clock periods (24MHz clock).  00 <b>64_CLOCKS</b> — 64 01 <b>128_CLOCKS</b> — 128 10 <b>256_CLOCKS</b> — 256 11 <b>512_CLOCKS</b> — 512
23 AUDIO_DIV_ MSB	MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDION[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.  <b>NOTE:</b> MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value  <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.  00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4
22 REG2_OK	Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output > brownout_target
21 REG2_ENABLE_ BO	Enables the brownout detection.
20 -	This field is reserved.
19 REG2_BO_ STATUS	Reg2 brownout status bit.
18–16 REG2_BO_ OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
15 AUDIO_DIV_LSB	LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDION[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4, /8, and /16.  <b>NOTE:</b> LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value  <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.  00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4

Table continues on the next page...

## PMU\_MISC2n field descriptions (continued)

Field	Description
14 -	This field is reserved. Reserved
13 REG1_ENABLE_ BO	Enables the brownout detection.
12 -	This field is reserved.
11 REG1_BO_ STATUS	Reg1 brownout status bit. 1 Brownout, supply is below target minus brownout offset.
10–8 REG1_BO_ OFFSET	This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V
7 PLL3_disable	Default value of "0". Should be set to "1" to turn off the USB-PLL(PLL3) in run mode. <b>NOTE:</b> Not related to PMU. See <a href="#">Clock Controller Module (CCM)</a> for more information.
6 -	This field is reserved.
5 REG0_ENABLE_ BO	Enables the brownout detection.
4 -	This field is reserved.
3 REG0_BO_ STATUS	Reg0 brownout status bit. 1 Brownout, supply is below target minus brownout offset.
REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation.  100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

# Chapter 46

## Pixel Pipeline (PXP)

### 46.1 Overview

This document describes the micro-architecture for the Pixel Processing Pipeline used to process graphics buffers or composite video and graphics data before sending to an LCD display or TV encoder.

It is used to minimize the memory footprint required for the display pipeline and provide an area and performance optimized to both SDRAM-less and SRAM-based systems.

The PXP integrates of several independent processing stages into a cohesive strategy to create flexible pixel pipeline.

The PXP combines the following into a single processing engine:

- Scaling
- Color Space Conversion (CSC)
- Rotation

By integrating multiple blocks, intermediate buffer operations to external memory are removed, reducing external memory bandwidth, power, and software control complexity. The PXP block diagram is shown below.

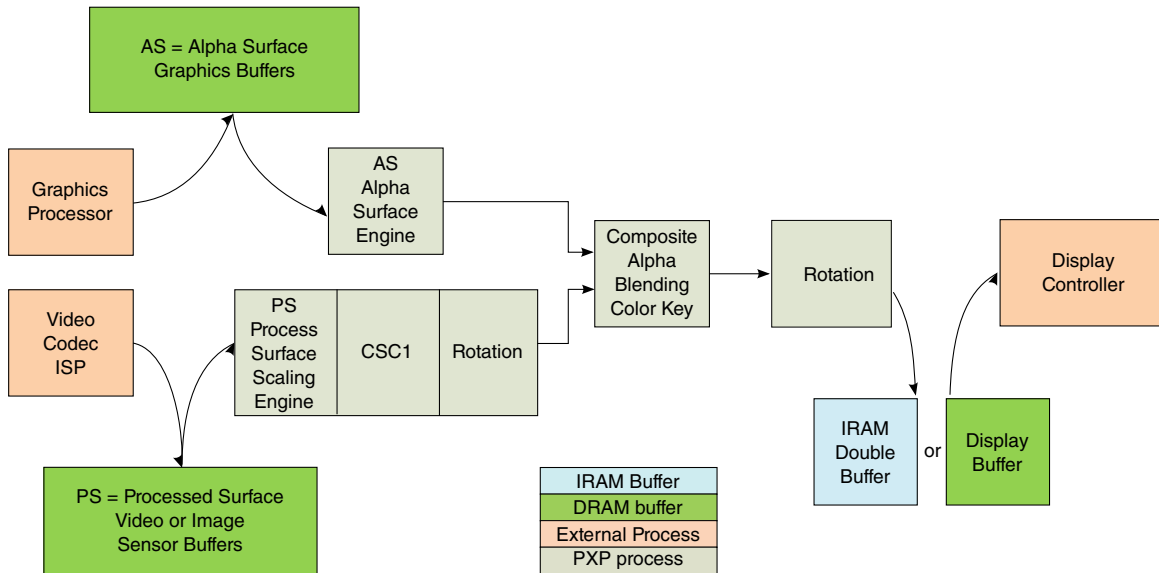

Figure 46-1. PXP Architecture

## 46.2 Clocks

The following table describes the clock sources for PXP. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

Table 46-1. PXP Clocks

Clock name	Clock Root	Description
clk	ipg_clk_root	PXP clock

## 46.3 Top-level architecture

The PXP consist of several pipelined blocks that perform the video source frame scaling, color space conversion, alpha-blending/color key algorithm, secondary CSC, pixel correction.

The entire pipeline operate within the requirements of the PXP architecture, and perform operations on either 8x8 or 16x16 pixel blocks in the representative source buffers. The entire pipeline operate within the context of two iteration counters that iterate through the appropriate grid of input blocks to produce the rotated output grid blocks in scan-line order.

shows the high-level architecture of the scaling, color space conversion, blending, pixel correction, rotation engines. The Alpha Surface Engine fetches one RGB graphics plane alpha surface (AS). The scaling engine fetches a single processed surface (PS), which can be blended with the AS surface. Although the PXP processes NxN pixel macro blocks, each of the AS or PS surfaces can have any pixel alignment within the output buffer. There are no restrictions and any pixel coordinates within the output buffer are valid. The upper left origin of the output buffer is defined as pixel 0,0. The upper left and lower right coordinates for each of the AS and PS are inclusive within the output buffer.

Figure 46-2 represents a sample output buffer configuration with both an AS and PS included. The alignment of each AS and PS within the output buffer can be at any arbitrary pixel locations. For example, the PS has an upper left coordinate (ULC) of 2,2 and a lower right coordinate (LRC) at pixel 13,13. The maximum value for the ULC and LRC for each of the AS and PS is bounded by the LRC of the output buffer, 15,15 for this example.

**Figure 46-2. Sample output buffer configuration**

The AS engine supports RGB pixel formats, and the PS engine supports RGB, YUV, and YCbCr pixel formats. The CSC1 can be used to convert to RGB pixel formats so that the PS surface can be blended with the AS surfaces in the compositing engine in the RGB color space. There is a single rotation engine in the PXP with a programmable location with two possible rotations, one after PS processing, other just before the transfer to display buffer. Rotation can occur after image composition or at the output of the PS engine. In the first scenario, all the data produced by the AS and PS engines is rotated. When the rotation module is programmed to rotate only PS images, the AS is not rotated, and AS pixels are combined with rotated PS surfaces.

### **46.3.1 Processing Details**

The PXP architecture has been driven primarily by the requirement that the output buffer must be processed and rotated without intermediate frame buffer stored in external memory.

This reduces the use of external memory bandwidth requirements thus reducing overall system power consumed.

Since the output of the rotation block must be NxN pixel blocks in scan order, the entire pipeline will operate on NxN pixel blocks. In essence, the pipeline will be able to operate on blocks in a random access fashion, but the entire pipeline will operate within the context of two iteration counters that will iterate through the horizontal and vertical input blocks to generate the required output block.

#### **Processing Pipeline**

The control block will coordinate the processing of the pixel blocks within the source and destination image buffers. It begins by issuing a command to each stage of the pipeline requesting that operations be done for the block at offset x, y. When the block accepts the command, it asserts its acknowledge signal for a single cycle to indicate the acceptance and allow the control unit to move to the next block.

When the PS and AS fetch engines have received a command, they will fetch the required data and place it into their fetch buffers. If compositing the RGB AS surface with the PS surface, then the output of the PS engine needs to be converted to the RGB color space using CSC1, since all compositing occurs in the RGB color space. For YUV output pixel formats, the CSC1 unit can be enabled to convert pixels into the RGB space for subsequent compositing with AS pixels. If the final output color space is YUV and there is no compositing required (AS not present, for example), then the CSC unit can be bypassed and the pixel data path will pass the YUV pixels to the rotation engine. For YUV output formats, scaling operations, and rotation operations are still valid, but blending RGB AS surfaces with YUV PS surfaces is NOT supported.

The alpha blender/color key module will process a pixel any time that both inputs present valid data.

A handshake will be created between each stage and a pipeline controller to handle the advance of the pipeline and generation of the iteration counters. The pipeline controller will also maintain the interlocks with the LCD interface for the case where the LCD display and pixel processing pipeline use the SRAM to maintain the double buffer block intermediate buffer.

### 46.3.2 Scaling Operation

The scaling engine operates on YUV (or YCbCr) 422 or 420 and any RGB formatted pixels. Each color plane is sourced from color planes indicated by different base address registers.

The scaling source data can be stored as 3 individual planes for each Y, U, and V data, stored as two planes as a single Y and interleaved UV plane, or stored as a single plane with YUV/RGB interleaved on a per byte basis.

The scaled output image is presented to the CSC module as YUV444 or RGB888 pixels with a single byte for each color channel. The scaler can reduce an input image by a maximum factor of 16. In this case, the output image will be 1/16 the dimension of the input image in each of the X and Y axis. There are no limits, essentially, on increasing the source image size. The theoretical maximum increase is 4096 since a 12 bit fractional step function is used when scaling an input image. Scaling in either axis, X or Y is independent, so a source image can appear stretched in either direction.

All source images pass through the scale engine. The PXP alpha blend module and AS pixel streams are in the RGB888 format, so PS pixel buffers must be converted to the RGB888 format for alpha blending. The scaling engine works with the CSC1 module to translate YUV/YCbCr pixel formats to RGB888 for output frame buffer compositing using the alpha blender. The CSC1 unit can be bypassed so compositing can occur in the alpha engine.

The scaling operation is divided into two scaling steps. The first step is a decimation scaler, and the second step is a bilinear filter. The decimation filter provide a maximum down scaling factor of 8, and the subsequent bilinear filter provides a maximum scaling factor of 2. Combined, the maximum scaling factor can be up to 16. The decimation and bilinear scaling engines are independently programmable. There is also an initial offset that is programmable to allow more source data to be considered in the bilinear scaling engine.

### 46.3.3 Decimation Image Scaling

The first of two scaling engines is the decimation filter.

The intent of the decimation filter is to use as much source data as is possible to create the output image frame buffer. The decimation filter simply discards certain pixels from the source PS image depending on the reduction selected.

For RGB pixel formats, each color channel is treated equally since there is the same amount of pixel data within each color plane. For YUV422/420 formats, the chroma samples are already subsampled by 2. In these decimation scenarios, the chroma decimation factor is adjusted to account for the pre-decimation of the chroma samples. For example, since YUV422 is already sub-sampled by 2 horizontally, an X decimation factor of 2 does not apply to the YUV422 pixels in the X direction. All the chroma samples are passed on to the bilinear filter in this case. As another example, an X decimation factor of 4 will decimate the chroma samples by 2, since this factor combined with the pre-decimation factor of 2 in the pixel source buffers totals an overall decimation factor of 4.

The following example will show which pixels (in green) in a source RGB buffer that are passed to the bilinear filter for an X decimation factor of 2 and a Y decimation factor of 4. All pixels coincident with dashed lines are discarded.

**Figure 46-3. RGB decimation X /2, Y /4**

Using the same decimation factor as the above scenario for RGB pixels, but using YUV420 source buffers, it can be shown that the decimation factor for the Y and UV components of data are decimated differently. This is due to the pre-decimation of the chroma samples in the source frame buffers. Figure 4: YUV420 decimation X /2, Y /4 indicates that the U/V samples in the X direction are not decimated, but the Y samples in the X direction are decimated by the factor of 2.

Figure 46-4. YUV420 decimation X /2, Y /4

### 46.3.4 Bilinear Image Scaling Filter

The PXP implements a bilinear scaling filter to resize an input image to a different resolution for display output.

The bilinear filter is a weighted average of the four nearest pixels that can be sourced to approximate the pixel in the output frame buffer.

When scaling YUV data, the UV values are offset by 0x80 (top bit inverted) to shift the signed UV bits into an unsigned equivalent with a range of 0 to 255. YCbCr data does not have to be shifted since it is defined as an unsigned byte. The REG\_CSC1\_COEF0[YCBCR\_MODE] bit controls whether this operation is applied to the input UV bytes.

After scaling, the offset is removed so that the range for UV data is signed from -128 to 127.

The reason for this adjustment is based on the implementation of an unsigned scaling engine, and therefore, is to ensure that the scaled values are handled properly. Consider the following table:

Format	pixel0	pixel1	average	Result
decimal	-2	+2	0	Correct
CbCr	0x7E	0x82	0x80	Correct (0x80 is 0 in CbCr)
UV	0xFE	0x02	0x80	Incorrect (0x80 is -128 in UV)
decimal	-32	+16	-8	Correct
CbCr	0x60	0x90	0x78	Correct (0x78 is -8 in CbCr)
UV	0xE0	0x10	0x78	Incorrect (0x78 is +120 in UV)

To compute the output pixel value at position as indicated by P, consider the diagram below.

Figure 46-5. Output Pixel Value

A step function is used to indicate the position of the pixel "P" in the output frame. This position may not coincide with a single pixel position in the input frame buffer. In this case, the four closest pixels in the input frame are used to approximate the value of the pixel in the output frame.

The PXP scaler first computes a linear filter in the X axis to create the two intermediate pixel values Px0 and Px1. The step function's X fractional component is used to provide the weighting factor for blending p00 with p10 to provide Px0. Likewise, Px1 is also derived from a linear filter using p01 and p11.

The equations for Px0 and Px1 are as follows:

$$Px0 = p00*(1-Rx) + p10*Rx$$

$$Px1 = p01*(1-Rx) + p11*Rx$$

The PXP scaler uses the intermediate X pixels Px0 and Px1 and implements a bilinear filter on these two pixel values to produce the final pixel value at position P. The remainder of the step function for the Y axis is used to compute the weighted average pixel result. The equation for final filtered pixel is:

$$P = Px0*(1-Ry) + Px1*Ry$$

### **46.3.5 YUV 4:2:2 Image Scaling**

The following figure illustrates the positioning of YUV samples for the 4:2:2 formats. There are twice as many Y luma samples then U and V chroma samples horizontally.

**Figure 46-6. YUV Sample Positioning, 4:2:2**

Consider the scaled output pixel  $P_s$  (pixel scaled) which has an accumulated step function of  $X=1.5$  and  $Y=0.5$ . The remainder for the step function is  $R_x = 0.5$  and  $R_y = 0.5$ . Or, the sub pixel position of output pixel  $P_s$  is half way between line 0 and 1 and half way between column 1 and 2.

The Y output component of  $P_s$  is simply the bilinear function of the four nearest Y samples from the input image. Specifically, the Y values at [1,0], [2,0], [1,1], and [2,1] are used to compute the Y for  $P_s$ .

For the U and V components of  $P_s$ , there are no samples present in the column position 1. The bilinear filter uses chroma components located at [0,0], [2,0], [0,1] and [2,1]. Since the chroma components are not sub sampled vertically, the remainder used to combine pixels vertically is  $R_y=0.5$  (the same as for Y). However, horizontally, the scaling engine shifts the remainder by a factor of 2. So an X axis step function value of  $X=1.5$  has a remainder  $R_x=0.75$ . Source chroma values are not replicated, they are completely interpolated using the four nearest chroma samples to approximate U and V at  $P_s$ .

### 46.3.6 YUV 4:2:0 Image Scaling

The following figure illustrates the positioning of YUV samples for the 4:2:0 formats. Chroma is sub sampled both horizontally and vertically. In this format, the chroma frame buffers contain  $\frac{1}{4}$  the data that the luma frame buffers store.

**Figure 46-7. YUV Sample Positioning, 4:2:0**

The Y output component for all scaled pixels in 4:2:0 formats are the same as for the 4:2:2 pixel formats.

The U and V output components have two considerations when computing the output pixel Ps.

1. All chroma samples from the input source image are shifted left and up by  $\frac{1}{2}$  a sample position of the input pixel matrix.
2. Odd scan lines are replicated using the previous even chroma scan line values. So, output image chroma values that map between even to odd scan lines are replicated in the vertical axis. In contrast, output image chroma values between odd to even scan lines are interpolated vertically.

The chroma values are interpolated horizontally as in the 4:2:2 pixel format.

As an example, consider the interpolated pixel Ps in the 4:2:0 diagram above. For the Y component, the interpolated output luma is a function of the Y values in the source frame buffer at position [1,0], [2,0], [1,1], [2,1].

For the U and V interpolated samples, the chroma values on scan line position 0.5 are shifted so that they coincide with the even luma sample points. They are also replicated so that a single chroma scan line is used twice. The chroma scan line at 0.5 is replicated to represent the 4:2:2 sample points for scan line 0 and 1. The chroma scan line at 2.5 is replicated to represent the 4:2:2 sample points for scan line 2 and 3. This pattern of chroma replication occurs for the entire source frame buffer during the scaling operation.

**Figure 46-8. Scaled Chroma Computation Examples**

The preceding diagram has two examples for the computation of the scaled chroma output pixel. For chroma at output position PsA (vertical position 0.5), interpolation occurs in the X axis using chroma values at column 0 and column 2. However, since line 0 and line 1 have equal chroma values due to chroma line replication, scaling in the Y axis results in replication of chroma values.

For chroma at output position PsB (vertical position 1.5), interpolation occurs in both the X and Y axis. The Y axis is an interpolation since the chroma values copied to scan line 1 and 2 and not the same.

In summary, any output image pixels that map to an odd scan line above and an even scan line below are interpolated vertically. Output image pixels that map to an even scan line above and an odd scan line below are replicated vertically.

### 46.3.7 RGB/YUV444 Image Scaling

For all RGB formats, the RGB pixels are converted up to RGB888 with 8 bits per each color component.

Then each color component is passed to the scaling engine and each component is treated in the same manner. The RGB scaling operation is the same as for the Y scaling operation described in the preceding sections. Also, YUV444 contains a byte for each color plane at each pixel location, so all three color components are scaled in the same manner.

## 46.3.8 Color Space Conversion (CSC)

The CSC1 module converts pixels between color spaces. It exists after scaling unit and is dedicated to converting from YUV to RGB. All coefficients are programmed as 2's complement numbers and the CSC unit can be bypassed if it is not desired in the pixel data path.

## 46.3.9 CSC1 Operation

The CSC1 module receives scaled YUV/YCbCr444 pixels from the scale engine and converts the pixels to the RGB888 color space only if CSC1 is enabled.

The CSC1 module will convert only to the RGB color space and it can be bypassed to allow YUV pixels through the data path. These pixels are loaded into the pixel FIFO for processing by subsequent modules in the pixel data path.

The following equations are used to perform YUV/YCbCr -> RGB conversion. The constants will be stored in the PXP control registers as two's complement values to allow flexibility in the implementation and to allow for differences in the video encode and decode operations. In addition, this provides a software mechanism to manipulate brightness or contrast.

$$R = C0(Y+Yoffset) + C1(V+UVoffset)$$

$$G = C0(Y+Yoffset) + C3(U+UVoffset) + C2(V+UVoffset)$$

$$B = C0(Y+Yoffset) + C4(U+UVoffset)$$

Note: In the equations above, U and V are synonymous with Cb and Cr in regards to the color space format of the source frame buffer.

Saturation of each color channel is checked and corrected for excursions outside the nominal YUV/YCbCr color spaces. Overflow for the three channels are saturated at 0x255 and underflow is saturated at 0x00.

The table below indicates the expected coefficients for YUV and YCbCr modes of operation:

Coefficient	YUV	YCbCr
Yoffset	0x000	0x1F0 (-16)
UVoffset	0x000	0x180 (-128)
C0	0x100 (1.00)	0x12A (1.164)
C1	0x123 (1.140)	0x198 (1.596)
C2	0x76B (-0.581)	0x730 (-0.813)

*Table continues on the next page...*

C3	0x79B (-0.394)	0x79C (-0.392)
C4	0x208 (2.032)	0x204 (2.017)

### 46.3.10 YUV versus YCbCr Support

By default, the PXP color space coefficients are set to support the conversion of YUV data to RGB data.

If YCbCr input is present, software must change the coefficient registers appropriately (see the register definitions for values). Software must also set the YCBCR\_MODE bit in the COEFF0 register to ensure proper conversion of YUV versus YCBCR data.

### 46.3.11 Alpha Blending/Color Key

Regardless of pixel input format, the PS and AS pixels are normalized to 32-bits, organized as one alpha and three data bytes. Alpha blending occurs in the RGB space, if blending is required, PS pixels should be converted to RGB space. If no alpha blending is required, then YUV pixels can bypass the alpha blending ALU without color space conversion. All pixels are processed by the pixel ALU, but the ALU operations can be disabled to achieve pixel pass through for either PS or AS source pixels.

### 46.3.12 Alpha Blend

The alpha value for an individual pixel represents a mathematical weighting factor applied to the AS pixel. An alpha value of 0x00 corresponds to a transparent pixel and a value of 0xFF corresponds to an opaque pixel.

The effective alpha value for an AS pixel is determined by the AS\_CTRL[ALPHA] and AS\_CTRL[ALPHA\_CTRL] register fields. If AS\_CTRL[ALPHA\_CTRL] = ALPHA\_OVERRIDE, the alpha value for the pixel is taken from the AS\_CTRL[ALPHA]. This can be useful for applying a constant alpha to an entire image or for image formats that don't include an alpha value. If AS\_CTRL[ALPHA\_CTRL] = ALPHA\_MULTIPLY, the pixel's alpha value will be multiplied by the pixel's ALPHA value in order to allow scaling of the pixel's alpha or to provide better control for pixel formats such as RGB1555, which only contains a single bit of alpha.

For each color channel, the equation used to blend two source pixels is defined below:

$G_a$  = PIO programmed global alpha (8-bit value).

$E_a$  = Embedded alpha associated with AS pixel.

$$\acute{a} = G\acute{a} * E\acute{a} + 0x80$$

The result for the red channel as an example:

$$R[7:0] = (\acute{a} * PS.r) + ((1 - \acute{a}) * AS.r)$$

When  $\acute{a}$  is 0xff, the PS pixel will not be blended with the AS pixel, but PS will be passed as the output pixel and will not be blended with AS. In this case, AS will be discarded. Likewise, if  $\acute{a}$  is 0x00 for a given pixel, PS will be loaded as the output pixel.

AS\_CTRL[ALPHA\_INVERT] provides the option to invert the final alpha value. This essentially inverts the effect the alpha value has on the AS and PS blending operation.

### 46.3.12.1 Porter-Duff Alpha Blend

Porter-Duff blend includes 12 blending modes to describe digital image composite. These processes include Clear, Source Only, Destination Only, Source Over, Source In, Source Out, Source Atop, Destination Over, Destination In, Destination Out, Destination Atop and XOR. Through these process it can achieve any 2D image composite.

To control the blending modes, please see below picture. All the registers showed below are included in HW\_PXP\_ALPHA\_A\_CTRL.

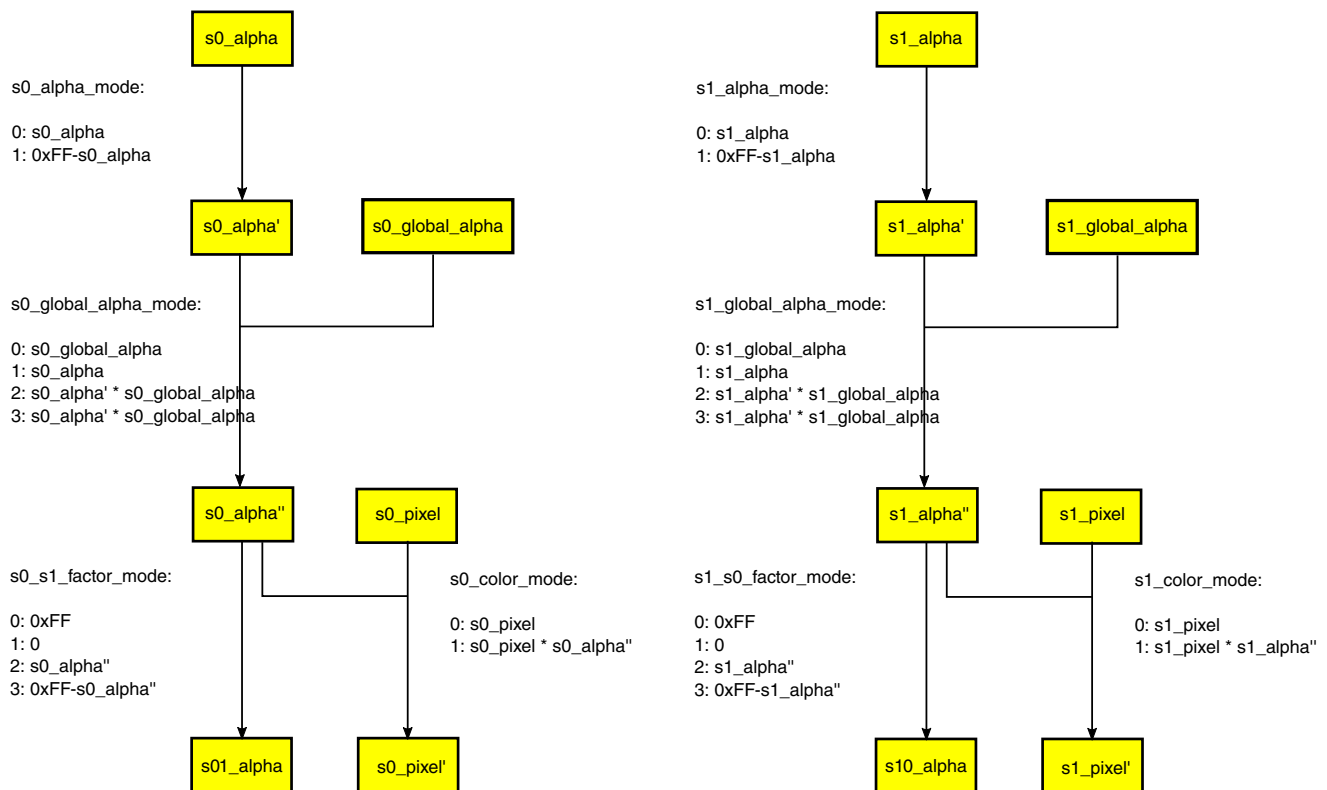

Figure 46-9. Porter-Duff Alpha Blend

### 46.3.13 Color Key

The color key function is provided to create transparent effects on the output pixel.

Color keying is applied on the input pixels after they are converted to 8-bits for each red, green, and blue color channels (color keys are not applied directly to 16-bit pixel formats but to their corresponding 24-bit representation). A color key range is programmable for both PS and AS pixels. If the PS 24-bit pixel is within the PS color key range, then AS is passed through the pixel pipeline. In this case, alpha blending does NOT occur.

Conversely, if PS is within the AS color key range, then PS is passed via the PXP data pipeline. If both PS and AS color key tests pass, then the back ground color register is passed onto following PXP processing components in the pipeline.

The condition for color keying to be satisfied is:

$$CK0.r.low \leq PS.r \leq CK0.r.high$$

$$CK0.g.low \leq PS.g \leq CK0.g.high$$

$$CK0.b.low \leq PS.b \leq CK0.b.high$$

For example, if the "red" 8-bit value for the PS pixel (or PS.r) is between the color key low and high values (CK0.r.l and CK0.r.h), the condition is true for the red color plane. When ALL three color planes meet this condition, then only the PS pixel is loaded into the output register.

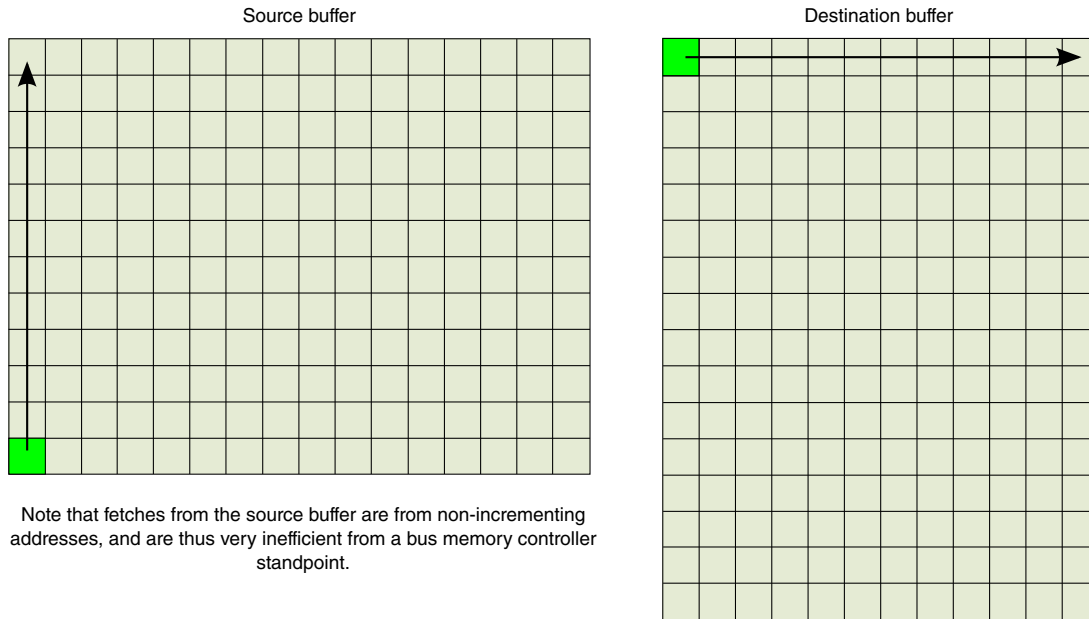

To disable color keying, program the low color key register value to 0xff and the high value to 0x00. This will guarantee that the color key range test will never be true.

### 46.3.14 Rotation

There is a single rotation resource integrated into the PXP. The location of this resource within the PXP data path is programmable. Rotation can occur after compositing the AS and PS buffers in the output stage.

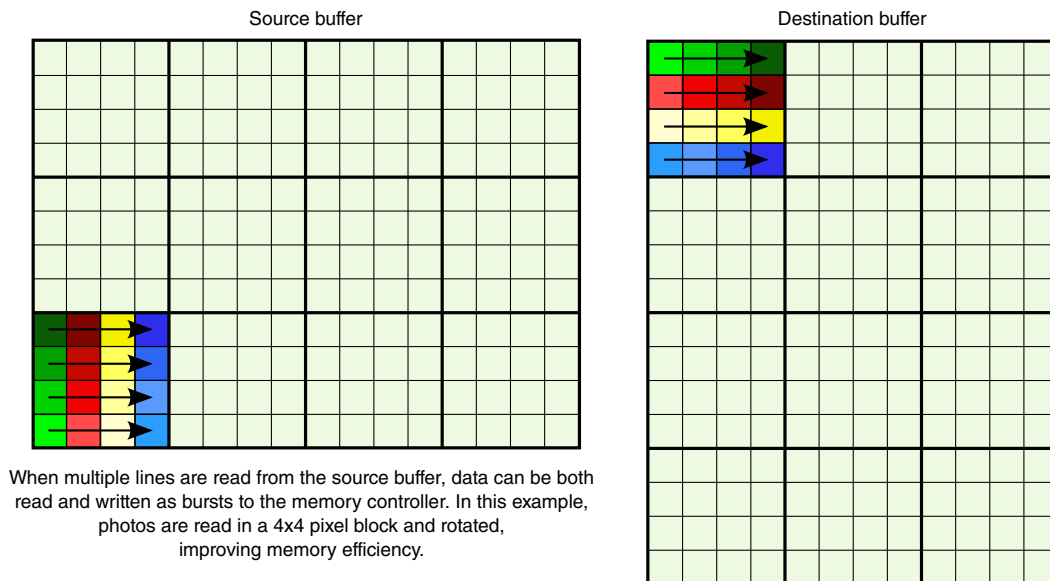

As an alternative configuration, the PS buffer can be rotated and later composited with the AS surface that is not rotated. There is a single configuration bit that provides the configuration of where rotation is implemented within the PXP.

To rotate graphics, the hardware must read pixels in one direction across a frame buffer and write them in a alternate orientation. For the 90 and 270 degree cases, this means that lines of pixels must either be read or written vertically in a frame buffer.

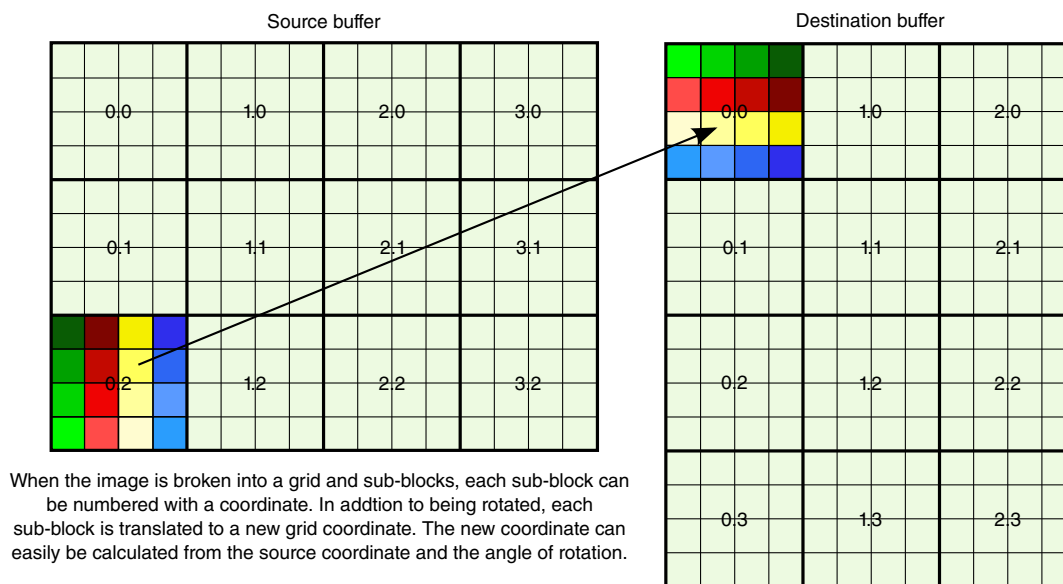

**Figure 46-10. Rotation Read and Write**

In order to rotate efficiently, multiple columns must be rotated to enable the engine to both fetch and store bursts of pixels, thus improving memory performance. The simplest method of doing this is to operate on square blocks of pixels. To rotate the image, each sub-block of pixels must be rotated by the required rotation angle.

**Figure 46-11. Rotated Sub-blocks**

To manage the rotation process, the source image can be broken into a grid of sub-blocks that have coordinates as shown in the diagram below. In addition to rotating the sub-block, each block must be translated to a new coordinate location. For each of the rotation angles (0, 90, 180, 270), it is possible to define a simple algorithm for computing the new translated grid address. The hardware must then simply compute the memory address from the base grid address for both load and store operations.

**Figure 46-12. Grid of Sub-Blocks with Coordinates**

In order to balance the requirements of reasonable burst sizes to the memory controller as well as keep the hardware storage requirements to a minimum, the blending/rotation engine will operate on either 8x8 or 16x16 pixel blocks. When using the Rotate engine with the input fetch engine, you need to program the input fetch engine to work in 8x8 block mode.

### NOTE

An important artifact of the PXP is when rotating a source image and the output is NOT divisible by the block size selected. The output engine essentially truncates any output pixels after the desired number of pixels has been written. Since the output buffer is written as a horizontal row of blocks, the incorrect pixels could be truncated and the final output image can look shifted. In the case where the block size is programmed to 8x8, and the output size that is programmed is 12x12, then there is a remainder of 4 pixels that will be truncated in either the X and/or Y axis when the PXP operation

is complete. The output will be shifted by 4 pixels in this example. To compensate for this, the source base address needs to be adjusted so the correct pixels get truncated and the image does not look shifted. In this example, with 90 degrees of rotation, the PS base address should be adjusted by 4 times the actual PS base address  $-(4 * \text{pitch})$ .

### 46.3.15 Output Buffer

The output buffer engine accepts data from the PXP pixel pipeline and issues requests to transfer the output pixels to external DRAM or the internal SRAM double buffer row of blocks.

### 46.3.16 Address calculator

Each of the blocks will manage its own fetch address using a common address calculator block that computes real addresses from a base address and relative block offset from the base.

Each block will then perform the multiple line fetches (or stores) required to perform the operation. This hides all the address buffer computations from the processing blocks and allows each block to simply track the coordinate of the block it is working on.

### 46.3.17 Block size selection

The PXP can be configured to process blocks that are either 8x8 pixels or 16x16 pixels with the REG\_CTRL[BLOCK\_SIZE] control bit.

When selecting a 16x16 pixel block size, the accesses to fetch AS and PS images and write the final frame buffer are more efficient since twice as much data is requested and processed per memory request.

When optimizing the system for memory bandwidth and image processing time, configure the PXP to process 16x16 pixel blocks.

### 46.3.18 Interlaced Video Support

The PXP has some minimal ability to generate interlaced video content from a progressive source. There two available options, based on the bandwidth requirements and how software is managing video frames.

The PXP can either interlace on the input side (by reading every other line of input data) or on the output side (by writing the individual lines of video into two separate fields). Generally, output interleaving should be used since it is the most flexible mode (it allows scaling and full overlay support) and it only requires a single pass of the PXP to generate two separate output fields.

Input interleaving can be beneficial in cases where the PXP is running at 60fps, since it requires fewer fetches to produce the output data. There is no direct hardware support for input interleaving, in that, there is no configuration bit that can be set to alter how the PXP processes a frame for input interleaving. Input interleaving is achieved by simply setting the source frame buffer pitch value to twice the value it would normally be set to for the equivalent progressive frame. The output parameters also need to be consistent with the desired processing effect. For example, the vertical resolution would be set to account for the reduced resolution to process the interlaced input buffers.

### 46.3.19 LCDIF Handshake

The PXP and LCDIF support a mode where the internal SRAM can be used for the frame buffer to minimize external memory bandwidth required.

This is accomplished by creating two buffers in SRAM, a double buffer row of blocks, where each correspond to 8/16-lines of the frame buffer. The buffers must be consecutive and allocated as a single block of data.

**Figure 46-13. Buffer in OCRAM**

The storage required can be calculated for an 8x8 block size as

- storage = 16 (lines) \* rotated\_row\_length \* pixel\_size

and for 16x16 block size as

- storage = 32 (lines) \* rotated\_row\_length \* pixel\_size

where pixel\_size = 4 for 32bpp or 2 for 16bpp modes. The following table lists the storage requirements for common image sizes using 8x8 block size:

Image Size	Storage (16bpp)	Storage (24bpp)	Storage (32bpp)
320x240 (QVGA) - 0/180 rotation	10KB	15KB	20KB
320x240 (QVGA) - 90/270 rotation	7.5KB	11.5KB	15KB
640x480 (VGA) - 0/180 rotation	20KB	30KB	40KB
640x480 (VGA) - 90/270 rotation	15KB	22.5KB	30KB

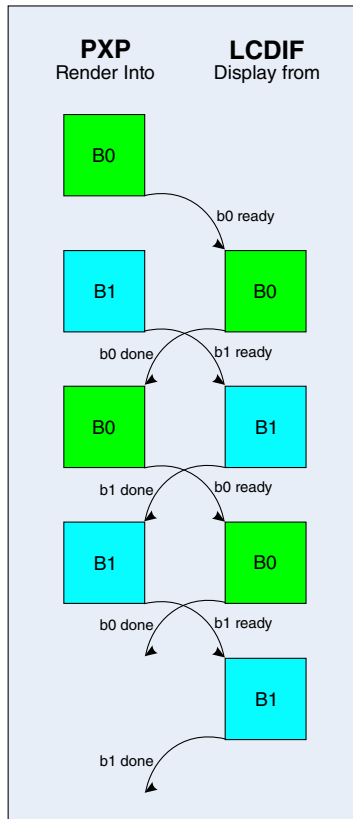

The following diagram shows how the minimal rotation buffer would be organized. As the engine and LCD progress down the image, they continually swap roles of filling and emptying each eight-line buffer.

**Figure 46-14. Minimal Rotation Buffer Organization**

When this mode is enabled, the PXP will process one row of pixel blocks and write the results to the first SRAM buffer (buffer 0). The PXP will then alternate between writing subsequent rows to buffer 0 and buffer 1. After the PXP generates the data for one buffer, the LCDIF will begin reading that buffer and send the contents to the display device. Once the LCDIF finishes reading a buffer, it will start displaying from the other buffer while the PXP continues filling the previously processed buffer.

**Figure 46-15. PXP and LCDIF Buffer Sharing**

To accomplish the buffer sharing, the PXP and LCDIF will maintain buffer status using a pair of handshake signals. When a buffer is filled by the PXP, it will assert the `pxp_lcdif_bx_ready` (where x is 0 or 1) signal to indicate to the LCDIF that the buffer has valid data. The LCDIF will then release the buffer by asserting the `lcdif_pxp_bx_done` signal.

The basic protocol is shown in the diagram below:

**Figure 46-16. Buffer Sharing Protocol**

The PXP will continue to assert the `bx_ready` signal until the corresponding `bx_done` signal is sampled high for one clock cycle. It will then deassert the `bn_ready` until the next time the buffer has been filled. After the PXP samples the `bx_done` signal asserted, it is free to begin filling the buffer with the next block size lines of display data. If a buffer has not been released when the PXP is ready to process data for that buffer, it will suspend rendering operations until the buffer has been released by the LCDIF.

### 46.3.20 LCDIF Abort

When the memory subsystem is not loaded, the PXP should be able to render the buffers faster than the LCDIF can drain the buffers.

It is possible under some scenarios (high LCDIF output rates with high memory latency) that the PXP may not be able to keep up with the LCDIF, even in the SRAM mode of operation. When this happens, the LCDIF will signal that it has completed one of the buffers before the other has been rendered by the PXP. This condition will be detected by the PXP's control logic as an "LCDIF Abort", which will cause the PXP to abort processing in the current row and proceed to the following row. It will acknowledge the abort to the LCDIF by raising the `buffer_ready` signal for the current buffer to enable the LCDIF to begin displaying the partially-filled buffer. While an abort will create artifacts in the video display, it does minimize the artifacts by limiting them to the remaining pixels blocks in the current row versus ruining the entire frame buffer.

Figure 46-17. LCDIF Abort

### 46.3.21 Theory of Operation

The PXP can be used to accelerate graphics operations by offloading graphics processing from the processor. The block can perform alpha blending and color key substitution on two RGB graphics buffers.

The PXP is organized as having a processed surface (PS) and an alpha surface (AS) that can be blended with the processed surface. There are no restrictions on the location of the AS or PS within the output surface (OS). As the PXP processes NxN blocks, operations

are performed on a pixel by pixel basis. The AS and PS pixels are alpha blended, color keyed, process by CSC resources as individual pixel components. This allows efficient block processing with supporting arbitrary alignment for both the AS and PS surfaces. The resulting pixel block is then written to the corresponding block in the output buffer.

### 46.3.22 Pixel Handling

All pixels are internally represented as 32-bit values regardless of input or output pixel formats. The pixels get converted in the AS and PS buffer engines to 24-bit pixel values. There is also an 8-bit alpha value at stages up to the alpha blender within the PXP for blending within the RGB color space. Compositing of AS and PS images can only occur in the RGB color space. If compositing is not required, then YUV pixels can be transferred and processed at all PXP pixel resource components.. The color orientation of pixels within the PXP can be controlled by the CSC1 resource.

For RGB, input pixels are converted into 32-bit pixel values using the following rules for both AS and PS:

1. 32-bit ARGB8888 pixels are read directly with no conversion.
2. 32-bit RGB888 pixels are assumed to have an alpha value of 0xFF (full opaque).
3. 6-bit RGB565 and RGB555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of 0xFF (opaque). The expansion process replicates the upper pixel bits into the lower pixel bits (for instance a 16-bit RGB555 triplet of 0x1F/0x10/0x07 would be expanded to 0xFF/0x84/0x39).
4. 16-bit RGB1555 values are expanded into the corresponding 24-bit color space and assigned an alpha value of either 0x00 or 0xFF, based on the 1-bit alpha value in the pixel. The ALPHA\_MULTIPLY function is useful in this scenario to allow scaling of the opaque pixels to a semi-transparent value.

Alpha values can be passed through the entire PXP data path and output in ARGB888 and ARGB555 pixel modes. Also, output pixels can be assigned an alpha value using the REG\_OUT\_CTRL[ALPHA] register. 16-bit pixels values are formed from the most significant bits of the 24-bit pixel values.

When YUV/YCbCr output formats are selected, all pixels are internally represented as either RGB or YUV pixels values.

### 46.3.23 Output Buffer Composition

The output buffer will be rendered by composing each pixel block from the associated PS and AS buffers.

The AS pixel buffer can be blended or color-keyed with the associated data from the PS buffer (either the PS image pixels or REG\_PS\_BACKGROUND register based on PS programmed coordinates).

Figure 46-18. Output Buffer Composition

### 46.3.24 PS Image Processing

As the PXP processes image buffers, it iterates over the output buffer by fetching the corresponding input buffer blocks and processing the pixels embedded in these.

### 46.3.25 Letterboxing

At each pixel coordinate, the control logic determines if the PS pixel (argument also applies to AS pixels) will be used in rendering the output pixel.

This is determined by checking the output pixel's coordinates against the REG\_OUT\_PS\_ULC and REG\_OUT\_PS\_LRC (ULC and LRC in short) register contents. For pixels outside this region, the PS pixel will be loaded with the pixel value from REG\_PS\_BACKGROUND, which can be used to effectively control the letterboxing color. There are no block size or block boundary restrictions when setting the ULC or LRC for either the AS or PS. The only restriction is that the ULC and LRC are within the OUT LRC extents.

**Figure 46-19. OUT Buffer**

### 46.3.26 Clipping source images

A subset of the PS buffer can be used in rendering the output buffer. The PXP\_PS\_BUF register can indicate an offset into the PS buffer that will be used for display within the OUTPUT buffer.

The pixel at the address defined in the PXP\_PS\_BUF register will be the pixel that is displayed at the pixel coordinate indicated by PXP\_OUT\_PS\_ULC within the output buffer. Essentially, the PXP\_PS\_BUF register can be used to establish an offset into the PS buffer thus clipping all PS buffer pixels that are at a lower address. The PXP\_PS\_PITCH will always indicate the number of bytes that are vertically adjacent in

the PS buffer. The settings in the PXP\_PS\_BUF, PXP\_OUT\_PS\_ULC, and PXP\_OUT\_PS\_LRC will determine the subset of the PS buffer, or clipped PS source buffer, that will be used in the output buffer.

It is important to note that when scaling the PS buffer, the coordinates of the PS buffer within the output buffer need to be consistent with the scaling factors and original PS buffer size.

**Figure 46-20. PS Buffer Scaling**

When sourcing a subset of the PS image, it should fall completely within the PS buffer to avoid displaying incorrect data. The following conditions should be met:

$$x\_base\_addr\_offset + x\_scale * (LRC\_X - ULC\_X) \leq PS\_pitch$$

$$y\_base\_addr\_offset + y\_scale * (LRC\_Y - ULC\_Y) \leq PS\_size$$

The PXP hardware does not check for these conditions and will render the image as programmed. The following case could indicate invalid programming parameters for the PXP:

**Figure 46-21. Example with Invalid Parameters**

### 46.3.27 Color Key Processing

Pixels may be made transparent to the corresponding AS by using the PS color key registers.

If a PS pixel matches the range specified by the REG\_PS\_COLORKEYLOW and REG\_PS\_COLORKEYHIGH registers, the pixel from the associated AS will be displayed. If no AS is present for the pixel, a black pixel will be generated since the default AS pixel is 0x00000000 (transparent black pixel).

The most common use for this is when a bitmap does not support an alpha-field or for applications such as "green screen" where an image is substituted for a solid background color .

**Figure 46-22. The PS image (player) and AS image (stadium)**

The green portion of the background image can be color keyed to display the contents of the AS buffer for locations that match the color range. For this example, the color range is:

PS Colorkey: 00<R<80 70<G<ff 00<B<80

The resulting image becomes:

**Figure 46-23. Resulting Image**

### 46.3.28 In Place Processing (PS buffer is destination buffer)

The PXP also has the ability to process an image and write the resulting buffer back to the original PS buffer. This is referred to as "in place" rendering.

This could be useful for basic blit operations into the PS buffer. IN\_PLACE operations are achieved by programming the OUT base address to the pixel location in the PS buffer that marks the upper left pixel of the update region. The actual region that is updated should be indicated by programming the ULC = (0,0) and the LRC = (X,Y). The region bounded by the coordinates will be updated, and the rest of the PS buffer will not be modified.

### 46.3.29 Alpha Surface (AS) Processing

The AS surface has a complete set of registers that determines how the AS effects the final OUT surface.

Most of the registers that exist for the PS surface also are defined for the AS surface where applicable. This is provided to replicate the SW interface for each PS and AS processes.

### 46.3.30 Alpha Handling

Alpha values in the AS are embedded in the source image pixels. For AS pixel formats that do not support an alpha value, the pixel is assigned an alpha value of 0xFF (opaque).

This can be modified by the AS control by setting either the ALPHA\_MULTIPLY or ALPHA\_OVERRIDE bit in the associated AS\_CTRL register. If ALPHA\_MULTIPLY is enabled, the 8-bit ALPHA value from the AS\_CTRL register is multiplied by the source alpha before blending with the PS image. If the ALPHA\_OVERRIDE bit is set, the 8-bit ALPHA value is simply substituted for the pixel.

### 46.3.31 Color Key Processing (AS\_CTRL)

The AS\_CTRL register also contains an ENABLE\_COLORKEY bit that can be used to enable or disable color key substitution for the AS.

When enabled, the pixel values are compared to the ASCOLORKEYLOW and ASCOLORKEYHIGH registers to determine if a match has occurred. When an AS pixel matches the color key range, the pixel from the AS image is considered transparent and the corresponding PS pixel is rendered. If both the PS and AS pixels match their corresponding color key ranges, the AS pixel is displayed unmodified.

AS color keys are handled in a manner similar to PS color keys. The same images used in the PS color key example could be used with the images swapped. In this case, matches on the AS image to the ASCOLORKEY register would display the PS pixels.

## 46.4 Output Image Processing

Several PXP options affect the resulting output image.

### 46.4.1 Output Image Size

The PXP generates an output image in the resolution programmed by the REG\_OUT\_LRC. As the PXP processes pixels, it iterates over the NxN blocks (in output scan-block order) based on the final image resolution.

### 46.4.2 Output Format

The result of PXP operations are written to the buffer pointed to by the REG\_OUT\_BUF/REG\_OUT\_BUF2 registers. The pixel format is controlled by the REG\_OUT\_CTRL[FORMAT] bit-field.

32-bit pixels are formed directly from the internal 24-bit representations and 16-bit pixel formats are generated by truncating the internal 24-bit values to the appropriate number of bits. For formats supporting an alpha value, the PXP assigns the alpha using the 8-bit value in the REG\_OUT\_CTRL[ALPHA] field. For ARGB1555, the most significant alpha bit is appended to the output pixel. Also, for ARGB4444, the most significant nibble is appended to the output pixel. Single and dual buffer YUV output formats are also available. Since each pixel in the data path is represented by a full YUV444 24bpp value, decimation reduces the output in cases of YUV422/420 output formats.

### 46.4.3 Rotation/Flip operations

The PXP supports four rotation angles in conjunction with vertical and horizontal flip options. The flip operations effectively take place before the rotation.

Rotations of 0, 90, 180, and 270 degrees are supported and any combination of rotation and flip are supported. There is no performance difference between any of these modes of operation.

## 46.5 Queuing PXP transactions

The PXP supports a primitive ability to queue up one operation while the current operation is running. This is enabled through the use of the REG\_NEXT register.

When this register is written, it enables the PXP to reload its current register contents with the data found at the location pointed to by this address when it completes processing of the current frame. This feature may be useful in helping to reduce the interrupt latency in servicing the PXP, especially in cases where the PXP and LCDIF are using the on-chip SRAM buffer handshake (since the PXP must begin generating next frame data immediately).

If the PXP is idle when the REG\_NEXT register is written, the PXP treats this as an indication that it should immediately load the values at the pointer and begin processing the frame. This ability should allow software to use the same routines when programming the PXP (so that the first frame doesn't differ from subsequent frames).

When loading values from the NEXT register, all registers in the PXP are reloaded. Some register loads have no effect

After writing the REG\_NEXT register, the PXP will set the REG\_NEXT[ENABLED] bit of the REG\_NEXT register to indicate that the next command has been queued. Software should first check the status of this bit to ensure that a previous command has not been enabled. Likewise, after programming the first frame in a sequence of frames, software should poll this bit until it is sampled logic 1'b0 before queuing the next operation.

The PXP will issue interrupts from frames as they complete, regardless of whether they were started by writing the control registers directly or using the REG\_NEXT register. When software receives an interrupt, it should check/clear the PXP's status register as normal, poll the REG\_PXP[ENABLED] bit, and then issue the next operation. A queued operation may be cancelled by issuing a CLEAR operation to the REG\_PXP[ENABLED] register bit. The SET and TOGGLE operations should never be used with this register.

## 46.6 Error Handling

The PXP does minimal checking on the control registers, so it is important that these are correctly specified. The PXP does monitor the bus transactions for errors and will report errors in the status register.

Upon receipt of a bus error, the PXP will set the ERROR interrupt and abort any further operations. Bus errors can be generated from any system access that results in an error response returned from the internal SIM Bus errors in the PXP are signaled as either a read or a write error, but do not indicate the failing address. Software may deduce the failing address from the current block status indicators.

### 46.6.1 Known PXP Limitations/Issues

The PXP has the following known limitations:

1. When using the NEXT register, the interrupt enable setting should remain the same for all frames. If not, the PXP will change the interrupt enable register value and possible cause the loss of an interrupt.
2. Rotations of 180/270 are not supported when performing LCD handshakes

## 46.7 PXP Memory Map/Register Definition

PXP Hardware Register Format Summary

**PXP memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
402B_4000	Control Register 0 (PXP_CTRL)	32	R/W	C000_0000h	<a href="#">46.7.1/2658</a>

### 46.7.1 Control Register 0 (PXP\_CTRLn)

The CTRL register contains controls for the PXP module.

PXP\_CTRL: 0x000

PXP\_CTRL\_SET: 0x004

PXP\_CTRL\_CLR: 0x008

PXP\_CTRL\_TOG: 0x00C

The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

#### EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 402B\_4000h base + 0h offset + (4d × i), where i=0d to 3d

**PXP\_CTRLn field descriptions**

Field	Description
31 SFTRST	Set this bit to zero to enable normal PXP operation. Set this bit to one (default) to disable clocking with the PXP and hold it in its reset (lowest power) state. This bit can be turned on and then off to reset the PXP block to its default state.
30 CLKGATE	This bit must be set to zero for normal operation. When set to one it gates off the clocks to the block.
29 RSVD4	Reserved, always set to zero.
28 EN_REPEAT	Enable the PXP to run continuously. When this bit is set, the PXP will repeat based on the current configuration register settings. If this bit is not set, the PXP will complete the process and enter the idle state ready to accept the next frame to be processed. This bit should be set when the LCDIF handshake mode is enabled so that the next frame is automatically generated for the next screen refresh cycle. If it not set and the handshake mode is enabled, the CPU will have to initiate the PXP for the next refresh cycle. When the PXP NEXT feature is used, it has priority over the REPEAT mode, in that the new register settings are fetched first, and then the next PXP operation will continue.
27–24 RSVD3	Reserved, always set to zero.
23 BLOCK_SIZE	Select the block size to process. 0x0 <b>8X8</b> — Process 8x8 pixel blocks. 0x1 <b>16X16</b> — Process 16x16 pixel blocks.
22 ROT_POS	This bit controls where rotation will occur in the PXP datapath. Setting this bit to 1'b0 will place the rotation resources at the output stage of the PXP data path. Image compositing will occur before pixels are processed for rotation. Setting this bit to a 1'b1 will place the rotation resources before image composition. Only the PS can be rotated in this configuration and AS will not be rotated.
21–12 RSVD1	Reserved, always set to zero.
11 VFLIP	Indicates that the output buffer should be flipped vertically (effect applied before rotation).
10 HFLIP	Indicates that the output buffer should be flipped horizontally (effect applied before rotation).
9–8 ROTATE	Indicates the clockwise rotation to be applied at the output buffer. The rotation effect is defined as occurring after the FLIP_X and FLIP_Y permutation.  0x0 <b>ROT_0</b> — 0x1 <b>ROT_90</b> — 0x2 <b>ROT_180</b> — 0x3 <b>ROT_270</b> —
7–5 Reserved	This read-only field is reserved and always has the value 0.
4 ENABLE_LCD_HANDSHAKE	Enable handshake with LCD controller. When this is set, the PXP will not process an entire framebuffer, but will instead process rows of NxN blocks in a double-buffer handshake with the LCDIF. This enables the use of the onboard SRAM for a partial frame buffer.
3 -	This field is reserved. Reserved
2 NEXT_IRQ_ENABLE	Next command interrupt enable. When set, the PXP will issue an interrupt when a queued command initiated by a write to the PXP_NEXT register has been loaded into the PXP's registers. This interrupt also indicates that a new command may now be queued.

*Table continues on the next page...*

**PXP\_CTRLn field descriptions (continued)**

Field	Description
1 IRQ_ENABLE	Interrupt enable. NOTE: When using the PXP_NEXT functionality to reprogram the PXP, the new value of this bit will be used and may therefore enable or disable an interrupt unintentionally.
0 ENABLE	Enables PXP operation with specified parameters. The ENABLE bit will remain set while the PXP is active and will be cleared once the current operation completes. Software should use the IRQ bit in the PXP_STAT when polling for PXP completion.

**46.7.2 Status Register (PXP\_STATn)**

The PXP Interrupt Status register provides interrupt status information.

PXP\_STAT: 0x010

PXP\_STAT\_SET: 0x014

PXP\_STAT\_CLR: 0x018

PXP\_STAT\_TOG: 0x01C

This register provides PXP interrupt status and the current X/Y block coordinate that is being processed.

**EXAMPLE**

```
PXP_STAT_CLR(BM_PXP_STAT_IRQ); // clear CSC interrupt
```

Address: 402B\_4000h base + 10h offset + (4d × i), where i=0d to 3d

## PXP Memory Map/Register Definition

### PXP\_STATn field descriptions

Field	Description
31–24 BLOCKX	Indicates the X coordinate of the block currently being rendered.
23–16 BLOCKY	Indicates the Y coordinate of the block currently being rendered.
15–9 RSVD2	Reserved, always set to zero.
8 LUT_DMA_LOAD_DONE_IRQ	Indicates that the LUT DMA transfer has completed.
7–4 AXI_ERROR_ID	Indicates the AXI ID of the failing bus operation.
3 NEXT_IRQ	Indicates that a command issued with the "Next Command" functionality has been issued and that a new command may be initiated with a write to the PXP_NEXT register.
2 AXI_READ_ERROR	Indicates PXP encountered an AXI read error and processing has been terminated.
1 AXI_WRITE_ERROR	Indicates PXP encountered an AXI write error and processing has been terminated.
0 IRQ	Indicates current PXP interrupt status. The IRQ is routed through the pxp_irq when the IRQ_ENABLE bit in the control register is set.

### 46.7.3 Output Buffer Control Register (PXP\_OUT\_CTRLn)

The OUT\_CTRL register contains controls for the Output Buffer.

PXP\_OUT\_CTRL: 0x020

PXP\_OUT\_CTRL\_SET: 0x024

PXP\_OUT\_CTRL\_CLR: 0x028

PXP\_OUT\_CTRL\_TOG: 0x02C

The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

### EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 402B\_4000h base + 20h offset + (4d × i), where i=0d to 3d

## PXP\_OUT\_CTRLn field descriptions

Field	Description
31–24 ALPHA	When generating an output buffer with an alpha component, the value in this field will be used when enabled to override the alpha passed through the pixel data pipeline.
23 ALPHA_ OUTPUT	Indicates that alpha component in output buffer pixels should be overwritten by PXP_OUT_CTRL[ALPHA]. If 0, retain their alpha value from the computed alpha for that pixel.
22–10 RSVD1	Reserved, always set to zero.
9–8 INTERLACED_ OUTPUT	Determines how the PXP writes it's output data. Output interlacing should not be used in conjunction with input interlacing. Splitting frames into fields is most efficient using output interlacing. 2-plane output formats AND interlaced output is NOT supported.  0x0 <b>PROGRESSIVE</b> — All data written in progressive format to the OUTBUF Pointer. 0x1 <b>FIELD0</b> — Interlaced output: only data for field 0 is written to the OUTBUF Pointer. 0x2 <b>FIELD1</b> — Interlaced output: only data for field 1 is written to the OUTBUF2 Pointer. 0x3 <b>INTERLACED</b> — Interlaced output: data for field 0 is written to OUTBUF and data for field 1 is written to OUTBUF2.
7–5 RSVD0	Reserved, always set to zero.
FORMAT	Output framebuffer format. The UV byte lanes are synonymous with CbCr byte lanes for YUV output pixel formats. For example, the YUV2P420 format should be selected when the output is YCbCr 2-plane 420 output format.  0x0 <b>ARGB8888</b> — 32-bit pixels 0x4 <b>RGB888</b> — 32-bit pixels (unpacked 24-bit pixel in 32 bit DWORD.) 0x5 <b>RGB888P</b> — 24-bit pixels (packed 24-bit format) 0x8 <b>ARGB1555</b> — 16-bit pixels 0x9 <b>ARGB4444</b> — 16-bit pixels 0xC <b>RGB555</b> — 16-bit pixels 0xD <b>RGB444</b> — 16-bit pixels 0xE <b>RGB565</b> — 16-bit pixels 0x10 <b>YUV1P444</b> — 32-bit pixels (1-plane XYUV unpacked) 0x12 <b>UYVY1P422</b> — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 <b>VYUY1P422</b> — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 <b>Y8</b> — 8-bit monochrome pixels (1-plane Y luma output) 0x15 <b>Y4</b> — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 <b>YUV2P422</b> — 16-bit pixels (2-plane UV interleaved bytes) 0x19 <b>YUV2P420</b> — 16-bit pixels (2-plane UV) 0x1A <b>YVU2P422</b> — 16-bit pixels (2-plane VU interleaved bytes) 0x1B <b>YVU2P420</b> — 16-bit pixels (2-plane VU)

#### 46.7.4 Output Frame Buffer Pointer (PXP\_OUT\_BUF)

Output Framebuffer Pointer. This register points to the beginning of the output frame buffer. This pointer is used for progressive format and field 0 when generating interlaced output.

This register is used by the logic to point to the current output location for the output frame buffer.

### EXAMPLE

```
PXP_OUT_BUF_WR( buffer );
```

Address: 402B\_4000h base + 30h offset = 402B\_4030h

#### PXP\_OUT\_BUF field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

## 46.7.5 Output Frame Buffer Pointer #2 (PXP\_OUT\_BUF2)

Output Framebuffer Pointer #2. This register points to the beginning of the output frame buffer for either field 1 when generating interlaced output or for the UV buffer when in YUV 2-plane output modes. Both interlaced output AND 2-plane output modes are not supported in a single PXP operation. This register is not used as the pointer to the second buffer when in LCDIF\_HANDSHAKE mode.

This register is used by the logic to point to the current output location for the field 1 or UV output frame buffer.

### EXAMPLE

```
PXP_OUT_BUF_WR( field0 ); // buffer for interlaced field 0
PXP_OUT_BUF2_WR( field1 ); // buffer for interlaced field 1
```

Address: 402B\_4000h base + 40h offset = 402B\_4040h

#### PXP\_OUT\_BUF2 field descriptions

Field	Description
ADDR	Current address pointer for the output frame buffer. The address can have any byte alignment. 64B alignment is recommended for optimal performance.

### 46.7.6 Output Buffer Pitch (PXP\_OUT\_PITCH)

This register contains the output buffer pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in output pixel address calculations.

#### EXAMPLE

```
PXP_OUT_PITCH_WR( 68 * 4 ); // The output buffer pitch is 68 pixels times 32 bits per pixel
```

Address: 402B\_4000h base + 50h offset = 402B\_4050h

**PXP\_OUT\_PITCH field descriptions**

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

### 46.7.7 Output Surface Lower Right Coordinate (PXP\_OUT\_LRC)

This register contains the size, or lower right coordinate, of the output buffer NOT rotated. It is implied that the upper left coordinate of the output surface is always [0,0]. When rotating the framebuffer, the PXP will automatically swap the X/Y, or WIDTH/HEIGHT, to accommodate the rotated size.

This register sets the size of the output frame buffer in pixels, not blocks. The frame buffer need not be a multiple of NxN pixels. Partial blocks will be written for output frame buffer sizes that are not divisible by N pixels in either dimension.

#### EXAMPLE

```
PXP_OUT_LRC[X]=319; // set width of output frame buffer to 320 pixels
PXP_OUT_LRC[Y]=243; // set height of output frame buffer to 244 pixels which is not
divisible by block size N
```

```
PXP_OUT_LRC_WR( BF_PXP_OUT_LRC_X(319) | BF_PXP_OUT_LRC_Y(243) );
```

Address: 402B\_4000h base + 60h offset = 402B\_4060h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W			X													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**PXP\_OUT\_LRC field descriptions**

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	Indicates number of horizontal PIXELS in the output surface (non-rotated). The output buffer pixel width minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.
15–14 RSVD0	Reserved, always set to zero.
Y	Indicates the number of vertical PIXELS in the output surface (non-rotated). The output buffer pixel height minus 1 should be programmed. The image size is not required to be a multiple of 8 pixels. The PXP will clip the pixel output at this boundary.

**46.7.8 Processed Surface Upper Left Coordinate (PXP\_OUT\_PS\_ULC)**

This register contains the upper left pixel coordinate for the Processed Surface in the OUTPUT buffer.

This register contains the upper left coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the PXP\_OUT\_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. If the value of the PXP\_OUT\_PS\_ULC is greater than the PXP\_OUT\_LRC, then no PS pixels will be fetched from memory, but only PXP\_PS\_BACKGROUND pixels will be processed by the PS engine. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the PXP\_OUT\_LRC extents will use the PS to render pixels into the output buffer.

**EXAMPLE**

```
PXP_OUT_PS_ULC_WR(0,0x0002_0002); // Processed Surface upper left coordinate at (X,Y) = 2,2. The PS surface will not effect pixels in the first and second row and column of the output buffer.
```

## PXP Memory Map/Register Definition

Address: 402B\_4000h base + 70h offset = 402B\_4070h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1			X												
W	RSVD1			X

W	RSVD0			Y												
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_OUT\_PS\_ULC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the processed surface (PS) in the output buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the processed surface in the output buffer.

## 46.7.9 Processed Surface Lower Right Coordinate (PXP\_OUT\_PS\_LRC)

This register contains the lower right extent for the Processed Surface in the OUTPUT buffer.

This register contains the lower right coordinate of the Processed Surface in the output frame buffer (in pixels). Values that are within the PXP\_OUT\_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the PS upper left coordinates, less than or equal to the PS lower right coordinates, and within the PXP\_OUT\_LRC extents will use the PS to render pixels into the output buffer.

### EXAMPLE

```
PXP_OUT_PS_ULC_WR(0,0x03FF_03FF); // With this UL/LR pair of pixel coordinates, only one
pixel at OUT[X,Y]=1023,1023 will use the PS to contribute to its value.
PXP_OUT_PS_LRC_WR(0,0x03FF_03FF);
```

Address: 402B\_4000h base + 80h offset = 402B\_4080h

**PXP\_OUT\_PS\_LRC field descriptions**

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the processed surface (PS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the processed surface in the output frame buffer.

**46.7.10 Alpha Surface Upper Left Coordinate (PXP\_OUT\_AS\_ULC)**

This register contains the upper left location for the Alpha Surface in the output buffer.

This register contains the upper left coordinate of AS in the output frame buffer (in pixels). Values that are within the PXP\_OUT\_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are greater than or equal to the upper left coordinates will use the AS to render pixels in the output buffer.

**EXAMPLE**

```
PXP_OUT_AS_ULC_WR(0,0x0001_0001); // Alpha Surface upper left coordinate at (X,Y) = 1,1.
The AS surface will not effect pixels in the first row or first column of the output buffer.
```

Address: 402B\_4000h base + 90h offset = 402B\_4090h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W				X

R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### PXP\_OUT\_AS\_ULC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the upper left X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the upper left Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

## 46.7.11 Alpha Surface Lower Right Coordinate (PXP\_OUT\_AS\_LRC)

This register contains the lower right extent for Alpha Surface in the output buffer.

This register contains the lower right coordinate of AS in the output frame buffer (in pixels). Values that are within the PXP\_OUT\_LRC X,Y extents are valid. The lowest valid value for these fields is 0,0. Pixel locations that are less than or equal to the lower right coordinates will use the AS to render pixels in the output buffer.

### EXAMPLE

```
PXP_AS_LRC_WR(0,0x03FF_03FF); // Alpha Surface lower right coordinate at (X,Y) = 1023,1023.
```

Address: 402B\_4000h base + A0h offset = 402B\_40A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	RSVD1															
W			X													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R	RSVD0															
W			Y													
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## PXP\_OUT\_AS\_LRC field descriptions

Field	Description
31–30 RSVD1	Reserved, always set to zero.
29–16 X	This field indicates the lower right X-coordinate (in pixels) of the alpha surface (AS) in the output frame buffer.
15–14 RSVD0	Reserved, always set to zero.
Y	This field indicates the lower right Y-coordinate (in pixels) of the alpha surface in the output frame buffer.

### 46.7.12 Processed Surface (PS) Control Register (PXP\_PS\_CTRL<sub>n</sub>)

The PS\_CTRL register contains controls for the Processed Surface Buffer.

PXP\_PS\_CTRL: 0x0B0

PXP\_PS\_CTRL\_SET: 0x0b4

PXP\_PS\_CTRL\_CLR: 0x0B8

PXP\_PS\_CTRL\_TOG: 0x0BC

The Control register contains the primary controls for the PXP block. The present bits indicate which of the sub-features of the block are present in the hardware.

#### EXAMPLE

```
PXP_CTRL_SET(BM_PXP_CTRL_SFTRST);
PXP_CTRL_CLR(BM_PXP_CTRL_SFTRST | BM_PXP_CTRL_CLKGATE);
```

Address: 402B\_4000h base + B0h offset + (4d × i), where i=0d to 3d

## PXP Memory Map/Register Definition

### PXP\_PS\_CTRLn field descriptions

Field	Description
31–12 RSVD1	Reserved, always set to zero.
11–10 DECX	Horizontal pre decimation filter control. 0x0 <b>DISABLE</b> — Disable pre-decimation filter. 0x1 <b>DECX2</b> — Decimate PS by 2. 0x2 <b>DECX4</b> — Decimate PS by 4. 0x3 <b>DECX8</b> — Decimate PS by 8.
9–8 DECY	Verticle pre decimation filter control. 0x0 <b>DISABLE</b> — Disable pre-decimation filter. 0x1 <b>DECY2</b> — Decimate PS by 2. 0x2 <b>DECY4</b> — Decimate PS by 4. 0x3 <b>DECY8</b> — Decimate PS by 8.
7–6 RSVD0	Reserved, always set to zero.
5 WB_SWAP	Swap bytes in words. For each 16 bit word, the two bytes will be swapped.
FORMAT	PS buffer format. To select between YUV and YCbCr formats, see bit 31 of the CSC1_COEF0 register. 0x4 <b>RGB888</b> — 32-bit pixels (unpacked 24-bit format) 0xC <b>RGB555</b> — 16-bit pixels 0xD <b>RGB444</b> — 16-bit pixels 0xE <b>RGB565</b> — 16-bit pixels 0x10 <b>YUV1P444</b> — 32-bit pixels (1-plane XYUV unpacked) 0x12 <b>UYVY1P422</b> — 16-bit pixels (1-plane U0,Y0,V0,Y1 interleaved bytes) 0x13 <b>VYUY1P422</b> — 16-bit pixels (1-plane V0,Y0,U0,Y1 interleaved bytes) 0x14 <b>Y8</b> — 8-bit monochrome pixels (1-plane Y luma output) 0x15 <b>Y4</b> — 4-bit monochrome pixels (1-plane Y luma, 4 bit truncation) 0x18 <b>YUV2P422</b> — 16-bit pixels (2-plane UV interleaved bytes) 0x19 <b>YUV2P420</b> — 16-bit pixels (2-plane UV) 0x1A <b>YVU2P422</b> — 16-bit pixels (2-plane VU interleaved bytes) 0x1B <b>YVU2P420</b> — 16-bit pixels (2-plane VU) 0x1E <b>YUV422</b> — 16-bit pixels (3-plane format) 0x1F <b>YUV420</b> — 16-bit pixels (3-plane format)

### 46.7.13 PS Input Buffer Address (PXP\_PS\_BUF)

PS Input Buffer Address. This should be programmed to the starting address of the RGB data or Y (luma) data for the PS plane.

This register contains the pointer to the Luma/RGB buffer. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

#### EXAMPLE

```
PXP_PS_BUF_WR(image_rgb); // RGB image
PXP_PS_BUF_WR(image_y); // Y (luma) image data
PXP_PS_UBUF_WR(image_u); // U (Cb) image data
PXP_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 402B\_4000h base + C0h offset = 402B\_40C0h

#### PXP\_PS\_BUF field descriptions

Field	Description
ADDR	Address pointer for the PS RGB or Y (luma) input buffer.

### 46.7.14 PS U/Cb or 2 Plane UV Input Buffer Address (PXP\_PS\_UBUF)

PS Chroma (U/Cb/UV) Input Buffer Address. This register points to the beginning of the PS U/Cb input buffer. In two plane operation, this register points to the beginning of the PS UV chroma input buffer.

This register contains the pointer to the Chroma U/Cb or 2 plane UV buffer. This register is unused when processing 1-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

#### EXAMPLE

```
PXP_PS_BUF_WR(image_y); // Y (luma) image data
PXP_PS_UBUF_WR(image_u); // U (Cb) image data
PXP_PS_VBUF_WR(image_v); // V (Cr) image data
```

## PXP Memory Map/Register Definition

Address: 402B\_4000h base + D0h offset = 402B\_40D0h

### PXP\_PS\_UBUF field descriptions

Field	Description
ADDR	Address pointer for the PS U/Cb or 2 plane UV Chroma input buffer.

## 46.7.15 PS V/Cr Input Buffer Address (PXP\_PS\_VBUF)

PS Chroma (V/Cr) Input Buffer Address. This register points to the beginning of the PS V/Cr input buffer. In one or two plane operation, this register is not used. In monochrome modes Y8 and Y4, the low 16 bits are used as the U/V data in the datapath instead of sourcing U/V data from external buffers. In this case, it represents a fixed value for U/V data.

This register contains the pointer to the Chroma V/Cr buffer. For Y8/Y4 modes, the low 16 bits are used as the monochrome U and V values in the data path. Bits [15:8] represent the U data byte, and bits [7:0] represent the V data byte. Other than with Y8/Y4 input buffer formats, this register is unused when processing 1 or 2-plane buffer formats. If the application requires an offset into the PS buffer, then this address can be set so that the desired offset is achieved. Any byte address is valid. For best performance, 64B alignment is recommended.

### EXAMPLE

```
PXP_PS_BUF_WR(image_y); // Y (luma) image data
PXP_PS_UBUF_WR(image_u); // U (Cb) image data
PXP_PS_VBUF_WR(image_v); // V (Cr) image data
```

Address: 402B\_4000h base + E0h offset = 402B\_40E0h

### PXP\_PS\_VBUF field descriptions

Field	Description
ADDR	Address pointer for the PS V/Cr Chroma input buffer.

### 46.7.16 Processed Surface Pitch (PXP\_PS\_PITCH)

This register contains the processed surface pitch in bytes.

Any byte value will indicate the vertical pitch of the PS source frame buffer. This value will be used in PS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input PS surface. For multi-plane formats, the Y buffer pitch should be programmed. For 2-plane YUV422, the UV pitch is the same as the Y pitch. For 3-plane YUV422, the U and V pitch is 1/2 the Y pitch. For 2-plane YUV420, the UV pitch is 1/2 the Y pitch. For 3-plane YUV420, the U and V pitch is 1/4 the Y pitch. All source buffers should comply with these U and V resolution reductions with respect to their Y source buffers.

#### EXAMPLE

```
PXP_PS_PITCH_WR( 64 * 4 ); // The output buffer pitch is 64 pixels times 32 bits per pixel
```

Address: 402B\_4000h base + F0h offset = 402B\_40F0h

**PXP\_PS\_PITCH field descriptions**

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

### 46.7.17 PS Background Color (PXP\_PS\_BACKGROUND)

PS Background Pixel Color. This register provides a pixel value used when processing pixels outside of the region specified by the PS Coordinate registers. This value can effectively be used to set the color of the letterboxing region around the PS image.

This register contains a pixel value to be used for any PS pixels that fall outside the PS extents. This is effectively a background or letterbox color. The CSC1 control and datapath pixel format should be considered when selecting the background color.

#### EXAMPLE

## PXP Memory Map/Register Definition

```
PXP_PS_BACKGROUND_WR(0x00000000); // letterbox is black
PXP_PS_BACKGROUND_WR(0x00800000); // letterbox is dark red
PXP_PS_BACKGROUND_WR(0x00008000); // letterbox is dark green
PXP_PS_BACKGROUND_WR(0x00000080); // letterbox is dark blue
```

Address: 402B\_4000h base + 100h offset = 402B\_4100h

### PXP\_PS\_BACKGROUND field descriptions

Field	Description
31–24 RSVD	Reserved, always set to zero.
COLOR	Background color (in 24bpp format) for any pixels not within the buffer range specified by the PS ULC/LRC.

## 46.7.18 PS Scale Factor Register (PXP\_PS\_SCALE)

PS Scale Factor. This register provides the scale factor for the PS buffer.

The maximum down scaling factor is 1/2 such that the output image in either axis is 1/2 the size of the source. The maximum up scaling factor is 2<sup>12</sup> for either axis. The reciprocal of the scale factor should be loaded into this register. To reduce the PS buffer by a factor of two in the output frame buffer, a value of 10.0000\_0000\_0000 should be loaded into this register. To scale up by a factor of 4, the value of 1/4, or 00.0100\_0000\_0000, should be loaded into this register. To scale up by 8/5, the value of 00.1010\_0000\_0000 should be loaded.

### EXAMPLE

```
PXP_PS_SCALE_WR(0x10001000); // 1:1 scaling (0x1.000)
PXP_PS_SCALE_WR(0x08000800); // 2x scaling (0x0.800)
PXP_PS_SCALE_WR(0x20002000); // 1/2x scaling (0x2.000)
```

Address: 402B\_4000h base + 110h offset = 402B\_4110h

**PXP\_PS\_SCALE field descriptions**

Field	Description
31 RSVD2	Reserved, always set to zero.
30–16 YSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the Y scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.
15 RSVD1	Reserved, always set to zero.
XSCALE	This is a two bit integer and 12 bit fractional representation (##.####_####_####) of the X scaling factor for the PS source buffer. The maximum value programmed should be 2 since scaling down by a factor greater than 2 is not supported with the bilinear filter. Decimation and the bilinear filter should be used together to achieve scaling by more than a factor of 2.

**46.7.19 PS Scale Offset Register (PXP\_PS\_OFFSET)**

PS Scale Offset. This register provides the initial scale offset for the PS buffer.

The X and Y offset provides the ability to access the source image with a per sub-pixel granularity. This provides the capability to use all source pixels to effect the output PS image. The fixed offset values can be used for sub-pixel adjustments in the bilinear scaling filter. For example, when scaling an image down by a factor of 2, an initial offset of 0x0 would result in sub-sampling every other pixel. If a fixed offset of 0x800 (1/2), all pixels are used in scaling the final output pixel value. In this case, the first output pixel would be the sum of  $(1/2 * P0) + (1/2 * P1)$ . This fixed offset is applied after the decimation filter stage, and before the bilinear filter stage.

**EXAMPLE**

```
PXP_PS_SCALE_WR(0x2000_2000); // 1/2x scaling (0x2.000)
PXP_PS_OFFSET_WR(0x0800_0800); // half-pixel offset in both X and Y to ensure averaging
versus pixel decimation
```

Address: 402B\_4000h base + 120h offset = 402B\_4120h

**PXP\_PS\_OFFSET field descriptions**

Field	Description
31–28 RSVD2	Reserved, always set to zero.
27–16 YOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the Y scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.
15–12 RSVD1	Reserved, always set to zero.
XOFFSET	This is a 12 bit fractional representation (0.####_####_####) of the X scaling offset. This represents a fixed pixel offset which gets added to the scaled address to determine source data for the scaling engine.

**46.7.20 PS Color Key Low (PXP\_PS\_CLRKEYLOW)**

This register contains the color key low value for the PS buffer.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between PXP\_PS\_CLRKEYLOW and PXP\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the PXP\_PS\_BACKGROUND color is passed down the pixel pipeline.

**EXAMPLE**

```

// colorkey values between
PXP_PS_CLRKEYLOW_WR (0x008000); // medium green and
PXP_PS_CLRKEYHIGH_WR(0x00FF00); // light green

```

Address: 402B\_4000h base + 130h offset = 402B\_4130h

### PXP\_PS\_CLRKEYLOW field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

## 46.7.21 PS Color Key High (PXP\_PS\_CLRKEYHIGH)

This register contains the color key high value for the PS buffer.

When processing an image, if the PXP finds a pixel in the PS buffer with a color that falls in the range between PXP\_PS\_CLRKEYLOW and PXP\_PS\_CLRKEYHIGH, it will insert the pixel from the AS channel. If the current AS pixel is letterboxed or if the AS also matches its colorkey range, the PXP\_PS\_BACKGROUND color is passed down the pixel pipeline.

### EXAMPLE

```

// colorkey values between
PXP_PS_CLRKEYLOW_WR (0x008000); // medium green and
PXP_PS_CLRKEYHIGH_WR(0x00FF00); // light green

```

Address: 402B\_4000h base + 140h offset = 402B\_4140h

**PXP\_PS\_CLRKEYHIGH field descriptions**

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of color key applied to PS buffer. To disable PS colorkeying, set the low colorkey to 0xFFFFFFFF and the high colorkey to 0x000000.

**46.7.22 Alpha Surface Control (PXP\_AS\_CTRL)**

This register contains buffer control for the Alpha Surface 0 input buffer.

The Alpha Surface Parameter register provides additional controls for AS.

**EXAMPLE**

```

u32 asparam;
    asparam = BF_PXP_ASPARAM_ENABLE      (1);
    asparam |= BF_PXP_ASPARAM_ALPHA_CTRL (BV_PXP_ASPARAM_ALPHA_CTRL_ROPs);
    asparam |= BF_PXP_ASPARAM_FORMAT    (BV_PXP_ASPARAM_FORMAT_RGB8888);
    asparam |= BF_PXP_ASPARAM_ROP      (BV_PXP_ASPARAM_ROP_XORAS);
PXP_ASPARAM_WR(0,asparam); // enable alpha surface to perform XOR ROP using RGB8888 AS
pixel format
    
```

Address: 402B\_4000h base + 150h offset = 402B\_4150h

### PXP\_AS\_CTRL field descriptions

Field	Description
31–21 RSVD1	Reserved, always set to zero.
20 ALPHA_INVERT	Setting this bit to logic 0 will not alter the alpha value. A logic 1 will invert the alpha value and apply (1-alpha) for image composition.
19–16 ROP	Indicates a raster operation to perform when enabled. Raster operations are enabled through the ALPHA_CTRL field.  0x0 <b>MASKAS</b> — AS AND PS 0x1 <b>MASKNOTAS</b> — nAS AND PS 0x2 <b>MASKASNOT</b> — AS AND nPS 0x3 <b>MERGEAS</b> — AS OR PS 0x4 <b>MERGENOTAS</b> — nAS OR PS 0x5 <b>MERGEASNOT</b> — AS OR nPS 0x6 <b>NOTCOPYAS</b> — nAS 0x7 <b>NOT</b> — nPS 0x8 <b>NOTMASKAS</b> — AS NAND PS 0x9 <b>NOTMERGEAS</b> — AS NOR PS 0xA <b>XORAS</b> — AS XOR PS 0xB <b>NOTXORAS</b> — AS XNOR PS
15–8 ALPHA	Alpha modifier used when the ALPHA_MULTIPLY or ALPHA_OVERRIDE values are programmed in PXP_AS_CTRL[ALPHA_CTRL]. The output alpha value will either be replaced (ALPHA_OVERRIDE) or scaled (ALPHA_MULTIPLY) when selected.
7–4 FORMAT	Indicates the input buffer format for AS.  0x0 <b>ARGB8888</b> — 32-bit pixels with alpha 0x4 <b>RGB888</b> — 32-bit pixels without alpha (unpacked 24-bit format) 0x8 <b>ARGB1555</b> — 16-bit pixels with alpha

Table continues on the next page...

**PXP\_AS\_CTRL field descriptions (continued)**

Field	Description
	0x9 <b>ARGB4444</b> — 16-bit pixels with alpha 0xC <b>RGB555</b> — 16-bit pixels without alpha 0xD <b>RGB444</b> — 16-bit pixels without alpha 0xE <b>RGB565</b> — 16-bit pixels without alpha
3 ENABLE_COLORKEY	Indicates that colorkey functionality is enabled for this alpha surface. Pixels found in the alpha surface colorkey range will be displayed as transparent (the PS pixel will be used).
2–1 ALPHA_CTRL	Determines how the alpha value is constructed for this alpha surface. Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels.  0x0 <b>Embedded</b> — Indicates that the AS pixel alpha value will be used to blend the AS with PS. The ALPHA field is ignored. 0x1 <b>Override</b> — Indicates that the value in the ALPHA field should be used instead of the alpha values present in the input pixels. 0x2 <b>Multiply</b> — Indicates that the value in the ALPHA field should be used to scale all pixel alpha values. Each pixel alpha is multiplied by the value in the ALPHA field. 0x3 <b>ROPs</b> — Enable ROPs. The ROP field indicates an operation to be performed on the alpha surface and PS pixels.
0 RSVD0	Reserved, always set to zero.

**46.7.23 Alpha Surface Buffer Pointer (PXP\_AS\_BUF)**

Alpha Surface 0 Buffer Address Pointer. This register points to the beginning of the Alpha Surface 0 input buffer.

This register is used to indicate the base address of the AS buffer.

**EXAMPLE**

```
u32* alpha_ptr;
PXP_ASn_WR(0, alpha_ptr);
```

Address: 402B\_4000h base + 160h offset = 402B\_4160h

**PXP\_AS\_BUF field descriptions**

Field	Description
ADDR	Address pointer for the alpha surface 0 buffer.

## 46.7.24 Alpha Surface Pitch (PXP\_AS\_PITCH)

This register contains the alpha surface pitch in bytes.

Any byte value will indicate the vertical pitch. This value will be used in AS pixel address calculations. This value has no relation to the UL and LR registers. It specifies how many bytes are between two vertically adjacent pixels in the input AS surface.

### EXAMPLE

```
PXP_AS_PITCH_WR( 1920 * 4 ); // The output buffer pitch is HD resolution at 32 bits per pixel
```

Address: 402B\_4000h base + 170h offset = 402B\_4170h

### PXP\_AS\_PITCH field descriptions

Field	Description
31–16 RSVD	Reserved, always set to zero.
PITCH	Indicates the number of bytes in memory between two vertically adjacent pixels.

## 46.7.25 Overlay Color Key Low (PXP\_AS\_CLRKEYLOW)

This register contains the color key low value for the AS buffer.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

### EXAMPLE

```

// colorkey values between
PXP_AS_CLRKEYLOW_WR (0x000000); // black and
PXP_AS_CLRKEYHIGH_WR(0x800000); // medium red

```

## PXP Memory Map/Register Definition

Address: 402B\_4000h base + 180h offset = 402B\_4180h

### PXP\_AS\_CLRKEYLOW field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	Low range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

## 46.7.26 Overlay Color Key High (PXP\_AS\_CLRKEYHIGH)

This register contains the color key high value for the AS buffer.

When processing an image, the if the PXP finds a pixel in the current overlay image with a color that falls in the range from the ASCOLORKEYLOW to ASCOLORKEYHIGH range, it will use the PS pixel value for that location. If no PS image is present or if the PS image also matches its colorkey range, the PS background color is used. Colorkey operations are higher priority than alpha or ROP operations.

### EXAMPLE

```

// colorkey values between
PXP_AS_CLRKEYLOW_WR (0x000000); // black and
PXP_AS_CLRKEYHIGH_WR(0x800000); // medium red
    
```

Address: 402B\_4000h base + 190h offset = 402B\_4190h

### PXP\_AS\_CLRKEYHIGH field descriptions

Field	Description
31–24 RSVD1	Reserved, always set to zero.
PIXEL	High range of RGB color key applied to AS buffer. Each overlay has an independent colorkey enable.

## 46.7.27 Color Space Conversion Coefficient Register 0 (PXP\_CSC1\_COEF0)

This register contains color space conversion coefficients in two's complement notation.

The coefficient 0 register contains coefficients used in the color space conversion algorithm. The Y and UV offsets are added to the source buffer to normalize them before the conversion. C0 is the coefficient that is used to multiply the luma component of the data for all three RGB components.

### EXAMPLE

```
// The equations used for Colorspace conversion are:
//   R = C0*(Y+YOFFSET) + C1*(V+UV_OFFSET)
//   G = C0*(Y+YOFFSET) + C3*(U+UV_OFFSET) + C2*(V+UV_OFFSET)
//   B = C0*(Y+YOFFSET) + C4*(U+UV_OFFSET)

PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 402B\_4000h base + 1A0h offset = 402B\_41A0h

## PXP Memory Map/Register Definition

### PXP\_CSC1\_COEF0 field descriptions

Field	Description
31 YCBCR_MODE	Set to 1 when performing YCbCr conversion to RGB. Set to 0 when converting RGB to YUV data. This bit changes the behavior of the scaler when performing U/V scaling.
30 BYPASS	Bypass the CSC unit in the scaling engine. When set to logic 1, bypass is enabled and the output pixels will be in the YUV/YCbCr color space. When set to logic 0, the CSC unit is enabled and the pixels will be converted based on the programmed coefficients.
29 RSVD1	Reserved, always set to zero.
28–18 C0	Two's compliment Y multiplier coefficient. YUV=0x100 (1.000) YCbCr=0x12A (1.164)
17–9 UV_OFFSET	Two's compliment phase offset implicit for CbCr data. Generally used for YCbCr to RGB conversion. YCbCr=0x180, YUV=0x000 (typically -128 or 0x180 to indicate normalized -0.5 to 0.5 range)
Y_OFFSET	Two's compliment amplitude offset implicit in the Y data. For YUV, this is typically 0 and for YCbCr, this is typically -16 (0x1F0)

## 46.7.28 Color Space Conversion Coefficient Register 1 (PXP\_CSC1\_COEF1)

This register contains color space conversion coefficients in two's compliment notation.

The Coefficient 1 register contains coefficients used in the color space conversion algorithm. C1 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the red component. C4 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the blue component. Both values should be coded as a two's compliment fixed point number with 8 bits right of the decimal.

### EXAMPLE

```
PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 402B\_4000h base + 1B0h offset = 402B\_41B0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	█																█															
Reset	0	0	0	0	0	0	0	1	0	0	1	0	0	0	1	1	0	0	0	0	0	0	0	1	0	0	0	0	1	0	0	0

**PXP\_CSC1\_COEF1 field descriptions**

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C1	Two's compliment Red V/Cr multiplier coefficient. YUV=0x123 (1.140) YCbCr=0x198 (1.596)
15–11 RSVD0	Reserved, always set to zero.
C4	Two's compliment Blue U/Cb multiplier coefficient. YUV=0x208 (2.032) YCbCr=0x204 (2.017)

## 46.7.29 Color Space Conversion Coefficient Register 2 (PXP\_CSC1\_COEF2)

This register contains color space conversion coefficients in two's compliment notation.

The Coefficient 2 register contains coefficients used in the color space conversion algorithm. C2 is the coefficient that is used to multiply the chroma (Cr/V) component of the data for the green component. C3 is the coefficient that is used to multiply the chroma (Cb/U) component of the data for the green component. Both values should be coded as a two's compliment fixed point number with 8 bits right of the decimal.

**EXAMPLE**

// NOTE: The default values for the CSCCOEF2 register are incorrect. C2 should be 0x76B and C3 should be 0x79C for proper operation.

```
PXP_CSCCOEF0_WR(0x04030000); // YUV coefficients: C0, Yoffset, UVoffset
PXP_CSCCOEF1_WR(0x01230208); // YUV coefficients: C1, C4
PXP_CSCCOEF2_WR(0x076B079b); // YUV coefficients: C2, C3
```

Address: 402B\_4000h base + 1C0h offset = 402B\_41C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### PXP\_CSC1\_COEF2 field descriptions

Field	Description
31–27 RSVD1	Reserved, always set to zero.
26–16 C2	Two's complement Green V/Cr multiplier coefficient. YUV=0x76B (-0.581) YCbCr=0x730 (-0.813)
15–11 RSVD0	Reserved, always set to zero.
C3	Two's complement Green U/Cb multiplier coefficient. YUV=0x79C (-0.394) YCbCr=0x79C (-0.392)

### 46.7.30 PXP Power Control Register (PXP\_POWER)

This register controls power states for PXP memories.

Address: 402B\_4000h base + 320h offset = 402B\_4320h

### PXP\_POWER field descriptions

Field	Description
31–12 CTRL	Power control for the PXP.
11–9 ROT_MEM_LP_STATE	Select the low power state of the ROT memory. 0x0 <b>NONE</b> — Memory is not in low power state. 0x1 <b>LS</b> — Light Sleep Mode. Low leakage mode, maintain memory contents. 0x2 <b>DS</b> — Deep Sleep Mode. Low leakage mode, maintain memory contents. 0x4 <b>SD</b> — Shut Down Mode. Shut Down periphery and core, no memory retention.
Reserved	This read-only field is reserved and always has the value 0.

### 46.7.31 Next Frame Pointer (PXP\_NEXT)

This register contains a pointer to a data structure used to reload the PXP registers at the end of the current frame.

To enable this functionality, software must write this register while the PXP is processing the current data frame (if the PXP is currently idle, this will also initiate an immediate load of registers from the pointer). The process of writing this register (WRITE operation) will set a semaphore in hardware to notify the control logic that a register

reload operation must be performed when the current frame processing is complete. At the end of a frame, the PXP will fetch the register settings from this location, signal an interrupt to software, then proceed with rendering the next frame of data. Software may cancel the reload operation by issuing a CLEAR operation to this register. SET and TOGGLE operations should not be used when addressing this register. All registers will be reloaded with the exception of the following: STAT, CSCCOEFn, NEXT. All other registers will be loaded in the order they appear in the register map. Once the pointer's contents have been loaded into the PXP's registers, the NEXT\_IRQ interrupt will be issued (see the PXP\_STATUS register).

## EXAMPLE

```
// create register command structure in memory
u32* pxp_commands0[48], pxp_commands1;
u32 rc;

// initialize control structure for frame 0
pxp_commands0[0] = ...; // CTRL
pxp_commands0[1] = ...; // OUT Buffer
...
pxp_commands0[47] = ..; // Overlay7 param2

// initialize control structure for frame 1
pxp_commands1[0] = ...; // CTRL
pxp_commands1[1] = ...; // OUT Buffer
...
pxp_commands1[47] = ..; // Overlay7 param2

// poll until a command isn't queued
while (rc=PXP_NEXT_RD() & BM_PXP_NEXT_ENABLED );
PXP_NEXT_WR(pxp_commands0); // enable PXP operation 0 via command pointer

// poll until first command clears
while (rc=PXP_NEXT_RD() & BM_PXP_NEXT_ENABLED );
PXP_NEXT_WR(pxp_commands1); // enable PXP operation 1 via command pointer
```

Address: 402B\_4000h base + 400h offset = 402B\_4400h

## PXP Memory Map/Register Definition

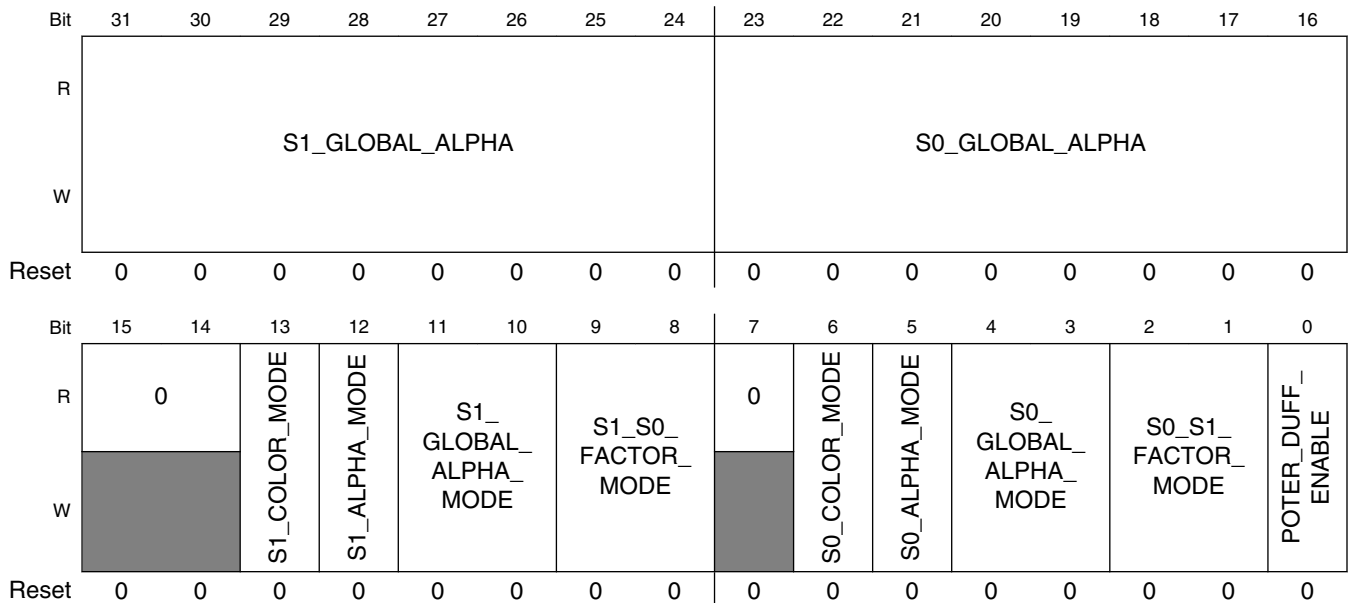

### PXP\_NEXT field descriptions

Field	Description
31–2 POINTER	A pointer to a data structure containing register values to be used when processing the next frame. The pointer must be 32-bit aligned and should reside in on-chip or off-chip memory.
1 RSVD	Reserved, always set to zero.
0 ENABLED	Indicates that the "next frame" functionality has been enabled. This bit reflects the status of the hardware semaphore indicating that a reload operation is pending at the end of the current frame.

## 46.7.32 PXP Alpha Engine A Control Register. (PXP\_PORTER\_DUFF\_CTRL)

Address: 402B\_4000h base + 440h offset = 402B\_4440h

**PXP\_PORTER\_DUFF\_CTRL field descriptions**

Field	Description
31–24 S1_GLOBAL_ALPHA	s1 global alpha
23–16 S0_GLOBAL_ALPHA	s0 global alpha
15–14 Reserved	This read-only field is reserved and always has the value 0.
13 S1_COLOR_MODE	s1 color mode
12 S1_ALPHA_MODE	s1 alpha mode
11–10 S1_GLOBAL_ALPHA_MODE	s1 global alpha mode
9–8 S1_S0_FACTOR_MODE	s1 to s0 factor mode

Table continues on the next page...

**PXP\_PORTER\_DUFF\_CTRL field descriptions (continued)**

<b>Field</b>	<b>Description</b>
7 Reserved	This read-only field is reserved and always has the value 0.
6 S0_COLOR_ MODE	s0 color mode
5 S0_ALPHA_ MODE	s0 alpha mode
4-3 S0_GLOBAL_ ALPHA_MODE	s0 global alpha mode
2-1 S0_S1_ FACTOR_MODE	s0 to s1 factor mode
0 POTER_DUFF_ ENABLE	poter_duff enable

# Chapter 47

## Quad Timer (TMR)

### 47.1 Overview

Each timer module (TMR) contains four identical counter/timer groups. Each 16-bit counter/timer group contains a prescaler, a counter, a load register, a hold register, a capture register, two compare registers, two status and control registers, and one control register. All of the registers except the prescaler are read/writable.

#### NOTE

This document uses the terms "Timer" and "Counter" interchangeably because the counter/timers may perform either or both tasks.

The load register provides the initialization value to the counter when the counter's terminal value has been reached.

The hold register captures the counter's value when other counters are being read. This feature supports the reading of cascaded counters.

The capture register enables an external signal to take a "snap shot" of the counter's current value.

The COMP1 and COMP2 registers provide the values to which the counter is compared. If a match occurs, the OFLAG (TMR Output signal) can be set, cleared, or toggled. At match time, an interrupt is generated if enabled, and the new compare value is loaded into the COMP1 or COMP2 registers from CMPLD1 and CMPLD2 if enabled.

The prescaler provides different time bases useful for clocking the counter/timer.

The counter provides the ability to count internal or external events.

Within a timer module (set of four timer/counters), the input pins are shareable.

## 47.2 Features

The TMR module design includes these distinctive features:

- Four 16-bit counters/timers
- Count up/down
- Counters are cascadable
- Programmable count modulo
- Max count rate equals peripheral clock/2 for external clocks
- Max count rate equals peripheral clock for internal clocks
- Count once or repeatedly
- Counters are preloadable
- Compare registers are preloadable (available with compare load feature)
- Counters can share available input pins
- Separate prescaler for each counter
- Each counter has capture and compare capability
- Programmable operation during debug mode
- Inputs may act as fault inputs
- Programmable input filter
- Counting start can be synchronized across counters

## 47.3 Modes of Operation

The TMR module design operates in only a single mode of operation: Functional Mode. The various counting modes are detailed in the Functional Description.

## 47.4 Block Diagram

Each of the timer/counter groups within the quad-timer are shown in this figure.

Figure 47-1. Quad Timer Block Diagram

## 47.5 Memory Map and Registers

The address of a register is the sum of a base address and an address offset. The base address is defined at the chip level and the address offset is defined at the module level. Make certain to check which quad timer is available on the chip being used, and which timer channels have external I/O.

### TMR memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
401D_C000	Timer Channel Compare Register 1 (TMR1_COMP10)	16	R/W	0000h	<a href="#">47.5.1/2703</a>

## 47.5.1 Timer Channel Compare Register 1 (TMRx\_COMP1n)

Address: Base address + 0h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	COMPARISON_1															
Write	COMPARISON_1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## TMRx\_COMP1n field descriptions

Field	Description
COMPARISON_1	Comparison Value 1 This read/write register stores the value used for comparison with the counter value in count up mode.

## 47.5.2 Timer Channel Compare Register 2 (TMRx\_COMP2n)

Address: Base address + 2h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	COMPARISON_2															
Write	COMPARISON_2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## TMRx\_COMP2n field descriptions

Field	Description
COMPARISON_2	Comparison Value 2 This read/write register stores the value used for comparison with the counter value in count down mode or alternating compare mode.

### 47.5.3 Timer Channel Capture Register (TMRx\_CAPTn)

Address: Base address + 4h offset + (32d × i), where i=0d to 3d

#### TMRx\_CAPTn field descriptions

Field	Description
CAPTURE	Capture Value This read/write register stores the value captured from the counter.

### 47.5.4 Timer Channel Load Register (TMRx\_LOADn)

Address: Base address + 6h offset + (32d × i), where i=0d to 3d

#### TMRx\_LOADn field descriptions

Field	Description
LOAD	Timer Load Register This read/write register stores the value used to initialize the counter after counter compare.

### 47.5.5 Timer Channel Hold Register (TMRx\_HOLDn)

Address: Base address + 8h offset + (32d × i), where i=0d to 3d

#### TMRx\_HOLDn field descriptions

Field	Description
HOLD	This read/write register stores the counter's values of specific channels whenever any of the four counters within a module is read.

## 47.5.6 Timer Channel Counter Register (TMRx\_CNTRn)

Address: Base address + Ah offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	COUNTER															
Write	COUNTER															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### TMRx\_CNTRn field descriptions

Field	Description
COUNTER	This read/write register is the counter for the corresponding channel in a timer module.

## 47.5.7 Timer Channel Control Register (TMRx\_CTRLn)

Address: Base address + Ch offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	
Read	CM				PCS				SCS
Write	CM				PCS				SCS
Reset	0	0	0	0	0	0	0	0	
Bit	7	6	5	4	3	2	1	0	
Read	SCS	ONCE	LENGTH	DIR	COINIT	OUTMODE			
Write	SCS	ONCE	LENGTH	DIR	COINIT	OUTMODE			
Reset	0	0	0	0	0	0	0	0	

### TMRx\_CTRLn field descriptions

Field	Description
15–13 CM	<p>Count Mode</p> <p>These bits control the basic counting and behavior of the counter.</p> <p>000 No operation</p> <p>001 Count rising edges of primary source<sup>1</sup></p> <p>010 Count rising and falling edges of primary source<sup>2</sup></p> <p>011 Count rising edges of primary source while secondary input high active</p> <p>100 Quadrature count mode, uses primary and secondary sources</p> <p>101 Count rising edges of primary source; secondary source specifies direction<sup>3</sup></p> <p>110 Edge of secondary source triggers primary count until compare</p> <p>111 Cascaded counter mode (up/down)<sup>4</sup></p>
12–9 PCS	<p>Primary Count Source</p> <p>These bits select the primary count source.</p> <p><b>NOTE:</b> A timer selecting its own output for input is not a legal choice. The result is no counting.</p> <p>0000 Counter 0 input pin</p> <p>0001 Counter 1 input pin</p> <p>0010 Counter 2 input pin</p>

Table continues on the next page...

## TMRx\_CTRLn field descriptions (continued)

Field	Description
	0011 Counter 3 input pin 0100 Counter 0 output 0101 Counter 1 output 0110 Counter 2 output 0111 Counter 3 output 1000 IP bus clock divide by 1 prescaler 1001 IP bus clock divide by 2 prescaler 1010 IP bus clock divide by 4 prescaler 1011 IP bus clock divide by 8 prescaler 1100 IP bus clock divide by 16 prescaler 1101 IP bus clock divide by 32 prescaler 1110 IP bus clock divide by 64 prescaler 1111 IP bus clock divide by 128 prescaler
8–7 SCS	Secondary Count Source  These bits identify the external input pin to be used as a count command or timer command. The selected input can trigger the timer to capture the current value of CNTR . The selected input can also be used to specify the count direction. The selected signal can also be used as a fault input when CSCTRL[FAULT] is set. The polarity of the signal can be inverted by SCTRL[IPS].  00 Counter 0 input pin 01 Counter 1 input pin 10 Counter 2 input pin 11 Counter 3 input pin
6 ONCE	Count Once  This bit selects continuous or one shot counting mode.  0 Count repeatedly. 1 Count until compare and then stop. If counting up, a successful compare occurs when the counter reaches a COMP1 value. If counting down, a successful compare occurs when the counter reaches a COMP2 value. When output mode \$4 is used, the counter re-initializes after reaching the COMP1 value, continues to count to the COMP2 value, and then stops.
5 LENGTH	Count Length  This bit determines whether the counter: <ul style="list-style-type: none"> <li>counts to the compare value and then re-initializes itself to the value specified in the LOAD (or CMPLD2) register, or</li> <li>continues counting past the compare value to the binary roll over.</li> </ul> 0 Count until roll over at \$FFFF and continue from \$0000. 1 Count until compare, then re-initialize. If counting up, a successful compare occurs when the counter reaches a COMP1 value. If counting down, a successful compare occurs when the counter reaches a COMP2 value. When output mode \$4 is used, alternating values of COMP1 and COMP2 are used to generate successful comparisons. For example, the counter counts until a COMP1 value is reached, re-initializes, counts until COMP2 value is reached, re-initializes, counts until COMP1 value is reached, and so on.
4 DIR	Count Direction  This bit selects either the normal count direction up, or the reverse direction, down.

*Table continues on the next page...*

## TMRx\_CTRLn field descriptions (continued)

Field	Description
	0 Count up. 1 Count down.
3 COINIT	Co-Channel Initialization  This bit enables another counter/timer within the module to force the re-initialization of this counter/timer when it has an active compare event.  0 Co-channel counter/timers cannot force a re-initialization of this counter/timer 1 Co-channel counter/timers may force a re-initialization of this counter/timer
OUTMODE	Output Mode  These bits determine the mode of operation for the OFLAG output signal.  000 Asserted while counter is active 001 Clear OFLAG output on successful compare 010 Set OFLAG output on successful compare 011 Toggle OFLAG output on successful compare 100 Toggle OFLAG output using alternating compare registers 101 Set on compare, cleared on secondary source input edge 110 Set on compare, cleared on counter rollover 111 Enable gated clock output while counter is active

1. Rising edges are counted only when SCTRL[IPS] = 0. Falling edges are counted when SCTRL[IPS] = 1. If the primary count source is IP bus clock divide by 1, only rising edges are counted regardless of the value of SCTRL[IPS].
2. IP bus clock divide by 1 cannot be used as a primary count source in edge count mode.
3. Rising edges are counted only when SCTRL[IPS] = 0. Falling edges are counted when SCTRL[IPS] = 1.
4. The primary count source must be set to one of the counter outputs.

## 47.5.8 Timer Channel Status and Control Register (TMRx\_SCTRLn)

Address: Base address + Eh offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8
Read	TCF	TCFIE	TOF	TOFIE	IEF	IEFIE	IPS	INPUT
Write								
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	CAPTURE_MODE		MSTR	EEOF	VAL	0	OPS	OEN
Write						FORCE		
Reset	0	0	0	0	0	0	0	0

## TMRx\_SCTRLn field descriptions

Field	Description
15 TCF	Timer Compare Flag  This bit is set when a successful compare occurs. This bit is cleared by writing a zero to this bit location.

Table continues on the next page...

## TMRx\_SCTRLn field descriptions (continued)

Field	Description
14 TCFIE	Timer Compare Flag Interrupt Enable This bit (when set) enables interrupts when TCF is set.
13 TOF	Timer Overflow Flag This bit is set when the counter rolls over its maximum value \$FFFF or \$0000 (depending on count direction). This bit is cleared by writing a zero to this bit location.
12 TOFIE	Timer Overflow Flag Interrupt Enable This bit (when set) enables interrupts when TOF is set.
11 IEF	Input Edge Flag This bit is set when CAPTMODE is enabled and a proper input transition occurs (on an input selected as a secondary count source) while the count mode does not equal 000. This bit is cleared by writing a zero to this bit position. This bit can also be cleared automatically by a read of CAPT when DMA[IEFDE] is set. <b>NOTE:</b> Setting the input polarity select bit (IPS) changes the edge to be detected. Also, the control register's secondary count source determines which external input pin is monitored by the detection circuitry.
10 IEFIE	Input Edge Flag Interrupt Enable This bit (when set) enables interrupts when IEF is set. <b>Restriction:</b> Do not set both this bit and DMA[IEFDE].
9 IPS	Input Polarity Select This bit (when set) inverts the input signal polarity.
8 INPUT	External Input Signal This read-only bit reflects the current state of the external input pin selected via the secondary count source after application of IPS and filtering.
7–6 CAPTURE_ MODE	Input Capture Mode These bits specify the operation of the capture register as well as the operation of the input edge flag. The input source is the secondary count source.  00 Capture function is disabled 01 Load capture register on rising edge (when IPS=0) or falling edge (when IPS=1) of input 10 Load capture register on falling edge (when IPS=0) or rising edge (when IPS=1) of input 11 Load capture register on both edges of input
5 MSTR	Master Mode This bit (when set) enables the compare function's output to be broadcasted to the other counters/timers in the module. This signal then can be used to re-initialize the other counters and/or force their OFLAG signal outputs.
4 EEOF	Enable External OFLAG Force This bit (when set) enables the compare from another counter/timer within the same module to force the state of this counter's OFLAG output signal.
3 VAL	Forced OFLAG Value This bit determines the value of the OFLAG output signal when software triggers a FORCE command.
2 FORCE	Force OFLAG Output

Table continues on the next page...

**TMRx\_SCTRLn field descriptions (continued)**

Field	Description
	This write only bit forces the current value of VAL to be written to the OFLAG output. This bit always reads as a zero. VAL and FORCE can be written simultaneously in a single write operation. Write to FORCE only if the counter is disabled. Setting this bit while the counter is enabled may yield unpredictable results.
1 OPS	Output Polarity Select  This bit determines the polarity of the OFLAG output signal.  0 True polarity. 1 Inverted polarity.
0 OEN	Output Enable  This bit determines the direction of the external pin.  0 The external pin is configured as an input. 1 The OFLAG output signal is driven on the external pin. Other timer groups using this external pin as their input see the driven value. The polarity of the signal is determined by OPS.

**47.5.9 Timer Channel Comparator Load Register 1 (TMRx\_CMPLD1n)**

Address: Base address + 10h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	COMPARATOR_LOAD_1															
Write	COMPARATOR_LOAD_1															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**TMRx\_CMPLD1n field descriptions**

Field	Description
COMPARATOR_LOAD_1	This read/write register is the comparator 1 preload value for the COMP1 register for the corresponding channel in a timer module.

**47.5.10 Timer Channel Comparator Load Register 2 (TMRx\_CMPLD2n)**

Address: Base address + 12h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	COMPARATOR_LOAD_2															
Write	COMPARATOR_LOAD_2															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**TMRx\_CMPLD2n field descriptions**

Field	Description
COMPARATOR_LOAD_2	This read/write register is the comparator 2 preload value for the COMP2 register for the corresponding channel in a timer module.

### 47.5.11 Timer Channel Comparator Status and Control Register (TMRx\_CSCTRLn)

Address: Base address + 14h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8
Read	DBG_EN		FAULT	ALT_LOAD	ROC	TCI	UP	0
Write	DBG_EN		FAULT	ALT_LOAD	ROC	TCI		
Reset	0	0	0	0	0	0	0	0
Bit	7	6	5	4	3	2	1	0
Read	TCF2EN	TCF1EN	TCF2	TCF1	CL2		CL1	
Write	TCF2EN	TCF1EN	TCF2	TCF1	CL2		CL1	
Reset	0	0	0	0	0	0	0	0

#### TMRx\_CSCTRLn field descriptions

Field	Description
15–14 DBG_EN	<p>Debug Actions Enable</p> <p>These bits allow the TMR module to perform certain actions in response to the chip entering debug mode.</p> <p>00 Continue with normal operation during debug mode. (default)                      01 Halt TMR counter during debug mode.                      10 Force TMR output to logic 0 (prior to consideration of SCTRL[OPS]).                      11 Both halt counter and force output to 0 during debug mode.</p>
13 FAULT	<p>Fault Enable</p> <p>The selected secondary input acts as a fault signal so that the timer OFLAG is cleared when the secondary input is set. When the secondary input is used in this mode, there is no resynchronization of the input so that there is a combinational path to clear the OFLAG. Fault inputs less than two clock periods wide will not be latched. Latched faults will be cleared the next time that the counter logic sets the OFLAG.</p> <p>0 Fault function disabled.                      1 Fault function enabled.</p>
12 ALT_LOAD	<p>Alternative Load Enable</p> <p>This bit allows for an alternative method for loading the counter during modulo counting. Normally, the counter can be loaded only with the value from the LOAD register. When this bit is set, the counter is loaded from the LOAD register when counting up and a match with COMP1 occurs, or the counter is loaded from the CMPLD2 register when counting down and a match with COMP2 occurs.</p> <p>0 Counter can be re-initialized only with the LOAD register.                      1 Counter can be re-initialized with the LOAD or CMPLD2 registers depending on count direction.</p>
11 ROC	<p>Reload on Capture</p> <p>This bit enables the capture function to cause the counter to be reloaded from the LOAD register.</p> <p>0 Do not reload the counter on a capture event.                      1 Reload the counter on a capture event.</p>

### 47.5.12 Timer Channel Input Filter Register (TMRx\_FILTn)

The FILT register programs the values for the filtering of the corresponding input without regard for the fact that any timer channel can use the input as a count source.

Input filter considerations:

- Set the FILT\_PER value such that the sampling period is larger than the period of the expected noise. In this way, a noise spike will corrupt only one sample. Choose the FILT\_CNT value to reduce the probability that noisy samples cause an incorrect transition to be recognized. The probability of an incorrect transition is defined as the probability of an incorrect sample raised to the power of (FILT\_CNT + 3).
- The values of FILT\_PER and FILT\_CNT must also be balanced against the desire for minimal latency in recognizing input transitions. Turning on the input filter (setting FILT\_PER to a non-zero value) introduces a latency of  $((FILT\_CNT + 3) \times FILT\_PER) + 2$  IP bus clock periods.

Address: Base address + 16h offset + (32d × i), where i=0d to 3d

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0					FILT_CNT			FILT_PER							
Write	0					0			0							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### TMRx\_FILTn field descriptions

Field	Description
15–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 FILT_CNT	Input Filter Sample Count These bits represent the number of consecutive samples that must agree prior to the input filter accepting an input transition. A value of 0x0 represents 3 samples. A value of 0x7 represents 10 samples. The value of FILT_CNT affects the input latency.
FILT_PER	Input Filter Sample Period These bits represent the sampling period (in IP bus clock cycles) of the TMR input signals. Each input is sampled multiple times at the rate specified by this field. If FILT_PER is 0x00 (default), then the input filter is bypassed. The value of FILT_PER affects the input latency.  When changing values for FILT_PER from one non-zero value to another non-zero value, write a value of zero first to clear the filter.

### 47.5.13 Timer Channel DMA Enable Register (TMRx\_DMA<sub>n</sub>)

Address: Base address + 18h offset + (32d × i), where i=0d to 3d

Read	0					CMPLD2DE	CMPLD1DE	IEFDE
Write								
Reset	0	0	0	0	0	0	0	0

#### TMRx\_DMA<sub>n</sub> field descriptions

Field	Description
15–3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 CMPLD2DE	Comparator Preload Register 2 DMA Enable Setting this bit enables DMA write requests for CMPLD2 whenever data is transferred out of the CMPLD2 register into the CNTR or COMP2 registers.
1 CMPLD1DE	Comparator Preload Register 1 DMA Enable Setting this bit enables DMA write requests for CMPLD1 whenever data is transferred out of the CMPLD1 register into the COMP1 register.
0 IEFDE	Input Edge Flag DMA Enable Setting this bit enables DMA read requests for CAPT when SCTRL[IEF] is set. <b>Restriction:</b> Do not set both this bit and SCTRL[IEFIE].

### 47.5.14 Timer Channel Enable Register (TMRx\_ENBL)

Address: Base address + 1Eh offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0												ENBL			
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1

#### TMRx\_ENBL field descriptions

Field	Description
15–4 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
ENBL	Timer Channel Enable These bits enable the prescaler (if it is being used) and counter in each channel. Multiple ENBL bits can be set at the same time to synchronize the start of separate counters. If an ENBL bit is set, then the

*Table continues on the next page...*

**TMRx\_ENBL field descriptions (continued)**

Field	Description
	corresponding channel starts its counter as soon as the CTRL[CM] field has a value other than 0. When an ENBL bit is clear, the corresponding counter maintains its current value.
0	Timer channel is disabled.
1	Timer channel is enabled. (default)

## 47.6 Functional Description

### 47.6.1 General

The counter/timer has two basic modes of operation: it can count internal or external events, or it can count an internal clock source while an external input signal is asserted, thus timing the width of the external input signal.

- The counter can count the rising, falling, or both edges of the selected input pin.
- The counter can decode and count quadrature encoded input signals.
- The counter can count up and down using dual inputs in a "count with direction" format.
- The counter's terminal count value (modulo) is programmable.
  - The value that is loaded into the counter after reaching its terminal count is programmable.
- The counter can count repeatedly, or it can stop after completing one count cycle.
- The counter can be programmed to count to a programmed value and then immediately reinitialize, or it can count through the compare value until the count "rolls over" to zero.

The external inputs to each counter/timer are shareable among each of the four counter/timers within the module. The external inputs can be used as:

- Count commands
- Timer commands
- They can trigger the current counter value to be "captured"
- They can be used to generate interrupt requests

The polarity of the external inputs are selectable.

The primary output of each timer/counter is the output signal OFLAG. The OFLAG output signal can be:

- Set, cleared, or toggled when the counter reaches the programmed value.
- The OFLAG output signal may be output to an external pin instead of having that pin serve as a timer input.
- The OFLAG output signal enables each counter to generate square waves, PWM, or pulse stream outputs.
- The polarity of the OFLAG output signal is selectable.

Any counter/timer can be assigned as a master. A master's compare signal can be broadcast to the other counter/timers within the module. The other counters can be configured to reinitialize their counters and/or force their OFLAG output signals to predetermined values when a master's counter/timer compare event occurs.

## 47.6.2 Usage of Compare Registers

The dual compare registers (COMP1 and COMP2) provide a bidirectional modulo count capability. The COMP1 register is used when the counter is *counting up*, and the COMP2 register is used when the counter is *counting down*. Alternating compare mode is the only exception.

The COMP1 register should be set to the desired maximum count value or FFFFh to indicate the maximum unsigned value prior to roll-over, and the COMP2 register should be set to the minimum count value or 0000h to indicate the minimum unsigned value prior to roll-under.

If CTRL[OUTMODE] is set to 100, the OFLAG will toggle while using alternating compare registers. In this variable frequency PWM mode, the COMP2 value defines the desired pulse width of the on time, and the COMP1 register defines the off time.

Use caution when changing COMP1 and COMP2 while the counter is active. If the counter has already passed the new value, it will count to FFFFh or 0000h, roll over, then begin counting toward the new value. The check is: Count=COMPx, *not* Count > COMP1 or Count < COMP2.

The use of the CMPLD1 and CMPLD2 registers to compare values will help to minimize this problem.

### 47.6.3 Usage of Compare Load Registers

The CMPLD1, CMPLD2, and CSCTRL registers offer a high degree of flexibility for loading compare registers with user-defined values on different compare events. To ensure correct functionality while using these registers we strongly suggest using the following method described in this section.

The purpose of the compare load feature is to allow quicker updating of the compare registers. In the past, a compare register could be updated using interrupts. However, because of the latency between an interrupt event occurring and the service of that interrupt, there was the possibility that the counter may have already counted past the new compare value by the time the compare register was updated by the interrupt service routine. The counter would then continue counting until it rolled over and reached the new compare value.

To address this, the compare registers are now updated in hardware in the same way the counter register is re-initialized to the value stored in the load register. The compare load feature allows the user to calculate new compare values and store them in to the comparator load registers. When a compare event occurs, the new compare values in the comparator load registers are written to the compare registers eliminating the use of software to do this.

The compare load feature is intended to be used in variable frequency PWM mode. The COMP1 register determines the pulse width for the logic low part of OFLAG and COMP2 determines the pulse width for the logic high part of OFLAG. The period of the waveform is determined by the COMP1 and COMP2 values and the frequency of the primary clock source. See the following figure.

**Figure 47-2. Variable PWM Waveform**

Should we desire to update the duty cycle or period of the above waveform, we would need to update the COMP1 and COMP2 values using the compare load feature.

## 47.6.4 Usage of the Capture Register

The capture register stores a copy of the counter's value when an input edge (positive, negative, or both) is detected. After a capture event occurs, no further updating of the capture register will occur until the SCTRL[IEF] (input edge flag) is cleared by writing a zero to the SCTRL[IEF].

## 47.6.5 Functional Modes

The selected external count signals are sampled at the TMR's base clock rate and then run through a transition detector. The maximum count rate is one-half of the TMR's base clock rate. Internal clock sources can be used to clock the counters at the TMR's base clock rate.

If a counter is programmed to count to a specific value and then stop, the CTRL[CM] field is cleared when the count terminates.

### 47.6.5.1 Stop Mode

If CTRL[CM] is set to '000', the counter is inert. No counting will occur. Stop mode will also disable the interrupts caused by input transitions on a selected input pin.

### 47.6.5.2 Count Mode

If CTRL[CM] is set to '001', the counter will count the rising edges of the selected clock source. This mode is useful for generating periodic interrupts for timing purposes, or counting external events such as "widgets" on a conveyor belt passing a sensor. If the selected input is inverted by setting SCTRL[IPS] (input polarity select), then the negative edge of the selected external input signal is counted.

#### Example: 47.6.5.2.1 Count Pulses from External Source

```
//      (See Processor Expert PulseAccumulator bean.)
//      This example uses TMR1 to count pulse (actually counts rising edges of the pulse)
//      from an external source (QT3).
//
void Pulse_Init(void)
{
    /* TMR1_CTRL: CM=0, PCS=3, SCS=0, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMR1_CTRL, 0x0600);          /* Set up mode */
}
```

## Functional Description

```
/* TMR1_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
   Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=0 */
setReg(TMR1_SCTRL,0x00);
setReg(TMR1_CNTR,0x00);          /* Reset counter register */
setReg(TMR1_LOAD,0x00);         /* Reset load register */
setRegBitGroup(TMR1_CTRL,CM,0x01); /* Run counter */
}
```

## Example: 47.6.5.2 Generate Periodic Interrupt By Counting Internal Clocks

```
//      (See Processor Expert TimerInt bean.)
//      This example generates an interrupt every 100ms,
//      assuming the chip is operating at 60 MHz.
//
// It does this by using the IP_bus_clk divided by 128 as the counter clock source.
// The counter then counts to 46874 where it matches the COMP1 value.
// At that time an interrupt is generated, the counter is reloaded and
// the next COMP1 value is loaded from CMPLD1.
//
void TimerInt_Init(void)
{
  /* TMR0_CTRL: CM=0,PCS=0,SCS=0,ONCE=0,LENGTH=1,DIR=0,COINIT=0,OUTMODE=0 */
  setReg(TMR0_CTRL,0x20);          /* Stop all functions of the timer */
  /* TMR0_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
   Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=0 */
  setReg(TMR0_SCTRL,0x00);
  setReg(TMR0_LOAD,0x00);          /* Reset load register */
  setReg(TMR0_COMP1,46874);        /* Set up compare 1 register */
  setReg(TMR0_CMPLD1,46874);       /* Also set the compare preload register */
  /* TMR0_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,TCF2EN=0,TCF1EN=1,
   TCF2=0,TCF1=0,CL2=0,CL1=1 */
  setReg(TMR0_CSCTRL,0x41);        /* Enable compare 1 interrupt and */
  /* compare 1 preload */
  setRegBitGroup(TMR0_CTRL,PCS,0xF); /* Primary Count Source to IP_bus_clk / 128 */
  setReg(TMR0_CNTR,0x00);          /* Reset counter register */
  setRegBitGroup(TMR0_CTRL,CM,0x01); /* Run counter */
}
```

## 47.6.5.3 Edge-Count Mode

If CTRL[CM] is set to '010', the counter will count both edges of the selected external clock source. This mode is useful for counting the changes in the external environment, such as a simple encoder wheel.

### Example: 47.6.5.3.1 Count Both Edges of External Source Signal

```
//      (See Processor Expert PulseAccumulator bean.)
//      This example uses TMR1 to count pulse (actually counts both edges of the pulse)
//      from an external source (QT3).
```

```
//
void Pulse_Init(void)
{
    /* TMR1_CTRL: CM=0,PCS=3,SCS=0,ONCE=0,LENGTH=0,DIR=0,COINIT=0,OUTMODE=0 */
    setReg(TMR1_CTRL,0x0600);          /* Set up mode */
    /* TMR1_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
       Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=0 */
    setReg(TMR1_SCTRL,0x00);
    setReg(TMR1_CNTR,0x00);           /* Reset counter register */
    setReg(TMR1_LOAD,0x00);          /* Reset load register */
    setRegBitGroup(TMR1_CTRL,CM,0x02); /* Run counter */
}

```

### 47.6.5.4 Gated-Count Mode

If CTRL[CM] is set to '011', the counter will count while the selected secondary input signal is high. This mode is used to time the duration of external events. If the selected input is inverted by setting SCTRL[IPS] (input polarity select), then the counter will count while the selected secondary input is low.

#### Example: 47.6.5.4.1 Capture Duration of External Pulse

```
//      (See Processor Expert PulseAccumulator bean.)
//      This example uses TMR1 to determine the duration of an external pulse.
//
//      The IP_bus clock is used as the primary counter. If the duration of the
//      external pulse is longer than 0.001 seconds one of the other IP_bus clock
//      dividers can be used. If the pulse duration is longer than 0.128 seconds
//      an external clock source will have to be used as the primary clock source.
//
void Pulse1_Init(void)
{
    /* TMR1_CTRL: CM=0,PCS=8,SCS=1,ONCE=0,LENGTH=0,DIR=0,COINIT=0,OUTMODE=0 */
    setReg(TMR1_CTRL,0x1080);          /* Set up mode */
    /* TMR1_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
       Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=0 */
    setReg(TMR1_SCTRL,0x00);
    setReg(TMR1_CNTR,0x00);           /* Reset counter register */
    setReg(TMR1_LOAD,0x00);          /* Reset load register */
    setRegBitGroup(TMR1_CTRL,CM,0x03); /* Run counter */
}

```

### 47.6.5.5 Quadrature-Count Mode

If CTRL[CM] is set to '100', the counter will decode the primary and secondary external inputs as quadrature encoded signals. Quadrature signals are usually generated by rotary or linear sensors used to monitor movement of motor shafts or mechanical equipment. The quadrature signals are square waves that are 90 degrees out of phase. The decoding of quadrature signal provides both count and direction information.

This figure shows a timing diagram illustrating the basic operation of a quadrature incremental position encoder.

Figure 47-3. Quadrature Incremental Position Encoder

### Example: 47.6.5.5.1 Quadrature Count Mode Example

```
//      (See Processor Expert PulseAccumulator bean.)
//      This example uses TMR0 for counting states of a quadrature position encoder.
//
//      Timer input 0 is used as the primary count source (PHASEA).
//      Timer input 1 is used as the secondary count source (PHASEB).
//
void Pulse_Init(void)
{
    /* TMR0_CTRL: CM=0, PCS=0, SCS=1, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMRC0_CTRL, 0x80);          /* Set up mode */
    /* TMR0_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=0, IEF=0, IEFIE=0, IPS=0, INPUT=0,
    Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=1 */
    setReg(TMR0_SCTRL, 0x00);
    setReg(TMR0_CNTR, 0x00);          /* Reset counter register */
    setReg(TMR0_LOAD, 0x00);          /* Reset load register */
    setReg(TMR0_COMP1, 0xFFFF);       /* Set up compare 1 register */
    setReg(TMR0_COMP2, 0x00);         /* Set up compare 2 register */
    /* TMR0_CSCTRL: DBG_EN=0, FAULT=0, ALT_LOAD=0, ROC=0, TCI=0, UP=0, OFLAG=0,
    TCF2EN=0, TCF1EN=0, TCF2=0, TCF1=0, CL2=0, CL1=0 */
    setReg(TMR0_CSCTRL, 0x00);
    setRegBitGroup(TMR0_CTRL, CM, 0x04); /* Run counter */
}
```

### 47.6.5.6 Quadrature-Count Mode with Index Input

As an extension to the quadrature count mode discussed in the previous paragraph, some rotary shafts have a HOME or INDEX indicator. This would be a third input to the timer that is used to reset the timer's counter.

In this example, channel 0 is used to decode the quadrature inputs, but it doesn't actually count. Because its upper and lower limits are both set to 0, its output is cascaded count up and count down signals each time the quadrature inputs indicate a change in count. Channel 1 works in cascaded count mode receiving its counting instructions from channel 0. When an input capture event occurs, channel 1 is programmed to reset its counter value. The channel 1 counter contains the position value for the shaft.

### Example: 47.6.5.6.1 Quadrature Count Mode with Index Input Example

```

//      (See Processor Expert PulseAccumulator bean.)
// This example uses TMR0 and TMR1 for counting states of a quadrature position encoder.
//
// Timer input 0 is used as the primary count source (PHASEA).
// Timer input 1 is used as the secondary count source (PHASEB).
// Timer input 2 is used as the index input source (INDEX).
//
void Pulse_Init(void)
{
    /* TMR0_CTRL: CM=0, PCS=0, SCS=1, ONCE=0, LENGTH=1, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMR0_CTRL, 0xA0);          /* Set up mode */
    /* TMR0_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=0, IEF=0, IEFIE=0, IPS=0, INPUT=0,
    Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
    setReg(TMR0_SCTRL, 0x00);
    setReg(TMR0_CNTR, 0x00);          /* Reset counter register */
    setReg(TMR0_LOAD, 0x00);          /* Reset load register */
    setReg(TMR0_COMP1, 0x00);         /* Set up compare 1 register */
    setReg(TMR0_COMP2, 0x00);         /* Set up compare 2 register */
    /* TMR0_CSCTRL: DBG_EN=0, FAULT=0, ALT_LOAD=0, ROC=0, TCI=0, UP=0, OFLAG=0,
    TCF2EN=0, TCF1EN=0, TCF2=0, TCF1=0, CL2=0, CL1=0 */
    setReg(TMR0_CSCTRL, 0x00);
    /* TMR1_CTRL: CM=7, PCS=100, SCS=2, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMR1_CTRL, 0xEA00);        /* Set up capture edge */
    /* TMR1_SCTRL: Capture_Mode=10 */
    setReg(TMR1_SCTRL, 0x0080);
    /* TMR1_CSTR: ROC=1 */
    setReg(TMR1_CTRL, 0x0800);        /* Set up reload on capture */
    setRegBitGroup(TMR0_CTRL, CM, 0x04); /* Run counter */
}

```

### 47.6.5.7 Signed-Count Mode

If CTRL[CM] is set to '101', the counter counts the primary clock source while the selected secondary source provides the selected count direction (up/down).

#### Example: 47.6.5.7.1 Signed Count Mode Example

```

//      (See Processor Expert PulseAccumulator bean.)
// This example uses TMR0 for signed mode counting.
//
// Timer input 2 is used as the primary count source.
// Timer input 1 is used to determine the count direction.
//
void Pulse_Init(void)
{
    /* TMR0_CTRL: CM=0, PCS=2, SCS=1, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMR0_CTRL, 0x0480);        /* Set up mode */
    /* TMR0_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=1, IEF=0, IEFIE=0, IPS=0, INPUT=0,
    Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
    setReg(TMR0_SCTRL, 0x1000);
    setReg(TMR0_CNTR, 0x00);          /* Reset counter register */
    setReg(TMR0_LOAD, 0x00);          /* Reset load register */
}

```

## Functional Description

```
setRegBitGroup(TMR0_CTRL,CM,0x05); /* Run counter */  
}
```

### 47.6.5.8 Triggered-Count Mode 1

If CSCTRL[TCI] is clear and CTRL[CM] is set to '110', the counter will begin counting the primary clock source after a positive transition (negative edge if SCTRL[IPS]=1) of the secondary input occurs. The counting will continue until a compare event occurs or another positive input transition is detected. If a second input transition occurs before a terminal count is reached, counting will stop and SCTRL[TCF] (timer compare flag) will be set. Subsequent secondary input transitions will continue to restart and stop the counting until a compare event occurs.

Figure 47-4. Triggered Count Mode 1 (CTRL[LENGTH]=0)

#### Example: 47.6.5.8.1 Triggered Count Mode 1 Example

```
// (See Processor Expert PulseAccumulator bean.)  
// This example uses TMR1 for triggered mode counting.  
//  
// Timer input 3 is used as the primary count source.  
// Timer input 2 is used for the trigger input.  
//  
void Pulse_Init(void)  
{  
    /* TMR1_CTRL: CM=0,PCS=3,SCS=2,ONCE=0,LENGTH=0,DIR=0,COINIT=0,OUTMODE=0 */  
    setReg(TMR1_CTRL,0x0700); /* Set up mode */  
    /* TMR1_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=1,IEF=0,IEFIE=0,IPS=0,INPUT=0,

    setReg(TMR1_SCTRL,0x1000);  
    setReg(TMR1_CNTR,0x00); /* Reset counter register */  
    setReg(TMR1_LOAD,0x00); /* Reset load register */  
    setReg(TMR1_COMP1,0x0012); /* Set up compare 1 register */  
    /* TMR1_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,  
    TCF2EN=0,TCF1EN=0,TCF2=0,TCF1=0,CL2=0,CL1=0 */  
    setReg(TMR1_CSCTRL,0x00);  
    setRegBitGroup(TMR1_CTRL,CM,0x06); /* Run counter */  
}
```

### 47.6.5.9 Triggered-Count Mode 2

If CSCTRL[TCI] is set and CTRL[CM] is set to '110', the counter will begin counting the primary clock source after a positive transition (negative edge if SCTRL[IPS]=1) of the secondary input occurs. The counting will continue until a compare event occurs or another positive input transition is detected. If a second input transition occurs before a terminal count was reached, the counter will reload and continue counting. When CSCTRL[TCI] is set, the OFLAG output mode, CTRL[OUTMODE], should probably be set to '101' (cleared on init, set on compare) to ensure the output will be in a known state after the second input transition and subsequent reload takes place.

Figure 47-5. Triggered Count Mode 2 (CTRL[LENGTH]=0)

#### Example: 47.6.5.9.1 Triggered Count Mode 2 Example

```
//      (See Processor Expert PulseAccumulator bean.)
//      This example uses TMR1 for triggered mode counting.
//
//      Timer input 3 is used as the primary count source.
//      Timer input 2 is used for the trigger input.
//
void Pulse_Init(void)
{
    /* TMR1_CTRL: CM=0, PCS=3, SCS=2, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=0 */
    setReg(TMR1_CTRL, 0x0700);          /* Set up mode */
    /* TMR1_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=1, IEF=0, IEFIE=0, IPS=0, INPUT=0,
       Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
    setReg(TMR1_SCTRL, 0x1000);

    setReg(TMR1_CNTR, 0x00);           /* Reset counter register */
    setReg(TMR1_LOAD, 0x00);           /* Reset load register */
    setReg(TMR1_COMP1, 0x0012);        /* Set up compare 1 register */
    /* TMR1_CSCTRL: DBG_EN=0, FAULT=0, ALT_LOAD=0, ROC=0, TCI=0, UP=0, OFLAG=0,
       TCF2EN=0, TCF1EN=0, TCF2=0, TCF1=0, CL2=0, CL1=0 */
    setReg(TMR1_CSCTRL, 0x00);
    setRegBitGroup(TMR1_CTRL, CM, 0x06); /* Run counter */
}
```

### 47.6.5.10 One-Shot Mode

If CTRL[CM] is set to '110', and the counter is set to reinitialize at a compare event (CTRL[LENGTH]=1), and CTRL[OUTMODE] is set to '101' (cleared on init, set on compare), the counter works in a one-shot mode. An external event causes the counter to count, and when the terminal count is reached, the output is asserted. This delayed output can be used to provide timing delays.

**Figure 47-6. One-Shot Mode (CTRL[LENGTH]=1)**

#### Example: 47.6.5.10.1 One-Shot Mode Example

```
// (See Processor Expert PulseAccumulator bean.)
// This example uses TMR1 for one-shot mode counting.
//
// Timer input 3 is used as the primary count source.
// Timer input 2 is used for the trigger input.
//
void Pulse_Init(void)
{
    /* TMR1_CTRL: CM=0, PCS=3, SCS=2, ONCE=0, LENGTH=0, DIR=0, COINIT=0, OUTMODE=5 */
    setReg(TMR1_CTRL, 0x0725);          /* Set up mode */
    /* TMR1_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=1, IEF=0, IEFIE=0, IPS=0, INPUT=0,
    Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
    setReg(TMR1_SCTRL, 0x1000);
    setReg(TMR1_CNTR, 0x00);           /* Reset counter register */
    setReg(TMR1_LOAD, 0x00);          /* Reset load register */
    setReg(TMR1_COMP1, 0x0004);       /* Set up compare 1 register */
    /* TMR1_CSCTRL: DBG_EN=0, FAULT=0, ALT_LOAD=0, ROC=0, TCI=0, UP=0, OFLAG=0,
    TCF2EN=0, TCF1EN=0, TCF2=0, TCF1=0, CL2=0, CL1=0 */
    setReg(TMR1_CSCTRL, 0x00);
    setRegBitGroup(TMR1_CTRL, CM, 0x06); /* Run counter */
}
```

### 47.6.5.11 Cascade-Count Mode

If CTRL[CM] is set to '111', the counter's input is connected to the output of another selected counter. The counter will count up and down as compare events occur in the selected source counter. This cascade or daisy-chained mode enables multiple counters to be cascaded to yield longer counter lengths. When operating in cascade mode, a special

high-speed signal path is used between modules rather than the OFLAG output signal. If the selected source counter is counting up and it experiences a compare event, the counter will be incremented. If the selected source counter is counting down and it experiences a compare event, the counter will be decremented.

Up to four counters may be cascaded to create a 64-bit wide synchronous counter. Check the data sheet to see if there are any frequency limits for cascaded counting mode.

Whenever any counter is read within a counter module, all of the counters' values within the module are captured in their respective hold registers. This action supports the reading of a cascaded counter chain. First read any counter of a cascaded counter chain, then read the hold registers of the other counters in the chain. The cascaded counter mode is synchronous.

### Note

It is possible to connect counters together by using the other (non-cascade) counter modes and selecting the outputs of other counters as a clock source. In this case, the counters are operating in a ripple mode, where higher order counters will transition a clock later than a purely synchronous design.

### Example: 47.6.5.11.1 Generate Periodic Interrupt Cascading Two Counters

```
// (See Processor Expert TimerInt bean.)
// This example generates an interrupt every 30 seconds,
// assuming the chip is operating at 60 MHz.
//
// To do this, counter 2 is used to count 60,000 IP_bus clocks, which means it
// will compare and reload every 0.001 seconds.
// Counter 3 is cascaded and used to count the 0.001 second ticks and
// generate the desired interrupt interval.
//
void TimerInt_Init(void)
{
// Set counter 2 to count IP_bus clocks
/* TMR2_CTRL: CM=0, PCS=8, SCS=0, ONCE=0, LENGTH=1, DIR=0, COINIT=0, OUTMODE=0 */
setReg(TMR2_CTRL, 0x1020); /* Stop all functions of the timer */
// Set counter 3 as cascaded and to count counter 2 outputs
/* TMR3_CTRL: CM=7, PCS=6, SCS=0, ONCE=0, LENGTH=1, DIR=0, COINIT=0, OUTMODE=0 */
setReg(TMR3_CTRL, 0xEC20); /* Set up cascade counter mode */
/* TMR3_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=0, IEF=0, IEFIE=0, IPS=0, INPUT=0,
Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
setReg(TMR3_SCTRL, 0x00);
/* TMR2_SCTRL: TCF=0, TCFIE=0, TOF=0, TOFIE=0, IEF=0, IEFIE=0, IPS=0, INPUT=0,
Capture_Mode=0, MSTR=0, EEOF=0, VAL=0, FORCE=0, OPS=0, OEN=0 */
setReg(TMR2_SCTRL, 0x00);
setReg(TMR3_CNTR, 0x00); /* Reset counter register */
setReg(TMR2_CNTR, 0x00);
setReg(TMR3_LOAD, 0x00); /* Reset load register */
setReg(TMR2_LOAD, 0x00);
setReg(TMR3_COMPL1, 30000); /* milliseconds in 30 seconds */
setReg(TMR3_CMPLD1, 30000);
setReg(TMR2_COMP1, 60000); /* Set to cycle every milisecond
```

## Functional Description

```
setReg(TMR2_CMPD1,60000);
/* TMR3_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,
   TCF2EN=0,TCF1EN=1,TCF2=0,TCF1=0,CL2=0,CL1=1 */
setReg(TMR3_CSCTRL,0x41); /* Enable compare 1 interrupt and */
                          /* compare 1 preload */
/* TMR2_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,
   TCF2EN=0,TCF1EN=0,TCF2=0,TCF1=0,CL2=0,CL1=1 */
setReg(TMR2_CSCTRL,0x01); /* Enable Compare 1 preload */
setRegBitGroup(TMR2_CTRL,CM,0x01); /* Run counter */
}
```

### 47.6.5.12 Pulse-Output Mode

If CTRL[CM]=001, and CTRL[OUTMODE] is set to 111' (gated clock output), and CTRL[ONCE] is set, then the counter will output a pulse stream of pulses that has the same frequency of the selected clock source, and the number of output pulses is equal to the compare value minus the init value. This mode is useful for driving step motor systems.

#### Note

This does not work if CTRL[PCS] is set to 1000 (IP\_bus/1).

Figure 47-7. Pulse Output Mode

### Example: 47.6.5.12.1 Pulse Outputs Using Two Counters

```
// (See Processor Expert PulseStream bean.)
// This example generates six 10ms pulses, from QT1 output.
// Assuming the chip is operating at 60 MHz.
//
// To do this, timer 3 is used to generate a clock with a period of 10ms.
//
// Timer 1 is used to gate these clocks and count the number of pulses that have
// been generated.
//
void PulseStream_Init(void)
{
// Select IP_bus_clk/16 as the clock source for Timer 3
/* TMR3_CTRL: CM=0,PCS=0x0C,SCS=0,ONCE=0,LENGTH=1,DIR=0,COINIT=0,OUTMODE=3 */
setReg(TMR3_CTRL,0x1823); /* Set up mode */
/* TMR3_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
```

```

        Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=0 */
    setReg(TMR3_SCTRL,0x00);
    setReg(TMR3_LOAD,0x00);                /* Reset load register */
    setReg(TMR3_COMP1,37500);              /* (16 * 37500) / 60e6 = 0.01 sec */
/* TMR3_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,
                TCF2EN=0,TCF1EN=0,TCF2=0,TCF1=0,CL2=0,CL1=0 */
    setReg(TMR3_CSCTRL,0x00);              /* Set up comparator control register */

// Timer 3 output is the clock source for this timer.
/* TMR1_CTRL: CM=0,PCS=7,SCS=0,ONCE=1,LENGTH=1,DIR=0,COINIT=0,OUTMODE=7 */
setReg(TMR1_CTRL,0x0E67);                 /* Set up mode */
/* TMR1_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
                Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=0,OPS=0,OEN=1 */
setReg(TMR1_SCTRL,0x01);
setReg(TMR1_CNTR,0x00);                   /* Reset counter register */
setReg(TMR1_LOAD,0x00);                   /* Reset load register */
setReg(TMR1_COMP1,0x04);                  /* Set up compare 1 register */

// set to interrupt after the last pulse
/* TMR1_CSCTRL: DBG_EN=0,FAULT=0,ALT_LOAD=0,ROC=0,TCI=0,UP=0,OFLAG=0,
                TCF2EN=0,TCF1EN=1,TCF2=0,TCF1=0,CL2=0,CL1=0 */
setReg(TMR1_CSCTRL,0x40);                 /* Set up comparator control register */
// Finally, start the counters running
setReg(TMR3_CNTR,0);                       /* Reset counter */
setRegBitGroup(TMR3_CTRL,CM,0x01);        /* Run source clock counter */
setRegBitGroup(TMR1_CTRL,CM,0x01);        /* Run counter */
}

```

### 47.6.5.13 Fixed-Frequency PWM Mode

If CTRL[CM]=001, count through roll-over (CTRL[LENGTH]=0), continuous count (CTRL[ONCE]=0) and CTRL[OUTMODE] is '110' (set on compare, cleared on counter roll-over), then the counter output yields a pulse-width modulated (PWM) signal with a frequency equal to the count clock frequency divided by 65,536 and a pulse-width duty cycle equal to the compare value divided by 65,536. This mode of operation is often used to drive PWM amplifiers used to power motors and inverters.

#### Example: 47.6.5.13.1 Fixed-Frequency PWM Mode Example

```

// (See Processor Expert PWM bean.)
// This example uses TMR0 for Fixed-Frequency PWM mode timing.
//
// The timer will count IP_bus clocks continuously until it rolls over.
// This results in a PWM period of 65536 / 60e6 = 1092.267 usec
//
// Initially, an output pulse width of 25 usec is generated ( 1500 / 60e6 )
// giving a PWM ratio of 1500 / 65536 = 2.289%
// This pulse width can be changed by changing the COMP1 register value (using CMPLD1).
//
void PWM1_Init(void)
{
    setReg(TMR0_CNTR,0);                    /* Reset counter */
/* TMR0_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,

```

## Functional Description

```
        Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=1,OPS=0,OEN=1 */
setReg(TMR0_SCTRL,0x05);          /* Enable output */
setReg(TMR0_COMP1,1500);         /* Store initial value to the duty-compare register */
/* TMR0_CTRL: CM=1,PCS=8,SCS=0,ONCE=0,LENGTH=0,DIR=0,COINIT=0,OUTMODE=6 */
setReg(TMR0_CTRL,0x3006);       /* Run counter */
}
```

### 47.6.5.14 Variable-Frequency PWM Mode

If CTRL[CM]=001, count until compare (CTRL[LENGTH]=1), continuous count (CTRL[ONCE] = 0) and CTRL[OUTMODE] is '100' (toggle OFLAG and alternate compare registers), then the counter output yields a pulse-width modulated (PWM) signal whose frequency and pulse width is determined by the values programmed into the COMP1 and COMP2 registers, and the input clock frequency. This method of PWM generation has the advantage of allowing almost any desired PWM frequency and/or constant on or off periods. This mode of operation is often used to drive PWM amplifiers used to power motors and inverters. The CMPLD1 and CMPLD2 registers are especially useful for this mode, as they allow the programmer time to calculate values for the next PWM cycle while the PWM current cycle is underway.

To set up the TMR to run in variable frequency PWM mode with compare preload please use the following setup for the specific counter you would like to use. When performing the setup, update the TMR\_CTRL register last because the counter will start counting if the count mode is changed to any value other than 000 (assuming the primary count source is already active).

#### Timer Control Register (CTRL)

- CM=001 (count rising edges of primary source)
- PCS=1000 (IP bus clock for best granularity for waveform timing)
- SCS=Any (ignored in this mode)
- ONCE=0 (want to count repeatedly)
- LENGTH=1 (want to count until compare value is reached and re-initialize counter register)
- DIR=Any (user's choice. The compare register values must be chosen carefully to account for things like roll-under, etc.)
- COINIT=0 (user can set this if they need this function)
- OUTMODE=100 (toggle OFLAG output using alternating compare registers)

## Timer Status and Control Register (SCTRL)

- OEN = 1 (output enable to allow OFLAG output to be put on an external pin. Set this bit as needed.)
- OPS = Any (user's choice)
- Make sure the rest of the bits are cleared for this register. We will enable interrupts in the comparator status and control register instead of in this register.

## Comparator Status and Control Register (CSCTRL)

- TCF2EN=1 (allow interrupt to be issued when CSCTRL[TCF2] is set)
- TCF1EN=0 (do not allow interrupt to be issued when CSCTRL[TCF1] is set)
- TCF1=0 (clear timer compare 1 interrupt source flag. This is set when counter register equals compare register 1 value and OFLAG is low)
- TCF2=0 (clear timer compare 2 interrupt source flag. This is set when counter register equals compare register 2 value and OFLAG is high)
- CL1=10 (load compare register when CSCTRL[TCF2] is asserted)
- CL2=01 (load compare register when CSCTRL[TCF1] is asserted)

## Interrupt Service Routines

To service the CSCTRL[TCF2] interrupts generated by the timer, the interrupt controller must be configured to enable the interrupts for the particular timer being used. Additionally the user will need to write an interrupt service routine to do at a minimum the following:

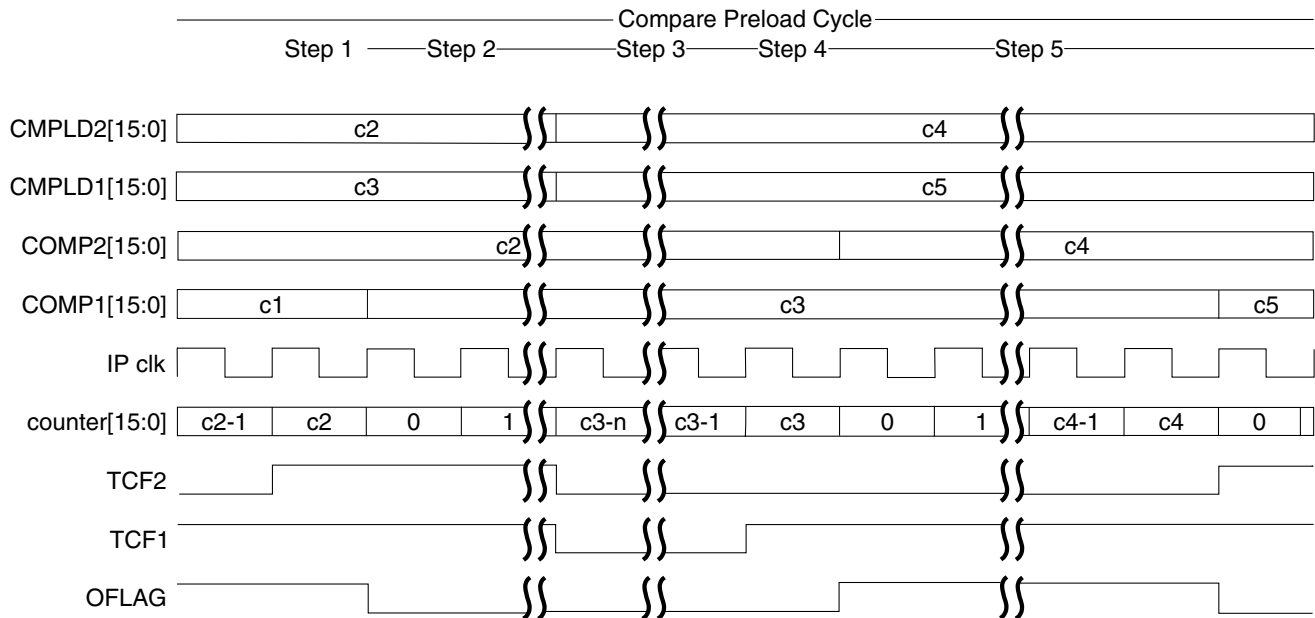

- Clear CSCTRL[TCF2] and CSCTRL[TCF1] flags.
- Calculate and write new values for both CMPLD1 and CMPLD2.

## Timing

This figure contains the timing for using the compare preload feature. The compare preload cycle begins with a compare event on COMP2 causing CSCTRL[TCF2] to be asserted. COMP1 is loaded with the value in the CMPLD1 (c3) one IP bus clock later. In addition an interrupt is asserted by the timer and the interrupt service routine is executed during which both comparator load registers are updated with new values (c4 and c5). When CSCTRL[TCF1] is asserted, COMP2 is loaded with the value in CMPLD2 (c4). And on the subsequent CSCTRL[TCF2] event, COMP1 is loaded with the value in

## Functional Description

CMPLD1 (c5). The cycle starts over again as an interrupt is asserted and the interrupt service routine clears CSCTRL[TCF1] and CSCTRL[TCF2] and calculates new values for CMPLD1 and CMPLD2.

- Step 1-- CNTR matches COMP2 value. CSCTRL[TCF2] is asserted and an interrupt request is generated.
- Step 2-- One clock later, OFLAG toggles, CMPLD1 is copied to COMP1, LOAD is copied to CNTR, the counter starts counting.
- Step 3-- The interrupt service routine clears CSCTRL[TCF1] and CSCTRL[TCF2] and the ISR loads CMPLD1 and CMPLD2 with the values for the next cycle. The counter continues counting until CNTR matches COMP1.
- Step 4-- CSCTRL[TCF1] is asserted. One clock later, OFLAG toggles, CMPLD2 is copied to COMP2, LOAD is copied to CNTR and the counter starts counting.
- Step 5--The counter continues counting until CNTR matches COMP2.

**Figure 47-8. Compare Load Timing**

### Example: 47.6.5.14.1 Variable Frequency PWM Mode

```
// (See Processor Expert PPG [Programmable Pulse Generator] bean.)
// This example starts with an 11 msec with a 31 msec cycle.
// Assuming the chip is operating at 60 MHz, the timer use IP_bus_clk/32 as its
// clock source.
//
// Initial pulse period: 60e6/32 clocks/sec * 31 ms = 58125 total clocks in period
// Initial pulse width: 60e6/32 clocks/sec * 11 ms = 20625 clocks in pulse
//
//
```

```

// Once the initial values of COMP1/CMPLD1 and COMP2/CMPLD2 are set the pulse width
// can be varied by load new values of CMPLD1 and CMPLD2 on each compare interrupt.
// (See Usage of Compare Load Registers.)
//
void PPG1_Init(void)
{
    setReg(TMR0_LOAD,0);          /* Clear load register */
    setReg(TMR0_CNTR,0);         /* Clear counter */
    /* TMR0_SCTRL: TCF=0,TCFIE=0,TOF=0,TOFIE=0,IEF=0,IEFIE=0,IPS=0,INPUT=0,
    Capture_Mode=0,MSTR=0,EEOF=0,VAL=0,FORCE=1,OPS=0,OEN=1 */
    setReg(TMR0_SCTRL,5);        /* Set Status and Control Register */
// Set compare preload operation and enable an interrupt on compare2 events.
/* TMR0_CSCTRL: TCF2EN=1,TCF1EN=0,TCF2=0,TCF1=0,CL21=0,CL20=1,CL11=1,CL10=0 */
    setReg(TMR0_CSCTRL,0x86);    /* Set Comparator Status and Control Register */

    setReg(TMR0_COMP1,20625);     /* Set the pulse width of the off time */
    setReg(TMR0_CMPLD1,20625);    /* Set the pulse width of the off time */
    setReg(TMR0_COMP2,58125-20625); /* Set the pulse width of the on time */
    setReg(TMR0_CMPLD2,58125-20625); /* Set the pulse width of the on time */
    /* TMR0_CTRL: CM=1,PCS=0xD,SCS=0,ONCE=0,LENGTH=1,DIR=0,COINIT=0,OUTMODE=4 */
    setRegBits(TMR0_CTRL,0x3A24); /* Set variable PWM mode and run counter */
}

```

## 47.7 Resets

### 47.7.1 General

The TMR module can be reset only by the RST\_B signal. This forces all registers to their reset state and clears the OFLAG signal if it is asserted. The counter will be turned off until the settings in the control register are changed.

**Table 47-1. Reset Summary**

Reset	Priority	Source	Characteristics
RST_B	n/a	Hardware Reset	Full System Reset

## 47.8 Clocks

### 47.8.1 General

The timer only receives the IP bus clock .

## 47.9 Interrupts

### 47.9.1 General

The TMR module can generate 20 interrupts, Five for each of the four counters/channels.

**Table 47-2. Interrupt Summary**

Core Interrupt	Interrupt	Description
TMR Channel 0	TMR0_COMP_IRQ_B	Compare Interrupt Request for Timer Channel 0
	TMR0_COMP1_IRQ_B	Compare 1 Interrupt Request for Timer Channel 0
	TMR0_COMP2_IRQ_B	Compare 2 Interrupt Request for Timer Channel 0
	TMR0_OVF_IRQ_B	Overflow Interrupt Request for Timer Channel 0
	TMR0_EDGE_IRQ_B	Input Edge Interrupt Request for Timer Channel 0
TMR Channel 1	TMR1_COMP_IRQ_B	Compare Interrupt Request for Timer Channel 1
	TMR1_COMP1_IRQ_B	Compare 1 Interrupt Request for Timer Channel 1
	TMR1_COMP2_IRQ_B	Compare 2 Interrupt Request for Timer Channel 1
	TMR1_OVF_IRQ_B	Overflow Interrupt Request for Timer Channel 1
	TMR1_EDGE_IRQ_B	Input Edge Interrupt Request for Timer Channel 1
TMR Channel 2	TMR2_COMP_IRQ_B	Compare Interrupt Request for Timer Channel 2
	TMR2_COMP1_IRQ_B	Compare 1 Interrupt Request for Timer Channel 2
	TMR2_COMP2_IRQ_B	Compare 2 Interrupt Request for Timer Channel 2
	TMR2_OVF_IRQ_B	Overflow Interrupt Request for Timer Channel 2
	TMR2_EDGE_IRQ_B	Input Edge Interrupt Request for Timer Channel 2
TMR Channel 3	TMR3_COMP_IRQ_B	Compare Interrupt Request for Timer Channel 3
	TMR3_COMP1_IRQ_B	Compare 1 Interrupt Request for Timer Channel 3
	TMR3_COMP2_IRQ_B	Compare 2 Interrupt Request for Timer Channel 3
	TMR3_OVF_IRQ_B	Overflow Interrupt Request for Timer Channel 3
	TMR3_EDGE_IRQ_B	Input Edge Interrupt Request for Timer Channel 3

### 47.9.2 Description of Interrupt Operation

#### 47.9.2.1 Timer Compare Interrupts

These interrupts are generated when a successful compare occurs between a counter and its compare registers while SCTRL[TCFIE] is set. These interrupts are cleared by writing a zero to the appropriate SCTRL[TCF].

When a timer compare interrupt is set in TMR\_SCTRL and the Compare Load registers are available, one of the following two interrupts will also be asserted.

#### 47.9.2.1.1 Timer Compare 1 Interrupts (Available with Compare Load Feature)

These interrupts are generated when a successful compare occurs between a counter and its COMP1 register while CSCTRL[TCF1EN] is set. These interrupts are cleared by writing a zero to the appropriate CSCTRL[TCF1].

#### 47.9.2.1.2 Timer Compare 2 Interrupts (Available with Compare Load Feature)

These interrupts are generated when a successful compare occurs between a counter and its COMP2 register while CSCTRL[TCF2EN] is set. These interrupts are cleared by writing a zero to the appropriate CSCTRL[TCF2].

### 47.9.2.2 Timer Overflow Interrupts

These interrupts are generated when a counter rolls over its maximum value while SCTRL[TOFIE] is set. These interrupts are cleared by writing zero to the appropriate SCTRL[TOF].

### 47.9.2.3 Timer Input Edge Interrupts

These interrupts are generated by a transition of the input signal (either positive or negative depending on IPS setting) while SCTRL[IEFIE] is set. These interrupts are cleared by writing a zero to the appropriate SCTRL[IEF].

## 47.10 DMA

The TMR module can generate twelve DMA requests: three for each of the four counters/channels. Refer to the following table.

**Table 47-3. DMA Summary**

DMA Request	DMA Enable	Description
Channels 0-3	DMA[IEFDE]	CAPT contains a value
	DMA[CMPLD1DE]	CMPLD1 needs an update
	DMA[CMPLD2DE]	CMPLD2 needs an update

# Chapter 48

## Synchronous Audio Interface (SAI)

### 48.1 Introduction

The I<sup>2</sup>S (or I2S) module provides a synchronous audio interface (SAI) that supports full-duplex serial interfaces with frame synchronization such as I<sup>2</sup>S, AC97, TDM, and codec/DSP interfaces.

#### 48.1.1 Features

Note that some of the features are not supported across all SAI instances; see the chip-specific information in the first section of this chapter.

- Transmitter with independent bit clock and frame sync supporting 4 data lines
- Receiver with independent bit clock and frame sync supporting 4 data lines
- Each data line can support a maximum Frame size of 32 words
- Word size of between 8-bits and 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous 32 × 32-bit FIFO for each transmit and receive data line
- Supports graceful restart after FIFO error
- Supports automatic restart after FIFO error without software intervention
- Supports packing of 8-bit and 16-bit data into each 32-bit FIFO word
- Supports combining multiple data line FIFOs into single data line FIFO

#### 48.1.2 Block diagram

The following block diagram also shows the module clocks.

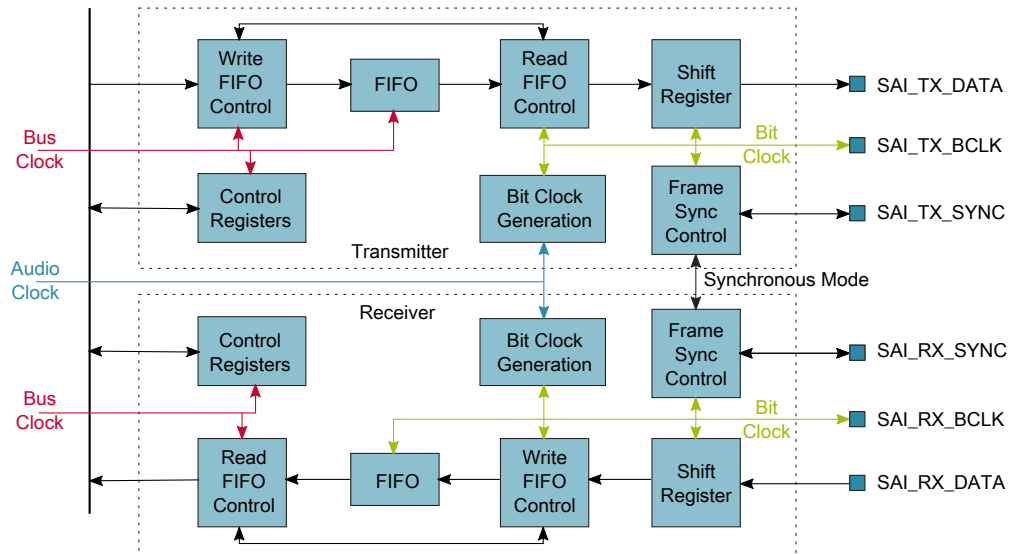

Figure 48-1. I<sup>2</sup>S/SAI block diagram

### 48.1.3 Modes of operation

Module power modes include Run mode, stop modes, low-leakage stop modes, and Debug mode.

#### 48.1.3.1 Run mode

In Run mode, the SAI transmitter and receiver operate normally.

#### 48.1.3.2 Stop modes

In Stop mode, the SAI transmitter and/or receiver can continue operating provided the appropriate Stop Enable bit is set (TCSR[STOPE] and/or RCSR[STOPE], respectively), and provided the transmitter and/or receiver is/are using an externally generated bit clock or an Audio Master Clock that remains operating in Stop mode. The SAI transmitter and/or receiver can generate an asynchronous interrupt to wake the CPU from Stop mode.

In Stop mode, if the Transmitter Stop Enable (TCSR[STOPE]) bit is clear, the transmitter is disabled after completing the current transmit frame, and, if the Receiver Stop Enable (RCSR[STOPE]) bit is clear, the receiver is disabled after completing the current receive frame. Entry into Stop mode is prevented—not acknowledged—while waiting for the transmitter and receiver to be disabled at the end of the current frame.

### 48.1.3.3 Debug mode

In Debug mode, the SAI transmitter and/or receiver can continue operating provided the Debug Enable bit is set. When TCSR[DBGE] or RCSR[DBGE] bit is clear and Debug mode is entered, the SAI is disabled after completing the current transmit or receive frame. The transmitter and receiver bit clocks are not affected by Debug mode.

## 48.2 External signals

Name	Function	I/O
SAI_TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	I/O
SAI_TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	I/O
SAI_TX_DATA[3:0]	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	O
SAI_RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	I/O
SAI_RX_SYNC	Receive Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	I/O
SAI_RX_DATA[3:0]	Receive Data. The receive data is sampled synchronously by the bit clock.	I
MCLK_EN	Audio Master Clock.	I

## 48.3 Functional description

This section provides a complete functional description of the block.

### 48.3.1 SAI clocking

The SAI clocks include:

- The audio master clock
- The bit clock
- The bus clock

### 48.3.1.1 Audio master clock

The audio master clock is used to generate the bit clock when the receiver or transmitter is configured for an internally generated bit clock. The transmitter and receiver can independently select between the bus clock and up to three audio master clocks to generate the bit clock.

The audio master clock generation and selection is chip-specific. Refer to chip-specific clocking information about how the audio master clocks are generated.

### 48.3.1.2 Bit clock

The SAI transmitter and receiver support asynchronous free-running bit clocks that can be generated internally from an audio master clock or supplied externally. There is also the option for synchronous bit clock and frame sync operation between the receiver and transmitter or between multiple SAI peripherals.

- If both transmitter and receiver are configured for asynchronous operation, then the transmitter and receiver will each use *their own* bit clock and frame sync.
- If the *transmitter* is configured for asynchronous mode and the receiver is configured for synchronous mode, then both transmitter and receiver will use the *transmitter* bit clock and frame sync.
- If the *receiver* is configured for asynchronous mode and the transmitter is configured for synchronous mode, then both transmitter and receiver will use the *receiver* bit clock and frame sync.

Note that the software configures synchronous or asynchronous mode, and that choice selects the bit clock/frame sync used.

Externally generated bit clocks must be:

- Enabled before the SAI transmitter or receiver is enabled
- Disabled after the SAI transmitter or receiver is disabled and completes its current frames

If the SAI transmitter or receiver is using an externally generated bit clock in asynchronous mode and that bit clock is generated by an SAI that is disabled in stop mode, then the transmitter or receiver should be disabled by software before entering stop mode. This issue does not apply when the transmitter or receiver is in a synchronous mode because all synchronous SAIs are enabled and disabled simultaneously.

### 48.3.1.3 Bus clock

The bus clock is used by the control and configuration registers and to generate synchronous interrupts and DMA requests.

#### NOTE

Although there is no specific minimum bus clock frequency specified, the bus clock frequency must be fast enough (relative to the bit clock frequency) to ensure that the FIFOs can be serviced, without generating either a transmitter FIFO underrun or receiver FIFO overflow condition.

## 48.3.2 SAI resets

The SAI is asynchronously reset on system reset. The SAI has a software reset and a FIFO reset.

### 48.3.2.1 Software reset

The SAI transmitter includes a software reset that resets all transmitter internal logic, including the bit clock generation, status flags, and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

The SAI receiver includes a software reset that resets all receiver internal logic, including the bit clock generation, status flags and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

### 48.3.2.2 FIFO reset

The SAI transmitter includes a FIFO reset that synchronizes the FIFO write pointer to the same value as the FIFO read pointer. This empties the FIFO contents and is to be used after TCSR[FEF] is set, and before the FIFO is re-initialized and TCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI transmitter can also reset the FIFO of individual data channels by setting the appropriate TCR3[CFR] bit. This should only be done when the corresponding TCR3[TCE] bit is clear.

The SAI receiver includes a FIFO reset that synchronizes the FIFO read pointer to the same value as the FIFO write pointer. This empties the FIFO contents and is to be used after the RCSR[FEF] is set and any remaining data has been read from the FIFO, and before the RCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI receiver can also reset the FIFO of individual data channels by setting the appropriate RCR3[CFR] bit. This should only be done when the corresponding RCR3[RCE] bit is clear.

### **48.3.3 Synchronous modes**

The SAI transmitter and receiver can operate synchronously to each other.

#### **48.3.3.1 Synchronous mode**

The SAI transmitter and receiver can be configured to operate with synchronous bit clock and frame sync.

If the transmitter bit clock and frame sync are to be used by both the transmitter and receiver:

- The transmitter must be configured for asynchronous operation and the receiver for synchronous operation.
- In synchronous mode, the receiver is enabled only when both the transmitter and receiver are enabled.
- It is recommended that the transmitter is the last enabled and the first disabled.

If the receiver bit clock and frame sync are to be used by both the transmitter and receiver:

- The receiver must be configured for asynchronous operation and the transmitter for synchronous operation.
- In synchronous mode, the transmitter is enabled only when both the receiver and transmitter are both enabled.
- It is recommended that the receiver is the last enabled and the first disabled.

When operating in synchronous mode, only the bit clock, frame sync, and transmitter/receiver enable are shared. The transmitter and receiver otherwise operate independently, although configuration registers must be configured consistently across both the transmitter and receiver.

### 48.3.4 Frame sync configuration

When enabled, the SAI continuously transmits and/or receives frames of data. Each frame consists of a fixed number of words and each word consists of a fixed number of bits. Within each frame, any given word can be masked causing the receiver to ignore that word and the transmitter to tri-state for the duration of that word.

The frame sync signal is used to indicate the start of each frame. A valid frame sync requires a rising edge (if active high) or falling edge (if active low) to be detected and the transmitter or receiver cannot be busy with a previous frame. A valid frame sync is also ignored (slave mode) or not generated (master mode) for the first four bit clock cycles after enabling the transmitter or receiver.

The transmitter and receiver frame sync can be configured independently with any of the following options:

- Externally generated or internally generated
- Active high or active low
- Assert with the first bit in frame or asserts one bit early
- Assert for a duration between 1 bit clock and the first word length
- Frame length from 1 to 32 words per frame
- Word length to support 8 to 32 bits per word
  - First word length and remaining word lengths can be configured separately
- Words can be configured to transmit/receive MSB first or LSB first

These configuration options cannot be changed after the SAI transmitter or receiver is enabled.

### 48.3.5 Data FIFO

Each transmit and receive channel includes a FIFO of size  $32 \times 32$ -bit. The FIFO data is accessed using the SAI Transmit/Receive Data Registers.

### 48.3.5.1 Data alignment

Data in the FIFO can be aligned anywhere within the 32-bit wide register through the use of the First Bit Shifted configuration field, which selects the bit index (between 31 and 0) of the first bit shifted.

Examples of supported data alignment and the required First Bit Shifted configuration are illustrated in [Figure 48-2](#) for LSB First configurations and [Figure 48-3](#) for MSB First configurations.

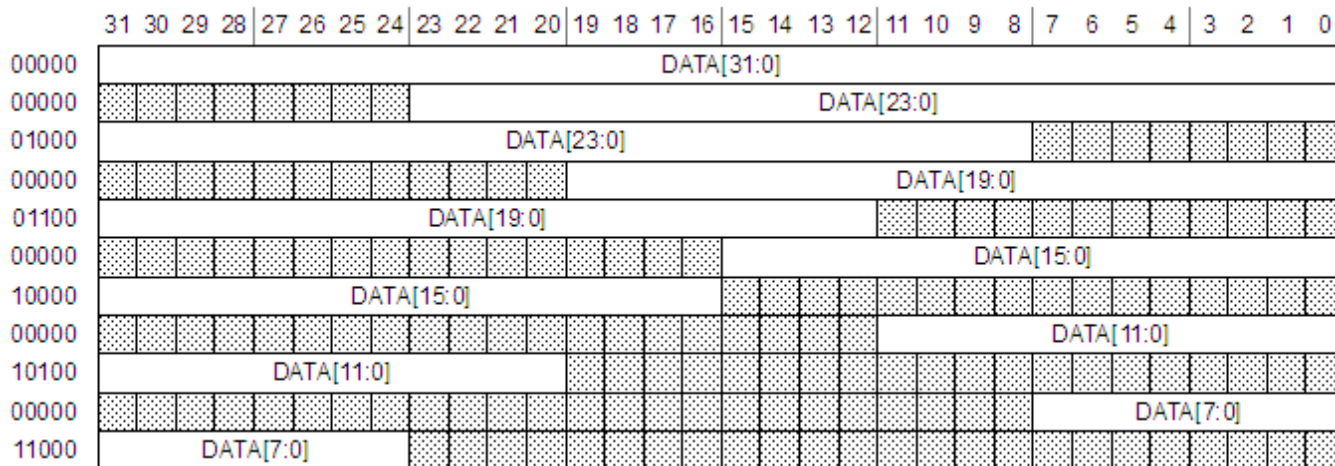

Figure 48-2. SAI first bit shifted, LSB first

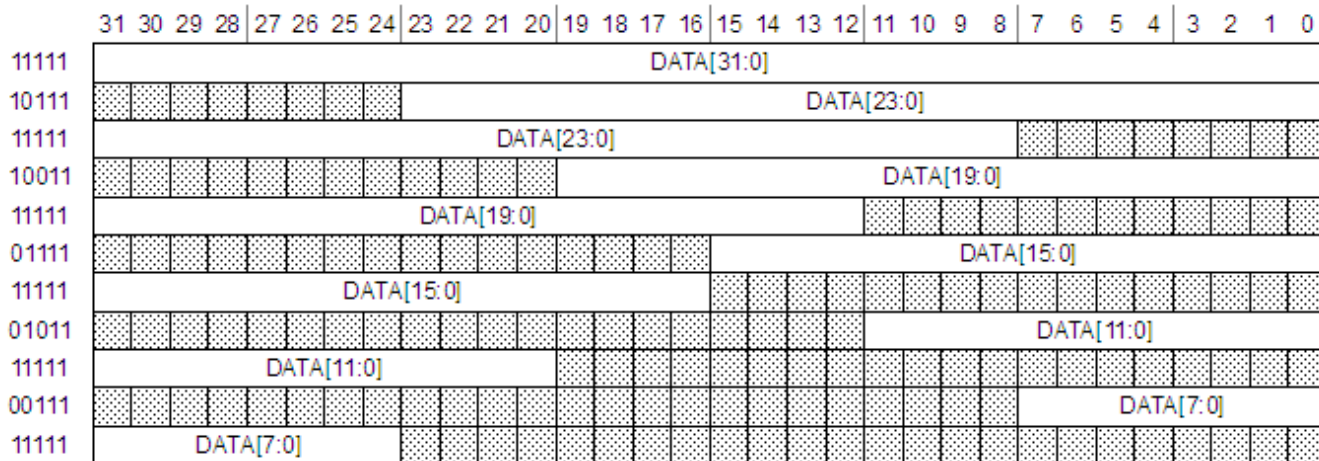

Figure 48-3. SAI first bit shifted, MSB first

### 48.3.5.2 FIFO pointers

When writing to a TDR, the WFP of the corresponding TFR increments after each valid write. The SAI supports 8-bit, 16-bit and 32-bit writes to the TDR and the FIFO pointer will increment after each individual write. Note that 8-bit writes should only be used when transmitting up to 8-bit data and 16-bit writes should only be used when transmitting up to 16-bit data.

Writes to a TDR are ignored if the FIFO is full. If the Transmit FIFO is empty, the TDR must be written at least three bit clocks before the start of the next unmasked word to avoid a FIFO underrun.

When reading an RDR, the RFP of the corresponding RFR increments after each valid read. The SAI supports 8-bit, 16-bit and 32-bit reads from the RDR and the FIFO pointer will increment after each individual read. Note that 8-bit reads should only be used when receiving up to 8-bit data and 16-bit reads should only be used when receiving up to 16-bit data.

Reads from an RDR are ignored if the FIFO is empty. If the Receive FIFO is full, the RDR must be read at least three bit clocks before the end of an unmasked word to avoid a FIFO overrun.

### 48.3.5.3 FIFO packing

FIFO packing supports storing multiple 8-bit or 16-bit data words in one 32-bit FIFO word for the transmitter and/or receiver. While this can be emulated by adjusting the number of bits per word and number of words per frame (for example, one 32-bit word per frame versus two 16-bit words per frame), FIFO packing does not require even multiples of words per frame and fully supports word masking. When FIFO packing is enabled, the FIFO pointers only increment when the full 32-bit FIFO word has been written (transmit) or read (receive) by software, supporting scenarios where different words within each frame are loaded/stored in different areas of memory.

When 16-bit FIFO packing is enabled for transmit, the transmit shift register is loaded at the start of each frame and after every second unmasked transmit word. The first word transmitted is taken from 16-bit word at byte offset \$0 (first bit is selected by TCFG5[FBT] must be configured within this 16-bit word) and the second word transmitted is taken from the 16-bit word at byte offset \$2 (first bit is selected by TCSR5[FBT][3:0]). The transmitter will transmit logic zero until the start of the next word once the 16-bit word has been transmitted.

When 16-bit FIFO packing is enabled for receive, the receive shift register is stored after every second unmasked received word, and at the end of each frame if there is an odd number of unmasked received words in each frame. The first word received is stored in the 16-bit word at byte offset \$0 (first bit is selected by RCFG5[FBT] and must be configured within this 16-bit word) and the second word received is stored in the 16-bit word at byte offset \$2 (first bit is selected by RCSR5[FBT][3:0]). The receiver will ignore received data until the start of the next word once the 16-bit word has been received.

The 8-bit FIFO packing is similar to 16-bit packing except four words are loaded or stored into each 32-bit FIFO word. The first word is loaded/stored in byte offset \$0, second word in byte offset \$1, third word in byte offset \$2 and fourth word in byte offset \$3. The TCFG5[FBT] and/or RCFG5[FBT] must be configured within byte offset \$0.

#### **48.3.5.4 FIFO Combine**

FIFO combining mode allows the separate FIFOs for multiple data channels to be used as a single FIFO for either software accesses or a single data channel or both. Note that the enabled data channels must be contiguous and data channel 0 must be enabled when FIFO Combine mode is enabled.

Combining FIFOs for software access (writing transmit FIFO registers, reading receive FIFO registers) allows a DMA controller or software to read or write multiple FIFOs without incrementing the address that is accessed. Once enabled, the first software access to a FIFO register will access the first enabled channel FIFO, while the second access to a FIFO register will access the second enabled channel FIFO. This continues until software accesses the last enabled channel FIFO and the pointer resets back to the first enabled channel FIFO. To reset the pointer manually, software can reset the FIFOs or disable the FIFO combining on software accesses.

Combining FIFOs for transmit data channels allows one data channel to use the FIFOs of all enabled channel FIFOs, with identical data output on each enabled data channel. The transmit shift registers for all enabled data channels are loaded at the start of each frame and every N unmasked words (where N is the number of enabled data channels). The first word transmitted is loaded from the first enabled channel FIFO, while the second word transmitted is loaded from the second enabled channel FIFO, and so on until the end of the frame. Since the first word in each frame is always loaded from the first enabled data channel, it is recommended that the number of unmasked words in each frame is evenly divisible by the number of enabled data channels.

Combining FIFOs for receive data channels allows one data channel to use the FIFOs of all enabled channel FIFOs, with received data from channel 0 stored into each enabled data channel. The receive shift register for all enabled data channels are stored after every N unmasked words (where N is the number of enabled data channels). The first word received is stored to the first enabled channel FIFO, while the second word received is stored to the second enabled channel FIFO, and so on until the end of the frame. Since the first word in each frame is always stored the first enabled data channel, it is recommended that the number of unmasked words in each frame is evenly divisible by the number of enabled data channels.

Note that combining FIFOs for data channels will load or store each channel FIFO at the same time. This means that FIFO error conditions are only checked every N words (where N is the number of enabled data channels) and that the FIFO warning and request flags will assert if any of the enabled data channel meets the warning flag or request flag conditions.

### **48.3.6 Word mask register**

The SAI transmitter and receiver each contain a word mask register, namely TMR and RMR, that can be used to mask any word in the frame. Because the word mask register is double buffered, software can update it before the end of each frame to mask a particular word in the next frame.

The TMR causes the Transmit Data pin to be tri-stated for the length of each selected word and the transmit FIFO is not read for masked words.

The RMR causes the received data for each selected word to be discarded and not written to the receive FIFO.

### **48.3.7 Interrupts and DMA requests**

The SAI transmitter and receiver generate separate interrupts and separate DMA requests, but support the same status flags. Asynchronous versions of the transmitter and receiver interrupts are generated to wake up the CPU from stop mode.

#### **48.3.7.1 FIFO request flag**

The FIFO request flag is set based on the number of entries in the FIFO and the FIFO watermark configuration.

The transmit FIFO request flag is set when the number of entries in any of the enabled transmit FIFOs is less than or equal to the transmit FIFO watermark configuration and is cleared when the number of entries in each enabled transmit FIFO is greater than the transmit FIFO watermark configuration.

The receive FIFO request flag is set when the number of entries in any of the enabled receive FIFOs is greater than the receive FIFO watermark configuration and is cleared when the number of entries in each enabled receive FIFO is less than or equal to the receive FIFO watermark configuration.

The FIFO request flag can generate an interrupt or a DMA request.

### **48.3.7.2 FIFO warning flag**

The FIFO warning flag is set based on the number of entries in the FIFO.

The transmit warning flag is set when the number of entries in any of the enabled transmit FIFOs is empty and is cleared when the number of entries in each enabled transmit FIFO is not empty.

The receive warning flag is set when the number of entries in any of the enabled receive FIFOs is full and is cleared when the number of entries in each enabled receive FIFO is not full.

The FIFO warning flag can generate an Interrupt or a DMA request.

### **48.3.7.3 FIFO error flag**

The transmit FIFO error flag is set when the any of the enabled transmit FIFOs underflow. After it is set, all enabled transmit channels will transmit zero data before TCSR[FEF] is cleared.

When TCR4[FCONT] is set, the FIFO will continue transmitting data following an underflow without software intervention. To ensure that data is transmitted in the correct order, the transmitter will continue from the same word number in the frame that caused the FIFO to underflow, but only after new data has been written to the transmit FIFO. Software should still clear the TCSR[FEF] flag, but without reinitializing the transmit FIFOs.

RCSR[FEF] is set when the any of the enabled receive FIFOs overflow. After it is set, all enabled receive channels discard received data until RCSR[FEF] is cleared and the next next receive frame starts. All enabled receive FIFOs should be emptied before RCSR[FEF] is cleared.

When RCR4[FCONT] is set, the FIFO will continue receiving data following an overflow without software intervention. To ensure that data is received in the correct order, the receiver will continue from the same word number in the frame that caused the FIFO to overflow, but only after data has been read from the receive FIFO. Software should still clear the RCSR[FEF] flag, but without emptying the receive FIFOs.

The FIFO error flag can generate only an interrupt.

#### 48.3.7.4 Sync error flag

The sync error flag, TCSR[SEF] or RCSR[SEF], is set when configured for an externally generated frame sync and the external frame sync asserts when the transmitter or receiver is busy with the previous frame. The external frame sync assertion is ignored and the sync error flag is set. When the sync error flag is set, the transmitter or receiver continues checking for frame sync assertion when idle or at the end of each frame.

The sync error flag can generate an interrupt only.

#### 48.3.7.5 Word start flag

The word start flag is set at the start of the second bit clock for the selected word, as configured by the Word Flag register field.

The word start flag can generate an interrupt only.

### 48.4 Memory map and register definition

A read or write access to an address from offset 0x100 and above will result in a bus error.

#### 48.4.1 I2S Register Descriptions

##### 48.4.1.1 I2S Memory Map

Base address: 4038\_4000 for SAI1; 4038\_8000 for SAI2; 4038\_C000 for SAI3.

**NOTE**

Number of Data Lines for TX and RX is 4 for SAI1, and is 1 for SAI2/SAI3.

### 48.4.1.4.3 Fields

Field	Function
31 TE	Transmitter Enable Enables/disables the transmitter. When software clears this field, the transmitter remains enabled, and this bit remains set, until the end of the current frame. 0b - Transmitter is disabled. 1b - Transmitter is enabled, or transmitter has been disabled and has not yet reached end of frame.
30 STOPE	Stop Enable Configures transmitter operation in Stop mode. This field is ignored and the transmitter is disabled in all low-leakage stop modes. 0b - Transmitter disabled in Stop mode. 1b - Transmitter enabled in Stop mode.
29 DBG E	Debug Enable Enables/disables transmitter operation in Debug mode. The transmit bit clock is not affected by debug mode. 0b - Transmitter is disabled in Debug mode, after completing the current frame. 1b - Transmitter is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the transmit bit clock, separately from the TE. This field is automatically set whenever TE is set. When software clears this field, the transmit bit clock remains enabled, and this bit remains set, until the end of the current frame. 0b - Transmit bit clock is disabled. 1b - Transmit bit clock is enabled.
27-26 —	Reserved
25 FR	FIFO Reset Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the transmitter is disabled or the FIFO error flag is set. 0b - No effect. 1b - FIFO reset.
24 SR	Software Reset

Table continues on the next page...

## Memory map and register definition

Field	Function
	When set, resets the internal transmitter logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. 0b - No effect. 1b - Software reset.
23-21 —	Reserved
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag. 0b - Start of word not detected. 1b - Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0b - Sync error not detected. 1b - Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled transmit FIFO has underrun. Write a logic 1 to this field to clear this flag. 0b - Transmit underrun not detected. 1b - Transmit underrun detected.
17 FWF	FIFO Warning Flag Indicates that an enabled transmit FIFO is empty. 0b - No enabled transmit FIFO is empty. 1b - Enabled transmit FIFO is empty.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled transmit channel FIFO is less than or equal to the transmit FIFO watermark. 0b - Transmit FIFO watermark has not been reached. 1b - Transmit FIFO watermark has been reached.
15-13 —	Reserved
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.

*Table continues on the next page...*

Field	Function
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
7-5 —	Reserved
4-2 —	Reserved
1 FWDE	FIFO Warning DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.

31-30 SYNC	Synchronous Mode Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the receiver must be configured for asynchronous operation. 00b - Asynchronous mode.

Table continues on the next page...

Field	Function
	01b - Synchronous with receiver. 10b - Reserved. 11b - Reserved.
29 BCS	<p>Bit Clock Swap</p> <p>This field swaps the bit clock used by the transmitter. When the transmitter is configured in asynchronous mode and this bit is set, the transmitter is clocked by the receiver bit clock (SAI_RX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the transmitter continues to use the transmit frame sync (SAI_TX_SYNC).</p> <p>When the transmitter is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the transmitter bit clock (SAI_TX_BCLK) but use the receiver frame sync (SAI_RX_SYNC).</p> <p>0b - Use the normal bit clock source. 1b - Swap the bit clock source.</p>
28 BCI	<p>Bit Clock Input</p> <p>When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the transmitter is delayed by the pad output delay (the transmitter is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time.</p> <p>The slave mode timing from the datasheet should be used for the transmitter when this bit is set. In synchronous mode, this bit allows the transmitter to use the slave mode timing from the datasheet, while the receiver uses the master mode timing. This field has no effect when configured for an externally generated bit clock .</p> <p>0b - No effect. 1b - Internal logic is clocked as if bit clock was externally generated.</p>
27-26 MSEL	<p>MCLK Select</p> <p>Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock.</p> <p><b>NOTE:</b> Depending on the device, some Master Clock options might not be available. See the chip-specific information for the meaning of each option.</p> <p>00b - Bus Clock selected. 01b - Master Clock (MCLK) 1 option selected. 10b - Master Clock (MCLK) 2 option selected. 11b - Master Clock (MCLK) 3 option selected.</p>
25 BCP	<p>Bit Clock Polarity</p> <p>Configures the polarity of the bit clock.</p> <p>0b - Bit clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1b - Bit clock is active low with drive outputs on falling edge and sample inputs on rising edge.</p>
24 BCD	<p>Bit Clock Direction</p> <p>Configures the direction of the bit clock.</p> <p>0b - Bit clock is generated externally in Slave mode. 1b - Bit clock is generated internally in Master mode.</p>
23-8 —	Reserved
7-0 DIV	<p>Bit Clock Divide</p> <p>Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is <math>(DIV + 1) * 2</math>.</p>

Field	Function
31-28 —	Reserved
27-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field will always return zero. FIFO pointers should only be reset when a channel is disabled or the FIFO error flag is set.  0b - No effect. 1b - Transmit data channel N FIFO is reset.
23-20 —	Reserved
19-16 TCE	Transmit Channel Enable Enables the corresponding data channel for transmit operation. Changing this field will take effect immediately for generating the FIFO request and warning flags, but at the end of each frame for transmit operation.  0b - Transmit data channel N is disabled. 1b - Transmit data channel N is enabled.
15-5	Reserved

Table continues on the next page...

Field	Function
—	
4-0 WDFL	Word Flag Configuration Configures which word sets the start of word flag. The value written must be one less than the word number. For example, writing 0 configures the first word in the frame. When configured to a value greater than TCR4[FRSZ], then the start of word flag is never set.

## 48.4.1.8 SAI Transmit Configuration 4 (TCR4)

### 48.4.1.8.1 Address

Register	Offset
TCR4	18h

### 48.4.1.8.2 Function

This register must not be altered when TCSR[TE] is set.

### 48.4.1.8.3 Diagram

### 48.4.1.8.4 Fields

Field	Function
31-29 —	Reserved
28 FCONT	FIFO Continue on Error Configures when the SAI will continue transmitting after a FIFO error has been detected.

*Table continues on the next page...*

## Memory map and register definition

Field	Function
	<p>0b - On FIFO error, the SAI will continue from the start of the next frame after the FIFO error flag has been cleared.</p> <p>1b - On FIFO error, the SAI will continue from the same word that caused the FIFO error to set after the FIFO warning flag has been cleared.</p>
27-26 FCOMB	<p>FIFO Combine Mode</p> <p>When FIFO combine mode is enabled for FIFO writes, software writing to any FIFO data register will alternate the write among the enabled data channel FIFOs. For example, if two data channels are enabled then the first write will be performed to the first enabled data channel FIFO and the second write will be performed to the second enabled data channel FIFO. Resetting the FIFO or disabling FIFO combine mode for FIFO writes will reset the pointer back to the first enabled data channel.</p> <p>When FIFO combine mode is enabled for FIFO reads from the transmit shift registers, the transmit data channel output will alternate between the enabled data channel FIFOs. For example, if two data channels are enabled then the first unmasked word will be transmitted from the first enabled data channel FIFO and the second unmasked word will be transmitted from the second enabled data channel FIFO. Since the first word of the frame is always transmitted from the first enabled data channel FIFO, it is recommended that the number of unmasked words per frame is evenly divisible by the number of enabled data channels.</p> <p>00b - FIFO combine mode disabled.            01b - FIFO combine mode enabled on FIFO reads (from transmit shift registers).            10b - FIFO combine mode enabled on FIFO writes (by software).            11b - FIFO combine mode enabled on FIFO reads (from transmit shift registers) and writes (by software).</p>
25-24 FPACK	<p>FIFO Packing Mode</p> <p>Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8-bit or 16-bit then only the first 8-bit or 16-bits are loaded from the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO write pointer will only increment when the full 32-bit FIFO word has been written by software.</p> <p>00b - FIFO packing is disabled            01b - Reserved            10b - 8-bit FIFO packing is enabled            11b - 16-bit FIFO packing is enabled</p>
23-21 —	Reserved
20-16 FRSZ	<p>Frame size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.</p>
15-13 —	Reserved
12-8 SYWD	<p>Sync Width</p> <p>Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.</p>
7-6 —	Reserved
5 CHMOD	<p>Channel Mode</p> <p>Configures if transmit data pins are configured for TDM mode or Output mode.</p> <p>0b - TDM mode, transmit data pins are tri-stated when slots are masked or channels are disabled.</p>

*Table continues on the next page...*

Field	Function
	1b - Output mode, transmit data pins are never tri-stated and will output zero when slots are masked or channels are disabled.
4 MF	MSB First Configures whether the LSB or the MSB is transmitted first. 0b - LSB is transmitted first. 1b - MSB is transmitted first.
3 FSE	Frame Sync Early 0b - Frame sync asserts with the first bit of the frame. 1b - Frame sync asserts one bit before the first bit of the frame.
2 ONDEM	On Demand Mode When set, and the frame sync is generated internally, a frame sync is only generated when the FIFO warning flag is clear. 0b - Internal frame sync is generated continuously. 1b - Internal frame sync is generated when the FIFO warning flag is clear.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0b - Frame sync is active high. 1b - Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0b - Frame sync is generated externally in Slave mode. 1b - Frame sync is generated internally in Master mode.

### 48.4.1.9.4 Fields

Field	Function
31-29 —	Reserved
28-24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23-21 —	Reserved
20-16 WOW	Word 0 Width Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15-13 —	Reserved
12-8 FBT	First Bit Shifted Configures the bit index for the first bit transmitted for each word in the frame. If configured for MSB First, the index of the next bit transmitted is one less than the current bit transmitted. If configured for LSB First, the index of the next bit transmitted is one more than the current bit transmitted. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
7-0 —	Reserved

### 48.4.1.10 SAI Transmit Data (TDRa)

### 48.4.1.10.1 Address

Register	Offset
TDR0	20h
TDR1	24h
TDR2	28h
TDR3	2Ch

### 48.4.1.10.2 Diagram

### 48.4.1.10.3 Fields

Field	Function
31-0	Transmit Data Register
TDR	Writes to this register when the transmit FIFO is not full will push the data written into the transmit data FIFO. Writes to this register when the transmit FIFO is full are ignored.

## 48.4.1.11 SAI Transmit FIFO (TFRa)

### 48.4.1.11.1 Address

Register	Offset
TFR0	40h
TFR1	44h
TFR2	48h
TFR3	4Ch

### 48.4.1.11.2 Function

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

### 48.4.1.11.3 Diagram

### 48.4.1.11.4 Fields

Field	Function
31 WCP	Write Channel Pointer When FIFO Combine mode is enabled for writes, indicates that this data channel is the next FIFO to be written. 0b - No effect. 1b - FIFO combine is enabled for FIFO writes and this FIFO will be written on the next FIFO write.
30-22 —	Reserved
21-16 WFP	Write FIFO Pointer FIFO write pointer for transmit data channel.
15-6 —	Reserved
5-0 RFP	Read FIFO Pointer FIFO read pointer for transmit data channel.

### 48.4.1.12 SAI Transmit Mask (TMR)

### 48.4.1.12.1 Address

Register	Offset
TMR	60h

### 48.4.1.12.2 Function

This register is double-buffered and updates:

1. When TCSR[TE] is first set
2. At the end of each frame.

This allows the masked words in each frame to change from frame to frame.

### 48.4.1.12.3 Diagram

### 48.4.1.12.4 Fields

Field	Function
31-0	Transmit Word Mask
TWM	Configures whether the transmit word is masked (transmit data pins are tri-stated or drive zero and transmit data not read from FIFO) for the corresponding word in the frame. 00000000000000000000000000000000b - Word N is enabled. 00000000000000000000000000000001b - Word N is masked. The transmit data pins are tri-stated or drive zero when masked.

### 48.4.1.13 SAI Receive Control (RCSR)

### 48.4.1.13.1 Address

Register	Offset
RCSR	88h

### 48.4.1.13.2 Diagram

### 48.4.1.13.3 Fields

Field	Function
31 RE	Receiver Enable Enables/disables the receiver. When software clears this field, the receiver remains enabled, and this bit remains set, until the end of the current frame. 0b - Receiver is disabled. 1b - Receiver is enabled, or receiver has been disabled and has not yet reached end of frame.
30 STOPE	Stop Enable Configures receiver operation in Stop mode. This bit is ignored and the receiver is disabled in all low-leakage stop modes. 0b - Receiver disabled in Stop mode. 1b - Receiver enabled in Stop mode.
29 DBG E	Debug Enable Enables/disables receiver operation in Debug mode. The receive bit clock is not affected by Debug mode. 0b - Receiver is disabled in Debug mode, after completing the current frame. 1b - Receiver is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the receive bit clock, separately from RE. This field is automatically set whenever RE is set. When software clears this field, the receive bit clock remains enabled, and this field remains set, until the end of the current frame. 0b - Receive bit clock is disabled. 1b - Receive bit clock is enabled.
27-26 —	Reserved

Table continues on the next page...

Field	Function
25 FR	FIFO Reset Resets the FIFO pointers. Reading this field will always return zero. FIFO pointers should only be reset when the receiver is disabled or the FIFO error flag is set. 0b - No effect. 1b - FIFO reset.
24 SR	Software Reset Resets the internal receiver logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. 0b - No effect. 1b - Software reset.
23-21 —	Reserved
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag. 0b - Start of word not detected. 1b - Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0b - Sync error not detected. 1b - Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled receive FIFO has overflowed. Write a logic 1 to this field to clear this flag. 0b - Receive overflow not detected. 1b - Receive overflow detected.
17 FWF	FIFO Warning Flag Indicates that an enabled receive FIFO is full. 0b - No enabled receive FIFO is full. 1b - Enabled receive FIFO is full.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled receive channel FIFO is greater than the receive FIFO watermark. 0b - Receive FIFO watermark not reached. 1b - Receive FIFO watermark has been reached.
15-13 —	Reserved
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts.

### 48.4.1.16.3 Fields

Field	Function
31-28 —	Reserved
27-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field will always return zero. FIFO pointers should only be reset when a channel is disabled or the FIFO error flag is set.  0b - No effect. 1b - Receive data channel N FIFO is reset.
23-20 —	Reserved
19-16 RCE	Receive Channel Enable Enables the corresponding data channel for receive operation. Changing this field will take effect immediately for generating the FIFO request and warning flags, but at the end of each frame for receive operation.  0b - Receive data channel N is disabled. 1b - Receive data channel N is enabled.
15-5 —	Reserved
4-0 WDFL	Word Flag Configuration Configures which word the start of word flag is set. The value written should be one less than the word number (for example, write zero to configure for the first word in the frame). When configured to a value greater than the Frame Size field, then the start of word flag is never set.

## 48.4.1.17 SAI Receive Configuration 4 (RCR4)

### 48.4.1.17.1 Address

Register	Offset
RCR4	98h

### 48.4.1.17.2 Function

This register must not be altered when RCSR[RE] is set.

## 48.4.1.17.3 Diagram

## 48.4.1.17.4 Fields

Field	Function
31-29 —	Reserved
28 FCONT	FIFO Continue on Error Configures when the SAI will continue receiving after a FIFO error has been detected. 0b - On FIFO error, the SAI will continue from the start of the next frame after the FIFO error flag has been cleared. 1b - On FIFO error, the SAI will continue from the same word that caused the FIFO error to set after the FIFO warning flag has been cleared.
27-26 FCOMB	FIFO Combine Mode When FIFO combine mode is enabled for FIFO reads, software reading any FIFO data register will alternate the read among the enabled data channel FIFOs. For example, if two data channels are enabled then the first read will be performed to the first enabled data channel FIFO and the second read will be performed to the second enabled data channel FIFO. Resetting the FIFO or disabling FIFO combine mode for FIFO reads will reset the pointer back to the first enabled data channel. When FIFO combine mode is enabled for FIFO writes from the receive shift registers, the first enabled data channel input will alternate between the enabled data channel FIFOs. For example, if two data channels are enabled then the first unmasked received word will be stored in the first enabled data channel FIFO and the second unmasked received word will be stored in the second enabled data channel FIFO. Since the first word of the frame is always stored in the first enabled data channel FIFO, it is recommended that the number of unmasked words per frame is evenly divisible by the number of enabled data channels. 00b - FIFO combine mode disabled. 01b - FIFO combine mode enabled on FIFO writes (from receive shift registers). 10b - FIFO combine mode enabled on FIFO reads (by software). 11b - FIFO combine mode enabled on FIFO writes (from receive shift registers) and reads (by software).
25-24 FPACK	FIFO Packing Mode Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8-bit or 16-bit then only the first 8-bit or 16-bits are stored to the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO read pointer will only increment when the full 32-bit FIFO word has been read by software.

Table continues on the next page...

## Memory map and register definition

Field	Function
	00b - FIFO packing is disabled 01b - Reserved. 10b - 8-bit FIFO packing is enabled 11b - 16-bit FIFO packing is enabled
23-21 —	Reserved
20-16 FRSZ	Frame Size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15-13 —	Reserved
12-8 SYWD	Sync Width Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7-6 —	Reserved
5 —	Reserved. Software should only write zero to this bit.
4 MF	MSB First Configures whether the LSB or the MSB is received first. 0b - LSB is received first. 1b - MSB is received first.
3 FSE	Frame Sync Early 0b - Frame sync asserts with the first bit of the frame. 1b - Frame sync asserts one bit before the first bit of the frame.
2 ONDEM	On Demand Mode When set, and the frame sync is generated internally, a frame sync is only generated when the FIFO warning flag is clear. 0b - Internal frame sync is generated continuously. 1b - Internal frame sync is generated when the FIFO warning flag is clear.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0b - Frame sync is active high. 1b - Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0b - Frame Sync is generated externally in Slave mode. 1b - Frame Sync is generated internally in Master mode.

RFR1	C4h
RFR2	C8h
RFR3	CCh

### 48.4.1.20.2 Function

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

### 48.4.1.20.3 Diagram

### 48.4.1.20.4 Fields

Field	Function
31-22 —	Reserved
21-16 WFP	Write FIFO Pointer FIFO write pointer for receive data channel.
15 RCP	Receive Channel Pointer When FIFO Combine mode is enabled for reads, indicates that this data channel is the next FIFO to be read. 0b - No effect. 1b - FIFO combine is enabled for FIFO reads and this FIFO will be read on the next FIFO read.

*Table continues on the next page...*

## Memory map and register definition

Field	Function
14-6 —	Reserved
5-0 RFP	Read FIFO Pointer FIFO read pointer for receive data channel.

### 48.4.1.21 SAI Receive Mask (RMR)

#### 48.4.1.21.1 Address

Register	Offset
RMR	E0h

#### 48.4.1.21.2 Function

This register is double-buffered and updates:

1. When RCSR[RE] is first set
2. At the end of each frame

This allows the masked words in each frame to change from frame to frame.

#### 48.4.1.21.3 Diagram

#### 48.4.1.21.4 Fields

Field	Function
31-0 RWM	Receive Word Mask Configures whether the receive word is masked (received data ignored and not written to receive FIFO) for the corresponding word in the frame. 00000000000000000000000000000000b - Word N is enabled. 00000000000000000000000000000001b - Word N is masked.

# Chapter 49

## Smart External Memory Controller (SEMC)

### 49.1 About this module

#### 49.1.1 Introduction

The SEMC is a multi-standard memory controller optimized for both high-performance and low pin-count. It can support multiple external memories in the same application with shared address and data pins. The interface supported includes SDRAM, NOR Flash, SRAM and NAND Flash, as well as 8080 display interface.

#### 49.1.2 Features

The SEMC includes the following features:

- Memory space:
  - Support up to 9 memory regions:
    - Region #0 for SDRAM CS0 device
    - Region #1 for SDRAM CS1 device
    - Region #2 for SDRAM CS2 device
    - Region #3 for SDRAM CS3 device
    - Region #4 and #8 for NAND device (IP command and AXI command use different region to avoid large region address range on AXI interface)
    - Region #5 for NOR device
    - Region #6 for SRAM device
    - Region #7 for 8080 display frame buffer
  - Each region is configurable for base address, memory size and valid bit
- AXI slave interface
  - Support 16 outstanding transfer totally for write and read
  - Support 8 outstanding transfer for write
  - Support 16 outstanding transfer for read

- Multi-device access pattern optimization with Queue A
  - 8 entries command reordering in Queue A
  - QoS priority, latency and efficiency adjustable arbitration scheme
- SDRAM access pattern optimization with Queue B
  - 8 entries command reordering in Queue B
  - QoS priority, latency and efficiency adjustable arbitration scheme
- Trigger device read or write access (AXI command)
- 32/16/8 bit access supported
- All burst length supported
- Only INCR and WRAP burst supported

### NOTE

(WRAP read/write with 16 bit or 8 bit size not supported)

- No prefetch/cachable support
- IP Bus interface
  - Internal configuration register access
  - Trigger device access such as device initialization/configuration/read/write (IP command)
- SDRAM interface
  - Support 8/16 bit modes
  - Up to 512Mb per each Chip Select (CS) and up to 4 CS
- NAND Flash interface
  - Support 8/16 bit modes
  - No HW ECC
  - Async mode only
  - Only supports device which is capable of cache read/write operations
  - Only supports page based read/write operation
- NOR Flash interface
  - Support 8/16 bit modes
  - Async mode
  - Address/Data Multiplexing mode and advanced address/data multiplexing mode (ADMUX and AADM mode)
  - Up to 128Mb memory size
  - NOR flash write access is supported only by IP command
- SRAM interface
  - Support 8/16 bit modes
  - Async mode
  - Address/Data Multiplexing mode and advanced address/data multiplexing mode (ADMUX and AADM mode)
  - Up to 128Mb memory size

- 8080 display interface
  - Support 8/16 bit modes
  - Without tearing effect support
- Misc
  - Dynamic I/O sharing which enables multiple external memory device in parallel
  - Up to 5 Chip Select (CS) signals
  - Ability to disable SDRAM and NAND controller by separate fuse bit
  - Support Address Latch Enable (ALE) for SRAM/NOR device

### 49.1.3 Operation Modes

SEMC supports following operation modes:

- Module Disable mode

In module disable mode, internal clock will be gated for low power. But Configuration and status register access is available.

This mode is entered by setting MCR[MDIS], and exited by clearing MCR[MDIS]. Software should polling STS0[IDLE] to promise no pending transaction to device before entering module disable mode.

- Stop mode

When the system requires SEMC to enter stop mode (ipg\_stop=0x1), SEMC will wait for all transactions to complete (STS0[IDLE]=0x1) and return ACK handshake to system (ipg\_stop\_ack=0x1). After ACK handshake returned, the system can gate off SEMC clock. There is no clock gating action internally.

SEMC exit this mode immediately when system stop mode request deasserted with the ACK handshake deasserted.

- Normal mode

All device access and internal configuration/status register access is available in normal mode. SEMC clock is not gated internally.

### 49.1.4 Block diagram

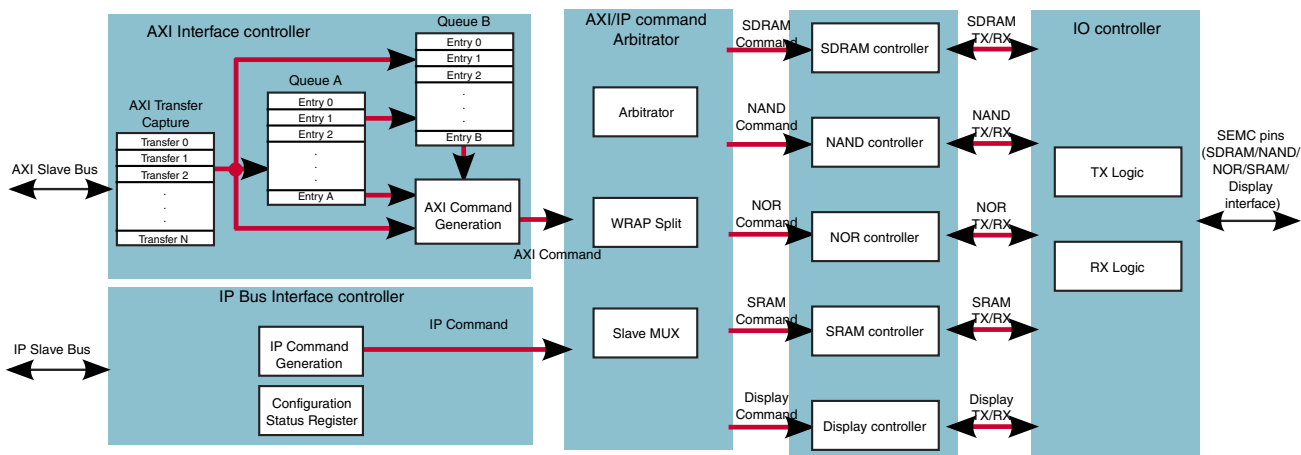

Figure 49-1. SEMC block diagram

## 49.2 Signals

This table describes the SEMC module signals.

Signal	Direction	Description
SEMC_DA[0]	IO	Data/Address Bit 0
SEMC_DA[1]	IO	Data/Address Bit 1
SEMC_DA[2]	IO	Data/Address Bit 2
SEMC_DA[3]	IO	Data/Address Bit 3
SEMC_DA[4]	IO	Data/Address Bit 4
SEMC_DA[5]	IO	Data/Address Bit 5
SEMC_DA[6]	IO	Data/Address Bit 6
SEMC_DA[7]	IO	Data/Address Bit 7
SEMC_DA[8]	IO	Data/Address Bit 8
SEMC_DA[9]	IO	Data/Address Bit 9
SEMC_DA[10]	IO	Data/Address Bit 10
SEMC_DA[11]	IO	Data/Address Bit 11
SEMC_DA[12]	IO	Data/Address Bit 12
SEMC_DA[13]	IO	Data/Address Bit 13
SEMC_DA[14]	IO	Data/Address Bit 14
SEMC_DA[15]	IO	Data/Address Bit 15
SEMC_DM[1]	O	Write Data Mask Bit 1

Table continues on the next page...

Signal	Direction	Description
SEMC_DM[0]	O	Write Data Mask Bit 0
SEMC_ADDR[0]	O	Address Bit 0
SEMC_ADDR[1]	O	Address Bit 1
SEMC_ADDR[2]	O	Address Bit 2
SEMC_ADDR[3]	O	Address Bit 3
SEMC_ADDR[4]	O	Address Bit 4
SEMC_ADDR[5]	O	Address Bit 5
SEMC_ADDR[6]	O	Address Bit 6
SEMC_ADDR[7]	O	Address Bit 7
SEMC_ADDR[8]	O	Address Bit 8
SEMC_ADDR[9]	O	Address Bit 9
SEMC_ADDR[10]	O	Address Bit 10
SEMC_ADDR[11]	O	Address Bit 11
SEMC_ADDR[12]	O	Address Bit 12
SEMC_BA[0]	O	Bank Address Bit 0
SEMC_BA[1]	O	Bank Address Bit 1
SEMC_CAS	O	Column Address selection
SEMC_RAS	O	Row Address selection
SEMC_WE	O	Write Enable (For SDRAM only)
SEMC_CKE	O	CKE (For SDRAM only)
SEMC_CLK	O	CLK (For SDRAM only)
SEMC_CS0	O	CS (For SDRAM CS0 only)
SEMC_CSX[0]	O	Chip Selection x 0 (Configurable)
SEMC_CSX[1]	O	Chip Selection x 1 (Configurable)
SEMC_CSX[2]	O	Chip Selection x 2 (Configurable)
SEMC_CSX[3]	O	Chip Selection x 3 (Configurable)
SEMC_RDY	IO	Ready input pin for NAND
SEMC_DQS	IO	DQS Dummy read strobe loopback pad.

### NOTE

For detail pin mux inside SEMC, please refer to [Pin Mux in SEMC](#)

## 49.3 Memory Map and register definition

This section includes the SEMC module memory map and detailed descriptions of all registers.

## 49.3.1 SEMC register descriptions

### 49.3.1.1 SEMC Memory map

W	WRC		RFRC						ACT2RW				PRE2ACT			
Reset	0	1	0	0	1	0	0	1	0	0	1	1	0	1	0	0

### 49.3.1.18.3 Fields

Field	Function
31-24 —	Reserved.
23-20 ACT2PRE	ACT to Precharge minimum time SEMC controller will promise (ACT2PRE+1) cycle delay between ACTIVE command to PRECHARGE/ PRECHARGE_ALL command.
19-16 CKEOFF	CKE OFF minimum time SEMC controller will promise clock suspend last at least (CKEOFF+1) cycle.
15-13 WRC	Write recovery time SEMC controller will promise (WRC+1) cycle delay between WRITE command to PRECHARGE/ PRECHARGE_ALL command. This could help to meet tWR timing requirement by SDRAM device.
12-8 RFRC	Refresh recovery time SEMC controller will promise (RFRC+1) cycle delay between REFRESH command to ACTIVE command. This could help to meet tRFC and tXSR timing requirement by SDRAM device.
7-4 ACT2RW	ACT to Read/Write wait time SEMC controller will promise (ACT2RW+1) cycle delay between ACTIVE command to READ/WRITE command. This could help to meet tRCD timing requirement by SDRAM device.
3-0 PRE2ACT	PRECHARGE to ACT/Refresh wait time SEMC controller will promise (PRE2ACT+1) cycle delay between PRECHARGE/PRECHARGE_ALL command to ACTIVE/REFRESH command. This could help to meet tRP timing requirement by SDRAM device.

### 49.3.1.19 SDRAM control register 2 (SDRAMCR2)

#### 49.3.1.19.1 Offset

Register	Offset
SDRAMCR2	48h

### 49.3.1.19.2 Diagram

### 49.3.1.19.3 Fields

Field	Function
31-24 ITO	SDRAM Idle timeout SEMC will close all opened pages if the SDRAM idle time lasts more than idle timeout period. SDRAM is considered idle when there is no AXI Bus transfer and no SDRAM command pending. 0000000b - IDLE timeout period is 256*Prescale period. 0000001-1111111b - IDLE timeout period is ITO*Prescale period.
23-16 ACT2ACT	ACT to ACT wait time
15-8 REF2REF	Refresh to Refresh wait time SEMC controller will promise (REF2REF+1) cycle delay between REFRESH command to REFRESH command. This could help to meet tRFC timing requirement by SDRAM device.
7-0 SRRC	Self Refresh Recovery time SEMC controller will promise (SRRC+1) cycle delay between Self-REFRESH command to any command.

## 49.3.1.20 SDRAM control register 3 (SDRAMCR3)

### 49.3.1.20.1 Offset

Register	Offset
SDRAMCR3	4Ch

## 49.3.1.20.2 Diagram

## 49.3.1.20.3 Fields

Field	Function
31-24 UT	<p>Refresh urgent threshold</p> <p>Internal refresh request is generated on every Refresh period. Before internal request timer count up to urgent request threshold, the refresh request will be considered as normal refresh request. Normal refresh request is handled in lower priority than any pending AXI command or IP command to SDRAM device. When internal request timer count up to this urgent threshold, refresh request will be considered as urgent refresh request. Urgent refresh request is handled in higher priority than any pending AXI command or IP command to SDRAM device.</p> <p><b>NOTE:</b> When urgent threshold is no less than refresh period, refresh request will always considered as urgent refresh request.</p> <p>Refresh urgent threshold is as following:</p> <p style="padding-left: 40px;">00000000b - 256*Prescaler period 00000001-11111111b - UT*Prescaler period</p>
23-16 RT	<p>Refresh timer period</p> <p>Refresh timer period is as following:</p> <p style="padding-left: 40px;">00000000b - 256*Prescaler period 00000001-11111111b - RT*Prescaler period</p>
15-8 PRESCALE	<p>Prescaler timer period</p> <p>Prescaler timer period is as following:</p> <p style="padding-left: 40px;">00000000b - 256*16 cycle 00000001-11111111b - PRESCALE*16 cycle</p>
7-4 —	Reserved.
3-1 REBL	<p>Refresh burst length</p> <p>SEMC could send multiple Auto-Refresh command in one burst when REBL is set to non-zero. The number of Auto-Refresh command cycle sent to all SDRAM device in one refresh period is as following.</p> <p style="padding-left: 40px;">000b - 1 001b - 2 010b - 3 011b - 4 100b - 5 101b - 6</p>

## 49.4 Functional description

The following sections describe functional details of the SEMC module.

### 49.4.1 Clocks

This section describes clocks and special clocking requirements of the SEMC module.

There is only one clock domain which is used for AXI bus interface, IP bus interface, internal logic and external interface.

### 49.4.2 Reset

This section describes how to reset the SEMC module and explains special requirements related to reset.

### 49.4.3 Pin Mux in SEMC

This table describes the pin mux in SEMC module.

Signal	SDRAM	NAND	NOR	SRAM	DBI (Display Interface)	Comment
SEMC_DA[0 ]	D0	D0	D0/A0	D0/A0	D0	HW MUX SEMC will determine the pin function according to its internal state (which device is been accessing).

#### 49.4.4 Device access by AXI Command

Devices could be read/written by AXI bus access directly. AXI command is the device access sequence triggered by AXI bus access. The device access sequence for AXI command will be described in the following sections.

#### NOTE

- The AXI bus memory map for each device is defined by SEMC\_BRx registers.
- There is no software configuration or polling need for AXI command except SEMC controller initialization. AXI master access external flash device transparently similar as normal AXI slave.
- AXI command is normally used to read/write access device memory space. IP command should be used to any other access, such as device register/OTP space access, device initialization.
- IP command could be used for memory read/write also similar as AXI command. But it's not recommended if only AXI command is available.

## 49.4.5 Device access by IP Command

Device could be accessed (initialized/configured/read/written) by IP bus access also. IP command is the device access sequence triggered by IP bus access. The device access sequence for IP command will be described in the following sections.

Device access could be triggered by IP command in following steps:

1. Set register IPCR0/IPCR1/IPCR2/IPTXD for Device address/Data Size/Write Data/Write Mask.
2. Set register IPCMD with valid command code (IPCMD.CMD) and command key (IPCMD.KEY).
3. Wait for IP Command Done (Wait for interrupt IPCMDDONE generated).
4. Read the device data from IPRXD. This is needed for read access only.

### NOTE

- If device address or command code setting is not valid, there will be IP command error interrupt generated (INTR.IPCMDERR) and no device access at all.
- If another IP command triggered when the previous IP command not finished yet, there will be IP command error interrupt generated.
- IPCR0/IPCR1/IPCR2/IPTXD is protected when IP command triggered by not finished yet. Any write access to these register will be ignored.
- IPCR0 device address field should be configured even the device don't need any address bit information such as WRITE ENABLE command. SEMC need the device address to determine which device should be accessed.

## 49.4.6 SDRAM Controller Operations

This section describes the SDRAM controller module's operations.

### 49.4.6.1 SDRAM address map

SDRAM device address map on SoC is indicated in following diagram:

SDRAM device address map when SDRAMCR0.PS=0x1 (16 bit mode)

SDRAM device address map when SDRAMCR0.PS=0x0 (8 bit mode)

**Figure 49-2. SDRAM device address map**

### 49.4.6.2 SDRAM device access by IP Command

Following SDRAM device access could be triggered by IP command:

1. SELF REFRESH
2. AUTO REFRESH
3. MODE REGISTER SET
4. PRECHARGE
5. PRECHARGE ALL
6. ACTIVE
7. READ
8. WRITE

#### 49.4.6.2.1 IP command - SDRAM Self Refresh

When IP command triggered with command code - SELF REFRESH to any SDRAM device, SEMC would send SELF REFRESH command to all SDRAM devices. After SELF REFRESH command finished, all SDRAM device should be in self refresh state and SEMC will keep this state on SDRAM interface (SEMC\_CKE=0x0 and SEMC\_CLK=0x0).

SEMC will bring all SDRAM device out from self refresh state when there is any new IP command or AXI command triggered to SDRAM device.

Following timing diagram illustrates the sequence for self-refresh entering and exiting by AXI command.

## Functional description

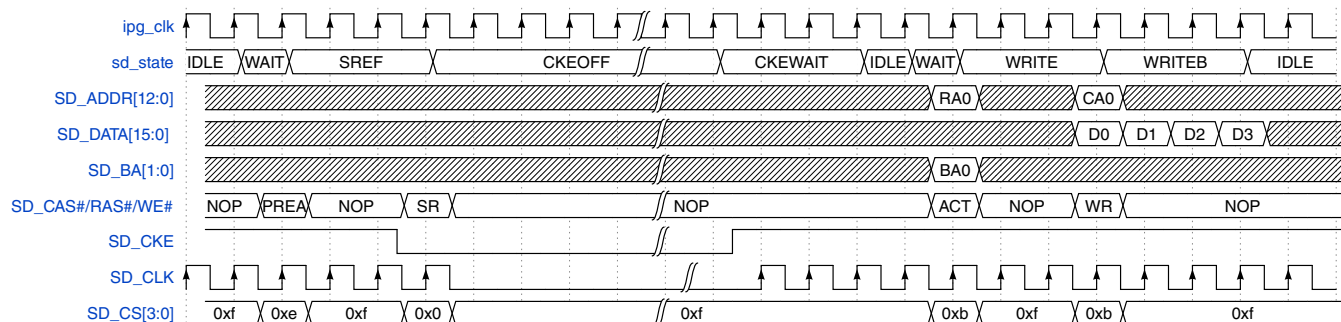

Figure 49-3. IP command - SDRAM Self Refresh

### 49.4.6.2.2 IP command - SDRAM Auto Refresh

When IP command triggered with command code - AUTO REFRESH, SEMC would send AUTO REFRESH command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - AUTO REFRESH.

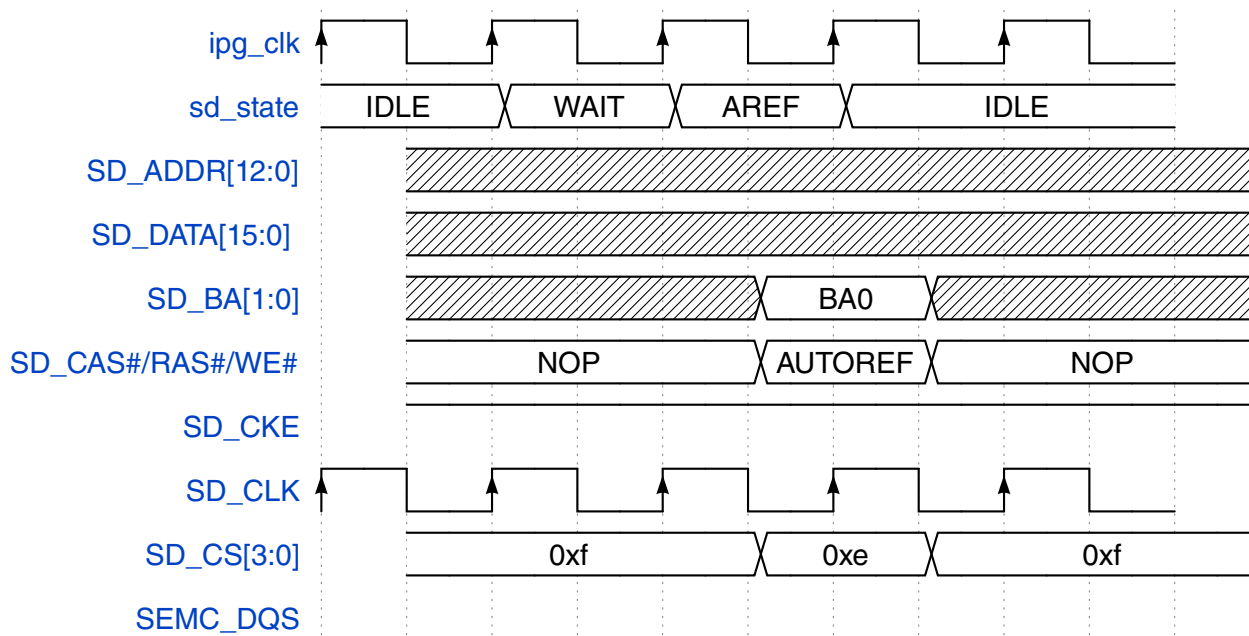

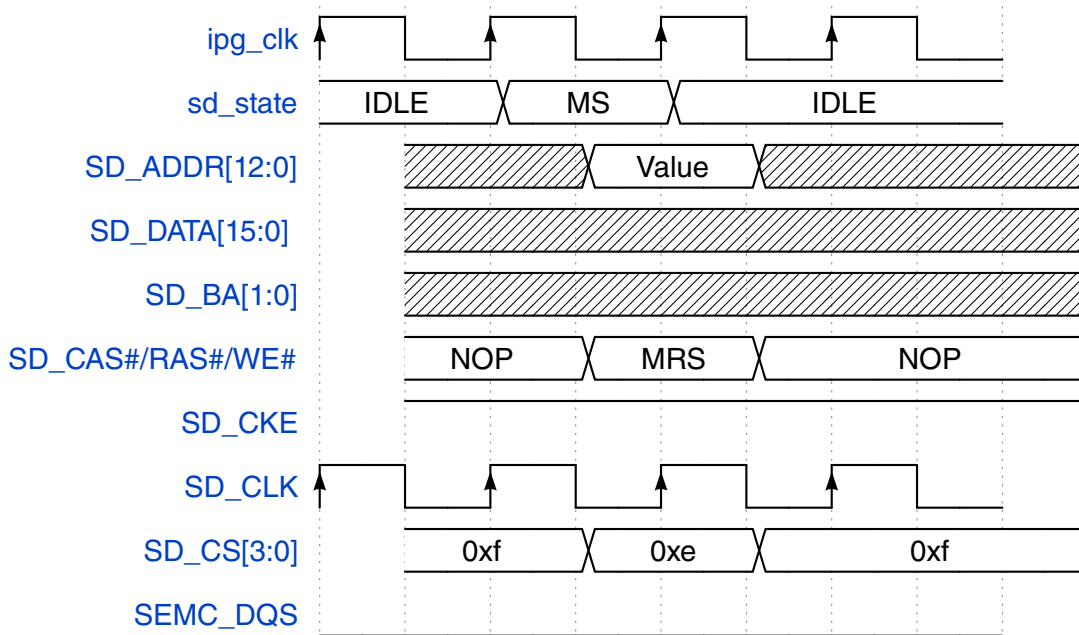

Figure 49-4. IP command - SDRAM Auto Refresh

### 49.4.6.2.3 IP command - SDRAM Mode Register Set

When IP command triggered with command code - Mode Register Set, SEMC would send MODE REGISTER SET command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - MODE REGISTER SET.

**Figure 49-5. IP command - SDRAM MODE REGISTER SET**

#### 49.4.6.2.4 IP command - SDRAM Precharge

When IP command triggered with command code - Precharge, SEMC would send PRECHARGE command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - PRECHARGE.

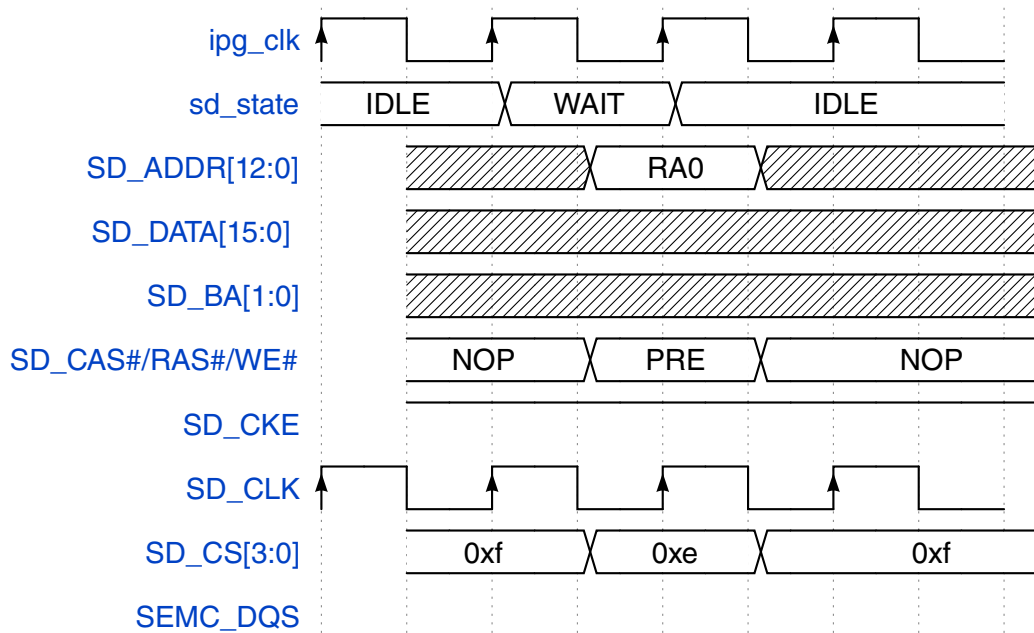

Figure 49-6. IP command - SDRAM PRECHARGE

#### 49.4.6.2.5 IP command - SDRAM Precharge ALL

When IP command triggered with command code - Precharge ALL, SEMC would send PRECHARGE ALL command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - PRECHARGE ALL.

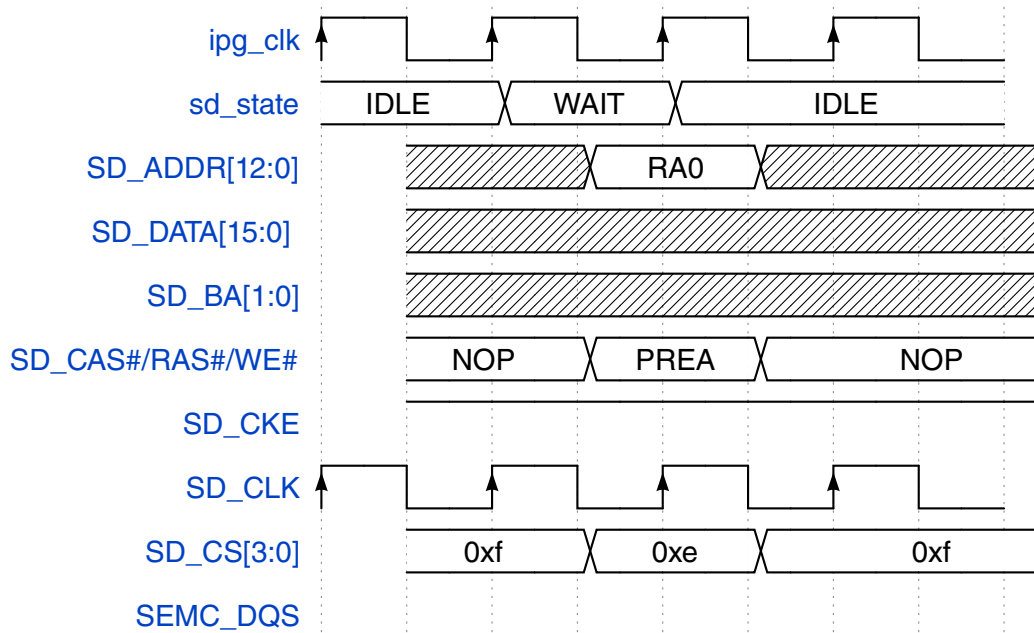

Figure 49-7. IP command - SDRAM PRECHARGE ALL

### 49.4.6.2.6 IP command - SDRAM Active

When IP command triggered with command code - Active, SEMC would send ACTIVE command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - ACTIVE.

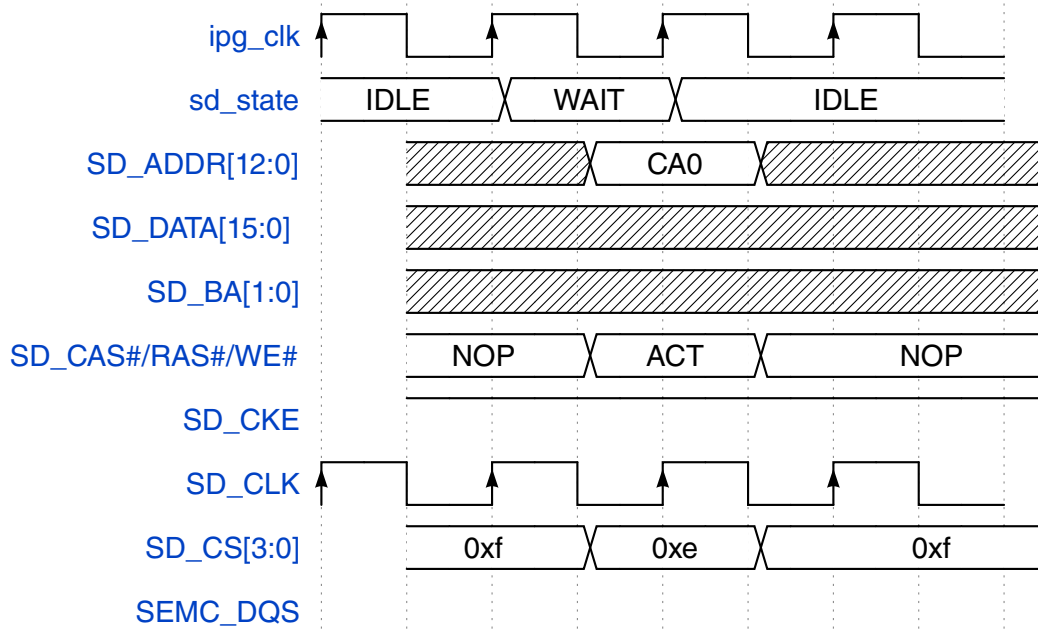

Figure 49-8. IP command - SDRAM PRECHARGE ALL

### 49.4.6.2.7 IP command - SDRAM READ

When IP command triggered with command code - READ, SEMC would send READ command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - READ.

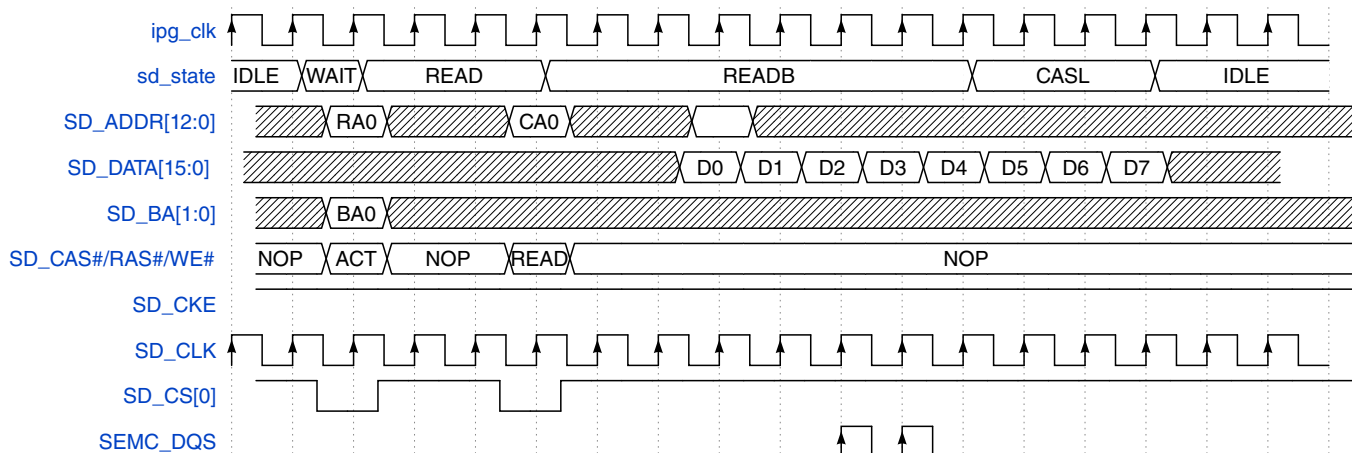

Figure 49-9. IP command - SDRAM READ

### 49.4.6.2.8 IP command - SDRAM WRITE

When IP command triggered with command code - WRITE, SEMC would send WRITE command to the SDRAM device accessed.

Following timing diagram illustrates the sequence for IP command - WRITE.

Figure 49-10. IP command - SDRAM WRITE

### 49.4.6.3 SDRAM device access by AXI Command

SDRAM device read/write access could be triggered by AXI Command. For AXI read access, SEMC would send READ commands to SDRAM device automatically and return data on AXI bus. For AXI write access, SEMC would save AXI bus write data and send WRITE commands to SDRAM device automatically

#### 49.4.6.3.1 SDRAM device read access by AXI Command

Following timing diagram illustrates the SDRAM device access triggered by AXI command (Read).

Figure 49-11. AXI command - SDRAM Read

### 49.4.6.3.2 SDRAM device write access by AXI Command

Following timing diagram illustrates the SDRAM device access triggered by AXI command (Write).

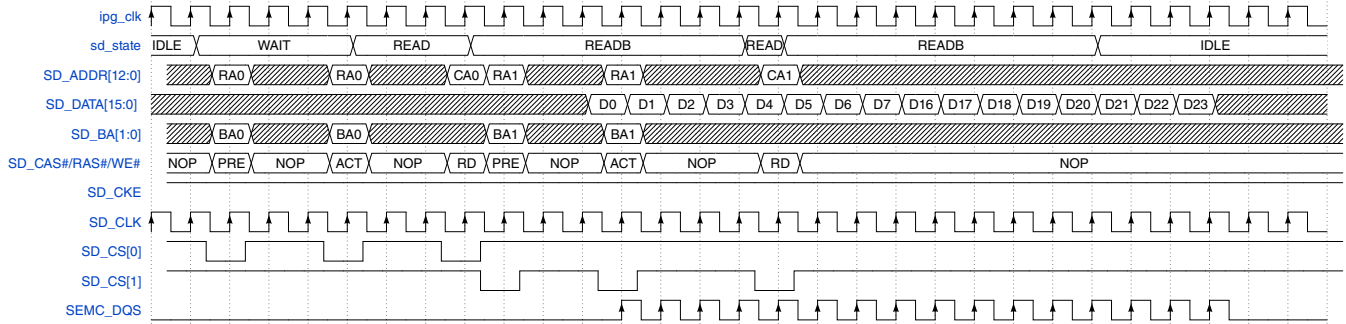

Figure 49-12. AXI command - SDRAM Write

### 49.4.6.3.3 SDRAM device pipelined access by AXI Command

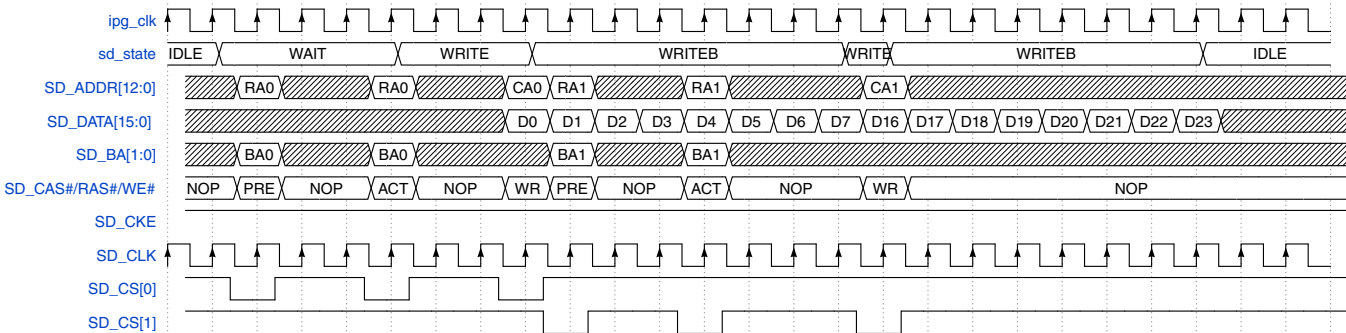

Following timing diagram illustrates the SDRAM device pipelined read access triggered by AXI command (Read).

## Functional description

**Figure 49-13. AXI command - Pipelined SDRAM Read**

Following timing diagram illustrates the SDRAM device pipelined write access triggered by AXI command (Write).

**Figure 49-14. AXI command - Pipelined SDRAM Write**

### 49.4.6.3.4 SDRAM back-to-back access

This section describes the SDRAM back-to-back access.

#### 49.4.6.3.4.1 SDRAM read-to-read access

SDRAM read-to-read access timing when CL=1 is as following:

**Figure 49-15. SDRAM Read-to-Read access (CL=1)**

SDRAM read-to-read access timing when CL=2 is as following:

**Figure 49-16. SDRAM Read-to-Read access (CL=2)**

SDRAM read-to-read access timing when CL=3 is as following:

Functional description

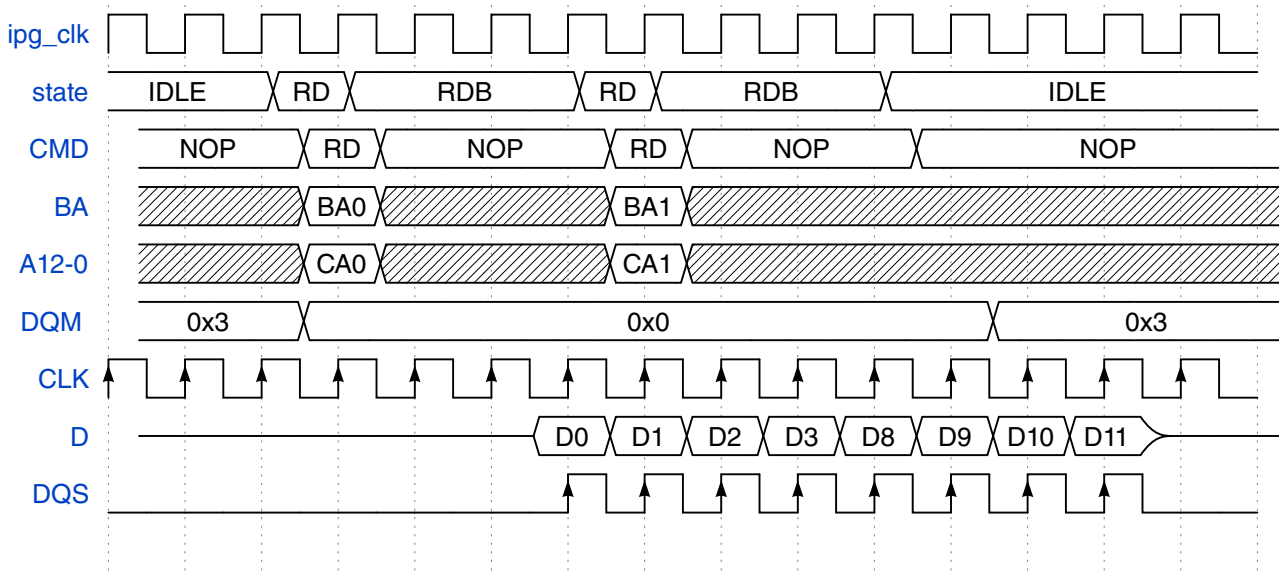

Figure 49-17. SDRAM Read-to-Read access (CL=3)

49.4.6.3.4.2 SDRAM read-to-write access

SDRAM read-to-write access timing when CL=1 is as following:

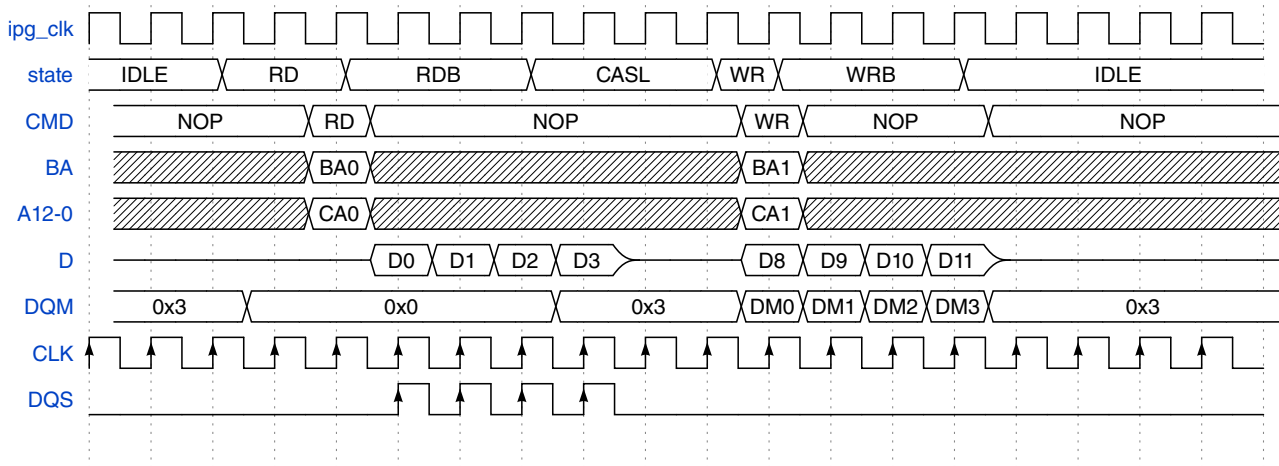

Figure 49-18. SDRAM Read-to-Write access (CL=1)

SDRAM read-to-write access timing when CL=2 is as following:

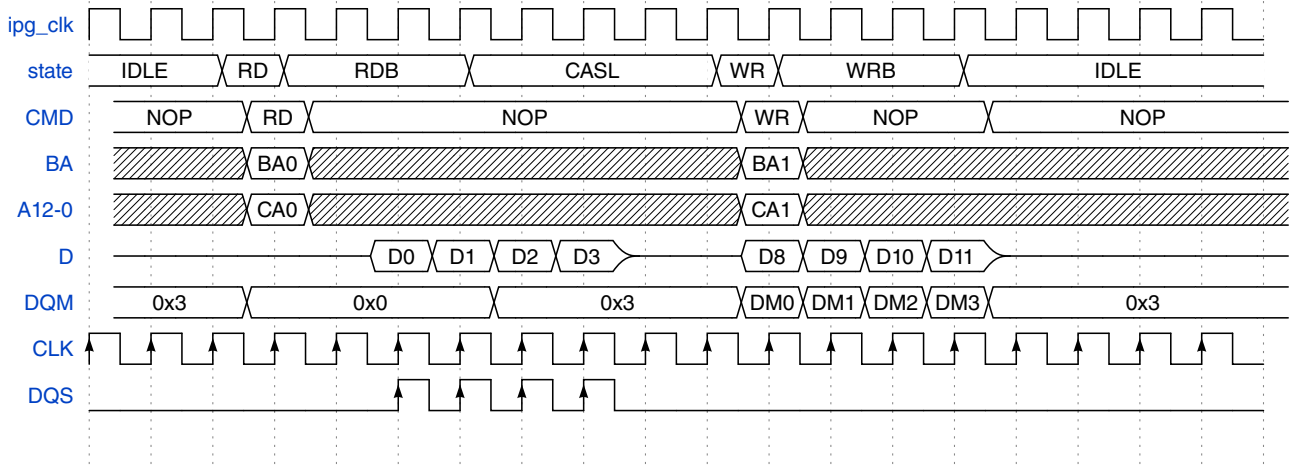

Figure 49-19. SDRAM Read-to-Write access (CL=2)

SDRAM read-to-write access timing when CL=3 is as following:

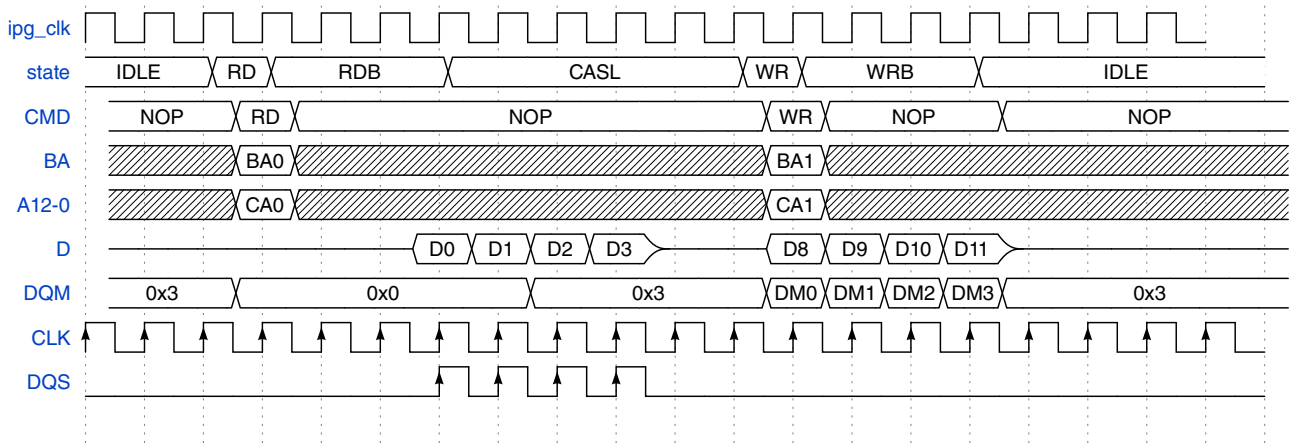

Figure 49-20. SDRAM Read-to-Write access (CL=3)

#### 49.4.6.3.4.3 SDRAM write-to-write access

SDRAM write-to-write access timing is as following:

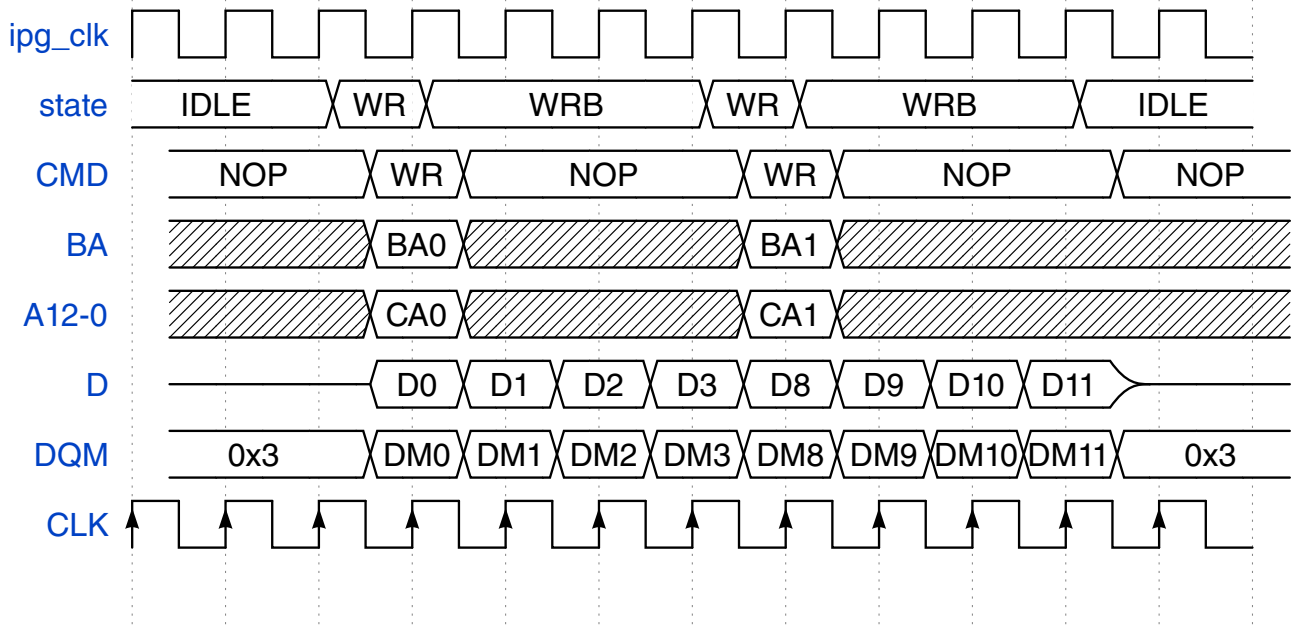

Figure 49-21. SDRAM Write-to-Write access

#### 49.4.6.3.4.4 SDRAM write-to-read access

SDRAM write-to-read access timing when CL=1 is as following:

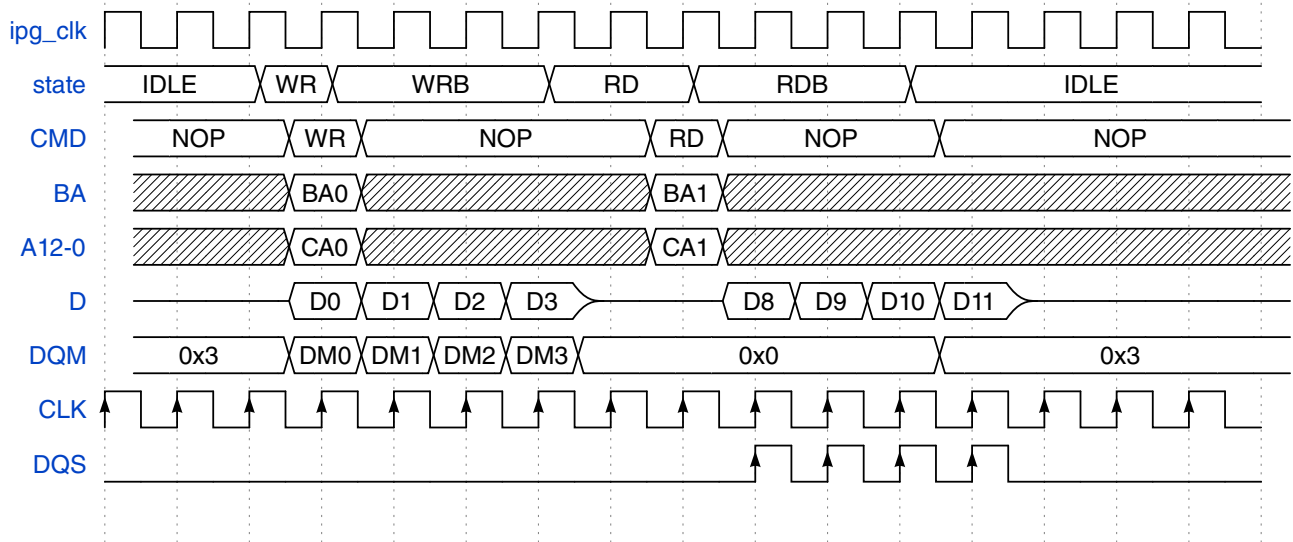

Figure 49-22. SDRAM Write-to-Read access (CL=1)

SDRAM write-to-read access timing when CL=2 is as following:

Figure 49-23. SDRAM Write-to-Read access (CL=2)

SDRAM write-to-read access timing when CL=3 is as following:

Figure 49-24. SDRAM Write-to-Read access (CL=3)

### 49.4.6.4 Refresh command - SDRAM AUTO Refresh

SEMC would send AUTO REFRESH command to all SDRAM devices when the refresh timer expired and SDRAM Refresh enabled (SDRAMCR3.REN=0x1). Multiple AUTO REFRESH command could be sent if refresh burst is not set to one (SDRAMCR3.REBL!=0x0).

Refresh command is triggered by interval refresh timer period.

Following timing diagram illustrates the sequence for Refresh Command.

Figure 49-25. Refresh command - SDRAM Auto Refresh

### 49.4.6.5 SDRAM low power feature

This section describes the low power feature implemented for SDRAM.

#### 49.4.6.5.1 Stop mode - SDRAM

When system enter STOP mode, SEMC will put all SDRAM device into self refresh state automatically. When system exit STOP mode, SEMC will bring SDRAM device out from self refresh state.

Following timing diagram illustrates the sequence for stop mode entering and exiting.

Figure 49-26. Stop mode Enter and Exit- SDRAM

### 49.4.6.5.2 BUS Idle - SDRAM

When there is no IP/AXI/Refresh command, SDRAM interface would be in IDLE state (NOP command and chip selection invalid). When SDRAM interface bus idle timer expired, SEMC will close all pages opened on all SDRAM devices. Please see xx for more detail about bus idle timer.

### 49.4.6.6 SDRAM Page Management

This section describes the SDRAM page management.

There are 8 pages row address saved internally: 4 pages for CS0/CS2 (4 bank), 4 pages for CS1/CS3 (4 bank). Device CS0 and CS2 page will never be opened at the same time. Before SEMC open pages on CS2, it will close all opened pages on CS0. This is similar for CS1/CS3.

SEMC close all pages on all CS in following cases:

1. SELF REFRESH triggered by IP command
2. SELF REFRESH triggered by stop mode enter
3. The idle time on AXI bus and SDRAM interface is longer than SDRAM idle timeout time (SDRAMCR2.ITO).

#### NOTE

SEMC will not sent out PRECHARGE-ALL command if there is no page opened on any bank/CS.

SEMC close all pages on one CS in following cases:

1. PRECHARGE ALL command triggered by IP command
2. AUTO REFRESH command triggered by IP command
3. ACTIVE/WRITE/READ command triggered by IP command and CS miss
4. WRITE/READ command triggered by current AXI command and CS miss

5. WRITE/READ command triggered by next AXI command (not accepted yet), CS miss and not same CS as current AXI command

### NOTE

One example for CS miss: Current IP command will access CS2 but there is page opened on CS0 already.

SEMC close one page on one CS in following cases:

1. PRECHARGE command triggered by IP command and this bank is opened
2. ACTIVE/READ/WRITE command triggered by IP command, this bank is opened and page missed.
3. WRITE/READ command triggered by current AXI command this bank is opened and page missed.
4. WRITE/READ command triggered by next AXI command (not accepted yet), this bank is opened, page missed and different bank accessed with current AXI command.

### NOTE

One example for page miss: current bank is opened but the opened page row address is different with current SDRAM command access.

SEMC open one page on one CS in following cases:

1. ACTIVE/READ/WRITE command triggered by IP command, this bank is not opened.
2. WRITE/READ command triggered by current AXI command this bank is not opened.
3. WRITE/READ command triggered by next AXI command (not accepted yet), this bank is not opened and different bank accessed with current AXI command.

### NOTE

One example for page miss: current bank is opened but the opened page row address is different with current SDRAM command access.

## 49.4.6.7 SDRAM Timers

This section describes the timers used for SDRAM operation

#### 49.4.6.7.1 Prescaler

The prescaler timer in SDRAM controller count freely with the period defined by SDRAM3.PRESCALE. When the prescaler timer expired, urgent refresh timer and SDRAM BUS IDLE timer count by 1.

#### 49.4.6.7.2 Refresh interval timer

The refresh interval timer also count when prescaler timer expires. The timer period is determined by SDRAMCR3.RT and SDRAMCR3.PRESCALE. When refresh interval timer expired, an internal refresh command will be triggered and SEMC will sent one or multiple AUTO REFRESH command on SDRAM interface.

#### 49.4.6.7.3 Urgent Refresh timer

Urgent refresh timer is used to determine whether current refresh request is urgent or normal. Before urgent refresh timer timeout, refresh request is handled in lower priority than AXI/IP command. When urgent refresh timer timed out, refresh request becomes urgent. SDRAM controller will handle Auto-Refresh command in higher priority than AXI/IP command.

#### 49.4.6.7.4 Beat timer

The beat timer is used to control SDRAM read/write/Auto Refresh command burst length.

#### 49.4.6.7.5 ACTIVE to READ/WRITE timer

The ACTIVE to READ/WRITE timer is used to promise the minimum cycle number between ACITVE command and READ/WRITE command on SDRAM interface.

#### 49.4.6.7.6 PRECHARGE to ACTIVE timer

The PRECHARGE to ACTIVE timer is used to promise the minimum cycle number between PRECHARGE/PRECHARGE ALL command and ACTIVE/AUTO REFRESH/SELF REFRESH command on SDRAM interface.

#### 49.4.6.7.7 CKE OFF timer

The CKEOFF timer is used to promise the minimum cycle of SDRAM CLK off state.

#### **49.4.6.7.8 SELF REFRESH recover timer**

The SRRC timer is used to promise the wait time between SDRAM device exit Self Refresh state and sending new Commands to device. SDRAM device may have limitation on Self Refresh recovery time. Before this recovery time expire, any command to device may cause unexpected behavior.

#### **49.4.6.7.9 AUTO REFRESH recover timer**

The RFRC timer is used to promise the minimum cycle number between Auto Refresh command and ACTIVE command on SDRAM interface. SDRAM device may have limitation on Refresh recovery time. Before this recovery time expire, any command to device may cause unexpected behavior.

#### **49.4.6.7.10 Refresh to Refresh timer**

The refresh to refresh timer is used to promise the minimum cycle number between Auto Refresh command and Auto Refresh command on SDRAM interface.

#### **49.4.6.7.11 ACTIVE to ACTIVE timer**

There are two ACT2ACT timer in SDRAM controller. ACT2ACT0 timer is used to promise the minimum cycle number between ACTIVE command and ACTIVE command on CS0/2 device. ACT2ACT1 timer is used to promise the minimum cycle number between ACTIVE command and ACTIVE command on CS1/3 device.

#### **49.4.6.7.12 ACTIVE to PRECHARGE timer**

There are two ACT2PRE timer in SDRAM controller. ACT2PRE0 timer is used to promise the minimum cycle number between ACTIVE command and PRECHARGE/PRECHARGE ALL command on CS0/2 device. ACT2PRE1 timer is used to promise the minimum cycle number between ACTIVE command and PRECHARGE/PRECHARGE ALL command on CS1/3 device.

#### **49.4.6.7.13 Write recovery timer**

The WRC timer is used to promise the minimum cycle number between WRITE command and PRECHARGE/PRECHARGE ALL command on SDRAM interface. SDRAM device may have limitation on WRITE recovery time. Before this recovery time expire, PRECHARGE/PRECHARGE ALL command to device may cause the write process failed.

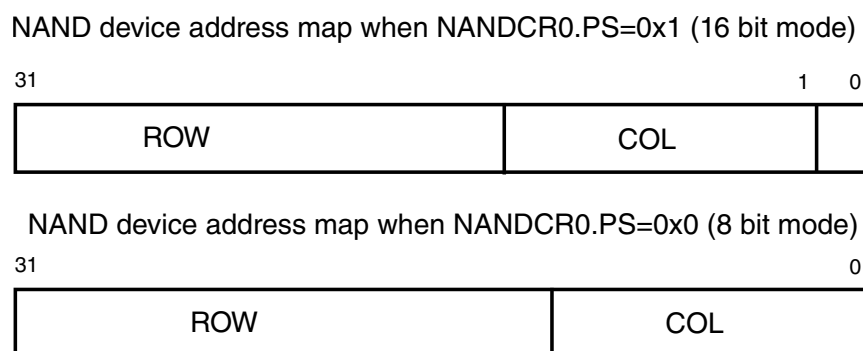

## 49.4.7 NAND Flash Controller Operations

This section describes the NAND Flash controller module's operations.

### 49.4.7.1 NAND Flash address map

NAND Flash device address map on SoC is indicated in the following diagram:

**Figure 49-27. NAND Flash Address Map**

### 49.4.7.2 NAND Flash access address type

There are 6 type address type access provided:

- One Byte Column address
- Two Byte Column address
- One Byte Row address
- Two Byte Row address
- Three Byte Row address
- Five Byte Row/Column address

For IP command, address type is determined by IPCMD register; For AXI command, address type is fixed to "Two Byte Column Address" because all NAND Flash access is in NAND page boundary.

#### 49.4.7.2.1 One Byte Column Address

One Byte column address type access is indicated as following:

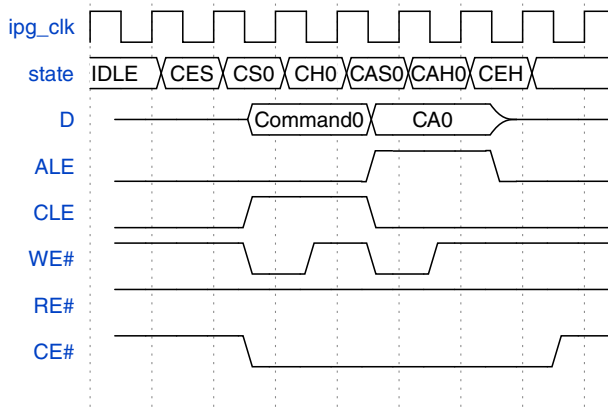

Figure 49-28. NAND Flash access Address type - One Byte Column Address

### 49.4.7.2.2 Two Byte Column Address

Two Byte column address type access is indicated as following:

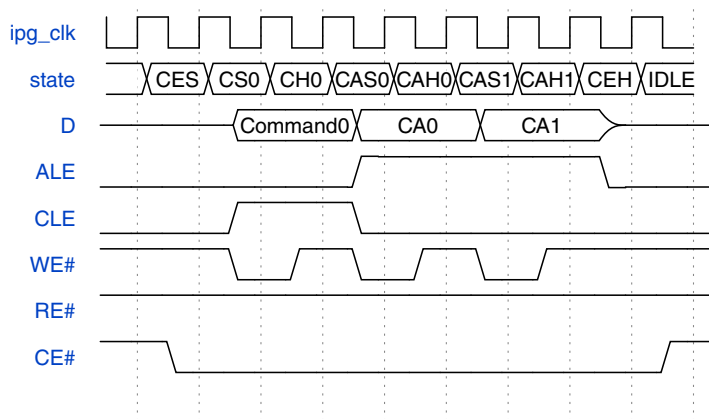

Figure 49-29. NAND Flash access Address type - Two Byte Column Address

### 49.4.7.2.3 One Byte Row Address

One Byte row address type access is indicated as following:

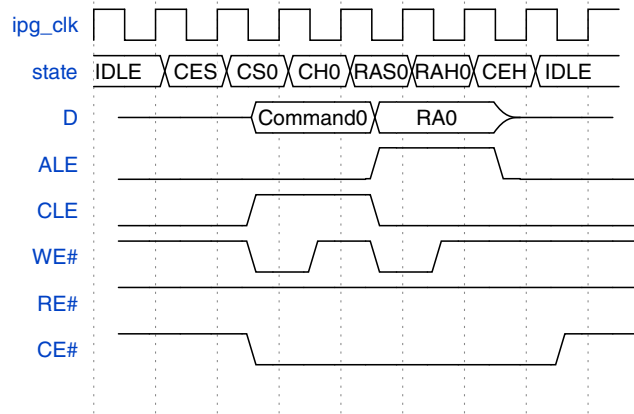

Figure 49-30. NAND Flash access Address type - One Byte Row Address

#### 49.4.7.2.4 Two Byte Row Address

Two Byte row address type access is indicated as following:

Figure 49-31. NAND Flash access Address type - Two Byte Row Address

#### 49.4.7.2.5 Three Byte Row Address

Three Byte row address type access is indicated as following:

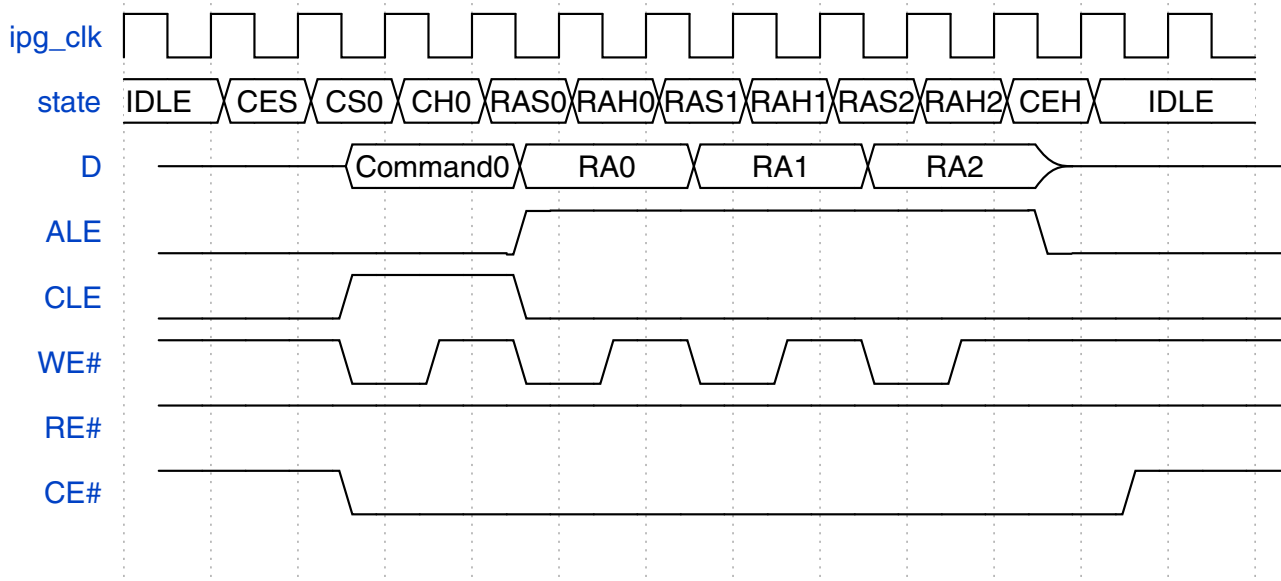

Figure 49-32. NAND Flash access Address type - Three Byte Row Address

### 49.4.7.2.6 Five Byte Row/Column Address

Five Byte row/column address type access is indicated as following:

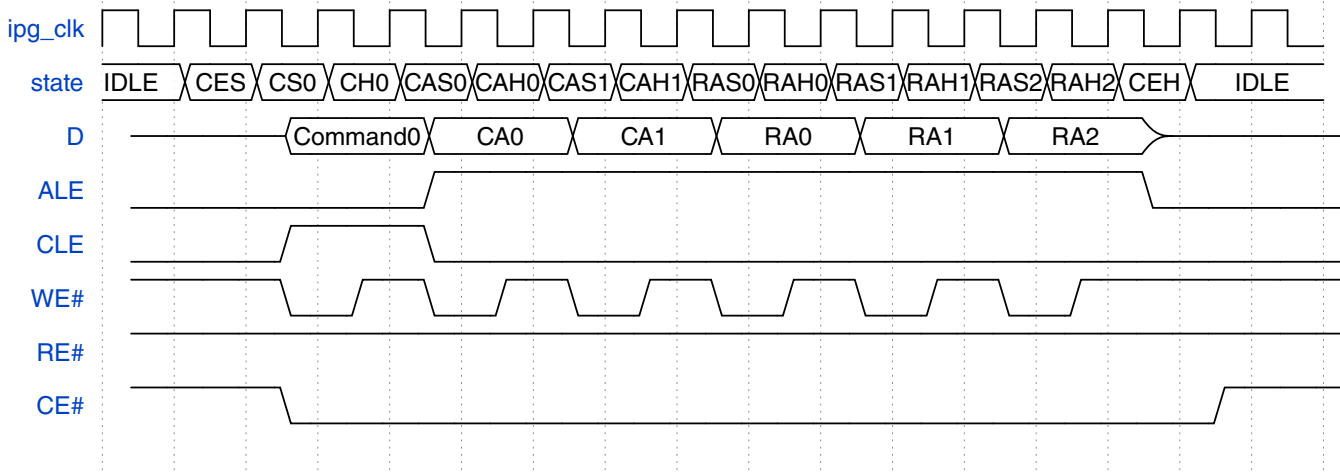

Figure 49-33. NAND Flash access Address type - Five Byte Row/Column Address

There are some option bits provide to support more NAND address type access. Five byte row/column address type could be overried as following:

Table 49-1. Address byte order for Row/Column Address five Byte mode

NDOPT3	NDOPT2	NDOPT1	Address byte order
0	0	0	CA0/CA1/RA0/RA1/RA2

Table continues on the next page...

**Table 49-1. Address byte order for Row/Column Address five Byte mode (continued)**

NDOPT3	NDOPT2	NDOPT1	Address byte order
0	0	1	CA0/RA0/RA1/RA2
0	1	0	CA0/CA1/RA0/RA1
0	1	1	CA0/RA0/RA1
1	-	0	CA0/CA1/RA0
1	-	1	CA0/RA0

### 49.4.7.3 NAND Flash access command type

NAND Flash access support following command types:

1. Command Phase Only
2. Command + Wait Phase
3. Command + Address Phase
4. Command + Address + Wait Phase
5. Command + Address + Read Phase
6. Command + Address + Write Phase (For IP command)
7. Command + Write Phase
8. Command + Read Phase
9. Write Phase Only
10. Read Phase Only
11. Command + Address + Command + Read Phase (For AXI command - Read)
12. Command + Address + Write Phase (For AXI command - Write)

#### 49.4.7.3.1 Command Phase Only

NAND Flash Command Phase Only access is indicated as following:

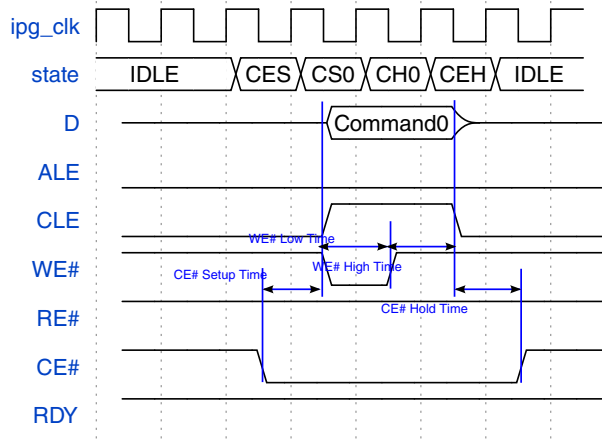

Figure 49-34. NAND Flash access command type - Command Phase Only

### 49.4.7.3.2 Command + Wait Phase

NAND Flash Command + Wait Phase access is indicated as following:

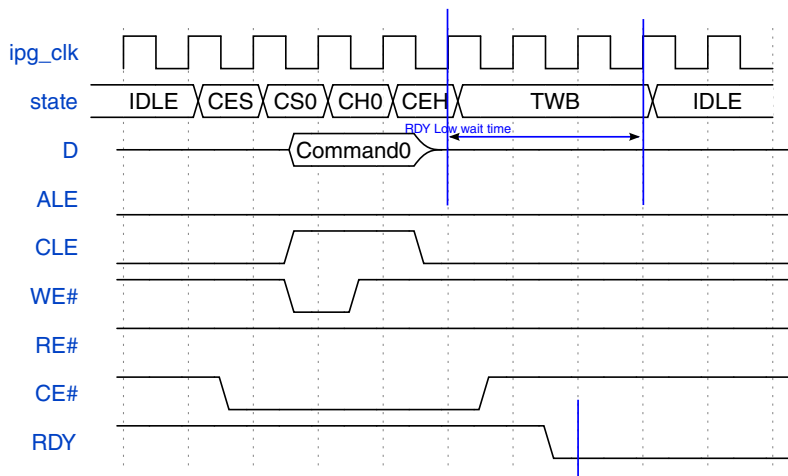

Figure 49-35. NAND Flash access command type - Command + Wait Phase

### 49.4.7.3.3 Command + Address Phase

NAND Flash Command + Address Phase access is indicated as following:

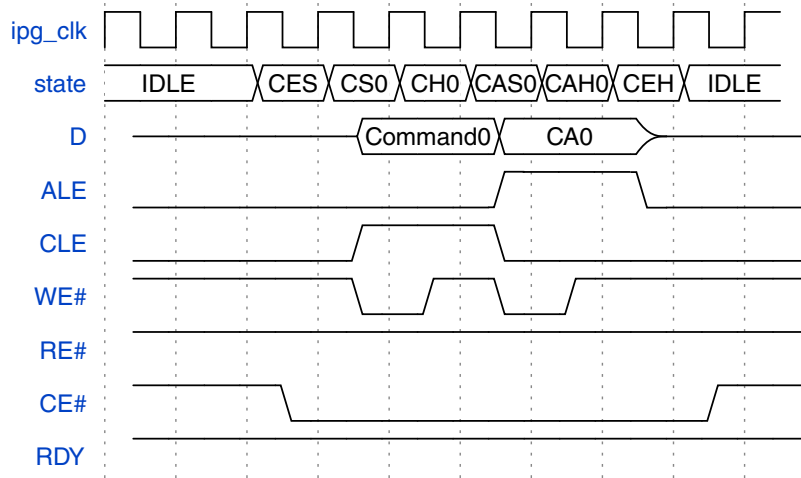

Figure 49-36. NAND Flash access command type - Command + Address Phase

#### 49.4.7.3.4 Command + Address + Wait Phase

NAND Flash Command + Address + Wait Phase access is indicated as following:

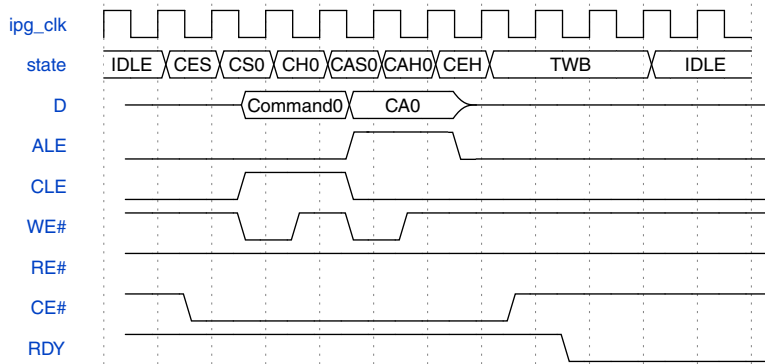

Figure 49-37. NAND Flash access command type - Command + Address + Wait Phase

#### 49.4.7.3.5 Command + Address + Read Phase

NAND Flash Command + Address + Read Phase access is indicated as following:

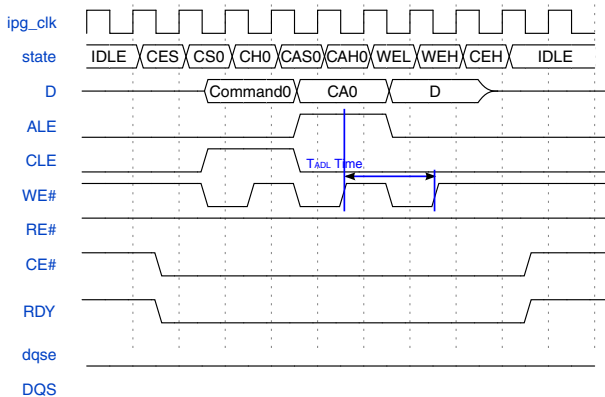

**Functional description**

**Figure 49-38. NAND Flash access command type - Command + Address + Read Phase**

**49.4.7.3.6 Command + Address + Write Phase (For IP command)**

NAND Flash Command + Address + Write Phase access is indicated as following:

**Figure 49-39. NAND Flash access command type - Command + Address + Write Phase**

**49.4.7.3.7 Command + Read Phase**

NAND Flash Command + Read Phase access is indicated as following:

Figure 49-40. NAND Flash access command type - Command + Read Phase

### 49.4.7.3.8 Command + Write Phase

NAND Flash Command + Write Phase access is indicated as following:

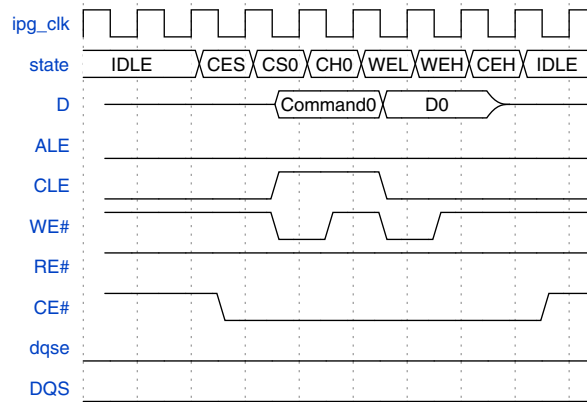

Figure 49-41. NAND Flash access command type - Command + Write Phase

### 49.4.7.3.9 Read Phase Only

NAND Flash Read Phase Only access is indicated as following:

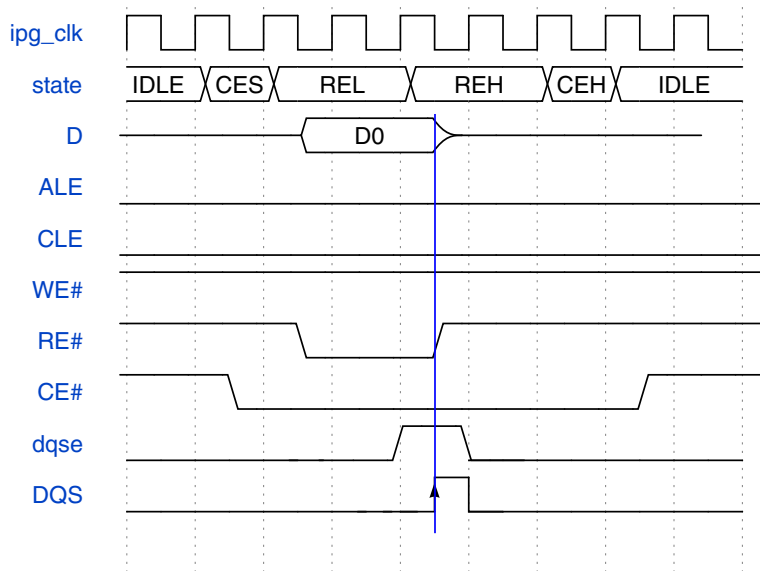

Figure 49-42. NAND Flash access command type - Read Phase Only

### 49.4.7.3.10 Write Phase Only

NAND Flash Write Phase Only access is indicated as following:

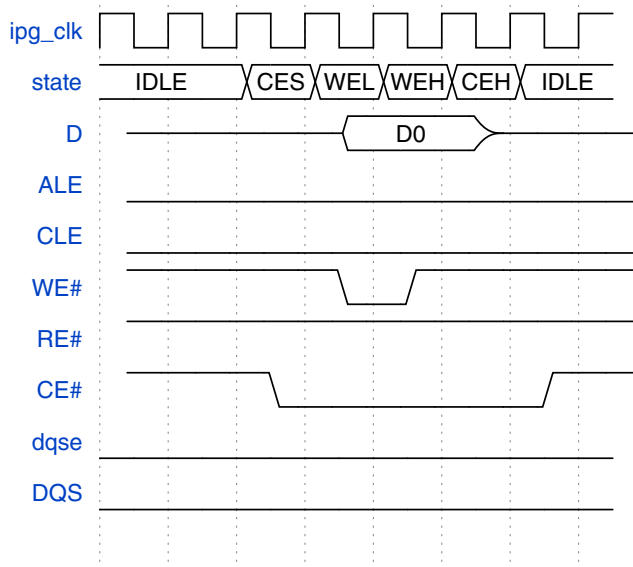

Figure 49-43. NAND Flash access command type - Write Phase Only

### 49.4.7.3.11 Command + Address + Command + Read Phase

NAND Flash Command + Address + Command + Read Phase access is indicated as following:

Figure 49-44. NAND Flash access command type - Command + Address + Command + Read Phase

### 49.4.7.3.12 Command + Address + Write Phase (For AXI command)

NAND Flash Command + Address + Write Phase access is indicated as following:

Figure 49-45. NAND Flash access command type - Command + Address + Write Phase

### 49.4.7.4 NAND Flash read access EDO and non-EDO mode

NAND Flash read access could be done in EDO or non-EDO mode. The timing indicated as following:

Figure 49-46. NAND Flash Read Access in EDO or non-EDO mode

## 49.4.8 NOR Flash Controller Operations

This section describes the NOR Flash controller module's operations.

### 49.4.8.1 NOR Flash Read Operation in ASYNC Mode

Flash read operation in ASYNC mode is indicated in following diagrams:

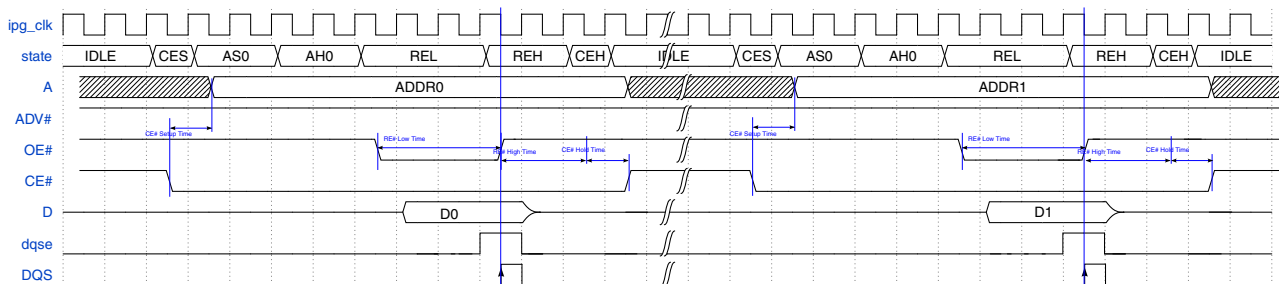

Figure 49-47. Flash Read in ASYNC mode (Non-ADMUX)

Figure 49-48. Flash Read in ASYNC mode (ADMUX)

Figure 49-49. Flash Read in ASYNC mode (AADM)

### 49.4.8.2 NOR Flash Write Operation in ASYNC mode

Flash write operation in ASYNC mode is indicated in following diagrams:

Figure 49-50. Flash Write in ASYNC mode (Non-ADMUX)

Figure 49-51. Flash Write in ASYNC mode (ADMUX)

Figure 49-52. Flash Write in ASYNC mode (AADM)

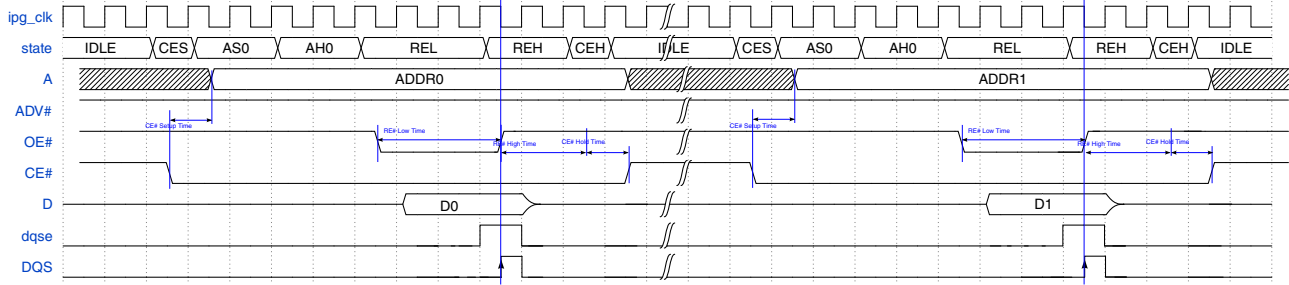

## 49.4.9 SRAM Controller Operations

This section describes the SRAM controller module's operations.

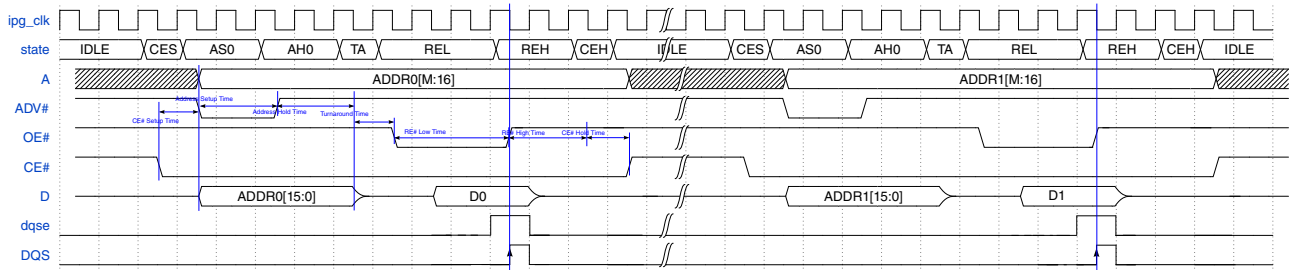

### 49.4.9.1 SRAM Read Operation in ASYNC Mode

SRAM read operation in ASYNC mode is indicated in following diagrams:

## Functional description

**Figure 49-53. SRAM Read in ASYNC mode (Non-ADMUX)**

**Figure 49-54. SRAM Read in ASYNC mode (ADMUX)**

**Figure 49-55. SRAM Read in ASYNC mode (AADM)**

### 49.4.9.2 SRAM Write Operation in ASYNC mode

SRAM write operation in ASYNC mode is indicated in following diagrams:

**Figure 49-56. SRAM Write in ASYNC mode (Non-ADMUX)**

Figure 49-57. SRAM Write in ASYNC mode (ADMUX)

Figure 49-58. SRAM Write in ASYNC mode (AADM)

## 49.4.10 Display Bus Interface Controller Operations

DBI read/write operation indicated as following.

Figure 49-59. DBI Read/Write operation

### NOTE

- For read access to DBI, it always handled as DBI DATA READ transaction
- For write access to DBI, it will be handled as DBI COMMAND WRITE transaction if address is higher than 0x10000 (with DBI Base address removed). Otherwise, it will be handled as DBI DATA WRITE transaction.
- DBI address is not sent to device at all. Only used to determine DBI COMMAND or DATA WRITE.
- DBI bus never sent out address information for COMMAND WRITE, DATA WRITE and DATA READ command.
- AXI WRAP write access to DBI is supported.

## Functional description

- AXI WRAP read access to DBI is not supported except when the first beat address offset is zero in the burst.
- DBI bus interface doesn't support WRITE MASK feature.
- All write strobe in AXI write access to DBI should be valid (one). If AXI write strobe is invalid(zero), SEMC will send write data 8'h00 instead of original write data.
- When DBI bus is 16 bit (DBICR0.PS=0x1), AXI command or IP command access (both read and write) start address to DBI bus should be 16 bit aligned. Otherwise the read data is unknown or the write data to DBI may be wrong. There will be no bus error response or internal error status generated.

# Chapter 50

## Secure Non-Volatile Storage (SNVS)

### 50.1 Chip-specific SNVS information

#### NOTE

Tamper Detection feature and related content is not applicable to this device.

### 50.2 SNVS introduction

SNVS is a companion module to the DCP module.

SNVS incorporates both security and non-security functionality. The SNVS non-security functionality is described in this document, but the SNVS security functionality is described only in the Security Reference Manual.

#### SNVS non-security functions:

- Realtime Counter (RTC) - a software accessible realtime counter
  - RTC can be set to the value in the SRTC
- Periodic Interrupt - a hardware-generated interrupt that occurs periodically at software-specified frequency
- General Purpose Register - a set of registers used to hold 128 bits of data specified by software
  - If the SNVS\_LP power input is connected to an uninterrupted power supply, e.g. a coin cell battery, the GPR value is maintained when main SoC is powered off
- Chip power-on/power-off - If the SNVS\_LP power input is connected to an uninterrupted power supply and the Power On button input signal is connected to a power button external to the chip, logic within SNVS\_LP can be used to wake the chip from a power down.

## 50.2.1 SNVS feature list

The following table summarizes the features of SNVS:

**Table 50-1. SNVS feature list**

Feature	Description	Links for Further Information
Real time counter (RTC)	<ul style="list-style-type: none"> <li>The RTC is driven by a dedicated clock, which is off when the system power is down.</li> <li>Programmable time alarm interrupt</li> <li>Periodic interrupt can be generated with software-selected frequency.</li> </ul>	<a href="#">SNVS_HP Real Time Counter</a>
Monotonic counter	<ul style="list-style-type: none"> <li>The monotonic counter can only increment.</li> <li>The monotonic counter does not rollover. Instead the monotonic counter logic issues an alarm if the monotonic counter reaches its maximum value.</li> <li>The monotonic counter value is marked as invalid if an SNVS tamper event is detected.</li> <li>If the SNVS_LP power input is connected to an uninterrupted power supply (see <a href="#">xref href="snvs_power_domains.dita#power_domains"/&gt;</a>), the monotonic counter value is retained even if the main chip is powered down.</li> </ul>	<a href="#">Using the Monotonic Counter (MC)</a>
General-purpose register	<ul style="list-style-type: none"> <li>The general-purpose register is available to software to store 128 bits of data.</li> <li>The general-purpose register is zeroized when a security violation is detected.</li> <li>If the SNVS_LP power input is connected to an uninterrupted power supply (see <a href="#">xref href="snvs_power_domains.dita#power_domains"/&gt;</a>), the general-purpose register value is retained even if the main chip is powered down.</li> </ul>	<a href="#">Using the General-Purpose Register</a>
Register access restrictions	<ul style="list-style-type: none"> <li>Registers can be programmed only when the SNVS is in functional state, i.e. not in scan mode.</li> <li>Some registers/values can be written only once per boot cycle.</li> </ul>	<a href="#">privileged and non-privileged registers</a>
Wakeup from power off	<ul style="list-style-type: none"> <li>Input signal from off chip requests SNVS_LP to power on the main SoC (Assuming that the SNVS_LP power input is connected to an uninterrupted power supply (see <a href="#">SNVS power domains</a>).</li> <li>Hardware debounces the input signal using software-specified signal bounce characteristics</li> </ul>	<a href="#">LP Wake-Up Interrupt Enable</a>

## 50.2.2 SNVS functional description

SNVS implements several non-security features that involve software interaction:

- reading or writing the Realtime Counter (RTC) (This is a non-privileged operation.) - software can also instruct SNVS to load the current SRTC value into the RTC
- reading or writing the General Purpose Register (GPR) (Npte that there may be a significant delay when reading or writing registers in the LP section if the LP clock is different from the HP clock.)

The following sections describe in more detail the operation of SNVS.

## 50.3 SNVS Structure

SNVS is organized as two major sub-modules:

- Low-Power Section of SNVS (SNVS\_LP)

The SNVS\_LP section provides hardware that enables secure storage and protection of sensitive data. The SNVS module is designed to safely hold security-related data such as cryptographic key, time counter, monotonic counter, and general purpose security information.

The SNVS\_LP block implements the following functional units:

- Control and Status Registers
- General Purpose Registers

When the LP section is powered by a backup battery the state of these registers is maintained even when the main chip power is off. (see [SNVS power domains](#))

- High-Power Section of SNVS (SNVS\_HP)

The SNVS\_HP section contains all SNVS status and configuration registers. It implements all features that enable system communication and provisioning of the SNVS\_LP section.

The SNVS\_HP provides an interface between SNVS\_LP and the rest of the system.

The SNVS\_HP block implements the following functional units:

- IP Bus Interface
- SNVS\_LP Interface
- Zeroizable Master Key Programming Mechanism
- Real Time Counter with Alarm Control and Status Registers
- Control and status registers

SNVS\_HP is in the chip's power supply domain and thus receives power along with the rest of the chip.

The following figure illustrates the structure of SNVS.

### 50.3.1 SNVS power domains

In some versions of SNVS (including this version), the LP (Low Power) section is implemented in an independent power domain from the HP (High Power) section, and most other logic on the chip. Throughout the SNVS documentation whenever mention is

made of "always-on" logic, this assumes a version of SNVS that implements an independent power domain for the LP section, and that the power for this section is supplied by an uninterrupted power supply. The purpose for the independent power domain is so that data can be retained and certain logic can remain functional even when the main chip logic is powered down. But this is possible only if the LP domain remains powered via an uninterrupted power supply when the main chip power domain is powered off. Usually this uninterrupted power supply would be a coin-cell battery, with possibly some power management logic to power the LP section from main power (and perhaps recharge the coin cell battery) when main power is on, and switch to coin-cell power when the main power is off. In versions of SNVS with an independent LP power domain the LP section can be electrically isolated from the rest of the chip logic to ensure that its logic does not get corrupted when the main chip is powered down. If the battery runs down or is removed, an LP POR will occur when the LP section next powers up. Note that some OEMs may choose to connect LP power to HP/main chip power and dispense with a coin cell battery. In that case the SNVS will operate the same as an SNVS without an independent LP power domain. No state will be retained in the LP section when the chip is powered down, and an LP POR will occur whenever there is an HP POR.

### 50.3.2 SNVS clock sources

The SNVS has the following clock sources:

- System peripheral clock input. This clock is used by the SNVS's internal logic, for example, the Security State Machine. This clock can be gated outside of the module when the SNVS indicates that it is not in use.
- HP RTC clock. This clock is used by SNVS\_HP real-time counter. This clock does not need to be synchronous with other clocks.

## 50.4 Runtime Procedures

SNVS implements a number of features that are intended to be accessed by software at runtime (as opposed to accessed at boot time). These features include:

- Real Time Clock (see [SNVS\\_HP Real Time Counter](#))
- Secure Real Time Clock (see [SNVS\\_LP Secure Real Time Counter \(SRTC\)](#))
- General Purpose Register (see [Using the General-Purpose Register](#))
- Monotonic Counter (see [Using the Monotonic Counter \(MC\)](#))

Procedures for using these features are described in the following sections.

## 50.4.1 Using SNVS Timer Facilities

SNVS incorporates timer facilities that can optionally generate an interrupt at a specified time. As described in the following sections, SNVS\_HP incorporates a Real Time Counter that is available for general use, and SNVS\_LP incorporates a Secure Real Time Counter intended for security applications.

### 50.4.1.1 SNVS\_HP Real Time Counter

SNVS\_HP implements a real time counter that can be read or written by any application; it has no privileged software access restrictions. When the chip is powered down the RTC is not active and it is reset at chip POR. The RTC can be used to generate a functional interrupt request either at a specific time, or at a specific frequency, or both. To generate an interrupt request at a specific time HPTA\_EN is set to 0, the desired time is written to HPTA\_MS and HPTA\_LS and then HPTA\_EN is set to 1. HPTA\_EN, HPTA\_MS and HPTA\_LS can be written by any software that has access to SNVS registers; there are no privileged access restrictions. The counter can be synchronized to the SNVS\_LP SRTC by writing to the HP\_TS bit of SNVS\_HP Control Register. This is particularly useful if the SNVS\_LP is powered from an uninterrupted power source (e.g. a coin cell battery) because the RTC can then be set from a chip-internal time source.

### 50.4.1.2 RTC/SRTC control bits setting

All SNVS registers are programmed from the register bus, consequently any software-initiated changes are synchronized with the IP clock. Several registers can also change synchronously with the RTC/SRTC clock after they are programmed. To avoid IP clock and RTC/SRTC clock synchronization issues, the following values can be changed only when the corresponding function is disabled.

**Table 50-2. RTC/SRTC synchronized values list**

Function	Value/register	Control bit setting
HP section		
HP Real Time Counter	HPRTCMR and HPRTCLR Registers	RTC_EN = 0 : HPRTCMR/HPRTCLR <b>can</b> be programmed RTC_EN = 1 : HPRTCMR/HPRTCLR <b>cannot</b> be programmed
HP Time Alarm	HPTAMR and HPTALR Registers	HPTA_EN = 0 : HPTAMR/HPTALR <b>can</b> be programmed

*Table continues on the next page...*

**Table 50-2. RTC/SRTC synchronized values list (continued)**

Function	Value/register	Control bit setting
		HPTA_EN = 1 : HPTAMR/HPTALR <b>cannot</b> be programmed
LP section		
LP Secure Real Time Counter	LPRTC MR and LPRTC LR Registers	SRTC_ENV = 0 : LPRTC MR/LPRTC LR <b>can</b> be programmed SRTC_ENV = 1 : LPRTC MR/LPRTC LR <b>cannot</b> be programmed
LP Time Alarm	LPTAR Register	LPTA_EN = 0 : LPTAR <b>can</b> be programmed LPTA_EN = 1 : LPTAR <b>cannot</b> be programmed

Use the following steps to program synchronized values:

1. Check the enable bit value. If set, clear it.
2. Verify that the enable bit is cleared. There are two reasons to verify the enable bit's setting:
  - Enable bit clearing does not happen immediately; it takes three IP clock cycles and two RTC/SRTC clock cycles to change the enable bit's value.
  - If the enable bit is locked for programming, it cannot be cleared.
3. Program the desired value.
4. Set the enable bit; it takes three IP clock cycles and two RTC/SRTC clock cycles for the bit to set.

#### **NOTE**

Incrementing the value programmed into RTC/SRTC registers by two compensates for the two RTC/SRTC clock cycle delay that is required to enable the counter.

### **50.4.1.3 Reading RTC and SRTC values**

Software should follow the following procedure to ensure that it has read correct data from the RTC (HPRTC MR and HPRTC LR) and SRTC (LPSRTC MR and LPSRTC LR) registers:

- Read the most-significant half and the least-significant half of the RTC/SRTC and then read both halves again. If the values read are the same both times, the value is correct.
- If the two consecutive pairs of reads yield different results, perform two more reads.

The worst case scenario may require three sessions of two consecutive pairs of reads. There are several reasons that the values may be incorrectly read initially:

- Synchronization issues between the RTC/SRTC clock and the system clock
- Since the counter continues to increment, there may be a carry from the least-significant 32-bits to the most-significant bits in between reading the two halves of the counter

## 50.4.2 Using Other SNVS Registers

The sections below describe how to use the General Purpose Register. Monotonic Counter. The sections below describe how to use the General Purpose Register and the Monotonic Counter.

### 50.4.2.1 Using the General-Purpose Register

SNVS implements a 128-bit general-purpose register allows software to store a small amount of data. To maintain backward compatibility with versions of SNVS that implement only a 32-bit general purpose register, the most-significant word of the general purpose register is aliased to the legacy address. The data in the GPR will be retained during system power-down mode as long as the SNVS\_LP remains powered by an uninterrupted power source (e.g. coin cell battery).

## 50.5 Reset and Initialization of SNVS

SNVS is implemented in two sections (HP and LP) that both must be initialized by software following POR. If the SNVS\_LP is powered by an uninterrupted power source that is separate from main SoC power, then SNVS can operate in either of two modes, depending upon whether the main SoC power is on or off. During main SoC power-down SNVS\_HP is powered-down, but SNVS\_LP is powered from the backup power supply and is electrically isolated from the rest of the chip. In this mode SNVS\_LP keeps its registers' values and monitors the SNVS\_LP tamper detection inputs, but the LP registers cannot be read or written. During main SoC power-up the isolation of SNVS\_LP is disabled and both SNVS\_HP and SNVS\_LP are powered from the main SoC power. Both LP and HP registers can be read and written (locks and privilege modes permitting). Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational.

Since the HP and LP sections reside in different power domains, the POR for the two sections can occur at different times. If the SNVS\_LP section remains powered by an uninterrupted power source when the main SoC power is off, SNVS\_LP is initialized rarely, typically once when the device is first powered on and again whenever the battery is replaced. During main SoC power-up the isolation of SNVS\_LP is disabled and both SNVS\_HP and SNVS\_LP are powered from the main SoC power. Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational. The SNVS\_HP section is powered from the main SoC power, so it must be initialized whenever the device is powered on. If the SNVS\_LP section is powered from the main SoC power rather than from an uninterrupted power source, the SNVS\_LP section must also be initialized at SoC POR.

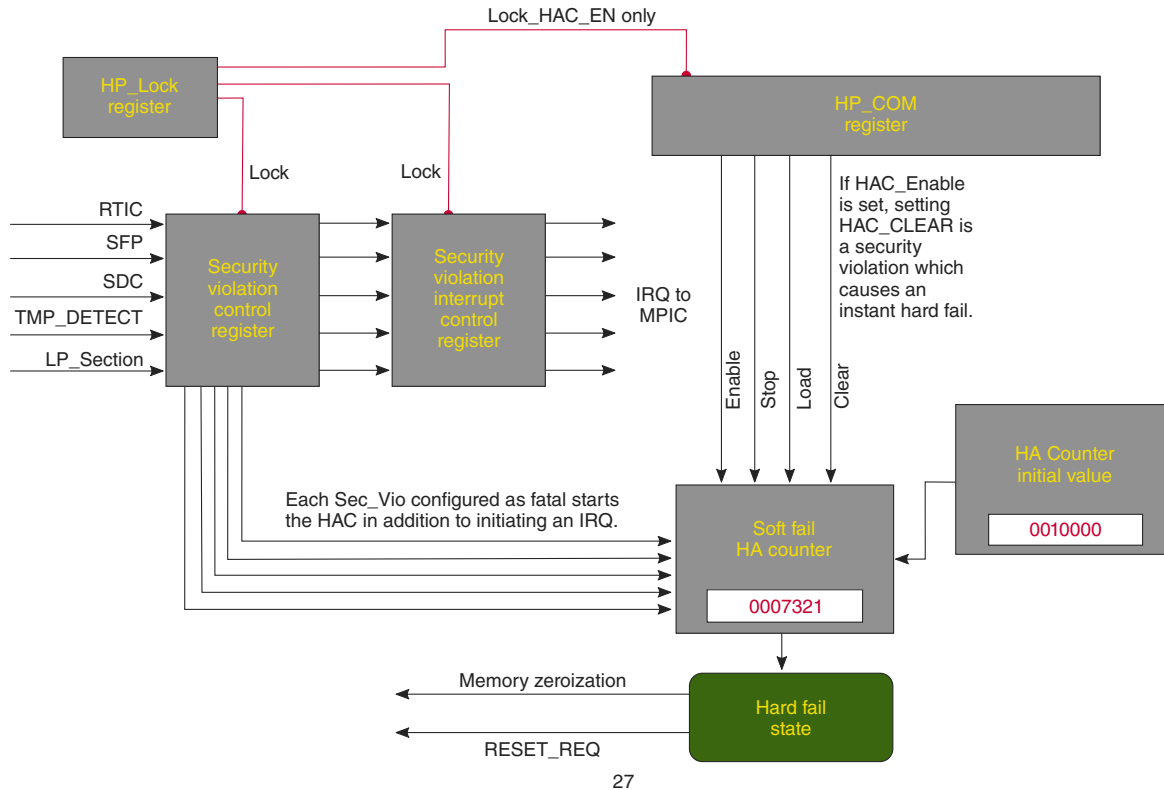

Initializing the LP section The following steps should be completed to properly initialize the SNVS LP section (required only on LP POR, i.e. when the battery is replaced):

1. Program the Power Glitch Detector and clear the power glitch record in the LP status register
2. If the SRTC will be used, set the Secure Real Time Clock
3. If the ZMK will be used, provision the ZMK
4. If the Monotonic Counter will be used, burn an additional Monotonic Counter Era bit in the fuse bank and reset the Monotonic Counter

Initializing the HP section The following steps should be completed to properly initialize the SNVS HP section (following successful completion of secure boot):

1. Perform normal or secure boot to put the SNVS into a functional state (Non-secure, Trusted, Secure)
2. At SNVS\_LP POR a power glitch violation will be asserted. Therefore at the first HP POR following an LP POR software should write the proper initialization value (41736166h) into the LPPGDR and clear the power glitch record in the LP status register. See [Power glitch detector \(PGD\)](#) for more details.
3. Transition SSM from trusted state to secure state (if not already done by HAB).
4. Enable security violations and interrupts in HPSVCR and HPSICR registers
5. Program SNVS general functions/configurations
6. Select Master Key (OTPMK, ZMK or XOR of the two. Default is OTPMK.)
7. Set lock bits. The ms bit of the SNVS\_HP lock register should be set before starting any functional operation. Setting this bit prevents further changes to the Master Key selection.

**Figure 50-1. Relationship Between the Registers**

### 50.5.1 Initialization Checklists

SNVS is implemented in two sections (HP and LP) that both must be initialized by software following POR. If the SNVS\_LP is powered by an uninterrupted power source that is separate from main SoC power, then SNVS can operate in either of two modes, depending upon whether the main SoC power is on or off. During main SoC power-down SNVS\_HP is powered-down, but SNVS\_LP is powered from the backup power supply and is electrically isolated from the rest of the chip. In this mode SNVS\_LP keeps its registers' values and monitors the SNVS\_LP tamper detection inputs, but the LP registers cannot be read or written. During main SoC power-up the isolation of SNVS\_LP is disabled and both SNVS\_HP and SNVS\_LP are powered from the main SoC power. Both LP and HP registers can be read and written (locks and privilege modes permitting). Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational.

Since the HP and LP sections reside in different power domains, the POR for the two sections can occur at different times. If the SNVS\_LP section remains powered by an uninterrupted power source when the main SoC power is off, SNVS\_LP is initialized rarely, typically once when the device is first powered on and again whenever the battery is replaced. During main SoC power-up the isolation of SNVS\_LP is disabled and both

SNVS\_HP and SNVS\_LP are powered from the main SoC power. Signals between the SNVS\_HP and SNVS\_LP sections are enabled and all SNVS functions are operational. The SNVS\_HP section is powered from the main SoC power, so it must be initialized whenever the device is powered on. If the SNVS\_LP section is powered from the main SoC power rather than from an uninterrupted power source, the SNVS\_LP section must also be initialized at SoC POR.

## 50.6 SNVS register descriptions

This section contains detailed register descriptions for the SNVS registers. Each description includes a standard register diagram and register table. The register table provides detailed descriptions of the register bit and field functions, in bit order.

SNVS registers consist of two types:

- Privileged read/write accessible
- Non-privileged read/write accessible

Privileged read/write accessible registers can only be accessed for read/write by privileged software. Unauthorized write accesses are ignored, and unauthorized read accesses return zero. Non-privileged software can access privileged access registers when the non-privileged software access enable bit is set in the SNVS\_HP Command Register.

- Non-Secure
- Trusted
- Secure

Non-privileged read/write accessible registers are read/write accessible by any software.

The LP register values are set only on LP POR and are unaffected by System (HP) POR. The HP registers are set only on System POR and are unaffected by LP POR.

The following table shows the SNVS main memory map.

### **NOTE**

For more information on security-related bitfields, see the Security Reference Manual for mxrt.

## 50.6.1 SNVS Memory map

SNVS base address: 400D\_4000h

Offset	Register	Width (In bits)	Access	Reset value
0h	SNVS_HP Lock Register (HPLR)	32	RW	0000_0000h
4h	SNVS_HP Command Register (HPCOMR)	32	RW	0000_0000h

Field	Function
31-28	Reserved.
—	

Table continues on the next page...

Field	Function
27 BTN_MASK	Button interrupt mask. This bit is used to mask the ipi_snvs_btn_int_b (button) interrupt request. 0: Interrupt disabled 1: Interrupt enabled
26-24 BTN_CONFIG	Button Configuration. This field is used to configure which feature of the button (BTN) input signal constitutes "active". 000: Button signal is active high 001: Button signal is active low 010: Button signal is active on the falling edge 011: Button signal is active on the rising edge 100: Button signal is active on any edge All other patterns are reserved.
23-17 —	Reserved.
16 —	Reserved
15 —	Reserved.
14-10 HPCALB_VAL	HP Calibration Value Defines signed calibration value for the HP Real Time Counter. This field can be programmed only when RTC Calibration is disabled (HPCALB_EN is not set). This is a 5-bit 2's complement value, hence the allowable calibration values are in the range from -16 to +15 counts per 32768 ticks of the counter.  00000b - +0 counts per each 32768 ticks of the counter 00001b - +1 counts per each 32768 ticks of the counter 00010b - +2 counts per each 32768 ticks of the counter 01111b - +15 counts per each 32768 ticks of the counter 10000b - -16 counts per each 32768 ticks of the counter 10001b - -15 counts per each 32768 ticks of the counter 11110b - -2 counts per each 32768 ticks of the counter 11111b - -1 counts per each 32768 ticks of the counter
9 —	Reserved.
8 HPCALB_EN	HP Real Time Counter Calibration Enabled Indicates that the time calibration mechanism is enabled.  0b - HP Timer calibration disabled 1b - HP Timer calibration enabled
7-4 PI_FREQ	Periodic Interrupt Frequency Defines frequency of the periodic interrupt. The interrupt is generated when a zero-to-one or one-to-zero transition occurs on the selected bit of the HP Real Time Counter and Real Time Counter and Periodic Interrupt are both enabled (RTC_EN and PI_EN are set). It is recommended to program this field when Periodic Interrupt is disabled (PI_EN is not set). The possible frequencies are:  0000b - bit 0 of the HPRTCLR is selected as a source of the periodic interrupt 0001b - bit 1 of the HPRTCLR is selected as a source of the periodic interrupt 0010b - bit 2 of the HPRTCLR is selected as a source of the periodic interrupt

*Table continues on the next page...*

## SNVS register descriptions

Field	Function
	0011b - bit 3 of the HPRTCLR is selected as a source of the periodic interrupt 0100b - bit 4 of the HPRTCLR is selected as a source of the periodic interrupt 0101b - bit 5 of the HPRTCLR is selected as a source of the periodic interrupt 0110b - bit 6 of the HPRTCLR is selected as a source of the periodic interrupt 0111b - bit 7 of the HPRTCLR is selected as a source of the periodic interrupt 1000b - bit 8 of the HPRTCLR is selected as a source of the periodic interrupt 1001b - bit 9 of the HPRTCLR is selected as a source of the periodic interrupt 1010b - bit 10 of the HPRTCLR is selected as a source of the periodic interrupt 1011b - bit 11 of the HPRTCLR is selected as a source of the periodic interrupt 1100b - bit 12 of the HPRTCLR is selected as a source of the periodic interrupt 1101b - bit 13 of the HPRTCLR is selected as a source of the periodic interrupt 1110b - bit 14 of the HPRTCLR is selected as a source of the periodic interrupt 1111b - bit 15 of the HPRTCLR is selected as a source of the periodic interrupt
3 PI_EN	HP Periodic Interrupt Enable The periodic interrupt can be generated only if the HP Real Time Counter is enabled. 0b - HP Periodic Interrupt is disabled 1b - HP Periodic Interrupt is enabled
2 DIS_PI	Disable periodic interrupt in the functional interrupt 0b - Periodic interrupt will trigger a functional interrupt 1b - Disable periodic interrupt in the function interrupt
1 HPTA_EN	HP Time Alarm Enable When set, the time alarm interrupt is generated if the value in the HP Time Alarm Registers is equal to the value of the HP Real Time Counter. 0b - HP Time Alarm Interrupt is disabled 1b - HP Time Alarm Interrupt is enabled
0 RTC_EN	HP Real Time Counter Enable. This bit syncs with the 32KHz clock. It won't update with the bus clock. 0b - RTC is disabled 1b - RTC is enabled

## 50.6.5 SNVS\_HP Status Register (HPSR)

Register	Offset
HPSR	14h

### 50.6.5.2 Function

The HP Status Register reflects the internal state of the SNVS. This is *not* a privileged write register.

### 50.6.5.3 Diagram

1. The value of Low Power Disable is determined by the *no\_battery* input signal to SNVS.

### 50.6.5.4 Fields

Field	Function
31	Reserved
—	
30-28	Reserved.
—	
27	Reserved
—	
26-25	Reserved.
—	
24-16	Reserved
—	
15-12	Reserved
—	
11-8	Reserved
—	
7	Button Interrupt
BI	Signal ipi_snvs_btn_int_b was asserted.
6	Button
BTN	Value of the BTN input. This is the external button used for PMIC control.

*Table continues on the next page...*

## SNVS register descriptions

Field	Function
	0: BTN not pressed 1: BTN pressed
5 —	Reserved.
4 LPDIS	Low Power Disable If 1, the low power section has been disabled by means of an input signal to SNVS.
3-2 —	Reserved.
1 PI	Periodic Interrupt Indicates that periodic interrupt has occurred since this bit was last cleared. 0b - No periodic interrupt occurred. 1b - A periodic interrupt occurred.
0 HPTA	HP Time Alarm Indicates that the HP Time Alarm has occurred since this bit was last cleared. 0b - No time alarm interrupt occurred. 1b - A time alarm interrupt occurred.

## 50.6.6 SNVS\_HP Real Time Counter MSB Register (HPRTC MR)

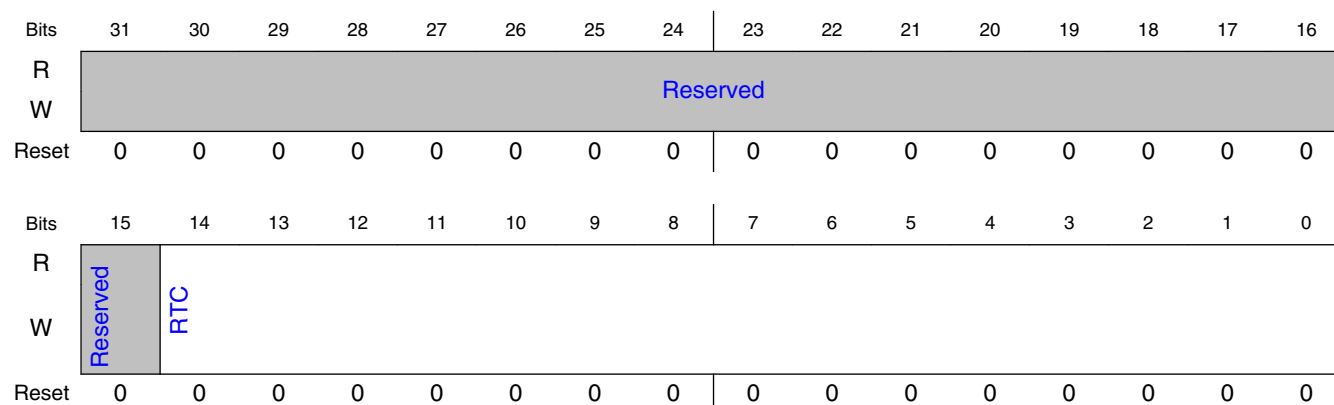

### 50.6.6.1 Offset

Register	Offset
HPRTC MR	24h

### 50.6.6.2 Function

The SNVS\_HP Real Time Counter MSB register contains the 15 most-significant bits of the HP Real Time Counter. This is *not* a privileged write register.

### 50.6.6.3 Diagram

### 50.6.6.4 Fields

Field	Function
31-15 —	Reserved
14-0 RTC	HP Real Time Counter The most-significant 15 bits of the RTC. This register can be programmed only when RTC is not active (RTC_EN bit is not set).

## 50.6.7 SNVS\_HP Real Time Counter LSB Register (HPRTCLR)

### 50.6.7.1 Offset

Register	Offset
HPRTCLR	28h

### 50.6.7.2 Function

The SNVS\_HP Real Time Counter LSB register contains the 32 least-significant bits of the HP real time counter. This is *not* a privileged write register.

### 50.6.7.3 Diagram

### 50.6.7.4 Fields

Field	Function
31-0	HP Real Time Counter
RTC	least-significant 32 bits. This register can be programmed only when RTC is not active (RTC_EN bit is not set).

## 50.6.8 SNVS\_HP Time Alarm MSB Register (HPTAMR)

### 50.6.8.1 Offset

Register	Offset
HPTAMR	2Ch

### 50.6.8.2 Function

The SNVS\_HP Time Alarm MSB register contains the most-significant bits of the SNVS\_HP Time Alarm value. This is *not* a privileged write register.

### 50.6.8.3 Diagram

### 50.6.8.4 Fields

Field	Function
31-15 —	Reserved.
14-0 HPTA_MS	HP Time Alarm, most-significant 15 bits. This register can be programmed only when HP time alarm is disabled (HPTA_EN bit is not set).

## 50.6.9 SNVS\_HP Time Alarm LSB Register (HPTALR)

### 50.6.9.1 Offset

Register	Offset
HPTALR	30h

### 50.6.9.2 Function

The SNVS\_HP Time Alarm LSB register contains the 32 least-significant bits of the SNVS\_HP Time Alarm value. This is *not* a privileged write register.

### 50.6.9.3 Diagram

### 50.6.9.4 Fields

Field	Function
31-0	HP Time Alarm, 32 least-significant bits.
HPTA_LS	This register can be programmed only when HP time alarm is disabled (HPTA_EN bit is not set).

## 50.6.10 SNVS\_LP Lock Register (LPLR)

### 50.6.10.1 Offset

Register	Offset
LPLR	34h

### 50.6.10.2 Function

The SNVS\_LP Lock Register contains lock bits for the SNVS\_LP registers. This is a privileged write register.

### 50.6.10.3 Diagram

### 50.6.10.4 Fields

Field	Function
31-29 —	Reserved.
28 —	Reserved.
27 —	Reserved.
26 —	Reserved.
25 —	Reserved.
24 —	Reserved.
23-10 —	Reserved.
9 —	Reserved
8 —	Reserved
7 —	Reserved.
6	Reserved

Table continues on the next page...

## SNVS register descriptions

Field	Function
—	
5 GPR_HL	General Purpose Register Hard Lock When set, prevents any writes to the GPR. Once set, this bit can only be reset by the LP POR. 0b - Write access is allowed. 1b - Write access is not allowed.
4 MC_HL	Monotonic Counter Hard Lock When set, prevents any writes (increments) to the MC Registers and MC_ENV bit. Once set, this bit can only be reset by the LP POR. 0b - Write access (increment) is allowed. 1b - Write access (increment) is not allowed.
3 —	Reserved
2 —	Reserved
1 —	Reserved
0 —	Reserved

## 50.6.11 SNVS\_LP Control Register (LPCR)

### 50.6.11.1 Offset

Register	Offset
LPCR	38h

### 50.6.11.2 Function

The SNVS\_LP Control Register contains various control bits of the LP section of SNVS. This is a privileged write register.

### 50.6.11.3 Diagram

### 50.6.11.4 Fields

Field	Function
31-25 —	Reserved.
24 —	Reserved.
