# **i.MX RT1050 Processor Reference Manual**

Document Number: IMXRT1050RM  
Rev. 1, 03/2018

# Contents

Section number	Title	Page
<b>Chapter 1</b>		
<b>Introduction</b>		
1.1	About This Document.....	201
1.1.1	Audience.....	201
1.1.2	Organization.....	201
1.1.3	Suggested Reading.....	201
1.1.3.1	General Information.....	202
1.1.3.2	Related Documentation.....	202
1.1.4	Conventions.....	202
1.1.5	Register Access.....	204
1.1.5.1	Register Diagram Field Access Type Legend.....	204
1.1.5.2	Register Macro Usage.....	204
1.1.6	Signal Conventions.....	206
1.1.7	Acronyms and Abbreviations.....	206
1.2	Introduction.....	209
1.2.1	Block Diagram.....	209
1.3	Features.....	211
1.4	Target Applications.....	212
1.5	Endianness Support.....	213
<b>Chapter 2</b>		
<b>Memory Maps</b>		
2.1	Memory system overview.....	215
2.2	ARM Platform Memory Map.....	215
<b>Chapter 3</b>		
<b>Interrupts, DMA Events, and XBAR Assignments</b>		
3.1	Overview.....	223
3.2	CM7 interrupts.....	223
3.3	DMA Mux.....	231

Section number	Title	Page
3.4	XBAR Resource Assignments.....	239

## Chapter 4 External Signals and Pin Multiplexing

4.1	Overview.....	251
4.1.1	Muxing Options.....	251

## Chapter 5 Fusemap

5.1	Boot Fusemap.....	277
5.2	Lock Fusemap.....	288
5.3	Fusemap Descriptions Table.....	288

## Chapter 6 External Memory Controllers

6.1	Overview.....	303
6.2	Smart External Memory Controller (SEMC) Overview.....	303
6.3	eMMC/eSD/SDIO.....	305
6.4	Quad Serial Peripheral Interface.....	306

## Chapter 7 System Debug

7.1	Overview.....	307
7.2	Chip and ARM Platform Debug Architecture.....	307
7.2.1	Debug Features.....	308
7.2.2	Debug system components.....	308
7.2.2.1	AMBA Trace Bus (ATB).....	308
7.2.2.2	CoreSight trace port interface (TPIU).....	309
7.2.2.3	Embedded Trace Macrocell (ETM).....	310
7.2.2.4	Instrumentation Trace Macrocell.....	310
7.2.3	Chip-Specific SJC Features.....	311
7.2.3.1	JTAG Disable Mode.....	311
7.2.3.2	JTAG ID.....	311
7.2.4	System JTAG controller main features.....	312

Section number	Title	Page
7.2.5	SJC TAP Port.....	312
7.2.6	SJC main blocks.....	312
7.3	Miscellaneous.....	313
7.3.1	Clock/Reset/Power.....	313
7.4	Supported tools.....	313

## Chapter 8 System Boot

8.1	Chip-specific Boot Information.....	315
8.2	Overview.....	318
8.3	Boot modes.....	319
8.3.1	Boot mode pin settings.....	320
8.3.2	High-level boot sequence.....	320
8.3.3	Boot From Fuses mode (BOOT_MODE[1:0] = 00b).....	321
8.3.4	Serial Downloader (BOOT_MODE[1:0] = 01b).....	322
8.3.5	Internal Boot mode (BOOT_MODE[1:0] = 0b10).....	322
8.3.6	Boot security settings.....	323
8.4	Device configuration.....	324
8.4.1	Boot eFUSE descriptions.....	324
8.4.2	GPIO boot overrides.....	325
8.4.3	Device Configuration Data (DCD).....	326
8.5	Device initialization.....	326
8.5.1	Internal ROM/RAM memory map.....	327
8.5.2	Boot block activation .....	327
8.5.3	Clocks at boot time.....	328
8.5.4	Enabling Caches.....	330
8.5.5	Exception handling.....	330
8.5.6	Interrupt handling during boot.....	331
8.5.7	Persistent bits.....	331
8.6	Boot devices (internal boot).....	331

Section number	Title	Page
8.6.1	Serial NOR Flash Boot via FlexSPI.....	332
8.6.1.1	Serial NOR eFUSE Configuration.....	332
8.6.1.2	FlexSPI Serial NOR Flash Boot Operation.....	333
8.6.1.3	FlexSPI NOR boot flow chart.....	333
8.6.2	Serial NAND Flash Boot over FlexSPI.....	334
8.6.2.1	Serial NAND eFUSE Configuration.....	334
8.6.2.2	FlexSPI NAND Flash Boot Flow and Boot Control Blocks (BCB).....	336
8.6.2.3	Firmware Configuration Block.....	339
8.6.2.4	Discovered Bad Blocks Table (DBBT).....	340
8.6.2.5	Bad block handling in ROM.....	341
8.6.3	Serial NOR and NAND configuration based on FlexSPI interface.....	341
8.6.3.1	FlexSPI Configuration Block .....	341
8.6.3.2	Serial NOR configuration block (512 bytes).....	346
8.6.3.3	Serial NAND configuration block (512 bytes).....	346
8.6.4	Parallel NOR flash Boot over SEMC.....	349
8.6.4.1	Parallel NOR eFUSE Configuration.....	349
8.6.4.2	SEMC Parallel NOR Flash Boot Operation.....	350
8.6.5	Parallel NAND flash Boot over SEMC.....	350
8.6.5.1	Parallel NAND eFUSE Configuration.....	351
8.6.5.2	Parallel NAND Flash Boot Control Blocks (BCB).....	353
8.6.5.3	Firmware Configuration Block (FCB).....	353
8.6.5.4	Discovered Bad Blocks Table (DBBT).....	355
8.6.5.5	Bad block handling in ROM.....	355
8.6.6	Parallel NOR and NAND configuration based on SEMC interface.....	356
8.6.6.1	SEMC Configuration Block.....	356
8.6.6.2	Parallel NOR Configuration Block (80 bytes).....	359
8.6.6.3	Parallel NAND Configuration Block (256 bytes).....	359
8.6.7	Expansion device.....	361
8.6.7.1	Expansion device eFUSE configuration.....	361

Section number	Title	Page
8.6.7.2	MMC and eMMC boot.....	364
8.6.7.3	SD, eSD, and SDXC.....	372
8.6.7.4	IOMUX configuration for SD/MMC.....	372
8.6.7.5	Redundant boot support for expansion device.....	373
8.6.8	Serial NOR/EEPROM through LPSPI.....	375
8.6.8.1	Serial NOR/EEPROM eFUSE configuration.....	375
8.7	Program image.....	376
8.7.1	Image Vector Table and Boot Data.....	376
8.7.1.1	Image vector table structure.....	377
8.7.1.2	Boot data structure.....	378
8.7.2	Device Configuration Data (DCD).....	378
8.7.2.1	Write data command.....	379
8.7.2.2	Check data command.....	381
8.7.2.3	NOP command.....	382
8.7.2.4	Unlock command.....	382
8.8	Plugin image.....	383
8.9	Serial Downloader.....	384
8.9.1	USB.....	386
8.9.1.1	USB configuration details.....	386
8.9.1.2	IOMUX configuration for USB.....	387
8.9.2	Serial Download Protocol (SDP).....	387
8.9.2.1	SDP commands.....	388
8.9.2.1.1	READ_REGISTER.....	388
8.9.2.1.2	WRITE_REGISTER.....	389
8.9.2.1.3	WRITE_FILE.....	389
8.9.2.1.4	ERROR_STATUS.....	391
8.9.2.1.5	DCD_WRITE.....	391
8.9.2.1.6	JUMP_ADDRESS.....	392
8.10	Recovery devices.....	393

Section number	Title	Page
8.11	SD/MMC manufacture mode.....	393
8.12	High-Assurance Boot (HAB).....	394
8.12.1	HAB API vector table addresses.....	395

## Chapter 9 Multimedia

9.1	Display and graphics subsystem.....	397
9.1.1	PiXeI Processing Pipeline.....	398
9.1.2	LCD Interface.....	398
9.1.3	CMOS Sensor Interface.....	398
9.2	Audio subsystem.....	399
9.2.1	Audio Subsystem Module Overview.....	400
9.2.2	Medium Quality Sound (MQS).....	402
9.2.3	Synchronous Audio Interface (SAI).....	403
9.2.4	Sony/Philips Digital Interface (SPDIF).....	403

## Chapter 10 Clock and Power Management

10.1	Introduction.....	405
10.2	Device Power Management Architecture Components.....	405
10.2.1	Centralized components of clock generation and management.....	406
10.2.2	Centralized components of power generation, distribution and management.....	407
10.2.3	Reset generation and distribution system.....	407
10.2.4	Power and clock management framework.....	407
10.3	Clock Management.....	408
10.3.1	Centralized components of clock management system.....	408
10.3.2	Clock generation.....	410
10.3.2.1	Crystal Oscillator (XTALOSC) .....	411
10.3.2.2	PLLs.....	411
10.3.2.2.1	General PLL Control and Status Functions.....	412
10.3.2.3	CCM .....	413

Section number	Title	Page
10.3.2.4	Low Power Clock Gating unit (LPCG).....	414
10.3.3	Peripheral components of clock management system.....	414
10.3.3.1	Interface and functional clock.....	415
10.3.3.2	Block level clock management.....	415
10.3.3.2.1	Master clock protocol.....	416
10.3.3.2.2	Slave clock protocol.....	416
10.3.3.3	Clock Domain(s).....	417
10.3.3.4	Domain level clock management.....	417
10.3.3.5	Domain dependencies.....	417
10.4	Power management.....	417
10.4.1	Centralized Components of Power Management System.....	417
10.4.1.1	Integrated PMU.....	418
10.4.1.1.1	DCDC Regulator.....	419
10.4.1.1.2	Analog LDO regulators.....	420
10.4.1.1.3	USB LDO.....	420
10.4.1.1.4	SNVS regulator.....	420
10.4.1.2	GPC - General Power Controller.....	421
10.4.1.3	SRC - System reset Controller.....	421
10.4.1.4	Power domain(s).....	422
10.4.1.4.1	Power distribution .....	422
10.4.1.4.2	Domain memory and domain logic state retention in case of power gating.....	423
10.4.1.4.3	Power Gating Domain Management.....	424
10.4.1.4.3.1	ARM Core Platform.....	424
10.4.1.4.3.2	FlexRAM PDRAMx.....	425
10.4.1.4.3.3	SoC.....	425
10.4.1.4.4	Power Gating domain dependencies.....	425
10.4.1.5	Voltage domains.....	426
10.4.1.6	Voltage domain management.....	426
10.4.1.6.1	Dynamic.....	426

Section number	Title	Page
10.4.1.6.1.1	Voltage Scaling.....	427
10.4.1.6.2	Static .....	427
10.4.1.6.2.1	Standby Leakage reduction (SLR).....	427
10.4.1.7	System domains layout.....	427
10.4.2	Power management techniques.....	429
10.4.2.1	Power saving techniques.....	430
10.4.2.2	Thermal-aware power management.....	431
10.4.2.3	Peripheral Power management.....	431
10.4.2.3.1	Video-Graphics system power management.....	431
10.4.2.3.2	IO power reduction.....	431
10.4.2.4	Examples of External Power Supply Interface.....	431
10.5	ONOFF (Button).....	432
10.6	WAKEUP Pin.....	433

## Chapter 11 System Security

11.1	Chapter overview.....	435
11.2	Feature summary.....	435
11.3	High-Assurance Boot (HAB).....	437
11.3.1	HAB process flow.....	438
11.3.2	HAB feature summary.....	440
11.4	Secure Non-Volatile Storage (SNVS) module.....	440
11.4.1	SNVS architecture.....	441
11.5	Data Co-Processor (DCP).....	441
11.6	Standalone True Random Number Generator (TRNG).....	442
11.7	OCOTP_CTRL.....	442
11.8	Central Security Unit (CSU).....	443
11.9	System JTAG Controller (SJC).....	443
11.9.1	Scan protection.....	444
11.10	Bus Encryption Engine (BEE).....	444

Section number	Title	Page
<b>Chapter 12</b>		
<b>ARM Cortex M7 Platform</b>		
12.1	ARM Cortex M7 Platform.....	447
12.1.1	Overview.....	447
12.1.2	Block Diagram.....	448
12.1.3	External Signals.....	448
12.1.4	Clocks.....	449
<b>Chapter 13</b>		
<b>Analog Comparator (ACMP)</b>		
13.1	Chip-specific CMP information.....	451
13.2	Introduction.....	451
13.2.1	CMP features.....	451
13.2.2	6-bit DAC key features.....	452
13.2.3	ANMUX key features.....	452
13.2.4	CMP, DAC and ANMUX diagram.....	453
13.2.5	CMP block diagram.....	454
13.3	Memory map/register definitions.....	456
13.3.1	CMP Control Register 0 (CMPx_CR0).....	457
13.3.2	CMP Control Register 1 (CMPx_CR1).....	458
13.3.3	CMP Filter Period Register (CMPx_FPR).....	459
13.3.4	CMP Status and Control Register (CMPx_SCR).....	459
13.3.5	DAC Control Register (CMPx_DACCR).....	461
13.3.6	MUX Control Register (CMPx_MUXCR).....	461
13.4	Functional description.....	462
13.4.1	CMP functional modes.....	462
13.4.1.1	Disabled mode (# 1).....	464
13.4.1.2	Continuous mode (#s 2A & 2B).....	464
13.4.1.3	Sampled, Non-Filtered mode (#s 3A & 3B).....	465
13.4.1.4	Sampled, Filtered mode (#s 4A & 4B).....	467

Section number	Title	Page
13.4.1.5	Windowed mode (#s 5A & 5B).....	469
13.4.1.6	Windowed/Resampled mode (# 6).....	471
13.4.1.7	Windowed/Filtered mode (#7).....	472
13.4.2	Power modes.....	472
13.4.2.1	Wait mode operation.....	472
13.4.2.2	Stop mode operation.....	473
13.4.3	Startup and operation.....	473
13.4.4	Low-pass filter.....	473
13.4.4.1	Enabling filter modes.....	474
13.4.4.2	Latency issues.....	474
13.5	CMP interrupts.....	476
13.6	DMA support.....	476
13.7	Digital-to-analog converter.....	477
13.8	DAC functional description.....	477
13.8.1	Voltage reference source select.....	477
13.9	DAC resets.....	478
13.10	DAC clocks.....	478
13.11	DAC interrupts.....	478

## Chapter 14 Analog-to-Digital Converter (ADC)

14.1	Overview.....	479
14.1.1	Features.....	479
14.1.2	ADC I/F block diagram.....	480
14.1.3	ADC block diagram.....	480
14.1.4	ADC module interface.....	481
14.1.5	Modes of Operation.....	482
14.2	External Signals.....	482
14.3	Functional Description.....	484
14.3.1	Clock Select and Divide Control.....	485

Section number	Title	Page
14.3.2	Voltage Reference Selection .....	486
14.3.3	Hardware Triggering and Channel Selection.....	486
14.3.4	Conversion Control.....	487
14.3.4.1	Initiating Conversions.....	487
14.3.4.2	Completing Conversions.....	488
14.3.4.3	Aborting Conversions.....	489
14.3.4.4	Power Control.....	490
14.3.4.5	Sample Time and Total Conversion Time.....	490
14.3.4.6	Conversion Time Examples.....	492
14.3.4.6.1	Typical conversion time configuration.....	493
14.3.4.6.2	Long conversion time configuration.....	493
14.3.4.6.3	Short conversion time configuration.....	494
14.3.4.7	Hardware Average Function.....	494
14.3.5	Automatic Compare Function.....	495
14.3.6	Calibration Function.....	496
14.3.7	User Defined Offset Function .....	497
14.3.8	MCU Wait Mode Operation.....	498
14.3.9	MCU Stop Mode Operation.....	498
14.3.9.1	Stop Mode With ADACK Disabled.....	498
14.3.9.2	Stop Mode With ADACK Enabled.....	499
14.4	Initialization Information.....	499
14.4.1	ADC Module Initialization Example.....	499
14.4.1.1	Initialization Sequence.....	500
14.4.1.2	Pseudo-Code Example.....	500
14.5	Application Information.....	501
14.5.1	Sources of Error.....	501
14.5.1.1	Sampling Error.....	501
14.5.1.2	Pin Leakage Error.....	502
14.5.1.3	Noise-Induced Errors.....	502

Section number	Title	Page
14.5.1.4	Code Width and Quantization Error.....	503
14.5.1.5	Linearity Errors.....	504
14.5.1.6	Code Jitter, Non-Monotonicity, and Missing Codes.....	504
14.6	Memory map and register definition.....	505
14.6.1	Control register for hardware triggers (ADCx_HC0).....	507
14.6.2	Control register for hardware triggers (ADCx_HCn).....	509
14.6.3	Status register for HW triggers (ADCx_HS).....	511
14.6.4	Data result register for HW triggers (ADCx_R0).....	513
14.6.5	Data result register for HW triggers (ADCx_Rn).....	514
14.6.6	Configuration register (ADCx_CFG).....	515
14.6.7	General control register (ADCx_GC).....	517
14.6.8	General status register (ADCx_GS).....	519
14.6.9	Compare value register (ADCx_CV).....	520
14.6.10	Offset correction value register (ADCx_OFS).....	521
14.6.11	Calibration value register (ADCx_CAL).....	522

## Chapter 15 ADC External Trigger Control (ADC\_ETC)

15.1	About this module.....	523
15.1.1	Introduction.....	523
15.1.2	Features.....	523
15.2	Block diagram.....	524
15.3	Functional description.....	525
15.3.1	Clocks.....	525
15.3.2	Reset.....	525
15.3.3	Operations.....	525
15.4	Memory Map and register definition.....	527
15.4.1	ADC_ETC register descriptions.....	527
15.4.1.1	ADC_ETC Memory map.....	527
15.4.1.2	ADC_ETC Global Control Register (CTRL).....	529

Section number	Title	Page
15.4.1.2.1	Offset.....	529
15.4.1.2.2	Function.....	530
15.4.1.2.3	Diagram.....	530
15.4.1.2.4	Fields.....	530
15.4.1.3	ETC DONE0 and DONE1 IRQ State Register (DONE0_1_IRQ).....	531
15.4.1.3.1	Offset.....	531
15.4.1.3.2	Function.....	531
15.4.1.3.3	Diagram.....	531
15.4.1.3.4	Fields.....	532
15.4.1.4	ETC DONE_2 and DONE_ERR IRQ State Register (DONE2_ERR_IRQ).....	533
15.4.1.4.1	Offset.....	533
15.4.1.4.2	Function.....	533
15.4.1.4.3	Diagram.....	533
15.4.1.4.4	Fields.....	534
15.4.1.5	ETC DMA control Register (DMA_CTRL).....	535
15.4.1.5.1	Offset.....	535
15.4.1.5.2	Function.....	535
15.4.1.5.3	Diagram.....	535
15.4.1.5.4	Fields.....	536
15.4.1.6	ETC_TRIG0 Control Register (TRIG0_CTRL).....	537
15.4.1.6.1	Offset.....	537
15.4.1.6.2	Function.....	537
15.4.1.6.3	Diagram.....	537
15.4.1.6.4	Fields.....	538
15.4.1.7	ETC_TRIG0 Counter Register (TRIG0_COUNTER).....	539
15.4.1.7.1	Offset.....	539
15.4.1.7.2	Function.....	539
15.4.1.7.3	Diagram.....	539
15.4.1.7.4	Fields.....	539

Section number	Title	Page
15.4.1.8	ETC_TRIG Chain 0/1 Register (TRIG0_CHAIN_1_0).....	539
15.4.1.8.1	Offset.....	539
15.4.1.8.2	Function.....	540
15.4.1.8.3	Diagram.....	540
15.4.1.8.4	Fields.....	540
15.4.1.9	ETC_TRIG Chain 2/3 Register (TRIG0_CHAIN_3_2).....	541
15.4.1.9.1	Offset.....	541
15.4.1.9.2	Function.....	541
15.4.1.9.3	Diagram.....	541
15.4.1.9.4	Fields.....	542
15.4.1.10	ETC_TRIG Chain 4/5 Register (TRIG0_CHAIN_5_4).....	542
15.4.1.10.1	Offset.....	542
15.4.1.10.2	Function.....	542
15.4.1.10.3	Diagram.....	542
15.4.1.10.4	Fields.....	543
15.4.1.11	ETC_TRIG Chain 6/7 Register (TRIG0_CHAIN_7_6).....	543
15.4.1.11.1	Offset.....	544
15.4.1.11.2	Function.....	544
15.4.1.11.3	Diagram.....	544
15.4.1.11.4	Fields.....	544
15.4.1.12	ETC_TRIG Result Data 1/0 Register (TRIG0_RESULT_1_0).....	545
15.4.1.12.1	Offset.....	545
15.4.1.12.2	Function.....	545
15.4.1.12.3	Diagram.....	545
15.4.1.12.4	Fields.....	545
15.4.1.13	ETC_TRIG Result Data 3/2 Register (TRIG0_RESULT_3_2).....	546
15.4.1.13.1	Offset.....	546
15.4.1.13.2	Function.....	546
15.4.1.13.3	Diagram.....	546

Section number	Title	Page
15.4.1.13.4	Fields.....	546
15.4.1.14	ETC_TRIG Result Data 5/4 Register (TRIG0_RESULT_5_4).....	547
15.4.1.14.1	Offset.....	547
15.4.1.14.2	Function.....	547
15.4.1.14.3	Diagram.....	547
15.4.1.14.4	Fields.....	547
15.4.1.15	ETC_TRIG Result Data 7/6 Register (TRIG0_RESULT_7_6).....	548
15.4.1.15.1	Offset.....	548
15.4.1.15.2	Function.....	548

15.4.1.83.1	Offset.....	630

Section number	Title	Page
15.4.1.83.2	Function.....	630
15.4.1.83.3	Diagram.....	630
15.4.1.83.4	Fields.....	630
15.4.1.84	ETC_TRIG Result Data 5/4 Register (TRIG7_RESULT_5_4).....	631
15.4.1.84.1	Offset.....	631
15.4.1.84.2	Function.....	631
15.4.1.84.3	Diagram.....	631
15.4.1.84.4	Fields.....	631
15.4.1.85	ETC_TRIG Result Data 7/6 Register (TRIG7_RESULT_7_6).....	632
15.4.1.85.1	Offset.....	632
15.4.1.85.2	Function.....	632
15.4.1.85.3	Diagram.....	632
15.4.1.85.4	Fields.....	632
15.5	Application information.....	633

## Chapter 16 AHB to IP Bridge (AIPSTZ)

16.1	Overview.....	635
16.1.1	Features.....	635
16.2	Clocks.....	635
16.3	Functional Description.....	636
16.4	Access Protections.....	637
16.5	Access Support.....	637
16.6	Initialization Information.....	638
16.6.1	Security Block.....	638
16.7	AIPSTZ Memory Map/Register Definition.....	639
16.7.1	Master Priviledge Registers (AIPSTZ <sub>x</sub> _MPR).....	641
16.7.2	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR).....	643
16.7.3	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR1).....	647
16.7.4	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR2).....	650

Section number	Title	Page
16.7.5	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR3).....	653
16.7.6	Off-Platform Peripheral Access Control Registers (AIPSTZ <sub>x</sub> _OPACR4).....	656

## Chapter 17 And-Or-Inverter (AOI)

17.1	Introduction.....	659
17.1.1	Overview.....	659
17.1.2	Features.....	661
17.1.3	Modes of Operation.....	661
17.2	External Signal Description.....	661
17.3	Memory Map and Register Descriptions.....	661
17.3.1	Boolean Function Term 0 and 1 Configuration Register for EVENT <sub>n</sub> (AOI <sub>x</sub> _BFCRT01 <sub>n</sub> ).....	663
17.3.2	Boolean Function Term 2 and 3 Configuration Register for EVENT <sub>n</sub> (AOI <sub>x</sub> _BFCRT23 <sub>n</sub> ).....	665
17.4	Functional Description.....	666
17.4.1	Configuration Examples for the Boolean Function Evaluation.....	667
17.4.2	AOI Timing Between Inputs and Outputs.....	669

## Chapter 18 Clock Controller Module (CCM)

18.1	Chip-specific CCM information.....	671
18.2	Overview.....	671
18.2.1	Features.....	672
18.2.2	CCM Block Diagram.....	672
18.3	External Signals.....	674
18.4	CCM Clock Tree.....	674
18.5	System Clocks.....	677
18.6	Functional Description.....	691
18.6.1	Clock Generation.....	691
18.6.1.1	External Low Frequency Clock - CKIL .....	691
18.6.1.1.1	CKIL synchronizing to IPG_CLK.....	691
18.6.1.2	External High Frequency Clock - CKIH and internal oscillator.....	691

Section number	Title	Page
18.6.1.3	PLL reference clock.....	691
18.6.1.3.1	ARM PLL.....	692
18.6.1.3.2	USB PLLs.....	692
18.6.1.3.3	System PLL.....	692
18.6.1.3.4	Audio / Video PLL.....	693
18.6.1.3.5	Ethernet PLL.....	693
18.6.1.4	Phase Fractional Dividers (PFD).....	693
18.6.1.5	CCM internal clock generation.....	694
18.6.1.5.1	Clock Switcher.....	694
18.6.1.5.2	PLL bypass procedure.....	695
18.6.1.5.3	PLL clock change.....	696
18.6.1.5.4	Clock Root Generator.....	696
18.6.1.5.5	Divider change handshake.....	697
18.6.1.6	Disabling / Enabling PLLs.....	697
18.6.1.7	Clock Switching Multiplexers.....	697
18.6.1.8	Low Power Clock Gating module (LPCG).....	698
18.6.2	DVFS support.....	700
18.6.3	Power modes.....	701
18.6.3.1	RUN mode.....	701
18.6.3.2	WAIT mode.....	701
18.6.3.2.1	Entering WAIT mode .....	701
18.6.3.2.2	Exiting WAIT mode .....	702
18.6.3.3	STOP mode.....	702
18.6.3.3.1	Entering STOP mode .....	702
18.6.3.3.2	Exiting STOP mode.....	702
18.7	CCM Memory Map/Register Definition.....	703
18.7.1	CCM Control Register (CCM_CCR).....	705
18.7.2	CCM Status Register (CCM_CSR).....	707
18.7.3	CCM Clock Switcher Register (CCM_CCSR).....	709

Section number	Title	Page
18.7.4	CCM Arm Clock Root Register (CCM_CACRR).....	710
18.7.5	CCM Bus Clock Divider Register (CCM_CBCDR).....	711
18.7.6	CCM Bus Clock Multiplexer Register (CCM_CBCMR).....	713
18.7.7	CCM Serial Clock Multiplexer Register 1 (CCM_CSCMR1).....	715
18.7.8	CCM Serial Clock Multiplexer Register 2 (CCM_CSCMR2).....	717
18.7.9	CCM Serial Clock Divider Register 1 (CCM_CSCDR1).....	718
18.7.10	CCM Clock Divider Register (CCM_CS1CDR).....	720
18.7.11	CCM Clock Divider Register (CCM_CS2CDR).....	722
18.7.12	CCM D1 Clock Divider Register (CCM_CDCDR).....	723
18.7.13	CCM Serial Clock Divider Register 2 (CCM_CSCDR2).....	725
18.7.14	CCM Serial Clock Divider Register 3 (CCM_CSCDR3).....	726
18.7.15	CCM Divider Handshake In-Process Register (CCM_CDHIPR).....	728
18.7.16	CCM Low Power Control Register (CCM_CLPCR).....	731
18.7.17	CCM Interrupt Status Register (CCM_CISR).....	733
18.7.18	CCM Interrupt Mask Register (CCM_CIMR).....	736
18.7.19	CCM Clock Output Source Register (CCM_CCOSR).....	738
18.7.20	CCM General Purpose Register (CCM_CGPR).....	740
18.7.21	CCM Clock Gating Register 0 (CCM_CCGR0).....	741
18.7.22	CCM Clock Gating Register 1 (CCM_CCGR1).....	743
18.7.23	CCM Clock Gating Register 2 (CCM_CCGR2).....	744
18.7.24	CCM Clock Gating Register 3 (CCM_CCGR3).....	745
18.7.25	CCM Clock Gating Register 4 (CCM_CCGR4).....	747
18.7.26	CCM Clock Gating Register 5 (CCM_CCGR5).....	748
18.7.27	CCM Clock Gating Register 6 (CCM_CCGR6).....	749
18.7.28	CCM Module Enable Override Register (CCM_CMEOR).....	751
18.8	CCM Analog Memory Map/Register Definition.....	752
18.8.1	Analog ARM PLL control Register (CCM_ANALOG_PLL_ARM $n$ ).....	756
18.8.2	Analog USB1 480MHz PLL Control Register (CCM_ANALOG_PLL_USB1 $n$ ).....	758
18.8.3	Analog USB2 480MHz PLL Control Register (CCM_ANALOG_PLL_USB2 $n$ ).....	761

Section number	Title	Page
18.8.4	Analog System PLL Control Register (CCM_ANALOG_PLL_SYS <i>n</i> ).....	763
18.8.5	528MHz System PLL Spread Spectrum Register (CCM_ANALOG_PLL_SYS_SS).....	764
18.8.6	Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_NUM).....	765
18.8.7	Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_SYS_DENOM).....	766
18.8.8	Analog Audio PLL control Register (CCM_ANALOG_PLL_AUDIO <i>n</i> ).....	767
18.8.9	Numerator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_NUM)....	769
18.8.10	Denominator of Audio PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_AUDIO_DENOM).....	769
18.8.11	Analog Video PLL control Register (CCM_ANALOG_PLL_VIDEO <i>n</i> ).....	771
18.8.12	Numerator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_NUM).....	773
18.8.13	Denominator of Video PLL Fractional Loop Divider Register (CCM_ANALOG_PLL_VIDEO_DENOM).....	773
18.8.14	Analog ENET PLL Control Register (CCM_ANALOG_PLL_ENET <i>n</i> ).....	774
18.8.15	480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_480 <i>n</i> ).....	775
18.8.16	528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM_ANALOG_PFD_528 <i>n</i> ).....	777
18.8.17	Miscellaneous Register 0 (CCM_ANALOG_MISC0 <i>n</i> ).....	780
18.8.18	Miscellaneous Register 1 (CCM_ANALOG_MISC1 <i>n</i> ).....	784
18.8.19	Miscellaneous Register 2 (CCM_ANALOG_MISC2 <i>n</i> ).....	787

## Chapter 19 CMOS Sensor Interface (CSI)

19.1	Overview.....	793
19.2	External Signals.....	794
19.3	Clocks.....	796
19.4	Principles of Operation.....	796
19.4.1	Data Transfer with the Embedded DMA Controllers.....	798
19.4.2	Gated Clock Mode.....	799
19.4.3	Non-Gated Clock Mode.....	799
19.4.4	CCIR656 Interlace Mode.....	800

Section number	Title	Page
19.4.5	CCIR656 Progressive Mode.....	802
19.4.6	Error Correction for CCIR656 Coding.....	803
19.5	Interrupt Generation.....	803
19.5.1	Start Of Frame Interrupt (SOF_INT).....	804
19.5.2	End Of Frame Interrupt (EOF_INT).....	804
19.5.3	Change Of Field Interrupt (COF_INT).....	804
19.5.4	CCIR Error Interrupt (ECC_INT).....	804
19.5.5	RxFIFO Full Interrupt (RxFF_INT).....	805
19.5.6	Statistic FIFO Full Interrupt (STATFF_INT).....	805
19.5.7	RxFIFO Overrun Interrupt (RFF_OR_INT).....	805
19.5.8	Statistic FIFO Overrun Interrupt (SFF_OR_INT).....	805
19.5.9	Frame Buffer1 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB1).....	805
19.5.10	Frame Buffer2 DMA Transfer Done Interrupt (DMA_TSF_DONE_FB2).....	805
19.5.11	Statistic FIFO DMA Transfer Done Interrupt (DMA_TSF_DONE_SFF).....	806
19.5.12	AHB Bus Response Error Interrupt (HRESP_ERR_INT).....	806
19.6	Data Packing Style.....	806
19.6.1	RX FIFO Path.....	807
19.6.1.1	Bayer Data.....	807
19.6.1.2	RGB565 Data.....	807
19.6.1.3	RGB888 Data.....	808
19.6.2	STAT FIFO Path.....	810
19.7	CSI Memory Map/Register Definition.....	810
19.7.1	CSI Control Register 1 (CSI_CSICR1).....	812
19.7.2	CSI Control Register 2 (CSI_CSICR2).....	816
19.7.3	CSI Control Register 3 (CSI_CSICR3).....	818
19.7.4	CSI Statistic FIFO Register (CSI_CSISTATFIFO).....	820
19.7.5	CSI RX FIFO Register (CSI_CSIRFIFO).....	821
19.7.6	CSI RX Count Register (CSI_CSIRXCNT).....	821
19.7.7	CSI Status Register (CSI_CSISR).....	822

Section number	Title	Page
19.7.8	CSI DMA Start Address Register - for STATFIFO (CSI_CSIDMASA_STATFIFO).....	825
19.7.9	CSI DMA Transfer Size Register - for STATFIFO (CSI_CSIDMATS_STATFIFO).....	825
19.7.10	CSI DMA Start Address Register - for Frame Buffer1 (CSI_CSIDMASA_FB1).....	826
19.7.11	CSI DMA Transfer Size Register - for Frame Buffer2 (CSI_CSIDMASA_FB2).....	827
19.7.12	CSI Frame Buffer Parameter Register (CSI_CSIFBUF_PARA).....	827
19.7.13	CSI Image Parameter Register (CSI_CSIIIMAG_PARA).....	828
19.7.14	CSI Control Register 18 (CSI_CSICR18).....	829
19.7.15	CSI Control Register 19 (CSI_CSICR19).....	831

## Chapter 20 DCDC Converter (DCDC)

20.1	Introduction.....	833
20.2	Features.....	833
20.3	Block diagram.....	834
20.4	Functional description.....	834
20.5	Application information.....	835
20.5.1	Turn on DCDC.....	835
20.5.2	Target voltage adjustment.....	835
20.5.3	Continuous conduction mode.....	835
20.5.4	Discontinuous conduction mode.....	836
20.5.5	Power saving mode.....	836
20.6	Memory Map and register definition.....	836
20.6.1	DCDC register descriptions.....	836
20.6.1.1	DCDC Memory map.....	836
20.6.1.2	DCDC Register 0 (REG0).....	837
20.6.1.2.1	Offset.....	837
20.6.1.2.2	Function.....	837
20.6.1.2.3	Diagram.....	837
20.6.1.2.4	Fields.....	838
20.6.1.3	DCDC Register 1 (REG1).....	840

Section number	Title	Page
20.6.1.3.1	Offset.....	840
20.6.1.3.2	Function.....	840
20.6.1.3.3	Diagram.....	840
20.6.1.3.4	Fields.....	841
20.6.1.4	DCDC Register 2 (REG2).....	842
20.6.1.4.1	Offset.....	842
20.6.1.4.2	Function.....	842
20.6.1.4.3	Diagram.....	842
20.6.1.4.4	Fields.....	843
20.6.1.5	DCDC Register 3 (REG3).....	844
20.6.1.5.1	Offset.....	844
20.6.1.5.2	Function.....	844
20.6.1.5.3	Diagram.....	844
20.6.1.5.4	Fields.....	845

## Chapter 21 Direct Memory Access Multiplexer (DMAMUX)

21.1	Chip-specific DMAMUX information.....	847
21.2	Introduction.....	847
21.2.1	Overview.....	847
21.2.2	Features.....	848
21.2.3	Modes of operation.....	848
21.3	External signal description.....	849
21.4	Memory map/register definition.....	849
21.4.1	DMA_CH_MUX Register Descriptions.....	849
21.4.1.1	DMA_CH_MUX Memory Map.....	849
21.4.1.2	Channel a Configuration (CHCFGa).....	850
21.4.1.2.1	Address.....	850
21.4.1.2.2	Function.....	850
21.4.1.2.3	Diagram.....	850

Section number	Title	Page
	21.4.1.2.4 Fields.....	851
21.5	Functional description.....	851
21.5.1	DMA channels with periodic triggering capability.....	851
21.5.2	Always-enabled DMA sources.....	854
21.6	Initialization/application information.....	855
21.6.1	Reset.....	855
21.6.2	Enabling and configuring sources.....	855
21.6.2.1	Configuration options.....	858

## Chapter 22 Enhanced Direct Memory Access (eDMA)

22.1	Introduction.....	859
22.1.1	eDMA system block diagram.....	859
22.1.2	Block parts.....	860
22.1.3	Features.....	861
22.2	Modes of operation.....	862
22.3	Memory map/register definition.....	863
22.3.1	TCD memory.....	863
22.3.2	TCD initialization.....	863
22.3.3	TCD structure.....	863
22.3.4	Reserved memory and bit fields.....	864
22.3.5	DMA Register Descriptions.....	864
22.3.5.1	DMA Memory Map.....	864
22.3.5.2	Control (CR).....	887
22.3.5.2.1	Address.....	887
22.3.5.2.2	Function.....	887
22.3.5.2.3	Diagram.....	888
22.3.5.2.4	Fields.....	888
22.3.5.3	Error Status (ES).....	890
22.3.5.3.1	Address.....	890

Section number	Title	Page
22.3.5.3.2	Function.....	890
22.3.5.3.3	Diagram.....	890
22.3.5.3.4	Fields.....	891
22.3.5.4	Enable Request (ERQ).....	892
22.3.5.4.1	Address.....	892
22.3.5.4.2	Function.....	892
22.3.5.4.3	Diagram.....	893
22.3.5.4.4	Fields.....	893
22.3.5.5	Enable Error Interrupt (EEI).....	895
22.3.5.5.1	Address.....	895
22.3.5.5.2	Function.....	896
22.3.5.5.3	Diagram.....	896
22.3.5.5.4	Fields.....	896
22.3.5.6	Clear Enable Error Interrupt (CEEI).....	899
22.3.5.6.1	Address.....	899
22.3.5.6.2	Function.....	899
22.3.5.6.3	Diagram.....	899
22.3.5.6.4	Fields.....	899
22.3.5.7	Set Enable Error Interrupt (SEEI).....	900
22.3.5.7.1	Address.....	900
22.3.5.7.2	Function.....	900
22.3.5.7.3	Diagram.....	900
22.3.5.7.4	Fields.....	900
22.3.5.8	Clear Enable Request (CERQ).....	901
22.3.5.8.1	Address.....	901
22.3.5.8.2	Function.....	901
22.3.5.8.3	Diagram.....	901
22.3.5.8.4	Fields.....	902
22.3.5.9	Set Enable Request (SERQ).....	902

Section number	Title	Page
22.3.5.9.1	Address.....	902
22.3.5.9.2	Function.....	902
22.3.5.9.3	Diagram.....	902
22.3.5.9.4	Fields.....	903
22.3.5.10	Clear DONE Status Bit (CDNE).....	903
22.3.5.10.1	Address.....	903
22.3.5.10.2	Function.....	903
22.3.5.10.3	Diagram.....	904
22.3.5.10.4	Fields.....	904
22.3.5.11	Set START Bit (SSRT).....	904
22.3.5.11.1	Address.....	904
22.3.5.11.2	Function.....	904
22.3.5.11.3	Diagram.....	905
22.3.5.11.4	Fields.....	905
22.3.5.12	Clear Error (CERR).....	905
22.3.5.12.1	Address.....	905
22.3.5.12.2	Function.....	906
22.3.5.12.3	Diagram.....	906
22.3.5.12.4	Fields.....	906
22.3.5.13	Clear Interrupt Request (CINT).....	906
22.3.5.13.1	Address.....	906
22.3.5.13.2	Function.....	907
22.3.5.13.3	Diagram.....	907
22.3.5.13.4	Fields.....	907
22.3.5.14	Interrupt Request (INT).....	908
22.3.5.14.1	Address.....	908
22.3.5.14.2	Function.....	908
22.3.5.14.3	Diagram.....	908
22.3.5.14.4	Fields.....	908

Section number	Title	Page
22.3.5.15	Error (ERR).....	911
	22.3.5.15.1 Address.....	911
	22.3.5.15.2 Function.....	911
	22.3.5.15.3 Diagram.....	912
	22.3.5.15.4 Fields.....	912
22.3.5.16	Hardware Request Status (HRS).....	914
	22.3.5.16.1 Address.....	914
	22.3.5.16.2 Function.....	914
	22.3.5.16.3 Diagram.....	915
	22.3.5.16.4 Fields.....	915
22.3.5.17	Enable Asynchronous Request in Stop (EARS).....	919
	22.3.5.17.1 Address.....	919
	22.3.5.17.2 Function.....	919
	22.3.5.17.3 Diagram.....	920
	22.3.5.17.4 Fields.....	920
22.3.5.18	Channel n Priority (DCHPRI3).....	922
	22.3.5.18.1 Address.....	922
	22.3.5.18.2 Function.....	922
	22.3.5.18.3 Diagram.....	923
	22.3.5.18.4 Fields.....	923
22.3.5.19	Channel n Priority (DCHPRI2).....	923
	22.3.5.19.1 Address.....	924
	22.3.5.19.2 Function.....	924
	22.3.5.19.3 Diagram.....	924
	22.3.5.19.4 Fields.....	924
22.3.5.20	Channel n Priority (DCHPRI1).....	925
	22.3.5.20.1 Address.....	925
	22.3.5.20.2 Function.....	925
	22.3.5.20.3 Diagram.....	925

Section number	Title	Page
22.3.5.20.4	Fields.....	925
22.3.5.21	Channel n Priority (DCHPRI0).....	926
22.3.5.21.1	Address.....	926
22.3.5.21.2	Function.....	926
22.3.5.21.3	Diagram.....	927
22.3.5.21.4	Fields.....	927
22.3.5.22	Channel n Priority (DCHPRI7).....	927
22.3.5.22.1	Address.....	927
22.3.5.22.2	Function.....	927
22.3.5.22.3	Diagram.....	928
22.3.5.22.4	Fields.....	928
22.3.5.23	Channel n Priority (DCHPRI6).....	928
22.3.5.23.1	Address.....	929
22.3.5.23.2	Function.....	929
22.3.5.23.3	Diagram.....	929

## **Chapter 23**

### **Quadrature Decoder (ENC)**

23.1	Introduction.....	1015
23.1.1	Features.....	1015
23.1.2	System Block Diagram.....	1015
23.1.3	Decoder Block Diagram.....	1016
23.1.3.1	Glitch Filter.....	1017
23.1.3.2	Edge Detect State Machine.....	1017
23.1.3.3	Position Counter.....	1017
23.1.3.4	Position Difference Counter.....	1018
23.1.3.5	Position Difference Counter Hold.....	1018
23.1.3.6	Revolution Counter.....	1018
23.1.3.7	Watchdog Timer.....	1019

Section number	Title	Page
23.1.3.8	Pulse Accumulator Functionality.....	1019
23.2	Signal Descriptions.....	1019
23.3	Functional Description.....	1020
23.3.1	Positive versus Negative Direction.....	1021
23.3.2	Prescaler for Slow or Fast Speed Measurement.....	1021
23.3.3	Holding Registers and Initializing Registers.....	1021
23.4	Resets.....	1022
23.5	Clocks.....	1022
23.6	Interrupts.....	1022
23.7	ENC register descriptions.....	1023
23.7.1	ENC Memory map.....	1023
23.7.2	Control Register (CTRL).....	1024
23.7.2.1	Offset.....	1024
23.7.2.2	Diagram.....	1024
23.7.2.3	Fields.....	1024
23.7.3	Input Filter Register (FILT).....	1026
23.7.3.1	Offset.....	1026
23.7.3.2	Function.....	1026
23.7.3.3	Diagram.....	1027
23.7.3.4	Fields.....	1027
23.7.4	Watchdog Timeout Register (WTR).....	1028
23.7.4.1	Offset.....	1028
23.7.4.2	Function.....	1028
23.7.4.3	Diagram.....	1028
23.7.4.4	Fields.....	1029
23.7.5	Position Difference Counter Register (POSD).....	1029
23.7.5.1	Offset.....	1029
23.7.5.2	Function.....	1029
23.7.5.3	Diagram.....	1030

Section number	Title	Page
23.7.5.4	Fields.....	1030
23.7.6	Position Difference Hold Register (POSDH).....	1030
23.7.6.1	Offset.....	1030
23.7.6.2	Function.....	1030
23.7.6.3	Diagram.....	1030
23.7.6.4	Fields.....	1031
23.7.7	Revolution Counter Register (REV).....	1031
23.7.7.1	Offset.....	1031
23.7.7.2	Function.....	1031
23.7.7.3	Diagram.....	1031
23.7.7.4	Fields.....	1031
23.7.8	Revolution Hold Register (REVH).....	1032
23.7.8.1	Offset.....	1032
23.7.8.2	Function.....	1032
23.7.8.3	Diagram.....	1032
23.7.8.4	Fields.....	1032
23.7.9	Upper Position Counter Register (UPOS).....	1032
23.7.9.1	Offset.....	1032
23.7.9.2	Function.....	1033
23.7.9.3	Diagram.....	1033
23.7.9.4	Fields.....	1033
23.7.10	Lower Position Counter Register (LPOS).....	1033
23.7.10.1	Offset.....	1033
23.7.10.2	Function.....	1033
23.7.10.3	Diagram.....	1033
23.7.10.4	Fields.....	1034
23.7.11	Upper Position Hold Register (UPOSH).....	1034
23.7.11.1	Offset.....	1034
23.7.11.2	Function.....	1034

<b>Section number</b>	<b>Title</b>	<b>Page</b>
23.7.11.3	Diagram.....	1034
23.7.11.4	Fields.....	1034
23.7.12	Lower Position Hold Register (LPOSH).....	1035
23.7.12.1	Offset.....	1035
23.7.12.2	Function.....	1035
23.7.12.3	Diagram.....	1035
23.7.12.4	Fields.....	1035
23.7.13	Upper Initialization Register (UINIT).....	1035
23.7.13.1	Offset.....	1036
23.7.13.2	Function.....	1036
23.7.13.3	Diagram.....	1036
23.7.13.4	Fields.....	1036
23.7.14	Lower Initialization Register (LINIT).....	1036
23.7.14.1	Offset.....	1036
23.7.14.2	Function.....	1036
23.7.14.3	Diagram.....	1037
23.7.14.4	Fields.....	1037
23.7.15	Input Monitor Register (IMR).....	1037
23.7.15.1	Offset.....	1037
23.7.15.2	Function.....	1037
23.7.15.3	Diagram.....	1037
23.7.15.4	Fields.....	1038
23.7.16	Test Register (TST).....	1038
23.7.16.1	Offset.....	1038
23.7.16.2	Function.....	1039
23.7.16.3	Diagram.....	1039
23.7.16.4	Fields.....	1039
23.7.17	Control 2 Register (CTRL2).....	1040
23.7.17.1	Offset.....	1040

Section number	Title	Page
23.7.17.2	Diagram.....	1040
23.7.17.3	Fields.....	1040
23.7.18	Upper Modulus Register (UMOD).....	1042
23.7.18.1	Offset.....	1042
23.7.18.2	Function.....	1042
23.7.18.3	Diagram.....	1042
23.7.18.4	Fields.....	1043
23.7.19	Lower Modulus Register (LMOD).....	1043
23.7.19.1	Offset.....	1043
23.7.19.2	Function.....	1043
23.7.19.3	Diagram.....	1043
23.7.19.4	Fields.....	1044
23.7.20	Upper Position Compare Register (UCOMP).....	1044
23.7.20.1	Offset.....	1044
23.7.20.2	Function.....	1044
23.7.20.3	Diagram.....	1044
23.7.20.4	Fields.....	1044
23.7.21	Lower Position Compare Register (LCOMP).....	1045
23.7.21.1	Offset.....	1045
23.7.21.2	Function.....	1045
23.7.21.3	Diagram.....	1045
23.7.21.4	Fields.....	1045

## Chapter 24 10/100-Mbps Ethernet MAC (ENET)

24.1	Introduction.....	1047
24.2	Overview.....	1047
24.2.1	Features.....	1048
24.2.1.1	Ethernet MAC features.....	1048
24.2.1.2	IP protocol performance optimization features.....	1049

Section number	Title	Page
24.2.1.3	IEEE 1588 features.....	1050
24.2.2	Block diagram.....	1050
24.3	External Signals.....	1051
24.4	Clocks.....	1059
24.5	Memory map/register definition.....	1059
24.5.1	Interrupt Event Register (ENET_EIR).....	1065
24.5.2	Interrupt Mask Register (ENET_EIMR).....	1067
24.5.3	Receive Descriptor Active Register (ENET_RDAR).....	1070
24.5.4	Transmit Descriptor Active Register (ENET_TDAR).....	1071
24.5.5	Ethernet Control Register (ENET_ECR).....	1072
24.5.6	MII Management Frame Register (ENET_MMFR).....	1074
24.5.7	MII Speed Control Register (ENET_MSCR).....	1074
24.5.8	MIB Control Register (ENET_MIBC).....	1077
24.5.9	Receive Control Register (ENET_RCR).....	1079
24.5.10	Transmit Control Register (ENET_TCR).....	1082
24.5.11	Physical Address Lower Register (ENET_PALR).....	1084
24.5.12	Physical Address Upper Register (ENET_PAUR).....	1084
24.5.13	Opcode/Pause Duration Register (ENET_OPD).....	1085
24.5.14	Transmit Interrupt Coalescing Register (ENET_TXIC).....	1085
24.5.15	Receive Interrupt Coalescing Register (ENET_RXIC).....	1086
24.5.16	Descriptor Individual Upper Address Register (ENET_IAUR).....	1087
24.5.17	Descriptor Individual Lower Address Register (ENET_IALR).....	1088
24.5.18	Descriptor Group Upper Address Register (ENET_GAUR).....	1088
24.5.19	Descriptor Group Lower Address Register (ENET_GALR).....	1089
24.5.20	Transmit FIFO Watermark Register (ENET_TFWR).....	1089
24.5.21	Receive Descriptor Ring Start Register (ENET_RDSR).....	1090
24.5.22	Transmit Buffer Descriptor Ring Start Register (ENET_TDSR).....	1091
24.5.23	Maximum Receive Buffer Size Register (ENET_MRBR).....	1092
24.5.24	Receive FIFO Section Full Threshold (ENET_RSFL).....	1093

<b>Section number</b>	<b>Title</b>	<b>Page</b>
24.5.25	Receive FIFO Section Empty Threshold (ENET_RSEM).....	1093
24.5.26	Receive FIFO Almost Empty Threshold (ENET_RAEM).....	1094
24.5.27	Receive FIFO Almost Full Threshold (ENET_RAFL).....	1094
24.5.28	Transmit FIFO Section Empty Threshold (ENET_TSEM).....	1095
24.5.29	Transmit FIFO Almost Empty Threshold (ENET_TAEM).....	1095
24.5.30	Transmit FIFO Almost Full Threshold (ENET_TAFL).....	1096
24.5.31	Transmit Inter-Packet Gap (ENET_TIPG).....	1096
24.5.32	Frame Truncation Length (ENET_FTRL).....	1097
24.5.33	Transmit Accelerator Function Configuration (ENET_TACC).....	1097
24.5.34	Receive Accelerator Function Configuration (ENET_RACC).....	1099
24.5.35	Reserved Statistic Register (ENET_RMON_T_DROP).....	1100
24.5.36	Tx Packet Count Statistic Register (ENET_RMON_T_PACKETS).....	1100
24.5.37	Tx Broadcast Packets Statistic Register (ENET_RMON_T_BC_PKT).....	1101
24.5.38	Tx Multicast Packets Statistic Register (ENET_RMON_T_MC_PKT).....	1101
24.5.39	Tx Packets with CRC/Align Error Statistic Register (ENET_RMON_T_CRC_ALIGN).....	1102
24.5.40	Tx Packets Less Than Bytes and Good CRC Statistic Register (ENET_RMON_T_UNDERSIZE).....	1102
24.5.41	Tx Packets GT MAX_FL bytes and Good CRC Statistic Register (ENET_RMON_T_OVERSIZE).....	1103
24.5.42	Tx Packets Less Than 64 Bytes and Bad CRC Statistic Register (ENET_RMON_T_FRAG).....	1103
24.5.43	Tx Packets Greater Than MAX_FL bytes and Bad CRC Statistic Register (ENET_RMON_T_JAB).....	1104
24.5.44	Tx Collision Count Statistic Register (ENET_RMON_T_COL).....	1104
24.5.45	Tx 64-Byte Packets Statistic Register (ENET_RMON_T_P64).....	1105

## Chapter 25

### External Watchdog Monitor (EWM)

25.1	Introduction.....	1195
25.1.1	Features.....	1195
25.1.2	Modes of Operation.....	1196
25.1.2.1	Stop Mode.....	1196
25.1.2.2	Wait Mode.....	1196
25.1.2.3	Debug Mode.....	1197
25.1.3	Block Diagram.....	1197
25.2	EWM Signal Descriptions.....	1198
25.3	Memory Map/Register Definition.....	1198
25.3.1	EWM Register Descriptions.....	1198
25.3.1.1	EWM Memory Map.....	1198
25.3.1.2	Control (CTRL).....	1199
25.3.1.2.1	Address.....	1199
25.3.1.2.2	Function.....	1199
25.3.1.2.3	Diagram.....	1199
25.3.1.2.4	Fields.....	1199
25.3.1.3	Service (SERV).....	1200
25.3.1.3.1	Address.....	1200
25.3.1.3.2	Function.....	1200
25.3.1.3.3	Diagram.....	1200

Section number	Title	Page
25.3.1.3.4	Fields.....	1200
25.3.1.4	Compare Low (CMPL).....	1201
25.3.1.4.1	Address.....	1201
25.3.1.4.2	Function.....	1201
25.3.1.4.3	Diagram.....	1201
25.3.1.4.4	Fields.....	1201
25.3.1.5	Compare High (CMPH).....	1202
25.3.1.5.1	Address.....	1202
25.3.1.5.2	Function.....	1202
25.3.1.5.3	Diagram.....	1202
25.3.1.5.4	Fields.....	1202
25.3.1.6	Clock Control (CLKCTRL).....	1203
25.3.1.6.1	Address.....	1203
25.3.1.6.2	Function.....	1203
25.3.1.6.3	Diagram.....	1203
25.3.1.6.4	Fields.....	1203
25.3.1.7	Clock Prescaler (CLKPRESCALER).....	1204
25.3.1.7.1	Address.....	1204
25.3.1.7.2	Function.....	1204
25.3.1.7.3	Diagram.....	1204
25.3.1.7.4	Fields.....	1204
25.4	Functional Description.....	1205
25.4.1	The EWM_out Signal.....	1205
25.4.2	EWM_OUT pin state in low power modes.....	1206
25.4.3	The EWM_in Signal.....	1206
25.4.4	EWM Counter.....	1207
25.4.5	EWM Compare Registers.....	1207
25.4.6	EWM Refresh Mechanism.....	1207
25.4.7	EWM Interrupt.....	1208

Section number	Title	Page
25.4.8	Selecting the EWM counter clock.....	1208
25.4.9	Counter clock prescaler.....	1208

## Chapter 26 Flexible Controller Area Network (FLEXCAN)

26.1	Overview.....	1209
26.1.1	Block Diagram.....	1209
26.1.2	FLEXCAN Module Features.....	1211
26.1.3	Modes of Operation.....	1212
26.2	External Signals.....	1213
26.3	Clocks.....	1213
26.4	Message Buffer Structure.....	1213
26.5	Rx FIFO Structure.....	1218
26.6	Functional Description.....	1221
26.6.1	Functional Overview.....	1221
26.6.2	Transmit Process.....	1222
26.6.3	Arbitration process.....	1223
26.6.3.1	Lowest Mailbox number first.....	1223
26.6.3.2	Highest Mailbox priority first.....	1223
26.6.3.2.1	Local Priority disabled.....	1224
26.6.3.2.2	Local Priority enabled.....	1224
26.6.4	Receive Process.....	1226
26.6.5	Matching Process.....	1228
26.6.6	Move Process.....	1232
26.6.6.1	Move-in.....	1232
26.6.6.2	Move-out.....	1233
26.6.7	Data Coherence.....	1234
26.6.7.1	Transmission Abort Mechanism.....	1234
26.6.7.2	Message Buffer Inactivation.....	1235
26.6.7.3	Message Buffer Lock Mechanism.....	1236

Section number	Title	Page
26.6.8	Rx FIFO.....	1237
26.6.9	CAN Protocol Related Features.....	1238
26.6.9.1	Remote Frames.....	1238
26.6.9.2	Overload Frames.....	1239
26.6.9.3	Time Stamp.....	1240
26.6.9.4	Protocol Timing.....	1240
26.6.9.5	Arbitration and Matching Timing.....	1242
26.6.10	Modes of Operation Details.....	1244
26.6.10.1	Freeze Mode.....	1244
26.6.10.2	Module Disable Mode.....	1245
26.6.10.3	Stop Mode.....	1246
26.6.11	Interrupts.....	1247
26.7	Initialization/Application Information.....	1248
26.7.1	FLEXCAN Initialization Sequence.....	1248
26.8	FLEXCAN Memory Map/Register Definition.....	1249
26.8.1	Module Configuration Register (FLEXCAN <sub>x</sub> _MCR).....	1257
26.8.2	Control 1 Register (FLEXCAN <sub>x</sub> _CTRL1).....	1262
26.8.3	Free Running Timer Register (FLEXCAN <sub>x</sub> _TIMER).....	1264
26.8.4	Rx Mailboxes Global Mask Register (FLEXCAN <sub>x</sub> _RXMGMASK).....	1265
26.8.5	Rx Buffer 14 Mask Register (FLEXCAN <sub>x</sub> _RX14MASK).....	1266
26.8.6	Rx Buffer 15 Mask Register (FLEXCAN <sub>x</sub> _RX15MASK).....	1267
26.8.7	Error Counter Register (FLEXCAN <sub>x</sub> _ECR).....	1267
26.8.8	Error and Status 1 Register (FLEXCAN <sub>x</sub> _ESR1).....	1269
26.8.9	Interrupt Masks 2 Register (FLEXCAN <sub>x</sub> _IMASK2).....	1272
26.8.10	Interrupt Masks 1 Register (FLEXCAN <sub>x</sub> _IMASK1).....	1273
26.8.11	Interrupt Flags 2 Register (FLEXCAN <sub>x</sub> _IFLAG2).....	1274
26.8.12	Interrupt Flags 1 Register (FLEXCAN <sub>x</sub> _IFLAG1).....	1274
26.8.13	Control 2 Register (FLEXCAN <sub>x</sub> _CTRL2).....	1276
26.8.14	Error and Status 2 Register (FLEXCAN <sub>x</sub> _ESR2).....	1281

Section number	Title	Page
26.8.15	CRC Register (FLEXCAN <sub>x</sub> _CRCR).....	1283
26.8.16	Rx FIFO Global Mask Register (FLEXCAN <sub>x</sub> _RXFGMASK).....	1284
26.8.17	Rx FIFO Information Register (FLEXCAN <sub>x</sub> _RXFIR).....	1285
26.8.18	Rx Individual Mask Registers (FLEXCAN <sub>x</sub> _RXIMR <sub>n</sub> ).....	1286
26.8.19	Glitch Filter Width Registers (FLEXCAN <sub>x</sub> _GFWR).....	1286

## Chapter 27 Flexible I/O (FlexIO)

27.1	Chip-specific FlexIO information.....	1289
27.2	Introduction.....	1289
27.2.1	Overview.....	1289
27.2.2	Features.....	1289
27.2.3	Block Diagram.....	1290
27.2.4	Modes of operation.....	1291

## Chapter 28

### Enhanced Flex Pulse Width Modulator (eFlexPWM)

28.1	Chip-specific FlexPWM information.....	1349
28.2	Introduction.....	1349
28.2.1	Features.....	1349
28.2.2	Modes of Operation.....	1350
28.2.3	Block Diagram.....	1351
28.2.3.1	PWM Submodule.....	1351
28.3	Signal Descriptions.....	1351
28.3.1	PWM[n]_A and PWM[n]_B - External PWM Output Pair.....	1351
28.3.2	PWM[n]_X - Auxiliary PWM Output signal.....	1352
28.3.3	FAULT[n] - Fault Inputs.....	1352
28.3.4	PWM[n]_EXT_SYNC - External Synchronization Signal.....	1352
28.3.5	EXT_FORCE - External Output Force Signal.....	1352
28.3.6	PWM[n]_EXTA and PWM[n]_EXTB - Alternate PWM Control Signals.....	1352
28.3.7	PWM[n]_OUT_TRIG0 and PWM[n]_OUT_TRIG1 - Output Triggers.....	1353
28.3.8	EXT_CLK - External Clock Signal.....	1353
28.4	PWM register descriptions.....	1353
28.4.1	PWM Memory map.....	1354
28.4.2	Counter Register (SM0CNT - SM3CNT).....	1358
28.4.2.1	Offset.....	1358
28.4.2.2	Function.....	1359

Section number	Title	Page
28.4.2.3	Diagram.....	1359
28.4.2.4	Fields.....	1359
28.4.3	Initial Count Register (SM0INIT - SM3INIT).....	1359
28.4.3.1	Offset.....	1359
28.4.3.2	Function.....	1360
28.4.3.3	Diagram.....	1360
28.4.3.4	Fields.....	1360
28.4.4	Control 2 Register (SM0CTRL2 - SM3CTRL2).....	1360
28.4.4.1	Offset.....	1360
28.4.4.2	Diagram.....	1361
28.4.4.3	Fields.....	1361
28.4.5	Control Register (SM0CTRL - SM3CTRL).....	1363
28.4.5.1	Offset.....	1363
28.4.5.2	Diagram.....	1363
28.4.5.3	Fields.....	1363
28.4.6	Value Register 0 (SM0VAL0 - SM3VAL0).....	1365
28.4.6.1	Offset.....	1365
28.4.6.2	Diagram.....	1366
28.4.6.3	Fields.....	1366
28.4.7	Fractional Value Register 1 (SM0FRACVAL1 - SM3FRACVAL1).....	1366
28.4.7.1	Offset.....	1366
28.4.7.2	Diagram.....	1366
28.4.7.3	Fields.....	1367
28.4.8	Value Register 1 (SM0VAL1 - SM3VAL1).....	1367
28.4.8.1	Offset.....	1367
28.4.8.2	Diagram.....	1367
28.4.8.3	Fields.....	1368
28.4.9	Fractional Value Register 2 (SM0FRACVAL2 - SM3FRACVAL2).....	1368
28.4.9.1	Offset.....	1368

Section number	Title	Page
28.4.9.2	Diagram.....	1368
28.4.9.3	Fields.....	1369
28.4.10	Value Register 2 (SM0VAL2 - SM3VAL2).....	1369
28.4.10.1	Offset.....	1369
28.4.10.2	Diagram.....	1369
28.4.10.3	Fields.....	1370
28.4.11	Fractional Value Register 3 (SM0FRACVAL3 - SM3FRACVAL3).....	1370
28.4.11.1	Offset.....	1370
28.4.11.2	Diagram.....	1370
28.4.11.3	Fields.....	1371
28.4.12	Value Register 3 (SM0VAL3 - SM3VAL3).....	1371
28.4.12.1	Offset.....	1371
28.4.12.2	Diagram.....	1371
28.4.12.3	Fields.....	1371
28.4.13	Fractional Value Register 4 (SM0FRACVAL4 - SM3FRACVAL4).....	1372
28.4.13.1	Offset.....	1372
28.4.13.2	Diagram.....	1372
28.4.13.3	Fields.....	1372
28.4.14	Value Register 4 (SM0VAL4 - SM3VAL4).....	1373
28.4.14.1	Offset.....	1373
28.4.14.2	Diagram.....	1373
28.4.14.3	Fields.....	1373
28.4.15	Fractional Value Register 5 (SM0FRACVAL5 - SM3FRACVAL5).....	1374
28.4.15.1	Offset.....	1374
28.4.15.2	Diagram.....	1374
28.4.15.3	Fields.....	1374
28.4.16	Value Register 5 (SM0VAL5 - SM3VAL5).....	1374
28.4.16.1	Offset.....	1375
28.4.16.2	Diagram.....	1375

Section number	Title	Page
28.4.16.3	Fields.....	1375
28.4.17	Fractional Control Register (SM0FRCTRL - SM3FRCTRL).....	1375
28.4.17.1	Offset.....	1375
28.4.17.2	Diagram.....	1376
28.4.17.3	Fields.....	1376
28.4.18	Output Control Register (SM0OCTRL - SM3OCTRL).....	1377
28.4.18.1	Offset.....	1377
28.4.18.2	Diagram.....	1377
28.4.18.3	Fields.....	1377
28.4.19	Status Register (SM0STS - SM3STS).....	1379
28.4.19.1	Offset.....	1379
28.4.19.2	Diagram.....	1379
28.4.19.3	Fields.....	1379
28.4.20	Interrupt Enable Register (SM0INTEN - SM3INTEN).....	1381
28.4.20.1	Offset.....	1381
28.4.20.2	Diagram.....	1381
28.4.20.3	Fields.....	1381
28.4.21	DMA Enable Register (SM0DMAEN - SM3DMAEN).....	1382
28.4.21.1	Offset.....	1382
28.4.21.2	Diagram.....	1382
28.4.21.3	Fields.....	1383
28.4.22	Output Trigger Control Register (SM0TCTRL - SM3TCTRL).....	1384
28.4.22.1	Offset.....	1384
28.4.22.2	Diagram.....	1384
28.4.22.3	Fields.....	1384
28.4.23	Fault Disable Mapping Register 0 (SM0DISMAP0 - SM3DISMAP0).....	1385
28.4.23.1	Offset.....	1385
28.4.23.2	Function.....	1386
28.4.23.3	Diagram.....	1386

Section number	Title	Page
28.4.23.4	Fields.....	1386
28.4.24	Fault Disable Mapping Register 1 (SM0DISMAP1 - SM3DISMAP1).....	1386

## Chapter 29 FlexRAM

29.1	Overview.....	1463
29.1.1	Introduction.....	1463
29.1.2	Features.....	1463
29.1.3	Block diagram.....	1465
29.2	Functional description.....	1465
29.2.1	Interface Conversion.....	1465
29.2.2	RAM Bank Allocation.....	1466
29.2.3	Low power modes.....	1467
29.2.4	Clocks.....	1467
29.2.5	Reset.....	1467
29.2.6	Interrupts.....	1467
29.3	Memory Map and register definition.....	1467
29.3.1	FLEXRAM register descriptions.....	1468
29.3.1.1	FLEXRAM Memory map.....	1468
29.3.1.2	TCM CTRL Register (TCM_CTRL).....	1468
29.3.1.2.1	Offset.....	1468
29.3.1.2.2	Function.....	1468
29.3.1.2.3	Diagram.....	1468
29.3.1.2.4	Fields.....	1469
29.3.1.3	Interrupt Status Register (INT_STATUS).....	1469
29.3.1.3.1	Offset.....	1469
29.3.1.3.2	Function.....	1469
29.3.1.3.3	Diagram.....	1470
29.3.1.3.4	Fields.....	1470

Section number	Title	Page
29.3.1.4	Interrupt Status Enable Register (INT_STAT_EN).....	1471
29.3.1.4.1	Offset.....	1471
29.3.1.4.2	Function.....	1471
29.3.1.4.3	Diagram.....	1471
29.3.1.4.4	Fields.....	1471
29.3.1.5	Interrupt Enable Register (INT_SIG_EN).....	1472
29.3.1.5.1	Offset.....	1472
29.3.1.5.2	Function.....	1472
29.3.1.5.3	Diagram.....	1472
29.3.1.5.4	Fields.....	1473

## Chapter 30 FlexSPI Controller

30.1	Chip-specific FlexSPI information.....	1475
30.2	Introduction.....	1475
30.2.1	Features.....	1475
30.2.2	Block diagram.....	1476
30.2.3	Operation Modes.....	1477
30.3	Glossary for FlexSPI module.....	1478
30.4	External Signal Description.....	1479
30.5	Memory Map and register definition.....	1480
30.5.1	Register Access.....	1480
30.5.2	FlexSPI register descriptions.....	1481
30.5.2.1	FlexSPI Memory map.....	1481
30.5.2.2	Module Control Register 0 (MCR0).....	1482
30.5.2.2.1	Offset.....	1482
30.5.2.2.2	Diagram.....	1482
30.5.2.2.3	Fields.....	1483
30.5.2.3	Module Control Register 1 (MCR1).....	1484
30.5.2.3.1	Offset.....	1484

Section number	Title	Page
30.5.2.3.2	Diagram.....	1484
30.5.2.3.3	Fields.....	1485
30.5.2.4	Module Control Register 2 (MCR2).....	1485
30.5.2.4.1	Offset.....	1485
30.5.2.4.2	Diagram.....	1485
30.5.2.4.3	Fields.....	1486
30.5.2.5	AHB Bus Control Register (AHBCR).....	1486
30.5.2.5.1	Offset.....	1486
30.5.2.5.2	Diagram.....	1487
30.5.2.5.3	Fields.....	1487
30.5.2.6	Interrupt Enable Register (INTEN).....	1488
30.5.2.6.1	Offset.....	1488
30.5.2.6.2	Diagram.....	1488
30.5.2.6.3	Fields.....	1489
30.5.2.7	Interrupt Register (INTR).....	1489
30.5.2.7.1	Offset.....	1489
30.5.2.7.2	Diagram.....	1490
30.5.2.7.3	Fields.....	1490
30.5.2.8	LUT Key Register (LUTKEY).....	1491
30.5.2.8.1	Offset.....	1491
30.5.2.8.2	Function.....	1491
30.5.2.8.3	Diagram.....	1491
30.5.2.8.4	Fields.....	1492
30.5.2.9	LUT Control Register (LUTCR).....	1492
30.5.2.9.1	Offset.....	1492
30.5.2.9.2	Function.....	1492
30.5.2.9.3	Diagram.....	1492
30.5.2.9.4	Fields.....	1493
30.5.2.10	AHB RX Buffer 0 Control Register 0 (AHBRXBUF0CR0).....	1493

Section number	Title	Page
30.5.2.10.1	Offset.....	1493
30.5.2.10.2	Diagram.....	1493
30.5.2.10.3	Fields.....	1494
30.5.2.11	AHB RX Buffer 1 Control Register 0 (AHBRXBUF1CR0).....	1494
30.5.2.11.1	Offset.....	1494
30.5.2.11.2	Diagram.....	1495
30.5.2.11.3	Fields.....	1495
30.5.2.12	AHB RX Buffer 2 Control Register 0 (AHBRXBUF2CR0).....	1495
30.5.2.12.1	Offset.....	1495
30.5.2.12.2	Diagram.....	1496
30.5.2.12.3	Fields.....	1496
30.5.2.13	AHB RX Buffer 3 Control Register 0 (AHBRXBUF3CR0).....	1496
30.5.2.13.1	Offset.....	1497
30.5.2.13.2	Diagram.....	1497
30.5.2.13.3	Fields.....	1497
30.5.2.14	Flash a Control Register 0 (FLSHA1CR0 - FLSHB2CR0).....	1498
30.5.2.14.1	Offset.....	1498
30.5.2.14.2	Function.....	1498
30.5.2.14.3	Diagram.....	1498
30.5.2.14.4	Fields.....	1498
30.5.2.15	Flash a Control Register 1 (FLSHA1CR1 - FLSHB2CR1).....	1499
30.5.2.15.1	Offset.....	1499
30.5.2.15.2	Function.....	1499
30.5.2.15.3	Diagram.....	1499
30.5.2.15.4	Fields.....	1499
30.5.2.16	Flash a Control Register 2 (FLSHA1CR2 - FLSHB2CR2).....	1500
30.5.2.16.1	Offset.....	1500
30.5.2.16.2	Function.....	1500
30.5.2.16.3	Diagram.....	1500

Section number	Title	Page
30.5.2.16.4	Fields.....	1501
30.5.2.17	Flash Control Register 4 (FLSHCR4).....	1502
30.5.2.17.1	Offset.....	1502
30.5.2.17.2	Function.....	1502
30.5.2.17.3	Diagram.....	1502
30.5.2.17.4	Fields.....	1503
30.5.2.18	IP Control Register 0 (IPCR0).....	1503
30.5.2.18.1	Offset.....	1503
30.5.2.18.2	Function.....	1504
30.5.2.18.3	Diagram.....	1504
30.5.2.18.4	Fields.....	1504
30.5.2.19	IP Control Register 1 (IPCR1).....	1504
30.5.2.19.1	Offset.....	1505
30.5.2.19.2	Function.....	1505
30.5.2.19.3	Diagram.....	1505
30.5.2.19.4	Fields.....	1505
30.5.2.20	IP Command Register (IPCMD).....	1506
30.5.2.20.1	Offset.....	1506
30.5.2.20.2	Function.....	1506

30.8.6	Application on FPGA device.....	1588

## **Chapter 31**

### **General Power Controller (GPC)**

31.1	Overview.....	1591
31.2	Clocks.....	1592
31.3	Power Gating Control (PGC).....	1592
31.3.1	Overview.....	1593
31.3.1.1	Features.....	1594
31.4	GPC Interrupt Controller (INTC).....	1594
31.4.1	Interrupt Controller features.....	1594
31.5	GPC Memory Map/Register Definition.....	1595

<b>Section number</b>	<b>Title</b>	<b>Page</b>
31.5.1	GPC Interface control register (GPC_CNTR).....	1595
31.5.2	IRQ masking register 1 (GPC_IMR1).....	1597
31.5.3	IRQ masking register 2 (GPC_IMR2).....	1597
31.5.4	IRQ masking register 3 (GPC_IMR3).....	1597
31.5.5	IRQ masking register 4 (GPC_IMR4).....	1598
31.5.6	IRQ status resister 1 (GPC_ISR1).....	1598
31.5.7	IRQ status resister 2 (GPC_ISR2).....	1599
31.5.8	IRQ status resister 3 (GPC_ISR3).....	1599
31.5.9	IRQ status resister 4 (GPC_ISR4).....	1600
31.5.10	IRQ masking register 5 (GPC_IMR5).....	1600
31.5.11	IRQ status resister 5 (GPC_ISR5).....	1601
31.6	PGC Memory Map/Register Definition.....	1601
31.6.1	PGC Mega Control Register (PGC_MEGA_CTRL).....	1602
31.6.2	PGC Mega Power Up Sequence Control Register (PGC_MEGA_PUPSCR).....	1603
31.6.3	PGC Mega Pull Down Sequence Control Register (PGC_MEGA_PDNSCR).....	1603
31.6.4	PGC Mega Power Gating Controller Status Register (PGC_MEGA_SR).....	1604
31.6.5	PGC CPU Control Register (PGC_CPU_CTRL).....	1605
31.6.6	PGC CPU Power Up Sequence Control Register (PGC_CPU_PUPSCR).....	1605
31.6.7	PGC CPU Pull Down Sequence Control Register (PGC_CPU_PDNSCR).....	1606
31.6.8	PGC CPU Power Gating Controller Status Register (PGC_CPU_SR).....	1607

## **Chapter 32**

### **General Purpose Input/Output (GPIO)**

32.1	Overview.....	1609
32.1.1	Block Diagram.....	1611
32.1.2	Features.....	1612
32.2	Clocks.....	1613
32.3	GPIO Functional Description.....	1613
32.3.1	GPIO Function.....	1613
32.3.2	GPIO pad structure.....	1613

Section number	Title	Page
32.3.2.1	Input Driver.....	1614
32.3.2.1.1	Schmitt trigger.....	1614
32.3.2.1.2	Input keeper.....	1615
32.3.2.2	Output Driver.....	1615
32.3.2.2.1	Drive strength.....	1616
32.3.2.2.2	Output keeper.....	1616
32.3.2.2.3	PU / PD / Keeper Logic.....	1617

## Chapter 33 General Purpose Timer (GPT)

33.1	Overview.....	1639
33.1.1	Features.....	1641
33.1.2	Modes and Operation.....	1641
33.2	External Signals.....	1641
33.2.1	External Clock Input .....	1643
33.2.2	Input Capture Trigger Signals .....	1643
33.2.3	Output Compare Signals.....	1643
33.3	Clocks.....	1644
33.4	Functional Description.....	1645
33.4.1	Operating Modes.....	1646
33.4.1.1	Restart Mode.....	1646
33.4.1.2	Free-Run Mode.....	1646
33.4.2	Operation.....	1646
33.4.2.1	Input Capture.....	1647
33.4.2.2	Output Compare.....	1648
33.4.2.3	Interrupts.....	1649

Section number	Title	Page
33.4.2.4	Low Power Mode Behavior.....	1650
33.4.2.5	Debug Mode Behavior.....	1650
33.5	Initialization/ Application Information .....	1650
33.5.1	Selecting the Clock Source .....	1650
33.6	GPT Memory Map/Register Definition.....	1651
33.6.1	GPT Control Register (GPTx_CR).....	1653
33.6.2	GPT Prescaler Register (GPTx_PR).....	1657
33.6.3	GPT Status Register (GPTx_SR).....	1658
33.6.4	GPT Interrupt Register (GPTx_IR).....	1659
33.6.5	GPT Output Compare Register 1 (GPTx_OCR1).....	1660
33.6.6	GPT Output Compare Register 2 (GPTx_OCR2).....	1661
33.6.7	GPT Output Compare Register 3 (GPTx_OCR3).....	1661
33.6.8	GPT Input Capture Register 1 (GPTx_ICR1).....	1662
33.6.9	GPT Input Capture Register 2 (GPTx_ICR2).....	1662
33.6.10	GPT Counter Register (GPTx_CNT).....	1663

## Chapter 34 IOMUX Controller (IOMUXC)

34.1	Overview.....	1665
34.1.1	Features.....	1666
34.2	Clocks.....	1667
34.3	Functional description.....	1667
34.3.1	ALT6 and ALT7 extended muxing modes.....	1668
34.3.2	SW Loopback through SION bit.....	1669
34.3.3	Daisy chain - multi pads driving same module input pin.....	1669
34.4	IOMUXC GPR Memory Map/Register Definition.....	1670
34.4.1	GPR0 General Purpose Register (IOMUXC_GPR_GPR0).....	1672
34.4.2	GPR1 General Purpose Register (IOMUXC_GPR_GPR1).....	1673
34.4.3	GPR2 General Purpose Register (IOMUXC_GPR_GPR2).....	1676
34.4.4	GPR3 General Purpose Register (IOMUXC_GPR_GPR3).....	1678

Section number	Title	Page
34.4.5	GPR4 General Purpose Register (IOMUXC_GPR_GPR4).....	1681
34.4.6	GPR5 General Purpose Register (IOMUXC_GPR_GPR5).....	1685
34.4.7	GPR6 General Purpose Register (IOMUXC_GPR_GPR6).....	1687
34.4.8	GPR7 General Purpose Register (IOMUXC_GPR_GPR7).....	1691
34.4.9	GPR8 General Purpose Register (IOMUXC_GPR_GPR8).....	1695
34.4.10	GPR9 General Purpose Register (IOMUXC_GPR_GPR9).....	1698
34.4.11	GPR10 General Purpose Register (IOMUXC_GPR_GPR10).....	1699
34.4.12	GPR11 General Purpose Register (IOMUXC_GPR_GPR11).....	1701
34.4.13	GPR12 General Purpose Register (IOMUXC_GPR_GPR12).....	1703
34.4.14	GPR13 General Purpose Register (IOMUXC_GPR_GPR13).....	1704
34.4.15	GPR14 General Purpose Register (IOMUXC_GPR_GPR14).....	1705
34.4.16	GPR15 General Purpose Register (IOMUXC_GPR_GPR15).....	1707
34.4.17	GPR16 General Purpose Register (IOMUXC_GPR_GPR16).....	1708
34.4.18	GPR17 General Purpose Register (IOMUXC_GPR_GPR17).....	1709
34.4.19	GPR18 General Purpose Register (IOMUXC_GPR_GPR18).....	1709
34.4.20	GPR19 General Purpose Register (IOMUXC_GPR_GPR19).....	1710
34.4.21	GPR20 General Purpose Register (IOMUXC_GPR_GPR20).....	1711
34.4.22	GPR21 General Purpose Register (IOMUXC_GPR_GPR21).....	1712
34.4.23	GPR22 General Purpose Register (IOMUXC_GPR_GPR22).....	1713
34.4.24	GPR23 General Purpose Register (IOMUXC_GPR_GPR23).....	1714
34.4.25	GPR24 General Purpose Register (IOMUXC_GPR_GPR24).....	1715
34.4.26	GPR25 General Purpose Register (IOMUXC_GPR_GPR25).....	1716
34.5	IOMUXC SNVS Memory Map/Register Definition.....	1716
34.5.1	SW_MUX_CTL_PAD_WAKEUP SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_WAKEUP).....	1718
34.5.2	SW_MUX_CTL_PAD_PMIC_ON_REQ SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_PMIC_ON_REQ).....	1719
34.5.3	SW_MUX_CTL_PAD_PMIC_STBY_REQ SW MUX Control Register (IOMUXC_SNVS_SW_MUX_CTL_PAD_PMIC_STBY_REQ).....	1720

Section number	Title	Page
34.5.4	SW_PAD_CTL_PAD_TEST_MODE SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_TEST_MODE).....	1721
34.5.5	SW_PAD_CTL_PAD_POR_B SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_POR_B).....	1723
34.5.6	SW_PAD_CTL_PAD_ONOFF SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_ONOFF).....	1725
34.5.7	SW_PAD_CTL_PAD_WAKEUP SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_WAKEUP).....	1727
34.5.8	SW_PAD_CTL_PAD_PMIC_ON_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_PMIC_ON_REQ).....	1729
34.5.9	SW_PAD_CTL_PAD_PMIC_STBY_REQ SW PAD Control Register (IOMUXC_SNVS_SW_PAD_CTL_PAD_PMIC_STBY_REQ).....	1731
34.6	IOMUXC SNVS GPR Memory Map/Register Definition.....	1732
34.6.1	GPR0 General Purpose Register (IOMUXC_SNVS_GPR_GPR0).....	1733
34.6.2	GPR1 General Purpose Register (IOMUXC_SNVS_GPR_GPR1).....	1733
34.6.3	GPR2 General Purpose Register (IOMUXC_SNVS_GPR_GPR2).....	1734
34.6.4	GPR3 General Purpose Register (IOMUXC_SNVS_GPR_GPR3).....	1735
34.7	IOMUXC Memory Map/Register Definition.....	1736
34.7.1	SW_MUX_CTL_PAD_GPIO_EMC_00 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_00).....	1757
34.7.2	SW_MUX_CTL_PAD_GPIO_EMC_01 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_01).....	1758
34.7.3	SW_MUX_CTL_PAD_GPIO_EMC_02 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_02).....	1760
34.7.4	SW_MUX_CTL_PAD_GPIO_EMC_03 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_03).....	1761
34.7.5	SW_MUX_CTL_PAD_GPIO_EMC_04 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_04).....	1762
34.7.6	SW_MUX_CTL_PAD_GPIO_EMC_05 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_05).....	1764
34.7.7	SW_MUX_CTL_PAD_GPIO_EMC_06 SW MUX Control Register (IOMUXC_SW_MUX_CTL_PAD_GPIO_EMC_06).....	1765

## Chapter 35 Keypad Port (KPP)

35.1	Overview .....	2287
35.1.1	Features.....	2289
35.1.2	Modes and Operations.....	2289
35.2	Clocks.....	2289
35.3	External Signals.....	2289
35.3.1	Input Pins.....	2290
35.3.2	Output Pins.....	2291
35.3.3	Generation of Transfer Error Signal on Peripheral Bus.....	2291
35.4	Functional Description.....	2291
35.4.1	Keypad Matrix Construction.....	2292
35.4.2	Keypad Port Configuration.....	2292
35.4.3	Keypad Matrix Scanning.....	2292
35.4.4	Keypad Standby.....	2293
35.4.5	Glitch Suppression on Keypad Inputs.....	2293
35.4.6	Multiple Key Closures.....	2294
35.4.6.1	Ghost Key Problem and Correction.....	2296
35.4.7	3-Point Contact Keys Support.....	2298
35.5	Initialization/Application Information.....	2299
35.5.1	Typical Keypad Configuration and Scanning Sequence.....	2299
35.5.2	Key Press Interrupt Scanning Sequence.....	2300

Section number	Title	Page
35.5.3	Additional Comments.....	2300
35.6	KPP Memory Map/Register Definition.....	2300
35.6.1	Keypad Control Register (KPP_KPCR).....	2301
35.6.2	Keypad Status Register (KPP_KPSR).....	2302
35.6.3	Keypad Data Direction Register (KPP_KDDR).....	2303
35.6.4	Keypad Data Register (KPP_KPDR).....	2304

## Chapter 36 Enhanced LCD Interface (eLCDIF)

36.1	Overview.....	2307
36.2	Functional Description.....	2307
36.2.1	Bus Interface Mechanisms.....	2308
36.2.1.1	Bus Master Operation in Write/Display Modes.....	2309
36.2.1.2	System Bus Master Performance.....	2309
36.2.1.3	DMA Operation in MPU Read Mode.....	2310
36.2.2	Write Data Path.....	2310
36.2.3	LCDIF Interrupts.....	2316
36.2.4	Initializing the LCDIF.....	2317
36.2.4.1	Write Modes.....	2317
36.2.5	DOTCLK Interface.....	2317
36.2.5.1	Code Example.....	2319
36.2.6	LUT.....	2319
36.2.7	Panel Interface Generator (Pigeon Mode).....	2320
36.2.8	LCDIF Pin Usage by Interface Mode.....	2323
36.3	Behavior During Reset.....	2324
36.4	LCDIF Memory Map/Register Definition.....	2324
36.4.1	LCDIF General Control Register (LCDIF_CTRL $n$ ).....	2329
36.4.2	LCDIF General Control1 Register (LCDIF_CTRL1 $n$ ).....	2331
36.4.3	LCDIF General Control2 Register (LCDIF_CTRL2 $n$ ).....	2334
36.4.4	LCDIF Horizontal and Vertical Valid Data Count Register (LCDIF_TRANSFER_COUNT).....	2336

Section number	Title	Page
36.4.5	LCD Interface Current Buffer Address Register (LCDIF_CUR_BUF).....	2336
36.4.6	LCD Interface Next Buffer Address Register (LCDIF_NEXT_BUF).....	2337
36.4.7	LCDIF VSYNC Mode and Dotclk Mode Control Register0 (LCDIF_VDCTRL0n).....	2337
36.4.8	LCDIF VSYNC Mode and Dotclk Mode Control Register1 (LCDIF_VDCTRL1).....	2339
36.4.9	LCDIF VSYNC Mode and Dotclk Mode Control Register2 (LCDIF_VDCTRL2).....	2339
36.4.10	LCDIF VSYNC Mode and Dotclk Mode Control Register3 (LCDIF_VDCTRL3).....	2340
36.4.11	LCDIF VSYNC Mode and Dotclk Mode Control Register4 (LCDIF_VDCTRL4).....	2341
36.4.12	Bus Master Error Status Register (LCDIF_BM_ERROR_STAT).....	2342
36.4.13	CRC Status Register (LCDIF_CRC_STAT).....	2342
36.4.14	LCD Interface Status Register (LCDIF_STAT).....	2343
36.4.15	LCDIF Threshold Register (LCDIF_THRES).....	2344
36.4.16	LCDIF Pigeon Mode Control0 Register (LCDIF_PIGEONCTRL0n).....	2345
36.4.17	LCDIF Pigeon Mode Control1 Register (LCDIF_PIGEONCTRL1n).....	2346
36.4.18	LCDIF Pigeon Mode Control2 Register (LCDIF_PIGEONCTRL2n).....	2347
36.4.19	Panel Interface Signal Generator Register (LCDIF_PIGEONn).....	2348
36.4.20	Panel Interface Signal Generator Register (LCDIF_PIGEONn).....	2349
36.4.21	Panel Interface Signal Generator Register (LCDIF_PIGEONn).....	2349
36.4.22	Lookup Table Data Register. (LCDIF_LUT_CTRL).....	2350
36.4.23	Lookup Table Control Register. (LCDIF_LUT0_ADDR).....	2351
36.4.24	Lookup Table Data Register. (LCDIF_LUT0_DATA).....	2351
36.4.25	Lookup Table Control Register. (LCDIF_LUT1_ADDR).....	2352
36.4.26	Lookup Table Data Register. (LCDIF_LUT1_DATA).....	2352

## Chapter 37 Low Power Inter-Integrated Circuit (LPI2C)

37.1	Chip-specific LPI2C information.....	2353
37.2	Introduction.....	2353
37.2.1	Features.....	2354
37.2.2	Block Diagram.....	2356
37.2.3	Modes of operation.....	2357

Section number	Title	Page
37.2.4	Signal Descriptions.....	2357
37.2.5	Wiring options.....	2357
37.3	Functional description.....	2359
37.3.1	Clocking and Resets.....	2359
37.3.2	Master Mode.....	2360
37.3.2.1	Transmit and Command FIFO commands.....	2360
37.3.2.2	Master operations.....	2361
37.3.2.3	Receive FIFO and Data Matching.....	2362
37.3.2.4	Timing Parameters.....	2362
37.3.2.5	Error Conditions.....	2364
37.3.2.6	Pin Configuration.....	2365
37.3.3	Slave Mode.....	2366
37.3.3.1	Address Matching.....	2366
37.3.3.2	Transmit and Receive Data.....	2366
37.3.3.3	Clock Stretching.....	2367
37.3.3.4	Timing Parameters.....	2367
37.3.3.5	Error Conditions.....	2368
37.3.4	Interrupts and DMA Requests.....	2368
37.3.4.1	Master mode.....	2368
37.3.4.2	Slave mode.....	2369
37.3.5	Peripheral Triggers.....	2370
37.4	Memory Map and Registers.....	2371
37.4.1	LPI2C register descriptions.....	2371
37.4.1.1	LPI2C Memory map.....	2371
37.4.1.2	Version ID Register (VERID).....	2372
37.4.1.2.1	Offset.....	2372
37.4.1.2.2	Function.....	2372
37.4.1.2.3	Diagram.....	2372
37.4.1.2.4	Fields.....	2373

Section number	Title	Page
37.4.1.3	Parameter Register (PARAM).....	2373
37.4.1.3.1	Offset.....	2373
37.4.1.3.2	Function.....	2373
37.4.1.3.3	Diagram.....	2373
37.4.1.3.4	Fields.....	2374
37.4.1.4	Master Control Register (MCR).....	2374
37.4.1.4.1	Offset.....	2374
37.4.1.4.2	Diagram.....	2374
37.4.1.4.3	Fields.....	2375
37.4.1.5	Master Status Register (MSR).....	2375
37.4.1.5.1	Offset.....	2376
37.4.1.5.2	Diagram.....	2376
37.4.1.5.3	Fields.....	2376
37.4.1.6	Master Interrupt Enable Register (MIER).....	2378
37.4.1.6.1	Offset.....	2378
37.4.1.6.2	Diagram.....	2378
37.4.1.6.3	Fields.....	2378
37.4.1.7	Master DMA Enable Register (MDER).....	2379
37.4.1.7.1	Offset.....	2379
37.4.1.7.2	Diagram.....	2379
37.4.1.7.3	Fields.....	2379
37.4.1.8	Master Configuration Register 0 (MCFGR0).....	2380
37.4.1.8.1	Offset.....	2380
37.4.1.8.2	Diagram.....	2380
37.4.1.8.3	Fields.....	2380
37.4.1.9	Master Configuration Register 1 (MCFGR1).....	2381
37.4.1.9.1	Offset.....	2381
37.4.1.9.2	Function.....	2381
37.4.1.9.3	Diagram.....	2381

Section number	Title	Page
37.4.1.9.4	Fields.....	2382
37.4.1.10	Master Configuration Register 2 (MCFGR2).....	2383
37.4.1.10.1	Offset.....	2383
37.4.1.10.2	Function.....	2384
37.4.1.10.3	Diagram.....	2384
37.4.1.10.4	Fields.....	2384
37.4.1.11	Master Configuration Register 3 (MCFGR3).....	2385
37.4.1.11.1	Offset.....	2385
37.4.1.11.2	Function.....	2385
37.4.1.11.3	Diagram.....	2385
37.4.1.11.4	Fields.....	2385
37.4.1.12	Master Data Match Register (MDMR).....	2386
37.4.1.12.1	Offset.....	2386
37.4.1.12.2	Function.....	2386
37.4.1.12.3	Diagram.....	2386
37.4.1.12.4	Fields.....	2386
37.4.1.13	Master Clock Configuration Register 0 (MCCR0).....	2387
37.4.1.13.1	Offset.....	2387
37.4.1.13.2	Function.....	2387
37.4.1.13.3	Diagram.....	2387
37.4.1.13.4	Fields.....	2387
37.4.1.14	Master Clock Configuration Register 1 (MCCR1).....	2388
37.4.1.14.1	Offset.....	2388
37.4.1.14.2	Function.....	2388
37.4.1.14.3	Diagram.....	2389
37.4.1.14.4	Fields.....	2389
37.4.1.15	Master FIFO Control Register (MFCR).....	2390
37.4.1.15.1	Offset.....	2390

## Chapter 38

### Low Power Serial Peripheral Interface (LPSPI)

38.1	Chip-specific LPSPI information.....	2411
38.2	Introduction.....	2411
38.2.1	Overview.....	2411
38.2.2	Features.....	2411
38.2.3	Block Diagram.....	2411
38.2.4	Modes of operation.....	2412
38.2.5	Signal Descriptions.....	2412
38.3	Functional description.....	2413
38.3.1	Clocking and Resets.....	2413
38.3.1.1	Functional clock.....	2413
38.3.1.2	External clock.....	2413
38.3.1.3	Bus clock.....	2414
38.3.1.4	Chip reset.....	2414
38.3.1.5	Software reset.....	2414
38.3.1.6	FIFO reset.....	2414
38.3.2	Master Mode.....	2414
38.3.2.1	Transmit and Command FIFO.....	2414
38.3.2.2	Receive FIFO and Data Match.....	2417
38.3.2.3	Timing Parameters.....	2417
38.3.2.4	Pin Configuration.....	2418
38.3.3	Slave Mode.....	2418

Section number	Title	Page
38.3.3.1	Transmit and Command FIFO.....	2419
38.3.3.2	Receive FIFO and Data Match.....	2420
38.3.3.3	Clocked Interface.....	2420
38.3.4	Interrupts and DMA Requests.....	2420
38.3.5	Peripheral Triggers.....	2421
38.3.5.1	Output Triggers.....	2421
38.3.5.2	Input Trigger.....	2421
38.4	Memory Map and Registers.....	2422
38.4.1	LPSPI register descriptions.....	2422
38.4.1.1	LPSPI Memory map.....	2422
38.4.1.2	Version ID Register (VERID).....	2423
38.4.1.2.1	Offset.....	2423
38.4.1.2.2	Diagram.....	2423
38.4.1.2.3	Fields.....	2423
38.4.1.3	Parameter Register (PARAM).....	2423
38.4.1.3.1	Offset.....	2424
38.4.1.3.2	Diagram.....	2424
38.4.1.3.3	Fields.....	2424
38.4.1.4	Control Register (CR).....	2424
38.4.1.4.1	Offset.....	2424
38.4.1.4.2	Diagram.....	2425
38.4.1.4.3	Fields.....	2425
38.4.1.5	Status Register (SR).....	2426
38.4.1.5.1	Offset.....	2426
38.4.1.5.2	Diagram.....	2426
38.4.1.5.3	Fields.....	2426
38.4.1.6	Interrupt Enable Register (IER).....	2427
38.4.1.6.1	Offset.....	2427
38.4.1.6.2	Diagram.....	2428

Section number	Title	Page
38.4.1.6.3	Fields.....	2428
38.4.1.7	DMA Enable Register (DER).....	2429
38.4.1.7.1	Offset.....	2429
38.4.1.7.2	Diagram.....	2429
38.4.1.7.3	Fields.....	2429
38.4.1.8	Configuration Register 0 (CFGR0).....	2430
38.4.1.8.1	Offset.....	2430
38.4.1.8.2	Diagram.....	2430
38.4.1.8.3	Fields.....	2430
38.4.1.9	Configuration Register 1 (CFGR1).....	2431
38.4.1.9.1	Offset.....	2431
38.4.1.9.2	Function.....	2431
38.4.1.9.3	Diagram.....	2431
38.4.1.9.4	Fields.....	2432
38.4.1.10	Data Match Register 0 (DMR0).....	2433
38.4.1.10.1	Offset.....	2434
38.4.1.10.2	Diagram.....	2434
38.4.1.10.3	Fields.....	2434
38.4.1.11	Data Match Register 1 (DMR1).....	2434
38.4.1.11.1	Offset.....	2434
38.4.1.11.2	Diagram.....	2434
38.4.1.11.3	Fields.....	2435
38.4.1.12	Clock Configuration Register (CCR).....	2435
38.4.1.12.1	Offset.....	2435

## **Chapter 39**

### **Low Power Universal Asynchronous Receiver/Transmitter (LPUART)**

39.1	Introduction.....	2445
39.1.1	Features.....	2445
39.1.2	Modes of operation.....	2446

Section number	Title	Page
39.1.2.1	Stop mode.....	2446
39.1.2.2	Wait mode.....	2446
39.1.2.3	Debug mode.....	2446
39.1.3	Signal Descriptions.....	2446
39.1.4	Block diagram.....	2447
39.2	Functional description.....	2449
39.2.1	Baud rate generation.....	2449
39.2.2	Transmitter functional description.....	2450
39.2.2.1	Send break and queued idle.....	2451
39.2.2.2	Hardware flow control.....	2452
39.2.2.3	Transceiver driver enable.....	2452
39.2.2.4	Transceiver driver enable using RTS_B.....	2453
39.2.3	Receiver functional description.....	2453
39.2.3.1	Data sampling technique.....	2454
39.2.3.2	Receiver wakeup operation.....	2455
39.2.3.2.1	Idle-line wakeup.....	2456
39.2.3.2.2	Address-mark wakeup.....	2457
39.2.3.2.3	Data match wakeup.....	2457
39.2.3.2.4	Address Match operation.....	2457
39.2.3.2.5	Idle Match operation.....	2458
39.2.3.2.6	Match On Match Off operation.....	2458
39.2.3.3	Hardware flow control.....	2459
39.2.3.4	Infrared decoder.....	2459
39.2.3.4.1	Start bit detection.....	2460
39.2.3.4.2	Noise filtering.....	2460
39.2.3.4.3	Low-bit detection.....	2460
39.2.3.4.4	High-bit detection.....	2460
39.2.4	Additional LPUART functions.....	2460
39.2.4.1	Data Modes.....	2460

Section number	Title	Page
39.2.4.2	Idle length.....	2461
39.2.4.3	Loop mode.....	2462
39.2.4.4	Single-wire operation.....	2462
39.2.5	Infrared interface.....	2462
39.2.5.1	Infrared transmit encoder.....	2463
39.2.5.2	Infrared receive decoder.....	2463
39.2.6	Interrupts and status flags.....	2463
39.2.7	Peripheral Triggers.....	2464
39.2.7.1	Output Triggers.....	2464
39.2.7.2	Input Trigger.....	2465
39.3	Register definition.....	2465
39.3.1	LPUART register descriptions.....	2465
39.3.1.1	LPUART Memory map.....	2465
39.3.1.2	Version ID Register (VERID).....	2466
39.3.1.2.1	Offset.....	2466
39.3.1.2.2	Function.....	2466
39.3.1.2.3	Diagram.....	2466
39.3.1.2.4	Fields.....	2467
39.3.1.3	Parameter Register (PARAM).....	2467
39.3.1.3.1	Offset.....	2467
39.3.1.3.2	Diagram.....	2467
39.3.1.3.3	Fields.....	2468
39.3.1.4	LPUART Global Register (GLOBAL).....	2468
39.3.1.4.1	Offset.....	2468
39.3.1.4.2	Diagram.....	2468
39.3.1.4.3	Fields.....	2469
39.3.1.5	LPUART Pin Configuration Register (PINCFG).....	2469
39.3.1.5.1	Offset.....	2469
39.3.1.5.2	Diagram.....	2469

Section number	Title	Page
39.3.1.5.3	Fields.....	2470
39.3.1.6	LPUART Baud Rate Register (BAUD).....	2470
39.3.1.6.1	Offset.....	2470
39.3.1.6.2	Diagram.....	2470
39.3.1.6.3	Fields.....	2471
39.3.1.7	LPUART Status Register (STAT).....	2473
39.3.1.7.1	Offset.....	2473
39.3.1.7.2	Diagram.....	2473
39.3.1.7.3	Fields.....	2474
39.3.1.8	LPUART Control Register (CTRL).....	2476
39.3.1.8.1	Offset.....	2476
39.3.1.8.2	Function.....	2477
39.3.1.8.3	Diagram.....	2477
39.3.1.8.4	Fields.....	2477
39.3.1.9	LPUART Data Register (DATA).....	2481
39.3.1.9.1	Offset.....	2481
39.3.1.9.2	Function.....	2481
39.3.1.9.3	Diagram.....	2481
39.3.1.9.4	Fields.....	2481
39.3.1.10	LPUART Match Address Register (MATCH).....	2483
39.3.1.10.1	Offset.....	2483
39.3.1.10.2	Diagram.....	2483
39.3.1.10.3	Fields.....	2483
39.3.1.11	LPUART Modem IrDA Register (MODIR).....	2484
39.3.1.11.1	Offset.....	2484
39.3.1.11.2	Function.....	2484
39.3.1.11.3	Diagram.....	2484
39.3.1.11.4	Fields.....	2484
39.3.1.12	LPUART FIFO Register (FIFO).....	2486

Section number	Title	Page
39.3.1.12.1	Offset.....	2486
39.3.1.12.2	Function.....	2486
39.3.1.12.3	Diagram.....	2486
39.3.1.12.4	Fields.....	2487
39.3.1.13	LPUART Watermark Register (WATER).....	2489
39.3.1.13.1	Offset.....	2489
39.3.1.13.2	Function.....	2489
39.3.1.13.3	Diagram.....	2489
39.3.1.13.4	Fields.....	2490

## Chapter 40 Medium Quality Sound (MQS)

40.1	Overview.....	2493
40.1.1	Block Diagram.....	2493
40.2	External Signals.....	2494
40.3	Interface Signals.....	2495
40.4	Programming Considerations.....	2495
40.4.1	Usage Model.....	2496

## Chapter 41 Network Interconnect Bus System (NIC-301)

41.1	Overview .....	2497
41.1.1	NIC-301 Main Features.....	2497
41.1.2	Modes and Operations.....	2498
41.2	External Signals.....	2498
41.3	Memory Map and Register Definition.....	2498

## Chapter 42 On-Chip OTP Controller (OCOTP\_CTRL)

42.1	Overview.....	2501
42.1.1	Features.....	2501
42.2	Clocks.....	2501
42.3	Top-Level Symbol and Functional Overview.....	2502

Section number	Title	Page
42.3.1	Operation.....	2502
42.3.1.1	Shadow Register Reload.....	2503
42.3.1.2	Fuse and Shadow register read.....	2503
42.3.1.3	Fuse and Shadow Register Writes.....	2504
42.3.1.4	Write Postamble.....	2505
42.3.2	Fuse Shadow Memory Footprint.....	2506
42.3.3	OTP Read/Write Timing Parameters.....	2506
42.3.4	Hardware Visible Fuses.....	2508
42.3.5	Behavior During Reset.....	2508
42.3.6	Secure JTAG control.....	2508
42.4	Fuse Map.....	2509
42.5	OCOTP Memory Map/Register Definition.....	2509
42.5.1	register descriptions.....	2509
42.5.1.1	OCOTP Memory map.....	2509
42.5.1.2	OTP Controller Control Register (HW_OCOTP_CTRL).....	2511
42.5.1.2.1	Offset.....	2511
42.5.1.2.2	Function.....	2511
42.5.1.2.3	Diagram.....	2512
42.5.1.2.4	Fields.....	2512
42.5.1.3	OTP Controller Control Register (HW_OCOTP_CTRL_SET).....	2513
42.5.1.3.1	Offset.....	2513
42.5.1.3.2	Function.....	2513
42.5.1.3.3	Diagram.....	2513
42.5.1.3.4	Fields.....	2514
42.5.1.4	OTP Controller Control Register (HW_OCOTP_CTRL_CLR).....	2515
42.5.1.4.1	Offset.....	2515
42.5.1.4.2	Function.....	2515
42.5.1.4.3	Diagram.....	2515
42.5.1.4.4	Fields.....	2515

Section number	Title	Page
42.5.1.5	OTP Controller Control Register (HW_OCOTP_CTRL_TOG).....	2516
42.5.1.5.1	Offset.....	2516
42.5.1.5.2	Function.....	2516
42.5.1.5.3	Diagram.....	2517
42.5.1.5.4	Fields.....	2517
42.5.1.6	OTP Controller Timing Register (HW_OCOTP_TIMING).....	2518
42.5.1.6.1	Offset.....	2518
42.5.1.6.2	Function.....	2518
42.5.1.6.3	Diagram.....	2518
42.5.1.6.4	Fields.....	2518
42.5.1.7	OTP Controller Write Data Register (HW_OCOTP_DATA).....	2519
42.5.1.7.1	Offset.....	2519
42.5.1.7.2	Function.....	2519
42.5.1.7.3	Diagram.....	2519
42.5.1.7.4	Fields.....	2519
42.5.1.8	OTP Controller Write Data Register (HW_OCOTP_READ_CTRL).....	2520
42.5.1.8.1	Offset.....	2520
42.5.1.8.2	Function.....	2520
42.5.1.8.3	Diagram.....	2520
42.5.1.8.4	Fields.....	2520
42.5.1.9	OTP Controller Read Data Register (HW_OCOTP_READ_FUSE_DATA).....	2521
42.5.1.9.1	Offset.....	2521
42.5.1.9.2	Function.....	2521
42.5.1.9.3	Diagram.....	2521
42.5.1.9.4	Fields.....	2521
42.5.1.10	Sticky bit Register (HW_OCOTP_SW_STICKY).....	2522
42.5.1.10.1	Offset.....	2522
42.5.1.10.2	Function.....	2522
42.5.1.10.3	Diagram.....	2522

Section number	Title	Page
42.5.1.10.4	Fields.....	2522
42.5.1.11	Software Controllable Signals Register (HW_OCOTP_SCS).....	2523
42.5.1.11.1	Offset.....	2523
42.5.1.11.2	Function.....	2523
42.5.1.11.3	Diagram.....	2523
42.5.1.11.4	Fields.....	2524
42.5.1.12	Software Controllable Signals Register (HW_OCOTP_SCS_SET).....	2524
42.5.1.12.1	Offset.....	2524
42.5.1.12.2	Function.....	2524
42.5.1.12.3	Diagram.....	2524
42.5.1.12.4	Fields.....	2525
42.5.1.13	Software Controllable Signals Register (HW_OCOTP_SCS_CLR).....	2525
42.5.1.13.1	Offset.....	2525
42.5.1.13.2	Function.....	2525
42.5.1.13.3	Diagram.....	2525
42.5.1.13.4	Fields.....	2526
42.5.1.14	Software Controllable Signals Register (HW_OCOTP_SCS_TOG).....	2526
42.5.1.14.1	Offset.....	2526
42.5.1.14.2	Function.....	2526
42.5.1.14.3	Diagram.....	2526
42.5.1.14.4	Fields.....	2527
42.5.1.15	OTP Controller Version Register (HW_OCOTP_VERSION).....	2527
42.5.1.15.1	Offset.....	2527
42.5.1.15.2	Function.....	2527
42.5.1.15.3	Diagram.....	2527
42.5.1.15.4	Fields.....	2527
42.5.1.16	OTP Controller Timing Register 2 (HW_OCOTP_TIMING2).....	2528

### Chapter 43 On-Chip RAM Memory Controller (OCRAM)

43.1	Overview.....	2571
43.2	Basic Functions.....	2572
43.2.1	Read/Write Arbitration.....	2572
43.3	Advanced Features.....	2573
43.3.1	Read Data Wait State.....	2573
43.3.2	Read Address Pipeline.....	2573
43.3.3	Write Data Pipeline.....	2574
43.3.4	Write Address Pipeline.....	2574
43.4	Programmable Registers.....	2574

### Chapter 44 Periodic Interrupt Timer (PIT)

44.1	Introduction.....	2577
44.1.1	Block diagram.....	2577
44.1.2	Features.....	2578
44.2	Modes of operation.....	2578
44.3	Signal description.....	2578
44.4	Functional description.....	2578
44.4.1	General operation.....	2578
44.4.1.1	Timers.....	2578
44.4.1.2	Debug mode.....	2580
44.4.2	Interrupts.....	2580
44.4.3	Chained timers.....	2580
44.5	Initialization and application information.....	2580
44.6	Example configuration for chained timers.....	2581
44.7	Example configuration for the lifetime timer.....	2582
44.8	PIT Register Descriptions.....	2583

Section number	Title	Page
44.8.1	PIT Memory Map.....	2583
44.8.2	PIT Module Control (MCR).....	2584
44.8.2.1	Address.....	2584
44.8.2.2	Function.....	2584
44.8.2.3	Diagram.....	2584
44.8.2.4	Fields.....	2584
44.8.3	PIT Upper Lifetime Timer (LTMR64H).....	2585
44.8.3.1	Address.....	2585
44.8.3.2	Function.....	2585
44.8.3.3	Diagram.....	2585
44.8.3.4	Fields.....	2586
44.8.4	PIT Lower Lifetime Timer (LTMR64L).....	2586
44.8.4.1	Address.....	2586
44.8.4.2	Function.....	2586
44.8.4.3	Diagram.....	2586
44.8.4.4	Fields.....	2587
44.8.5	Timer Load Value (LDVALa).....	2587
44.8.5.1	Address.....	2587
44.8.5.2	Function.....	2587
44.8.5.3	Diagram.....	2587
44.8.5.4	Fields.....	2588
44.8.6	Current Timer Value (CVALa).....	2588
44.8.6.1	Address.....	2588
44.8.6.2	Function.....	2588
44.8.6.3	Diagram.....	2588
44.8.6.4	Fields.....	2589
44.8.7	Timer Control (TCTRLa).....	2589
44.8.7.1	Address.....	2589
44.8.7.2	Function.....	2589

Section number	Title	Page
44.8.7.3	Diagram.....	2590
44.8.7.4	Fields.....	2590
44.8.8	Timer Flag (TFLGa).....	2590
44.8.8.1	Address.....	2590
44.8.8.2	Function.....	2591
44.8.8.3	Diagram.....	2591
44.8.8.4	Fields.....	2591

## Chapter 45 Power Management Unit (PMU)

45.1	Chip-specific PMU information.....	2593
45.2	Overview.....	2593
45.3	Digital LDO Regulators.....	2594
45.4	Analog LDO Regulators.....	2595
45.4.1	LDO 1P1.....	2595
45.4.2	LDO 2P5.....	2596
45.4.3	Low Power Operation.....	2596
45.5	USB LDO Regulator.....	2597
45.6	SNVS Regulator.....	2597
45.7	PMU Memory Map/Register Definition.....	2598
45.7.1	Regulator 1P1 Register (PMU_REG_1P1n).....	2600
45.7.2	Regulator 3P0 Register (PMU_REG_3P0n).....	2603
45.7.3	Regulator 2P5 Register (PMU_REG_2P5n).....	2605
45.7.4	Digital Regulator Core Register (PMU_REG_COREn).....	2607
45.7.5	Miscellaneous Register 0 (PMU_MISC0n).....	2611
45.7.6	Miscellaneous Register 1 (PMU_MISC1n).....	2615
45.7.7	Miscellaneous Control Register (PMU_MISC2n).....	2617

## Chapter 46 Pixel Pipeline (PXP)

46.1	Overview.....	2623
------	---------------	------

<b>Section number</b>	<b>Title</b>	<b>Page</b>
46.2	Clocks.....	2624
46.3	Top-level architecture.....	2624
46.3.1	Processing Details.....	2626
46.3.2	Scaling Operation.....	2627
46.3.3	Decimation Image Scaling.....	2628
46.3.4	Bilinear Image Scaling Filter .....	2630
46.3.5	YUV 4:2:2 Image Scaling.....	2632
46.3.6	YUV 4:2:0 Image Scaling.....	2633
46.3.7	RGB/YUV444 Image Scaling.....	2635
46.3.8	Color Space Conversion (CSC).....	2635
46.3.9	CSC1 Operation.....	2636
46.3.10	YUV versus YCbCr Support.....	2637
46.3.11	Alpha Blending/Color Key .....	2637
46.3.12	Alpha Blend.....	2637
	46.3.12.1 Porter-Duff Alpha Blend.....	2638
46.3.13	Color Key.....	2639
46.3.14	Rotation.....	2639
46.3.15	Output Buffer.....	2642
46.3.16	Address calculator.....	2642
46.3.17	Block size selection.....	2642
46.3.18	Interlaced Video Support.....	2642
46.3.19	LCDIF Handshake.....	2643
46.3.20	LCDIF Abort.....	2646
46.3.21	Theory of Operation.....	2646
46.3.22	Pixel Handling.....	2647
46.3.23	Output Buffer Composition.....	2647
46.3.24	PS Image Processing.....	2648
46.3.25	Letterboxing.....	2649
46.3.26	Clipping source images.....	2649

Section number	Title	Page
46.3.27	Color Key Processing.....	2651
46.3.28	In Place Processing (PS buffer is destination buffer).....	2653
46.3.29	Alpha Surface (AS) Processing.....	2653
46.3.30	Alpha Handling.....	2653
46.3.31	Color Key Processing (AS_CTRL).....	2653
46.4	Output Image Processing.....	2654
46.4.1	Output Image Size.....	2654
46.4.2	Output Format.....	2654
46.4.3	Rotation/Flip operations.....	2654
46.5	Queuing PXP transactions.....	2655
46.6	Error Handling.....	2655
46.6.1	Known PXP Limitations/Issues.....	2656
46.7	PXP Memory Map/Register Definition.....	2656
46.7.1	Control Register 0 (PXP_CTRL $n$ ).....	2658
46.7.2	Status Register (PXP_STAT $n$ ).....	2661
46.7.3	Output Buffer Control Register (PXP_OUT_CTRL $n$ ).....	2662
46.7.4	Output Frame Buffer Pointer (PXP_OUT_BUF).....	2664
46.7.5	Output Frame Buffer Pointer #2 (PXP_OUT_BUF2).....	2665
46.7.6	Output Buffer Pitch (PXP_OUT_PITCH).....	2666
46.7.7	Output Surface Lower Right Coordinate (PXP_OUT_LRC).....	2666
46.7.8	Processed Surface Upper Left Coordinate (PXP_OUT_PS_ULC).....	2667
46.7.9	Processed Surface Lower Right Coordinate (PXP_OUT_PS_LRC).....	2668
46.7.10	Alpha Surface Upper Left Coordinate (PXP_OUT_AS_ULC).....	2669
46.7.11	Alpha Surface Lower Right Coordinate (PXP_OUT_AS_LRC).....	2670
46.7.12	Processed Surface (PS) Control Register (PXP_PS_CTRL $n$ ).....	2671
46.7.13	PS Input Buffer Address (PXP_PS_BUF).....	2673
46.7.14	PS U/Cb or 2 Plane UV Input Buffer Address (PXP_PS_UBUF).....	2673
46.7.15	PS V/Cr Input Buffer Address (PXP_PS_VBUF).....	2674
46.7.16	Processed Surface Pitch (PXP_PS_PITCH).....	2675

Section number	Title	Page
46.7.17	PS Background Color (PXP_PS_BACKGROUND).....	2675
46.7.18	PS Scale Factor Register (PXP_PS_SCALE).....	2676
46.7.19	PS Scale Offset Register (PXP_PS_OFFSET).....	2677
46.7.20	PS Color Key Low (PXP_PS_CLRKEYLOW).....	2678
46.7.21	PS Color Key High (PXP_PS_CLRKEYHIGH).....	2679
46.7.22	Alpha Surface Control (PXP_AS_CTRL).....	2680
46.7.23	Alpha Surface Buffer Pointer (PXP_AS_BUF).....	2682
46.7.24	Alpha Surface Pitch (PXP_AS_PITCH).....	2683
46.7.25	Overlay Color Key Low (PXP_AS_CLRKEYLOW).....	2683
46.7.26	Overlay Color Key High (PXP_AS_CLRKEYHIGH).....	2684
46.7.27	Color Space Conversion Coefficient Register 0 (PXP_CSC1_COEF0).....	2685
46.7.28	Color Space Conversion Coefficient Register 1 (PXP_CSC1_COEF1).....	2686
46.7.29	Color Space Conversion Coefficient Register 2 (PXP_CSC1_COEF2).....	2687
46.7.30	PXP Power Control Register (PXP_POWER).....	2688
46.7.31	Next Frame Pointer (PXP_NEXT).....	2688
46.7.32	PXP Alpha Engine A Control Register. (PXP_PORTER_DUFF_CTRL).....	2691

## Chapter 47 Quad Timer (TMR)

47.1	Overview.....	2693
47.2	Features.....	2694
47.3	Modes of Operation.....	2694
47.4	Block Diagram.....	2694
47.5	Memory Map and Registers.....	2695
47.5.1	Timer Channel Compare Register 1 (TMR <sub>x</sub> _COMP1 <sub>n</sub> ).....	2703
47.5.2	Timer Channel Compare Register 2 (TMR <sub>x</sub> _COMP2 <sub>n</sub> ).....	2703
47.5.3	Timer Channel Capture Register (TMR <sub>x</sub> _CAPT <sub>n</sub> ).....	2704
47.5.4	Timer Channel Load Register (TMR <sub>x</sub> _LOAD <sub>n</sub> ).....	2704
47.5.5	Timer Channel Hold Register (TMR <sub>x</sub> _HOLD <sub>n</sub> ).....	2704
47.5.6	Timer Channel Counter Register (TMR <sub>x</sub> _CNTR <sub>n</sub> ).....	2705

Section number	Title	Page
47.5.7	Timer Channel Control Register (TMRx_CTRLn).....	2705
47.5.8	Timer Channel Status and Control Register (TMRx_SCTRLn).....	2707
47.5.9	Timer Channel Comparator Load Register 1 (TMRx_CMPLD1n).....	2709
47.5.10	Timer Channel Comparator Load Register 2 (TMRx_CMPLD2n).....	2709
47.5.11	Timer Channel Comparator Status and Control Register (TMRx_CSCTRLn).....	2710
47.5.12	Timer Channel Input Filter Register (TMRx_FILTn).....	2712
47.5.13	Timer Channel DMA Enable Register (TMRx_DMAen).....	2713
47.5.14	Timer Channel Enable Register (TMRx_ENBL).....	2713
47.6	Functional Description.....	2714
47.6.1	General.....	2714
47.6.2	Usage of Compare Registers.....	2715
47.6.3	Usage of Compare Load Registers.....	2716
47.6.4	Usage of the Capture Register.....	2717
47.6.5	Functional Modes.....	2717
47.6.5.1	Stop Mode.....	2717
47.6.5.2	Count Mode.....	2717
47.6.5.3	Edge-Count Mode.....	2718
47.6.5.4	Gated-Count Mode.....	2719
47.6.5.5	Quadrature-Count Mode.....	2719
47.6.5.6	Quadrature-Count Mode with Index Input.....	2720
47.6.5.7	Signed-Count Mode.....	2721
47.6.5.8	Triggered-Count Mode 1.....	2722
47.6.5.9	Triggered-Count Mode 2.....	2723
47.6.5.10	One-Shot Mode.....	2723
47.6.5.11	Cascade-Count Mode.....	2724
47.6.5.12	Pulse-Output Mode.....	2726
47.6.5.13	Fixed-Frequency PWM Mode.....	2727
47.6.5.14	Variable-Frequency PWM Mode.....	2728
47.7	Resets.....	2731

Section number	Title	Page
47.7.1	General.....	2731
47.8	Clocks.....	2731
47.8.1	General.....	2731
47.9	Interrupts.....	2732
47.9.1	General.....	2732
47.9.2	Description of Interrupt Operation.....	2732
47.9.2.1	Timer Compare Interrupts.....	2732
47.9.2.1.1	Timer Compare 1 Interrupts (Available with Compare Load Feature).....	2733
47.9.2.1.2	Timer Compare 2 Interrupts (Available with Compare Load Feature).....	2733
47.9.2.2	Timer Overflow Interrupts.....	2733
47.9.2.3	Timer Input Edge Interrupts.....	2733
47.10	DMA.....	2733

## Chapter 48 Synchronous Audio Interface (SAI)

48.1	Introduction.....	2735
48.1.1	Features.....	2735
48.1.2	Block diagram.....	2735
48.1.3	Modes of operation.....	2736
48.1.3.1	Run mode.....	2736
48.1.3.2	Stop modes.....	2736
48.1.3.3	Debug mode.....	2737
48.2	External signals.....	2737
48.3	Functional description.....	2737
48.3.1	SAI clocking.....	2737
48.3.1.1	Audio master clock.....	2738
48.3.1.2	Bit clock.....	2738
48.3.1.3	Bus clock.....	2739
48.3.2	SAI resets.....	2739
48.3.2.1	Software reset.....	2739

Section number	Title	Page
48.3.2.2	FIFO reset.....	2739
48.3.3	Synchronous modes.....	2740
48.3.3.1	Synchronous mode.....	2740
48.3.4	Frame sync configuration.....	2741
48.3.5	Data FIFO.....	2741
48.3.5.1	Data alignment.....	2741
48.3.5.2	FIFO pointers.....	2742
48.3.5.3	FIFO packing.....	2743
48.3.5.4	FIFO Combine.....	2744
48.3.6	Word mask register.....	2745
48.3.7	Interrupts and DMA requests.....	2745
48.3.7.1	FIFO request flag.....	2745
48.3.7.2	FIFO warning flag.....	2746
48.3.7.3	FIFO error flag.....	2746
48.3.7.4	Sync error flag.....	2747
48.3.7.5	Word start flag.....	2747
48.4	Memory map and register definition.....	2747
48.4.1	I2S Register Descriptions.....	2747
48.4.1.1	I2S Memory Map.....	2747
48.4.1.2	Version ID (VERID).....	2748
48.4.1.2.1	Address.....	2748
48.4.1.2.2	Function.....	2748
48.4.1.2.3	Diagram.....	2748
48.4.1.2.4	Fields.....	2749
48.4.1.3	Parameter (PARAM).....	2749
48.4.1.3.1	Address.....	2749
48.4.1.3.2	Function.....	2749
48.4.1.3.3	Diagram.....	2749
48.4.1.3.4	Fields.....	2750

Section number	Title	Page
48.4.1.4	SAI Transmit Control (TCSR).....	2750
48.4.1.4.1	Address.....	2750
48.4.1.4.2	Diagram.....	2750
48.4.1.4.3	Fields.....	2751
48.4.1.5	SAI Transmit Configuration 1 (TCR1).....	2753
48.4.1.5.1	Address.....	2753
48.4.1.5.2	Diagram.....	2753
48.4.1.5.3	Fields.....	2753
48.4.1.6	SAI Transmit Configuration 2 (TCR2).....	2754
48.4.1.6.1	Address.....	2754
48.4.1.6.2	Function.....	2754
48.4.1.6.3	Diagram.....	2754
48.4.1.6.4	Fields.....	2754

## Chapter 49 Smart External Memory Controller (SEMC)

49.1	About this module.....	2779
49.1.1	Introduction.....	2779
49.1.2	Features.....	2779

Section number	Title	Page
49.1.3	Operation Modes.....	2781
49.1.4	Block diagram.....	2782
49.2	Signals.....	2782
49.3	Memory Map and register definition.....	2783
49.3.1	SEMC register descriptions.....	2784
49.3.1.1	SEMC Memory map.....	2784
49.3.1.2	Module Control Register (MCR).....	2785
49.3.1.2.1	Offset.....	2785
49.3.1.2.2	Diagram.....	2785
49.3.1.2.3	Fields.....	2786
49.3.1.3	IO Mux Control Register (IOCR).....	2787
49.3.1.3.1	Offset.....	2787
49.3.1.3.2	Diagram.....	2787
49.3.1.3.3	Fields.....	2787
49.3.1.4	Master Bus (AXI) Control Register 0 (BMCR0).....	2788
49.3.1.4.1	Offset.....	2788
49.3.1.4.2	Function.....	2789
49.3.1.4.3	Diagram.....	2789
49.3.1.4.4	Fields.....	2789
49.3.1.5	Master Bus (AXI) Control Register 1 (BMCR1).....	2789
49.3.1.5.1	Offset.....	2789
49.3.1.5.2	Function.....	2790
49.3.1.5.3	Diagram.....	2790
49.3.1.5.4	Fields.....	2790
49.3.1.6	Base Register 0 (For SDRAM CS0 device) (BR0).....	2790
49.3.1.6.1	Offset.....	2790
49.3.1.6.2	Function.....	2791
49.3.1.6.3	Diagram.....	2791
49.3.1.6.4	Fields.....	2791

Section number	Title	Page
49.3.1.7	Base Register 1 (For SDRAM CS1 device) (BR1).....	2792
49.3.1.7.1	Offset.....	2792
49.3.1.7.2	Function.....	2792
49.3.1.7.3	Diagram.....	2792
49.3.1.7.4	Fields.....	2792
49.3.1.8	Base Register 2 (For SDRAM CS2 device) (BR2).....	2793
49.3.1.8.1	Offset.....	2793
49.3.1.8.2	Function.....	2794
49.3.1.8.3	Diagram.....	2794
49.3.1.8.4	Fields.....	2794
49.3.1.9	Base Register 3 (For SDRAM CS3 device) (BR3).....	2795
49.3.1.9.1	Offset.....	2795
49.3.1.9.2	Function.....	2795
49.3.1.9.3	Diagram.....	2795
49.3.1.9.4	Fields.....	2796
49.3.1.10	Base Register 4 (For NAND device) (BR4).....	2796
49.3.1.10.1	Offset.....	2796
49.3.1.10.2	Function.....	2797
49.3.1.10.3	Diagram.....	2797
49.3.1.10.4	Fields.....	2797
49.3.1.11	Base Register 5 (For NOR device) (BR5).....	2798
49.3.1.11.1	Offset.....	2798
49.3.1.11.2	Function.....	2798
49.3.1.11.3	Diagram.....	2798
49.3.1.11.4	Fields.....	2799
49.3.1.12	Base Register 6 (For PSRAM device) (BR6).....	2799
49.3.1.12.1	Offset.....	2799
49.3.1.12.2	Function.....	2800
49.3.1.12.3	Diagram.....	2800

Section number	Title	Page
49.3.1.12.4	Fields.....	2800
49.3.1.13	Base Register 7 (For DBI-B (MIPI Display Bus Interface Type B) device) (BR7).....	2801
49.3.1.13.1	Offset.....	2801
49.3.1.13.2	Function.....	2801
49.3.1.13.3	Diagram.....	2801
49.3.1.13.4	Fields.....	2802
49.3.1.14	Base Register 8 (For NAND device) (BR8).....	2803

49.4.9.1	SRAM Read Operation in ASYNC Mode.....	2881
49.4.9.2	SRAM Write Operation in ASYNC mode.....	2882
49.4.10	Display Bus Interface Controller Operations.....	2883

## Chapter 50 Secure Non-Volatile Storage (SNVS)

50.1	Chip-specific SNVS information.....	2885
50.2	SNVS introduction.....	2885
50.2.1	SNVS feature list.....	2885
50.2.2	SNVS functional description.....	2886

<b>Section number</b>	<b>Title</b>	<b>Page</b>
50.3	SNVS Structure.....	2887
50.3.1	SNVS power domains.....	2887
50.3.2	SNVS clock sources.....	2888
50.4	Runtime Procedures.....	2888
50.4.1	Using SNVS Timer Facilities.....	2889
50.4.1.1	SNVS_HP Real Time Counter.....	2889
50.4.1.2	RTC/SRTC control bits setting.....	2889
50.4.1.3	Reading RTC and SRTC values.....	2890
50.4.2	Using Other SNVS Registers.....	2891
50.4.2.1	Using the General-Purpose Register.....	2891
50.5	Reset and Initialization of SNVS.....	2891
50.5.1	Initialization Checklists.....	2893
50.6	SNVS register descriptions.....	2894
50.6.1	SNVS Memory map.....	2895
50.6.2	SNVS_HP Lock Register (HPLR).....	2895
50.6.2.1	Offset.....	2895
50.6.2.2	Function.....	2895
50.6.2.3	Diagram.....	2896
50.6.2.4	Fields.....	2896
50.6.3	SNVS_HP Command Register (HPCOMR).....	2897
50.6.3.1	Offset.....	2897
50.6.3.2	Function.....	2898
50.6.3.3	Diagram.....	2898
50.6.3.4	Fields.....	2898
50.6.4	SNVS_HP Control Register (HPCR).....	2900
50.6.4.1	Offset.....	2900
50.6.4.2	Function.....	2900
50.6.4.3	Diagram.....	2900
50.6.4.4	Fields.....	2900

Section number	Title	Page
50.6.5	SNVS_HP Status Register (HPSR).....	2902
50.6.5.1	Offset.....	2902
50.6.5.2	Function.....	2902
50.6.5.3	Diagram.....	2903
50.6.5.4	Fields.....	2903
50.6.6	SNVS_HP Real Time Counter MSB Register (HPRTCMR).....	2904
50.6.6.1	Offset.....	2904

50.6.18.3	Diagram.....	2921
50.6.18.4	Fields.....	2921
50.6.19	SNVS_HP Version ID Register 2 (HPVIDR2).....	2922
50.6.19.1	Offset.....	2922
50.6.19.2	Function.....	2922
50.6.19.3	Diagram.....	2922
50.6.19.4	Fields.....	2923

## Chapter 51 Sony/Philips Digital Interface (SPDIF)

51.1	Overview .....	2925
51.2	External Signals.....	2927
51.3	Clocks.....	2927
51.4	Functional Description.....	2927
51.4.1	SPDIF Receiver.....	2928
51.4.1.1	Audio Data Reception.....	2929
51.4.1.1.1	Application Note.....	2931
51.4.1.2	Channel Status Reception.....	2932
51.4.1.2.1	Channel Status Interrupt.....	2932
51.4.1.3	User Bit Reception.....	2932

Section number	Title	Page
51.4.1.4	Validity Flag Reception.....	2934
51.4.1.5	SPDIF Receiver Interrupt Exception Definition.....	2935
51.4.1.6	Standards Compliance.....	2935
51.4.1.7	SPDIF PLOCK Detection and Rxclk Output.....	2936
51.4.1.8	Measuring Frequency of SPDIF_RxClk.....	2936
51.4.2	SPDIF Transmitter.....	2937
51.4.2.1	Audio Data Transmission.....	2937
51.4.2.2	Channel Status Transmission.....	2938
51.4.2.3	Validity Flag Transmission.....	2938
51.5	SPDIF Memory Map/Register Definition.....	2938
51.5.1	SPDIF Configuration Register (SPDIF_SCR).....	2940
51.5.2	CDText Control Register (SPDIF_SRCD).....	2942
51.5.3	PhaseConfig Register (SPDIF_SRPC).....	2943
51.5.4	InterruptEn Register (SPDIF_SIE).....	2944
51.5.5	InterruptStat Register (SPDIF_SIS).....	2946
51.5.6	InterruptClear Register (SPDIF_SIC).....	2948
51.5.7	SPDIFRxLeft Register (SPDIF_SRL).....	2949
51.5.8	SPDIFRxRight Register (SPDIF_SRR).....	2950
51.5.9	SPDIFRxCChannel_h Register (SPDIF_SRCSH).....	2950
51.5.10	SPDIFRxCChannel_l Register (SPDIF_SRCSL).....	2951
51.5.11	UchannelRx Register (SPDIF_SRU).....	2951
51.5.12	QchannelRx Register (SPDIF_SRQ).....	2952
51.5.13	SPDIFTxLeft Register (SPDIF_STL).....	2952
51.5.14	SPDIFTxRight Register (SPDIF_STR).....	2953
51.5.15	SPDIFTxCChannelCons_h Register (SPDIF_STCSCH).....	2953
51.5.16	SPDIFTxCChannelCons_l Register (SPDIF_STCSCL).....	2954
51.5.17	FreqMeas Register (SPDIF_SRFM).....	2954
51.5.18	SPDIFTxClk Register (SPDIF_STC).....	2955

## Chapter 52

Section number	Title	Page
<b>System Reset Controller (SRC)</b>		
52.1	SRC Overview.....	2957
52.1.1	Features.....	2957
52.2	External Signals.....	2957
52.3	Clocks.....	2958
52.4	Top-level resets, power-up sequence and external supply integration.....	2958
52.4.1	Reset and Power-up Flow.....	2959
52.4.2	Finite-State Machine (FSM).....	2961
52.4.3	Power mode transitions.....	2962
52.5	Power-On Reset and power sequencing.....	2963
52.5.1	External POR using SRC_POR_B.....	2963
52.5.2	Internal POR.....	2963
52.6	Functional Description.....	2964
52.6.1	Reset Control.....	2964
52.6.1.1	Reset inputs and outputs.....	2964
52.6.1.2	Reset Handling.....	2966
52.6.1.2.1	POR (SRC_POR_B).....	2966
52.6.1.2.2	COLD RESET.....	2967
52.6.2	Parallel Reset Requests.....	2967
52.6.3	Boot Mode Control.....	2968
52.6.3.1	BOOT_MODE Pin Latching.....	2968
52.7	SRC Memory Map/Register Definition.....	2969
52.7.1	SRC Control Register (SRC_SCR).....	2970
52.7.2	SRC Boot Mode Register 1 (SRC_SBMR1).....	2972
52.7.3	SRC Reset Status Register (SRC_SRSR).....	2973
52.7.4	SRC Boot Mode Register 2 (SRC_SBMR2).....	2976
52.7.5	SRC General Purpose Register 1 (SRC_GPR1).....	2977
52.7.6	SRC General Purpose Register 2 (SRC_GPR2).....	2978
52.7.7	SRC General Purpose Register 3 (SRC_GPR3).....	2978

<b>Section number</b>	<b>Title</b>	<b>Page</b>
52.7.8	SRC General Purpose Register 4 (SRC_GPR4).....	2979
52.7.9	SRC General Purpose Register 5 (SRC_GPR5).....	2979
52.7.10	SRC General Purpose Register 6 (SRC_GPR6).....	2980
52.7.11	SRC General Purpose Register 7 (SRC_GPR7).....	2980
52.7.12	SRC General Purpose Register 8 (SRC_GPR8).....	2981
52.7.13	SRC General Purpose Register 9 (SRC_GPR9).....	2981
52.7.14	SRC General Purpose Register 10 (SRC_GPR10).....	2982

### **Chapter 53 Temperature Monitor (TEMPMON)**

53.1	Overview.....	2983
53.2	Software Usage Guidelines.....	2984
53.3	TEMPMON Memory Map/Register Definition.....	2986
53.3.1	Tempensor Control Register 0 (TEMPMON_TEMPSENSE0n).....	2987
53.3.2	Tempensor Control Register 1 (TEMPMON_TEMPSENSE1n).....	2989
53.3.3	Tempensor Control Register 2 (TEMPMON_TEMPSENSE2n).....	2989

### **Chapter 54 Touch Screen Controller (TSC)**

54.1	Overview.....	2991
54.1.1	Features.....	2992
54.2	Functional Description.....	2993
54.2.1	Operating modes.....	2993
54.2.1.1	Idle.....	2993
54.2.1.2	Pre-charge.....	2993
54.2.1.3	Detection.....	2993
54.2.1.4	Measurement.....	2994
54.2.1.5	Data valid check.....	2994
54.2.1.6	Interrupt.....	2994
54.2.1.7	Reset.....	2994
54.2.1.8	Debug mode.....	2994

Section number	Title	Page
54.2.2	Configuration.....	2995
54.2.2.1	TSC configurations.....	2995
54.2.2.2	TSC-ADC-TSC analogue configuration.....	2995
54.2.2.3	TSC, TSC analogue and ADC connection.....	2996
54.2.2.4	TSC and GPIO.....	2996
54.2.2.5	ADC-TSC co-working.....	2997
54.3	TSC Memory Map/Register Definition.....	2998
54.3.1	TSC_BASIC_SETTING.....	2999
54.3.2	TSC_PRE_CHARGE_TIME.....	3000
54.3.3	Flow Control (TSC_FLOW_CONTROL).....	3000
54.3.4	Measure Value (TSC_MEASURE_VALUE).....	3001
54.3.5	Interrupt Enable (TSC_INT_EN).....	3002
54.3.6	Interrupt Signal Enable (TSC_INT_SIG_EN).....	3003
54.3.7	Interrupt Status (TSC_INT_STATUS).....	3004
54.3.8	TSC_DEBUG_MODE.....	3006
54.3.9	TSC_DEBUG_MODE2.....	3008

## Chapter 55 Universal Serial Bus Controller (USB)

55.1	Overview.....	3013
55.1.1	Features.....	3014
55.1.2	Modes of Operation.....	3015
55.1.2.1	Normal Mode.....	3016
55.1.2.2	Low-Power Mode.....	3016
55.2	External Signals.....	3016
55.3	Functional Description.....	3017
55.3.1	USB 2.0 Controller Core 0/1.....	3017
55.3.1.1	Host Mode.....	3017
55.3.1.2	Peripheral (Device) Mode.....	3018
55.3.2	USB Power Control.....	3018

Section number	Title	Page
55.3.2.1	Entering Low Power Suspend Mode.....	3018
55.3.2.2	Wake-Up Events.....	3019
55.3.2.2.1	Host Mode Events.....	3019
55.3.3	Interrupts.....	3020
55.3.3.1	USB Core Interrupts.....	3020
55.3.3.2	USB Wake-Up Interrupts.....	3020
55.4	USB Operation Model.....	3020
55.4.1	Register Interface.....	3021
55.4.1.1	Configuration, Control and Status Register Set.....	3021
55.4.1.2	Identification Registers.....	3023
55.4.1.3	OTG Operations.....	3023
55.4.2	Host Data Structures.....	3024
55.4.2.1	Periodic Frame List.....	3024
55.4.2.2	Asynchronous List Queue Head Pointer.....	3026
55.4.2.3	Isochronous (High-Speed) Transfer Descriptor (iTDD).....	3027
55.4.2.3.1	Next Link Pointer.....	3028
55.4.2.3.2	iTD Transaction Status and Control List.....	3029
55.4.2.3.3	iTD Buffer Page Pointer List (Plus).....	3030
55.4.2.4	Split Transaction Isochronous Transfer Descriptor (siTD).....	3032
55.4.2.4.1	Next Link Pointer.....	3032
55.4.2.4.2	siTD Endpoint Capabilities/Characteristics.....	3033
55.4.2.4.3	siTD Transfer State.....	3034
55.4.2.4.4	siTD Buffer Pointer List (plus).....	3035
55.4.2.4.5	siTD Back Link Pointer.....	3036
55.4.2.5	Queue element transfer descriptor (qTD).....	3036
55.4.2.5.1	Next qTD Pointer.....	3037
55.4.2.5.2	Alternate Next qTD Pointer.....	3038
55.4.2.5.3	qTD Token.....	3038
55.4.2.5.4	qTD Buffer Page Pointer List.....	3041

Section number	Title	Page
55.4.2.6	Queue Head.....	3042
55.4.2.6.1	Queue Head Horizontal Link Pointer.....	3042
55.4.2.6.2	Queue Head Endpoint Capabilities/Characteristics.....	3043
55.4.2.6.3	Transfer Overlay-Queue Head.....	3045
55.4.2.7	Periodic Frame Span Traversal Node (FSTN).....	3046
55.4.2.7.1	FSTN Normal Path Pointer .....	3047
55.4.2.7.2	FSTN Back Path Link Pointer .....	3047
55.4.3	Host Operational Model .....	3048
55.4.3.1	Host Controller Initialization .....	3048
55.4.3.2	Port Routing and Control.....	3050
55.4.3.2.1	Port Routing Control through EHCI Configured (CF) Bit .....	3052
55.4.3.2.2	Port Routing Control through PortOwner and Disconnect Event .....	3053
55.4.3.2.3	Example Port Routing State Machine .....	3055
55.4.3.2.3.1	EHCI HC Owner .....	3055
55.4.3.2.3.2	Companion HC Owner .....	3056
55.4.3.2.4	Port Power .....	3056
55.4.3.2.5	Port Reporting Over-Current .....	3057
55.4.3.3	Suspend/Resume-Host Operational Model .....	3058
55.4.3.3.1	Port Suspend/Resume .....	3058
55.4.3.4	Schedule Traversal Rules.....	3061
55.4.3.4.1	Example - Preserving Micro-Frame Integrity .....	3063
55.4.3.4.1.1	Transaction Fit - A Best-Fit Approximation Algorithm .....	3063
55.4.3.5	Periodic Schedule Frame Boundaries vs Bus Frame Boundaries .....	3065
55.4.3.6	Periodic Schedule .....	3068
55.4.3.7	Managing Isochronous Transfers Using iTDs .....	3070
55.4.3.7.1	Host Controller Operational Model for iTDs .....	3070
55.4.3.7.2	Software Operational Model for iTDs .....	3072
55.4.3.7.2.1	Periodic scheduling threshold.....	3074
55.4.3.8	Asynchronous Schedule .....	3075

Section number	Title	Page
55.4.3.8.1	Adding Queue Heads to Asynchronous Schedule.....	3076
55.4.3.8.2	Removing Queue Heads from Asynchronous Schedule .....	3077
55.4.3.8.3	Empty Asynchronous Schedule Detection .....	3079
55.4.3.8.4	Restarting Asynchronous Schedule Before EOF .....	3080
55.4.3.8.4.1	Example Method for Restarting Asynchronous Schedule Traversal .....	3081
55.4.3.8.4.2	Async Sched Not Active .....	3082
55.4.3.8.4.3	Async Sched Active .....	3082
55.4.3.8.4.4	Async Sched Sleeping .....	3083
55.4.3.8.4.5	Example Derivation for AsyncSchedSleepTime.....	3083
55.4.3.8.5	Asynchronous schedule traversal: Start Event.....	3083
55.4.3.8.6	Reclamation Status Bit (USBSTS Register).....	3084
55.4.3.9	Operational Model for Nak Counter.....	3084
55.4.3.9.1	Nak Count Reload Control .....	3086
55.4.3.9.1.1	Wait for List Head .....	3087
55.4.3.9.1.2	Do Reload .....	3087
55.4.3.9.1.3	Wait for Start Event .....	3087
55.4.3.10	Managing Control/Bulk/Interrupt Transfers through Queue Heads.....	3088
55.4.3.10.1	Fetch Queue Head .....	3090
55.4.3.10.2	Advance Queue .....	3090
55.4.3.10.3	Execute Transaction .....	3091
55.4.3.10.3.1	Interrupt Transfer Pre-condition Criteria .....	3092

## Chapter 56 Universal Serial Bus 2.0 Integrated PHY (USB-PHY)

56.1	USB PHY Overview.....	3273
56.2	Operation.....	3273
56.2.1	UTMI.....	3273
56.2.2	Digital Transmitter.....	3274
56.2.3	Digital Receiver.....	3274
56.2.4	Analog Receiver.....	3274
56.2.4.1	HS Differential Receiver.....	3275
56.2.4.2	Squelch Detector.....	3276
56.2.4.3	LS/FS Differential Receiver.....	3276
56.2.4.4	HS Disconnect Detector.....	3276
56.2.4.5	USB Plugged-In Detector.....	3276
56.2.4.6	Single-Ended USB_DP Receiver.....	3277

Section number	Title	Page
56.2.4.7	Single-Ended USB_DN Receiver.....	3277
56.2.4.8	9X Oversample Module.....	3277
56.2.5	Analog Transmitter.....	3277
56.2.5.1	Switchable High-Speed 45Ω Termination Resistors.....	3277
56.2.5.2	Low-Speed/Full-Speed Differential Driver.....	3278
56.2.5.3	High-Speed Differential Driver.....	3278
56.2.5.4	Switchable 1.5KΩ USB_DP Pullup Resistor.....	3278
56.2.5.5	Switchable 15KΩ USB_DP Pulldown Resistor.....	3278
56.2.6	Recommended Register Configuration for USB Certification.....	3280
56.2.7	Charger detection.....	3280
56.2.7.1	Charger detect control table.....	3280
56.2.7.2	Data pin contact detector.....	3280
56.2.7.3	Charger detector.....	3281
56.2.7.4	Charger detection software flow.....	3281
56.2.7.5	Dead Battery Protect.....	3283
56.3	USB PHY Memory Map/Register Definition.....	3283
56.3.1	USB PHY Power-Down Register (USBPHY <sub>x</sub> _PwDn).....	3286
56.3.2	USB PHY Transmitter Control Register (USBPHY <sub>x</sub> _TXn).....	3288
56.3.3	USB PHY Receiver Control Register (USBPHY <sub>x</sub> _RXn).....	3289
56.3.4	USB PHY General Control Register (USBPHY <sub>x</sub> _CTRLn).....	3291
56.3.5	USB PHY Status Register (USBPHY <sub>x</sub> _STATUS).....	3294
56.3.6	USB PHY Debug Register (USBPHY <sub>x</sub> _DEBUGn).....	3296
56.3.7	UTMI Debug Status Register 0 (USBPHY <sub>x</sub> _DEBUG0_STATUS).....	3298
56.3.8	UTMI Debug Status Register 1 (USBPHY <sub>x</sub> _DEBUG1n).....	3299
56.3.9	UTMI RTL Version (USBPHY <sub>x</sub> _VERSION).....	3300
56.4	USB Analog Memory Map/Register Definition.....	3300
56.4.1	USB VBUS Detect Register (USB_ANALOG_USB1_VBUS_DETECTn).....	3302
56.4.2	USB Charger Detect Register (USB_ANALOG_USB1_CHRG_DETECTn).....	3303
56.4.3	USB VBUS Detect Status Register (USB_ANALOG_USB1_VBUS_DETECT_STAT).....	3305

Section number	Title	Page
56.4.4	USB Charger Detect Status Register (USB_ANALOG_USB1_CHRG_DETECT_STAT).....	3307
56.4.5	USB Misc Register (USB_ANALOG_USB1_MISCN).....	3308
56.4.6	USB VBUS Detect Register (USB_ANALOG_USB2_VBUS_DETECTn).....	3309
56.4.7	USB Charger Detect Register (USB_ANALOG_USB2_CHRG_DETECTn).....	3311
56.4.8	USB VBUS Detect Status Register (USB_ANALOG_USB2_VBUS_DETECT_STAT).....	3313
56.4.9	USB Charger Detect Status Register (USB_ANALOG_USB2_CHRG_DETECT_STAT).....	3315
56.4.10	USB Misc Register (USB_ANALOG_USB2_MISCN).....	3316
56.4.11	Chip Silicon Version (USB_ANALOG_DIGPROG).....	3317

## Chapter 57 Ultra Secured Digital Host Controller (uSDHC)

57.1	Chip-specific uSDHC information.....	3319
57.2	Overview.....	3319
57.2.1	Features.....	3322
57.2.2	Modes and Operations.....	3323
57.2.2.1	Data transfer Modes.....	3323
57.3	External Signals.....	3323
57.3.1	Signals Overview.....	3324
57.4	Clocks.....	3325
57.5	Functional Description.....	3325
57.5.1	Data Buffer.....	3325
57.5.1.1	Write Operation Sequence.....	3327
57.5.1.2	Read Operation Sequence.....	3328
57.5.1.3	Data Buffer and Block Size.....	3329
57.5.1.4	Dividing Large Data Transfer.....	3329
57.5.2	DMA AHB Interface.....	3330
57.5.2.1	Internal DMA Request.....	3331
57.5.2.2	DMA Burst Length.....	3332
57.5.2.3	AHB Master Interface.....	3332
57.5.2.4	ADMA Engine.....	3332

Section number	Title	Page
57.5.2.4.1	ADMA Concept and Descriptor Format.....	3333
57.5.2.4.2	ADMA Interrupt.....	3337
57.5.2.4.3	ADMA Error.....	3338
57.5.3	Register Bank with IP Bus Interface.....	3338
57.5.3.1	SD Protocol Unit.....	3339
57.5.3.2	SD control misc.....	3340
57.5.3.3	SD Clock control.....	3340
57.5.3.4	Command control.....	3340
57.5.3.5	Data control.....	3341
57.5.4	Clock & Reset Manager.....	3341
57.5.5	Clock Generator.....	3342
57.5.6	SDIO Card Interrupt.....	3342
57.5.6.1	Interrupts in 1-bit Mode.....	3342
57.5.6.2	Interrupt in 4-bit Mode.....	3343
57.5.6.3	Card Interrupt Handling.....	3343
57.5.7	Card Insertion and Removal Detection.....	3344
57.5.8	Power Management and Wake Up Events.....	3345
57.5.8.1	Setting Wake Up Events.....	3346
57.5.9	MMC fast boot.....	3346
57.5.9.1	Boot operation.....	3346
57.5.9.2	Alternative boot operation.....	3347
57.6	Initialization/Application of uSDHC.....	3348
57.6.1	Command Send & Response Receive Basic Operation.....	3348
57.6.2	Card Identification Mode.....	3349
57.6.2.1	Card Detect.....	3349
57.6.2.2	Reset.....	3350
57.6.2.3	Voltage Validation.....	3351
57.6.2.4	Card Registry.....	3353
57.6.3	Card Access.....	3354

Section number	Title	Page
57.6.3.1	Block Write.....	3354
57.6.3.1.1	Normal Write.....	3354
57.6.3.1.2	DDR Write.....	3356
57.6.3.1.3	Write with Pause.....	3356
57.6.3.2	Block Read.....	3358
57.6.3.2.1	Normal Read.....	3358
57.6.3.2.2	DDR Read.....	3358
57.6.3.2.3	Read with Pause.....	3359
57.6.3.2.4	DLL (Delay Line) in Read Path.....	3360
57.6.3.3	Suspend Resume.....	3362
57.6.3.3.1	Suspend.....	3362
57.6.3.3.2	Resume.....	3363
57.6.3.4	ADMA Usage.....	3363
57.6.3.5	Transfer Error.....	3364
57.6.3.5.1	CRC Error.....	3364
57.6.3.5.2	Internal DMA Error.....	3364
57.6.3.5.3	Transfer ADMA Error.....	3365
57.6.3.5.4	Auto CMD12 Error.....	3365
57.6.3.6	Card Interrupt.....	3366
57.6.4	Switch Function.....	3366
57.6.4.1	Query, Enable and Disable SDIO High Speed Mode.....	3367
57.6.4.2	Query, Enable and Disable SD High Speed Mode/SDR50/SDR104/DDR50.....	3367
57.6.4.3	Query, Enable and Disable MMC High Speed Mode.....	3368
57.6.4.4	Set MMC Bus Width.....	3368
57.6.5	ADMA Operation.....	3368
57.6.5.1	ADMA1 Operation.....	3369
57.6.5.2	ADMA2 Operation.....	3369
57.6.6	Fast Boot Operation.....	3370
57.6.6.1	Normal fast boot flow .....	3370

<b>Section number</b>	<b>Title</b>	<b>Page</b>
57.6.6.2	Alternative fast boot flow.....	3371
57.6.6.3	Fast boot application case (in DMA mode).....	3371
57.7	Commands for MMC/SD/SDIO.....	3373
57.8	Software Restrictions.....	3379
57.8.1	Initialization Active.....	3379
57.8.2	Software Polling Procedure.....	3379
57.8.3	Suspend Operation.....	3379
57.8.4	Data Length Setting.....	3379
57.8.5	(A)DMA Address Setting.....	3380
57.8.6	Data Port Access.....	3380
57.8.7	Change Clock Frequency.....	3380
57.8.8	Multi-block Read.....	3380
57.9	uSDHC Memory Map/Register Definition.....	3381
57.9.1	uSDHC register descriptions.....	3381
57.9.1.1	uSDHC Memory map.....	3381
57.9.1.2	DMA System Address (DS_ADDR).....	3382
57.9.1.2.1	Offset.....	3382
57.9.1.2.2	Function.....	3382
57.9.1.2.3	Diagram.....	3382
57.9.1.2.4	Fields.....	3383
57.9.1.3	Block Attributes (BLK_ATT).....	3384
57.9.1.3.1	Offset.....	3384
57.9.1.3.2	Function.....	3384
57.9.1.3.3	Diagram.....	3384
57.9.1.3.4	Fields.....	3384
57.9.1.4	Command Argument (CMD_ARG).....	3385
57.9.1.4.1	Offset.....	3385
57.9.1.4.2	Function.....	3385

## Chapter 58 Watchdog Timer (WDOG1-2)

58.1	Overview.....	3449
58.1.1	Features.....	3450
58.2	External signals.....	3451
58.3	Clocks.....	3451
58.4	Watchdog mechanism and system integration.....	3452
58.5	Functional description.....	3452
58.5.1	Timeout event.....	3452
58.5.1.1	Servicing WDOG to reload the counter.....	3453
58.5.2	Interrupt event .....	3453
58.5.3	Power-down counter event.....	3454
58.5.4	Low power modes.....	3454
58.5.4.1	STOP and DOZE mode.....	3454
58.5.4.2	WAIT mode.....	3454

Section number	Title	Page
58.5.5	Debug mode.....	3455
58.5.6	Operations.....	3455
58.5.6.1	Watchdog reset generation.....	3455
58.5.6.2	WDOG_B generation.....	3456
58.5.7	Reset.....	3458
58.5.8	Interrupt.....	3458
58.5.9	Flow Diagrams.....	3458
58.6	Initialization.....	3460
58.7	WDOG Memory Map/Register Definition.....	3461
58.7.1	WDOG Register Descriptions.....	3461
58.7.1.1	WDOG Memory Map.....	3461
58.7.1.2	Watchdog Control (WCR).....	3461
58.7.1.2.1	Address.....	3461
58.7.1.2.2	Function.....	3462
58.7.1.2.3	Diagram.....	3462
58.7.1.2.4	Fields.....	3462
58.7.1.3	Watchdog Service (WSR).....	3464
58.7.1.3.1	Address.....	3464
58.7.1.3.2	Function.....	3464
58.7.1.3.3	Diagram.....	3464
58.7.1.3.4	Fields.....	3464
58.7.1.4	Watchdog Reset Status (WRSR).....	3464
58.7.1.4.1	Address.....	3464
58.7.1.4.2	Function.....	3465
58.7.1.4.3	Diagram.....	3465
58.7.1.4.4	Fields.....	3465
58.7.1.5	Watchdog Interrupt Control (WICR).....	3466
58.7.1.5.1	Address.....	3466
58.7.1.5.2	Function.....	3466

Section number	Title	Page
58.7.1.5.3	Diagram.....	3466
58.7.1.5.4	Fields.....	3466
58.7.1.6	Watchdog Miscellaneous Control (WMCR).....	3467
58.7.1.6.1	Address.....	3467
58.7.1.6.2	Function.....	3467
58.7.1.6.3	Diagram.....	3467
58.7.1.6.4	Fields.....	3467

## Chapter 59 RTWDOG (WDOG3)

59.1	Chip-specific RTWDOG information.....	3469
59.2	Introduction.....	3469
59.2.1	Features.....	3469
59.2.2	Block diagram.....	3470
59.3	Memory map and register definition.....	3471
59.3.1	WDOG Register Descriptions.....	3471
59.3.1.1	WDOG Memory Map.....	3471
59.3.1.2	Watchdog Control and Status (CS).....	3471
59.3.1.2.1	Address.....	3471
59.3.1.2.2	Diagram.....	3472
59.3.1.2.3	Fields.....	3472
59.3.1.3	Watchdog Counter (CNT).....	3474
59.3.1.3.1	Address.....	3474
59.3.1.3.2	Function.....	3474
59.3.1.3.3	Diagram.....	3474
59.3.1.3.4	Fields.....	3475
59.3.1.4	Watchdog Timeout Value (TOVAL).....	3475
59.3.1.4.1	Address.....	3475
59.3.1.4.2	Function.....	3475
59.3.1.4.3	Diagram.....	3476

<b>Section number</b>	<b>Title</b>	<b>Page</b>
	59.3.1.4.4 Fields.....	3476
59.3.1.5	Watchdog Window (WIN).....	3476
	59.3.1.5.1 Address.....	3476
	59.3.1.5.2 Function.....	3476
	59.3.1.5.3 Diagram.....	3477
	59.3.1.5.4 Fields.....	3477
59.4	Functional description.....	3477
59.4.1	Clock source.....	3478
59.4.2	Watchdog refresh mechanism.....	3479
	59.4.2.1 Window mode.....	3479
	59.4.2.2 Refreshing the Watchdog.....	3480
59.4.3	Configuring the Watchdog.....	3480
	59.4.3.1 Configuring the Watchdog Once.....	3480
	59.4.3.2 Reconfiguring the Watchdog.....	3481
	59.4.3.2.1 Unlocking the Watchdog.....	3481
59.4.4	Using interrupts to delay resets.....	3481
59.4.5	Backup reset.....	3482
59.4.6	Functionality in debug and low-power modes.....	3482
59.4.7	Fast testing of the watchdog.....	3483
	59.4.7.1 Testing each byte of the counter.....	3483
	59.4.7.2 Entering user mode.....	3484
59.5	Application Information.....	3484
59.5.1	Disable Watchdog.....	3485
59.5.2	Configure Watchdog.....	3485
59.5.3	Refreshing the Watchdog.....	3485

## Chapter 60 Inter-Peripheral Crossbar Switch A (XBARA)

60.1	Chip-specific XBAR information.....	3487
60.2	Introduction.....	3488

Section number	Title	Page
60.2.1	Overview.....	3488
60.2.2	Features.....	3489
60.2.3	Modes of Operation.....	3489
60.2.4	Block Diagram.....	3489
60.3	Signal Descriptions.....	3490
60.3.1	XBAR_OUT[0:NUM_OUT-1] - MUX Outputs.....	3491
60.3.2	XBAR_IN[0:NUM_IN-1] - MUX Inputs.....	3491
60.3.3	DMA_REQ[n] - DMA Request Output(s).....	3491
60.3.4	DMA_ACK[n] - DMA Acknowledge Input(s).....	3491
60.3.5	INT_REQ[n] - Interrupt Request Output(s).....	3491
60.4	Memory Map and Register Descriptions.....	3491
60.4.1	Crossbar A Select Register 0 (XBARAx_SEL0).....	3495
60.4.2	Crossbar A Select Register 1 (XBARAx_SEL1).....	3495
60.4.3	Crossbar A Select Register 2 (XBARAx_SEL2).....	3496
60.4.4	Crossbar A Select Register 3 (XBARAx_SEL3).....	3496
60.4.5	Crossbar A Select Register 4 (XBARAx_SEL4).....	3497
60.4.6	Crossbar A Select Register 5 (XBARAx_SEL5).....	3497
60.4.7	Crossbar A Select Register 6 (XBARAx_SEL6).....	3498
60.4.8	Crossbar A Select Register 7 (XBARAx_SEL7).....	3498
60.4.9	Crossbar A Select Register 8 (XBARAx_SEL8).....	3499
60.4.10	Crossbar A Select Register 9 (XBARAx_SEL9).....	3499
60.4.11	Crossbar A Select Register 10 (XBARAx_SEL10).....	3500
60.4.12	Crossbar A Select Register 11 (XBARAx_SEL11).....	3500
60.4.13	Crossbar A Select Register 12 (XBARAx_SEL12).....	3501
60.4.14	Crossbar A Select Register 13 (XBARAx_SEL13).....	3501
60.4.15	Crossbar A Select Register 14 (XBARAx_SEL14).....	3502
60.4.16	Crossbar A Select Register 15 (XBARAx_SEL15).....	3502
60.4.17	Crossbar A Select Register 16 (XBARAx_SEL16).....	3503
60.4.18	Crossbar A Select Register 17 (XBARAx_SEL17).....	3503

<b>Section number</b>	<b>Title</b>	<b>Page</b>
60.4.19	Crossbar A Select Register 18 (XBARAx_SEL18).....	3504
60.4.20	Crossbar A Select Register 19 (XBARAx_SEL19).....	3504
60.4.21	Crossbar A Select Register 20 (XBARAx_SEL20).....	3505
60.4.22	Crossbar A Select Register 21 (XBARAx_SEL21).....	3505
60.4.23	Crossbar A Select Register 22 (XBARAx_SEL22).....	3506
60.4.24	Crossbar A Select Register 23 (XBARAx_SEL23).....	3506
60.4.25	Crossbar A Select Register 24 (XBARAx_SEL24).....	3507
60.4.26	Crossbar A Select Register 25 (XBARAx_SEL25).....	3507
60.4.27	Crossbar A Select Register 26 (XBARAx_SEL26).....	3508
60.4.28	Crossbar A Select Register 27 (XBARAx_SEL27).....	3508
60.4.29	Crossbar A Select Register 28 (XBARAx_SEL28).....	3509
60.4.30	Crossbar A Select Register 29 (XBARAx_SEL29).....	3509
60.4.31	Crossbar A Select Register 30 (XBARAx_SEL30).....	3510
60.4.32	Crossbar A Select Register 31 (XBARAx_SEL31).....	3510
60.4.33	Crossbar A Select Register 32 (XBARAx_SEL32).....	3511
60.4.34	Crossbar A Select Register 33 (XBARAx_SEL33).....	3511
60.4.35	Crossbar A Select Register 34 (XBARAx_SEL34).....	3512
60.4.36	Crossbar A Select Register 35 (XBARAx_SEL35).....	3512
60.4.37	Crossbar A Select Register 36 (XBARAx_SEL36).....	3513
60.4.38	Crossbar A Select Register 37 (XBARAx_SEL37).....	3513
60.4.39	Crossbar A Select Register 38 (XBARAx_SEL38).....	3514
60.4.40	Crossbar A Select Register 39 (XBARAx_SEL39).....	3514
60.4.41	Crossbar A Select Register 40 (XBARAx_SEL40).....	3515
60.4.42	Crossbar A Select Register 41 (XBARAx_SEL41).....	3515

60.4.44	Crossbar A Select Register 43 (XBARAx_SEL43).....	3516
60.4.45	Crossbar A Select Register 44 (XBARAx_SEL44).....	3517
60.4.46	Crossbar A Select Register 45 (XBARAx_SEL45).....	3517
60.4.47	Crossbar A Select Register 46 (XBARAx_SEL46).....	3518

<b>Section number</b>	<b>Title</b>	<b>Page</b>
60.4.48	Crossbar A Select Register 47 (XBARAx_SEL47).....	3518
60.4.49	Crossbar A Select Register 48 (XBARAx_SEL48).....	3519
60.4.50	Crossbar A Select Register 49 (XBARAx_SEL49).....	3519
60.4.51	Crossbar A Select Register 50 (XBARAx_SEL50).....	3520
60.4.52	Crossbar A Select Register 51 (XBARAx_SEL51).....	3520
60.4.53	Crossbar A Select Register 52 (XBARAx_SEL52).....	3521
60.4.54	Crossbar A Select Register 53 (XBARAx_SEL53).....	3521
60.4.55	Crossbar A Select Register 54 (XBARAx_SEL54).....	3522
60.4.56	Crossbar A Select Register 55 (XBARAx_SEL55).....	3522
60.4.57	Crossbar A Select Register 56 (XBARAx_SEL56).....	3523
60.4.58	Crossbar A Select Register 57 (XBARAx_SEL57).....	3523
60.4.59	Crossbar A Select Register 58 (XBARAx_SEL58).....	3524
60.4.60	Crossbar A Select Register 59 (XBARAx_SEL59).....	3524
60.4.61	Crossbar A Select Register 60 (XBARAx_SEL60).....	3525
60.4.62	Crossbar A Select Register 61 (XBARAx_SEL61).....	3525
60.4.63	Crossbar A Select Register 62 (XBARAx_SEL62).....	3526
60.4.64	Crossbar A Select Register 63 (XBARAx_SEL63).....	3526
60.4.65	Crossbar A Select Register 64 (XBARAx_SEL64).....	3527
60.4.66	Crossbar A Select Register 65 (XBARAx_SEL65).....	3527
60.4.67	Crossbar A Control Register 0 (XBARAx_CTRL0).....	3528
60.4.68	Crossbar A Control Register 1 (XBARAx_CTRL1).....	3530
60.5	Functional Description.....	3532
60.5.1	General.....	3532
60.5.2	Functional Mode.....	3532
60.6	Resets.....	3533
60.7	Clocks.....	3533
60.8	Interrupts and DMA Requests.....	3533

**Chapter 61**  
**Inter-Peripheral Crossbar Switch B (XBARB)**

Section number	Title	Page
61.1	Chip-specific XBAR information.....	3535
61.2	Introduction.....	3536
61.3	Memory Map and Register Descriptions.....	3536
61.3.1	Crossbar B Select Register 0 (XBARBx_SEL0).....	3537
61.3.2	Crossbar B Select Register 1 (XBARBx_SEL1).....	3538
61.3.3	Crossbar B Select Register 2 (XBARBx_SEL2).....	3538
61.3.4	Crossbar B Select Register 3 (XBARBx_SEL3).....	3539
61.3.5	Crossbar B Select Register 4 (XBARBx_SEL4).....	3539
61.3.6	Crossbar B Select Register 5 (XBARBx_SEL5).....	3540
61.3.7	Crossbar B Select Register 6 (XBARBx_SEL6).....	3540
61.3.8	Crossbar B Select Register 7 (XBARBx_SEL7).....	3541

## Chapter 62 Crystal Oscillator (XTALOSC)

62.1	Overview.....	3543
62.2	External Signals.....	3543
62.3	Crystal Oscillator 24 MHz.....	3544
62.3.1	Oscillator Configuration (24 MHz).....	3544
62.3.2	Bypass Configuration (24 MHz).....	3545
62.3.3	RC Oscillator (24 MHz).....	3545
62.3.4	Crystal Frequency Detection(24 MHz).....	3546
62.4	Crystal Oscillator 32 kHz.....	3546
62.4.1	Oscillator Configuration (32 kHz).....	3546

# Chapter 1

## Introduction

### 1.1 About This Document

The i.MX RT1050 processors are NXP's latest additions to a growing family of real-time processing products offering high-performance processing optimized for lowest power consumption and best real-time response.

The i.MX RT1050 processors feature NXP's advanced implementation of the ARM<sup>®</sup>Cortex<sup>®</sup>-M7 core.

#### 1.1.1 Audience

This manual is intended for the board-level product designers and product software developers. This manual assumes that the reader has a background in computer engineering and/or software engineering and understands the concepts of the digital system design, microprocessor architecture, Input/Output (I/O) devices, industry standard communication, and device interface protocols.

#### 1.1.2 Organization

This document covers the chip at a system level and provides an architectural overview. It also covers the system memory map, system-level interrupt events, external pins and pin multiplexing, external memory, system debug, system boot, multimedia subsystem, power management, and system security.

#### 1.1.3 Suggested Reading

This section lists the additional resources that provide background for the information in this manual, as well as general information about the architecture.

### 1.1.3.1 General Information

The following documentation provides useful background information about the ARM Cortex processor.

For information about the ARM Cortex processor see:

- <http://infocenter.arm.com>

### 1.1.3.2 Related Documentation

NXP documentation is available from the sources listed on the back cover of this manual; the document order numbers are included in parentheses for ease in ordering.

For a current list of documentation, refer to <http://www.nxp.com>.

## 1.1.4 Conventions

This document uses the following notational conventions:

#### *cleared / set*

When a bit has a value of zero, it is said to be cleared; when it has a value of one, it is said to be set.

#### *mnemonics*

Instruction mnemonics are shown in lowercase bold.

#### *italics*

Italics indicate variable command parameters, for example, **bcctrx**.

The book titles in the text are set in italics.

#### *15*

An integer in decimal.

#### *0x*

the prefix to denote a hexadecimal number.

#### *0b*

The prefix to denote a binary number. Binary values of 0 and 1 are written without a prefix.

#### *n'H4000CA00*

The n-bit hexadecimal number.

#### *BLK\_REG\_NAME*

The register names are all uppercase. The block mnemonic is prepended with an underscore delimiter (\_).

**BLK\_REG[FIELD]**

The fields within registers appear in brackets. For example, ESR[RLS] refers to the Receive Last Slot field of the ESAI Status Register.

**BLK\_REG[ *n* ]**

The bit number *n* within the BLK.REG register.

**BLK\_REG[ *l:r* ]**

The register bit ranges. The ranges are indicated by the left-most bit number *l* and the right-most bit number *r*, separated by a colon (:). For example, ESR[15:0] refers to the lower half word in the ESAI Status Register.

**x, U**

In some contexts, such as signal encodings, an unitalicized x indicates a "don't care" or "uninitialized". The binary value can be 1 or 0.

***x***

An italicized *x* indicates an alphanumeric variable.

***n, m***

Italicized *n* or *m* represent integer variables.

**!**

Binary logic operator NOT.

**&&**

Binary logic operator AND.

**||**

Binary logic operator OR.

**^ or <O+>**

Binary logic operator XOR. For example, A <O+> B.

**|**

Bit-wise OR. For example, 0b0001 | 0b1000 yields the value of 0b1001.

**&**

Bit-wise AND. For example, 0b0001 and 0b1000 yields the value of 0b0000.

**{A,B}**

Concatenation, where the *n*-bit value A is prepended to the *m*-bit value B to form an (*n* + *m*)-bit value. For example, {0, REG<sub>*m*</sub> [14:0]} yields a 16-bit value with 0 in the most significant bit.

**- or grey fill**

Indicates a reserved bit field in a register. Although these bits can be written to with ones or zeros, they always read zeros.

**>>**

Shift right logical one position.

**<<**

Shift left logical one position.

- <= Assignment.
- == Compare equal.
- != Compare not equal.
- > Greater than.
- < Less than.

## 1.1.5 Register Access

### 1.1.5.1 Register Diagram Field Access Type Legend

This figure provides the interpretation of the notation used in the register diagrams for a number of common field access types:

**Figure 1-1. Register Field Conventions**

#### NOTE

For reserved register fields, the software should mask off the data in the field after a read (the software can't rely on the contents of data read from a reserved field) and always write all zeros.

### 1.1.5.2 Register Macro Usage

A common operation is to update one field without disturbing the contents of the remaining fields in the register. Normally, this requires a read-modify-write (RMW) operation, where the CPU reads the register, modifies the target field, then writes the results back to the register. This is an expensive operation in terms of CPU cycles, because of the initial register read.

To address this issue, some hardware registers are implemented as a group, including registers that can be used to either set, clear, or toggle (SCT) individual bits of the primary register. When writing to an SCT register, all the bits set to 1 perform the associated operation on the primary register, while the bits set to 0 are not affected. The SCT registers always read back 0, and should be considered write-only. The SCT registers are not implemented if the primary register is read-only.

With this architecture, it is possible to update one or more fields using only register writes. First, all bits of the target fields are cleared by a write to the associated clear register, then the desired value of the target fields is written to the set register. This sequence of two writes is referred to as a clear-set (CS) operation.

A CS operation does have one potential drawback. Whenever a field is modified, the hardware sees a value of 0 before the final value is written. For most fields, passing through the 0 state is not a problem. Nonetheless, this behavior is something to consider when using a CS operation.

Also, a CS operation is not required for fields that are one-bit wide. While the CS operation works in this case, it is more efficient to simply set or clear the target bit (that is, one write instead of two). A simple set or clear operation is also atomic, while a CS operation is not.

Note that not all macros for set, clear, or toggle (SCT) are atomic. For registers that do not provide hardware support for this functionality, these macros are implemented as a sequence of read-modify-write operations. When an atomic operation is required, the developer should pay attention to this detail, because unexpected behavior might result if an interrupt occurs in the middle of the critical section comprising the update sequence.

A set of SCT registers is offered for registers in many modules on this device, as described in this manual. In a module memory map table, the suffix `_SET`, `_CLR`, or `_TOG` is added to the base name of the register. For example, the `CCM_ANALOG_PLL_ARM` register has three other registers called `CCM_ANALOG_PLL_ARM_SET`, `CCM_ANALOG_PLL_ARM_CLR`, and `CCM_ANALOG_PLL_ARM_TOG`.

In the sub-section that describes one of these sets of registers, a short-hand convention is used to denote that a register has the SCT register set. There is an italicized *n* appended to the end of the short register name. Using the above example, the name used for this register is `CCM_ANALOG_PLL_ARMn`. When you see this designation, there is a SCT register set associated with the register, and you can verify this by checking it in the memory map table. The address offset for each of these registers is given in the form of the following example:

Address: `20C_8000h` base + `0h` offset +  $(4d \times i)$ , where  $i=0d$  to  $3d$

In this example, the address for each of the base registers and their three SCT registers can be calculated as:

Register	Address
CCM_ANALOG_PLL_ARM	20C_8000h
CCM_ANALOG_PLL_ARM_SET	20C_8004h
CCM_ANALOG_PLL_ARM_CLR	20c_8008h
CCM_ANALOG_PLL_ARM_TOG	20C_800Ch

### 1.1.6 Signal Conventions

**b, B**

When appended to a signal name, this indicates that a signal is active-low.

**NEG\_ACTIVE**

Overbar also denotes a negative active signal.

**UPPERCASE**

Package pin names, Block I/O signals.

**lowercase**

Lowercase is used to indicate internal signals.

### 1.1.7 Acronyms and Abbreviations

The table below contains acronyms and abbreviations used in this document.

Acronyms and Abbreviated Terms

Term	Meaning
ADC	Analog-to-Digital Converter
AHB	Advanced High-performance Bus
AIPS	Arm IP Bus
ALU	Arithmetic Logic Unit
AMBA	Advanced Microcontroller Bus Architecture
APB	Advanced Peripheral Bus
ASRC	Asynchronous Sample Rate Converter
AXI	Advanced eXtensible Interface
BEE	Bus Encryption Engine
BIST	Built-In Self Test
CA/CM	Arm Cortex-A/Cortex-M
CAN	Controller Area Network
CCM	Clock Controller Module

*Table continues on the next page...*

Term	Meaning
CPU	Central Processing Unit
CSI	CMOS Sensor Interface
CSU	Central Security Unit
CTI	Cross Trigger Interface
DAP	Debug Access Port
DCP	Data Co-Processor
DDR	Double data rate
DMA	Direct memory access
DPLL	Digital phase-locked loop
DRAM	Dynamic random access memory
ECC	Error correcting codes
LPSPi	Low-power SPI
EDMA	Enhanced Direct Memory Access
EIM	External Interface Module
ENET	Ethernet
EPIT	Enhanced Periodic Interrupt Timer
EPROM	Erasable Programmable Read-Only Memory
ETF	Embedded Trace FIFO
ETM	Embedded Trace Macrocell
FIFO	First-In-First-Out
GIC	General Interrupt Controller
GPC	General Power Controller
GPIO	General-Purpose I/O
GPR	General-Purpose Register
GPS	Global Positioning System
GPT	General-Purpose Timer
GPU	Graphics Processing Unit
GPV	Global Programmers View
HAB	High-Assurance Boot
I2C or I <sup>2</sup> C	Inter-Integrated Circuit
IC	Integrated Circuit
IEEE	Institute of Electrical and Electronics Engineers
IOMUX	Input-Output Multiplexer
IP	Intellectual Property
IrDA	Infrared Data Association
JTAG	Joint Test Action Group (a serial bus protocol usually used for test purposes)
LDO	Low-Dropout
LIFO	Last-In-First-Out
LRU	Least-Recently Used
LSB	Least-Significant Byte
LUT	Look-Up Table

*Table continues on the next page...*

## About This Document

Term	Meaning
LVDS	Low Voltage Differential Signaling
MAC	Medium Access Control
MCM	Miscellaneous control Module
MMC	Multimedia Card
MSB	Most-Significant Byte
MT/s	Mega Transfers per second
OCRAM	On-Chip Random-Access Memory
OCOTP	On-Chip One-Time Programmable Controller
PCI	Peripheral Component Interconnect
PCIe	PCI enhanced
PCMCIA	Personal Computer Memory Card International Association
PGC	Power Gating Controller
PIC	Programmable Interrupt Controller
PMU	Power Management Unit
POR	Power-On Reset
PSRAM	Pseudo-Static Random Access Memory
PWM	Pulse Width Modulation
PXP	Pixel Pipeline
QoS	Quality of Service
R2D	Radians to Degrees
RISC	Reduced Instruction Set Computing
ROM	Read-Only Memory
ROMCP	ROM Controller with Patch
RTOS	Real-Time Operating System
Rx	Receive
SAI	Synchronous Audio Interface
SCU	Snoop Control Unit
SD	Secure Digital
SDIO	Secure Digital Input/Output
SDLC	Synchronous Data Link Control
SDMA	Smart DMA
SIM	Subscriber Identification Module
SNVS	Secure Non-Volatile Storage
SoC	System-on-Chip
SPBA	Shared Peripheral Bus Arbiter
SPDIF	Sony Phillips Digital Interface
SPI	Serial Peripheral Interface
SRAM	Static Random-Access Memory
SRC	System Reset Controller
TFT	Thin-Film Transistor
TPIU	Trace Port Interface

*Table continues on the next page...*

Term	Meaning
TSGEN	Time Stamp Generator
Tx	Transmit
TZASC	TrustZone Address Space Controller
UART	Universal Asynchronous Receiver/Transmitter
USB	Universal Serial Bus
USDHC	Ultra Secured Digital Host Controller
WDOG	Watchdog
WLAN	Wireless Local Area Network
WXGA	Wide Extended Graphics Array

## 1.2 Introduction

The i.MX RT1050 is a new processor family featuring NXP's advanced implementation of the high performance ARM Cortex<sup>®</sup>-M7 Core. It provides high CPU performance and best real-time response.

This device provides various memory interfaces, including SDRAM, Raw NAND FLASH, NOR FLASH, SD/eMMC, Quad SPI (FlexSPI), and a wide range of other interfaces for connecting peripherals, such as WLAN, Bluetooth<sup>™</sup>, displays, camera sensors, and GPS. Same as other i.MX processors, this i.MX RT series also has rich audio and video features, including LCD display, basic 2D graphics, camera interface, SPDIF and I2S audio interface.

### 1.2.1 Block Diagram

The functional block diagram is shown in the figure below. This diagram provides a view of the chip's major functional components and core complexes.

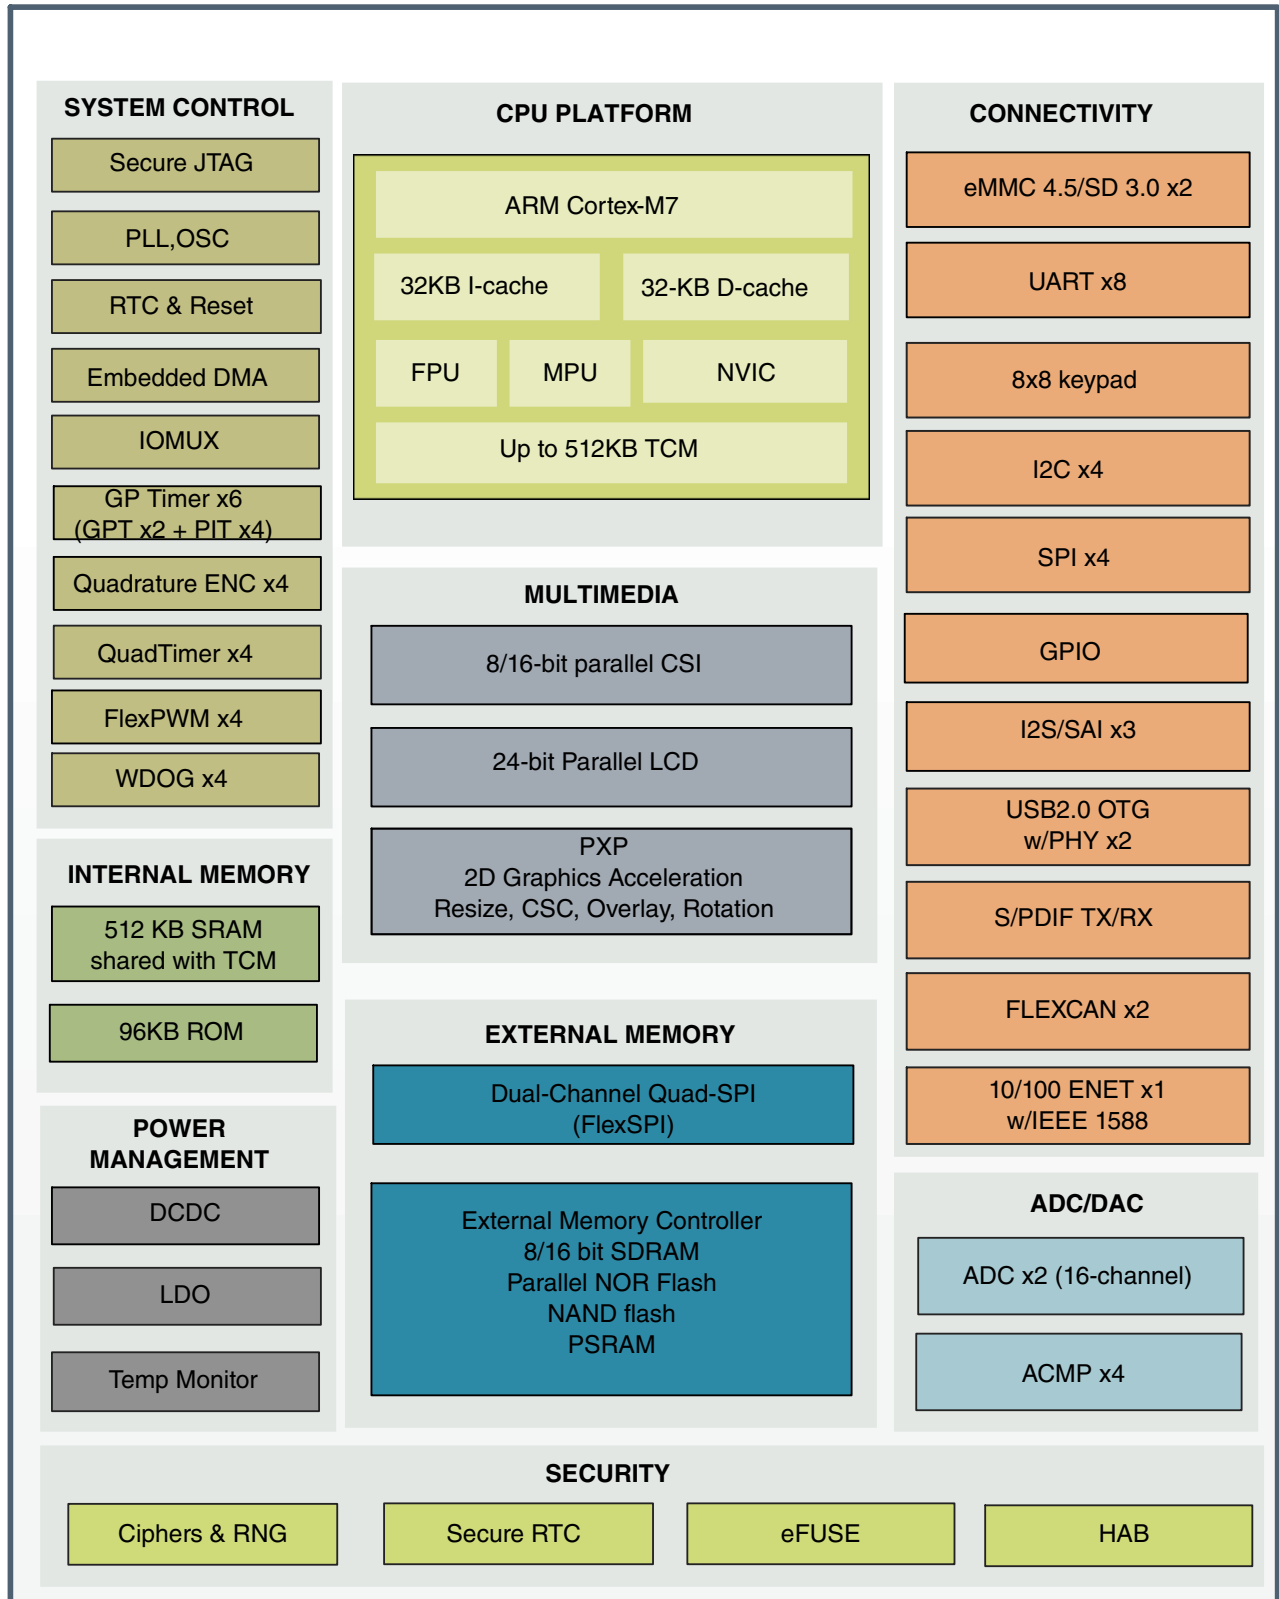

Figure 1-2. Simplified Block Diagram

## 1.3 Features

The i.MX RT1050 processors are based on ARM®Cortex®-M7 Platform, which have the following features:

Single ARM Cortex-M7 with:

- 32 KB L1 Instruction Cache
- 32 KB L1 Data Cache
- Single-precision and double-precision FPU (Floating Point Unit)

Security:

- High Assurance Boot (HAB)
- Data Co-Processor (DCP)
- Bus Encryption Engine
- True Random Number Generator
- Secure Non-volatile Storage
- Secure JTAG Controller

External Memory Interfaces:

- 8/16-bit SDRAM, up to SDRAM-166
- 8-bit SLC NAND FLASH, with ECC handled in SW
- SD/eMMC
- Single/Dual channel Quad SPI FLASH with XIP support
- Parallel NOR FLASH with XIP support

Graphics:

- Generic 2D Graphics engine (PXP)
  - Flexible image composition options – alpha, chroma key
  - Multiple pixel format support (RGB, YUV444, YUV422, YUV420, YUV400)
  - Color space conversion

Display Interface:

- Parallel RGB LCD interface, supporting 8/16/24 bit interface and upto WXGA resolution
  - Smart LCD Display with 8/16-bit MPU/8080 interface
  - Support Index color with 256 entry × 24bit color LUT

Camera Sensor Interface:

- Support 8/16/24-bit CSI Input

Audio:

- S/PDIF Input and Output

## Target Applications

- 3x SAI (synchronous audio interface) modules supporting I2S, AC97, TDM, and codec/DSP interfaces
- MQS interface for medium quality audio via GPIO pads

## Connectivity:

- 2x USB 2.0 OTG controller with integrated PHY interface
- 2x Ultra Secure Digital Host Controller (uSDHC) interfaces
- 10M/100M Ethernet controller with support for IEEE1588
- 8x Universal asynchronous receiver/transmitter (UARTs) modules
- 4x I2C modules
- 4x SPI modules
- 2x FlexCAN modules

## On Chip Memory:

- Boot ROM (96 KB)
- On-chip RAM, configurable RAM up to 512KB shared with M7 TCM

## Timers:

- 2x General Programmable Timer (GPT)
- 4x Periodical Interrupt Timer (PIT)
- 4x Quad Timer (QTimer)
- 4x FlexPWM

## System Debug:

- ARM CoreSight debug and trace architecture
- Trace Port Interface Unit (TPIU) to support off-chip real-time trace
- Cross Triggering Interface (CTI)
- Support for 5-pin (JTAG) and SWD debug interfaces

## Power Management:

- Full PMIC integration, including on-chip DCDC and LDO
- Temperature sensor with programmable trim points
- GPC hardware power management controller

## Analog:

- 3x Analog-Digital-Converters (ADC), one of which supports differential inputs
- 2x Digital-Analog-Converters (DAC)
- 8x Analog Comparators (ACMP)

## 1.4 Target Applications

This processor can be used in areas such as industrial HMI, IoT, and motor control and home appliances.

The architecture's flexibility enables it to be used in a wide variety of other general embedded applications too. This processor provides all interfaces necessary to connect peripherals such as WLAN, Bluetooth™, GPS, camera sensors, and multiple displays.

## 1.5 Endianness Support

The chip supports only the Little Endian mode.

# Chapter 2

## Memory Maps

### 2.1 Memory system overview

This section introduces the memory architecture of the chip.

### 2.2 ARM Platform Memory Map

The chip memory map has been provided in the following tables.

**Table 2-1. System memory map (CM7)**

Start Address	End Address	Size	Description
E010_0000	FFFF_FFFF	511MB	Reserved
E000_0000	E00F_FFFF	1MB	CM7 PPB
8000_0000	DFFF_FFFF	1.5GB	SEMC external memories (SDRAM, NOR, PSRAM, NAND and 8080) shared memory space
7FC0_0000	7FFF_FFFF	4MB	FlexSPI RX FIFO
7F80_0000	7FBF_FFFF	4MB	FlexSPI TX FIFO
6000_0000	7F7F_FFFF	504MB	FlexSPI/ FlexSPI ciphertext
4800_0000	5FFF_FFFF	384MB	Reserved
4400_0000	47FF_FFFF	64MB	Reserved
4200_0000	43FF_FFFF	32MB	Reserved
4180_0000	41FF_FFFF	8MB	Reserved
4170_0000	417F_FFFF	1MB	GPV Reserved
4160_0000	416F_FFFF	1MB	GPV Reserved
4150_0000	415F_FFFF	1MB	GPV Reserved
4140_0000	414F_FFFF	1MB	"cpu" configuration port
4130_0000	413F_FFFF	1MB	Reserved for "ems" GPV
4120_0000	412F_FFFF	1MB	Reserved for "per" GPV
4110_0000	411F_FFFF	1MB	"m" configuration port

*Table continues on the next page...*

**NOTE**

Accessing the reserved memory regions can result in unpredictable behavior.

# Chapter 3

## Interrupts, DMA Events, and XBAR Assignments

### 3.1 Overview

This section describes the assignments of interrupts from the ARM domain and from the DMA events .

### 3.2 CM7 interrupts

The Nested Vectored Interrupt Controller (NVIC) collects up to 240 interrupt request sources and provides an interface to the Cortex-M7 core.

This table describes the Cortex-M7 interrupt sources:

**Table 3-1. CM7 domain interrupt summary**

IRQ	Module	Logic	Description
0	eDMA	OR	eDMA Channel 0 Transfer Complete
			eDMA Channel 16 Transfer Complete
1		OR	eDMA Channel 1 Transfer Complete
			eDMA Channel 17 Transfer Complete
2		OR	eDMA Channel 2 Transfer Complete
			eDMA Channel 18 Transfer Complete
3		OR	eDMA Channel 3 Transfer Complete
			eDMA Channel 19 Transfer Complete
4		OR	eDMA Channel 4 Transfer Complete
			eDMA Channel 20 Transfer Complete
5		OR	eDMA Channel 5 Transfer Complete
			eDMA Channel 21 Transfer Complete
6		OR	eDMA Channel 6 Transfer Complete
			eDMA Channel 22 Transfer Complete
7	OR	eDMA Channel 7 Transfer Complete	

*Table continues on the next page...*

**Table 3-1. CM7 domain interrupt summary (continued)**

IRQ	Module	Logic	Description	
8		OR	eDMA Channel 23 Transfer Complete

			I2C-3 Interrupt slave
31	LPI2C4	OR	I2C-4 Interrupt master async
			I2C-4 Interrupt slave async
			I2C-4 Interrupt master
			I2C-4 Interrupt slave
32	LPSP1	-	LPSP1 interrupt request line to the core
33	LPSP2	-	LPSP2 interrupt request line to the core
34	LPSP3	-	LPSP3 interrupt request line to the core
35	LPSP4	-	LPSP4 interrupt request line to the core
36	CAN1	-	Combined interrupt of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
37	CAN2	-	Combined interrupt of ini_int_busoff, ini_int_error, ipi_int_mbor, ipi_int_rxwarning, ipi_int_txwarning and ipi_int_wakein.
38	CM7	-	FlexRAM address out of range Or access hit IRQ
39	KPP	-	Keypad Interrupt
40	TSC_DIG	-	TSC interrupt
41	GPR_IRQ	-	Used to notify cores on exception condition while boot
42	LCDIF	-	LCDIF Sync Interrupt
43	CSI	-	CSI interrupt
44	PXP	-	PXP interrupt
45	WDOG2	-	Watchdog Timer reset
46	SNVS_HP_WRAPPER	-	SNVS Functional Interrupt
47		-	SNVS Security Interrupt
48	SNVS_LP_WRAPPER	OR	ON-OFF button press shorter than 5 secs (pulse event)
	SNVS_HP_WRAPPER		ON-OFF button press shorter than 5 secs (pulse event)
49	CSU	-	CSU Interrupt Request 1. Indicates to the processor that one or more alarm inputs were asserted
50	DCP	-	Combined DCP channel interrupts (except channel 0) and CRC interrupt
51		-	IRQ of DCP channel 0

Table continues on the next page...

**Table 3-1. CM7 domain interrupt summary (continued)**

IRQ	Module	Logic	Description
52		-	Reserved
53	TRNG	-	TRNG Interrupt
54	SJC	-	SJC Interrupt from General Purpose register.
55	BEE	-	BEE IRQ
56	SAI1	OR	SAI RX interrupt
			SAI RX async interrupt
			SAI TX interrupt
			SAI TX async interrupt
57	SAI2	OR	SAI RX interrupt
			SAI RX async interrupt
			SAI TX interrupt
			SAI TX async interrupt
58	SAI3	-	SAI RX interrupt
59		-	SAI TX interrupt
60	SPDIF	OR	SPDIF Rx interrupt
			SPDIF Tx interrupt
61	PMU	-	Brown-out event on either the 1.1, 2.5 or 3.0 regulators.
62	Reserved	-	Reserved
63	Temperature Monitor	OR	TempSensor low
			TempSensor high
64		-	TempSensor panic
65	USB PHY	-	USBPHY (UTMI0), Interrupt
66		-	USBPHY (UTMI1), Interrupt
67	ADC1	OR	ADC1 interrupt
			ADC1 async interrupt
68	ADC2	OR	ADC2 interrupt
			ADC2 async interrupt

# Chapter 4

## External Signals and Pin Multiplexing

### 4.1 Overview

The chip contains a limited number of pins, most of which have multiple signal options. These signal-to-pin and pin-to-signal options are selected by the input-output multiplexer called IOMUX. The IOMUX is also used to configure other pin characteristics, such as voltage level, drive strength, and hysteresis.

The muxing options table lists the external signals grouped by the module instance, the muxing options for each signal, and the registers used to route the signal to the chosen pad.

#### 4.1.1 Muxing Options

##### NOTE

System STOP/WAIT status can be observed on pin. See [CCM\\_WAIT](#) and [CCM\\_STOP](#) in the table below.

**Table 4-1. Muxing Options**

Instance	Port	Pad	Mode
ADC1	ADC1_IN0	GPIO_AD_B1_11	-
	ADC1_IN1	GPIO_AD_B0_12	-
	ADC1_IN2	GPIO_AD_B0_13	-

# Chapter 5

## Fusemap

### 5.1 Boot Fusemap

This section describes the various modes and the selection of the required boot devices.

A separate map is given for each and every boot device. The device select is specified by the BOOT\_CFG1[7:4] fuses.

**Table 5-1. Boot device select**

Boot Device	BOOT_CFG1[7]	BOOT_CFG1[6]	BOOT_CFG1[5]	BOOT_CFG1[4]
FlexSPI1 (Serial NOR)	0	0	0	0
SD	0	1	x	x
MMC/eMMC	1	0	x	x
SEMC (NAND)	0	0	1	x
SEMC (NOR)	0	0	0	1
FlexSPI1 (Serial NAND)	1	1	x	x

### NOTE

The fuses marked as “Reserved” are reserved for NXP internal (and future) use only. Customers **must not** attempt to burn these, because the IC behavior may be unpredictable. The reserved fuses can be read as either '0' or '1'.

**Table 5-2. FlexSPI1 (Serial NOR) boot fusemap**

Address	7	6	5	4	3	2	1	0
0x450[7:0] (BOOT_CFG1)	0	0	0	0	HOLD TIME 00 - 500us 01 - 1 ms 10 - 3ms 11 - 10ms	EncryptedXIP 0 - Disabled 1 - Enabled	Reserved	Reserved

*Table continues on the next page...*

**Table 5-2. FlexSPI1 (Serial NOR) boot fusemap (continued)**

Address	7	6	5	4	3	2	1	0

## 5.3 Fusemap Descriptions Table

This section describes the chip fusemap descriptions.

**Table 5-9. Fusemap Descriptions**

Fuse Address	Fuses Name	Number of Fuses	Fuses Function	Setting	Locked by
0x400[1:0]	TESTER_LOCK	2	Perform lock on Tester programmed fuses.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register) x1 - Write Lock (The controlled field can be read or sensed only) 1x - Operation Lock (The controlled field can't be overridden)	N/A
0x400[3:2]	BOOT_CFG_LOCK	2	Perform lock on BOOT related fuses.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register) x1 - Write Lock (The controlled field can be read or sensed only) 1x - Operation Lock (The controlled field can't be overridden)	N/A
0x400[5:4]	MEM_TRIM_LOCK	2	Trimming fuses. Burnt on the tester or by customer before the final product shipment.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register) x1 - Write Lock (The controlled field can be read or sensed only) 1x - Operation Lock (The controlled field can't be overridden)	N/A
0x400[6]	SJC_RESP_LOCK	1	SJC response lock	0 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register) 1 - Lock (The controlled field can't be read, sensed, burned or overridden in the corresponded IIM register)	N/A
0x400[7]	Reserved	1	Reserved	Reserved	Reserved
0x400[9:8]	MAC_ADDR_LOCK	2	Lock MAC_ADDR fuses.	00 - Unlock (The controlled field can be read, sensed, burned or overridden in the corresponded IIM register)	N/A

# Chapter 6

## External Memory Controllers

### 6.1 Overview

This chip has these external memory interfaces and controllers:

- Smart External Memory Controller (SEMC)
- eSD/eMMC/SDIO Interface
- Quad Serial Peripheral Interface (QSPI)

### 6.2 Smart External Memory Controller (SEMC) Overview

The SEMC is a multi-standard memory controller optimized for both high-performance and low pin-count. It can support multiple external memories in the same application with shared address and data pins. The interface supported includes SDRAM, NOR Flash, SRAM and NAND Flash, as well as 8080 display interface.

The key features of the SEMC include:

- Support up to 8 memory regions up to 512Mbit per region which can be configured to be memory space of SDRAM, NOR Flash, NAND Flash, SRAM or 8080 display frame buffer
- Up to 5 Chip Select (CS) signals
- Ability to disable SDRAM and NAND controller by separate fuse bit
- Support Address Latch Enable (ALE)
- SDRAM interface
  - Supports both 8-bit and 16-bit modes
  - Up to 512Mb per each Chip Select (CS) and up to 4x CS
- NOR Flash and SRAM interface
  - Supports both 8-bit and 16-bit modes
  - Async mode
  - Address and Data Multiplexing (ADM)

## Smart External Memory Controller (SEMC) Overview

- Up to 128Mb per each Chip Select (CS)
- Support NOR Flash program via IPBus configuration
- 8080 display interface
  - Supports both 8/16/24-bit modes
  - Up to 100MHz
  - Without tearing effect support
- NAND Flash
  - 8/16-bit NAND FLASH,
  - Async mode only
  - Only supports device which is capable of cache read/write operations
  - Only supports page based operation
- Dynamic I/O sharing which enables multiple external memory device in parallel
- Multi-device access pattern scheduler
  - 8 entries scheduler
  - QoS priority, latency and efficiency adjustable arbitration scheme
- SDRAM access pattern optimization
  - 8 entries command reordering queue
  - QoS priority, latency and efficiency adjustable arbitration scheme

The following is the high level functional diagram for the SEMC:

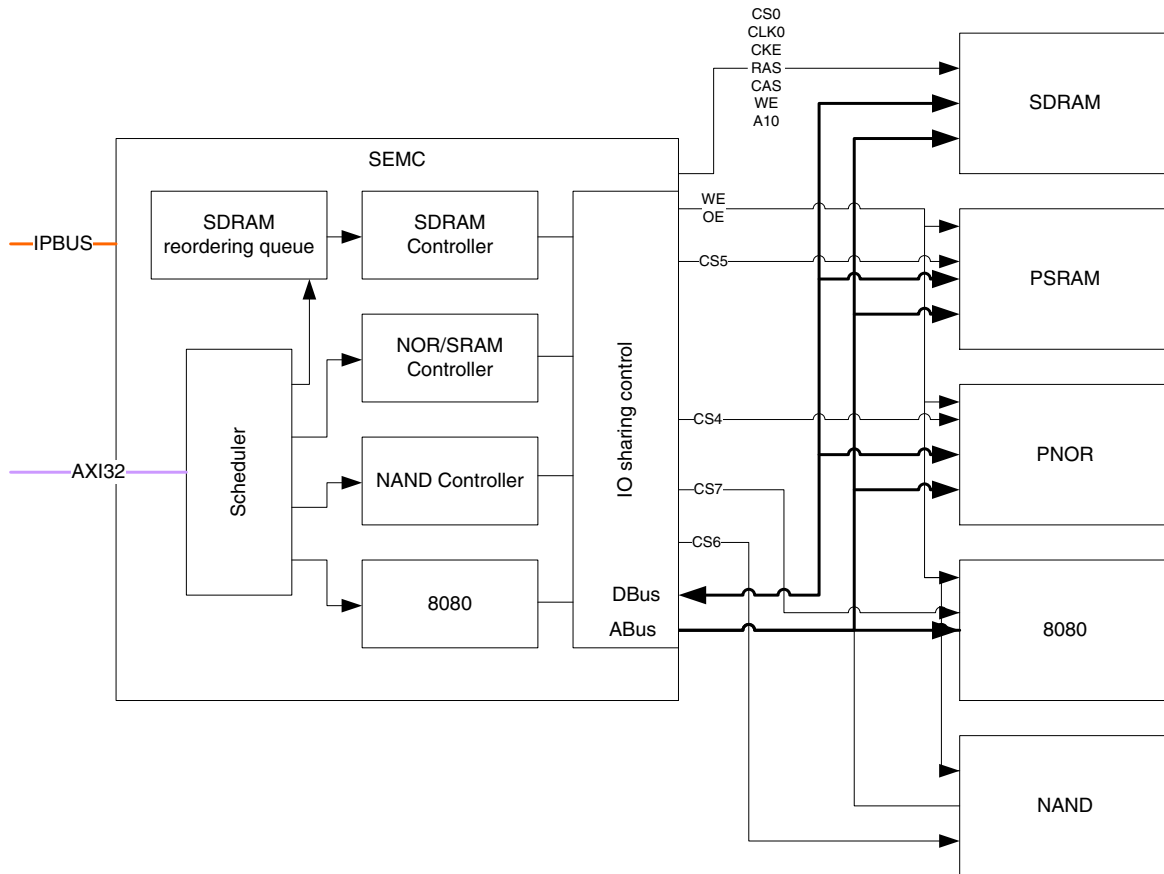

Figure 6-1. SEMC High-Level Functional Diagram

### 6.3 eMMC/eSD/SDIO

This chip has two Ultra Secured Digital Host Controller (uSDHC) modules for SD/eMMC interface. It provides the interface between the host system and the SD/SDIO/MMC cards.

The key features include:

- Support SD/SDIO standard, up to version 3.0
- Support MMC standard, up to version 4.5
- Support 3.3V and 1.8V operation, but do not support 1.2V operation.
- Supports 1-bit / 4-bit SD and SDIO modes, 1-bit / 4-bit / 8-bit MMC modes
  - Up to 800 Mbps of data transfer for SDIO cards using 4 parallel data lines in SDR mode

- Up to 400 Mbps of data transfer for SDIO card using 4 parallel data lines in DDR mode
- Up to 800 Mbps of data transfer for SDXC cards using 4 parallel data lines in SDR mode
- Up to 400 Mbps of data transfer for SDXC card using 4 parallel data lines in DDR mode
- Up to 1600 Mbps of data transfer for MMC cards using 8 parallel data lines in SDR mode
- Up to 800 Mbps of data transfer for MMC cards using 8 parallel data lines in DDR mode

## 6.4 Quad Serial Peripheral Interface

This chip has one Quad Serial Peripheral Interface block (named FlexSPI) acts as an interface to one or two external serial flash devices, each with up to four bidirectional data lines.

The key features includes:

- Each channel can be configured as 1/2/4-bit operation
- Support both dual-channel or single-channel operation
- Support both SDR mode and DDR mode
- Support up to 166MHz SDR Mode and 166MHz DDR Mode (with external Flash device DQS input)
- Support up to 133MHz SDR Mode and 66MHz DDR Mode (with internal DQS loopback mode);

# Chapter 7

## System Debug

### 7.1 Overview

This section describes the hardware and software debug and application development features and resources of the chip. It describes the following:

- Core/platform-specific resources
- Resources associated with complex IP blocks
- Chip-wide resources
- Interface to the external debug and development tools

The debug and trace architecture is designed around the following:

- ARM CoreSight architecture, adapted to SoC (for core debug), including a cross-trigger subsystem for cross-domain triggering of debug resources
- JTAG port used to interact with core under the debug by means of SJC, the system JTAG controller port
- DAP, the debug access port that supports the interface to the ARM RealView Debugging tools and other third-party tools
- TPIU, a trace port interface unit that efficiently accesses the program trace information from the system
- Various chip-wide resources, such as debug features built into the IP blocks and critical signal visibility available through alternate pin functions or observability muxes

### 7.2 Chip and ARM Platform Debug Architecture

The ARM Debug architecture is based on the CoreSight architecture by ARM. The CoreSight architecture provides a system-wide solution to real-time debug and trace.

The CoreSight architecture is embodied in a set of CoreSight components and compliant processors that form the CoreSight systems. Its architecture maintains the traditional requirements of debug and trace:

- To access the debug functionality without software interaction
- To connect to a running system without performing a reset

Full access to the processor debug capability is available by the ARM debug register map through the Advanced Peripheral Bus (APB) slave port. The core includes a Processor Debug Unit which stops program execution, examines and alters the processor and coprocessor state, examines and alters the memory and input/output peripheral state, and restarts the processor core.

## 7.2.1 Debug Features

- EmbeddedICE-RT logic
  - Support for both the monitor-mode and halt-mode debugging:
  - Core run/halt control, debug status/control
  - Breakpoint/watchpoint control
  - Core-mapped and memory-mapped resource examination/modification
- Data communication channel between the ARM core and the host debugger via JTAG or SWD and the Debug Access Port (DAP) module

The chip includes ARM CoreSight components for debug and trace solutions.

## 7.2.2 Debug system components

The CoreSight components include:

- ETM (Embedded Trace Macrocell) supporting instruction trace
- ITM (Instrumentation Trace Macrocell)
- TPIU (Trace Port Interface)
- Cross Triggering logic for event routing, including CTIs

Other related IPs and functionality:

- Flash Patch and Breakpoint unit (FPB)

### 7.2.2.1 AMBA Trace Bus (ATB)

ATB transfers trace data through the chip CoreSight infrastructure. The trace sources are ATB masters and the sinks are ATB slaves. The ARM (via PTM) cores are the data generators. Link components such as the Trace Funnel and Replicator provide both the master and slave interfaces.

The ATB protocol supports:

- Stalling of trace sources to enable the CoreSight components to funnel and combine the sources into a single trace stream
- Association of the trace data with the generating source using trace source IDs. The CoreSight system can trace up to 111 different items at any time
- Capture and transfer of multiple byte bus widths, currently to 32 bits
- A flushing mechanism to force the historic trace to drain from any sources, links, or sinks up to the point that the request is initiated

### 7.2.2.2 CoreSight trace port interface (TPIU)

#### TPIU (Cortex-M7)

TPIU is one of the CoreSight trace sink components. It acts as a bridge between the on-chip trace data and a data stream that is then driven out the trace port.

TPIU uses the ATB interface to accept trace data from a trace source, either directly or by using a trace funnel. TPIU has 4 bit port connected to the chip pad.

The APB interface is the programming interface for the TPIU configuration.

The features of the sub-blocks are as follows:

- **Formatter**—Inserts source ID signals into the data packet stream so that the trace data can be re-associated with the trace source.
- **Asynchronous FIFO**—Enables trace data to be driven out at a speed that is not dependent on the on-chip bus clock.
- **Register Bank**—Contains the management, control and status registers for triggers, flushing behavior and external control.
- **Trace out**—The Trace out block serializes the formatted data before it goes off-chip.
- **Pattern Generator**—The Pattern Generator unit provides a simple set of defined bit sequences or patterns that can be output over the Trace Port and be detected by the TPA or other associated Trace Capture Device (TCD). The TCD can use these patterns to indicate if it is possible to increase or decrease the trace port clock speed.

The TPIU accepts trace data from a trace source, either direct from a trace source or using a Trace Funnel. The APB interface is the programming interface for the TPIU. The Trace Clock driving the data out to external pins can be obtained from either an on chip or off chip source, selectable via a mux.

The output of the TPIU is connected via external pins (MPS of TRACEDATA in [Debug Configuration](#), which can be 1, 2, or 4 bits). The system may utilize double data rate pins to either use a lower clock speed than that of the 32-bit ATB interface, or use fewer than 4 data pins for the output, based on the ability of the technology used. Given the speed of the ATB, 4 data pins with double data rate is recommended, with the external interface running at half the speed of the ATB. The speed of the external interface is from TRACECLKIN, and should be selectable via an on chip or off chip clock. TRACECLK is equal to TRACECLKIN / 2, and is divided in the TPIU to clock trace data at the trace capture unit.

TPIU used to be part of the ARM platform sub blocks in previous versions of i.MX products, placing the TPIU off platform allows future debug trace sources from the chip level to connect to the TPIU by means of a funnel.

For more information, see ARM Cortex M7 Integration and Implementation Manual.

### 7.2.2.3 Embedded Trace Macrocell (ETM)

Instruction trace, also known as ETM (Embedded Trace Macrocell) trace, is a continuously collected sequence of every executed instruction for a selected portion of the application. ETM generates trace packets and sends them to the trace bus. ETM does not actually output every address or instruction that the processor has reached or executed; it usually generates compressed information about the program flow and outputs full addresses only if needed (for example, if a branch has taken place). Because the debugger knows the application code image, the debugger can then reconstruct the full instruction sequence from the trace data.

For more information about ETM, refer to *ARM® CoreSight™ ETM-M7 Revision r0p1 Technical Reference Manual*.

### 7.2.2.4 Instrumentation Trace Macrocell

The ITM (Instrumentation Trace Macrocell) generates trace information as packets. There are four sources that can generate packets. If multiple sources generate packets at the same time, the ITM arbitrates the order in which packets are output. The four sources in decreasing order of priority are:

- Synchronization: DWT provides periodic requests to make ITM generate synchronization packet. Trace capture hardware uses it to identify the alignment of packet bytes in the bit-stream.
- Software Trace: Application software can write console messages directly to ITM stimulus ports, and output them to the host as trace packets.
- Hardware trace: The DWT generates these packets, and the ITM outputs them.
- Timestamping: ITM can generate timestamp packets that are inserted in to the trace stream, to help the host debugger to find out the timing of events. Timestamps are generated relative to packets. The ITM receives a 64-bit counter to generate the timestamp.

Trace data from ITM will be forwarded to TPIU and streamed out via the trace port.

For more information about ITM, refer to *ARMv7-M Architecture Reference Manual*.

## 7.2.3 Chip-Specific SJC Features

### 7.2.3.1 JTAG Disable Mode

In addition to different JTAG security modes that are implemented internally in the System JTAG Controller (SJC), there is an option to disable the SJC functionality by e-fuse configuration.

This creates additional JTAG mode "JTAG Disabled" with highest level of JTAG protection. In this mode all JTAG features are disabled. Specifically, the following debug features are disabled in addition to the features that were already disabled in "No Debug" JTAG mode:

- Non-Secure JTAG control registers (PLL configuration, Deterministic Reset, PLL bypass)
- Non-Secure JTAG status registers (Core status)
- Chip Identification Code (IDCODE)

### 7.2.3.2 JTAG ID

**Table 7-1. i.MX JTAG ID**

Device	Silicon revision	JTAG ID
i.MX RT1050	Rev 1.1 (Silicon A1)	188C_301Dh

## 7.2.4 System JTAG controller main features

- IEEE P1149.1, 1149.6 (standard JTAG) interface to off-chip test and development equipment
  - Includes an SJC-only mode for true IEEE P1149.1 compliance, used primarily for board-level implementation of boundary scan.
  - Supports IEEE P1149.6 extensions to the JTAG standard for AC testing of selected I/O signals.
- Debug-related control and status; putting selected cores into reset and/or debug mode and monitoring individual core status signals by means of JTAG
- System status, such as the state of the PLLs (locked or not locked)
- levels of security, ranging from no security to no JTAG accessibility to the chip

## 7.2.5 SJC TAP Port

The SJC supports the following standard JTAG pins:

- TRSTB
- TDI
- TDO
- TCK
- TMS

## 7.2.6 SJC main blocks

- Interface to the outside world via the standard JTAG pins
- Interface to the external Debug\_Event pin
- A master TAP controller which implements the standard JTAG state machine
- Implementation of the mandatory and optional IEEE P1149.1 (JTAG) instructions
  - Mandatory: "EXTEST", "SAMPLE/PRELOAD", and "BYPASS"
  - Optional: "ID\_CODE" (SOC JTAG ID register), "HIGHZ"
- The ExtraDebug registers, which implement a variety of control and status features
  - Three 32-bit insecure general purpose status registers
  - Two 32-bit secure status registers - one predefined, one general purpose.
  - Control and status registers for debug, core, charge pump, and PLL.
- Four levels of fuse-defined security, ranging from no security to no access.

Both predefined and user-defined control and status functions are supported by the SJC.

## 7.3 Miscellaneous

The Miscellaneous function described in this section provide useful general capabilities.

### 7.3.1 Clock/Reset/Power

CDBGPWRUPREQ and CDBGPWRUPACK are the handshake signals between the DAP and the clock control module to ensure debug power and clocks are turned on. If the debug components are always powered on, the handshake becomes a mechanism to turn debug clocks on. Similarly, there is a register bit in the CCM which allows internal software to turn debug clocks on as well because the CDBGPWRUPREQ is in the TCLK domain and is inaccessible to software.

The debug components can receive resets from the following sources:

- Debug Reset (CDBGGRSTREQ bit within the SWJ-DP CTRL/STAT register of the DAP) in the TCLK domain. This allows the debug tools to reset the debug logic.
- System POR reset

## 7.4 Supported tools

DS-5 ARM Debugger is supported.

The debugger is connected to the chip from the host by the DS-5 ICE protocol converter. Other third party tools can be used via the standard JTAG interface, but may need to be adapted for individual IC. It is important to check with tool vendors for specific tool requirements, especially for on-chip IC.

# Chapter 8

## System Boot

### 8.1 Chip-specific Boot Information

This device has various peripherals supported by the ROM bootloader.

## 8.2 Overview

The boot process begins at the Power-On Reset (POR) where the hardware reset logic forces the ARM core to begin the execution starting from the on-chip boot ROM.

The boot ROM code uses the state of the internal register `BOOT_MODE[1:0]` as well as the state of various eFUSES and/or GPIO settings to determine the boot flow behavior of the device.

The main features of the ROM include:

- Support for booting from various boot devices
- Serial downloader support (USB OTG and UART)
- Device Configuration Data (DCD) and plugin
- Digital signature and encryption based High-Assurance Boot (HAB)
- Wake-up from the low-power modes
- Encrypted XIP on Serial NOR via FlexSPI interface powered by BEE and DCP controller

The boot ROM supports these boot devices:

- Serial NOR Flash via FlexSPI
- Serial NAND Flash via FlexSPI
- Parallel NOR Flash via SEMC
- RAWNAND Flash via SEMC
- SD/MMC
- SPI NOR/EEPROM via LPSPI

The boot ROM uses the state of the `BOOT_MODE` and eFUSES to determine the boot device. For development purposes, the eFUSES used to determine the boot device may be overridden using the GPIO pin inputs.

The boot ROM code also allows to download the programs to be run on the device. The example is a provisioning program that can make further use of the serial connection to provide a boot device with a new image. Typically, the provisioning program is downloaded to the internal RAM and allows to program the boot devices, such as the SD/MMC flash. The ROM serial downloader uses a high-speed USB in a non-stream mode connection.

The boot ROM allows waking up from the low-power modes. On reset, the ROM checks the power gating status register. When waking from the low-power mode, the core skips loading an image from the boot device and jumps to the address saved in `PERSISTENT_ENTRY0`.

The Device Configuration Data (DCD) feature allows the boot ROM code to obtain the SOC configuration data from an external program image residing on the boot device. As an example, the DCD can be used to program the SDRAM controller for optimal settings, improving the boot performance. The DCD is restricted to the memory areas and peripheral addresses that are considered essential for the boot purposes (see [Write data command](#)).

A key feature of the boot ROM is the ability to perform a secure boot, also known as a High-Assurance Boot (HAB). This is supported by the HAB security library which is a subcomponent of the ROM code. The HAB uses a combination of hardware and software together with the Public Key Infrastructure (PKI) protocol to protect the system from executing unauthorized programs. Before the HAB allows the user image to execute, the image must be signed. The signing process is done during the image build process by the private key holder and the signatures are then included as a part of the final program image. If configured to do so, the ROM verifies the signatures using the public keys included in the program image. In addition to supporting the digital signature verification to authenticate the program images, the encrypted boot is also supported. The encrypted boot can be used to prevent the cloning of the program image directly off the boot device. A secure boot with HAB can be performed on all boot devices supported on the chip in addition to the serial downloader. The HAB library in the boot ROM also provides the API functions, allowing the additional boot chain components (bootloaders) to extend the secure boot chain. The out-of-fab setting for the `SEC_CONFIG` is the open configuration, in which the ROM/HAB performs the image authentication, but all authentication errors are ignored and the image is still allowed to execute.

## 8.3 Boot modes

During reset, the chip checks the power gating controller status register.

During boot, the core's behavior is defined by the boot mode pin settings, as described in [Boot mode pin settings](#). When waking up from the low-power boot mode, the core skips the clock settings. The boot ROM checks that the PERSISTENT\_ENTRY0 (see [Persistent bits](#)) is a pointer to a valid address space (OCRAM, or DDR). If the PERSISTENT\_ENTRY0 is a pointer to a valid range, it starts the execution using the entry point from the PERSISTENT\_ENTRY0 register. If the PERSISTENT\_ENTRY0 is a pointer to an invalid range, the core performs the system reset.

### 8.3.1 Boot mode pin settings

The device has four boot modes (one is reserved for NXP use). The boot mode is selected based on the binary value stored in the internal BOOT\_MODE register.

The BOOT\_MODE is initialized by sampling the BOOT\_MODE0 and BOOT\_MODE1 inputs on the rising edge of the POR\_B. After these inputs are sampled, their subsequent state does not affect the contents of the BOOT\_MODE internal register. The state of the internal BOOT\_MODE register may be read from the BMOD[1:0] field of the SRC Boot Mode Register (SRC\_SBMR2). The available boot modes are: Boot From Fuses, serial boot via USB, and Internal Boot. See this table for settings:

**Table 8-2. Boot MODE pin settings**

BOOT_MODE[1:0]	Boot Type
00	Boot From Fuses
01	Serial Downloader
10	Internal Boot
11	Reserved

## 8.3.2 High-level boot sequence

The figure found here show the high-level boot ROM code flow.

Figure 8-1. Boot flow

### 8.3.3 Boot From Fuses mode (BOOT\_MODE[1:0] = 00b)

A value of 00b in the BOOT\_MODE[1:0] register selects the Boot From Fuses mode.

This mode is similar to the Internal Boot mode described in [Internal Boot mode \(BOOT\\_MODE\[1:0\] = 0b10\)](#) with one difference. In this mode, the GPIO boot override pins are ignored. The boot ROM code uses the boot eFUSE settings only. This mode also supports a secure boot using HAB.

If set to Boot From Fuses, the boot flow is controlled by the BT\_FUSE\_SEL eFUSE value. If BT\_FUSE\_SEL = 0, indicating that the boot device (for example, flash, SD/MMC) was not programmed yet, the boot flow jumps directly to the Serial Downloader. If BT\_FUSE\_SEL = 1, the normal boot flow is followed, where the ROM attempts to boot from the selected boot device.

The first time a board is used, the default eFUSES may be configured incorrectly for the hardware on the platform. In such case, the Boot ROM code may try to boot from a device that does not exist. This may cause an electrical/logic violation on some pads. Using the Boot From Fuses mode addresses this problem.

Setting the BT\_FUSE\_SEL=0 forces the ROM code to jump directly to the Serial Downloader. This allows a bootloader to be downloaded which can then provision the boot device with a program image and blow the BT\_FUSE\_SEL and the other boot configuration eFUSES. After the reset, the boot ROM code determines that the BT\_FUSE\_SEL is blown (BT\_FUSE\_SEL = 1) and the ROM code performs an internal boot according to the new eFUSE settings. This allows the user to set BOOT\_MODE[1:0]=00b on a production device and burn the fuses on the same device (by forcing the entry to the Serial Downloader), without changing the value of the BOOT\_MODE[1:0] or the pullups/pulldowns on the BOOT\_MODE pins.

### **8.3.4 Serial Downloader (BOOT\_MODE[1:0] = 01b)**

The Serial Downloader provides a means to download a Program Image to the chip over USB or UART serial connection. In this mode, typically a host PC can communicate to the ROM bootloader using serial download protocol. Serial downloader and the protocol are discussed in [Serial Downloader](#).

### **8.3.5 Internal Boot mode (BOOT\_MODE[1:0] = 0b10)**

A value of 0b10 in the BOOT\_MODE[1:0] register selects the Internal Boot mode. In this mode, the processor continues to execute the boot code from the internal boot ROM.

The boot code performs the hardware initialization, loads the program image from the chosen boot device, performs the image validation using the HAB library (see [Boot security settings](#)), and then jumps to an address derived from the program image. If an error occurs during the internal boot, the boot code jumps to the Serial Downloader (see [Serial Downloader \(BOOT\\_MODE\[1:0\] = 01b\)](#)). A secure boot using the HAB is possible in all the three boot modes.

When set to the Internal Boot, the boot flow may be controlled by a combination of eFUSE settings with an option of overriding the fuse settings using the General Purpose I/O (GPIO) pins. The GPIO Boot Select FUSE (BT\_FUSE\_SEL) determines whether the ROM uses the GPIO pins for a selected number of configuration parameters or eFUSES in this mode.

- If BT\_FUSE\_SEL = 1, all boot options are controlled by the eFUSES described in [Boot eFUSE descriptions](#).
- If BT\_FUSE\_SEL = 0, the specific boot configuration parameters may be set using the GPIO pins rather than eFUSES. The fuses that can be overridden when in this mode are indicated in the GPIO column of [Boot eFUSE descriptions](#). [GPIO boot overrides](#) provides the details of the GPIO pins.

The use of the GPIO overrides is intended for development since these pads are used for other purposes in the deployed products. NXP recommends controlling the boot configuration by the eFUSES in the deployed products and reserving the use of the GPIO mode for the development and testing purposes only.

### 8.3.6 Boot security settings

The internal boot modes use one of three security configurations.

- **Closed:** This level is intended for use with shipping-secure products. All HAB functions are executed and the security hardware is initialized (the Security Controller or SNVS enters the Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, and the boot flow is aborted with the control being passed to the serial downloader. At this level, the execution does not leave the internal ROM unless the target executable image is authenticated.
- **Open:** This level is intended for use in non-secure products or during the development phases of a secure product. All HAB functions are executed as for a closed device. The security hardware is initialized (except for the SNVS which is left in the Non-Secure state), the DCD is processed if present, and the program image is authenticated by the HAB before its execution. All detected errors are logged, but have no influence on the boot flow which continues as if the errors did not occur. This configuration is useful for a secure product development because the program image runs even if the authentication data is missing or incorrect, and the error log can be examined to determine the cause of the authentication failure.
- **Field Return:** This level is intended for the parts returned from the shipped products.

**NOTE**

If the DIR\_BT\_DIS eFuse is not blown, the authentication may be bypassed. In this case the system is not secure.

**8.4 Device configuration**

This section describes the external inputs that control the behavior of the Boot ROM code.

This includes the boot device selection (FlexSPI NOR, FlexSPI NAND, Parallel NOR, SD, MMC, and so on), boot device configuration (SD bus width, speed, and so on), and other. In general, the source for this configuration comes from the eFUSES embedded inside the chip. However, certain configuration parameters can be sourced from the GPIO pins, allowing further flexibility during the development process.

**8.4.1 Boot eFUSE descriptions**

This table is a comprehensive list of the configuration parameters that the ROM uses.

**Table 8-3. Boot eFUSE descriptions**

Fuse	Configuration	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
DIR_BT_DIS	OEM	Disables the NXP reserved modes. Must be set for the secure boot. .	NA	0	0—The reserved NXP modes are enabled. 1—The reserved NXP modes are disabled.
BT_FUSE_SEL	OEM	In the Internal Boot mode BOOT_MODE[1:0] = 10, the BT_FUSE_SEL fuse determines whether the boot settings indicated by a Yes in the GPIO column are controlled by the GPIO pins or the eFUSE settings in the On-Chip OTP Controller (OCOTP).  In the Boot From Fuse mode BOOT_MODE[1:0] = 00, the BT_FUSE_SEL fuse indicates whether the bit configuration eFuses are programmed.	NA	0	If BOOT_MODE[1:0] = 0b10: <ul style="list-style-type: none"> <li>• 0—The bits of the SBMR are overridden by the GPIO pins.</li> <li>• 1—The specific bits of the SBMR are controlled by the eFUSE settings.</li> </ul> If BOOT_MODE[1:0] = 0b00 <ul style="list-style-type: none"> <li>• 0—The BOOT configuration eFuses are not programmed yet. The boot flow jumps to the serial downloader.</li> <li>• 1—The BOOT configuration eFuses are programmed. The regular boot flow is performed.</li> </ul>

*Table continues on the next page...*

**Table 8-3. Boot eFUSE descriptions  
(continued)**

Fuse	Configuratio n	Definition	GPIO <sup>1</sup>	Shipped value	Settings <sup>2</sup>
SEC_CONFIG[1:0]	SEC_CONFIG[0] - NXP SEC_CONFIG[1] - OEM	Security Configuration, as defined in <a href="#">Boot security settings</a>	NA	01	00—Reserved 01—Open (allows any program image, even if the authentication fails) 1x—Closed (The program image executes only if authenticated)
FIELD_RETURN	OEM	Enables the NXP reserved modes.			0—The NXP reserved modes are enabled/disabled based on the DIR_BT_DIS value. 1—The NXP reserved modes are enabled.
SRK_HASH[255:0]	OEM	256-bit hash value of the super root key (SRK_HASH)	NA	0	Settings vary—used by HAB
UNIQUE_ID[63:0]	NXP	Device Unique ID, 64-bit UID	NA	Unique ID	Settings vary—used by HAB
BOOT_CFG1[7:0]	OEM	Boot configuration 1	Yes	0	Specific to the selected boot mode
BOOT_CFG2[3:0]	OEM	Boot configuration 2	Yes	0	Specific to the selected boot mode
BOOT_CFG2[3]	OEM	Infinite Loop Enable at the start of the boot ROM. Used for debugging purposes. Ignored if the DIR_BT_DIS is 1 and FIELD_RETURN is 0.	Yes	0	0—Disabled 1—Enabled
LPB_BOOT	OEM	Low-Power Boot	No	0	
WDOG_ENABLE	OEM	Watchdog reset counter enable	No	0	0—The watchdog reset counter is disabled during the serial downloader. 1—The watchdog reset counter is enabled during the serial downloader.
PAD_SETTINGS	OEM	Override values for the SD/MMC and NAND boot modes	No	0	Override these IO PAD settings: <ul style="list-style-type: none"> <li>• PAD_SETTINGS[0]—Slew Rate</li> <li>• PAD_SETTINGS[3:1]—Drive Strength</li> <li>• PAD_SETTINGS[5:4]—Speed Settings</li> </ul>

1. This setting can be overridden by the GPIO settings when the BT\_FUSE\_SEL fuse is intact. See [GPIO Boot Overrides](#) for the corresponding GPIO pin.
2. 0 = intact fuse and 1= blown fuse

## 8.4.2 GPIO boot overrides

This table provides a list of the GPIO boot overrides:

**Table 8-4. GPIO Boot Overrides**

Package Pin	Direction on reset	eFuse
GPIO_AD_B0_04/BOOT_MODE0	Input	Boot Mode selection
GPIO_AD_B0_05/BOOT_MODE1	Input	
GPIO_B0_04	Input	BOOT_CFG1[0]
GPIO_B0_05	Input	BOOT_CFG1[1]
GPIO_B0_06	Input	BOOT_CFG1[2]
GPIO_B0_07	Input	BOOT_CFG1[3]
GPIO_B0_08	Input	BOOT_CFG1[4]
GPIO_B0_09	Input	BOOT_CFG1[5]
GPIO_B0_10	Input	BOOT_CFG1[6]
GPIO_B0_11	Input	BOOT_CFG1[7]
GPIO_B0_12	Input	BOOT_CFG2[0]
GPIO_B0_13	Input	BOOT_CFG2[1]
GPIO_B0_14	Input	BOOT_CFG2[2]
GPIO_B0_15	Input	BOOT_CFG2[3]

### NOTE

Refer to the Fusemap chapter for more information on fuses mapped to the GPIO pins.

The input pins provided are sampled at boot, and can be used to override the corresponding eFUSE values, depending on the setting of the BT\_FUSE\_SEL fuse.

## 8.4.3 Device Configuration Data (DCD)

The DCD is the configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various on-chip peripherals. See [Device Configuration Data \(DCD\)](#) for more details on DCD.

## 8.5 Device initialization

This section describes the details of the ROM and provides the initialization details.

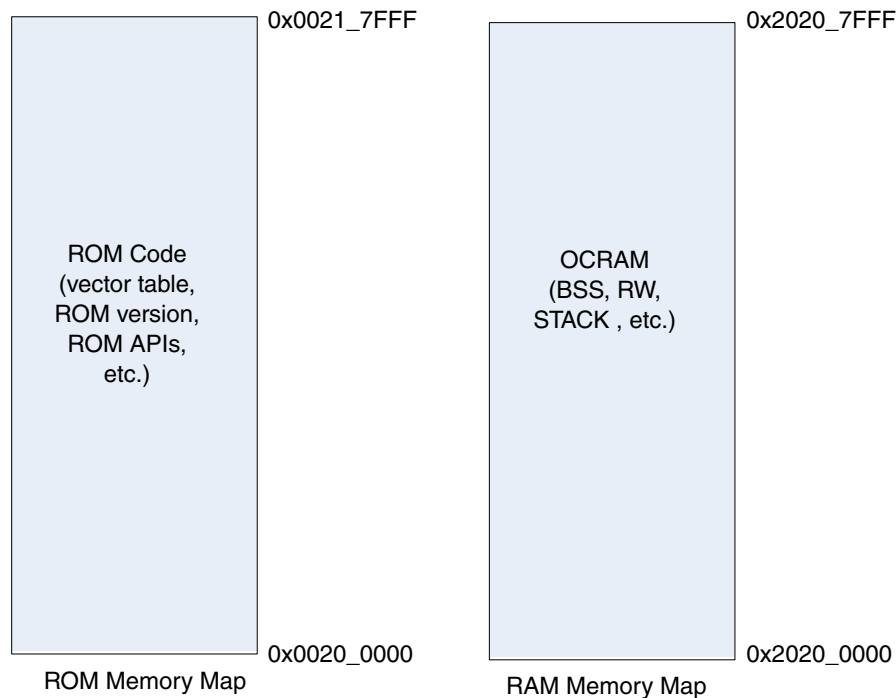

This includes details on:

- The ROM memory map

- The RAM memory map
- On-chip blocks that the ROM must use or change the POR register default values
- Clock initialization
- Enabling the L1 I/D cache
- Exception handling and interrupt handling

### 8.5.1 Internal ROM/RAM memory map

These figures show the internal ROM and RAM memory map:

**Figure 8-2. Internal ROM and RAM memory map**

#### NOTE

The entire OGRAM region can be used freely after the boot.

### 8.5.2 Boot block activation

The boot ROM affects a number of different hardware blocks which are activated and play a vital role in the boot flow.

## Device initialization

The ROM configures and uses the following blocks (listed in an alphabetical order) during the boot process. Note that the blocks actually used depend on the boot mode and the boot device selection:

Block	Description
CCM	Clock Control Module
FlexSPI	Flexible SPI Interface which supports serial NOR, Serial NAND and serial RAM devices
OCOTP	On Chip One Time Programmable Controller containing the eFUSES
IOMUXC	I/O Multiplexer Control which allows the GPIO use to override the eFUSE boot settings
IOMUX GPR	I/O Multiplexer control General Purpose Registers
LPSPI	Low Power SPI interface which supports serial NOR/EEPROM devices
SEMC	Smart External Memory Controller which supports parallel NOR and RAWNAND (SLC) devices
SNVS	Secure Non- Volatile Storage
SRC	System Reset Controller
USB	Used for Serial download of a boot device provisioning program
uSDHC	Ultra-Secure Digital Host Controller
WDOG 1	WatchDog Timer

### 8.5.3 Clocks at boot time

The table below shows the various clocks and their sources used by the ROM.

**Table 8-5. Normal Frequency Clock Configurations**

BOOT_FREQ(0x460[2])	LPB_BOOT(0x470[22:21])	Core Clock Frequency(MHz)
0	0	396
	1	198
	2	99
	3	49.5
1	0	528
	1	264
	2	132
	3	66

Following reset, the ARM core has access to all peripherals. The ROM code will disable the clocks listed in the following table:

**Table 8-6. List of Disabled Clocks**

## 8.5.4 Enabling Caches

The boot ROM includes a feature that enables the caches to improve the boot speed.

L1 instruction cache is enabled at the start of image download. And, the L1 data cache is enabled at the start of image authentication.

By default, the L1-ICache and DCache are enabled by ROM. However, there are fuse bits that can be programmed for ROM not to enable the L1 I/DCache at boot.

The Cache features are controlled by the BT\_ICACHE\_DISABLE fuse and BT\_DCACHE\_DISABLE fuses. By default, both fuses are not blown meaning the ROM uses the L1-ICache and L1-DCache of the ARM core. This improves the performance of the HAB signature verification software.

## 8.5.5 Exception handling

The exception vectors (interrupt vectors/vector table) are located at the start of ROM. During the boot phase, CPU loads the SP and PC from exception vectors and then boot to ROM.

After boot the program image can relocate the vectors as required.

## 8.5.6 Interrupt handling during boot

No special interrupt-handling routines are required during the boot process. The interrupts are disabled during the boot ROM execution and may be enabled in a later boot stage.

## 8.5.7 Persistent bits

Some modes of the boot ROM require the registers that keep their values after a warm reset. The SRC General-Purpose registers are used for this purpose.

See this table for persistent bits list and description:

**Table 8-7. Persistent bits**

Bit name	Bit location	Description
PERSIST_SECONDARY_BOOT	SRC_GPR10[30]	This bit identifies which image must be used—primary and secondary. Used only for eMMC/SD boot.
PERSISTENT_ENTRY0[31:0]	SRC_GPR1[31:0]	Holds the entry function for the CPU0 to wake up from the low-power mode.
PERSISTENT_ARG0[31:0]	SRC_GPR2[31:0]	Holds the argument of entry function for the CPU0 to wake up from the low-power mode.
PERSIST_REDUNDANT_BOOT	SRC_GPR10[27:26]	This field identifies which image must be used - 0/1/2/3. Used for both SPI NAND and SLC raw NAND devices.

## 8.6 Boot devices (internal boot)

The chip supports these boot flash devices:

- Serial NOR flash via FlexSPI Interface
- Serial NAND Flash via FlexSPI Interface

## Boot devices (internal boot)

- Parallel NOR flash with the Smart External Memory Controller (SEMC), located on CS0, 16-bit bus width.
- NAND Flash with SEMC interface, located on CS0, 8-bit/16-bit bus width.
- SD/MMC/eSD/SDXC/eMMC4.4 via uSDHC interface, supporting high capacity cards
- Serial NOR/EEPROM boot via LPSPI

The selection of the external boot device type is controlled by the BOOT\_CFG1[7:4] eFUSES. See this table for more details:

**Table 8-8. Boot device selection**

BOOT_CFG1[7:4]	Boot device
0000b	Serial NOR boot via FlexSPI
01xxb	SD Boot via uSDHC
10xxb	eMMC/MMC boot via uSDHC
001xb	SLC NAND boot via SEMC
0001b	Parallel NOR boot via SEMC
11xxb	Serial NAND boot via FlexSPI

## 8.6.1 Serial NOR Flash Boot via FlexSPI

### 8.6.1.1 Serial NOR eFUSE Configuration

**Table 8-9. Fuse definition for Serial NOR over FlexSPI**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG1[1]	OEM	Encrypted XIP	Yes	0	0 – Disabled 1 - Enabled
BOOT_CFG1[3:2]	OEM	Hold time before read from device	Yes	0	0 – 500us 1 – 1ms 2 – 3ms 3 – 10ms
BOOT_CFG1[7:4]	OEM	Boot device selection	Yes	0	0 – Serial NOR device is selected as boot device
BOOT_CFG2[2:0]	OEM	Flash Type	Yes	0	000b-Device supports 3B read by default 001b-Device supports 4B read by default

*Table continues on the next page...*

**Table 8-9. Fuse definition for Serial NOR over FlexSPI (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
					010b-HyperFlash 1V8 011b-HyperFlash 3V3 100b-MXIC Octal DDR 101b-Micron Octal DDR 111b-QSPI device supports 3B read by default (on secondary pinmux option)
BOOT_CFG2[3]	BOOT_CFG2[3]	Infinite-Loop (Debug use only)	Yes	0	0 - Disable 1 - Enable

### 8.6.1.2 FlexSPI Serial NOR Flash Boot Operation

The Boot ROM attempts to boot from Serial NOR flash if the BOOT\_CFG1 [7:4] fuses are programmed to 0b'0000 as shown in the Serial NOR eFUSE Configuration table, then the ROM will initialize FlexSPI1 interface. FlexSPI interface initialization is a two-step process.

The ROM expects the 512-byte FlexSPI NOR configuration parameters as explained in next section to be present at offset 0 in Serial NOR flash. The ROM reads these configuration parameters using the read command specified by BOOT\_CFG2[2:0] with Serial clock operating at 30 MHz.

In the second step, ROM configures FlexSPI1 interface with the parameters provided in configuration block read from Serial NOR flash and starts the boot procedure. Refer to [Table 8-17](#) for details regarding FlexSPI configuration parameters and to the FlexSPI NOR boot flow chart for detailed boot flow chart of FlexSPI NOR.

Both booting an XIP and non XIP image are supported from Serial NOR Flash. For XIP boot, the image has to be built for FlexSPI address space and for non XIP the image can be built to execute from Internal RAM.

### 8.6.1.3 FlexSPI NOR boot flow chart

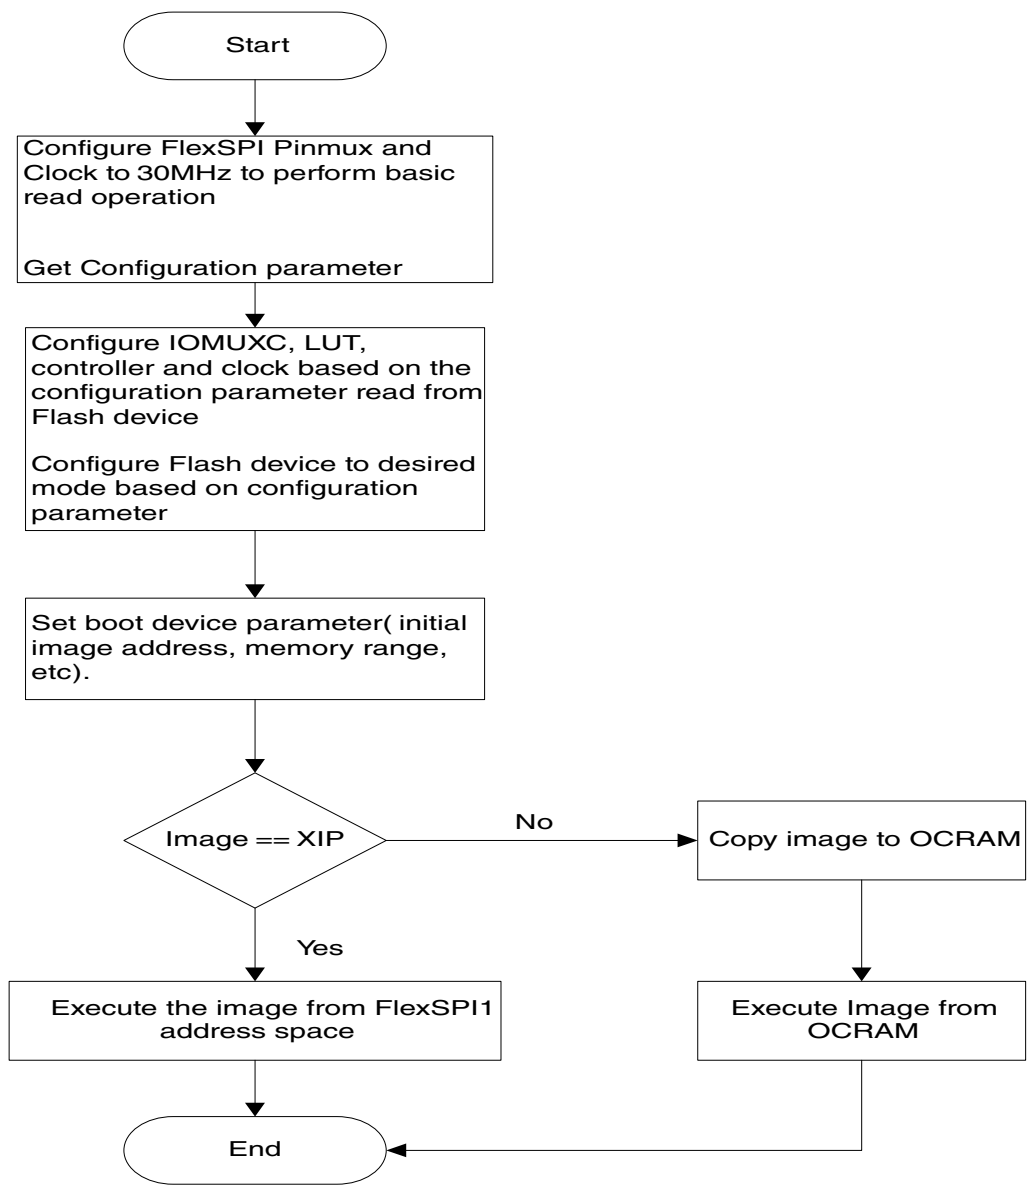

Figure 8-3. FlexSPI NOR boot flow

### 8.6.2 Serial NAND Flash Boot over FlexSPI

The boot ROM supports a number of Serial NAND Flash devices from different vendors. The Embedded Error Correction and Control (ECC) module in SPI NAND devices are used to detect and correct the errors.

### 8.6.2.1 Serial NAND eFUSE Configuration

The boot ROM determines the configuration of external Serial NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins during boot. See below table for parameters details.

**Table 8-10. Fuse definition for Serial NAND over FlexSPI**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG1[1:0]	OEM	Search Stride for FCB and DBBT Search strides in terms of page	Yes	0	0 - 64 1 - 128 2 - 256 3 - 32
BOOT_CFG1[3:2]	OEM	Hold Time before access to Serial NAND	Yes	0	0 - Hold time determined by Read Status command 1 - 500us 2 - 1ms 3 - 3ms
BOOT_CFG1[4]	OEM	Column address width	Yes	0	0 - 12 bits 1 - 13 bits
BOOT_CFG1[5]	OEM	Default safe communication frequency	Yes	0	0 – High Speed (50MHz) 1 – Low Speed (30MHz)
BOOT_CFG1[7:6]	OEM	Primary boot device selection	Yes	0	00 – Serial NOR 11 – Serial NAND
BOOT_CFG2[0]	OEM	Boot Search Count of FCB and DBBT	Yes	0	0 - 1 1 - 2
BOOT_CFG2[2:1]	OEM	CS de-asserted interval between two commands	Yes	0	0 – 100ns 1 – 200ns 2 – 400ns 3 – 50ns
BOOT_CFG2[3]	OEM	Infinite-Loop: (Debug USE only)	Yes	0	0 - Disable 1- Enable
0x6E0[7]	OEM	SPI NAND BOOT - Override Busy Offset	No	0	0 – Use default busy bit offset 0 1 – Override default busy bit offset using Busy bit offset
0x6E0[3:0]	OEM	SPI NAND BOOT - Busy Bit offset	No	0	

*Table continues on the next page...*

**Table 8-10. Fuse definition for Serial NAND over FlexSPI (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
0x6E0[13:8]	OEM	SPI NAND Boot - Page Read Time (in terms of micro seconds)	No	0	
0x6E0[23:16]	OEM	Page Read Command	No	0	Available only if it is not 0
0x6F0[31:24]	OEM	Cache Read command	No	0	Available only if it is not 0

**NOTE**

BOOT\_CFGx sampled on GPIO pins depends on BT\_FUSE\_SEL setting.

**8.6.2.2 FlexSPI NAND Flash Boot Flow and Boot Control Blocks (BCB)**

There are two BCB data structures:

- FCB
- DBBT

As part of the NAND media initialization, the ROM driver uses safe NAND timings to search for a Firmware Configuration Block (FCB) that contains the optimum NAND timings, page address of Discovered Bad Block Table (DBBT) Search Area and start page address of primary and secondary firmware.

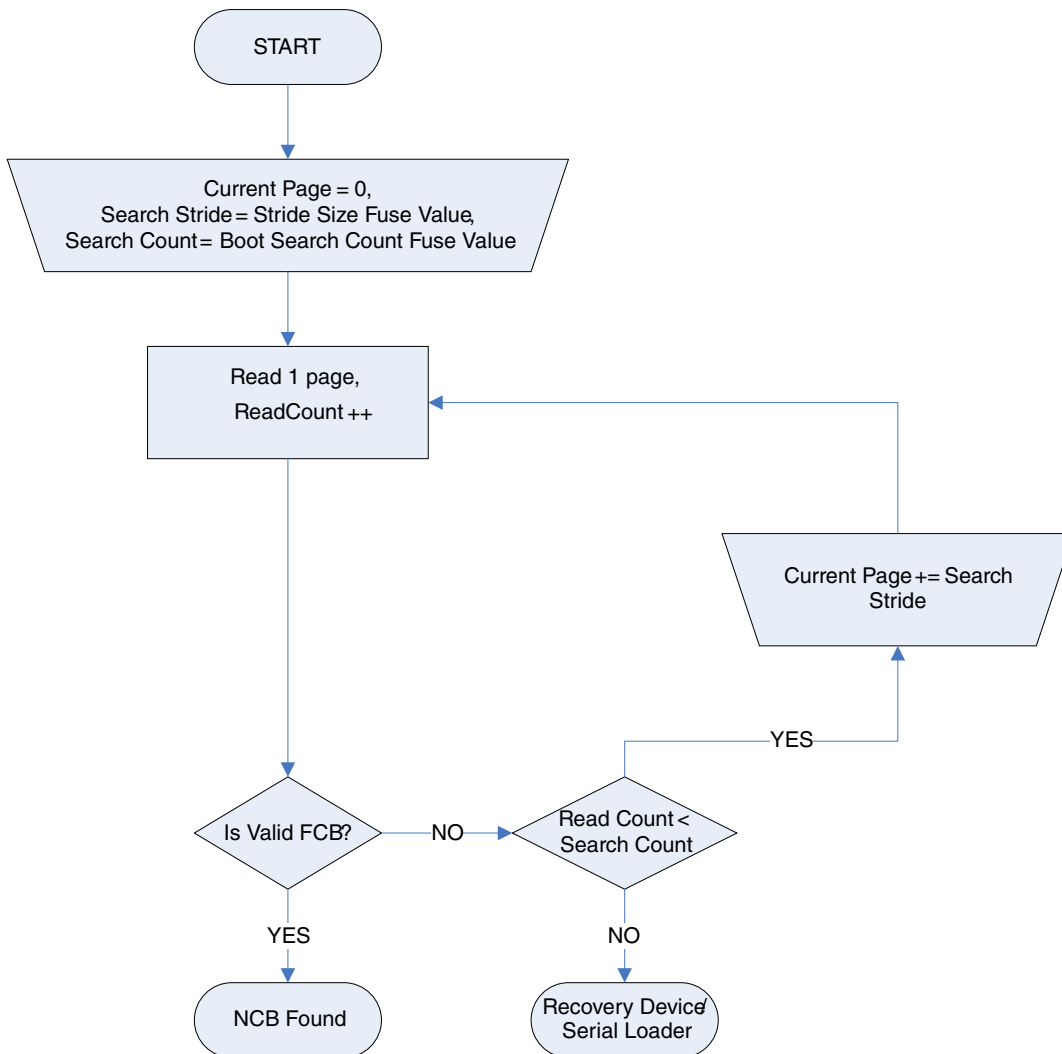

The built-in HW ECC in Serial NAND device is used during data read, the FCB data structure is protected using CRC checksum. Driver reads raw 2048 bytes of first sector and runs through CRC check that determines whether FCB data is valid or not.

If the FCB is found, the optimum NAND timings are loaded for further reads. If the ECC fails, or the fingerprints do not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next BCB until SearchCount pages have been read.

If search fails to find a valid FCB, the NAND driver responds with an error and the boot ROM enters into serial download mode.

The FCB contains the page address of DBBT Search Area, and the page address for primary and secondary boot images. DBBT is searched in DBBT Search Area just like how FCB is searched. After the FCB is read, the DBBT is loaded, and the primary or secondary boot image is loaded using starting page address from FCB.

Figure 8-4 shows the state diagram of FCB search.

**Figure 8-4. FCB Search Flow**

Once FCB is found, the boot ROM searches for the Discovered Bad Blocks Table (DBBT). If DBBT Search Area is 0 in FCB, then ROM assumes that there are no bad blocks on NAND device boot area. See Figure 8-5 for the DBBT search flow.

**Figure 8-5. DBBT Search Flow**

The BCB search and load function also monitors the ECC correction threshold and sets the `PERSIST_BLOCK_REWRITE` persistent bit if the threshold exceeds the maximum ECC correction ability.

If during primary image read there is a page with a number of errors higher than ECC can correct, the boot ROM will turn on `PERSIST_SECONDARY_BOOT` bit and perform SW reset (After SW reset, secondary image is used).

If during secondary image read there is a page with number of errors higher than ECC can correct, the boot ROM goes to serial loader.

### 8.6.2.3 Firmware Configuration Block

The FCB is at the first page in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, in case the first Serial NAND block becomes corrupted, the ROM will find its copy in the next Serial NAND block. The search area should span over at least two Serial NAND blocks. The location information for DBBT search area and images are all specified in the FCB. Table 25-9 show the Flash Control Block Structure.

**Table 8-11. Flash Control Block Structure**

Name	Offset	Size Bytes	Description									
crcChecksum	0x000	4	Checksum									
fingerprint	0x004	4	0x4E46_4342 ASCII: "NFCB"									
version	0x008	4	0x0000_0001									
DBBTSearchStartPage	0x00C	4	Start Page address for bad block table search area									
searchStride	0x010	2	Search stride for DBBT and FCB search. Not used by ROM Max value is 8.									
searchCount	0x012	2	Copies of DBBT and FCB. Not used by ROM, max value is 8.									
firmwareCopies	0x014	4	Firmware copies Valid range 1-8.									
Reserved	0x018	40	Reserved for future use Must be set to 0.									
firmwareInfoTable	0x40	64	This table consists of (up to 8 entries): <table border="1" data-bbox="1149 1543 1474 1854"> <thead> <tr> <th>Field</th> <th>Size</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>StartPage</td> <td>4</td> <td>Start page of this firmware</td> </tr> <tr> <td>pageCount</td> <td>4</td> <td>Pages in this firmware</td> </tr> </tbody> </table>	Field	Size	Description	StartPage	4	Start page of this firmware	pageCount	4	Pages in this firmware
Field	Size	Description										
StartPage	4	Start page of this firmware										
pageCount	4	Pages in this firmware										

*Table continues on the next page...*

**Table 8-11. Flash Control Block Structure (continued)**

Name	Offset	Size Bytes	Description
			<b>NOTE:</b> The StartPage must be the first page of a NAND block.
Reserved	0x080	128	Reserved Must be set to 0
spiNandConfigBlock	0x100	512	Serial NAND configuration block over FlexSPI
Reserved	0x300	256	Must be set to 0

**NOTE**

1. The “crcChecksum” is calculated with an MPEG2 variant of CRC-32. See [Table 8-12](#) for more details.
2. The “crcChecksum” calculation starts from fingerprint to the end of FCB, 1020 bytes in total.
3. The “spiNandConfigBlock” is FlexSPI NAND configuration block which consists of common FlexSPI memory configuration block and Serial NAND specified configuration parameters.

**Table 8-12. CRC-32 variant algorithm**

Property	Description
Width	32 bits
Polynomial	0x04C11BD7
Init Value	0xFFFFFFFF
Reflect in	False
Reflect Out	False
XOR Out	0x00000000

**8.6.2.4 Discovered Bad Blocks Table (DBBT)**

**Table 8-13. DBBT Structure**

Name	Offset	Size in Bytes	Description
crcChecksum	0x000	4	Checksum
Fingerprint	0x004	4	32-bit word with a value of 0x4442_4254, in asci “DBBT”

*Table continues on the next page...*

**Table 8-13. DBBT Structure (continued)**

Name	Offset	Size in Bytes	Description
Version	0x008	4	32-bit version number, this version of DBBT is 0x00000001
-	0x00C	4	Reserved
badBlockNumber	0x010	4	Number of bad blocks
Reserved	0x014	12	Must be filled with 0x00s
Bad Block entries	0x020-0x41F	256	Bad Block entries, only the first "badBlockNumber" entries are valid, the remaining entries must be filled with 0x00s

**NOTE**

1. Maximum bad block number is 256.
2. The "crcChecksum" is calculated with the same algorithm as the one in FCB, from Fingerprint to the end of DBBT, 1052 bytes in total.

**8.6.2.5 Bad block handling in ROM**

During the firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block checked.

**8.6.3 Serial NOR and NAND configuration based on FlexSPI interface**

The ROM SW supports Serial NOR and Serial NAND based on FlexSPI module, using a 448-bytes common FlexSPI configuration block and several specified parameters for Serial NOR and Serial NAND respectively. See below sections for more details.

**8.6.3.1 FlexSPI Configuration Block**

FlexSPI Configuration block consists of parameters regarding specific Flash devices including read command sequence, quad mode enablement sequence (optional), etc.

**Table 8-14. FlexSPI Configuration block**

Name	Offset	Size(bytes)	Description
Tag	0x000	4	0x42464346, ascii:” FCFB”
Version	0x004	4	0x56010000 / 0x56010100 [07:00] bugfix = 0 [15:08] minor = 0 / 1 [23:16] major = 1 [31:24] ascii ‘V’
-	0x008	4	Reserved
readSampleClkSrc	0x00C	1	0 – internal loopback 1 – loopback from DQS pad 3 – Flash provided DQS
dataHoldTime	0x00D	1	Serial Flash CS Hold Time Recommend default value is 0x03
dataSetupTime	0x00E	1	Serial Flash CS setup time Recommended default value is 0x03
columnAdressWidth	0x00F	1	3 – For HyperFlash 12/13 – For Serial NAND, see datasheet to find correct value 0 – Other devices
deviceModeCfgEnable	0x010	1	Device Mode Configuration Enable feature 0 – Disabled 1 – Enabled
-	0x011	1	Reserved
waitTimeCfgCommands	0x013	2	Wait time for all configuration commands, unit 100us. Available for device that support v1.1.0 FlexSPI configuration block. If it is greater than 0, ROM will wait waitTimeCfgCommands * 100us for all device memory configuration commands instead of using read status to wait until these commands complete.
deviceModeSeq	0x014	4	Sequence parameter for device mode configuration
deviceModeArg	0x018	4	Device Mode argument, effective only when deviceModeCfgEnable = 1
configCmdEnable	0x01C	1	Config Command Enable feature

Table continues on the next page...

Table 8-14. FlexSPI Configuration block (continued)

Name	Offset	Size(bytes)	Description
			0 – Disabled 1 – Enabled
-	0x01D	3	Reserved
configCmdSeqs	0x020	16	Sequences for Config Command, allow 4 separate configuration command sequences.
cfgCmdArgs	0x030	16	Arguments for each separate configuration command sequence.
controllerMiscOption	0x040	4	Bit0 – differential clock enable Bit1 – CK2 enable, must set to 0 in this silicon Bit2 – ParallelModeEnable, must set to 0 for this silicon Bit3 – wordAddressableEnable Bit4 – Safe Configuration Frequency enable set to 1 for the devices that support DDR Read instructions Bit5 – Pad Setting Override Enable Bit6 – DDR Mode Enable, set to 1 for device supports DDR read command
deviceType	0x044	1	1 – Serial NOR 2 – Serial NAND
sflashPadType	0x045	1	1 – Single pad 2 – Dual pads 4 – Quad pads 8 – Octal pads
serialClkFreq	0x046	1	Chip specific value, for this silicon 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 133 MHz 8 – 166 MHz Other value: 30 MHz

Table continues on the next page...

**Table 8-14. FlexSPI Configuration block (continued)**

Name	Offset	Size(bytes)	Description
lutCustomSeqEnable	0x047	1	0 – Use pre-defined LUT sequence index and number 1 - Use LUT sequence parameters provided in this block
-	0x048	8	Reserved
sflashA1Size	0x050	4	For SPI NOR, need to fill with actual size For SPI NAND, need to fill with actual size * 2
sflashA2Size	0x054	4	The same as above
sflashB1Size	0x058	4	The same as above
sflashB2Size	0x05C	4	The same as above
csPadSettingOverride	0x060	4	Set to 0 if it is not supported
sclkPadSettingOverride	0x064	4	Set to 0 if it is not supported
dataPadSettingOverride	0x068	4	Set to 0 if it is not supported
dqsPadSettingOverride	0x06C	4	Set to 0 if it is not supported
timeoutInMs	0x070	0	Maximum wait time during read busy status  0 – Disabled timeout checking feature Other value – Timeout if the wait time exceeds this value.
commandInterval	0x074	4	Unit: ns Currently, it is used for SPI NAND only at high frequency
dataValidTime	0x078	4	Time from clock edge to data valid edge, unit ns. This field is used when the FlexSPI Root clock is less than 100 MHz and the read sample clock source is device provided DQS signal without CK2 support.  [31:16] data valid time for DLLB in terms of 0.1 ns [15:0] data valid time for DLLA in terms of 0.1 ns
busyOffset	0x07C	2	busy bit offset, valid range : 0-31
busyBitPolarity	0x07E	2	0 – busy bit is 1 if device is busy 1 – busy bit is 0 if device is busy
lookupTable	0x080	256	Lookup table

Table continues on the next page...

**Table 8-14. FlexSPI Configuration block (continued)**

Name	Offset	Size(bytes)	Description
lutCustomSeq	0x180	48	Customized LUT sequence, see below table for details.
	0x1B0	16	Reserved for future use

**Note:**

1. To customize the LUT sequence for some specific device, users need to enable “lutCustomSeqEnable” and fill in corresponding “lutCustomSeq” field specified by command index below.
2. For Serial (SPI) NOR, the pre-defined LUT index is as follows:

**Table 8-15. LUT sequence definition for Serial NOR**

Command Index	Name	Index in lookup table	Description
0	Read	0	Read command Sequence
1	ReadStatus	1	Read Status command
2	WriteEnable	3	Write Enable command sequence
3	EraseSector	5	Erase Sector Command
4	PageProgram	9	Page Program Command
5	ChipErase	11	Full Chip Erase
6	Dummy	15	Dummy Command as needed
	Reserved	2,4,6,7,8,10,12,13,14	All reserved indexes can be freely used for other purpose

3. For Serial (SPI) NAND, the pre-defined LUT index is as follows:

**Table 8-16. LUT sequence definition for Serial NAND**

Command Index	Name	Index in lookup table	Description
0	ReadFromCache	0	Read from cache
1	ReadStatus	1	Read Status
2	WriteEnable	3	Write Enable
3	BlockErase	5	Erase block
4	ProgramLoad	9	Program Load
5	ReadPage	11	Read page to cache
6	ReadEccStatus	13	Read ECC Status

*Table continues on the next page...*

**Table 8-16. LUT sequence definition for Serial NAND (continued)**

Command Index	Name	Index in lookup table	Description
7	ProgramExecute	14	Program Execute
8	ReadFromCacheOdd	4	Read from Cache while page in odd plane
9	ProgramLoadOdd	10	Program Load for pages within odd blocks
	Reserved	2,6,7,8,12,15	All reserved indexes can be freely used for other purposes

### 8.6.3.2 Serial NOR configuration block (512 bytes)

**Table 8-17. Serial NOR configuration block**

Name	Offset	Size (Bytes)	Description
memCfg	0	448	The common memory configuration block, see FlexSPI configuration block for more details
pageSize	0x1C0	4	Page size in terms of bytes, not used by ROM
sectorSize	0x1C4	4	Sector size in terms of bytes, not used by ROM
ipCmdSerialClkFreq	0x1C8	4	Chip specific value, not used by ROM 0 – No change, keep current serial clock unchanged 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 133 MHz 8 – 166 MHz
Reserved	0x1CC	52	Reserved for future use

### 8.6.3.3 Serial NAND configuration block (512 bytes)

Table 8-18. Serial NAND configuration block

Name	Offset	Size (Bytes)	Description
memCfg	0	448	The common memory configuration block, see FlexSPI configuration block for more details
pageDataSize	0x1C0	4	Page size in terms of bytes, usually, it is 2048 or 4096
pageTotalSize	0x1C4	4	It equals to $2^{\wedge}$ width of column address
pagesPerBlock	0x1C8	4	Pages in one block
bypassReadStatus	0x1CC	1	0 – Read Status Register 1 – Bypass Read status register
bypassEccRead	0x1CD	1	0 – Perform ECC read 1 – Bypass ECC read
hasMultiPlanes	0x1CE	1	0 – Only 1 plane 1 – Has two planes
skippOddBlocks	0x1CF	1	0 – Read Odd blocks 1 – Skip Odd blocks
eccCheckCustomEnable	0x1D0	1	0 – Use the common ECC check command and ECC related masks 1 - Use ECC check related masks provided in this configuration block
ipCmdSerialClkFreq	0x1D1	1	Chip specific value, not used by ROM  0 – No change, keep current serial clock unchanged 1 – 30 MHz 2 – 50 MHz 3 – 60 MHz 4 – 75 MHz 5 – 80 MHz 6 – 100 MHz 7 – 133 MHz 8 – 166 MHz
readPageTimeUs	0x1D2	2	Wait time during page read, this field will take effect on if the bypassReadStatus is set to 1.  <b>NOTE:</b> Only applicable to ROM.

Table continues on the next page...

**Table 8-18. Serial NAND configuration block (continued)**

Name	Offset	Size (Bytes)	Description
eccStatusMask	0x1D4	4	ECC Status Mask
eccFailureMask	0x1D8	4	ECC Check Failure mask
blocksPerDevice	0x1DC	4	Blocks in a Serial NAND
Reserved	0x1ED	32	Reserved for future use

Below is an example of Serial NAND configuration block for Winbond W25N01GVZEIG:

```

const flexspi_nand_config_t kSerialNandCfgBlk =
{
    .memConfig =
    {
        .tag = FLEXSPI_CFG_BLK_TAG,
        .version = FLEXSPI_CFG_BLK_VERSION,
        .readSampleClkSrc = kFlexSPIReadSampleClk_LoopbackInternally,
        .dataHoldTime = 3,
        .dataSetupTime = 3,
        .columnAddressWidth = 12,
        .deviceModeCfgEnable = 1,
        .deviceModeSeq = { 1, 2 },
        .deviceType = kFlexSpiDeviceType_SerialNAND,
        .sflashPadType = kSerialFlash_4Pads,
        .serialClkFreq = kFlexSpiSerialClk_50MHz,
        .lutCustomSeqEnable = 0,
        .sflashA1Size = 128 * 1024 * 1024U * 2, // Flash size = 2 * actual data size
        (exclude spare space)
        .lookupTable =
        {
            // Read cache 4 I/O
            [4 * NOR_CMD_LUT_SEQ_IDX_READ] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD, 0xEB,
            CADDR_SDR, FLEXSPI_4PAD, 0x10),
            [4 * NOR_CMD_LUT_SEQ_IDX_READ + 1] = FLEXSPI_LUT_SEQ(DUMMY_SDR, FLEXSPI_4PAD,
            0x04, READ_SDR, FLEXSPI_4PAD, 0x80),
            // Clear Status1 flag
            [4 * 2] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD, 0x1F, CMD_SDR, FLEXSPI_1PAD,
            0xA0),
            [4 * 2 + 1] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD, 0x00, STOP, FLEXSPI_1PAD,
            0x00),
            // Read Page
            [4 * NAND_CMD_LUT_SEQ_IDX_READPAGE] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD,
            0x13, RADDR_SDR, FLEXSPI_1PAD, 0x18),
            // Read Status
            [4 * NAND_CMD_LUT_SEQ_IDX_READSTATUS] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD,
            0x0F, CMD_SDR, FLEXSPI_1PAD, 0xC0),
            [4 * NAND_CMD_LUT_SEQ_IDX_READSTATUS + 1] = FLEXSPI_LUT_SEQ(READ_SDR,
            FLEXSPI_1PAD, 0x01, STOP, FLEXSPI_1PAD, 0),
            // Write Enable
            [4 * NAND_CMD_LUT_SEQ_IDX_WRITEENABLE] = FLEXSPI_LUT_SEQ(CMD_SDR, FLEXSPI_1PAD,
            0x06, STOP, FLEXSPI_1PAD, 0),

```

## 8.6.4 Parallel NOR flash Boot over SEMC

The Smart External Memory Controller (SEMC) works in an asynchronous mode, and supports Muxed Address/Data scheme.

### 8.6.4.1 Parallel NOR eFUSE Configuration

The boot ROM determines the configuration of external Parallel NOR flash by parameters, either provided by eFUSE, or sampled on GPIO pins during boot. See below table for parameters details.

**Table 8-19. Fuse definition for Parallel NOR over SEMC**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG [7:4]	OEM	Primary boot device selection	Yes	0000	0001 – Parallel NOR
BOOT_CFG [2:0]	OEM	SEMC Clock frequency	Yes	000	000 – 33MHz 001 – 66MHz 010 – 108MHz 011 – 133MHz 1xx – 166MHz
BOOT_CFG [8]	OEM	AC timing parameter configuration	Yes	0	0 – Default configuration 1 – Configured by Fuse
BOOT_CFG [9]	OEM	Data port size	Yes	0	0 – 16 bits 1 – 8 bits
BOOT_CFG [10]	OEM	DQS pin pad enablement	Yes	0	0 – Disabled 1 – Enabled
BOOT_CFG [11]	OEM	Infinite-Loop: (Debug USE only)	Yes	0	0 - Disable 1 - Enable
0x6E0[2:0]	OEM	PCS pin selection	No	000	000 – CSX0 001 – CSX1

*Table continues on the next page...*

**Table 8-19. Fuse definition for Parallel NOR over SEMC (continued)**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
					010 – CSX2 011 – CSX3 1xx – A8
0x6E0[5:3]	OEM	Address port size	No	000	0xx – <= 24 bits 100 – 25 bits 101 – 26 bits 110 – 27 bits 111 – 28 bits
0x6E0[6]	OEM	ADV pin polarity	No	0	0 – Low active 1 – High active
0x6E0[7]	OEM	RDY pin polarity	No	0	0 – High active 1 – Low active
0x6E0[9:8]	OEM	AC timing parameter - CES	No	00	Value = (CES*5 + 1) cycle
0x6E0[11:10]	OEM	AC timing parameter - CEH	No	00	Value = (CEH*5 + 1) cycle
0x6E0[13:12]	OEM	AC timing parameter - CEITV	No	00	Value = (CEITV*5 + 1) cycle
0x6E0[15:14]	OEM	AC timing parameter - TA	No	00	Value = (TA*5 + 1) cycle
0x6E0[19:16]	OEM	AC timing parameter - AS	No	0000	Value = (AS + 1) cycle
0x6E0[23:20]	OEM	AC timing parameter - AH	No	0000	Value = (AH + 1) cycle
0x6E0[27:24]	OEM	AC timing parameter - REL	No	0000	Value = (REL + 1) cycle
0x6E0[31:28]	OEM	AC timing parameter - REH	No	0000	Value = (REH + 1) cycle

### 8.6.4.2 SEMC Parallel NOR Flash Boot Operation

The Boot ROM attempts to boot from Parallel NOR flash if the BOOT\_CFG [7:4] fuses are programmed to 0b'0000 as shown in the Parallel NOR eFUSE Configuration table. ROM supports booting from both XIP and non-XIP images from Parallel NOR Flash. For XIP boot, the image has to be built for SEMC address space and for non XIP the image can be built to execute from Internal RAM.

## 8.6.5 Parallel NAND flash Boot over SEMC

The boot ROM supports a number of Parallel SLC NAND flash devices from different vendors. Both the Error Correction and Control (ECC) module in NAND device and software ECC algorithm (SECDED) in boot ROM can be used to detect the errors, based on the fuse settings.

### 8.6.5.1 Parallel NAND eFUSE Configuration

The boot ROM determines the configuration of external Parallel NAND flash by parameters, either provided by eFUSE, or sampled on GPIO pins, during boot. See below table for parameters details:

**Table 8-20. Fuse definition for Parallel NAND over SEMC**

Fuse	Config	Definitions	GPIO	Shipped Value	Settings
BOOT_CFG [7:5]	OEM	Primary boot device selection	Yes	000	001 – Parallel NAND
BOOT_CFG [0]	OEM	Boot Search count of FCB and DBBT	Yes	0	0 - 1 1 – 2
BOOT_CFG [4:1]	OEM	Search stride for FCB and DBBT in terms of pages	Yes	0000	0000 – 64 Others – $2^{\wedge}$ BOOT_SEARCH_STRIDE
BOOT_CFG [8]	OEM	NAND ONFI compliant	Yes	0	0 – ONFI 1.0 1 – Non-ONFI
BOOT_CFG [9]	OEM	ECC selection	Yes	0	0 – Software ECC (SECDED) 1 – Device ECC <b>NOTE:</b> For “ECC selection” option, it can only be set as Device ECC When NAND device has built-in ECC module and the ECC module is enabled by default.
BOOT_CFG [10]	OEM	DQS pin pad enablement	Yes	0	0 – Disabled 1 – Enabled
BOOT_CFG [11]	OEM	Infinite-Loop: (Debug USE only)	Yes	0	0 – Disable 1 – Enable
0x6E0[2:0]	OEM	PCS pin selection	No	000	000 – CSX0 001 – CSX1 010 – CSX2 011 – CSX3

*Table continues on the next page...*

### 8.6.5.2 Parallel NAND Flash Boot Control Blocks (BCB)

There are two BCB data structures:

- Firmware Configuration Block (FCB)
- Discovered Bad Blocks Table (DBBT)

As part of the Parallel NAND media initialization, the ROM driver uses proper Parallel NAND parameters specified by FUSE to search for an FCB that contains the complete Parallel NAND parameters, page address of DBBT Search Area and Image info, including image copies, start page address and image size in terms of pages for each image.

FCB data structure is protected using Embedded ECC module in Parallel NAND devices or software ECC in ROM. The ROM driver reads 2048 bytes of first sector and checks the ECC check status to determine whether FCB data is valid or not.

If the FCB is found, the complete NAND parameters (Parallel NAND configuration block) are loaded for further reads, if the ECC fails, or the fingerprint does not match, or the CRC checksum does not match, the Block Search state machine increments page number to Search Stride number of pages to read for the next FCB until Search Count pages have been read.

If search fails to find a valid FCB, the Parallel NAND driver responds with an error and the boot ROM enters into Recovery boot mode (Secondary boot, if it is enabled, or Serial download mode).

The FCB contains the page address of DBBT Search Area, and the info for images. DBBT is searched in DBBT Search area just like how FCB is searched. After the FCB is read, the DBBT is loaded, then the boot image is loaded using starting page address from FCB.

### 8.6.5.3 Firmware Configuration Block (FCB)

The FCB is at the first page in the first good block. The FCB should be present at each search stride of the search area.

The search area contains copies of the FCB at each stride distance, in case the first Serial NAND block becomes corrupted, the ROM will find its copy in the next Parallel NAND block. The search area should span over at least two Parallel NAND blocks. The location information for DBBT search area and images are all specified in the FCB. Below Table shows the FCB Structure.

Name	offset	Size (Bytes)	Description
bcbHeader	0x000	12	See <a href="#">Table 8-21</a> for details
DBBTSearchAreaStartPage	0x00c	4	Start Page address for bad block table search area
searchStride	0x010	2	Search stride for DBBT and FCB search. Not used by ROM Max value is 8.
searchCount	0x012	2	Copies of DBBT and FCB. Not used by ROM, max value is 8.
firmwareCopies	0x014	4	Firmware copies Valid range 1-8.
-	0x018	40	Reserved
firmwareTable	0x040	64	For details see <a href="#">Table 8-22</a>
-	0x080	128	Reserved
nandConfig	0x100	256	Parallel NAND configuration block over SEMC
-	0x200	512	Reserved

**Table 8-21. Header Description**

Field	Size	Description
crcChecksum	4	Checksum
fingerprint	4	0x4E46_4342 ASCII: "NFCB"
version	4	0x0000_0001

**Table 8-22. Table Descriptions**

Field	Size	Description
startPage	4	Start page of this firmware
pagesInFirmware	4	Pages in this firmware

**NOTE**

- The “crcChecksum” is calculated with an MPEG2 variant of CRC-32.
- The “crcChecksum” calculation starts from fingerprint to the end of FCB, 1020 bytes in total.
- The “nandConfig” is SEMC NAND configuration block which consists of common SEMC memory configuration block and Parallel NAND specified configuration parameters. See [Parallel NAND eFUSE Configuration](#) for more details.

**8.6.5.4 Discovered Bad Blocks Table (DBBT)****Table 8-23. DBBT Structure**

Name	offset	Size (Bytes)	Description
bcbHeader	0x000	12	See <a href="#">Table 8-24</a> for details
-	0x00c	4	Reserved
badBlockNumber	0x010	4	Number of bad blocks
-	0x014	12	Reserved
badBlockTable	0x020	1024	Bad Block entries, only the first “badBlockNumber” entries are valid, the remaining entries must be filled with 0x00s

**Table 8-24. Header Description**

Field	Size	Description
crcChecksum	4	Checksum
fingerprint	4	0x4442_4254 ASCII: “DBBT”
version	4	0x0000_0001

**NOTE**

- Maximum bad block number is 256.
- The “crcChecksum” is calculated with the same algorithm as the one in FCB, from Fingerprint to the end of DBBT, 1052 bytes in total.

### 8.6.5.5 Bad block handling in ROM

During firmware boot, at the block boundary, the Bad Block table is searched for a match to the next block.

If no match is found, the next block can be loaded. If a match is found, the block must be skipped and the next block is checked.

### 8.6.6 Parallel NOR and NAND configuration based on SEMC interface

The ROM SW supports Parallel NOR and Parallel NAND based on SEMC module, using an 80-bytes common SEMC configuration block and several specified parameters for Parallel NOR and Parallel NAND respectively. See below sections for more details.

#### 8.6.6.1 SEMC Configuration Block

SEMC Configuration block consists of all parameters related to specific Flash devices.

**Table 8-25. SEMC control block structure**

Name	offset	Size (Bytes)	Description

## 8.6.7 Expansion device

The ROM supports booting from the MMC/eMMC and SD/eSD compliant devices.

### 8.6.7.1 Expansion device eFUSE configuration

The SD/MMC/eSD/eMMC/SDXC boot can be performed using the USDHC ports. The port can be configured based on either the setting of the BOOT\_CFG1[1] (Port Select) fuse or its corresponding GPIO overrides.

All USDHC ports support the fast boot. See this table for details:

**Table 8-30. USDHC eFuse Descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings
0x450[7:6]	OEM	Boot device selection	Yes	00	01 - SD/eSD/SDXC boot from the USDHC interface 10 - MMC/eMMC boot from the USDHC interface

The boot code supports these standards:

- MMCv4.4 or less
- eMMCv4.4 or less
- SDv2.0 or less
- eSDv2.10 rev-0.9, with or without FAST\_BOOT
- SDXCv3.0

The MMC/SD/eSD/SDXC/eMMC can be connected to any of the USDHC blocks and can be booted by copying 4 KB of data from the MMC/SD/eSD/eMMC device to the internal RAM. After checking the Image Vector Table header value (0xD1) from program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts from the Boot Data Structure the destination pointer and length of image to be copied to the RAM device from where the code execution occurs.

The maximum image size to load into the SD/MMC boot is 32 MB. This is due to a limited number of uSDHC ADMA Buffer Descriptors allocated by the ROM.

**NOTE**

The initial 4 KB of the program image must contain the IVT, DCD, and the Boot Data structures.

**Table 8-31. SD/MMC frequencies**

	SD	MMC	MMC (DDR mode)
Identification (KHz)	347.22		
Normal-speed mode (MHz)	25	20	25
High-speed mode (MHz)	50	40	50
UHSI SDR50 (MHz)	100		
UHSI SDR104 (MHz)	200		

**NOTE**

The boot ROM code reads the application image length and the application destination pointer from the image.

**8.6.7.2 MMC and eMMC boot**

This table provides the MMC and eMMC boot details.

**Table 8-32. MMC and eMMC boot details**

Normal boot mode	<p>During the initialization (normal boot mode), the MMC frequency is set to 347.22 KHz. When the MMC card enters the identification portion of the initialization, the voltage validation is performed, and the ROM boot code checks the high-voltage settings and the card capacity. The ROM boot code supports both the high-capacity and low-capacity MMC/eMMC cards. After the initialization phase is complete, the ROM boot code switches to a higher frequency (20 MHz in the normal boot mode or 40 MHz in the high-speed mode). The eMMC is also interfaced via the USDHC and follows the same flow as the MMC.</p> <p>The boot partition can be selected for an MMC4.x card after the card initialization is complete. The ROM code reads the BOOT_PARTITION_ENABLE field in the Ext_CSD[179] to get the boot partition to be set. If there is no boot partition mentioned in the BOOT_PARTITION_ENABLE field or the user partition was mentioned, the ROM boots from the user partition.</p>
eMMC4.3 or eMMC4.4 device supporting special boot mode	<p>If using an eMMC4.3 or eMMC4.4 device that supports the special boot mode, it can be initiated by pulling the CMD line low. If the BOOT ACK is enabled, the eMMC4.3/eMMC4.4 device sends the BOOT ACK via the DATA lines and the ROM can read the BOOT ACK [S010E] to identify the eMMC4.3/eMMC4.4 device. The eMMC4.3/eMMC4.4 device with the "boot mode" feature can only be supported via the ESDHCV3-3 and with or without the BOOT ACK. If the BOOT</p>

Table continues on the next page...

Table 8-32. MMC and eMMC boot details (continued)

	ACK is enabled, the ROM waits 50 ms to get the BOOT ACK and if the BOOT ACK is received by the ROM. If BOOT ACK is disabled ROM waits 1 second for data. If the BOOT ACK or data was received, the eMMC4.3/eMMC4.4 is booted in the "boot mode", otherwise the eMMC4.3/eMMC4.4 boots as a normal MMC card from the selected boot partition. This boot mode can be selected by the BOOT_CFG1[4] (fast boot) fuse. The BOOT ACK is selected by the BOOT_CFG2[1].
eMMC4.4 device	If using the eMMC4.4 device, the Double Data Rate (DDR) mode can be used. This mode can be selected by the BOOT_CFG2[7:5] (bus width) fuse.

### 8.6.7.3 SD, eSD, and SDXC

After the normal boot mode initialization begins, the SD/eSD/SDXC frequency is set to 347.22 kHz. During the identification phase, the SD/eSD/SDXC card voltage validation is performed. During the voltage validation, the boot code first checks with the high-voltage settings; if that fails, it checks with the low-voltage settings.

The capacity of the card is also checked. The boot code supports the high-capacity and low-capacity SD/eSD/SDXC cards after the voltage validation card initialization is done.

During the card initialization, the ROM boot code attempts to set the boot partition for all SD, eSD, and SDXC devices. If this fails, the boot code assumes that the card is a normal SD or SDXC card. If it does not fail, the boot code assumes it is an eSD card. After the initialization phase is over, the boot code switches to a higher frequency (25 MHz in the normal-speed mode or 50 MHz in the high-speed mode). The ROM also supports the FAST\_BOOT mode booting from the eSD card. This mode can be selected by the BOOT\_CFG1[0] (Fast Boot).

For the UHSI cards, the clock speed fuses can be set to SDR50 or SDR104 on USDHC1, USDHC2 ports. This enables the voltage switch process to set the signaling voltage to 1.8 V during the voltage validation. The bus width is fixed at a 4-bit width and a sampling point tuning process is needed to calibrate the number of the delay cells. If the SD Loopback Clock eFuse is set, the feedback clock comes directly from the loopback SD clock, instead of the card clock (by default). The SD clock speed can be selected by the BOOT\_CFG1[5:4], and the SD Loopback Clock is selected by the BOOT\_CFG1[2].

The UHSI calibration start value (MMC\_DLL\_DLY[6:0]) and the step value SD\_CALIBRATION\_STEP[1:0] can be set to optimize the sample point tuning process.

If the SD Power Cycle Enable eFuse is 1, the ROM sets the SD\_RST pad low, waits for 5 ms, and then sets the SD\_RST pad high. If the SD\_RST pad is connected to the SD power supply enable logic on board, it enables the power cycle of the SD card. This may be crucial in case the SD logic is in the 1.8 V states and must be reset to the 3.3 V states.

The SDR50 and SDR104 boots are not supported on the USDHC1 and USDHC2 ports because there are no reset signals for those ports when connected in the IOMUX.

### 8.6.7.4 IOMUX configuration for SD/MMC

**Table 8-33. IOMUX configuration for SD/MMC**

Signal	USDHC1	USDHC2

### 8.6.7.5 Redundant boot support for expansion device

The ROM supports the redundant boot for an expansion device. The primary or secondary image is selected, depending on the PERSIST\_SECONDARY\_BOOT setting. (see [Table 8-7](#)).

If the PERSIST\_SECONDARY\_BOOT is 0, the boot ROM uses address 0x0 for the primary image.

If the PERSIST\_SECONDARY\_BOOT is 1, the boot ROM reads the secondary image table from address 0x200 on the boot media and uses the address specified in the table.

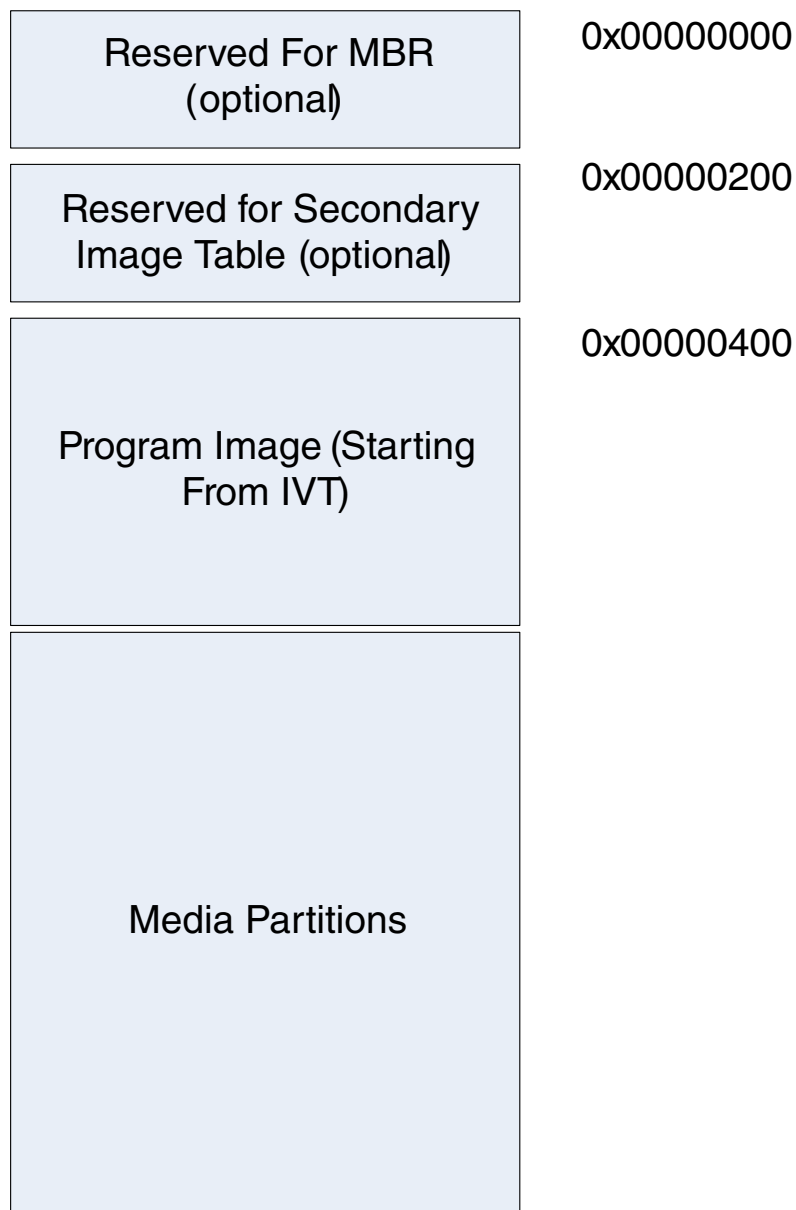

**Table 8-34. Secondary image table format**

Reserved (chipNum)
Reserved (driveType)
tag
firstSectorNumber
Reserved (sectorCount)

Where:

- The tag is used as an indication of the valid secondary image table. It must be 0x00112233.
- The firstSectorNumber is the first 512-byte sector number of the secondary image.

For the secondary image support, the primary image must reserve the space for the secondary image table. See this figure for the typical structures layout on an expansion device.

**Figure 8-13. Expansion device structures layout**

For the Closed mode, if there are failures during primary image authentication, the boot ROM turns on the PERSIST\_SECONDARY\_BOOT bit (see [Table 8-7](#)) and performs the software reset. (After the software reset, the secondary image is used.)

## 8.6.8 Serial NOR/EEPROM through LPSPI

The chip supports booting from serial memory devices, such as EEPROM and serial flash, using the LPSPI.

These ports are available for serial boot: LPSPI (LPSPI1, LPSPI2, LPSPI3, LPSPI4) interfaces.

### 8.6.8.1 Serial NOR/EEPROM eFUSE configuration

The boot ROM code determines the type of device using the following parameters, either provided by the eFUSE settings or sampled on the I/O pins, during boot.

**Table 8-35. Serial NOR/EEPROM boot eFUSE descriptions**

Fuse	Config	Definition	GPIO	Shipped value	Settings
EEPROM_RECOVERY_EN(0x4D0[24])	OEM	EEPROM recovery enable	No	0	0 - 3B (24-bit) 1 - 2B (16-bit)
SPI_ADDRESSING(0x6D0[27])	OEM	SPI addressing (SPI only)	No	0	0 - 2 B (16-bit) 1 - 3 B (24-bit)
LPSPI_PORT_SEL(0x6D0[26:25])	OEM	Port select	No	00	00 - LPSPI1 01 - LPSPI2 10 - LPSPI3 11 - LPSPI4
LPSPI_SPEED (0x6D0[29:28])	OEM	LPSPI Speed select	No	00	00 - 20 MHz 01 - 10 MHz 10 - 5 MHz 11 - 2 MHz

The LPSPI1/2/3/4 block can be used as a boot device using the LPSPI interface for the serial ROM boot. The SPI interface is configured to operate at speed specified by LPSPI\_SPED\_SEL fuse field.

The boot ROM copies 4 KB of data from the serial ROM device to the internal RAM. After checking the Image Vector Table header value (0xD1) from the program image, the ROM code performs a DCD check. After a successful DCD extraction, the ROM code extracts the destination pointer and length of image from the Boot Data Structure to be copied to the RAM device from where the code execution occurs.

**NOTE**

The Initial 4 KB of program image must contain the IVT, DCD, and the Boot Data Structures.

## 8.7 Program image

This section describes the data structures that are required to be included in the user's program image. The program image consists of:

- Image vector table—a list of pointers located at a fixed address that the ROM examines to determine where the other components of the program image are located.
- Boot data—a table that indicates the program image location, program image size in bytes, and the plugin flag.
- Device configuration data—IC configuration data.
- User code and data.

### 8.7.1 Image Vector Table and Boot Data

The Image Vector Table (IVT) is the data structure that the ROM reads from the boot device supplying the program image containing the required data components to perform a successful boot.

The IVT includes the program image entry point, a pointer to Device Configuration Data (DCD) and other pointers used by the ROM during the boot process. The ROM locates the IVT at a fixed address that is determined by the boot device connected to the Chip. The IVT offset from the base address and initial load region size for each boot device type is defined in the table below. The location of the IVT is the only fixed requirement by the ROM. The remainder of the image memory map is flexible and is determined by the contents of the IVT.

**Table 8-36. Image Vector Table Offset and Initial Load Region Size**

Boot Device Type	Image Vector Table Offset	Initial Load Region Size
FlexSPI NOR/SEMC NOR	4 Kbyte = 0x1000 bytes	Entire Image Size
SD/MMC/eSD/eMMC/SDXC	1 Kbyte = 0x400 bytes	4 Kbyte
SPI NOR/EEPROM/SEMC NAND/ FlexSPI NAND	1 Kbyte = 0x400 bytes	4 Kbyte

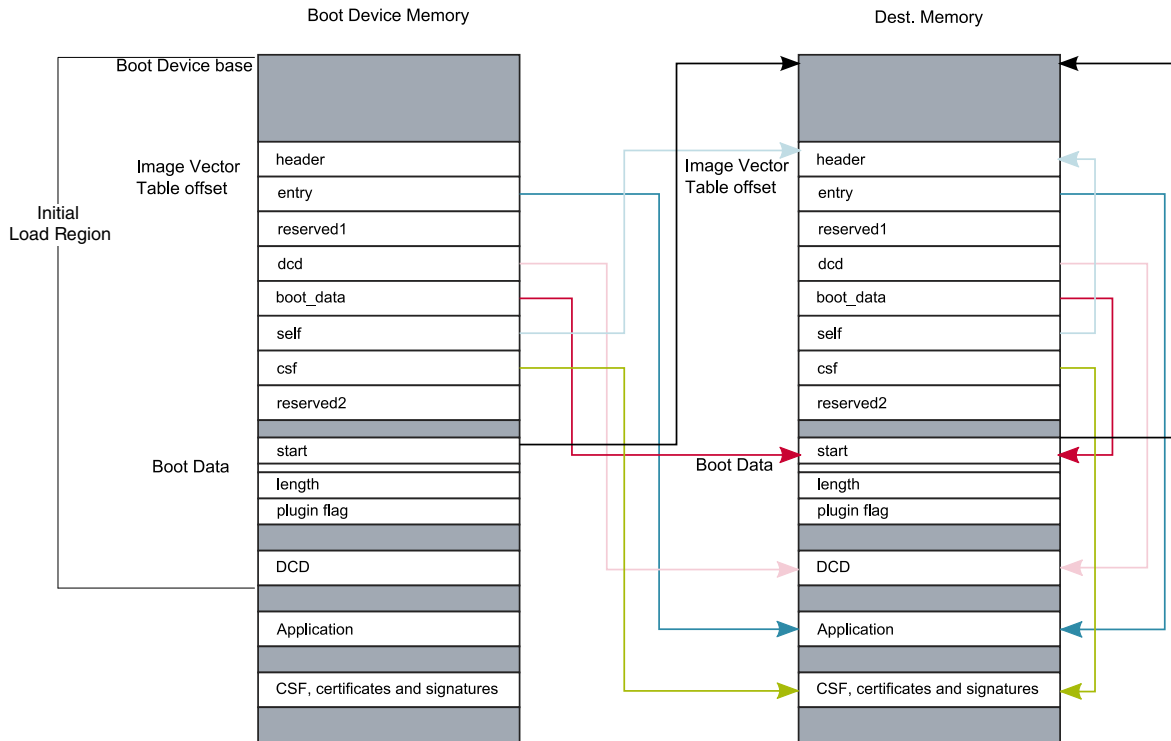

Figure 8-14. Image Vector Table

### 8.7.1.1 Image vector table structure

The IVT has the following format where each entry is a 32-bit word:

Table 8-37. IVT format

header
entry: Absolute address of the first instruction to execute from the image
reserved1: Reserved and should be zero
dcd: Absolute address of the image DCD. The DCD is optional so this field may be set to NULL if no DCD is required. See <a href="#">Device Configuration Data (DCD)</a> for further details on the DCD.
boot data: Absolute address of the boot data
self: Absolute address of the IVT. Used internally by the ROM.
csf: Absolute address of the Command Sequence File (CSF) used by the HAB library. See <a href="#">High-Assurance Boot (HAB)</a> for details on the secure boot using HAB. This field must be set to NULL when not performing a secure boot
reserved2: Reserved and should be zero

Figure 8-15 shows the IVT header format:

Tag	Length	Version
-----	--------	---------

**Figure 8-15. IVT header format**

where:

Tag: A single byte field set to 0xD1  
 Length: a two byte field in big endian format containing the overall length of the IVT, in bytes, including the header. (the length is fixed and must have a value of 32 bytes)  
 Version: A single byte field set to 0x40 or 0x41

### 8.7.1.2 Boot data structure

The boot data must follow the format defined in the table found here, each entry is a 32-bit word.

**Table 8-38. Boot data format**

start	Absolute address of the image
length	Size of the program image
plugin	Plugin flag (see <a href="#">Plugin image</a> )

## 8.7.2 Device Configuration Data (DCD)

Upon reset, the chip uses the default register values for all peripherals in the system. However, these settings typically are not ideal for achieving the optimal system performance and there are even some peripherals that must be configured before they can be used.

The DCD is a configuration information contained in the program image (external to the ROM) that the ROM interprets to configure various peripherals on the chip.

For example, some components (such as SDRAM) require some sequence of register programming as a part of the configuration before it is ready to be used. The DCD feature can be used to program the SEMC register to the optimal settings.

The ROM determines the location of the DCD table based on the information located in the Image Vector Table (IVT). See [Image Vector Table and Boot Data](#) for more details. The DCD table shown below is a big-endian byte array of the allowable DCD commands. The maximum size of the DCD is limited to 1768 B.

Header
[CMD]
[CMD]
...

**Figure 8-16. DCD data format**

The DCD header is 4 B with the following format:

Tag	Length	Version
-----	--------	---------

**Figure 8-17. DCD header format**

where:

Tag: A single-byte field set to 0xD2

Length: a two-byte field in the big-endian format containing the overall length of the DCD (in bytes) including the header

Version: A single-byte field set to 0x41

### 8.7.2.1 Write data command

The write data command is used to write a list of given 1-, 2- or 4-byte values (or bitmasks) to a corresponding list of target addresses.

The format of the write data command (in a big-endian byte array) is shown in this table:

**Table 8-39. Write data command format**

Tag	Length	Parameter
	Address	
	Value/Mask	
	[Address]	
	[Value/Mask]	
	...	
	[Address]	
	[Value/Mask]	

## Program image

where:

Tag: a single-byte field set to 0xCC

Length: a two-byte field in a big-endian format, containing the length of the Write Data Command (in bytes) including the header

Address: the target address to which the data must be written

Value/Mask: the data value (or bitmask) to be written to the preceding address

The parameter field is a single byte divided into the bitfields, as follows:

**Table 8-40. Write data command parameter field**

7	6	5	4	3	2	1	0
flags					bytes		

where

bytes: the width of the target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only specific bits may be overwritten at the target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

One or more target address and value/bitmask pairs can be specified. The same bytes' and flags' parameters apply to all locations in the command.

When successful, this command writes to each target address in accordance with the flags as follows:

**Table 8-41. Interpretation of write data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	*address = val_msk	Write value
0	1	*address = val_msk	Write value
1	0	*address &= ~val_msk	Clear bitmask
1	1	*address  = val_msk	Set bitmask

### NOTE

If any of the target addresses does not have the same alignment as the data width indicated in the parameter field, none of the values are written.

If any of the values are larger or any of the bitmasks are wider than permitted by the data width indicated in the parameter field, none of the values are written.

If any of the target addresses do not lie within the allowed region, none of the values are written. The list of allowable blocks and target addresses for the chip are provided below.

### 8.7.2.2 Check data command

The check data command is used to test for a given 1-, 2-, or 4-byte bitmasks from a source address.

The check data command is a big-endian byte array with the format shown in this table:

**Table 8-42. Check data command format**

Tag	Length	Parameter
	Address	
	Mask	
	[Count]	

where:

Tag: a single-byte field set to 0xCF

Length: a two-byte field in the big-endian format containing the length of the check data command (in bytes) including the header

Address: the source address to test

Mask: the bit mask to test

Count: an optional poll count; If the count is not specified, this command polls indefinitely until the exit condition is met. If count = 0, this command behaves as for the NOP.

The parameter field is a single byte divided into bitfields, as follows:

**Table 8-43. Check data command parameter field**

7	6	5	4	3	2	1	0
flags				bytes			

where

bytes: the width of target locations in bytes (either 1, 2, or 4)

flags: control flags for the command behavior

Data Mask = bit 3: if set, only the specific bits may be overwritten at a target address (otherwise all bits may be overwritten)

Data Set = bit 4: if set, the bits at the target address are overwritten with this flag (otherwise it is ignored)

This command polls the source address until either the exit condition is satisfied, or the poll count is reached. The exit condition is determined by the flags as follows:

**Table 8-44. Interpretation of check data command flags**

"Mask"	"Set"	Action	Interpretation
0	0	(*address & mask) == 0	All bits clear
0	1	(*address & mask) == mask	All bits set

*Table continues on the next page...*

**Table 8-44. Interpretation of check data command flags (continued)**

"Mask"	"Set"	Action	Interpretation
1	0	(*address & mask)!= mask	Any bit clear
1	1	(*address & mask)!= 0	Any bit set

**NOTE**

If the source address does not have the same alignment as the data width indicated in the parameter field, the value is not read.

If the bitmask is wider than permitted by the data width indicated in the parameter field, the value is not read.

**8.7.2.3 NOP command**

This command has no effect.

The format of the NOP command is a big-endian four-byte array, as shown in this table:

**Table 8-45. NOP command format**

Tag	Length	Undefined
-----	--------	-----------

where:

Tag: a single-byte field set to 0xC0

Length: a two-byte field in big endian containing the length of the NOP command in bytes (fixed to a value of 4)

Undefined: this byte is ignored and can be set to any value.

**8.7.2.4 Unlock command**

The unlock command is used to prevent specific engine features from being locked when exiting the ROM.

The format of the unlock command (in a big-endian byte array) is shown in this table:

**Table 8-46. Unlock command format**

Tag	Length	Eng
	Value	
	Value	
	...	

*Table continues on the next page...*

**Table 8-46. Unlock command format (continued)**

Value
-------

where:

### NOTE

This command may not be used in the DCD structure if the SEC\_CONFIG is configured as closed.

## 8.8 Plugin image

The ROM supports a limited number of boot devices. When using other devices as a boot source (for example, Ethernet, CDROM, or USB), the supported boot device must be used (typically serial ROM) as a firmware to provide the missing boot drivers. Additionally, the plugin can be customized to support boot drivers, which is more flexible when performing the device initialization, such as condition judging, delay assertion, or to apply custom settings to the boot device and memory system.

In addition to the standard images, the chip also supports plugin images. The plugin images return the execution to the ROM whereas the standard image does not.

The boot ROM detects the image type using the plugin flag of the boot data structure (see [Boot data structure](#)). If the plugin flag is 1, then the ROM uses the image as a plugin function. The function must initialize the boot device and copy the program image to the final location. At the end, the plugin function must return with the program image parameters. (See [High-level boot sequence](#) for details about the boot flow).

The boot ROM authenticates the plugin image before running the plugin function and then authenticates the program image.

The plugin function must follow the API described below:

```
typedef BOOLEAN (*plugin_download_f)(void **start, size_t *bytes, UINT32
*ivt_offset);
```

#### ARGUMENTS PASSED:

- start - the image load address on exit.
- bytes - the image size on exit.
- ivt\_offset - the offset (in bytes) of the IVT from the image start address on exit.

#### RETURN VALUE:

- 1 - success
- 0 - failure

## 8.9 Serial Downloader

The Serial Downloader provides a means to download a program image to the chip over the USB and UART serial connection.

In this mode, the ROM programs the WDOG1 for a time-out specified by the fuse WDOG Time-out Select (See the Fusemap chapter for details) if the WDOG\_ENABLE eFuse is 1 and continuously polls for the USB and UART connection. If no activity is found on the USB OTG1 and UART and the watchdog timer expires, the ARM core is reset.

### NOTE

After the downloaded image is loaded, it is responsible for managing the watchdog resets properly.

This figure shows the USB and UART boot flow:

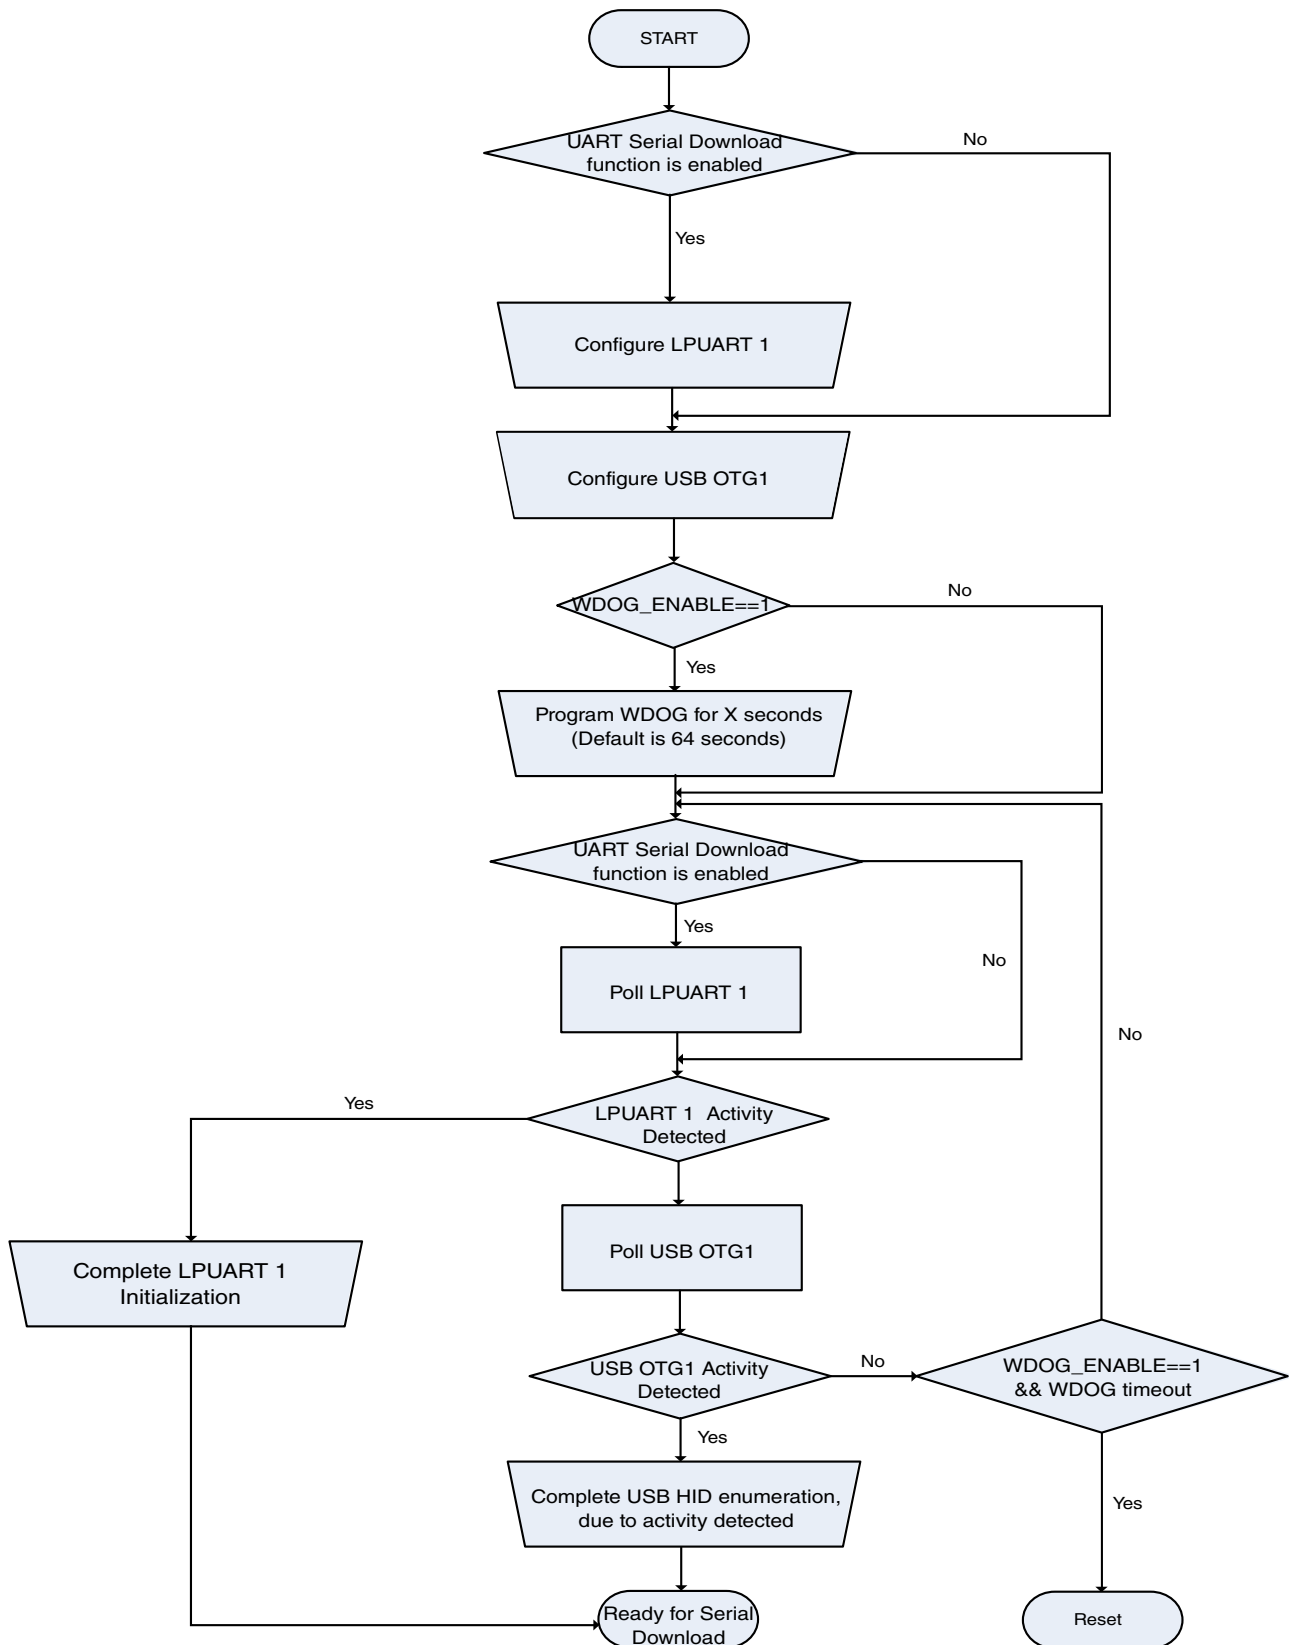

Figure 8-18. Serial Downloader boot flow

## 8.9.1 USB

The USB support is composed of the USBOH3(USB OTG1 core controller, compliant with the USB 2.0 specification) and the USBPHY (HS USB transceiver).

The ROM supports the USB OTG port for boot purposes. The other USB ports on the chip are not supported for boot purposes.

The USB Driver is implemented as a USB HID class. A collection of four HID reports are used to implement the SDP protocol for data transfers, as described in [Table 8-47](#).

**Table 8-47. USB HID reports**

Report ID (first byte)	Transfer endpoint	Direction	Length	Description
1	control OUT	Host to device	17 B	SDP command from the host to the device.
2	control OUT	Host to device	Up to 1025 B	Data associated with the report 1 SDP command.
3	interrupt	Device to host	5 B	HAB security configuration. The device sends 0x12343412 in the closed mode and 0x56787856 in the open mode.
4	interrupt	Device to host	Up to 65 B	Data in response to the SDP command in report 1.

### 8.9.1.1 USB configuration details

The USB OTG function device driver supports a high speed (HS for UTMI) non-stream mode with a maximal packet size of 512 B and a low-level USB OTG function.

The VID/PID and strings for the USB device driver are listed in the following table.

**Table 8-48. VID/PID and strings for USB device driver**

Descriptor	Value
VID	0x15A2 (NXP vendor ID)
PID <sup>1</sup>	
String Descriptor1 (manufacturer)	NXP Semiconductors
String Descriptor2 (product)	S Blank

*Table continues on the next page...*

**Table 8-48. VID/PID and strings for USB device driver (continued)**

Descriptor	Value
String Descriptor4	NXP Flash
String Descriptor5	NXP Flash

1. Allocation based on the BPN (Before Part Number)

### 8.9.1.2 IOMUX configuration for USB

The interface signals of the UTMI PHY are not configured in the IOMUX. The UTMI PHY interface uses the dedicated contacts on the IC. See the chip data sheet for details.

## 8.9.2 Serial Download Protocol (SDP)

The 16-byte SDP command from the host to device is sent using the HID report 1. This table describes the 16-byte SDP command data structure:

**Table 8-49. 16-byte SDP command data structure**

BYTE offset	Size	Name	Description
0	2	COMMAND TYPE	These commands are supported for the ROM: <ul style="list-style-type: none"> <li>• 0x0101 READ_REGISTER</li> <li>• 0x0202 WRITE_REGISTER</li> <li>• 0x0404 WRITE_FILE</li> <li>• 0x0505 ERROR_STATUS</li> <li>• 0x0A0A DCD_WRITE</li> <li>• 0x0B0B JUMP_ADDRESS</li> </ul>
2	4	ADDRESS	Only relevant for these commands: READ_REGISTER, WRITE_REGISTER, WRITE_FILE, DCD_WRITE, and JUMP_ADDRESS.  For the READ_REGISTER and WRITE_REGISTER commands, this field is the address to a register. For the WRITE_FILE and JUMP_ADDRESS commands, this field is an address to the internal or external memory address.
6	1	FORMAT	Format of access, 0x8 for an 8-bit access, 0x10 for a 16-bit access, and 0x20 for a 32-bit access. Only relevant for the READ_REGISTER and WRITE_REGISTER commands.

*Table continues on the next page...*

**Table 8-49. 16-byte SDP command data structure (continued)**

BYTE offset	Size	Name	Description
7	4	DATA COUNT	Size of the data to read or write. Only relevant for the WRITE_FILE, READ_REGISTER, WRITE_REGISTER, and DCD_WRITE commands. For the WRITE_FILE and DCD_WRITE commands, the DATA COUNT is in the byte units.
11	4	DATA	The value to write. Only relevant for the WRITE_REGISTER command.
15	1	RESERVED	Reserved

### 8.9.2.1 SDP commands

The SDP commands are described in the following sections.

#### 8.9.2.1.1 READ\_REGISTER

The transaction for the READ\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration, and Report4 for the response or the register value.

The register to read is specified in the ADDRESS field of the SDP command. The first device sends Report3 with the security configuration followed by the Report4 with the bytes read at a given address. If the count is greater than 64, multiple reports with the report id 4 are sent until the entire data requested by the host is sent. The STATUS is either 0x12343412 for the closed parts and 0x56787856 for the open or field return parts.

Report1, Command, Host to Device:

1	Valid values for the READ_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host: first response report

4	Register value
---	----------------

ID 4 bytes of data containing the register value. If the number of bytes requested is less than 4, the remaining bytes must be ignored by the host.

Multiple reports of the report id 4 are sent until the entire requested data is sent.

Report4, Response, Device to Host: last response report

4	Register value
---	----------------

ID 64 bytes of data containing the register value. If the number of bytes requested is less than 64, the remaining bytes must be ignored by the host.

### 8.9.2.1.2 WRITE\_REGISTER

The transaction for the WRITE\_REGISTER command consists of these reports: Report1 for the command, Report3 for the security configuration and Report4 for the write status.

The host sends Report1 with the WRITE\_REGISTER command. The register to write is specified in the ADDRESS field of the SDP command of Report1, with the FORMAT field set to the data type (number of bits to write, either 8, 16, or 32) and the value to write in the DATA field of the SDP command. The device writes the DATA to the register address and returns the WRITE\_COMPLETE code using Report4 and the security configuration using Report3 to complete the transaction.

Report1, Command, Host to Device:

1	Valid values for WRITE_REGISTER COMMAND, ADDRESS, FORMAT, DATA_COUNT and DATA
---	---

ID 16-byte SDP command

Report3, Response, Device to Host:

3	4 bytes indicating the security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes data with the first 4 bytes to indicate that the write is completed with code 0x128A8A12. On failure, the device reports the HAB error status.

### 8.9.2.1.3 WRITE\_FILE

The transaction for the WRITE\_FILE command consists of these reports: Report1 for the command phase, Report2 for the data phase, Report3 for the HAB mode, and Report4 to indicate that the data are received in full.

The size of each Report2 is limited to 1024 bytes (limitation of the USB HID protocol). Hence, multiple Report2 packets are sent by the host in the data phase until the entire data is transferred to the device. When the entire data (DATA\_COUNT bytes) is received, the device sends Report3 with the HAB mode and Report4 with 0x88888888, indicating that the file download completed.

Report1, Host to Device:

1	Valid values for WRITE_FILE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP command

=====Optional Begin=====

Host sends the ERROR\_STATUS command to query if the HAB rejected the address

===== Optional End=====

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report2, Host to Device:

2	File data
---	-----------

ID Max 1024 bytes data per report

Report3, Device to Host:

3	4 bytes indicating security configuration
---	---

ID 4 bytes status

Report4, Response, Device to Host:

4	COMPLETE (0x88888888) status
---	------------------------------

ID 64 bytes data with the first four bytes to indicate that the file download completed with code 0x88888888. On failure, the device reports the HAB error status.

#### 8.9.2.1.4 ERROR\_STATUS

The transaction for the SDP command ERROR\_STATUS consists of three reports.

Report1 is used by the host to send the command; the device sends global error status in four bytes of Report4 after returning the security configuration in Report3. When the device receives the ERROR\_STATUS command, it returns the global error status that is updated for each command. This command is useful to find out whether the last command resulted in a device error or succeeded.

Report1, Command, Host to Device:

1	ERROR_STATUS COMMAND
---	----------------------

ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	Four bytes Error status
---	-------------------------

ID first 4 bytes status in 64 bytes Report4

#### 8.9.2.1.5 DCD\_WRITE

The SDP command DCD\_WRITE is used by the host to send multiple register writes in one shot. This command is provided to speed up the process of programming the register writes (such as to configure an external RAM device).

The command goes with Report1 from the host with COMMAND TYPE set to DCD\_WRITE, ADDRESS which is used as a temporary location of the DCD data, and DATA\_COUNT to the number of bytes sent in the data out phase. In the data phase, the

host sends the data for a number of registers using Report2. The device completes the transaction with Report3 indicating the security configuration and Report4 with the WRITE\_COMPLETE code 0x12828212.

Report1, Command, Host to Device:

1	DCD_WRITE COMMAND, ADDRESS, DATA_COUNT
---	--

ID 16-byte SDP Command

Report2, Data, Host to Device:

2	DCD binary data
---	-----------------

ID Max 1024 bytes per report

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

ID 4 bytes status

Report4, Response, Device to Host:

4	WRITE_COMPLETE (0x128A8A12) status
---	------------------------------------

ID 64 bytes report with the first four bytes to indicate that the write completed with the code 0x128A8A12. On failure, the device reports the HAB error status.

See [Device Configuration Data \(DCD\)](#) for the DCD format description.

### **8.9.2.1.6 JUMP\_ADDRESS**

The SDP command JUMP\_ADDRESS is the last command that the host can send to the device. After this command, the device jumps to the address specified in the ADDRESS field of the SDP command and starts to execute.

This command usually follows after the WRITE\_FILE command. The command is sent by the host in the command-phase of the transaction using Report1. There is no data phase for this command, but the device sends the status Report3 to complete the transaction. If the authentication fails, it also sends Report4 with the HAB error status.

Report1, Command, Host to Device:

1	JUMP_ADDRESS COMMAND, ADDRESS
---	-------------------------------

### ID 16-byte SDP Command

Report3, Response, Device to Host:

3	Four bytes indicating the security configuration
---	--

### ID 4 bytes status

This report is sent by the device only in case of an error jumping to the given address, or if the device reports error in Report4, Response, Device to Host:

4	Four bytes HAB error status
---	-----------------------------

ID 4 bytes status, 64 bytes report length

## 8.10 Recovery devices

The chip supports recovery devices. If the primary boot device fails, the boot ROM tries to boot from the recovery device using one of the LPSPI ports.

To enable the recovery device, the EEPROM\_RECOVERY\_EN fuse must be set. Additionally, the serial EEPROM fuses must be set as described in [Serial NOR/EEPROM through LPSPI](#).

## 8.11 SD/MMC manufacture mode

When the internal boot and recover boot (if enabled) failed, the boot goes to the SD/MMC manufacture mode before the serial download mode. In the manufacture mode, one bit bus width is used despite of the fuse setting.

## High-Assurance Boot (HAB)

Figure 8-19. SD/MMC manufacture boot flow

## 8.12 High-Assurance Boot (HAB)

The High Assurance Boot (HAB) component of the ROM protects against the potential threat of attackers modifying the areas of code or data in the programmable memory to make it behave in an incorrect manner. The HAB also prevents the attempts to gain access to features which must not be available.

The integration of the HAB feature with the ROM code ensures that the chip does not enter an operational state if the existing hardware security blocks detected a condition that may be a security threat or if the areas of memory deemed to be important were modified. The HAB uses the RSA digital signatures to enforce these policies.

**Figure 8-20. Secure boot components**

The figure above illustrates the components used during a secure boot using HAB. The HAB interfaces with the SNVS to make sure that the system security state is as expected. The HAB also uses the hardware block to accelerate the SHA-256 message digest operations performed during the signature verifications. The HAB also includes a software implementation of SHA-256 for cases where a hardware accelerator can't be used. The RSA key sizes supported are 1024, 2048, and 3072 bits. The RSA signature verification operations are performed by a software implementation contained in the HAB library. The main features supported by the HAB are:

- X.509 public key certificate support
- CMS signature format support

#### **NOTE**

NXP provides the reference Code Signing Tool (CST) for key generation and code signing for use with the HAB library. The CST can be found by searching for "IMX\_CST\_TOOL" at <http://www.nxp.com>.

#### **NOTE**

For further details on using the secure boot feature using HAB, contact your local NXP representative.

### **8.12.1 HAB API vector table addresses**

For devices that perform a secure boot, the HAB library may be called by the boot stages that execute after the ROM code.

**NOTE**

For additional information on the secure boot including the HAB API, contact your local NXP representative.

# Chapter 9 Multimedia

## 9.1 Display and graphics subsystem

The chip display and graphics subsystem consists of the dedicated modules found here.

- LCD Interface (LCDIF): 24-bit parallel RGB LCD interface
- PXP pixel pipeline: 2D graphics and pixel/image processing engine
- Camera Sensor Interface (CSI): up to 24-bit parallel interface for image sensor

The following figure shows the high-level integration scheme of the chip display and graphics system.

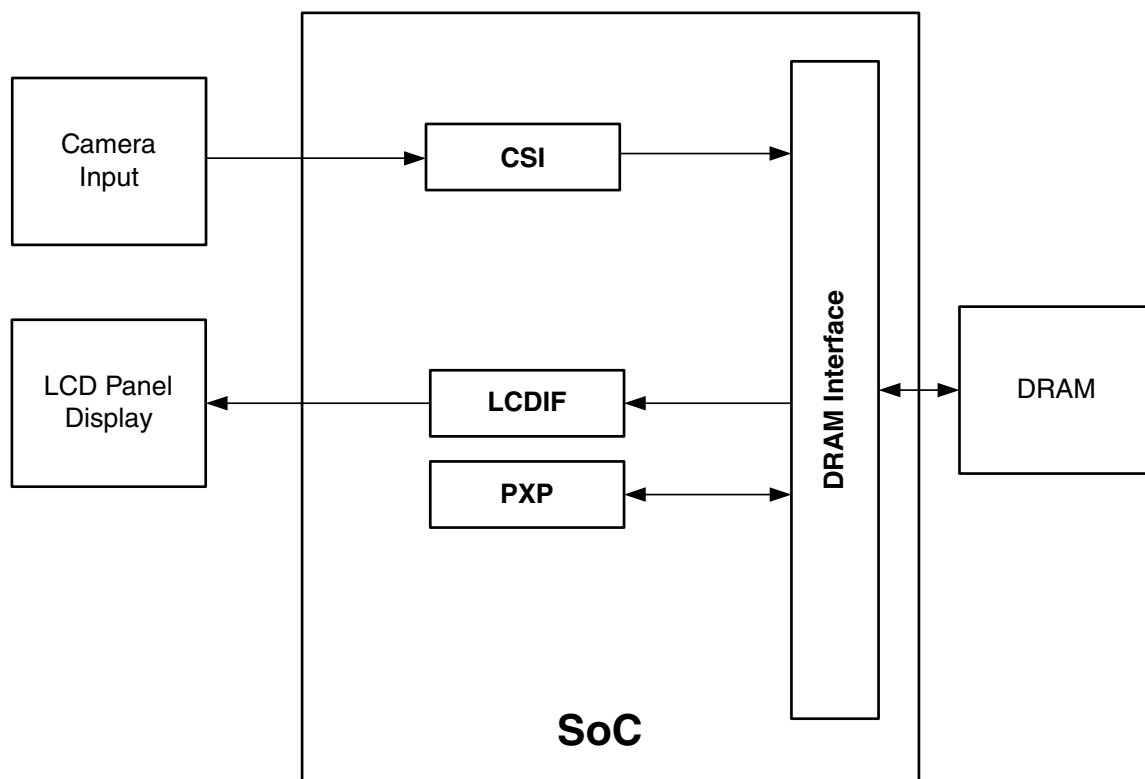

Figure 9-1. Chip display and graphics subsystem

### 9.1.1 PiXel Processing Pipeline

The pixel processing pipeline is used to perform image processing on image/video buffers before sending to an LCD display.

The main features of PXP include:

- Multiple input/output format support, including YUV/RGB/Grayscale
- Supports both RGB/YUV scaling
- Supports overlay with Alpha blending
- Supports Rotation of 0, 90, 180, and 270 degrees in conjunction with vertical and horizontal flip options

### 9.1.2 LCD Interface

The LCDIF is a general purpose display controller that is used to drive a wide range of display devices. These displays can vary in size and capability. Many of these displays have had an asynchronous parallel MPU interface for command and data transfer to an integrated frame buffer. There are other popular displays that support moving pictures and require the RGB interface mode (called DOTCLK interface in this document) or the VSYNC mode for high-speed data transfers.

The block has several major features:

- Bus master interface to source frame buffer data for display refresh and a DMA interface to manage input data transfers from the LCD requiring minimal CPU overhead.
- 8/16/18/24 bit LCD data bus support available depending on I/O mux options.
- Programmable timing and parameters for MPU, VSYNC and DOTCLK LCD interfaces to support a wide variety of displays.

### 9.1.3 CMOS Sensor Interface

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and

output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit data port for YCC, YUV, or RGB data input.
- 8-bit/10-bit/16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit/pixel data format to 32-bit receive FIFO packing.
- 128 × 32 FIFO to store received image pixel data. Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support for 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support for double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources:
  - Start of Frame
  - End of Frame
  - Change of Field
  - FIFO full
  - FIFO overrun
  - DMA transfer done
  - CCIR error
  - AHB bus response error
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

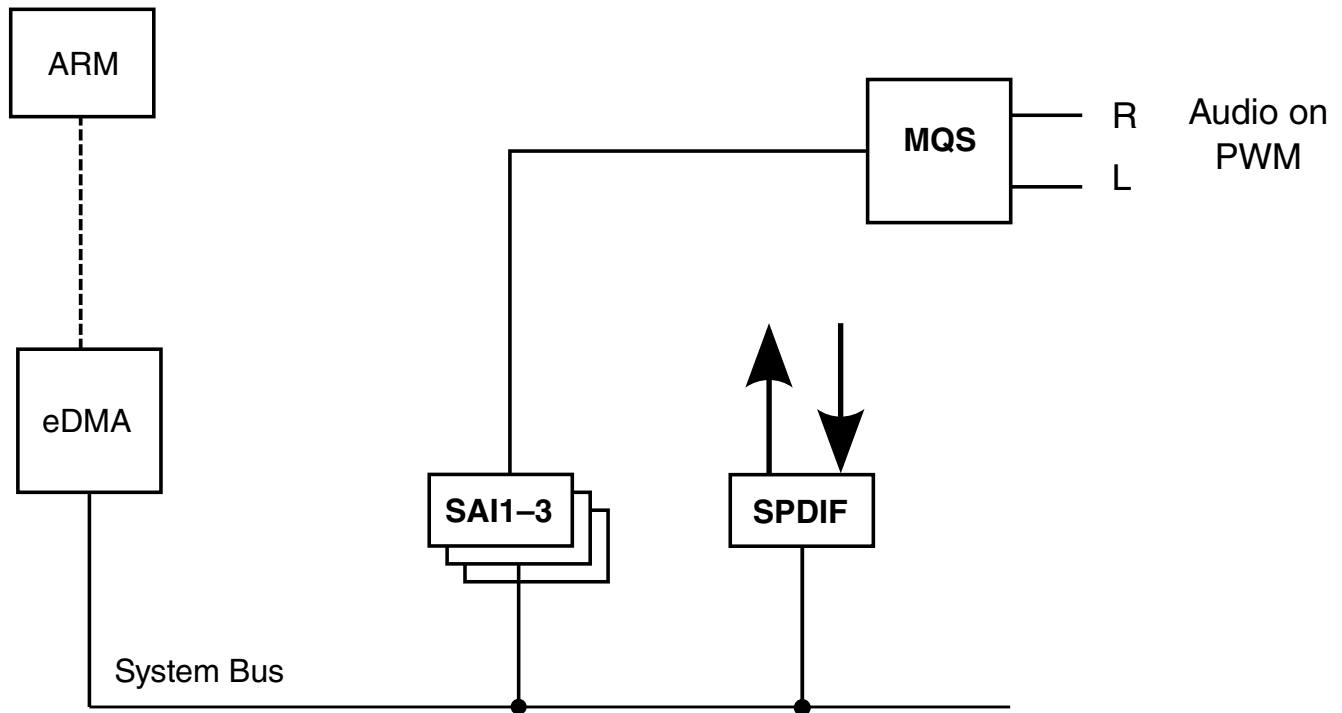

## 9.2 Audio subsystem

The audio subsystem consists of the following modules: SAI-1, SAI-2, SAI-3, SPDIF and MQS. In addition, the IOMUX must be appropriately configured to get signals in and out of the chip.

[Audio Subsystem Module Overview](#) provides an overview of each of the audio subsystem component modules, followed by a module-specific section.

## 9.2.1 Audio Subsystem Module Overview

The following figure shows a high level block diagram of the audio subsystem.

**Figure 9-2. Audio subsystem block diagram**

SAI1–3 are synchronous serial interfaces used to transfer audio data. They can be accessed by both the eDMA and ARM CPUs. Their input/output are connected to the pads through IOMUX.

MQS (medium quality speaker) is used to convert the I2S audio data from SAI to PWM signals that can drive external speaker directly. Its audio source comes from SAI-3 and its output is connected to pads through IOMUX.

The SPDIF (Sony/Philips digital interface) audio module is a stereo transceiver that allows the processor to receive and transmit digital audio over it. The SPDIF receiver section includes a frequency measurement block that allows the precise measurement of an incoming sampling frequency. A recovered clock is provided by the SPDIF receiver section and may be used to drive both internal and external components in the system.

The audio interfaces are summarized as the table below.

**Table 9-1. Audio Interface Summary**

Interface	Function	RX Data Line	TX Data Line
SAI-1	External audio	4	4
SAI-2	External audio	1	1
SAI-3	External audio	1	1
MQS	External audio	0	2
SPDIF	External audio	1	1

SAI-1 is used for multi-channel audio interface, which supports up to 8-channels audio input or 8-channels audio output at 384 kHz/32-bit. SAI-2 and SAI-3 can be used for stereo audio input and output up to 384 kHz/32-bit. Also SAI-3 is able to drive MQS directly as a low-cost audio output.

Detailed clock multiplexing scheme is shown in the following figure.

## Audio subsystem

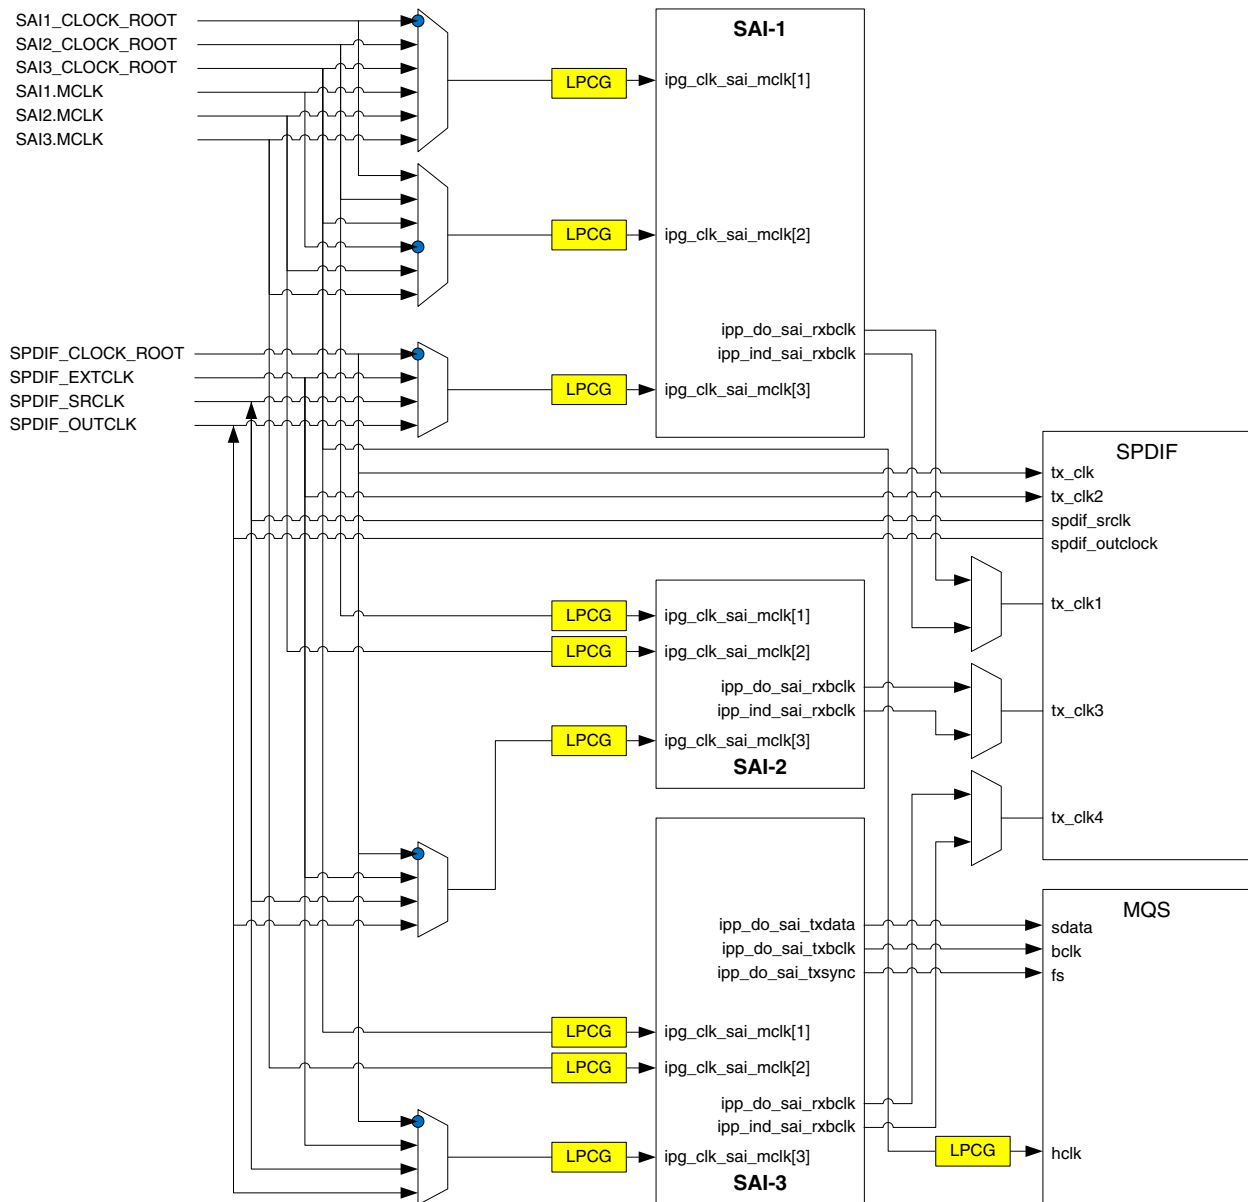

Figure 9-3. Audio subsystem clocking diagram

### 9.2.2 Medium Quality Sound (MQS)

MQS is used to generate medium quality audio via a standard GPIO in the pinmux. The user can connect stereo speakers or headphones to a power amplifier without an additional DAC chip.

- 2-channel, LSB-valid 16 bit, MSB shift-out first serial data (sdata)
- Frame sync aligned with the left channel data
- 44 kHz or 48 kHz I2S signals from SAI3

- SNR target as no more than 20 dB for the signals below 10 kHz
- Signals over 10 kHz have worse THD+N values

### 9.2.3 Synchronous Audio Interface (SAI)

- Transmitter with independent Bit Clock and Frame Sync supporting 1 data line
- Receiver with independent Bit Clock and Frame Sync supporting 1 data line
- Maximum Frame Size of 32 Words
- Word size programmable from 8-bits to 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous FIFO for each Transmit and Receive data line
- Graceful restart after FIFO Error

### 9.2.4 Sony/Philips Digital Interface (SPDIF)

The Sony/Philips Digital Interface (SPDIF) module is a stereo transceiver that allows the processor to receive and transmit digital audio over it using the IEC60958 standard, consumer format. The chip provides a single SPDIF receiver with one input, and one SPDIF transmitter with one output.

The SPDIF transceiver allows the handling of both SPDIF channel status (CS) and User (U) data and features a frequency measurement block that allows the precise measurement of the incoming sampling frequency.

The clock recovered by the SPDIF receiver is provided to drive both internal and external components in the system such as the SPDIF transmitter, ESAI ports, as well as external A/Ds or D/As, with clocking control provided via related registers.

The SPDIF is composed of two parts: SPDIF Receiver and SPDIF Transmitter. The SPDIF receiver extracts the audio data from each SPDIF frame and places the data in two 16-word-deep FIFOs, one FIFO for the left channel, the other FIFO for the right channel. The FIFOs support programmable watermark levels so that FIFO Full service request can be triggered when the combined number of data words stored in both FIFOs is 2, 8, 16 or 32 words. It is recommended to program the watermark level to trigger a FIFO Full service request when 16 word locations are filled. For optimal performance when servicing the FIFO Full service request, the FIFOs should be read alternately, starting with the left channel FIFO. The Channel Status and User Bits are also extracted from each frame and placed in the corresponding registers. The SPDIF receiver provides a bypass option for direct transfer of the SPDIF input signal to the SPDIF transmitter.

For the SPDIF transmitter, the audio data is provided by the processor via the SPDIFTxLeft and SPDIFTxRight registers, and the data is stored in two 16-word-deep FIFOs, one for the right channel, the other for the left channel. The FIFOs support programmable watermark levels so that FIFO Empty service request can be triggered when the combined number of empty data words locations in both FIFOs is 8, 16, 24 or 32 words. It is recommended to program the watermark level to trigger a FIFO Empty service request when 16 word locations are empty. For optimal performance when servicing the FIFO Empty service request, the FIFOs should be written alternately, starting with the left channel FIFO. The Channel Status bits are also provided via the corresponding registers. The SPDIF transmitter generates an SPDIF output bitstream in the biphase mark format (IEC 60958), which consists of audio data, channel status and user bits.

The data handled by the SPDIF module is 24-bit wide. The 24-bit SPDIF data is aligned in the 24 least significant bits of the 32-bit shared peripheral bus data word. The 8 most significant bits of the 32-bit word are ignored by the SPDIF Transmitter when data is being stored in the Transmit FIFOs from the peripheral bus. The 8 most significant bits of the 32-bit word are zeroed by the SPDIF Receiver module when the data is being read from the Receiver FIFOs to the peripheral bus.

Note that 16-bit data is left-aligned in the 24-bit word format of the SPDIF. This means that when receiving 16-bit data, it will be located in the middle two bytes of the 32-bit peripheral bus data word, while the 8 bits of the MSB and the 8 bits of the LSB will be zero. When 16-bit data is to be transmitted, the 32-bit word to be written to the SPDIF Transmit FIFOs should be created as follows: the 16-bit data should be located in the middle two bytes of the 32-bit data word and the 8 bits of the LSB must be set to zero, while the 8 bits of the MSB will be ignored.

The SPDIF Transmit clock is generated by the SPDIF internal clock generator module and the clock sources are from outside of the SPDIF block. The clock sources should provide a clock that is at least  $64 \times F_s$ , where  $F_s$  is the sampling frequency. The external clock source should provide at least  $128 \times F_s$ . Clocks of higher frequency may be provided as long as the multiplication factor is a power of 2 (for example,  $128x$ ,  $256x$  or  $512x$ ). Also, clock frequency precision of 100ppm or better should be provided.

# Chapter 10

## Clock and Power Management

### 10.1 Introduction

This chapter describes the Clock and Power Management architecture of the SoC.

The chip targets applications where low power consumption, long battery life, always-on and instant-on capabilities are paramount, and where there is no need for active cooling. To achieve these capabilities, the primary focus of the chip's design is reducing current consumption as much as possible, while simultaneously enabling the maximum level of peak performance and a balanced level of sustained performance for target applications. To achieve this, the chip architecture uses a wide range of power-management techniques and their combinations for maximum system design flexibility.

This chapter contains information about:

- Structural components of the power and clock management systems of the chip
- Power, clock and thermal management techniques supported by the chip

All given numerical values are typical or examples. For accurate values one should refer to the datasheet.

### 10.2 Device Power Management Architecture Components

To provide a clean and versatile architecture supporting a wide range of power-management techniques, clocks, and power rails are managed resources.

For each rail, two levels of management are defined: the first level is centralized or SoC-level resource management, and the second is a local or "module level" resource management.

The high level architectural view of the clock, power and thermal management system of the chip is presented in the figure below.

## Device Power Management Architecture Components

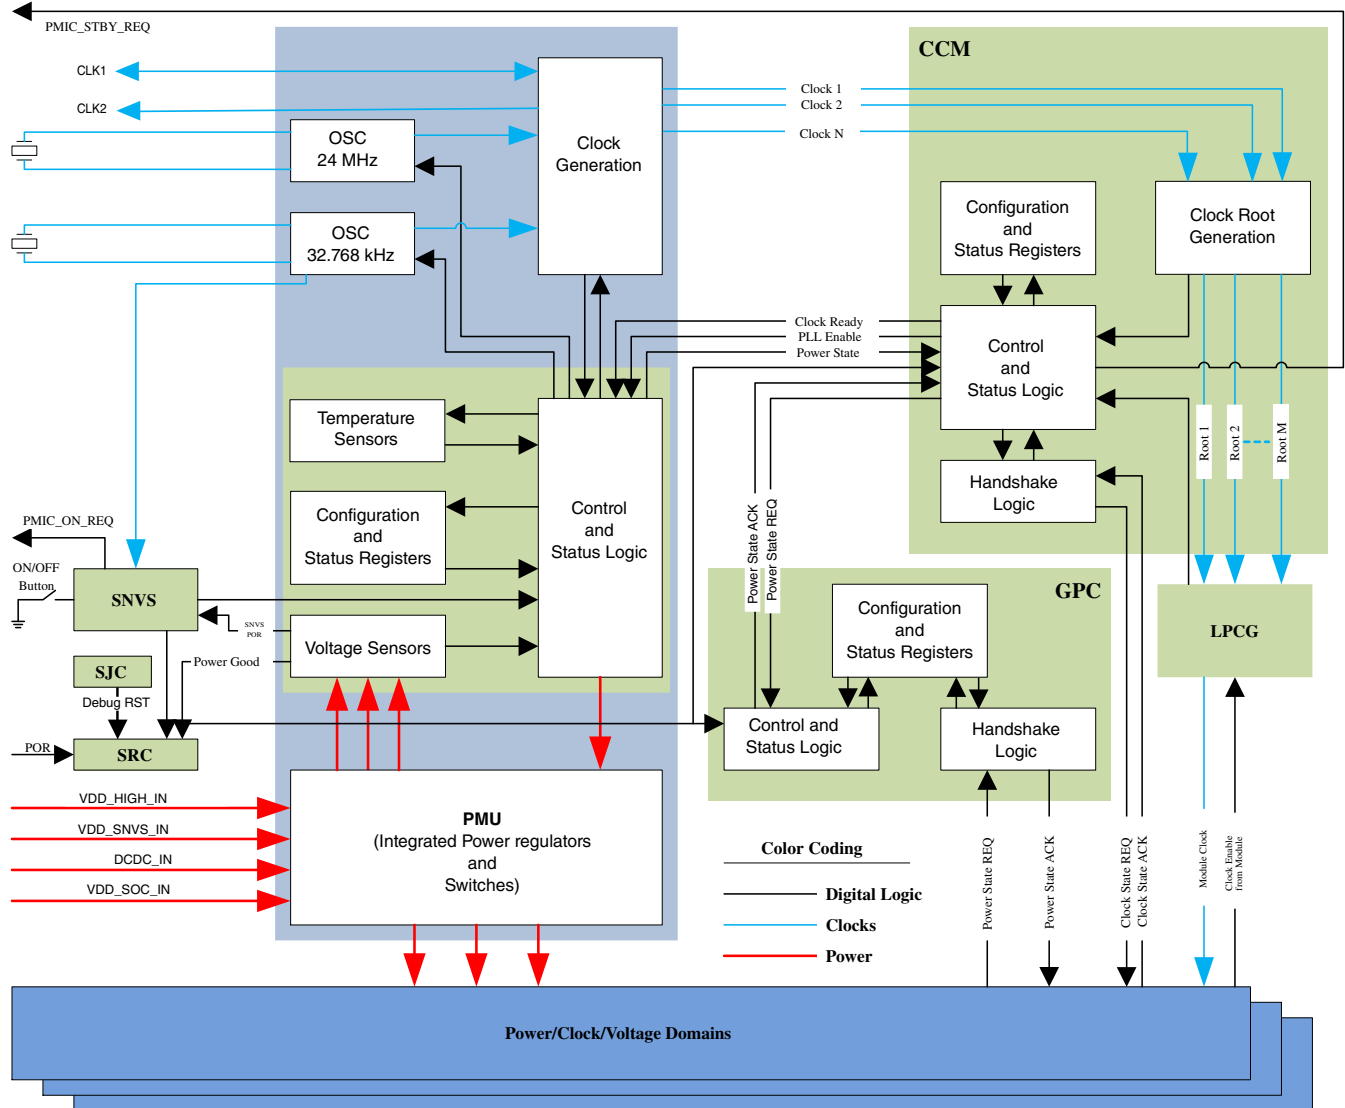

Figure 10-1. Power and clock management framework

### 10.2.1 Centralized components of clock generation and management

Centralized components of the clock generation and management sub-system are implemented in the following blocks:

- **CCM (Clock Control Module):** The CCM module provides control for primary (source level) and secondary (root level) clock generation, division, distribution, synchronization, and coarse-level gating. See [Clock Controller Module \(CCM\)](#) for

information on the CCM architecture, functional description and programming model.

- **LPCG (Low Power Clock Gating):** This module distributes the clocks to all blocks in the SoC and handles block level software-controllable and automated clock gating. See [Clock Controller Module \(CCM\)](#) for information on the LPCG architecture and functional description.

## 10.2.2 Centralized components of power generation, distribution and management

Centralized components of the power generation, distribution and management subsystem are implemented in the following blocks:

- **Power Management Unit (PMU).** See [Power Management Unit \(PMU\)](#) for information on the PMU architecture, functional description and programming model.
- **General Power Controller (GPC).** See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.
- **On Chip DC-DC regulator.** See the DCDC chapter for more detailed information.

## 10.2.3 Reset generation and distribution system

Power and clock management are accompanied with an appropriate reset generation and distribution system, centralized functions of which are implemented by the [System Reset Controller \(SRC\)](#). See [General Power Controller \(GPC\)](#) for information on the GPC architecture, functional description and programming model.

## 10.2.4 Power and clock management framework

Together, the modules listed above provide enhanced power-management features with centralized control for the clock, reset, and power-management signals on the SoC.

The centralized management framework defines the managed components of the power-management architecture. These components are called the clock, power, and voltage domains.

### NOTE

A domain is a group of modules or functional blocks that share a common resource entity (for example, common clock root, common power source, or a common power switch). The

software component managing shared resources should take into account the joint constraints of all the modules belonging to that resource domain.

## 10.3 Clock Management

### 10.3.1 Centralized components of clock management system

The clock generation and management system is built around the CCM and LPCG blocks.

A high level block diagram of the clock management system in the SoC environment is shown in the following figure.

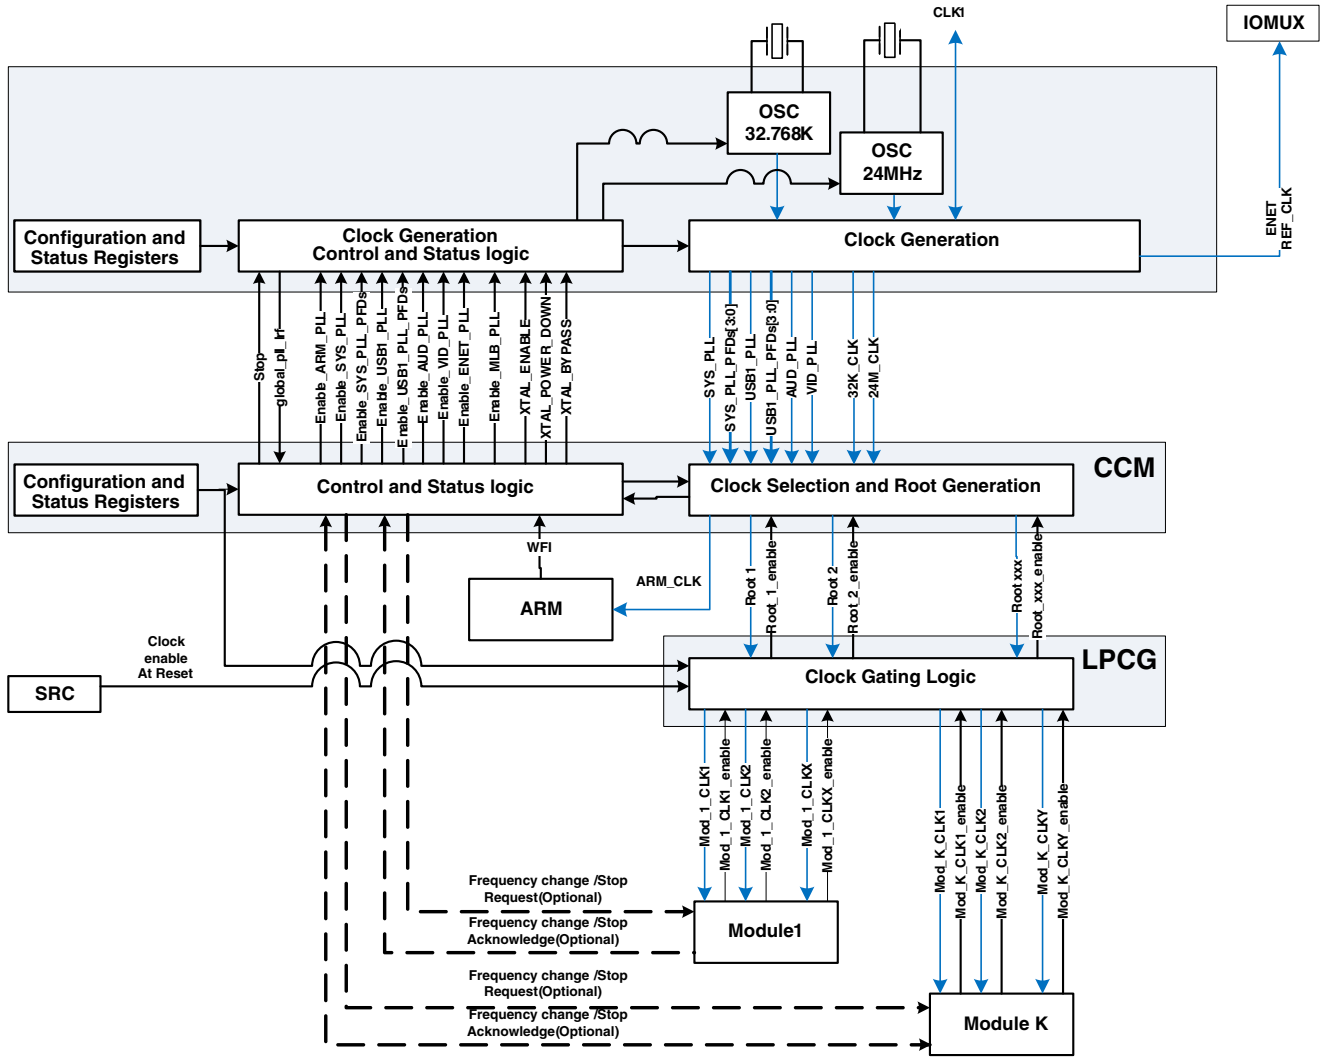

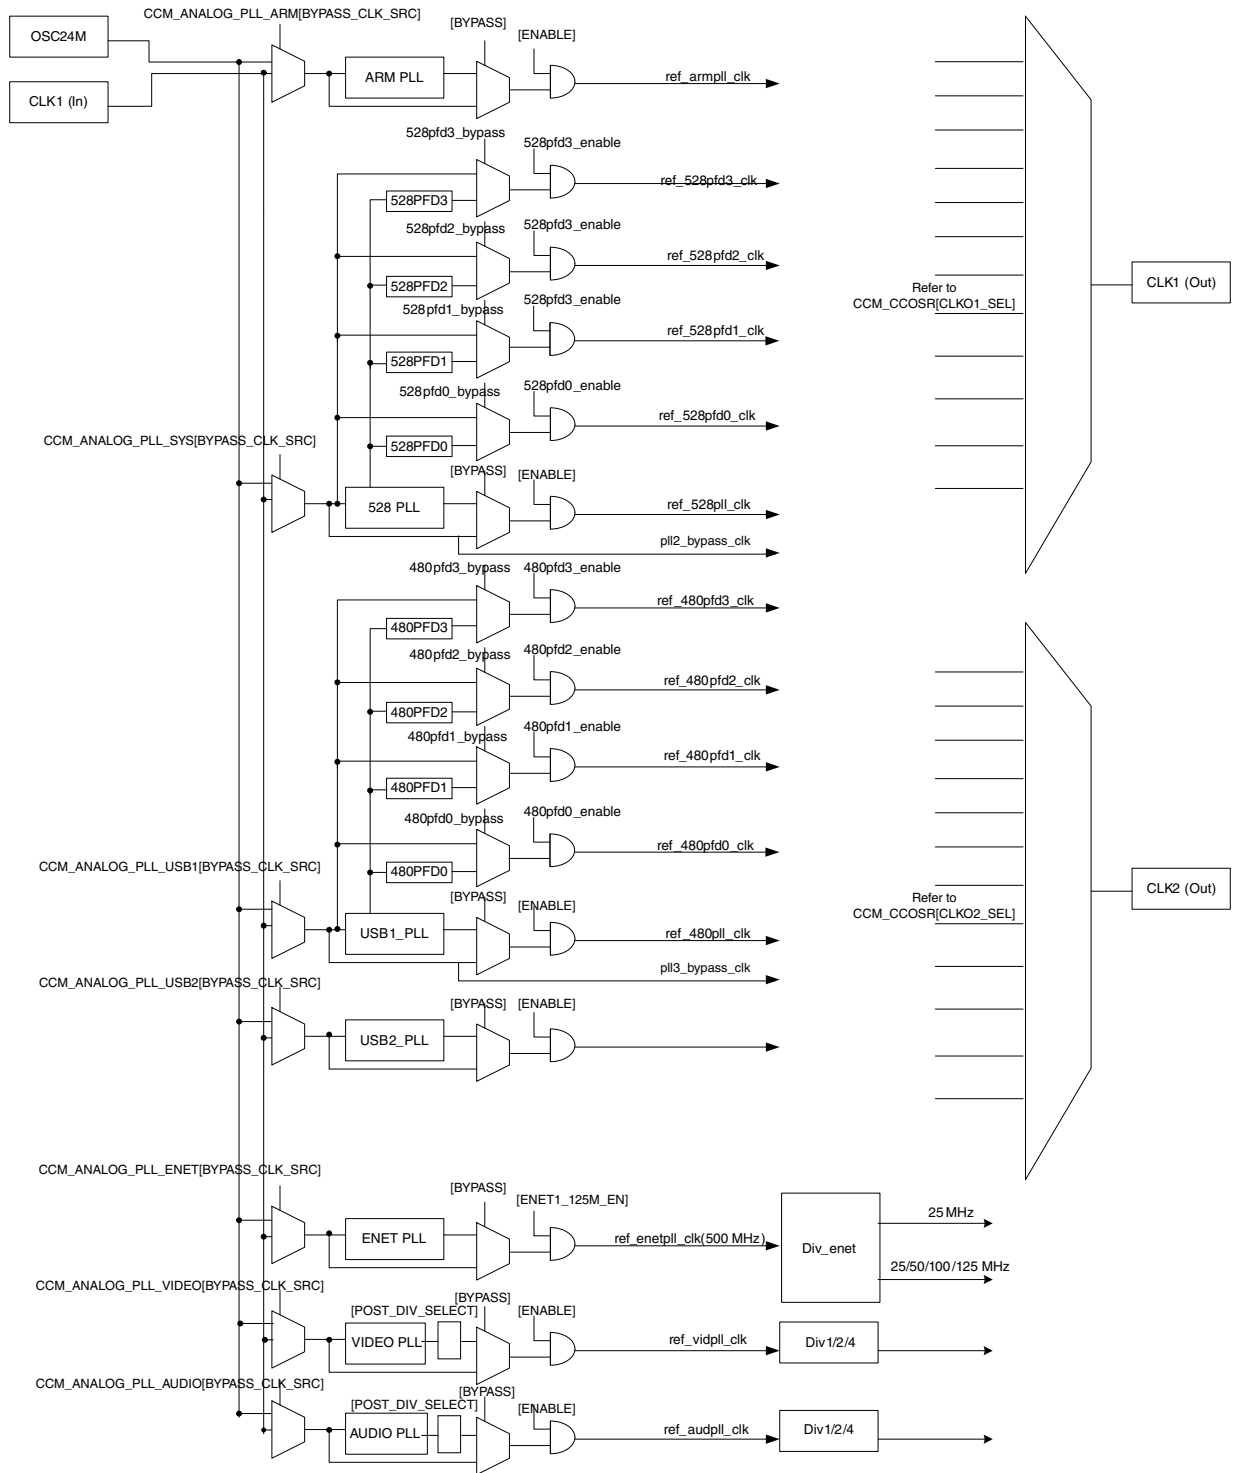

Figure 10-2. Clock Management System

A high level block diagram of the clock generation is shown in the figure below.

**Figure 10-3. Primary Clock Generation**

### 10.3.2 Clock generation

The clock generation section includes the components detailed in the following sections.

### 10.3.2.1 Crystal Oscillator (XTALOSC)

The Crystal Oscillator block is comprised of both the high frequency oscillator (typical frequency is 24 MHz) and the low frequency real time clock oscillator (typical frequency of 32.768 KHz). Each of these oscillators is implemented as a biased amplifier that, when combined with a suitable external quartz crystal and external load capacitors, implements an oscillator. See [Crystal Oscillator \(XTALOSC\)](#) for details of the XTALOSC block.

#### NOTE

24 MHz XTALOSC can be the external clock source of SYSTICK.

### 10.3.2.2 PLLs

Seven PLLs are included in the clock generation section. Two of these PLLs are each equipped with four Phase Fractional Dividers (PFDs) in order to generate additional frequencies.

#### NOTE

Each PFD works independently by interpolating the VCO of the PLL to which it is connected. It effectively takes the PLL VCO frequency and produces  $18/N \times F_{vco}$  at its output where N ranges from 12 to 35. PFD is a completely digital design with no analog components or feedback loops. The frequency switch time is much faster than a PLL because keeping the base PLL locked and changing the integer N only changes the logical combination of the interpolated outputs of the VCO. Note that the PFD not only enables faster frequency changes than a PLL, but also allows the configuration to be safely changed "on-the-fly" without going through the output clock disabling/enabling process.

The seven PLLs are listed below:

- PLL1 (also referred to as ARM\_PLL) - This is the PLL clocking the ARM core complex. It is a programmable integer frequency multiplier capable of output frequency of up to 1.3 GHz. Note that this frequency is higher than the maximum chip supported frequency 1.0 GHz.
- PLL2 (also referred to as System\_PLL or 528\_PLL) - PLL2 runs at a fixed multiplier of 22, producing 528 MHz output frequency with 24 MHz reference from XTALOSC. Besides the main output, this PLL drives four PFDs

(PLL2\_PFD0...PLL2\_PFD3). The main PLL output and its PFD outputs are used as inputs for many clock roots. These do not require exact/constant frequency and can be changed as a part of dynamic frequency scaling procedure. Typically, this PLL or its PFDs are a clock source for internal system buses, internal processing logic, SDRAM interface, NAND/NOR interface modules, etc.

- PLL3 (also referred to as USB1\_PLL) - PLL3 is used in conjunction with the first instance of USB PHY (USBPHY1, also known as OTG PHY). This PLL drives four PFDs (PLL3\_PFD0...PLL3\_PFD3) and runs at a fixed multiplier of 20. This results in a VCO frequency of 480 MHz with a 24 MHz oscillator. The main PLL output and its PFD outputs are used as inputs for many clock roots that require constant frequency, such as UART and other serial interfaces, audio interfaces, etc.
- PLL4 (also referred to as an Audio PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision audio clock with standardized audio frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for serial audio interfaces and as a reference clock for external audio codecs. It is equipped with a divider on its output and can generate divided by 1, 2 or 4 from the PLL VCO frequency.
- PLL5 (also referred to as a Video PLL) - This is a fractional multiplier PLL used for generating a low jitter and high precision video clock with standardized video frequencies. The PLLs oscillator frequency range is from 650 MHz to 1300 MHz, and the frequency resolution is better than 1 Hz. This clock is mainly used as a clock for display and video interfaces. It is equipped with dividers on its output and can generate clock divided by 1, 2, 4, 8 or 16 from the PLL VCO frequency
- PLL6 (also referred to as ENET\_PLL) - This PLL implements a fixed  $20 + (5/6)$  multiplier. With a 24 MHz input, it has a VCO frequency of 500 MHz. This PLL is used to generate:
  - 50 or 25 MHz for the external ethernet interface.
  - 125 MHz for reduced gigabit ethernet interface.
  - 100 MHz for general purposes.
- PLL7 (also referred to as USB2\_PLL) - This PLL provides clock exclusively to USB2 PHY (USBPHY2, also known as OTG PHY). It runs at a fixed multiplier of 20, resulting in a VCO frequency of 480 MHz with a 24 MHz oscillator.

### 10.3.2.2.1 General PLL Control and Status Functions

Each PLLs configuration and control functions are accessible individually through its PFDs and global configuration and status registers.

Reference input clock for any of the PLLs could be selected individually by the `BYPASS_CLK_SRC` field of the PLL control register. See [CCM Analog Memory Map/ Register Definition](#) for more information.

Each of the PLLs could be individually configured to "Bypass", "Output disabled" and "Power Down" modes.

When configured in "Bypass" PLL pass directly its input reference clocks to the PLL output. Bypassing the PLL is done by setting the BYPASS bit in the control register. For the PLL equipped with PFDs the input reference clock is also bypassed to all PFDs outputs.

When configured in output disabled mode (ENABLE=0), the PLL's output is completely gated and there is neither a bypass clock nor PLL generated clock that propagates to PLL output. Each PLL output has an individual "Output Enable" control bit. The PFDs are gated by the ENABLE bit of their associated PLL. Each PFD does have an associated clock gate bit that can be used to turn it off individually.

When configured in "Power Down mode" most of the PLL circuitry is switched off. Neither main PLL output nor PFD outputs are available in this mode.

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, Configuration of Phase Fractional Dividers (EB790) at [www.nxp.com](http://www.nxp.com) for procedure details.

Individual PLL status is reflected in "PLL Lock" bits of the PLL control registers. PLL enable logic which monitors the register value change is implemented to gate off the PLL outputs during the "lock in" period.

Outputs are generated to be sent out by monitoring the individual PLL lock flags and filtering out any random initial edges.

Individual PLL Lock ready flags are first "ORED" with "enables" and then "ANDED" together to generate the global PLL lock ready flag that reflects status of all PLLs enabled in certain moment.

[CCM Memory Map/Register Definition](#) and [CCM Analog Memory Map/Register Definition](#) contains detailed descriptions of the memory mapped registers and control functions of the clock generation sub-module.

### 10.3.2.3 CCM

CCM includes:

- Clock root generation logic - This sub-block provides the registers that control most of the secondary clock source programming, including both the primary clock source selection and the clock dividers. The clock roots are each individual clocks to the core, system buses (AXI, AHB, IPG) and all other SoC peripherals, among those are serial clocks, baud clocks, and special functional clocks. Most of clock roots are specific per module.
- CCM, in coordination with GPC, PMU and SRC, manages the **Power modes**, namely RUN, WAIT and STOP modes. The gating of the peripheral clocks is programmable in RUN and WAIT modes.

CCM manages the frequency scaling procedure for:

- ARM core clock - "on the fly" without clock interruption, by either shifting between PLL sources **PLL clock change** or by changing the divider ratio.
- Peripheral root clock - by using programmable divider. The division factor can change on the fly without loss of clocks.

### NOTE

On-the-fly frequency changing for synchronous interfaces like serial audio interfaces, video and display interfaces, or general purpose serial interfaces (e.g. UART, CAN) may cause synchronization loss and should not be done.

#### 10.3.2.4 Low Power Clock Gating unit (LPCG)

The LPCG block receives the root clocks from CCM and splits them to clock branches for each block. The clock branches are individually gated clocks.

The enables for those gates can come from three sources:

- Clock enable signal from CCM - This signal is generated depending on the power mode the system is in. For each power mode, it is defined in the software using the configuration of the CGR bits in CCM.
- Clock enable signal from the block - This signal is generated by the block based on its internal logic. Not every enable signal from the block is used. Each clock enable signal from the block can be overridden based on the programmable bit in CCM.
- Clock enable signal from the reset controller (SRC) - This signal will enable the clock during the reset procedure.

### 10.3.3 Peripheral components of clock management system

### 10.3.3.1 Interface and functional clock

Each block within the SoC has specific clock input characteristic requirements. Based on the characteristics of the clocks delivered to modules, the clocks are divided into two categories: bus interface clocks and functional clocks.

The bus interface clocks have the following characteristics:

- They ensure proper communication between any block/subsystem and the system buses.
- In most cases, they supply the system interface and configuration registers of the block.
- A typical block has one system bus clock, but blocks with multiple interface clocks may also exist (that is, when a block is connected to multiple buses).
- The bus interface clocks are always fed by the outputs of the CCM/LPCG.
- Clock management for this type of clock is always implemented at the system level because it requires coordinated clock management between the block and system buses.

Functional clocks have the following characteristics:

- They supply the functional part of a block or a subsystem.
- Typically, these clocks are completely asynchronous and independent from the bus interface clock of the same block.
- A block can have one or more functional clocks. Some functional clocks are mandatory, while others are optional for its functioning. A block needs its mandatory clock(s) to be operational. The optional clocks are used for specific features and can be shut down without stopping the block activity.
- The functional clocks are fed either by a CCM/LPCG block functional clock output, or by some other clock source, such as a clock output of another block or an external signal coming from IOMUX.

### 10.3.3.2 Block level clock management

Each block in the system may also have specific clock requirements. Certain module clocks must be active when operating in some specific modes, or may be gated in some others. Generally, the activation and gating of the module clocks are managed by LPCG. Hence, the LPCG block must be programmed properly and, in case of hardware controllable clock gating, peripheral module should provide signals indicating when to activate and when to gate the module clocks.

The LPCG block differentiates the clock-management behavior for device modules based on whether the block can initiate transactions on the device interconnect (called master module), or if it cannot initiate transactions and only responds to the transactions initiated by the master (called slave module). Thus, two hardware-based clock-management protocols are used:

- Master protocol - Clock-management protocol between the CCM/LPCG and blocks that can be bus master
- Slave protocol - Clock-management protocol between the CCM/LPCG and slave modules

### 10.3.3.2.1 Master clock protocol

This protocol is used to indicate that a master module is ready to initiate a transaction on the device interconnect and requests specific (both functional and interface) clocks. The CCM/LPCG block ensures that the required clocks are active when the master module requests that the CCM/LPCG enable them. The module is said to be functional after the required clocks are activated.

Similarly, when the master module no longer requires the clocks, it informs the LPCG/CCM block and the LPCG/CCM can then gate the clocks to the module and all the clock precedents that are not used by other blocks. The master module is then said to be in clock-gated or partially clock gated mode.

Examples of module supporting master clock protocol USDHC. Please see details in chapters describing these modules and in the CCM enable override register (CCM\_CMEOR).

### 10.3.3.2.2 Slave clock protocol

This hardware protocol allows CCM to control the state of a slave module. CCM informs the slave module, through assertion of a stop/change request, when its clocks (both interface and functional) can be changed or gated. The slave acknowledges the request and CCM is then allowed to gate or change the clocks to the block.

Similarly, a clock-gated slave module may need to be woken up because of some event or a service request from a master module. In this situation, CCM enables the clocks to the module and then de-asserts the stop request to signal the module to wake up.

Examples of modules supporting slave clock protocol are CAN, and GPT. Please see details in chapters describing these modules and in the CCM Module Enable Override Register (CCM\_CMEOR). See [CCM Memory Map/Register Definition](#) for more details.

The protocol in both "master" and "slave" cases is completely hardware-controlled, but software should configure the clock management behavior for the module in two places: in the CCM registers associated with the block and in the block configuration registers.

### 10.3.3.3 Clock Domain(s)

A clock domain is a group of blocks fed by clock signals controlled by the same clock controls in CCM. By gating the clocks in a clock domain, the clocks to all the blocks belonging to that clock domain can be gated/activated, either by software control or by hardware control associated with block activity. Thus, a clock domain allows efficient control of the dynamic power consumption of the domain.

The device is partitioned into multiple clock domains and each clock domain is controlled by an associated group of clock gating cells within the LPCG block. This allows the CCM/LPCG to individually activate and gate each clock domain of the system.

### 10.3.3.4 Domain level clock management

The domain clock manager can automatically (based on hardware conditions) and manage the bus interface clocks within the clock domain. The functional clocks within the clock domain are managed through software settings.

### 10.3.3.5 Domain dependencies

A domain dependency is a hierarchical relationship between two clock domains. Clock domain "X" is said to depend on a clock domain "Y" when a block in clock domain "Y" provides services (or even just a clock) to a block in clock domain "X". As a result, clock domain "Y" must be active whenever clock domain "X" is active.

The dependency between two clock domains may also exist if one clock domain serves to ensure communication between two blocks (for example, the clock domain of the device interconnect).

## 10.4 Power management

### 10.4.1 Centralized Components of Power Management System

The power generation and management system is built around the PMU and GPC blocks. A high level block diagram of the power management system in the SoC environment is shown in the figure below.

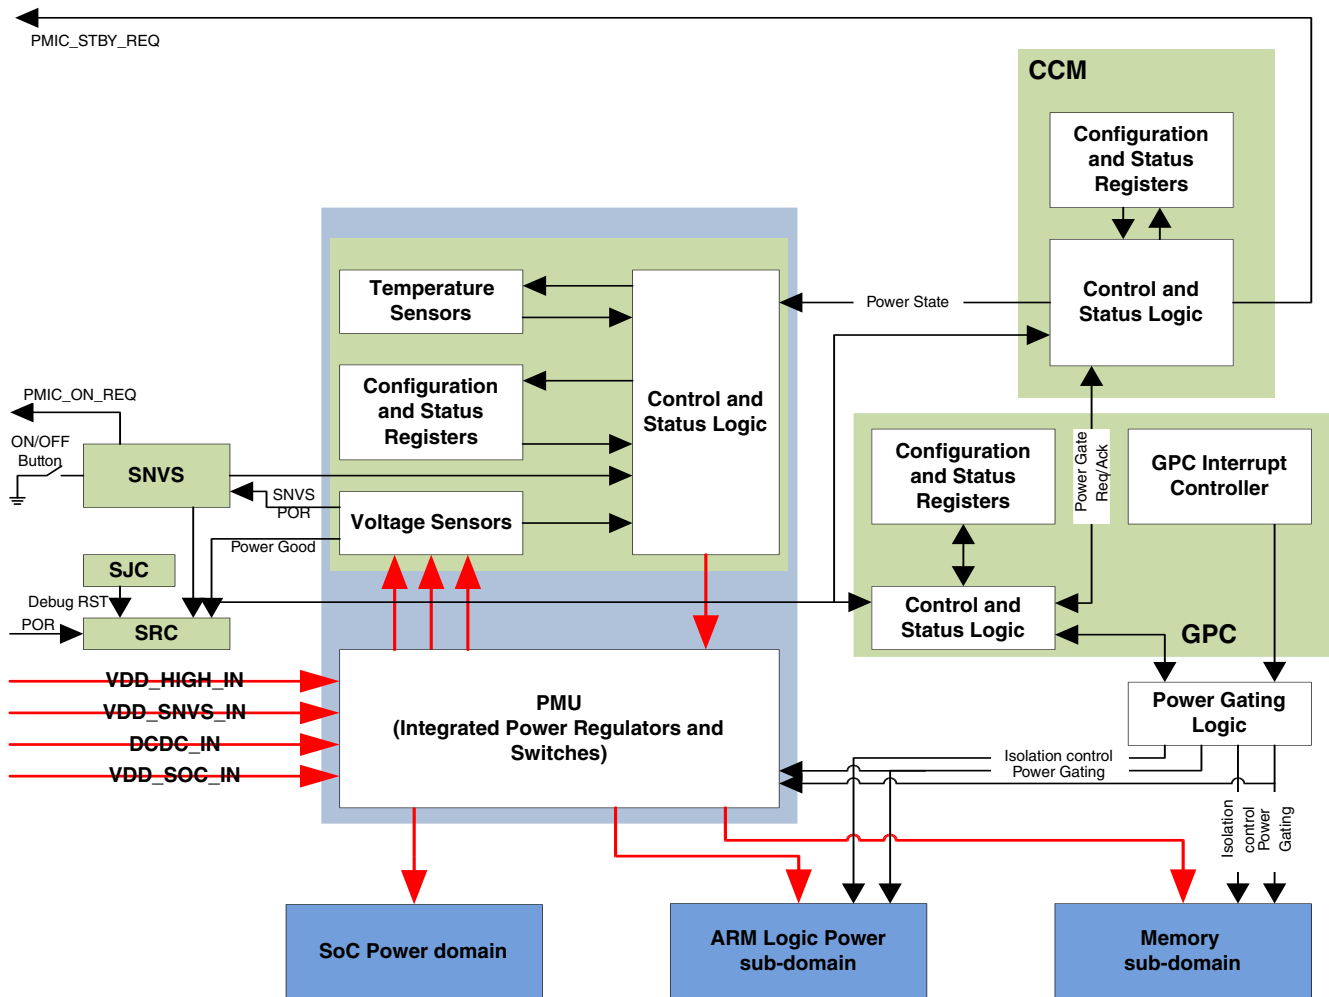

Figure 10-4. Power Management System

#### 10.4.1.1 Integrated PMU

The first component of the power management system, referred to as the integrated PMU, is designed to simplify the external power interface.

It consists of a set of secondary power supplies that enable SoC operations from just two or three primary supplies. The high level block diagram of the power tree, utilizing the integrated PMU, is shown below.

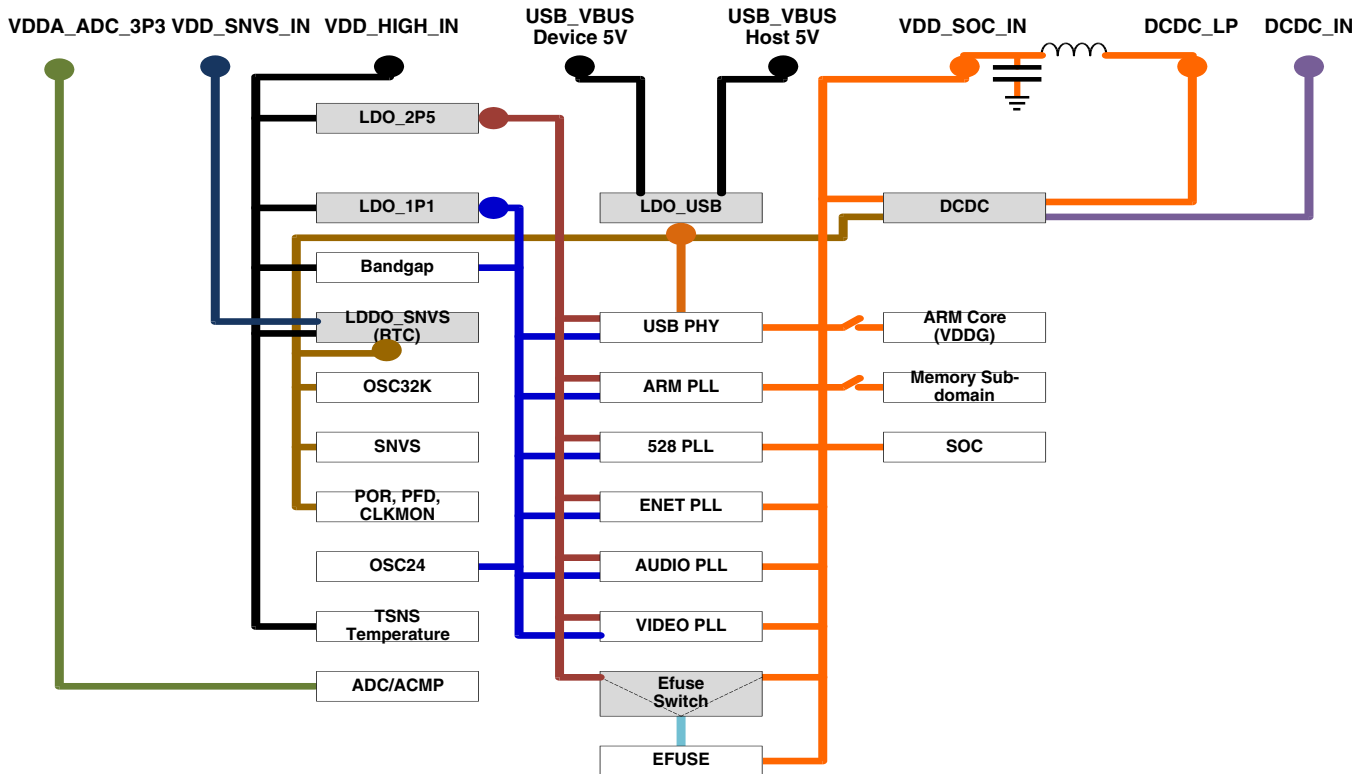

Figure 10-5. SOC Power Tree

The integrated PMU includes the following components:

- On-chip DCDC regulator
- Two Analog LDO regulators
- USB LDO
- SNVS regulator

See [Power Management Unit \(PMU\)](#) for further details on integrated PMU functional description and programmability.

#### 10.4.1.1.1 DCDC Regulator

The DCDC regulator includes the following features:

- Adjustable (25 mV per step) high efficiency regulator
- Supports 3.3 V ( $\pm 10\%$ ) input voltage
- Output ranged in 0.9 V~1.3 V
- Supports nominal run, low power standby and off modes
- Supports 0.9 V~1.3 V output in run mode
- Supports 0.9 V~1.0 V output in standby mode
- Over current and over voltage detection

These modes allow the regulator to implement voltage scaling and power gating, and allow bypass when an external high power efficient regulator is used as a direct source for some of the SoC loads.

The DVFS in a typical cost/complexity optimized application is considered by mean of internal DCDC. DCDC workpoint can be dynamically adjusted according to requirement system working frequency.

#### **10.4.1.1.2 Analog LDO regulators**

There are two analog LDO regulators used for general system purposes:

- LDO\_1P1 - The LDO\_1P1 (VDD\_HIGH\_IN, NVCC\_PLL) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 1.1V output voltage. This regulator supplies digital portions of USB PHYs, PLLs, and the internal 24 MHz oscillator.
- LDO\_2P5 - The LDO\_2P5 (VDD\_HIGH\_IN, VDD\_HIGH\_CAP) linearly regulates down a higher supply voltage (2.8V-3.3V) to produce a nominal 2.5V output voltage. The regular 2.5V LDO is combined with an alternate self-biased low-precision weak regulator which can be enabled for applications that need to keep the 2.5V output voltage alive during low power modes, where the main regulator and its associated global bandgap reference module are disabled to save power. The output of this weak-regulator is not programmable and is a function of its input power supply as well as its load current. Typically with a 3V input power supply, the weak-regulator output is 2.525V and its output impedance is approximately 400Ohm. Special procedure is recommended to move load back and forth between the main and low power regulators. This regulator supplies most of the analog circuitry of the integrated PHYs, and other analog and mix signal components integrated into the SoC.

#### **10.4.1.1.3 USB LDO**

The USB\_LDO linearly regulates down the USB VBUS input voltages (typically 5V) to produce a nominal 3.0V output voltage. This regulator has a built in power-mux that allows the user to run the regulator from either one of the VBUS supplies when both are present. If only one of the VBUS voltages is present, the regulator automatically selects that supply. Current limit is also included to help the system keep the in-rush current within limits as required in USB 2.0 specification. This regulator supplies only low speed and full speed transceivers of USB PHYs.

#### 10.4.1.1.4 SNVS regulator

The SNVS regulator takes the SNVS\_IN supply and generates the SNVS\_CAP supply, which in turn powers the real time clock and low power section of the SNVS blocks. If VDDHIGH\_IN is present, then the SNVS\_IN supply is internally shorted to the VDDHIGH\_IN supply to allow coin cell recharging if necessary.

#### 10.4.1.2 GPC - General Power Controller

The GPC block includes the sub-blocks listed here.

- Power Gating Controller (PGC) - This sub-block of GPC has the following functions:
  - Provides the user with the ability to switch off power to a target subsystem.
  - Generates power-up and power-down control sequences. This includes interaction with CCM/LPCG and SRC, and control for clock and reset generation for power domains affected by power gating.
  - Provides programmable registers that adjust the timing of the power control signals.
  - Controls the CPU power domain and Memory sub-domain (PDRAM<sub>x</sub>).
- Wake-up interrupt controller - This controller initiates the system wake-up from low power modes when only low frequency real time clock remains active, and thus the Generic Interrupt Controller (GIC) can not handle synchronous interrupt signals. Additional features are as follows:
  - Supports up to 160 interrupts
  - Provides an option to mask/unmask each interrupt
  - Detects interrupts and generates the wake up signal

See [General Power Controller \(GPC\)](#) for further details on GPC, its sub-blocks, and information on its functional description and programmability.

#### 10.4.1.3 SRC - System reset Controller

The reset controller is responsible for the generation of all reset signals and boot configuration decoding.

It determines the source and the type of reset, such as POR and COLD, and performs the necessary reset signal qualifications. SRC is capable of generating reset sequences in the following conditions:

- in interaction with external PMIC, based on external POR\_B signal and "power ready" signals generated by the integrated PMU
- or in interaction with the integrated PMU only, based on its "power ready" signal.

Based on the type of reset, the reset logic generates the reset sequence for either the entire SoC or for the blocks that are power-gated.

See [System Reset Controller \(SRC\)](#) for further details on SRC functional description and programmability.

### 10.4.1.4 Power domain(s)

A power domain is a group of blocks or sub-blocks fed by power sources controlled by the same power controls in GPC.

Some power domains can be split into a logic sub-domain and a memory sub-domain. The memory sub-domain in such case may contain two entities:

- Memory array(s) - Powered by a dedicated voltage rail enabling memory retention while core is OFF.
- Memory interface logic - Powered by the same voltage source as the logic sub-domain of the power domain.

Signals crossing power domain boundaries or sub-domain boundaries are passed through proper isolation and/or level-shifting cells to ensure robust operations of the SoC when some of domains are power gated or working at a reduced voltage.

The following figure shows the power domain interface within the system.

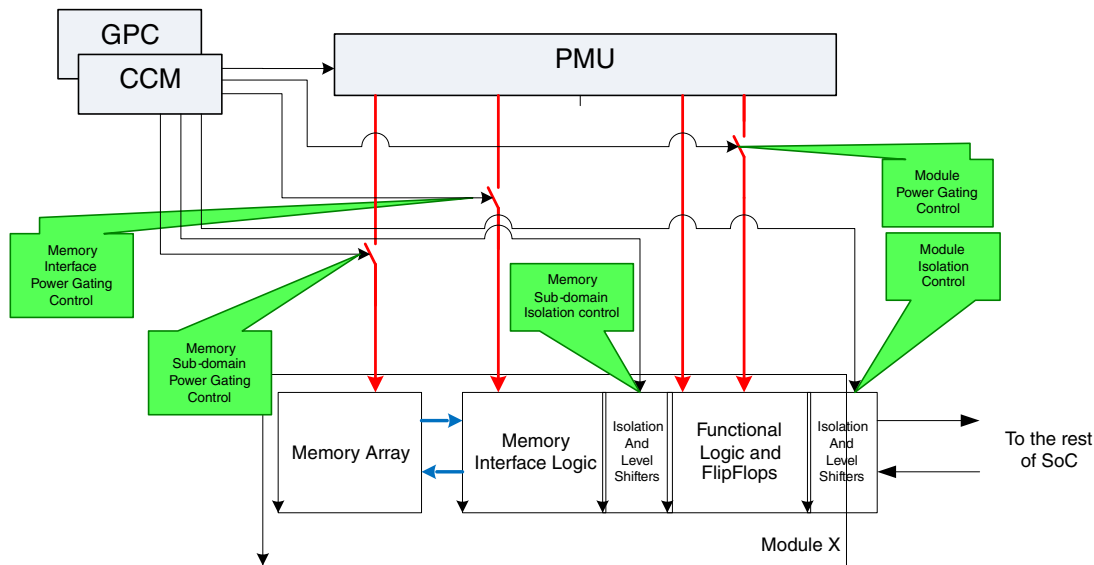

Figure 10-6. Power domain interface

#### 10.4.1.4.1 Power distribution

The power distribution tree is comprised of multiple power domains. The main power domains are:

- ARM - The ARM domain contains the ARM Core platform (except for TCM memory arrays and controller). This domain can be supplied from internal or external controllable regulator.
- FlexRAM Memory array - The FlexRAM memory array is partitioned into 3 sub-domains: 32 KB always-on domain (also known as **PDRET** domain: Bank0 of FlexRAM), 224 KB **PDRAM0** domain (Bank1 to Bank7 of FlexRAM) and 256 KB **PDRAM1** domain (Bank8 to Bank15 of FlexRAM) which could be power-gated separately.
- SNVS/RTC low power domain - The SRTC domain contains only counter, comparator and compared data of the on-chip RTC. This domain should be supplied from an external single cell LiION battery and/or an external pre-regulated power supply. SNVS also contains Low Power State Retention (LPSR) GPIO, IOMUX, and LPSR general purpose register.
- Analog domain - The analog domain contains the PLLs, LDOs and USB PHY. The domain supplies should be constant to allow continuous clock during any dynamic voltage scaling techniques. The digital supply should be provided from an internal regulator, and can be combined with the memory array supply. The analog supply should be provided from internal low noise regulator.
- Main SoC logic - The main SoC logic domain contains the rest of the logic of the SoC. It is supplied by the same power supply as the ARM Core Platform.

From a DVFS and Power Gating standpoint, the following digital logic domains are affected:

- ARM Core Platform - DVFS and power gating.
- FlexRAM memories - DVFS and power gating.
- Main SoC logic - DVFS, no power gating.

#### 10.4.1.4.2 Domain memory and domain logic state retention in case of power gating

The following is the list of relevant memories and logic domains with the description of their state-retention support.

#### NOTE

For more detailed information, see the table "Low Power Mode Definition" in this chapter.

- ARM Core Platform logic - the software state retention for all logic is implemented in this domain and L1 cache memories. That means that the content of relevant

registers should be stored in some memory retaining its state (OCRAM for example) while the logic domain is power-gated.

- FlexRAM PDRET memories - hardware state-retention in all power modes except SNVS mode.
- FlexRAM PDRAM0 memories - hardware state-retention . When ARM core is power gated, PDRAM0 memories can be either leaved on with its content retained or power gated together with the core.
- FlexRAM PDRAM1 memories - can be powered gated (together) independently of ARM core power gating.
- SoC - hardware state-retention .
- SNVS\_LP - hardware state-retention even when SoC supplies are removed.

### 10.4.1.4.3 Power Gating Domain Management

The following bullets provide the sequence required for power-gating the relevant power-domains:

#### 10.4.1.4.3.1 ARM Core Platform

1. Copy through software all the Core configuration registers to a powered-on memory
2. Configure the GPC/PGC CPU registers in [PGC Memory Map/Register Definition](#) as follows to power-down the core on the next "WFI" instruction:
  - Configure the GPC/PGC PGC\_CPU\_PDNSCR Register ISO and ISO2SW bits. These bits determine the delay between the power-down request to enabling the platform isolation and the platform isolation to the actual power-off switch to the supplies accordingly.
  - Configure the GPC/PGC PGC\_CPU\_PUPSCR Register SW and SW2ISO bits. These bits determine the delay between the power-up request to the actual power-up of the supplies and the last to the platform isolation disabling.
  - Configure the GPC PGC PGC\_CPU\_CTRL PCR bit to allow the power down of the platform
  - ARM Core Platform should execute a "WFI" instruction.

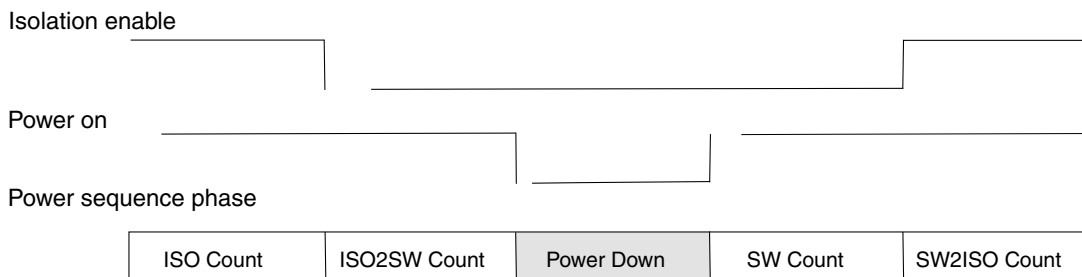

Figure 10-7. ARM Core Platform isolation and power on switch flow

#### 10.4.1.4.3.2 FlexRAM PDRAMx

1. Configure the CCM CGR bits ([CCM Memory Map/Register Definition](#)) to disable the clocks of related domains .
2. Configure the GPC/PGC Registers ([GPC Memory Map/Register Definition](#)) as follows to power-down isolate the PDRAMx logic from the rest of the SoC logic:

Configure the GPC/PGC PDNSCR Register ISO bits. These bits determine the delay between the power-down request to enabling the LDO domain isolation.

Configure the GPC/PGC PUPSCR Register SW2ISO bits. These bits determine the power-up request to the LDO domain isolation disabling.

Configure the GPC/PGC CTRL[PCR] bit to allow the power down of the block.

Configure the GPC/PGC GPC\_CNTR to power down PDRAMx

**Figure 10-8. PDRAMx isolation and power on switch flow**

#### 10.4.1.4.3.3 SoC

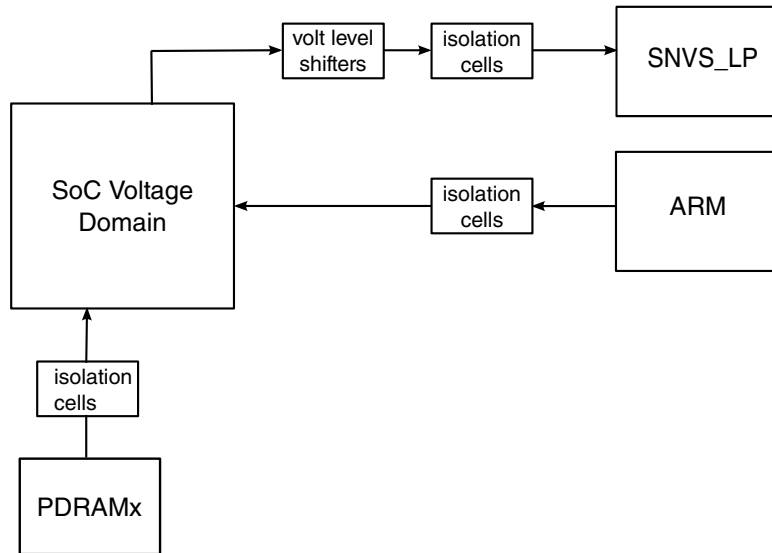

For additional power reduction it is possible to do the following:

- Power-down the internal oscillator by configuring the following bits CCM\_CCR[COSEC\_EN] ([CCM Memory Map/Register Definition](#)). This can be done only in case there is no dependency on 24 MHz XTAL for wake-up.
- It is possible to turn off and turn on the PMIC supplies to the SoC even when the SoC supplies are off. Since SNVS\_LP is powered through an "always on" supply, configuring the SNVS\_LP DP\_EN to "1" allows changing the PMIC\_ON\_REQ pad (SoC on/off supply indication to the PMIC) through the ONOFF pad.

#### 10.4.1.4.4 Power Gating domain dependencies

There are 3 power domains that need to be isolated in different power-down cases:

- ARM Core Platform and PDRAMx - Isolation needs to be enabled before power-down. This is taken care of automatically once CCM and PGC are configured and the ARM Core Platform executes the "WFI" instruction.
- SNVS\_LP - Different from the 2 cases above, the SNVS\_LP isolation isolates the signals coming from the SoC to the SNVS\_LP. This is required for saving the contents of the SNVS\_LP (such as the real-time clock). The isolation is activated in 2 ways:
  - Automatically through the power-fail detector in the PMU
  - Through software configuration

Note: The arrows refer to the signal directions for the voltage level shifters and isolation cells

**Figure 10-9. Isolation cells and Voltage level shifters placing**

### 10.4.1.5 Voltage domains

The list found here states the different voltage domains and their scalability in regarding to power-saving in dynamic and static scenarios.

- SoC domain: including Core Platform, FlexRAM memories and SoC logic - Scalable voltage in both dynamic and static scenarios
- ANALOG components including PLLs - Fixed voltage
- I/O - Fixed voltage
- SNVS\_LP - Fixed voltage

### 10.4.1.6 Voltage domain management

### 10.4.1.6.1 Dynamic

#### 10.4.1.6.1.1 Voltage Scaling

A simplistic way to reduce power consumption in dynamic scenarios is to scale down the ARM, SoC and voltage according to the allowed voltage points and corresponding frequencies specified in datasheet.

### 10.4.1.6.2 Static

#### 10.4.1.6.2.1 Standby Leakage reduction (SLR)

Standby leakage reduction is a power-management technique utilizing:

- Reduced supply voltage for relevant domains

With SLR, the device switches into low-power active system modes automatically or in response to user requests during system Stop, Wait, or DSM modes (that is, in situations when no application is started and no system activity is presented).

When applying SLR, the system remains in the lowest static power mode while retaining logic and memory states. This technique trades static power consumption for wake-up latency while maintaining fast system response time suitable for most applications.

See CCM Control Register (CCM\_CCR), CCM Low Power Control Register (CCM\_CLPCR) and PMU Miscellaneous Register 0 (PMU\_MISC0) for further details on SLR programmability options.

The following describes the flow for applying standby voltage:

- Configure the external PMIC standby voltage, refer to chip datasheet.
- Configure CCM\_CCR[RBC\_EN] bits to bypass and disable PMU regulators in the next ARM "WFI" execution.
- Configure CCM\_CCR[REG\_BYP\_COUNT] bits to allow proper voltage restoration by the external PMIC when exiting standby.
- ARM Core Platform executes the "WFI" instruction that completes the software sequence putting the SoC into low power mode

### 10.4.1.7 System domains layout

The following table describes the different power modes.

**NOTE**

The IDLE, SUSPEND and SNVS are usually referred as low power mode.

- **IDLE Modes:** CPU in WFI state, some portion of the chip can be clock gated or power gated. The chip can wakeup from this mode from IRQ with a very short latency. IDLE mode is entered automatically from RUN mode when CPU executes WFI instruction, so the state of IDLE mode will have dependency on the state of the RUN mode. To avoid showing a lot of IDLE modes, the following two IDLE states are defined:
  - **System IDLE:** the IDLE mode entered from Low Speed Run mode. When entering from other RUN modes, the difference is mainly the CPU/Bus frequency.
  - **Low Power IDLE:** the IDLE mode entered from Low Power RUN mode.
- **SUSPEND Mode:** CPU power gated, all clocks gated only except 32KHz, analog modules also enter low power state. It provides the lowest power while keeps the system alive, but it would have longer exit time.
- **SNVS Mode:** All the modules are turned off, only except RTC is active.

**Table 10-1. Low Power Mode Definition**

	<b>System IDLE</b>	<b>Low Power IDLE</b>	<b>SUSPEND</b>	<b>SNVS</b>
CCM LPM Mode	WAIT	WAIT	STOP	—
ARM Core (PDM7)	WFI	WFI	Power Down	OFF
L1 Cache	ON	ON	Power Down	OFF
FlexRAM (PDRET)	ON	ON	ON	OFF
FlexRAM (PDRAM0)	ON	ON	Power Down	OFF
FlexRAM (PDRAM1)	ON/OFF	ON/OFF	Power Down	OFF
VDD_SOC_IN Voltage	1.15 V	0.95 V	0.925 V	OFF
528 PLL	ON	Power Down	Power Down	OFF
Other PLL	Power Down	Power Down	Power Down	OFF
XTAL	ON	OFF	OFF	OFF
RC OSC	OFF	ON	OFF	OFF
LDO2P5	ON	OFF	OFF	OFF
LDO1P1	ON	OFF	OFF	OFF
WEAK2P5	OFF	ON	OFF	OFF
WEAK1P1	OFF	ON	OFF	OFF

*Table continues on the next page...*

**Table 10-1. Low Power Mode Definition (continued)**

	System IDLE	Low Power IDLE	SUSPEND	SNVS
Bandgap	ON	OFF	OFF	OFF
Low Power Bandgap	ON	ON	ON	OFF
AHB clock	33 MHz	12 MHz	OFF	OFF
IPG clock	33 MHz	12 MHz	OFF	OFF
PER clock	33 MHz	12 MHz	OFF	OFF
Module clocks	ON as needed	ON as needed	OFF	OFF
GPIO wakeup	Yes	Yes	Yes	Yes (1 pin only)
RTC wakeup	Yes	Yes	Yes	Yes
USB remote wakeup	Yes	Yes	Yes	No
Other wakeup source	Yes	Yes	No	No

There is a single hardware signal coming into PMU which sets the PMU in either of two "STOP" states. The STOP state is implemented is controlled by the PMU\_MISC0[STOP\_MODE\_CONFIG] bit (See [PMU Memory Map/Register Definition](#)). It is recommended that the blocks be configured for safe powerdown/up through the registers before asserting the stop\_mode signal. Blocks not described in the section below are unaffected by stop\_mode.

If the stop\_mode\_config is set to zero, thus in the STOP mode all blocks powered down in minimum power configuration.

If the stop\_mode\_config is set to one, thus in the STOP mode some of the blocks remain powered and in different states as defined in the table below.

**Table 10-2. STOP mode configuration**

Block	STOP_MODE_CONFIG=0	STOP_MODE_CONFIG=1
reg1p1	off	on
reg2p5	off	on
reg3p0	off/on depending on vbus. Uses crude local reference if vbus is present	off/on depending on vbus . Uses analog central bandgap if VBUS is present.
bandgap	off	functional
temp_sensor	off	off
well_bias	hardware controlled	hardware controlled
All PLLs	off	off
OSC24M	off	Controlled by CCM configuration

## 10.4.2 Power management techniques

The device supports the power-management techniques with the features found here.

- Partitioning of the device into voltage, power, clock, and reset domains
- Domain isolation that allows flexible configurations of domains on/off states to form use cases targeting various applications
- Clock tree with selective clock-gating conditions and almost independent clock roots
- Power, reset, and clock control hardware mechanism to manage sleep and wake-up dependencies of power domains
- Software-controllable and hardware-controllable clock gating for functional modules and buses
- Memory retention and state retention capability (Software State Retention for ARM core) for preserving memory contents and device state in low-power modes
- Support for low-power device modes input/output (I/O) pad configuration for minimum power
- Variety of operating modes to optimize device performance and wake-up times
- Thermal monitoring and thermal aware performance management

Many of the low power features are fully or partially software controllable and can be configured for the specific requirements of a target system.

Combining these techniques, the system designer may meet tight requirements of low-power standby and operational modes while maintaining high performance for time-critical tasks.

### 10.4.2.1 Power saving techniques

The table below lists power saving techniques supported by the SoC in their connection to different components of power consumption.

**Table 10-3. Power saving design/architecture and power saving techniques**

Techniques	Active SoC Power	Standby SoC Power	System Power
Temperature Monitoring, and active frequency throttling	√		
ARM Core Platform SRPG (Software)		√	
ARM Core Platform Power Gating		√	
Clock gating (automatic dynamic and forced)	√		
Integrated PMU (IR drop, efficiency, accuracy)	√		√
C4 package (IR drop, thermal)	√		
Display Backlight optimization (SW)			√
Architecture: FlexRAM memories	√		

*Table continues on the next page...*

**Table 10-3. Power saving design/architecture and power saving techniques (continued)**

Techniques	Active SoC Power	Standby SoC Power	System Power
Architecture: USB integration			√
Low Power DRAM: SDRAM			√

### 10.4.2.2 Thermal-aware power management

The temperature sensor block (TEMPMON) implements a temperature sensor/conversion function. The block features an alarm function that can raise an interrupt signal if the temperature is above a specified threshold.

Software may implement temperature aware DVFS for the ARM domain as well as temperature aware frequency scaling for other system components to ensure that both the frequency and voltage is lowered when the die temperature is above the specified limit.

Software may also implement temperature aware task scheduling to ensure that non-critical tasks are suspended when the die temperature is above the specified limit.

See [Temperature Monitor \(TEMPMON\)](#) for further details on temperature monitor functions and programmability options.

### 10.4.2.3 Peripheral Power management

#### 10.4.2.3.1 Video-Graphics system power management

#### 10.4.2.3.2 IO power reduction

Software configures IO to low power modes:

- PHYs - make sure that all unused PHYs are placed to lowest power state. Please refer relevant chapter for further information about different PHYs
- Digital IOs - Make sure all unnecessary PU/PD are disabled and IO are switched to either minimal drive strength or to input mode (when applicable)

### 10.4.2.4 Examples of External Power Supply Interface

This section presents the example of external power supply interfacing to the chip.

## ONOFF (Button)

The scenario based on integrated PMU system is presented in the following figure. This scenario minimizes BoM and board design complexity.

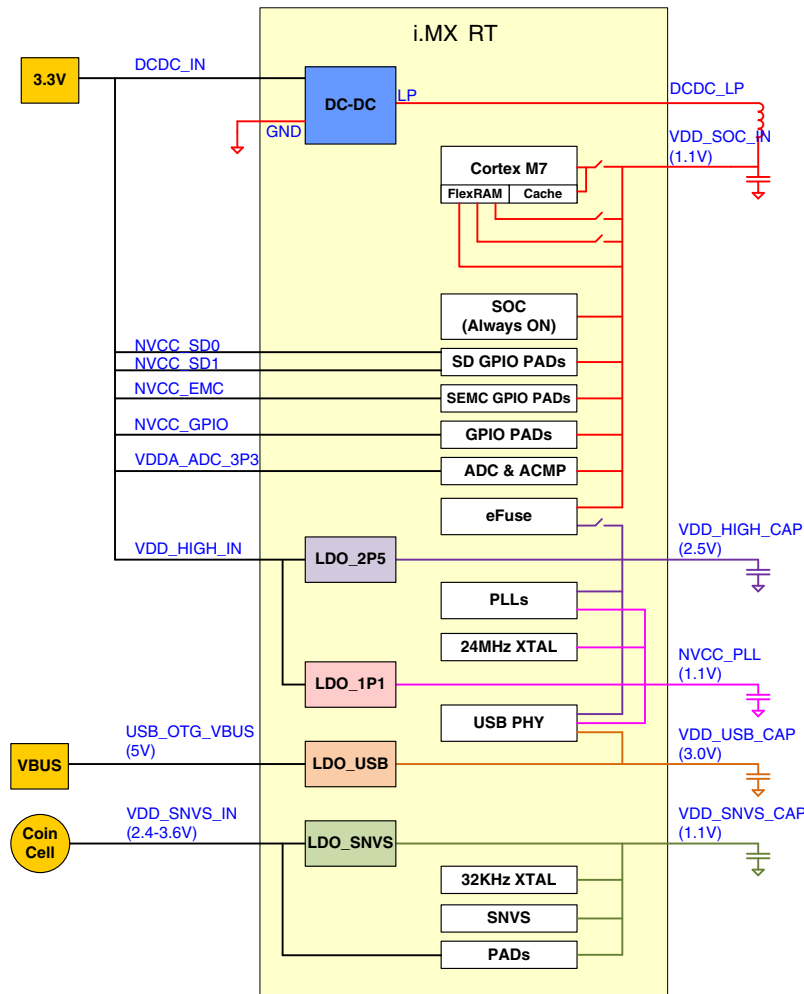

Figure 10-10. SOC Power Architecture

## 10.5 ONOFF (Button)

The chip supports the use of a button input signal to request main SoC power state changes (i.e. On or Off) from the PMU.

The ONOFF logic inside of SNVS\_LP allows for connecting directly to a PMIC or other voltage regulator device. The logic takes a button input signal and then outputs a pmic\_en\_b and set\_pwr\_off\_irq signal. PMIC logic also supports the SNVS\_LP tamper logic which will allow waking the system up when a tamper event has happened while in the OFF state. The logic has two different modes of operation (Dumb and Smart mode).

The Dumb PMIC Mode uses `pmic_en_b` to issue a level signal for on and off. Dumb pmic mode has many different configuration options which include (debounce, off to on time, and max time out).

- **Debounce:** The debounce configuration supports 0 msec, 50 msec, 100 msec and 500 msec. The debounce is used to generate the `set_pwr_off_irq` interrupt. While in the ON state and the button is pressed longer than the debounce time the `set_pwr_off_irq` is generated.
- **Off to On Time:** The Off to On configuration supports 0 msec, 50 msec, 100 msec, and 500 msec. This configuration supports the time it takes to request power on after the configured button press time has been reached. Once the button is pressed longer than the configuration time, the state machine will transition from the OFF to the ON state.
- **Max Timeout:** The max timeout configuration supports 5 secs, 10 secs, 15 secs and disable. This configuration supports the time it takes to request power down after the button has been pressed for the defined time.

The Dumb PMIC mode uses a 2 state state machine, as shown below. The output of the `pmic_en_b` is generated by the state of the state machine.

**Figure 10-11. Dumb PMIC Mode State Machine**

The Smart PMIC mode is meant to connect to another PMIC. The `pmic_en_b` signal issues a pulse instead of a level signal. The only configuration option available for this mode is the Debounce configuration that is used for the `set_pwr_off_irq`.

## 10.6 WAKEUP Pin

This chip supports the use of a WAKEUP pin (GPIO5\_IO00 ALT5) to request main SoC power on to exit SNVS mode. To use it, follow the tips below.

- SNVS must be in Dumb PMIC mode (*default*, and must for on-chip DCDC)
- Configure IOMUXC\_SNVS to select WAKEUP pin ALT5 to mux it to GPIO5\_IO00
- Configure GPIO5 ICR to either low level or high level sensitive
- Set GPIO5 IMR bit0 to enable GPIO5\_IO00 interrupt
- Enter SNVS mode by SW or ON/OFF button, then on-chip DCDC will be off, and PMIC\_ON\_REQ pin will also go to low to notify outside
- Assert WAKEUP pin for at least two 32 KHz cycles (active high or low depends on GPIO5 ICR configuration), so that GPIO5 interrupt gets sampled by SNVS module
- SNVS will assert PMIC\_ON\_REQ pin high and on-chip DCDC begins to ramp on
- SoC power on procedure (except SNVS) begins (ROM boot, ...)

# Chapter 11

## System Security

### 11.1 Chapter overview

This chapter provides an overview of the following chip security components, explaining the purpose and features of each of them.

- High Assurance Boot (HAB) feature in the system boot
- Secure Non-Volatile Storage (SNVS) with the security monitor, key storage, and real-time clock
- Data co-processor (DCP) with cryptographic acceleration
- Hardware encryption and hash algorithm engine for AES128 and SHA-1/256
- True Random Number Generator (TRNG)
- On-chip One-Time Programmable Element Controller (OCOTP\_CTRL) with on-chip electrical fuse arrays
- Central Security Unit (CSU)
- System JTAG Controller (SJC) with secure debug
- Bus Encryption Engine (BEE) for on-the-fly FlexSPI(QSPI) Flash decryption

### 11.2 Feature summary

This figure shows a simplified diagram of the security subsystem:

**Figure 11-1. Security subsystem (simplified)**

This diagram represents an example of the CSU use.

All platforms built using this chip share a general need for security, though the specific security requirements vary greatly from platform to platform. For example, portable consumer devices need to protect a different type and cost of assets than the automotive or industrial platforms. Each market must be protected against different kinds of attacks. The platform designers need an appropriate set of counter measures to meet the security needs of their specific platform.

To help the platform designers to meet the requirements of each market, the chip incorporates a range of security features. Most of these features provide protection against specific kinds of attack, and can be configured for different levels according to the required degree of protection. These features are designed to work together or independently. They can be also integrated with the appropriate software to create defensive layers. In addition, the chip includes a general-purpose accelerator that enhances the performance of selected industry-standard cryptographic algorithms.

The security features include:

- Secure High-Assurance Boot
  - Security library embedded in the tamper-proof on-chip ROM
  - Authenticated boot, which protects against unauthorized software
    - Verification of the code signature during boot
    - RSA-1024/2048/3072/4096 keys anchored to the OTP fingerprint (SHA-256)

- Encrypted boot which protects the software compatibility
- Runs every time the chip is reset
- Image version control/image revocation (on-chip OTP-based)
- Secure storage
  - Off-chip storage protection using AES-128 and the chip's unique hardware-only key
- Hardware cryptographic accelerators
  - Symmetric: AES-128,
  - Hash message digest: SHA-1, SHA-256,
- True and pseudorandom number generator
- On-chip secure real-time clock with autonomous power domain
- Secure debugging
  - Configurable protection against unauthorized JTAG manipulation
  - Three security levels + a complete JTAG disable
  - Support for JTAG port secure reopening for field return debugging
- Universal unique ID
- Electrical fuses (OTP Memory)
- Hardware bus encryption
  - AES-128 encryption, supporting ECB and CTR modes
  - Non-secured access filtering

### 11.3 High-Assurance Boot (HAB)

The HAB, which is the high-assurance boot feature in the system boot ROM, detects and prevents the execution of unauthorized software (malware) during the boot sequence.

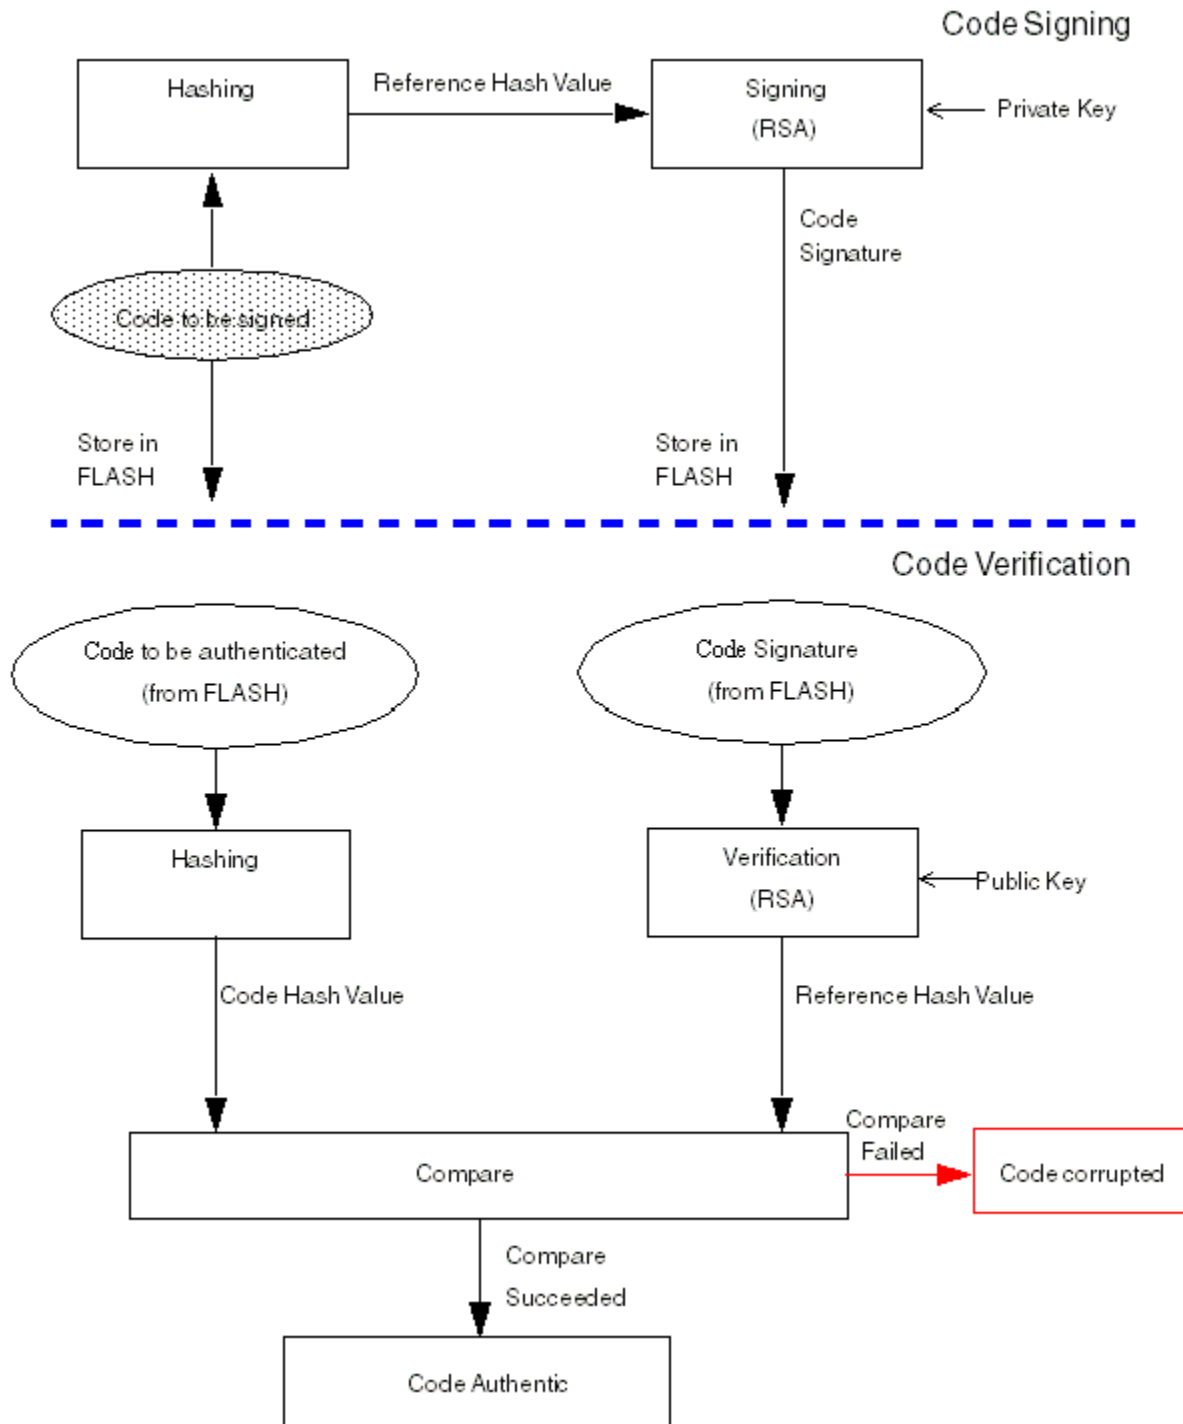

When the unauthorized software is permitted to gain control of the boot sequence, it can be used for a variety of goals, such as exposing stored secrets; circumventing access controls to sensitive data, services, or networks, or for repurposing the platform. The unauthorized software can enter the platform during upgrades or reprovisioning, or when booting from the USB connections or removable devices.

The HAB protects against unauthorized software by:

- Using digital signatures to recognize the authentic software. This enables you to boot the device to a known initial state and run the software signed by the device manufacturer.
- Using code encryption to protect the confidential software during off-chip storage. When activated, the HAB decrypts the software loaded into the RAM before execution.

### 11.3.1 HAB process flow

The following figure shows the flow for creating and verifying digital signatures. The top half of this figure shows the signing process, which is performed off-chip. The bottom half shows the verification process performed on-chip during every system boot.

**Figure 11-2. Code signing and authentication processes**

The original software is programmed into the flash memory (or any other boot device) along with the signature. The HAB uses a public key to recover the reference hash value from the signature; it then compares the reference hash value to the current hash value

calculated from the software in the flash. If the contents of the flash are modified either intentionally or unintentionally, the two hash values do not match and the verification fails.

### 11.3.2 HAB feature summary

The HAB features:

- Enforced internal boot via on-chip masked ROM
- Authentication of software loaded from any boot device (including the USB download)
- Authenticated decryption of software loaded from any boot device (including USB download) using the AES keys (128-bit)
- CMS PKCS#1 signature verification using the RSA public keys (from 1024-bit to 4096-bit) and the SHA-256 hash algorithm
- Public Key Infrastructure (PKI) support using X.509v3 certificates
- Root public key fingerprint in the manufacturer-programmable on-chip fuses
- Multiple root public keys with revocation by fuses
- Initialization of other security components
- Authenticated USB download fall-over on any security failure
- Open configuration for development purposes and non-secure platforms
- Closed configuration for shipping secure platforms

On the chip, the HAB is integrated with these security features:

- The HAB initializes the SNVS security monitor state machine. A successful secure boot with the HAB is required for the platform software to gain access to use the DCP master secret key selected by SNVS.
- The HAB reads the root public key fingerprint, revocation mask, and security configuration from the OCOTP\_CTRL.
- The HAB initializes the CSU.
- The HAB can use the DCP to accelerate hash calculations.

## 11.4 Secure Non-Volatile Storage (SNVS) module

- Provides a non-volatile real-time clock maintained by a coin-cell battery during system power down for use in both the secure and non-secure platforms.
- Protects the secure real-time clock against rollback attacks in time-sensitive protocols such as DRM and PKI
- Deters replay attacks in time-independent protocols such as certificate or firmware revocations

- Handles tamper detection and tamper reaction to defend sensitive data and operations against compromise, both at run-time and during system power-down
- Controls the access to the OTP master secret key used by the DCP to protect confidential data in the off-chip storage
- Provides non-volatile highly protected storage for an alternative master secret key

### 11.4.1 SNVS architecture

The SNVS is partitioned into two sections: a low-power part (SNVS\_LP) and a high-power part (SNVS\_HP).

The SNVS\_LP block is in the always-powered-up domain. It is isolated from the rest of the logic by isolation cells which are library-instantiated cells that insure that the powered-up logic is not corrupted when the power goes down in the rest of the chip.

The SNVS\_LP has these functional units:

- Zeroizable Master Key
- Secure non-rollover real-time counter with alarm
- Non-rollover monotonic counter
- Power glitch detector
- General-purpose register
- Control and status registers

The SNVS\_HP is in the chip power-supply domain. The SNVS\_HP provides an interface between the SNVS\_LP and the rest of the system. The access to the SNVS\_LP registers can be gained through the SNVS\_HP only when it is powered up according to the access permission policy.

The SNVS\_HP has these functional units:

- IP bus interface
- SNVS\_LP interface
- System Security Monitor (SSM)
- Zeroizable Master Key programming mechanism
- Master Key control block
- Non-secure real-time counter with alarm
- Control and status registers

## 11.5 Data Co-Processor (DCP)

For security purposes, the Data Co-Processor (DCP) provides hardware acceleration for the cryptographic algorithms. The features of DCP include:

- Encryption Algorithms: AES-128 (ECB and CBC modes)
- Hashing Algorithms: SHA-1 and SHA-256
- CRC-32
- Key selection from the SNVS, DCP internal key storage, or general memory
- Internal Memory for storing up to four AES-128 keys—when a key is written to a key slot it can be read only by the DCP AES-128 engine
- IP slave interface
- DMA

## 11.6 Standalone True Random Number Generator (TRNG)

The SA-TRNG is hardware accelerator module that generates a 512-bit entropy as needed by an entropy consuming module or by other post processing functions. A typical entropy consumer is a pseudo random number generator (PRNG) which can be implemented to achieve both true randomness and cryptographic strength random numbers using the SA-TRNG output as its entropy seed. The PRNG is not part of this module.

## 11.7 OCOTP\_CTRL

The OCOTP\_CTRL provides the primary user-visible mechanism for interfacing with the on-chip fuses. These fuses' uses include:

- Unique chip identifiers
- Mask revision numbers
- Cryptographic keys
- Security configuration
- Boot characteristics
- Various control signals requiring permanent non-volatility

For security purposes, the fuses protect the confidentiality or integrity of the critical security data against both the software attacks and the board-level hardware attacks.

The OCOTP\_CTRL provides:

- Shadow cache of fuse values, loaded at reset, before the system boot

- Ability to read and override the fuse values in the shadow cache (does not affect the fuse element)
- Ability to read the fuses directly (ignoring the shadow cache)
- Ability to write (program) the fuses by software or JTAG
- Fuses and shadow cache bits enforce read-protect, override-protect, and write-protect
- Lock fuses for selected fuse fields
- Scan protection
- Volatile software-accessible signals which can be used for software control of hardware elements (not requiring non-volatility).

## 11.8 Central Security Unit (CSU)

Central Security Unit (CSU) sets access control policies between the bus masters and bus slaves, enabling the peripherals to be separated into distinct security domains. This protects against the indirect unauthorized access to data which occurs when the software programs a DMA bus master to access addresses that the software itself is prohibited from accessing directly. Configuring the DMA bus master privileges in the CSU consistently with the software privileges defends against such indirect unauthorized access.

The CSU provides:

- Configuration of peripheral access permissions for peripherals that are unable to control their own access permissions
- Configuration of bus master privileges for bus masters that are unable to control their own privileges
- Optional locking of the individual CSU settings until the next power-on reset

## 11.9 System JTAG Controller (SJC)

The JTAG port provides debug access to hardware blocks, including the ARM processor and the system bus. This enables program control and manipulation as well as visibility to the chip peripherals and memory.

The JTAG port must be accessible during initial platform development, manufacturing tests, and general troubleshooting. Given its capabilities, JTAG manipulation is a known attack vector for accessing sensitive data and gaining control over software execution.

The System JTAG Controller (SJC) protects against the whole range of attacks based on unauthorized JTAG manipulation. It also provides a JTAG port that conforms to the IEEE 1149.1 and IEEE 1149.6 (AC) standards for BSR (boundary-scan) testing.

The SJC provides these security levels:

- The JTAG Disabled-JTAG use is permanently blocked.
- The No-Debug-All security sensitive JTAG features are permanently blocked.
- The Secure JTAG-JTAG use is restricted (as in the No-Debug level) unless a secret-key challenge/response protocol is successfully executed.
- The JTAG Enabled-JTAG use is unrestricted.

The security levels are selected via the e-fuse configuration.

### 11.9.1 Scan protection

The chip includes further scan protection logic for those SJC modes where the JTAG use is allowed. This ensures that the access to critical security values is protected as follows:

- The chip is reset when entering the scan mode.
- All modules are reset two clock cycles before receiving the scan-enable indication.
- The chip cannot exit the scan mode without a reset.
- The security modules (including SNVS, CSU, and OCOTP\_CTRL) have an additional scan-protection logic to protect the sensitive internal data and functionality.

See the "System JTAG Controller (SJC)" chapter in the Security Reference Manual for more information on the SJC.

## 11.10 Bus Encryption Engine (BEE)

The Bus Encryption Engine (BEE) is implemented as an on-the-fly decryption engine, which is used for decrypting cypher context of FlexSPI. The main features of the BEE are:

- Standard AXI interconnection
- On-the-fly AES-128 decryption, supporting ECB and CTR modes
- Aliased memory space support. Address remapping for up to two individual regions
- Independent AES Key management for those two individual regions
- Bus access pattern optimization with the aid of the local store and forward buffer

- Non-secured access filtering based on the security label of the access
- Illegal access check and filtering

# Chapter 12

## ARM Cortex M7 Platform

### 12.1 ARM Cortex M7 Platform

#### 12.1.1 Overview

The Cortex-M7 platform features a single ARM®Cortex®-M7 processor in this chip. The ARM®Cortex®-M7 processor is a highly efficient, high-performance, embedded processor that features low interrupt latency, low-cost debug, and has backwards compatibility with existing Cortex-M profile processors. The processor has an in-order super-scalar pipeline by which many instructions can be dual-issued, including load/load and load/store instruction pairs because of multiple memory interfaces.

Memory interfaces that the processor supports include:

- Tightly-Coupled Memory (TCM)
- Harvard instruction and data caches and AXI master (AXIM) interface
- Dedicated low-latency AHB-Lite peripheral (AHBP) interface

The ARM Cortex-M7 Platform supports the following:

- 32 KB L1 Instruction Cache
- 32 KB L1 Data Cache
- Floating Point Unit (FPU) with support for the FPv5 architecture
- Internal Trace (TRC)

The number of IRQs supported for this chip is 160. In addition, it supports various components composing the ARM CoreSight debug/Trace system, such as ETM and CTI.

#### **NOTE**

This chip supports up to 16 interrupt priority levels, i.e. it implements bits [7:4] of each NVIC Interrupt Priority Register.

### 12.1.2 Block Diagram

A block diagram for the Cortex-M7 is given below:

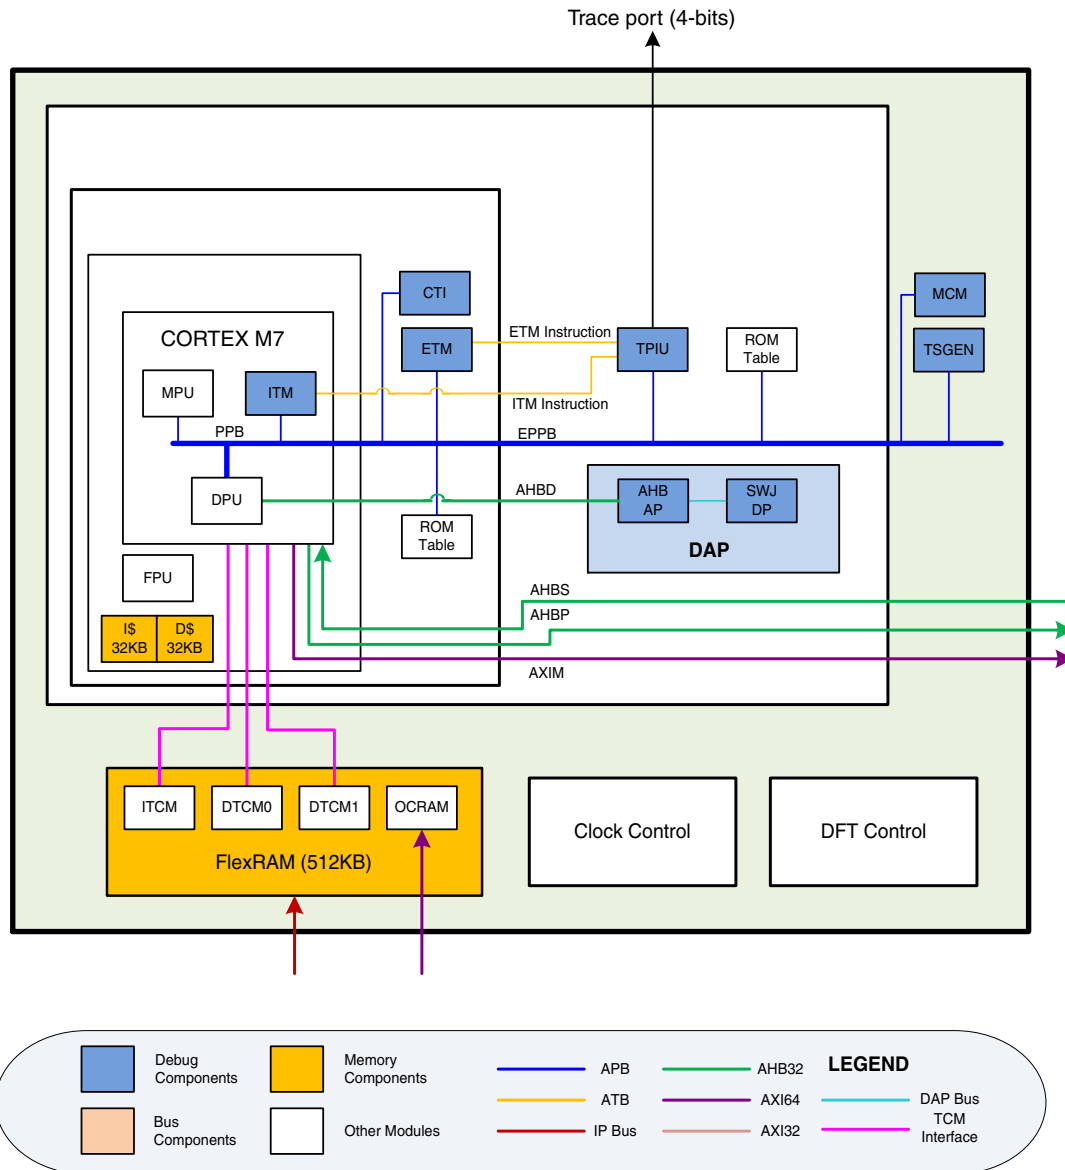

Figure 12-1. Cortex-M7 Platform Block Diagram

### 12.1.3 External Signals

Table 12-1. External Signals

Signal	Description	Pad	Mode	Direction
ARM_TRACE0	Trace signal	GPIO_BO_04	ALT3	O

Table continues on the next page...

**Table 12-1. External Signals (continued)**

ARM_TRACE1	Trace signal	GPIO_BO_05	ALT3	O
ARM_TRACE2	Trace signal	GPIO_BO_06	ALT3	O
ARM_TRACE3	Trace signal	GPIO_BO_07	ALT3	O
ARM_TRACE_CLK	Clock Signal	GPIO_BO_12	ALT2	O
ARM_EVENT0	Output Event signal	GPIO_BO_14	ALT2	O
ARM_EVENT1	Input Event Signal	GPIO_BO_15	ALT2	I

## 12.1.4 Clocks

**Table 12-2. ARM Clocks**

<b>Clock Name</b>	<b>Clock Root</b>	<b>Description</b>
ipg_clk	ipg_clk_root	Peripheral clock
axi_clk	ipg_clk_root	Bus clock
main_clk	ahb_clk_root	ARM core clock

# Chapter 13

## Analog Comparator (ACMP)

### 13.1 Chip-specific CMP information

#### NOTE

$V_{in1}$  and  $V_{in2}$  are all connected to  $V_{DDA}$ , on this device.

### 13.2 Introduction

The comparator (CMP) module provides a circuit for comparing two analog input voltages. The comparator circuit is designed to operate across the full range of the supply voltage, known as rail-to-rail operation.

The Analog MUX (ANMUX) provides a circuit for selecting an analog input signal from eight channels. One signal is provided by the 6-bit digital-to-analog converter (DAC). The mux circuit is designed to operate across the full range of the supply voltage.

The 6-bit DAC is 64-tap resistor ladder network which provides a selectable voltage reference for applications where voltage reference is needed. The 64-tap resistor ladder network divides the supply reference  $V_{in}$  into 64 voltage levels. A 6-bit digital signal input selects the output voltage level, which varies from  $V_{in}$  to  $V_{in}/64$ .  $V_{in}$  can be selected from two voltage sources,  $V_{in1}$  and  $V_{in2}$ . The 6-bit DAC from a comparator is available as an on-chip internal signal only and is not available externally to a pin.

#### 13.2.1 CMP features

The CMP has the following features:

- Operational over the entire supply range
- Inputs may range from rail to rail
- Programmable hysteresis control

- Selectable interrupt on rising-edge, falling-edge, or both rising or falling edges of the comparator output
- Selectable inversion on comparator output
- Capability to produce a wide range of outputs such as:
  - Sampled
  - Windowed, which is ideal for certain PWM zero-crossing-detection applications
  - Digitally filtered:
    - Filter can be bypassed
    - Can be clocked via external SAMPLE signal or scaled bus clock
- External hysteresis can be used at the same time that the output filter is used for internal functions
- Two software selectable performance levels:
  - Shorter propagation delay at the expense of higher power
  - Low power, with longer propagation delay
- DMA transfer support
  - A comparison event can be selected to trigger a DMA transfer
- Functional in all modes of operation
- The window and filter functions are not available in the following modes:
  - Stop
  - VLPS

### 13.2.2 6-bit DAC key features

The 6-bit DAC has the following features:

- 6-bit resolution
- Selectable supply reference source
- Power Down mode to conserve power when not in use
- Option to route the output to internal comparator input

### 13.2.3 ANMUX key features

The ANMUX has the following features:

- Two 8-to-1 channel mux
- Operational over the entire supply range

### 13.2.4 CMP, DAC and ANMUX diagram

The following figure shows the block diagram for the High-Speed Comparator, DAC, and ANMUX modules.

Figure 13-1. CMP, DAC and ANMUX block diagram

### 13.2.5 CMP block diagram

The following figure shows the block diagram for the CMP module.

**Figure 13-2. Comparator module block diagram**

In the CMP block diagram:

- The Window Control block is bypassed when  $CR1[WE] = 0$
- If  $CR1[WE] = 1$ , the comparator output will be sampled on every bus clock when  $WINDOW=1$  to generate  $COUTA$ . Sampling does NOT occur when  $WINDOW = 0$ .
- The Filter block is bypassed when not in use.
- The Filter block acts as a simple sampler if the filter is bypassed and  $CR0[FILTER\_CNT]$  is set to  $0x01$ .
- The Filter block filters based on multiple samples when the filter is bypassed and  $CR0[FILTER\_CNT]$  is set greater than  $0x01$ .
  - If  $CR1[SE] = 1$ , the external  $SAMPLE$  input is used as sampling clock
  - If  $CR1[SE] = 0$ , the divided bus clock is used as sampling clock

- If enabled, the Filter block will incur up to one bus clock additional latency penalty on COUT due to the fact that COUT, which is crossing clock domain boundaries, must be resynchronized to the bus clock.
- CR1[WE] and CR1[SE] are mutually exclusive.

## 13.3 Memory map/register definitions

### CMP memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/ page
4009_4000	CMP Control Register 0 (CMP1_CR0)	8	R/W	00h	<a href="#">13.3.1/457</a>
4009_4001	CMP Control Register 1 (CMP1_CR1)	8	R/W	00h	<a href="#">13.3.2/458</a>

### 13.3.1 CMP Control Register 0 (CMPx\_CR0)

Address: Base address + 0h offset

Bit	7	6	5	4	3	2	1	0
Read	0	FILTER_CNT			0	0	HYSTCTR	
Write								
Reset	0	0	0	0	0	0	0	0

#### CMPx\_CR0 field descriptions

Field	Description
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6–4 FILTER_CNT	<p>Filter Sample Count</p> <p>Represents the number of consecutive samples that must agree prior to the comparator output filter accepting a new output state. For information regarding filter programming and latency, see the <a href="#">Functional description</a>.</p> <p>000 Filter is disabled. If SE = 1, then COUT is a logic 0. This is not a legal state, and is not recommended. If SE = 0, COUT = COUTA.</p> <p>001 One sample must agree. The comparator output is simply sampled.</p> <p>010 2 consecutive samples must agree.</p> <p>011 3 consecutive samples must agree.</p> <p>100 4 consecutive samples must agree.</p> <p>101 5 consecutive samples must agree.</p> <p>110 6 consecutive samples must agree.</p> <p>111 7 consecutive samples must agree.</p>
3 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
2 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
HYSTCTR	<p>Comparator hard block hysteresis control</p> <p>Defines the programmable hysteresis level. The hysteresis values associated with each level are device-specific. See the Data Sheet of the device for the exact values.</p> <p>00 Level 0</p> <p>01 Level 1</p> <p>10 Level 2</p> <p>11 Level 3</p>

### 13.3.2 CMP Control Register 1 (CMPx\_CR1)

Address: Base address + 1h offset

Bit	7	6	5	4	3	2	1	0
Read	SE	WE	0	PMODE	INV	COS	OPE	EN
Write								
Reset	0	0	0	0	0	0	0	0

#### CMPx\_CR1 field descriptions

Field	Description
7 SE	<p>Sample Enable</p> <p>At any given time, either SE or WE can be set. If a write to this register attempts to set both, then SE is set and WE is cleared. However, avoid writing 1s to both field locations because this "11" case is reserved and may change in future implementations.</p> <p>0 Sampling mode is not selected. 1 Sampling mode is selected.</p>
6 WE	<p>Windowing Enable</p> <p>At any given time, either SE or WE can be set. If a write to this register attempts to set both, then SE is set and WE is cleared. However, avoid writing 1s to both field locations because this "11" case is reserved and may change in future implementations.</p> <p>0 Windowing mode is not selected. 1 Windowing mode is selected.</p>
5 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
4 PMODE	<p>Power Mode Select</p> <p>See the electrical specifications table in the device Data Sheet for details.</p> <p>0 Low-Speed (LS) Comparison mode selected. In this mode, CMP has slower output propagation delay and lower current consumption. 1 High-Speed (HS) Comparison mode selected. In this mode, CMP has faster output propagation delay and higher current consumption.</p>
3 INV	<p>Comparator INVERT</p> <p>Allows selection of the polarity of the analog comparator function. It is also driven to the COUT output, on both the device pin and as SCR[COUT], when OPE=0.</p> <p>0 Does not invert the comparator output. 1 Inverts the comparator output.</p>
2 COS	<p>Comparator Output Select</p> <p>0 Set the filtered comparator output (CMPO) to equal COUT. 1 Set the unfiltered comparator output (CMPO) to equal COUTA.</p>
1 OPE	<p>Comparator Output Pin Enable</p>

Table continues on the next page...

## CMPx\_CR1 field descriptions (continued)

Field	Description
	0 CMPO is not available on the associated CMPO output pin. If the comparator does not own the pin, this field has no effect. 1 CMPO is available on the associated CMPO output pin. The comparator output (CMPO) is driven out on the associated CMPO output pin if the comparator owns the pin. If the comparator does not own the field, this bit has no effect.
0 EN	Comparator Module Enable Enables the Analog Comparator module. When the module is not enabled, it remains in the off state, and consumes no power. When the user selects the same input from analog mux to the positive and negative port, the comparator is disabled automatically. 0 Analog Comparator is disabled. 1 Analog Comparator is enabled.

## 13.3.3 CMP Filter Period Register (CMPx\_FPR)

Address: Base address + 2h offset

Bit	7	6	5	4	3	2	1	0
Read	FILT_PER							
Write	FILT_PER							
Reset	0	0	0	0	0	0	0	0

## CMPx\_FPR field descriptions

Field	Description
FILT_PER	Filter Sample Period Specifies the sampling period, in bus clock cycles, of the comparator output filter, when CR1[SE]=0. Setting FILT_PER to 0x0 disables the filter. Filter programming and latency details appear in the <a href="#">Functional description</a> . This field has no effect when CR1[SE]=1. In that case, the external SAMPLE signal is used to determine the sampling period.

## 13.3.4 CMP Status and Control Register (CMPx\_SCR)

Address: Base address + 3h offset

Bit	7	6	5	4	3	2	1	0
Read	0	DMAEN	0	IER	IEF	CFR	CFF	COUT
Write						w1c	w1c	
Reset	0	0	0	0	0	0	0	0

**CMPx\_SCR field descriptions**

Field	Description
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
6 DMAEN	DMA Enable Control  Enables the DMA transfer triggered from the CMP module. When this field is set, a DMA request is asserted when CFR or CFF is set.  0 DMA is disabled. 1 DMA is enabled.
5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
4 IER	Comparator Interrupt Enable Rising  Enables the CFR interrupt from the CMP. When this field is set, an interrupt will be asserted when CFR is set.  0 Interrupt is disabled. 1 Interrupt is enabled.
3 IEF	Comparator Interrupt Enable Falling  Enables the CFF interrupt from the CMP. When this field is set, an interrupt will be asserted when CFF is set.  0 Interrupt is disabled. 1 Interrupt is enabled.
2 CFR	Analog Comparator Flag Rising  Detects a rising-edge on COUT, when set, during normal operation. CFR is cleared by writing 1 to it. During Stop modes, CFR is level sensitive .  0 Rising-edge on COUT has not been detected. 1 Rising-edge on COUT has occurred.
1 CFF	Analog Comparator Flag Falling  Detects a falling-edge on COUT, when set, during normal operation. CFF is cleared by writing 1 to it. During Stop modes, CFF is level sensitive .  0 Falling-edge on COUT has not been detected. 1 Falling-edge on COUT has occurred.
0 COUT	Analog Comparator Output  Returns the current value of the Analog Comparator output, when read. The field is reset to 0 and will read as CR1[INV] when the Analog Comparator module is disabled, that is, when CR1[EN] = 0. Writes to this field are ignored.

### 13.3.5 DAC Control Register (CMPx\_DACCR)

Address: Base address + 4h offset

Bit	7	6	5	4	3	2	1	0
Read	DACEN	VRSEL	VOSEL					
Write								
Reset	0	0	0	0	0	0	0	0

#### CMPx\_DACCR field descriptions

Field	Description
7 DACEN	<p>DAC Enable</p> <p>Enables the DAC. When the DAC is disabled, it is powered down to conserve power.</p> <p>0 DAC is disabled. 1 DAC is enabled.</p>
6 VRSEL	<p>Supply Voltage Reference Source Select</p> <p>0 <math>V_{in1}</math> is selected as resistor ladder network supply reference. 1 <math>V_{in2}</math> is selected as resistor ladder network supply reference.</p>
VOSEL	<p>DAC Output Voltage Select</p> <p>Selects an output voltage from one of 64 distinct levels.</p> <p><math>DACO = (V_{in} / 64) * (VOSEL[5:0] + 1)</math>, so the DACO range is from <math>V_{in} / 64</math> to <math>V_{in}</math>.</p>

### 13.3.6 MUX Control Register (CMPx\_MUXCR)

Address: Base address + 5h offset

Bit	7	6	5	4	3	2	1	0
Read	Reserved	0	PSEL			MSEL		
Write								
Reset	0	0	0	0	0	0	0	0

#### CMPx\_MUXCR field descriptions

Field	Description
7 Reserved	<p>Bit can be programmed to zero only .</p> <p>This field is reserved.</p>
6 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
5–3 PSEL	<p>Plus Input Mux Control</p> <p>Determines which input is selected for the plus input of the comparator. For INx inputs, see CMP, DAC, and ANMUX block diagrams.</p>

*Table continues on the next page...*

**CMPx\_MUXCR field descriptions (continued)**

Field	Description
	<p><b>NOTE:</b> When an inappropriate operation selects the same input for both muxes, the comparator automatically shuts down to prevent itself from becoming a noise generator.</p> <p>000 IN0 001 IN1 010 IN2 011 IN3 100 IN4 101 IN5 110 IN6 111 IN7</p>
MSEL	<p>Minus Input Mux Control</p> <p>Determines which input is selected for the minus input of the comparator. For INx inputs, see CMP, DAC, and ANMUX block diagrams.</p> <p><b>NOTE:</b> When an inappropriate operation selects the same input for both muxes, the comparator automatically shuts down to prevent itself from becoming a noise generator.</p> <p>000 IN0 001 IN1 010 IN2 011 IN3 100 IN4 101 IN5 110 IN6 111 IN7</p>

## 13.4 Functional description

The CMP module can be used to compare two analog input voltages applied to INP and INM.

CMPO is high when the non-inverting input is greater than the inverting input, and is low when the non-inverting input is less than the inverting input. This signal can be selectively inverted by setting CR1[INV] = 1.

SCR[IER] and SCR[IEF] are used to select the condition which will cause the CMP module to assert an interrupt to the processor. SCR[CFF] is set on a falling-edge and SCR[CFR] is set on rising-edge of the comparator output. The optionally filtered CMPO can be read directly through SCR[COOUT].

## 13.4.1 CMP functional modes

There are the following main sub-blocks to the CMP module:

- The comparator itself
- The window function
- The filter function

The filter, CR0[FILTER\_CNT], can be clocked from an internal or external clock source. The filter is programmable with respect to the number of samples that must agree before a change in the output is registered. In the simplest case, only one sample must agree. In this case, the filter acts as a simple sampler.

The external sample input is enabled using CR1[SE]. When set, the output of the comparator is sampled only on rising edges of the sample input.

The "windowing mode" is enabled by setting CR1[WE]. When set, the comparator output is sampled only when WINDOW=1. This feature can be used to ignore the comparator output during time periods in which the input voltages are not valid. This is especially useful when implementing zero-crossing-detection for certain PWM applications.

The comparator filter and sampling features can be combined as shown in the following table. Individual modes are discussed below.

**Table 13-1. Comparator sample/filter controls**

Mode #	CR1[EN]	CR1[WE]	CR1[SE]	CR0[FILTER_CNT]	FPR[FILT_PER]	Operation
1	0	X	X	X	X	<b>Disabled</b> See the <a href="#">Disabled mode (# 1)</a> .
2A	1	0	0	0x00	X	<b>Continuous Mode</b> See the <a href="#">Continuous mode (#s 2A &amp; 2B)</a> .
2B	1	0	0	X	0x00	
3A	1	0	1	0x01	X	<b>Sampled, Non-Filtered mode</b> See the <a href="#">Sampled, Non-Filtered mode (#s 3A &amp; 3B)</a> .
3B	1	0	0	0x01	> 0x00	
4A	1	0	1	> 0x01	X	<b>Sampled, Filtered mode</b> See the <a href="#">Sampled, Filtered mode (#s 4A &amp; 4B)</a> .
4B	1	0	0	> 0x01	> 0x00	
5A	1	1	0	0x00	X	<b>Windowed mode</b> Comparator output is sampled on every rising bus clock edge when SAMPLE=1 to generate COUTA. See the <a href="#">Windowed mode (#s 5A &amp; 5B)</a> .
5B	1	1	0	X	0x00	
6	1	1	0	0x01	0x01–0xFF	<b>Windowed/Resampled mode</b>

*Table continues on the next page...*

**Table 13-1. Comparator sample/filter controls (continued)**

Mode #	CR1[EN]	CR1[WE]	CR1[SE]	CR0[FILTER_CNT]	FPR[FILT_PER]	Operation
						Comparator output is sampled on every rising bus clock edge when SAMPLE=1 to generate COUTA, which is then resampled on an interval determined by FILT_PER to generate COUT.  See the <a href="#">Windowed/Resampled mode (# 6)</a> .
7	1	1	0	> 0x01	0x01–0xFF	<b>Windowed/Filtered mode</b> Comparator output is sampled on every rising bus clock edge when SAMPLE=1 to generate COUTA, which is then resampled and filtered to generate COUT.  See the <a href="#">Windowed/Filtered mode (#7)</a> .
All other combinations of CR1[EN], CR1[WE], CR1[SE], CR0[FILTER_CNT], and FPR[FILT_PER] are illegal.						

For cases where a comparator is used to drive a fault input, for example, for a inverter-control module such as PWM, it must be configured to operate in Continuous mode so that an external fault can immediately pass through the comparator to the target fault circuitry.

### Note

Filtering and sampling settings must be changed only after setting CR1[SE]=0 and CR0[FILTER\_CNT]=0x00. This resets the filter to a known state.

#### 13.4.1.1 Disabled mode (# 1)

In Disabled mode, the analog comparator is non-functional and consumes no power. CMPO is 0 in this mode.

#### 13.4.1.2 Continuous mode (#s 2A & 2B)

**Figure 13-3. Comparator operation in Continuous mode**

The analog comparator block is powered and active. CMPO may be optionally inverted, but is not subject to external sampling or filtering. Both window control and filter blocks are completely bypassed. SCR[COUT] is updated continuously. The path from comparator input pins to output pin is operating in combinational unlocked mode. COUT and COUTA are identical.

For control configurations which result in disabling the filter block, see the [Filter Block Bypass Logic](#) diagram.

### 13.4.1.3 Sampled, Non-Filtered mode (#s 3A & 3B)

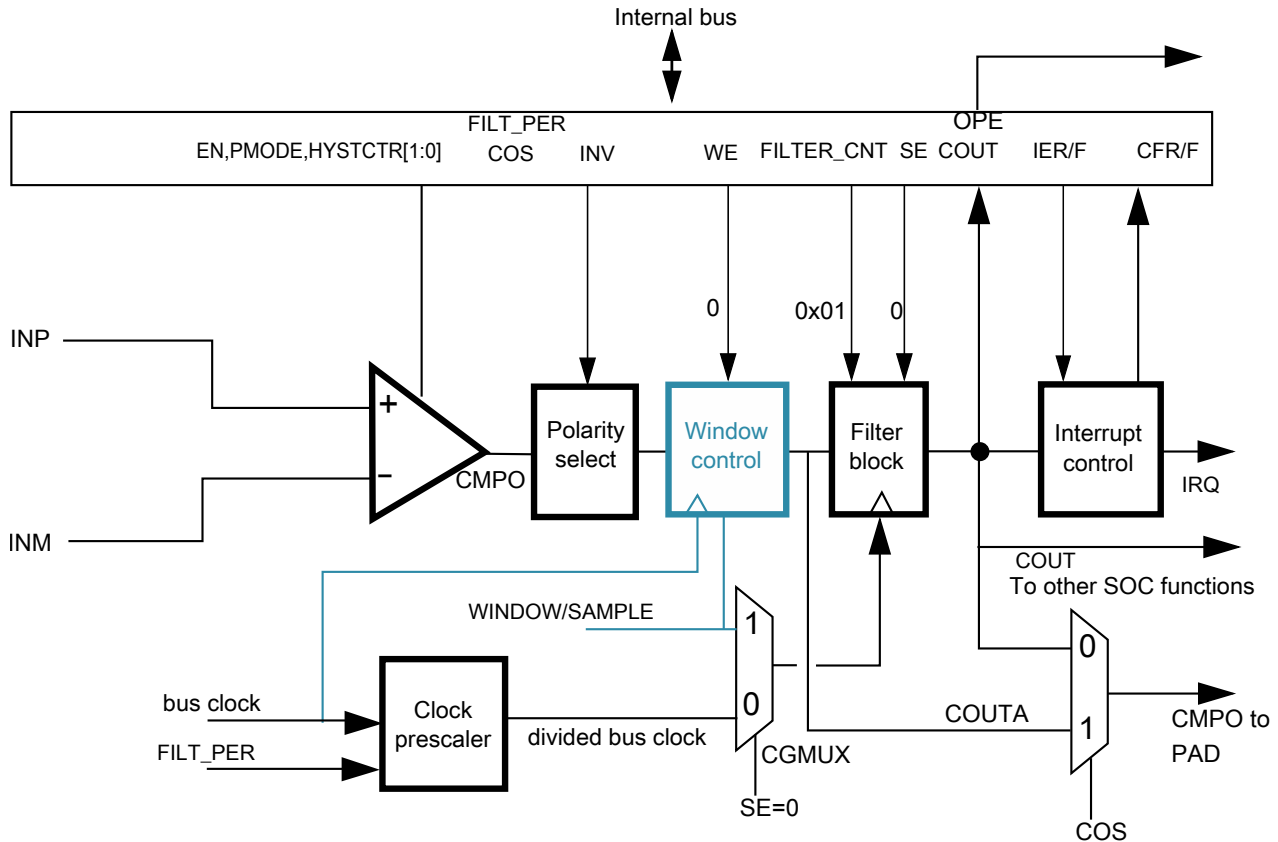

**Figure 13-4. Sampled, Non-Filtered (# 3A): sampling point externally driven**

In Sampled, Non-Filtered mode, the analog comparator block is powered and active. The path from analog inputs to COUTA is combinational unclocked. Windowing control is completely bypassed. COUTA is sampled whenever a rising-edge is detected on the filter block clock input.

The only difference in operation between Sampled, Non-Filtered (# 3A) and Sampled, Non-Filtered (# 3B) is in how the clock to the filter block is derived. In #3A, the clock to filter block is externally derived while in #3B, the clock to filter block is internally derived.

The comparator filter has no other function than sample/hold of the comparator output in this mode (# 3B).

**Figure 13-5. Sampled, Non-Filtered (# 3B): sampling interval internally derived**

#### 13.4.1.4 Sampled, Filtered mode (#s 4A & 4B)

In Sampled, Filtered mode, the analog comparator block is powered and active. The path from analog inputs to COUTA is combinational unlocked. Windowing control is completely bypassed. COUTA is sampled whenever a rising edge is detected on the filter block clock input.

The only difference in operation between Sampled, Non-Filtered (# 3A) and Sampled, Filtered (# 4A) is that, now,  $CR0[FILTER\_CNT] > 1$ , which activates filter operation.

Functional description

Figure 13-6. Sampled, Filtered (# 4A): sampling point externally driven

**Figure 13-7. Sampled, Filtered (# 4B): sampling point internally derived**

The only difference in operation between Sampled, Non-Filtered (# 3B) and Sampled, Filtered (# 4B) is that now,  $CR0[FILTER\_CNT] > 1$ , which activates filter operation.

### 13.4.1.5 Windowed mode (#s 5A & 5B)

The following figure illustrates comparator operation in the Windowed mode, ignoring latency of the analog comparator, polarity select, and window control block. It also assumes that the polarity select is set to non-inverting state.

#### NOTE

The analog comparator output is passed to **COUTA** only when the **WINDOW** signal is high.

In actual operation, **COUTA** may lag the analog inputs by up to one bus clock cycle plus the combinational path delay through the comparator and polarity select logic.

Functional description

Figure 13-8. Windowed mode operation

Figure 13-9. Windowed mode

For control configurations which result in disabling the filter block, see [Filter Block Bypass Logic](#) diagram.

When any windowed mode is active, COUTA is clocked by the bus clock whenever WINDOW = 1. The last latched value is held when WINDOW = 0.

### 13.4.1.6 Windowed/Resampled mode (# 6)

The following figure uses the same input stimulus shown in Figure 13-8, and adds resampling of COUTA to generate COUT. Samples are taken at the time points indicated by the arrows in the figure. Again, prop delays and latency are ignored for the sake of clarity.

This example was generated solely to demonstrate operation of the comparator in windowed/resampled mode, and does not reflect any specific application. Depending upon the sampling rate and window placement, COUT may not see zero-crossing events detected by the analog comparator. Sampling period and/or window placement must be carefully considered for a given application.

Figure 13-10. Windowed/resampled mode operation

This mode of operation results in an unfiltered string of comparator samples where the interval between the samples is determined by FPR[FILT\_PER] and the bus clock rate. Configuration for this mode is virtually identical to that for the Windowed/Filtered Mode shown in the next section. The only difference is that the value of CR0[FILTER\_CNT] must be 1.

### 13.4.1.7 Windowed/Filtered mode (#7)

This is the most complex mode of operation for the comparator block, as it uses both windowing and filtering features. It also has the highest latency of any of the modes. This can be approximated: up to 1 bus clock synchronization in the window function +  $((CR0[FILTER\_CNT] * FPR[FILT\_PER]) + 1) * \text{bus clock}$  for the filter function.

When any windowed mode is active, COUTA is clocked by the bus clock whenever WINDOW = 1. The last latched value is held when WINDOW = 0.

Figure 13-11. Windowed/Filtered mode

## 13.4.2 Power modes

### 13.4.2.1 Wait mode operation

During Wait and VLPW modes, the CMP, if enabled, continues to operate normally and a CMP interrupt can wake the MCU.

### 13.4.2.2 Stop mode operation

Depending on clock restrictions related to the MCU core or core peripherals, the MCU is brought out of stop when a compare event occurs and the corresponding interrupt is enabled. Similarly, if CR1[OPE] is enabled, the comparator output operates as in the normal operating mode and comparator output is placed onto the external pin. In Stop modes, the comparator can be operational in both:

- High-Speed (HS) Comparison mode when CR1[PMODE] = 1
- Low-Speed (LS) Comparison mode when CR1[PMODE] = 0

It is recommended to use the LS mode to minimize power consumption.

If stop is exited with a reset, all comparator registers are put into their reset state.

### 13.4.3 Startup and operation

A typical startup sequence is listed here.

- The time required to stabilize COUT will be the power-on delay of the comparators plus the largest propagation delay from a selected analog source through the analog comparator, windowing function and filter. See the Data Sheets for power-on delays of the comparators. The windowing function has a maximum of one bus clock period delay. The filter delay is specified in the [Low-pass filter](#).
- During operation, the propagation delay of the selected data paths must always be considered. It may take many bus clock cycles for COUT and SCR[CFR]/SCR[CFF] to reflect an input change or a configuration change to one of the components involved in the data path.
- When programmed for filtering modes, COUT will initially be equal to 0, until sufficient clock cycles have elapsed to fill all stages of the filter. This occurs even if COUTA is at a logic 1.

### 13.4.4 Low-pass filter

The low-pass filter operates on the unfiltered and unsynchronized and optionally inverted comparator output COUTA and generates the filtered and synchronized output COUT.

Both COUTA and COUT can be configured as module outputs and are used for different purposes within the system.

Synchronization and edge detection are always used to determine status register bit values. They also apply to COUT for all sampling and windowed modes. Filtering can be performed using an internal timebase defined by FPR[FILT\_PER], or using an external SAMPLE input to determine sample time.

The need for digital filtering and the amount of filtering is dependent on user requirements. Filtering can become more useful in the absence of an external hysteresis circuit. Without external hysteresis, high-frequency oscillations can be generated at COUTA when the selected INM and INP input voltages differ by less than the offset voltage of the differential comparator.

### 13.4.4.1 Enabling filter modes

Filter modes can be enabled by:

- Setting CR0[FILTER\_CNT] > 0x01 and
- Setting FPR[FILT\_PER] to a nonzero value or setting CR1[SE]=1

If using the divided bus clock to drive the filter, it will take samples of COUTA every FPR[FILT\_PER] bus clock cycles.

The filter output will be at logic 0 when first initialized, and will subsequently change when all the consecutive CR0[FILTER\_CNT] samples agree that the output value has changed. In other words, SCR[COUT] will be 0 for some initial period, even when COUTA is at logic 1.

Setting both CR1[SE] and FPR[FILT\_PER] to 0 disables the filter and eliminates switching current associated with the filtering process.

#### **Note**

Always switch to this setting prior to making any changes in filter parameters. This resets the filter to a known state. Switching CR0[FILTER\_CNT] on the fly without this intermediate step can result in unexpected behavior.

If CR1[SE]=1, the filter takes samples of COUTA on each positive transition of the sample input. The output state of the filter changes when all the consecutive CR0[FILTER\_CNT] samples agree that the output value has changed.

### 13.4.4.2 Latency issues

The value of FPR[FILT\_PER] or SAMPLE period must be set such that the sampling period is just longer than the period of the expected noise. This way a noise spike will corrupt only one sample. The value of CR0[FILTER\_CNT] must be chosen to reduce the probability of noisy samples causing an incorrect transition to be recognized. The probability of an incorrect transition is defined as the probability of an incorrect sample raised to the power of CR0[FILTER\_CNT].

The values of FPR[FILT\_PER] or SAMPLE period and CR0[FILTER\_CNT] must also be traded off against the desire for minimal latency in recognizing actual comparator output transitions. The probability of detecting an actual output change within the nominal latency is the probability of a correct sample raised to the power of CR0[FILTER\_CNT].

The following table summarizes maximum latency values for the various modes of operation *in the absence of noise*. Filtering latency is restarted each time an actual output transition is masked by noise.

**Table 13-2. Comparator sample/filter maximum latencies**

Mode #	CR1[EN]	CR1[WE]	CR1[SE]	CR0[FILTER_CNT]	FPR[FILT_PER]	Operation	Maximum latency <sup>1</sup>
1	0	X	X	X	X	Disabled	N/A
2A	1	0	0	0x00	X	Continuous Mode	$T_{PD}$
2B	1	0	0	X	0x00		
3A	1	0	1	0x01	X	Sampled, Non-Filtered mode	$T_{PD} + T_{SAMPLE} + T_{per}$
3B	1	0	0	0x01	> 0x00		$T_{PD} + (FPR[FILT\_PER] * T_{per}) + T_{per}$
4A	1	0	1	> 0x01	X	Sampled, Filtered mode	$T_{PD} + (CR0[FILTER\_CNT] * T_{SAMPLE}) + T_{per}$
4B	1	0	0	> 0x01	> 0x00		$T_{PD} + (CR0[FILTER\_CNT] * FPR[FILT\_PER] * T_{per}) + T_{per}$
5A	1	1	0	0x00	X	Windowed mode	$T_{PD} + T_{per}$
5B	1	1	0	X	0x00		$T_{PD} + T_{per}$
6	1	1	0	0x01	0x01 - 0xFF	Windowed / Resampled mode	$T_{PD} + (FPR[FILT\_PER] * T_{per}) + 2T_{per}$
7	1	1	0	> 0x01	0x01 - 0xFF	Windowed / Filtered mode	$T_{PD} + (CR0[FILTER\_CNT] * FPR[FILT\_PER] * T_{per}) + 2T_{per}$

1.  $T_{PD}$  represents the intrinsic delay of the analog component plus the polarity select logic.  $T_{SAMPLE}$  is the clock period of the external sample clock.  $T_{per}$  is the period of the bus clock.

## 13.5 CMP interrupts

The CMP module is capable of generating an interrupt on either the rising- or falling-edge of the comparator output, or both.

The following table gives the conditions in which the interrupt request is asserted and deasserted.

When	Then
SCR[IER] and SCR[CFR] are set	The interrupt request is asserted
SCR[IEF] and SCR[CFF] are set	The interrupt request is asserted
SCR[IER] and SCR[CFR] are cleared for a rising-edge interrupt	The interrupt request is deasserted
SCR[IEF] and SCR[CFF] are cleared for a falling-edge interrupt	The interrupt request is deasserted

## 13.6 DMA support

Normally, the CMP generates a CPU interrupt if there is a change on the COUT. When DMA support is enabled by setting SCR[DMAEN] and the interrupt is enabled by setting SCR[IER], SCR[IEF], or both, the corresponding change on COUT forces a DMA transfer request rather than a CPU interrupt instead. When the DMA has completed the transfer, it sends a transfer completing indicator that deasserts the DMA transfer request and clears the flag to allow a subsequent change on comparator output to occur and force another DMA request.

The comparator can remain functional in STOP modes.

When DMA support is enabled by setting SCR[DMAEN] and the interrupt is enabled by setting SCR[IER], SCR[IEF], or both, the corresponding change on COUT forces a DMA transfer request to wake up the system from STOP modes. After the data transfer has finished, system will go back to STOP modes. Refer to DMA chapters in the device reference manual for the asynchronous DMA function for details.

## 13.7 Digital-to-analog converter

The figure found here shows the block diagram of the DAC module.

It contains a 64-tap resistor ladder network and a 64-to-1 multiplexer, which selects an output voltage from one of 64 distinct levels that outputs from DACO. It is controlled through the DAC Control Register (DACCR). Its supply reference source can be selected from two sources  $V_{in1}$  and  $V_{in2}$ . The module can be powered down or disabled when not in use. When in Disabled mode, DACO is connected to the analog ground.

Figure 13-12. 6-bit DAC block diagram

## 13.8 DAC functional description

This section provides DAC functional description information.

### 13.8.1 Voltage reference source select

- $V_{in1}$  connects to the primary voltage source as supply reference of 64 tap resistor ladder
- $V_{in2}$  connects to an alternate voltage source

## **13.9 DAC resets**

This module has a single reset input, corresponding to the chip-wide peripheral reset.

## **13.10 DAC clocks**

This module has a single clock input, the bus clock.

## **13.11 DAC interrupts**

This module has no interrupts.

# Chapter 14

## Analog-to-Digital Converter (ADC)

### 14.1 Overview

The analog-to-digital converter (ADC) is a successive approximation ADC designed for operation within an integrated microcontroller system-on-chip.

#### 14.1.1 Features

The features of the ADC are as follows:

- Configuration registers
  - 32-bit, word aligned, byte enabled registers. (byte and halfword access is not supported)
- Linear successive approximation algorithm with up to 12-bit resolution with 10/11 bit accuracy.
- Up to 10 ENOB (dedicated single ended channels)
- Up to 1MS/s sampling rate
- Up to 8 single-ended external analog inputs
- Single or continuous conversion (automatic return to idle after single conversion)
- Output Modes: (in right-justified unsigned format)
  - 12-bit
  - 10-bit
  - 8-bit
- Configurable sample time and conversion speed/power
- Conversion complete and hardware average complete flag and interrupt
- Input clock selectable from up to three sources
- Asynchronous clock source for lower noise operation with option to output the clock
- Selectable asynchronous hardware conversion trigger with hardware channel select
- Automatic compare with interrupt for less-than, greater-than or equal-to, within range, or out-of-range, programmable value
- Operation in low power modes for lower noise operation

## Overview

- Hardware average function
- Self-calibration mode

### 14.1.2 ADC I/F block diagram

The following diagram represents the ADC I/F block.

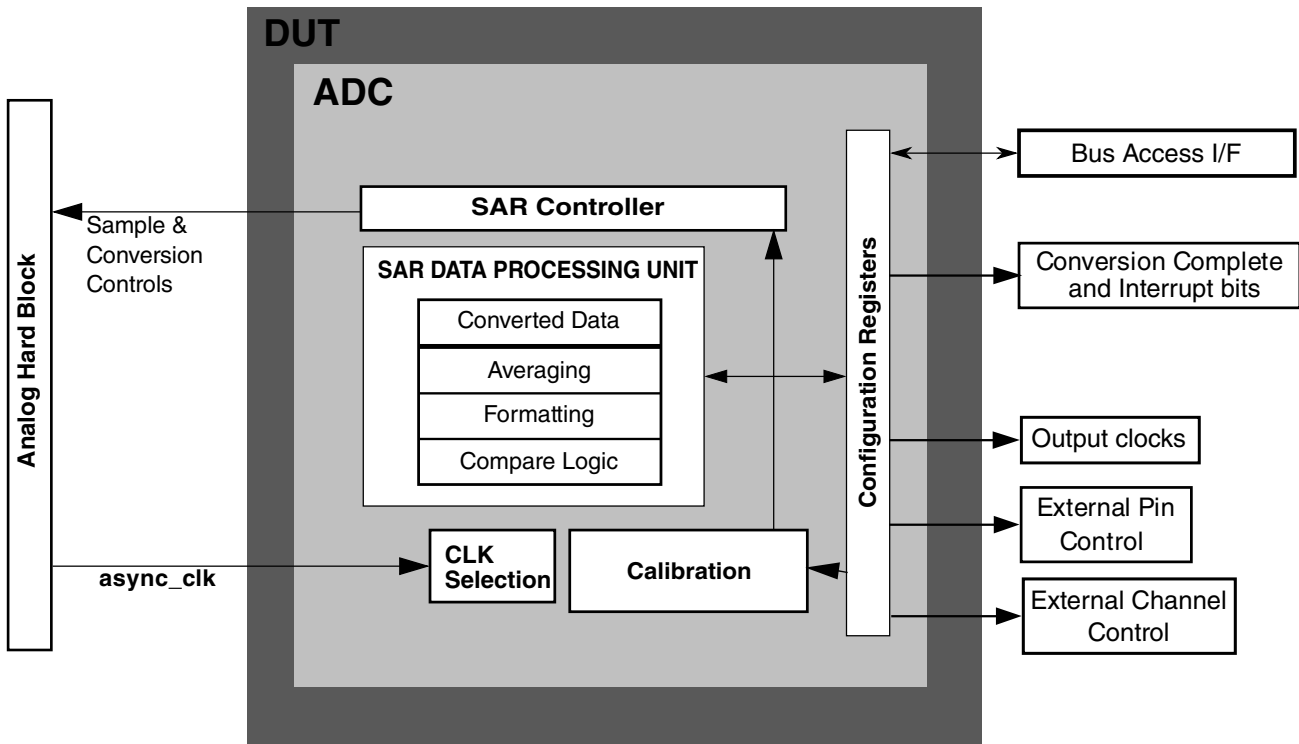

Figure 14-1. ADC I/F block diagram

### 14.1.3 ADC block diagram

The following figure shows a top-level block diagram of the ADC module.

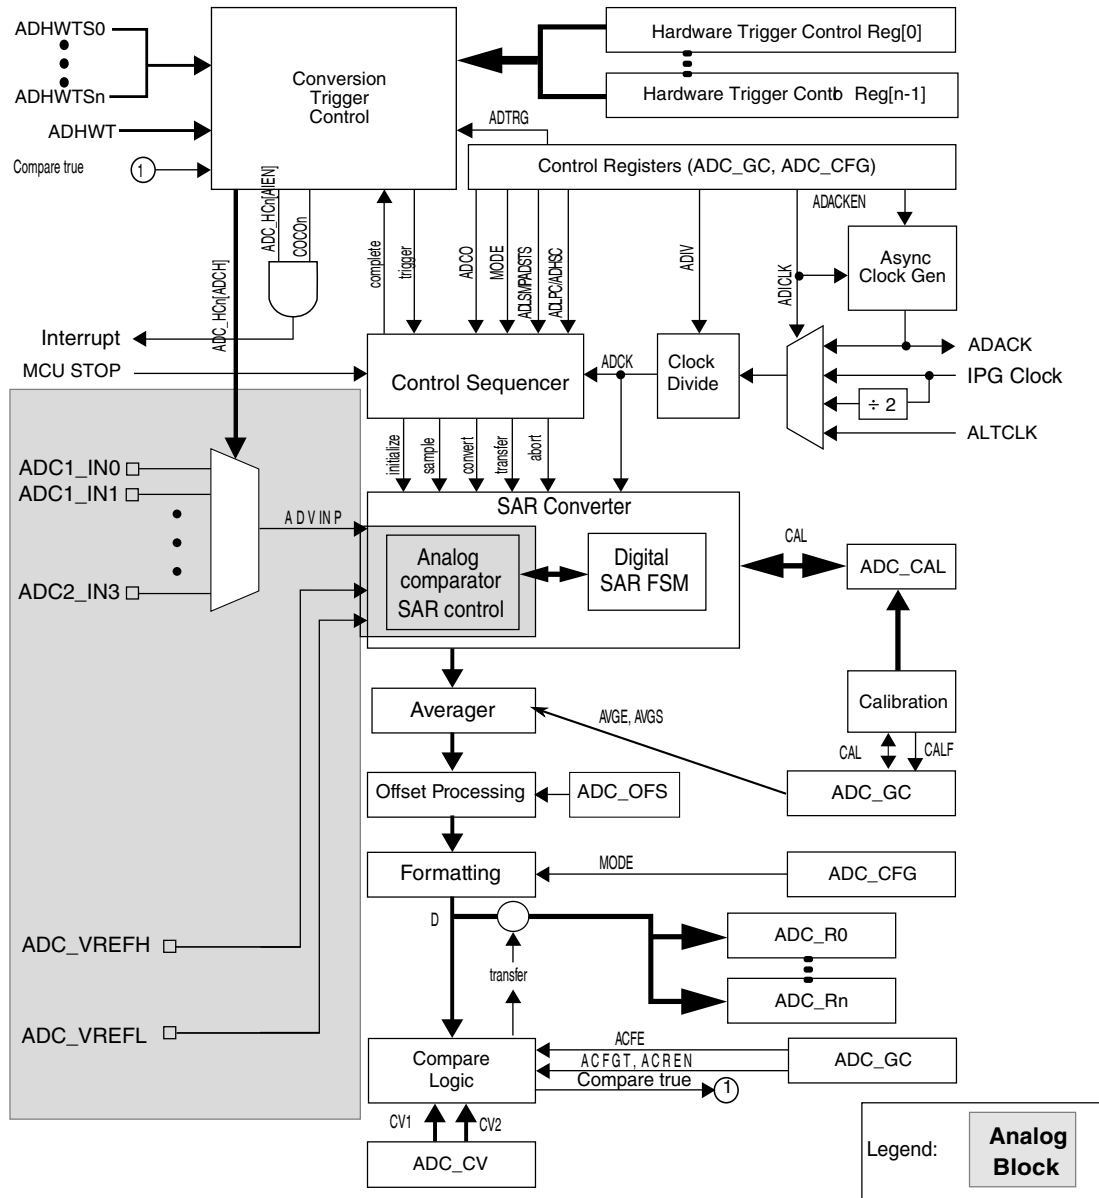

Figure 14-2. ADC block diagram

### 14.1.4 ADC module interface

The ADC is connected to many interfaces such as the clocks and reset, access bus, voltage references, interrupt controller, hardware triggers, ADC pin control, and analog I/F as shown in the following figure.

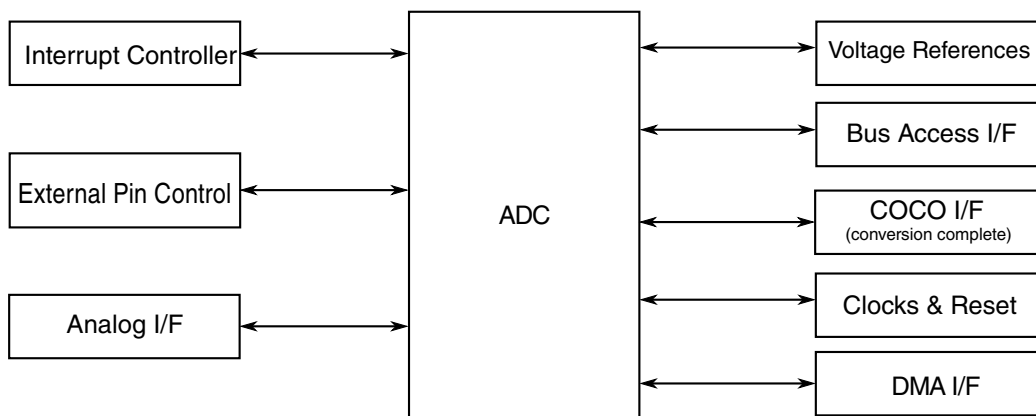

Figure 14-3. ADC module interface

### 14.1.5 Modes of Operation

By default, the ADC is in disabled mode. In this state, no conversion or other actions occur. All of the ADC control registers are accessible in this state through an access bus interface. To enable the ADC, required configurations should be done by programming the ADC configuration registers.

## 14.2 External Signals

The following table describes the external signals of ADC:

Table 14-1. ADC external signals

Signal	Description	Pad	Mode	Direction
ADC 1_IN0	Analog channel 1 input 0	GPIO_AD_B1_11	-	I
ADC1_IN1	Analog channel 1 input 1	GPIO_AD_B0_12	-	I
ADC1_IN2	Analog channel 1 input 2	GPIO_AD_B0_13	-	I
ADC1_IN3	Analog channel 1 input 3	GPIO_AD_B0_14	-	I
ADC1_IN4	Analog channel 1 input 4	GPIO_AD_B0_15	-	I
ADC1_IN5	Analog channel 1 input 5	GPIO_AD_B1_00	-	I
ADC1_IN6	Analog channel 1 input 6	GPIO_AD_B1_01	-	I
ADC1_IN7	Analog channel 1 input 7	GPIO_AD_B1_02	-	I

Table continues on the next page...

**Table 14-1. ADC external signals (continued)**

Signal	Description	Pad	Mode	Direction
ADC1_IN8	Analog channel 1 input 8	GPIO_AD_B1_03	-	I
ADC1_IN9	Analog channel 1 input 9	GPIO_AD_B1_04	-	I
ADC1_IN10	Analog channel 1 input 10	GPIO_AD_B1_05	-	I
ADC1_IN11	Analog channel 1 input 11	GPIO_AD_B1_06	-	I
ADC1_IN12	Analog channel 1 input 12	GPIO_AD_B1_07	-	I
ADC1_IN13	Analog channel 1 input 13	GPIO_AD_B1_08	-	I
ADC1_IN14	Analog channel 1 input 14	GPIO_AD_B1_09	-	I
ADC1_IN15	Analog channel 1 input 15	GPIO_AD_B1_10	-	I
ADC2_IN0	Analog channel 2 input 0	GPIO_AD_B1_11	-	I
ADC2_IN1	Analog channel 2 input 1	GPIO_AD_B1_12	-	I
ADC2_IN2	Analog channel 2 input 2	GPIO_AD_B1_13	-	I
ADC2_IN3	Analog channel 2 input 3	GPIO_AD_B1_14	-	I
ADC2_IN4	Analog channel 2 input 4	GPIO_AD_B1_15	-	I
ADC2_IN5	Analog channel 2 input 5	GPIO_AD_B1_00	-	I
ADC2_IN6	Analog channel 2 input 6	GPIO_AD_B1_01	-	I
ADC2_IN7	Analog channel 2 input 7	GPIO_AD_B1_02	-	I
ADC2_IN8	Analog channel 2 input 8	GPIO_AD_B1_03	-	I
ADC2_IN9	Analog channel 2 input 9	GPIO_AD_B1_04	-	I
ADC2_IN10	Analog channel 2 input 10	GPIO_AD_B1_05	-	I
ADC2_IN11	Analog channel 2 input 11	GPIO_AD_B1_06	-	I
ADC2_IN12	Analog channel 2 input 12	GPIO_AD_B1_07	-	I
ADC2_IN13	Analog channel 2 input 13	GPIO_AD_B1_08	-	I
ADC2_IN14	Analog channel 2 input 14	GPIO_AD_B1_09	-	I

*Table continues on the next page...*

**Table 14-1. ADC external signals (continued)**

Signal	Description	Pad	Mode	Direction
ADC2_IN15	Analog channel 2 input 15	GPIO_AD_B1_10	-	I

**NOTE**

The ADC input signals connect to GPIO[0:9]. The GPIO default configuration is enabled for keeper. The keeper causes an undesired jump behavior in ADC. To avoid the problem, disable keeper before starting ADC. For detailed information about keeper, refer to the GPIO block.

**14.3 Functional Description**

There are three possible states which ADC module can be in:

1. Disabled State
2. Idle state
3. Performing conversions

**Disabled State:**

The ADC module is disabled during reset or stop mode (if internal clock is not selected as source of clock), or when the ADCH bits of the hardware control (ADC\_HC*n*) registers are all high.

**Idle State:**

The module is idle when a conversion has completed and another conversion has not been initiated. When idle and the asynchronous clock output enable is disabled (ADACKEN = 0), the module is in its lowest power state.

**Conversion State:**

The ADC can perform an analog-to-digital conversion on any of the software selectable channels. All modes perform conversion by a successive approximation algorithm.

To meet accuracy specifications the ADC module must be calibrated using the on chip calibration function. Calibration is recommended to be done after any reset.

When the conversion is completed, the result is placed in the data result registers (ADC\_Rn). The conversion complete flag (COCON) field in the Hardware Status register is/are then set and an interrupt is generated, if the respective conversion complete interrupt has been enabled (ADC\_HCN[AIEN]=1).

The ADC module has the capability of automatically comparing the result of a conversion with the contents of the compare value registers. The compare function is enabled by setting ACFE (ADC Compare Function Enable) in the ADC general control register.

The ADC module has the capability of automatically averaging the result of multiple conversions. The hardware average function is enabled by setting AVGE in the ADC general control register.

### 14.3.1 Clock Select and Divide Control

The ADC digital module has two clock sources:

- IPG clock
- Internal clock (ADACK) is a dedicated clock used only by the ADC.

ADC digital block generates IPG clock/2 by internally dividing the IPG clock. The final clock is chosen from the following clocks.

- IPG clock
- IPG clock divided by 2
- ADACK

From the three clocks listed above, one is chosen depending on the configuration of ADICLK[1:0] bits of ADC\_CFG. This chosen clock is divided depending on the configuration of ADIV[1:0] bits of ADC\_CFG. The final generated clock is used as conversion clock for ADC.

ADICLK	Selected Clock Source
00	IPG clock
01	IPG clock divided by 2
10	Reserved
11	Asynchronous clock (ADACK)

- The IPG clock. This is the default selection following reset.

- The IPG clock divided by two. For higher IPG clock rates, this allows a maximum divide by 16 of the IPG clock using the ADIV bits.
- The asynchronous clock (ADACK). This clock is generated from a clock source within the ADC module. Conversions are possible using ADACK as the input clock source while the MCU is in stop mode.

Whichever clock is selected, its frequency must fall within the specified frequency range for ADCK. If the available clocks are too slow, the ADC may not perform according to specifications. If the available clocks are too fast, the clock must be divided to the appropriate frequency. This divider is specified by the ADIV bits and can be divide-by 1, 2, 4, or 8.

### 14.3.2 Voltage Reference Selection

The ADC can be configured to use reference pairs as the reference voltages used for conversions ( $V_{REFSH}$  and  $V_{REFSL}$ ). Each pair contains a positive reference which must be between the minimum Ref Voltage High and  $V_{DDAD}$ , and a ground reference which must be at the same potential as  $V_{SSAD}$ . The pairs can be as follows:

- External ( $V_{REFH}$  and  $V_{REFL}$ )

These voltage references are selected by configuring ADC\_CFG[REFSEL].

### 14.3.3 Hardware Triggering and Channel Selection

The ADC module has a trigger input (known as Alternate Trigger) which provides asynchronous hardware conversion trigger when the ADTRG bit in ADC configuration register (ADC\_CFG) is set and any of the external hardware trigger select is high.

To be reliably captured, the Alternate Trigger pulse must be high for sufficient time to satisfy clocking requirement of capturing Flop and the external hardware trigger select event must be set for sufficient time before and after the positive edge of Alternate trigger pulse to meet the setup / hold requirement of capturing flop.

If an external hardware trigger select event gets asserted during a conversion it must stay asserted until end of current conversion and remain set until the receipt of the an Alternate Trigger to initiate a new conversion.

When the Alternate Trigger source is available and hardware triggering is enabled (ADC\_CFG[ADTRG]=1), a conversion is initiated on the rising edge of the Alternate Trigger after a external hardware trigger select event has occurred.

If a conversion is in progress when a rising edge of a trigger occurs, the rising edge is ignored. In continuous conversion configuration, only the initial rising edge to launch continuous conversions is observed and until conversion gets aborted the ADC will continue to do conversions on the same ADC Hardware Trigger Control register that initiated the conversion. The hardware trigger function operates in conjunction with any of the conversion modes and configurations.

The channel selected for the conversion will depend on the settings of active Hardware Trigger register field `ADC_HCn[ADCH]` of enabled external hardware trigger.

### NOTE

Asserting more than one external hardware trigger select signal at the same time will result in unknown results. To avoid this, only select one external hardware trigger select signal prior to the next intended conversion.

When the conversion is completed, the result is placed in the data registers associated with the external hardware trigger received (active trigger selects `ADC_Rn`). The conversion complete flag associated with the external hardware trigger received (`ADC_HS[COCON]`) is then set and an interrupt is generated if the respective conversion complete interrupt has been enabled (`ADC_HCn[AIEN]=1`).

## 14.3.4 Conversion Control

Conversions are performed as determined by `ADC_CFG[MODE]` field.

Conversions can be initiated by either software or hardware triggers. In addition, the ADC can be configured for low power operation, long sample time, continuous conversion, hardware average, and automatic comparison of conversion results with predetermined values.

### 14.3.4.1 Initiating Conversions

A conversion is initiated:

- Following a write to `ADC_HC0` (with `ADCHn` bits not all 1's) and when a software triggered operation is selected (`ADTRG=0`).
- Following a hardware trigger event if hardware triggered operation is selected (`ADTRG=1`) and a external hardware trigger select event has occurred. The channel selected will depend on the active trigger select signal active selects `ADC_HC1`; if neither is active the off condition is selected).

### Note

Selecting more than one external hardware trigger select signal (`ext_hwts[n]`) prior to a conversion completion will generate unknown results. To avoid this, only select one hardware trigger select signal (`ext_hwts[n]`) prior to a conversion completion.

- Following the transfer of the result to the data registers when continuous conversion is enabled (`ADCO=1` in `ADC_GC` register).

If continuous conversion is enabled, a new conversion is automatically initiated after the completion of the current conversion. In software triggered operation (`ADTRG=0`), continuous conversions begin after `ADC_HC0` is written and continue until aborted. In hardware triggered operation (`ADTRG=1` and one external hardware trigger select event has occurred), continuous conversions begin after a hardware trigger event and continue until aborted.

If hardware averaging is enabled, a new conversion is automatically initiated after the completion of the current conversion until the correct number of conversions is completed. In software triggered operation, conversions begin after `ADC_HC0` is written. In a hardware triggered operation, conversions begin after a hardware trigger. If continuous conversions is also enabled, a new set of conversions to be averaged are initiated following the last of the selected number of conversions.

#### 14.3.4.2 Completing Conversions

A conversion is completed when the result of the conversion is transferred into the data result registers. (provided the compare function & hardware averaging is disabled), this is indicated by the setting of `COCON`. If hardware averaging is enabled, `COCON` sets only, if the last of the selected number of conversions is complete. If the compare function is enabled, `COCON` sets and conversion result data is transferred only if the compare condition is true. If both hardware averaging and compare functions are enabled, then `COCON` sets only if the last of the selected number of conversions is complete and the compare condition is true. An interrupt is generated, if `ADC_HCn[AIEN]` is high at the time that `COCON` is set and if `DMAEN` is set, DMA request is asserted, if `COCON` is set. Both the requests get deasserted when `COCON` is low, cleared, which happens when data is read.

In all modes a blocking mechanism prevents a new result from overwriting previous data in ADC\_Rn, if the previous data is in the process of being read. When blocking is active (OVWREN=0 in ADC\_CFG), the conversion result data transfer is blocked, COCON is not set, and the new result is lost. In all other cases of operation, when a conversion result data transfer is blocked, another conversion is initiated regardless of the state of ADCO (single or continuous conversions enabled).

### Note

If continuous conversions are enabled, the blocking mechanism could result in the loss of data occurring at specific timepoints. To avoid this issue, the data must be read in fewer cycles than an ADC conversion time, accounting for interrupt or software polling loop latency.

If single conversions are enabled, the blocking mechanism could result in several discarded conversions and excess power consumption. To avoid this issue, the data registers must not be read after initiating a single conversion until the conversion completes.

#### 14.3.4.3 Aborting Conversions

Any conversion in progress is aborted when:

- The MCU enters stop mode with ADACK not enabled.
- In software trigger mode, write to ADC\_HC0 register, while ADC\_HC0 is actively (already) controlling a conversion, aborts the current conversion. Since none of the ADC\_HC1 - ADC\_HCn registers are used for software trigger operation, writing to any of them will not initiate a new conversion nor abort the software triggered active conversion.
- In hardware trigger mode, writing to any of the ADC\_HC0 - ADC\_HCn registers, while that specific register is actively controlling a conversion, will abort the current conversion.
- A write to any ADC register other than the ADC\_HC0: ADC\_HCn registers occurs. This indicates a mode of operation change has occurred and the current conversion is therefore invalid.

### Note

When a conversion is aborted, the contents of the data result registers, ADCR<sub>n</sub> are not altered. The data result registers continue to hold the values, transferred after the completion of the last successful conversion. If the conversion is aborted by a reset or stop (not operated with internal ADACK), ADCR<sub>n</sub> (data result register) return to their reset states.

#### 14.3.4.4 Power Control

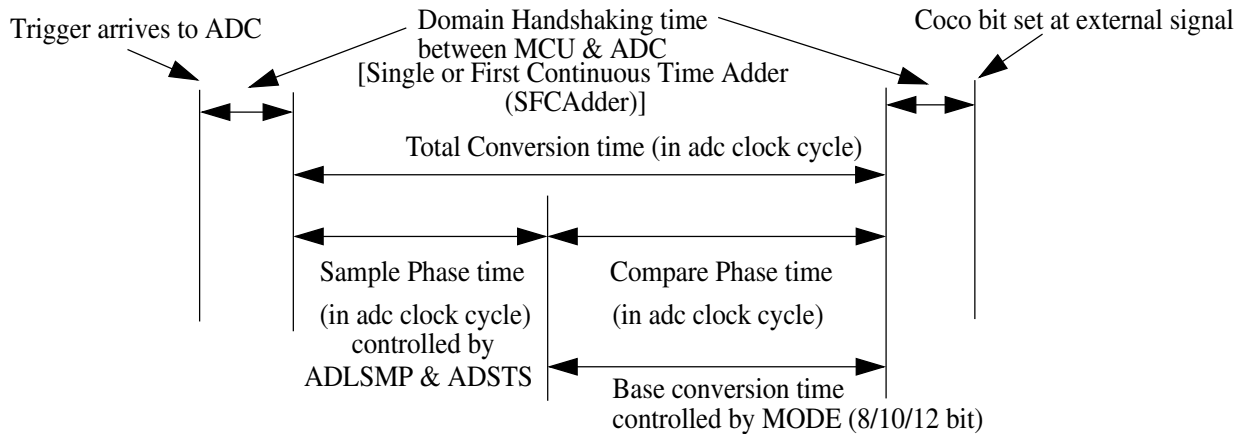

The ADC module remains in its idle state until a conversion is initiated. If ADACK is selected as the conversion clock source but the asynchronous clock output is disabled (ADACKEN=0), the ADACK clock generator will also remain in its idle state (disabled) until a conversion is initiated. If the asynchronous clock output is enabled (ADACKEN=1), it will remain active regardless of the state of the ADC or the MCU power mode.

Power consumption when the ADC is active can be reduced by setting ADLPC.

#### 14.3.4.5 Sample Time and Total Conversion Time

The total conversion time depends upon the following:

- the sample phase time (as determined by ADLSMP and ADSTS bits in ADC\_CFG register),
- the compare phase time (determined by MODE bits)
- the frequency of the conversion clock ( $f_{ADCK}$ ).
- the MCU bus frequency (for Handshaking and selection of clock)

**Figure 14-4. ADC conversion time details**

After the module becomes active, sampling of the input begins. ADLSMP and ADSTS decide the sample time duration. When sampling is complete, the converter is isolated from the input channel and a successive approximation algorithm is performed to determine the digital value of the analog signal. The result of the conversion is transferred to ADC\_Rn upon completion of the conversion algorithm.

If the bus frequency is less than the  $f_{ADCK}$  frequency, precise sample time for continuous conversions cannot be guaranteed.

The maximum total conversion time is determined by the clock source chosen and the divide ratio selected. The clock source is selectable by the ADICLK bits in ADC\_CFG register, and the divide ratio is specified by the ADIV bits.

The maximum total conversion time for all configurations is summarized in [Equation 1 on page 491](#). Refer to [Table 14-2](#) through [Table 14-5](#) for the variables referenced in the equation.

$$\text{ConversionTime} = \text{SFCAdder} + \text{AverageNum} \times (\text{BCT} + \text{LSTAdder})$$

**Equation 1. Equation of Conversion Time**

**Table 14-2. Single or First Continuous Time Adder (SFCAdder)**

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
x	0x, 10	3 ADCK cycles (before starting of conversion) + 1ADCK (after end of conversion) + 2 bus clock cycles
1	11	3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles
0	11	1.5 $\mu$ s +

**Table 14-2. Single or First Continuous Time Adder (SFCAdder)**

ADACKEN	ADICLK	Single or First Continuous Time Adder (SFCAdder)
		3 ADCK cycles (before starting of conversion) + 1 ADCK (after end of conversion) + 2 bus clock cycles

**Table 14-3. Average Number Factor (AverageNum)**

AVGE	AVGS[1:0]	Average Number Factor (AverageNum)
0	xx	1
1	00	4
1	01	8
1	10	16
1	11	32

**Table 14-4. Base Conversion Time (BCT) (compare phase duration)**

Mode	Base Conversion Time (BCT) (compare phase duration)
8 bit	17 ADCK cycles
10 bit	21 ADCK cycles
12 bit	25 ADCK cycles

**Table 14-5. Long Sample Time**

ADLSMP	ADSTS	Long Sample Time Adder (LSTAdder)
0	00	3 ADCK cycles
0	01	5 ADCK cycles
0	10	7 ADCK cycles (default)
0	11	9 ADCK cycles
1	00	13 ADCK cycles
1	01	17 ADCK cycles
1	10	21 ADCK cycles
1	11	25 ADCK cycles

**Note**

The ADCK frequency must be between  $f_{ADCK}$  minimum and  $f_{ADCK}$  maximum to meet ADC specifications.

### 14.3.4.6 Conversion Time Examples

The following examples uses [Equation 1 on page 491](#) and the information provided in tables [Table 14-2](#) through [Table 14-5](#).

#### 14.3.4.6.1 Typical conversion time configuration

A typical configuration for ADC conversion is: 10-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, ADLSMP=0,ADLSTS=10 and high speed conversion disabled. The conversion time for a single conversion is calculated by using [Equation 1 on page 491](#) and the information provided in [Table 14-6](#) through [Table 14-8](#). The table below list the variables of [Equation 1 on page 491](#).

**Table 14-6. Typical Conversion Time**

Variable	Time
SFCAdder	4 ADCK cycles + 2 bus clock cycles
AverageNum	1
BCT	21 ADCK cycles
LSTAdder	7

The resulting conversion time is generated using the parameters listed in [Table 14-6](#). So for Bus clock equal to 40 Mhz and ADCK equal to 40 Mhz the resulting conversion time is 0.85 us.

#### 14.3.4.6.2 Long conversion time configuration

A configuration for long ADC conversion is: 12-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-8 ratio selected, and a bus frequency of 40 MHz, long sample time enabled (ADLSMP=1, ADSTS=11) and configured for longest adder and high speed conversion disabled. Average enabled for 32 conversions (AVGE=1, AVGS=11). The conversion time for this conversion is calculated by using equation on [Sample Time and Total Conversion Time](#) and the information provided in [Table 14-2](#) through [Table 14-5](#). The table below lists the variables of equation.

**Table 14-7. Typical Conversion Time**

Variable	Time
SFCAdder	4 ADCK cycles + 2 bus clock cycles
AverageNum	32
BCT	25 ADCK cycles
LSTAdder	25 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 14-7](#). So for Bus clock equal to 40 Mhz and ADCK equal to 5 Mhz the resulting conversion time is 10.0226 us (AverageNum). This results in a total conversion time of 320.85 us.

### 14.3.4.6.3 Short conversion time configuration

A configuration for short ADC conversion is: 8-bit mode, with the bus clock selected as the input clock source, the input clock divide-by-1 ratio selected, and a bus frequency of 40 MHz, long sample time disabled(ADLSMP=0, ADSTS=00) and high speed conversion enabled. The conversion time for this conversion is calculated by using the equation and the information provided in [Table 14-2](#) to [Table 14-5](#). The table below list the variables of equation.

**Table 14-8. Typical Conversion Time**

Variable	Time
SFCAdder	4 ADCK cycles + 2 bus clock cycles
AverageNum	1
BCT	17 ADCK cycles
LSTAdder	3 ADCK cycles

The resulting conversion time is generated using the parameters listed in [Table 14-8](#). So for Bus clock equal to 40Mhz and ADCK equal to 40Mhz the resulting conversion time is 650 ns.

### 14.3.4.7 Hardware Average Function

The hardware average function can be enabled (AVGE=1) to perform a hardware average of multiple conversions. The number of conversions is determined by the AVGS[1:0] bits, which select 4, 8, 16 or 32 conversions to be averaged. While the hardware average function is in progress the ADACT bit will be set.

After the selected input is sampled and converted, the result is placed in an accumulator from which an average is calculated once the selected number of conversions has been completed. When hardware averaging is selected the completion of a single conversion will not set the COCON bit.

If the compare function is either disabled or evaluates true, after the selected number of conversions are completed, the average conversion result is transferred into the data result registers, ADC\_Rn , and the COCON bit is set. An ADC interrupt is generated upon the setting of COCON if the respective ADC interrupt is enabled (AIENn=1).

### 14.3.5 Automatic Compare Function

The compare function can be configured to check if the result is less than or greater-than-or-equal-to a single compare value, or if the result falls within or outside a range determined by two compare values. The compare mode is determined by ACFGT, ACREN and the values in the compare value register (ADC\_CV). After the input is sampled and converted, the compare values (CV1 and CV2) are used as described in the table below. There are six compare modes as shown in the table below.

**Table 14-9. Compare Modes**

ACFGT	ACREN	CV1 relative to CV2	Function	Compare Mode Description
0	0	-	Less than threshold	Compare true if the result is less than the CV1 registers.
1	0	-	Greater than or equal to threshold	Compare true if the result is greater than or equal to CV1 registers.
0	1	Less than or equal	Outside range, not inclusive	Compare true if the result is less than CV1 <b>Or</b> the result is Greater than CV2
0	1	Greater than	Inside range, not inclusive	Compare true if the result is less than CV1 <b>And</b> the result is greater than CV2
1	1	Less Than or equal	Inside range, inclusive	Compare true if the result is greater than or equal to CV1 <b>And</b> the result is less than or equal to CV2
1	1	Greater than	Outside range, inclusive	Compare true if the result is greater than or equal to CV1 <b>Or</b> the result is less than or equal to CV2

With the ADC range enable bit set, ADCREN =1, if compare value 1(CV1 value) is less than or equal to the compare value 2 (CV2 value), setting ACFGT will select a trigger-if-inside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-outside-compare-range, not-inclusive-of-endpoints function.

If CV1 is greater than the CV2, setting ACFGT will select a trigger-if-outside-compare-range, inclusive-of-endpoints function. Clearing ACFGT will select a trigger-if-inside-compare-range, not-inclusive-of-endpoints function.

If the condition selected evaluates true, COCON is set.

Upon completion of a conversion while the compare function is enabled, if the compare condition is not true, COCON is not set and the conversion result data will not be transferred to the result register. If the hardware averaging function is enabled, the compare function compares the averaged result to the compare values. The same compare function definitions apply. An ADC interrupt is generated upon the setting of COCON if the respective ADC interrupt is enabled (ADC\_HCn[AIEN]=1).

## Note

The compare function can monitor the voltage on a channel while the MCU is in wait or stop3 mode. The ADC interrupt wakes the MCU when the compare condition is met.

### 14.3.6 Calibration Function

The ADC contains a self-calibration function that is required to achieve the specified accuracy. Calibration should be run or valid calibration values should be written after power up and system reset (as the calibration register will be reset on reset assertion) with specified settings before any conversion is initiated. The calibration function sets the calibration value at the end of running the full calibration sequence in ADC\_CAL register. The user must configure the ADC correctly prior to starting the calibration process, and must allow the process to run the full calibration sequence by checking the status of ADC\_GC[*CAL*] and ADC\_GS[*CALF*] so that the generated calibration value can be loaded.

Prior to calibration, the user must configure the ADC's clock source and frequency, low power configuration, voltage reference selection, sample time, averaging, and the high speed configuration according to the application's clock source availability and needs. If the application uses the ADC in a wide variety of configurations, the configuration for which the highest accuracy is required should be selected, or multiple calibrations can be done for the different configurations. The input channel, conversion mode, continuous function and compare function are all ignored during the calibration process.

To initiate calibration, the user sets the CAL bit and the calibration will automatically begin if the ADTRG bit = 0. If ADTRG = 1, the CAL bit will not get set and the calibration fail flag (CALF) will be set. While calibration is active, no ADC register can be written and no stop mode may be entered or the calibration routine will be aborted causing the CAL bit to clear and the CALF bit to set.

At the end of a calibration sequence the COCO[0] bit of the ADC\_HS register will be set. The ADC\_HCn[AIEN] bit can be used to allow an interrupt to occur at the end of a calibration sequence. If, at the end of calibration routine, the CALF bit is not set, the automatic calibration routine completed successfully.

To complete calibration, the user must follow the below procedure :

- Configure ADC\_CFG with actual operating values for maximum accuracy.
- Configure the ADC\_GC values along with CAL bit
- Check the status of CALF bit in ADC\_GS and the CAL bit in ADC\_GC
- When CAL bit becomes '0' then check the CALF status and COCO[0] bit status

When complete the user may reconfigure and use the ADC as desired.

A second calibration may also be performed if desired by clearing and again setting the CAL bit

Overall the calibration routine may take as many as 14000 ADCK cycles and 100 bus cycles, depending on the results and the clock source chosen.

### 14.3.7 User Defined Offset Function

The ADC Offset Correction Register (ADC\_OFS) contains the user configured offset value. This register is 13 bit wide. The value in MSB (13th bit) is the operation bit, if this bit is '0' then the value in rest 12 bit is added with the converted result value to generate final result to be loaded into ADC\_Rn and if this bit is '1' then this field is subtracted from converted value to generate final Result (ADC\_Rn). If the Final result is above the maximum or below the minimum result value, it is forced to the appropriate limit for the current mode of operation. Forced to 0x0FFF if over and 0x0000 if lower for 12 bit mode.

The offset value has no effect during calibration on the final result.

The formatting of the ADC Offset Register is different from the Data Result Registers (ADC\_Rn) to preserve the resolution of the value regardless of the conversion mode selected. Lower order bits are ignored in lower resolution modes. For example, in 8b single-ended mode, the bits OFS[11:4] are subtracted from D[7:0] when bit OFS[12] (sign bit) is '1' ; indicates subtraction and bits OFS[4:0] are ignored. For 12b single-ended mode, bits OFS[11:0] are directly subtracted from the conversion result data CDATA[11:0] when OFS[12] (sign bit) is '1'. The similar is the addition operation when OFS[12](sign bit) is 0.

ADC\_OFS is manually set according to user requirements once the self calibration sequence is done (CAL is cleared). The user have to write ADC\_OFS with desired value.

#### NOTE

There is an effective limit to the values of Offset that can be set by the user. If the magnitude of the offset is too great the results of the conversions will cap off at the limits.

The offset function may be employed by the user to remove application offsets or DC bias values. An offset correction that results in an out-of-range value will be forced to the minimum or maximum value.

For applications which may change the offset repeatedly during operation, it is recommended to store the initial offset value in flash so that it can be recovered and added to any user offset adjustment value and the sum stored in the ADC\_OFS registers.

### **14.3.8 MCU Wait Mode Operation**

Wait mode is a **lower power-consumption standby mode** from which **recovery is fast** because **the clock sources remain active**. If a conversion is in progress when the MCU enters wait mode, it continues until completion. Conversions can be initiated while the MCU is in wait mode by means of the hardware trigger or if continuous conversions are enabled.

The bus clock, bus clock divided by two, and ADACK are available as conversion clock sources while in wait mode.

A conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from wait mode.

If the compare and hardware averaging functions are disabled, a conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from wait mode if the respective ADC interrupt is enabled (ADC\_HCn[AIEN]=1).

If the hardware averaging function is enabled the COCON will set (and generate an interrupt if enabled) when the selected number of conversions are complete.

If the compare function is enabled the COCON will set (and generate an interrupt if enabled) only if the compare conditions are met.

If a single conversion is selected and the compare trigger is not met, the ADC will return to its idle state and cannot wake the MCU from wait mode unless a new conversion is initiated by the hardware trigger.

### **14.3.9 MCU Stop Mode Operation**

Stop mode is a low power-consumption standby mode during which most or all clock sources on the MCU are disabled. Stop mode is entered when stop indication comes from the MCU.

### 14.3.9.1 Stop Mode With ADACK Disabled

If the asynchronous clock, ADACK, is not selected as the conversion clock, executing a stop instruction aborts the current conversion and places the ADC in its idle state. The contents of the ADC registers, including ADC\_Rn are unaffected by stop mode. After exiting from stop mode, a software or hardware trigger is required to resume conversions.

### 14.3.9.2 Stop Mode With ADACK Enabled

If ADACK is selected as the conversion clock, the ADC continues operation during stop mode. For guaranteed ADC operation, the MCU's voltage regulator must remain active during stop mode.

If a conversion is in progress when the MCU enters stop mode, it continues until completion. Conversions can be initiated while the MCU is in stop mode by means of the hardware trigger or if continuous conversions are enabled.

A conversion complete event sets the COCON and generates an ADC interrupt to wake the MCU from stop mode :

#### Note

The ADC module can wake the system from low-power stop and cause the MCU to begin consuming run-level currents without generating a system level interrupt. To prevent this scenario, software should ensure the conversion result data transfer blocking mechanism (discussed in [Completing Conversions](#)) is cleared when entering stop and continuing ADC conversions.

## 14.4 Initialization Information

This section gives an example that provides some basic direction on how to initialize and configure the ADC module. User can configure the module for 8, 10, 12 bit resolution, single or continuous conversion, and a polled or interrupt approach, among many other options.

### 14.4.1 ADC Module Initialization Example

This section describes the initialization sequence along with pseudo-code.

### 14.4.1.1 Initialization Sequence

Before the ADC module can be used to complete conversions, an initialization procedure must be performed. A typical sequence is as follows:

- Calibrate the ADC by following the calibration instructions in [Calibration Function](#)
- Update the configuration register (ADC\_CFG) to select the input clock source and the divide ratio used to generate the internal clock, ADCK. This register is also used for selecting sample time and low-power configuration.
- Update General control register (ADC\_GC) to select whether conversions will be continuous or completed only once (ADCO) and to select whether to perform hardware averaging, etc.
- Update Trigger control register (ADC\_HCn) to select the conversion trigger (hardware or software, i.e. configure ADTRG bit) and compare function options, if enabled.

### 14.4.1.2 Pseudo-Code Example

In this example, the ADC module is set up with interrupts enabled to perform a single 10-bit conversion at low power with a long sample time on input channel 1, where the internal ADCK clock is derived from the bus clock divided by 1.

#### ADC\_CFG

Bit 7	ADLPC	1	Configures for low power (lowers maximum clock speed).
Bit 6:5	ADIV	00	Sets the ADCK to the input clock ÷ 1.
Bit 4	ADLSMP	1	Configures for long sample time.
Bit 3:2	MODE	10	Sets mode at 10-bit conversions.
Bit 1:0	ADICLK	00	Selects bus clock as input clock source.

#### ADC\_GC

Bit 7	CAL	0	Flag indicates if a conversion is in progress.
Bit 6	ADCO	0	Software trigger selected.
Bit 5	AVGE	0	Compare function disabled.
Bit 4	ACFE	0	Compare function disabled.
Bit 3	ACFGT	0	Not used in this example.
Bit 2	ACREN	0	Not used in this example.
Bit 1	DMAEN	0	Not used in this example.
Bit 0	ADACKEN	0	Not used in this example.

#### ADC\_HC0

```

Bit 7   AIEN   1   Conversion complete interrupt enabled.
Bit 4:0 ADCH   00001 Input channel 1 selected as ADC input channel.

```

## ADC\_R0

Holds results of conversion. Read high byte (ADCRHA) before low byte (ADCRLA) so that conversion data cannot be overwritten with data from the next conversion.

## ADC\_CV

Holds compare values when compare function enabled.

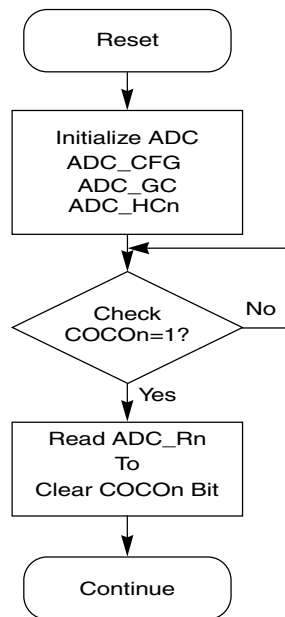

Figure 14-5. Initialization Flowchart for Example

## 14.5 Application Information

This section contains information for using the ADC module in applications. The ADC has been designed to be integrated into a microcontroller for use in embedded control applications requiring an A/D converter.

### 14.5.1 Sources of Error

Several sources of error exist for A/D conversions. These are discussed in the following sections.

### 14.5.1.1 Sampling Error

For proper conversions, the input must be sampled long enough to achieve the proper accuracy. Given the maximum input resistance of approximately  $7\text{k}\Omega$  and input capacitance of approximately  $1.3\text{ pF}$ , sampling to within  $1/4\text{LSB}$  (at 12-bit resolution) can be achieved within the nominal sample window (6 cycles @  $40\text{ MHz}$  maximum  $\text{ADCK}$  frequency) provided the resistance of the external analog source ( $R_{AS}$ ) is kept below  $4\text{ k}\Omega$ .

Higher source resistances or higher-accuracy sampling is possible by setting  $\text{ADLSMP}$  and changing the  $\text{ADSTS}$  bits (to increase the sample window) or decreasing  $\text{ADCK}$  frequency to increase sample time.

### 14.5.1.2 Pin Leakage Error

Leakage on the I/O pins can cause conversion error if the external analog source resistance ( $R_{AS}$ ) is high. If this error cannot be tolerated by the application, keep  $R_{AS}$  lower than  $V_{DDAD}/(2^N \cdot I_{LEAK})$  for less than  $1/4\text{LSB}$  leakage error ( $N = 8$  in 8-bit, 10 in 10-bit or 12 in 12-bit mode).

### 14.5.1.3 Noise-Induced Errors

System noise that occurs during the sample or conversion process can affect the accuracy of the conversion. The ADC accuracy numbers are guaranteed as specified only if the following conditions are met:

- There is a  $0.1\text{ }\mu\text{F}$  low-ESR capacitor from  $V_{REFH}$  to  $V_{REFL}$ .
- There is a  $0.1\text{ }\mu\text{F}$  low-ESR capacitor from  $V_{DDAD}$  to  $V_{SSAD}$ .
- If inductive isolation is used from the primary supply, an additional  $1\text{ }\mu\text{F}$  capacitor is placed from  $V_{DDAD}$  to  $V_{SSAD}$ .
- $V_{SSAD}$  (and  $V_{REFL}$ , if connected) is connected to  $V_{SS}$  at a quiet point in the ground plane.
- Operate the MCU in wait or stop mode before initiating (hardware triggered conversions) or immediately after initiating (hardware or software triggered conversions) the ADC conversion.

- For software triggered conversions, immediately follow the write to ADCSC1 with a wait instruction or stop instruction.
- For stop mode operation, select ADACK as the clock source. Operation in stop reduces  $V_{DD}$  noise but increases effective conversion time due to stop recovery.
- There is no I/O switching, input or output, on the MCU during the conversion.

There are some situations where external system activity causes radiated or conducted noise emissions or excessive  $V_{DD}$  noise is coupled into the ADC. In these situations, or when the MCU cannot be placed in wait or stop or I/O activity cannot be halted, these recommended actions may reduce the effect of noise on the accuracy:

- Place a 0.01  $\mu\text{F}$  capacitor (CAS) on the selected input channel to  $V_{REFL}$  or  $V_{SS}$  (this improves noise issues, but affects the sample rate based on the external analog source resistance).
- Average the result by converting the analog input many times in succession and dividing the sum of the results. Four samples are required to eliminate the effect of a 1LSB, one-time error.
- Reduce the effect of synchronous noise by operating off the asynchronous clock (ADACK) and averaging. Noise that is synchronous to ADCK cannot be averaged out.

#### 14.5.1.4 Code Width and Quantization Error

##### Note

This will remain the same as long as the result is rounded for 8 and 10-bit modes. If the result is truncated in 8/10b modes then they will match 12b mode where the quantization error is -1 to 0.

The ADC quantizes the ideal straight-line transfer function into 4096 steps (in 12-bit mode). Each step ideally has the same height (1 code) and width. The width is defined as the delta between the transition points to one code and the next. The ideal code width for an N bit converter (in this case N can be 8, 10 or 12), defined as 1LSB, is:

$$1\text{lsb} = (V_{REFH} - V_{REFL}) / 2^N$$

There is an inherent quantization error due to the digitization of the result. For 8-bit or 10-bit conversions the code transitions when the voltage is at the midpoint between the points where the straight line transfer function is exactly represented by the actual

transfer function. Therefore, the quantization error will be  $\pm 1/2$  lsb in 8- or 10-bit mode. As a consequence, however, the code width of the first (0x000) conversion is only 1/2 lsb and the code width of the last (0xFF or 0x3FF) is 1.5 lsb.

For 12-bit conversions the code transitions only after the full code width is present, so the quantization error is -1 lsb to 0 lsb and the code width of each step is 1 lsb.

### 14.5.1.5 Linearity Errors

The ADC may also exhibit non-linearity of several forms. Every effort has been made to reduce these errors but the system should be aware of them because they affect overall accuracy. These errors are:

- Zero-scale error ( $E_{ZS}$ ) (sometimes called offset) — This error is defined as the difference between the actual code width of the first conversion and the ideal code width (1/2 lsb in 8-bit or 10-bit modes and 1 lsb in 12-bit mode). If the first conversion is 0x001, the difference between the actual 0x001 code width and its ideal (1 lsb) is used.
- Full-scale error ( $E_{FS}$ ) — This error is defined as the difference between the actual code width of the last conversion and the ideal code width (1.5 lsb in 8-bit or 10-bit modes and 1LSB in 12-bit mode). If the last conversion is 0x3FE, the difference between the actual 0x3FE code width and its ideal (1LSB) is used.
- Differential non-linearity (DNL) — This error is defined as the worst-case difference between the actual code width and the ideal code width for all conversions.
- Integral non-linearity (INL) — This error is defined as the highest-value the (absolute value of the) running sum of DNL achieves. More simply, this is the worst-case difference of the actual transition voltage to a given code and its corresponding ideal transition voltage, for all codes.
- Total unadjusted error (TUE) — This error is defined as the difference between the actual transfer function and the ideal straight-line transfer function and includes all forms of error.

### 14.5.1.6 Code Jitter, Non-Monotonicity, and Missing Codes

Analog-to-digital converters are susceptible to three special forms of error. These are code jitter, non-monotonicity, and missing codes.

Code jitter is when, at certain points, a given input voltage converts to one of two values when sampled repeatedly. Ideally, when the input voltage is infinitesimally smaller than the transition voltage, the converter yields the lower code (and vice-versa). However, even small amounts of system noise can cause the converter to be indeterminate (between two codes) for a range of input voltages around the transition voltage. This range is normally around  $\pm 1/2$  lsb in 8-bit or 10-bit mode, or around 2 lsb in 12-bit mode, and increases with noise.

This error may be reduced by repeatedly sampling the input and averaging the result. Additionally the techniques discussed in [Noise-Induced Errors](#) reduces this error.

Non-monotonicity is defined as when, except for code jitter, the converter converts to a lower code for a higher input voltage. Missing codes are those values never converted for any input value.

In 8-bit or 10-bit mode, the ADC is guaranteed to be monotonic and have no missing codes.

## 14.6 Memory map and register definition

The ADC-Digital contains 32-bit, word aligned, byte enables registers; byte or half word access are not supported. All configuration registers are accessible via 32-bit access bus Interface. Write access to reserved locations have no impact while read access to reserved locations always return 0.

### NOTE

No protection or indication mechanism is available (for example, 32-bit access starting with address offset value 0x01 or 0x02 or 0x03). The ADC does not check for correctness of the programmed values in the registers and the programmer must ensure that correct values are being written.

### ADC memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
400C_4000	Control register for hardware triggers (ADC1_HC0)	32	R/W	0000_001Fh	<a href="#">14.6.1/507</a>

## 14.6.1 Control register for hardware triggers (ADCx\_HC0)

ADC\_HC0 can be used for both software and hardware trigger mode. Other ADC\_HC $n$  ( $n = 1\dots$ ) are for use only in hardware trigger mode. The ADC\_HC0 to ADC\_HC $n$  ( $n = 1\dots$ ) registers have identical fields, and are used to control ADC operation. At any one point in time, only one of the ADC\_HC0 to ADC\_HC $n$  ( $n = 1\dots$ ) registers is actively controlling ADC conversions. Updating ADC\_HC0 while ADC\_HC $n$  ( $n = 1\dots$ ) is actively controlling a conversion is allowed (and vice-versa for any of the ADC\_HC $n$  ( $n = 1\dots$ ) registers). Writing ADC\_HC0 while ADC\_HC0 is actively controlling a conversion aborts the current conversion. In software trigger mode (ADTRG=0), writes to ADC\_HC0 subsequently initiates a new conversion (if the ADCH bits are equal to a value other than all 1s). Similarly, writing any of the ADC\_HC $n$  ( $n = 1\dots$ ) registers while that specific ADC\_HC $n$  register is actively controlling a conversion aborts the current conversion. ADC\_HC $n$  ( $n = 1\dots$ ) register is not used for software trigger operation and therefore writes to any of them do not initiate a new conversion.

6–5 Reserved	This read-only field is reserved and always has the value 0.
ADCH	<p>Input Channel Select</p> <p>This 5-bit field selects one of the input channels. The successive approximation converter subsystem is turned off when the channel select bits are all set (ADCH = 11111b). This feature allows for explicit disabling of the ADC and isolation of the input channel from all sources. Terminating continuous conversions this way prevents an additional single conversion from being performed.</p> <p>00000-01111 External channels 0 to 15. 10000 External channel selection from ADC_ETC 10001-10111 Reserved 11000 Reserved. 11001 VREFSH = internal channel, for ADC self-test, hard connected to VRH internally 11010 Reserved. 11011 Reserved. 11100-11110 Reserved. 11111 Conversion Disabled. Hardware Triggers will not initiate any conversion.</p>

## 14.6.2 Control register for hardware triggers (ADCx\_HCn)

ADC\_HCn ( $n = 1\dots$ ) are for use only in hardware trigger mode. The ADC\_HC0 to ADC\_HCn registers have identical fields, and are used to control ADC operation. At any one point in time, only one of the ADC\_HC0 to ADC\_HCn registers is actively controlling ADC conversions. Updating ADC\_HC0 while ADC\_HCn is actively controlling a conversion is allowed (and vice-versa for any of the ADC\_HCn registers). Writing any of the ADC\_HCn registers while that specific ADC\_HCn register is actively controlling a conversion aborts the current conversion. Any of the ADC\_HCn ( $n = 1\dots$ ) registers are not used for software trigger operation and therefore writes to any of them do not initiate a new conversion.

### ADCx\_HCn field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 AIEN	Conversion Complete Interrupt Enable/Disable Control  An interrupt is generated whenever ADC_HS[COCO0]=1 (conversion ADC_HC0 completed), provided the corresponding interrupt is enabled.  1 Conversion complete interrupt enabled 0 Conversion complete interrupt disabled
6–5 Reserved	This read-only field is reserved and always has the value 0.
ADCH	Input Channel Select  This 5-bit field selects one of the input channels. The successive approximation converter subsystem is turned off when the channel select bits are all set (ADCH =11111b). This feature allows for explicit disabling of the ADC and isolation of the input channel from all sources. Terminating continuous conversions this way prevents an additional single conversion from being performed.  00000-01111 External channels 0 to 15. 10000 External channel selection from ADC_ETC

Table continues on the next page...

**ADCx\_HCn field descriptions (continued)**

Field	Description
10001-10111	Reserved
11000	Reserved.
11001	VREFSH = internal channel, for ADC self-test, hard connected to VRH internally
11010	Reserved.
11011	Reserved.
11100-11110	Reserved.
11111	Conversion Disabled. Hardware Triggers will not initiate any conversion.

### 14.6.3 Status register for HW triggers (ADCx\_HS)

Bit 0 is used for both software and hardware trigger modes of operation. Bit 1 to bit (n-1) indicate the rest of the HW triggers' statuses similar to bit 0, potentially corresponding to multiple ADC\_HC registers (for use only in hardware trigger mode).

Address: Base address + 20h offset

### 14.6.5 Data result register for HW triggers (ADCx\_Rn)

Contains the result of an ADC conversion of the channel selected by the respective Hardware Trigger and channel control register (ADC\_HC0:ADC\_HCn). For every ADC\_HC0:ADC\_HCn status and channel control register, there is a respective ADC\_R0 to ADC\_Rn data result register. Unused bits in the ADC\_Rn register are cleared in unsigned right justified modes. For example when configured for 10-bit single-ended mode, D[31:10] are cleared. The table below describes the behavior of the data result registers in the different modes of operation.

**Table 14-11. Data Result Register Description**

Conversion Mode	Data Result Register bits															Format	
	D31	D30	...	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1		D0

### ADCx\_CFG field descriptions

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 OVWREN	Data Overwrite Enable  Controls the overwriting of the next converted Data onto the existing (previous) unread data into the Data result register.  1 Enable the overwriting. 0 Disable the overwriting. Existing Data in Data result register will not be overwritten by subsequent converted data.
15–14 AVGS	Hardware Average select  Determines how many ADC conversions will be averaged to create the ADC average result. This functionality is activated when ADC_GC[AVGE] = 1.  00 4 samples averaged 01 8 samples averaged 10 16 samples averaged 11 32 samples averaged
13 ADTRG	Conversion Trigger Select  Selects the type of trigger used for initiating a conversion. Two types of trigger are selectable: software trigger and hardware trigger. When software trigger is selected, a conversion is initiated following a write to ADC_HC0. When hardware trigger is selected, a conversion is initiated following the assertion of a pulse on Alternate Hardware trigger input along with the assertion of the enable of respective the hardware Triggers input.

Table continues on the next page...

## ADCx\_CFG field descriptions (continued)

Field	Description
	0 Software trigger selected 1 Hardware trigger selected
12–11 REFSEL	Voltage Reference Selection Selects the voltage reference source used for conversions.  00 Selects VREFH/VREFL as reference voltage. 01 Reserved 10 Reserved 11 Reserved
10 ADHSC	High Speed Configuration This bit configures the ADC for high speed operation. The internal ADC clock is higher than normal.  0 Normal conversion selected. 1 High speed conversion selected.
9–8 ADSTS	Defines the sample time duration. This has two modes, short and long. When long sample time is selected (ADLSMP=1) this works for long sample time otherwise this works for short sample. This allows higher impedance inputs to be accurately sampled or to maximize conversion speed for lower impedance inputs. Longer sample times can also be used to lower overall power consumption when continuous conversions are enabled if high conversion rates are not required.  00 Sample period (ADC clocks) = 2 if ADLSMP=0b Sample period (ADC clocks) = 12 if ADLSMP=1b 01 Sample period (ADC clocks) = 4 if ADLSMP=0b Sample period (ADC clocks) = 16 if ADLSMP=1b 10 Sample period (ADC clocks) = 6 if ADLSMP=0b Sample period (ADC clocks) = 20 if ADLSMP=1b 11 Sample period (ADC clocks) = 8 if ADLSMP=0b Sample period (ADC clocks) = 24 if ADLSMP=1b
7 ADLPC	Low-Power Configuration Puts the ADC hard block into low power mode and reduces the comparator enable period by controlling its timing in the SAR controller block towards the analog hard block. The signal indicating low power mode to the Analog block is asserted when this bit is set.  0 ADC hard block not in low power mode. 1 ADC hard block in low power mode.
6–5 ADIV	Clock Divide Select Selects the divide ratio used by the ADC to generate the internal clock ADCK.  00 Input clock 01 Input clock / 2 10 Input clock / 4 11 Input clock / 8
4 ADLSMP	Long Sample Time Configuration

Table continues on the next page...

## ADCx\_CFG field descriptions (continued)

Field	Description
	<p>Selects between different sample times based on the ADC_CFG[ADSTS] field. This bit adjusts the sample period to allow higher impedance inputs to be accurately sampled or to maximize conversion speed for lower impedance inputs. If high conversion rates are not required, longer sample times can also be used to lower overall power consumption when continuous conversions are enabled. When ADLSMP=1, the Long Sample Time mode is selected and the time is defined by ADSTS[1:0] of the ADC_CFG register.</p> <p>0 Short sample mode. 1 Long sample mode.</p>
3–2 MODE	<p>Conversion Mode Selection</p> <p>Used to set the ADC resolution mode.</p> <p>00 8-bit conversion 01 10-bit conversion 10 12-bit conversion 11 Reserved</p>
ADICK	<p>Input Clock Select</p> <p>Selects the input clock source to generate the internal clock ADCK.</p> <p>00 IPG clock 01 IPG clock divided by 2 10 Reserved 11 Asynchronous clock (ADACK)</p>

## 14.6.7 General control register (ADCx\_GC)

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 48h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## ADCx\_GC field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
7 CAL	<p>Calibration</p> <p>CAL begins the calibration sequence when set. This bit stays set while the calibration is in progress and is cleared when the calibration sequence is complete. The ADC_GS[CALF] bit must be checked to determine the result of the calibration sequence. Once started, the calibration routine cannot be interrupted by writes to the ADC registers or the results will be invalid and the ADC_GS[CALF] bit will set. Setting the CAL bit will abort any current conversion.</p>
6 ADCO	<p>Continuous Conversion Enable</p> <p>Enables continuous conversions.</p> <p>0 One conversion or one set of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion. 1 Continuous conversions or sets of conversions if the hardware average function is enabled (AVGE=1) after initiating a conversion.</p>
5 AVGE	<p>Hardware average enable</p> <p>Enables the hardware average function of the ADC.</p> <p>0 Hardware average function disabled 1 Hardware average function enabled</p>
4 ACFE	<p>Compare Function Enable</p> <p>Enables the compare function.</p> <p>0 Compare function disabled 1 Compare function enabled</p>
3 ACFGT	<p>Compare Function Greater Than Enable</p> <p>Configures the compare function to check the conversion result relative to the compare value register (ADC_CV) based upon the value of ACREN (bit 2 in ADC_GC register). The ACFE bit must be set for ACFGT to have any effect.</p> <p>0 Configures "Less Than Threshold, Outside Range Not Inclusive and Inside Range Not Inclusive" functionality based on the values placed in the ADC_CV register. 1 Configures "Greater Than Or Equal To Threshold, Outside Range Inclusive and Inside Range Inclusive" functionality based on the values placed in the ADC_CV registers.</p>
2 ACREN	<p>Compare Function Range Enable</p> <p>Configures the compare function to check the conversion result of the input being monitored is either between or outside the range formed by the compare values in register (ADC_CV) determined by the value of ACFGT. The ACFE bit must be set for ACFGT to have any effect.</p> <p>0 Range function disabled. Only the compare value 1 of ADC_CV register (CV1) is compared. 1 Range function enabled. Both compare values of ADC_CV registers (CV1 and CV2) are compared.</p>
1 DMAEN	<p>DMA Enable</p> <p>Enables the DMA logic.</p>

*Table continues on the next page...*

## ADCx\_GC field descriptions (continued)

Field	Description
	0 DMA disabled (default) 1 DMA enabled
0 ADACKEN	Asynchronous clock output enable  Enables the ADC's asynchronous clock source and the clock source output regardless of the conversion and input clock select (ADC_CFG[ADICLK]) settings of the ADC. Based on MCU configuration, the asynchronous clock may be used by other modules (see module introduction section). Setting this bit allows the clock to be used even while the ADC is idle or operating from a different clock source. Also, latency of initiating a single or first-continuous conversion with the asynchronous clock selected is reduced since the ADACK clock is already operational.  0 Asynchronous clock output disabled; Asynchronous clock only enabled if selected by ADICLK and a conversion is active. 1 Asynchronous clock and clock output enabled regardless of the state of the ADC

## 14.6.8 General status register (ADCx\_GS)

Controls the calibration, continuous convert, hardware averaging functions, conversion active, hardware/software trigger select, compare function and voltage reference select of the ADC module.

Address: Base address + 4Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0													AWKST	CALF	ADACT
W	[Shaded]													w1c	w1c	[Shaded]
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ADCx\_GS field descriptions**

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
2 AWKST	Asynchronous wakeup interrupt status  Holds the status of asynchronous interrupt status that occurred during stop mode. This bit is set when ipg_stop is deasserted and ipg_clk has started. It is cleared by writing '1' to it. Clearing this bit also deasserts the Asynchronous interrupt to CPU.  1 Asynchronous wake up interrupt occurred in stop mode. 0 No asynchronous interrupt.
1 CALF	Calibration Failed Flag  Displays the result of the calibration sequence. The calibration sequence will fail if Hardware Trigger is selected (i.e. ADC_CFG[ADTRG] = 1), or any ADC register is written, or any stop mode is entered before the calibration sequence completes. The CALF bit is cleared by writing a 1 to it.  0 Calibration completed normally. 1 Calibration failed. ADC accuracy specifications are not guaranteed.
0 ADACT	Conversion Active  Indicates that a conversion or hardware averaging is in progress. ADACT is set when a conversion is initiated and cleared when a conversion is completed or aborted.  0 Conversion not in progress. 1 Conversion in progress.

**14.6.9 Compare value register (ADCx\_CV)**

Contains compare values used to compare with the conversion result when the compare function is enabled (ADC\_GC[ACFE]=1). The compare values are right justified. Therefore, the compare function only uses the compare value register bits that are related to the ADC mode of operation. (e.g. in 8 bit mode, CV1 = ADC\_CV[7:0] and CV2 = ADC\_CV[23:16], similarly in 10 bit mode, CV1 = ADC\_CV[9:0] and CV2 = ADC\_CV[25:16] etc.) The compare value 2 in this register is utilized only when the compare range function is enabled (ADC\_GC[ACREN]=1).

Address: Base address + 50h offset

**ADCx\_CV field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27–16 CV2	Compare Value 2  Contains a compare value used to compare with the conversion result when the compare function and compare range function are enabled (ADC_GC[ACFE]=1, ADC_GC[ACREN]=1).
15–12 Reserved	This read-only field is reserved and always has the value 0.
CV1	Compare Value 1  Contains a compare value used to compare with the conversion result when the compare function is enabled (ADC_GC[ACFE]=1).

**14.6.10 Offset correction value register (ADCx\_OFS)**

Contains the user-defined offset error correction value. This register is 13 bits wide. The value in the most significant bit (13th bit) is the operation bit. If this bit is ‘0’ then the value in the other 12 bits is added with the converted result value to generate final result to be loaded into ADC\_Rn; if this bit is ‘1’ then this field is subtracted from converted value to generate final result (ADC\_Rn).

Address: Base address + 54h offset

Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

**ADCx\_OFS field descriptions**

Field	Description
31–13 Reserved	This read-only field is reserved and always has the value 0.
12 SIGN	Sign bit  0 The offset value is added with the raw result 1 The offset value is subtracted from the raw converted value
OFS	Offset value  User configurable offset value.

### 14.6.11 Calibration value register (ADCx\_CAL)

Contains calibration information that is generated by the calibration function. This register contains a calibration value of four bits(CAL[3:0]); this is automatically set once the self calibration sequence is done (ADC\_SC[CAL] bit is cleared). If this register is written to by the user after calibration, the linearity error specifications may not be met.

Address: Base address + 58h offset

#### ADCx\_CAL field descriptions

Field	Description
31–4 Reserved	This read-only field is reserved and always has the value 0.
CAL_CODE	Calibration Result Value  This value is automatically loaded and updated at the end of calibration.

# Chapter 15

## ADC External Trigger Control (ADC\_ETC)

### 15.1 About this module

#### 15.1.1 Introduction

The ADC\_ETC module enables multiple users share the ADC modules in a TIME-Division-Multiplexing (TDM) way. The external triggers can be from Cross BAR(XBAR) and TSC in SOC. The ADC\_ETC has two channels, each channel can support one TSC and four external triggers from XBAR to one ADC module. The ADC\_ETC can support interrupt mode and DMA mode.

#### 15.1.2 Features

The ADC\_ETC includes the following features:

- External trigger interface with dual ADCs, support up to 8 Hardware External Trigger (HWT) control for each ADC
- Capable of triggering dual ADC in SyncMode or AsyncMode:
  - In SyncMode ADC1 and ADC2 are controlled by the same trigger source.
  - In AsyncMode ADC1 and ADC2 are controlled by separate trigger source.
- Support up to four external trigger inputs for each ADC:
  - Four single to multiple (up to 8) trigger sources. One external trigger results in multiple sequential triggers to ADC.
  - Flexible ADC trigger interval and initial delay control.
  - Each trigger sources can be configured as HW or SW trigger mode.
- ADC result holding and status reporting
- External trigger auto hold and arbitration

## Block diagram

- Each external trigger can be configured with a fixed priority. External trigger with the highest priority is served first.
- Hold one trigger event upon arbitration lose or ADC busy.
- Support ADC trigger interface cascading
- Support interrupt mode and DMA mode

## 15.2 Block diagram

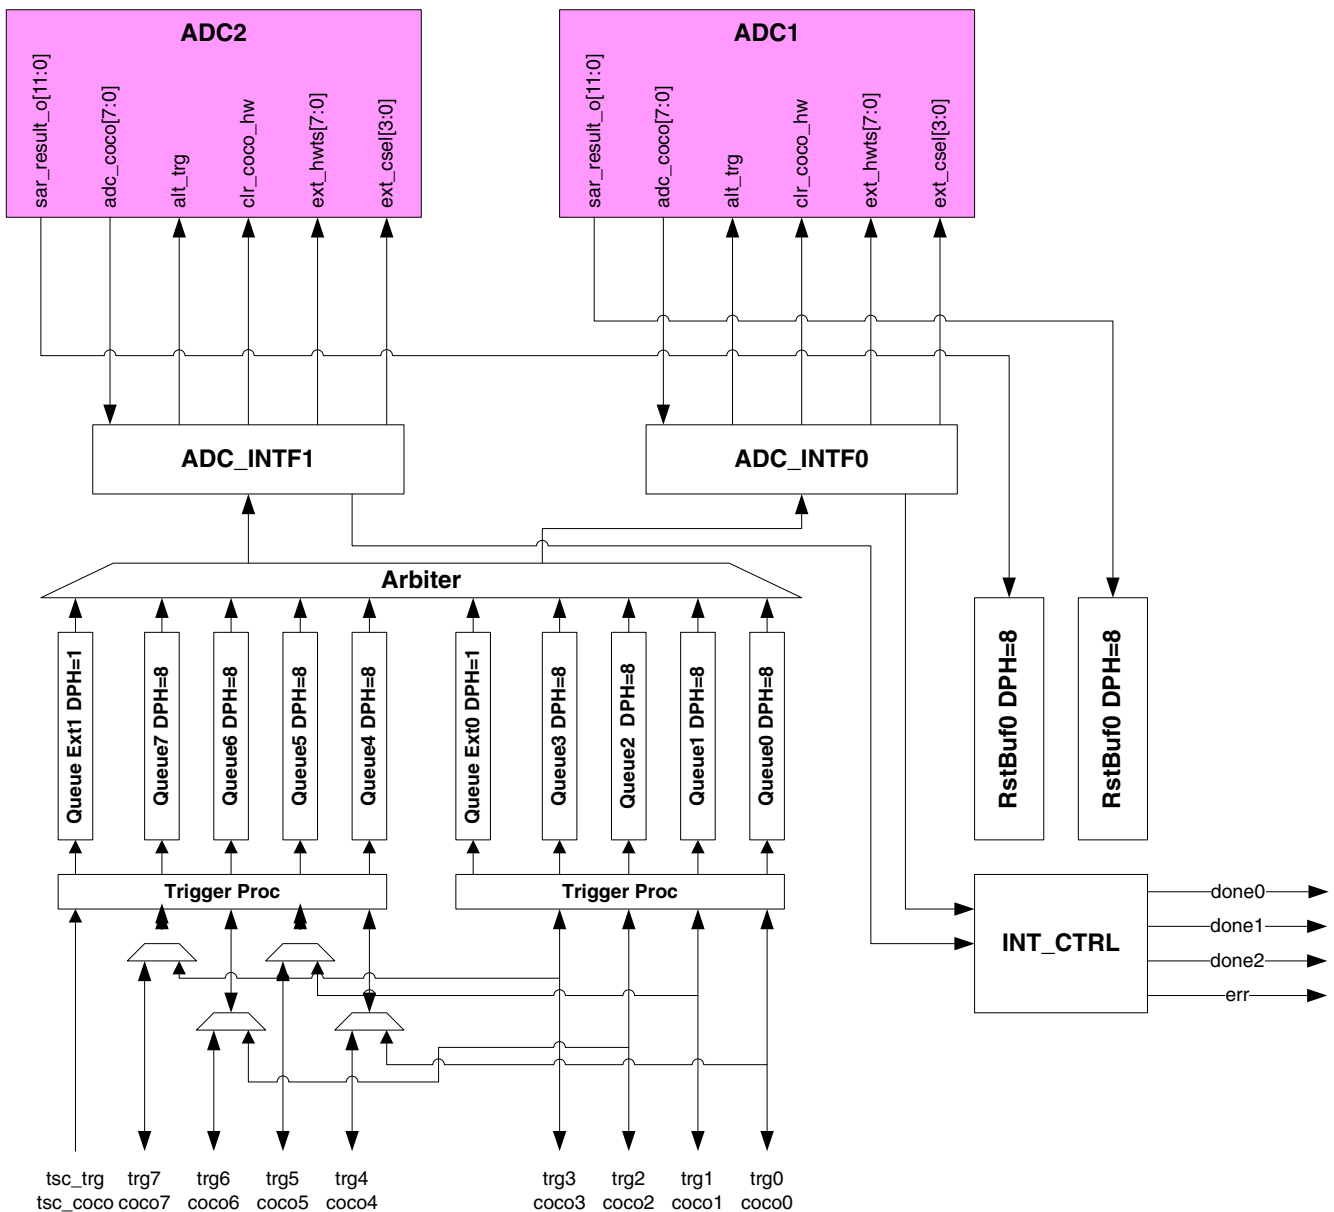

Figure 15-1. ADC\_ETC block diagram

## 15.3 Functional description

The ADC\_ETC block works with XBAR and TSC blocks to share with the ADC modules. The following sections describe functional details of the ADC\_ETC module.

### 15.3.1 Clocks

The ADC\_ETC module has one global functional clock: ipg\_clk. The ipg\_clk is used for register read/write operations, also all the functionality inside the ADC\_ETC module are synchronized to this clock.

As XBAR and TSC input can be SYNC or ASYNC with the ADC\_ETC clock, the ipg\_clk need to be set that can capture the trigger input edge after the double synchronous circuit.

### 15.3.2 Reset

The ADC\_ETC has two resets: ipg\_hard\_async\_reset\_b and sw\_reset\_n. The ipg\_hard\_async\_reset\_b is a hardware reset, which resets all registers in ADC\_ETC block. While the sw\_reset\_n is a software reset, which can reset all configuration registers by software.

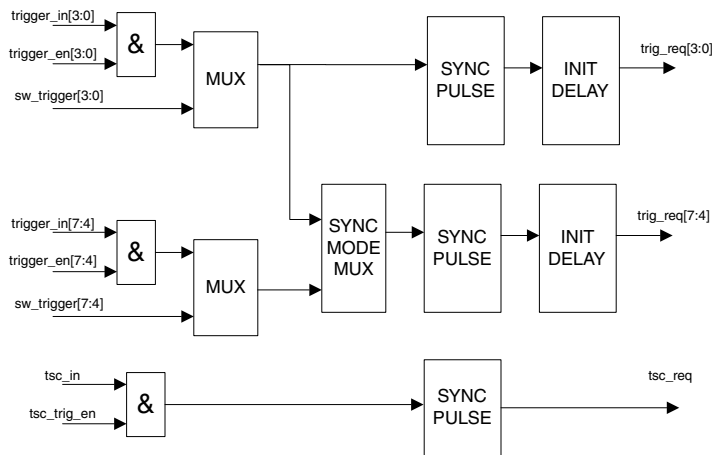

### 15.3.3 Operations

This section describes the ADC\_ETC module's operations.

The trigger process is used to process the multiple input source, trigger\_enable can be used to mask the hardware trigger source. Software can select the hardware trigger or software trigger by configuration, and the selected source will be double synchronized and detected the posedge pulse before request to the arbiter. SYNC\_MODE process only apply to the second ADC module inputs.

The trigger process diagram is indicated as below:

## Functional description

**Figure 15-2. Trigger process diagram**

The trigger requests from XBAR and TSC have fixed priority setting before go to the arbiter. There are total eight priority levels available for each trigger request, 7 is the highest priority level while 0 is the lowest priority level. If multiple trigger requests have the same priority level, then the round-robin scheme will be applied for the requests to the ADC trigger source. The trigger request will be granted only when previous trigger had finished and the ADC module is IDLE. When in SYNC mode, the trigger request will be granted only when both ADC modules are IDLE state.

When there is trigger request that is granted, the ETC sends these signals to ADC according to corresponding configurations: Multiple ADC triggers, HWTS[7:0] as corresponding hardware trigger select signal, and with CSEL[3:0]. When ADC finished conversion, the ADC would send back a complete signal `adc_coco` to ETC, then ETC will store correct ADC converted results into the internal registers, and clear the ADC COCO signals at correct order. All parts of this steps are automatically done by hardware. DMA request or interrupts will assert according to the software configurations.

Each ADC trigger of the eight external trigger sources has separate configurations by software, including Interrupt Enable (IE), Back to Back ADC trigger (B2B), HWTS and CSEL to ADC. The ADC\_ETC have four interrupts output of Done0, Done1, Done2 and Error Interrupt. The Done0/1/2 interrupts are controlled by software for each ADC trigger (i.e. 2'b00: No interrupt when finished; 2'b01: Finished interrupt on Done0; 2'b10: Finished interrupt on Done1; 2'b11: Finished interrupt on Done2). Error interrupt occurs when there is an external trigger ignored by ADC\_ETC due to the previous trigger not finished yet.

The ETC ADC interface timing is indicated in below diagrams:

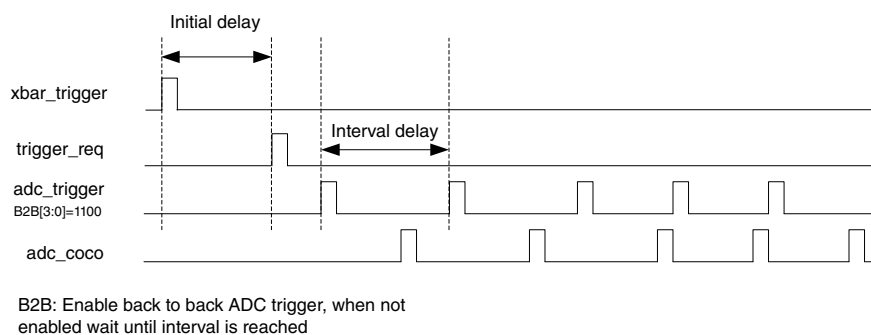

Figure 15-3. ETC ADC interface timing

## 15.4 Memory Map and register definition

This section includes the ADC\_ETC module memory map and detailed descriptions of all registers.

### 15.4.1 ADC\_ETC register descriptions

ADC\_ETC memory map

#### 15.4.1.1 ADC\_ETC Memory map

ADC\_ETC base address: 403B\_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	ADC_ETC Global Control Register (CTRL)	32	RW	C000_0000h
4h	ETC DONE0 and DONE1 IRQ State Register (DONE0_1_IRQ)	32	RW	0000_0000h
8h	ETC DONE_2 and DONE_ERR IRQ State Register (DONE2_ERR_IRQ)	32	RW	0000_0000h
Ch	ETC DMA control Register (DMA_CTRL)	32	RW	0000_0000h

### 15.4.1.2 ADC\_ETC Global Control Register (CTRL)

### 15.4.1.2.1 Offset

Register	Offset
CTRL	0h

### 15.4.1.2.2 Function

ADC\_ETC global control register

This register controls various high-level functions of the ADC\_ETC

### 15.4.1.2.3 Diagram

### 15.4.1.2.4 Fields

Field	Function
31 SOFTRST	Software reset, high active. When write 1 ,all logical will be reset.
30 TSC_BYPASS	1'b1: TSC is bypassed to ADC2. 1'b0: TSC not bypassed. <b>NOTE:</b> To use ADC2, this bit should be cleared.
29	1'b0: Trig DMA_REQ with latched signal, REQ will be cleared when ACK and source request cleared.

Table continues on the next page...

Field	Function
DMA_MODE_SEL	1'b1: Trig DMA_REQ with pulsed signal, REQ will be cleared by ACK only.
28-24 —	Reserved.
23-16 PRE_DIVIDER	Pre-divider for trig delay and interval .
15-13 EXT1_TRIG_PRIORITY	External TSC1 trigger priority, 7 is Highest, 0 is lowest .
12 EXT1_TRIG_ENABLE	TSC1 TRIG enable register. 1'b1: enable external TSC1 trigger. 1'b0: disable external TSC1 trigger.
11-9 EXT0_TRIG_PRIORITY	External TSC0 trigger priority, 7 is Highest, 0 is lowest .
8 EXT0_TRIG_ENABLE	TSC0 TRIG enable register. 1'b1: enable external TSC0 trigger. 1'b0: disable external TSC0 trigger.
7-0 TRIG_ENABLE	TRIG enable register. 1'b1: enable correspond external XBAR trigger [7 ... 0] . 1'b0: disable correspond external XBAR trigger [7 ... 0] .

### 15.4.1.3 ETC DONE0 and DONE1 IRQ State Register (DONE0\_1\_IRQ)

#### 15.4.1.3.1 Offset

Register	Offset
DONE0_1_IRQ	4h

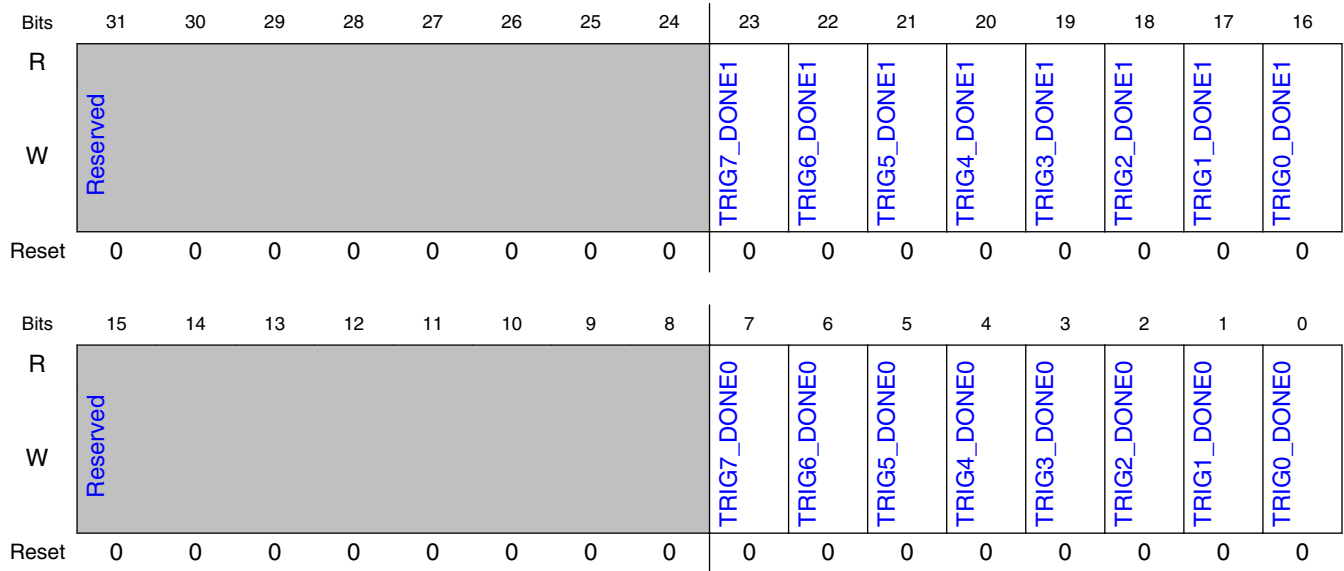

#### 15.4.1.3.2 Function

This register has the state for ETC DONE0 and DONE1 interrupts

#### NOTE

The IRQs are cleared by writing a logic 1 to the bits.

### 15.4.1.3.3 Diagram

### 15.4.1.3.4 Fields

Field	Function
31-24 —	Reserved.
23 TRIG7_DONE1	TRIG7 done1 interrupt detection
22 TRIG6_DONE1	TRIG6 done1 interrupt detection
21 TRIG5_DONE1	TRIG5 done1 interrupt detection
20 TRIG4_DONE1	TRIG4 done1 interrupt detection
19 TRIG3_DONE1	TRIG3 done1 interrupt detection
18 TRIG2_DONE1	TRIG2 done1 interrupt detection
17 TRIG1_DONE1	TRIG1 done1 interrupt detection
16 TRIG0_DONE1	TRIG0 done1 interrupt detection
15-8 —	Reserved.

Table continues on the next page...

Field	Function
7 TRIG7_DONE0	TRIG7 done0 interrupt detection
6 TRIG6_DONE0	TRIG6 done0 interrupt detection
5 TRIG5_DONE0	TRIG5 done0 interrupt detection
4 TRIG4_DONE0	TRIG4 done0 interrupt detection
3 TRIG3_DONE0	TRIG3 done0 interrupt detection
2 TRIG2_DONE0	TRIG2 done0 interrupt detection
1 TRIG1_DONE0	TRIG1 done0 interrupt detection
0 TRIG0_DONE0	TRIG0 done0 interrupt detection

#### 15.4.1.4 ETC DONE\_2 and DONE\_ERR IRQ State Register (DONE2\_ERR\_IRQ)

##### 15.4.1.4.1 Offset

Register	Offset
DONE2_ERR_IRQ	8h

##### 15.4.1.4.2 Function

This register has the state for ETC DONE2 and DONE\_ERR interrupts

#### NOTE

The IRQs are cleared by writing a logic 1 to the bits.

### 15.4.1.15 ETC\_TRIG Result Data 7/6 Register (TRIG0\_RESULT\_7\_6)

#### 15.4.1.15.1 Offset

Register	Offset
TRIG0_RESULT_7_6	34h

#### 15.4.1.15.2 Function

This register contains the result data of ETC\_TRIG 7/6

#### 15.4.1.15.3 Diagram

### 15.4.1.15.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA7	Result DATA7
15-12 —	Reserved.
11-0 DATA6	Result DATA6

### 15.4.1.16 ETC\_TRIG1 Control Register (TRIG1\_CTRL)

#### 15.4.1.16.1 Offset

Register	Offset
TRIG1_CTRL	38h

#### 15.4.1.16.2 Function

ETC\_TRIG1 control register

This register controls various functions of the ETC\_TRIG1

### 15.4.1.16.3 Diagram

### 15.4.1.16.4 Fields

Field	Function
31-17 —	Reserved.
16 SYNC_MODE	TRIG mode control . 1'b0: Disable sync mode; 1'b1: Enable sync mode
15 —	Reserved.
14-12 TRIG_PRIORITY	External trigger priority, 7 is highest, 0 is lowest .
11 —	Reserved.
10-8 TRIG_CHAIN	TRIG chain length to the ADC. 0: Trig length is 1; ... 7: Trig length is 8;
7-5 —	Reserved.
4 TRIG_MODE	TRIG mode register. 1'b0: hardware trigger. 1'b1: software trigger.
3-1 —	Reserved.
0 SW_TRIG	Software write 1 as the TRIGGER. This register is self-clearing.

### 15.4.1.17 ETC\_TRIG1 Counter Register (TRIG1\_COUNTER)

#### 15.4.1.17.1 Offset

Register	Offset
TRIG1_COUNTER	3Ch

#### 15.4.1.17.2 Function

This register controls ETC\_TRIG1 counter

#### 15.4.1.17.3 Diagram

#### 15.4.1.17.4 Fields

Field	Function
31-16 SAMPLE_INTERVAL	TRIGGER sampling interval counter
15-0 INIT_DELAY	TRIGGER initial delay counter

### 15.4.1.18 ETC\_TRIG Chain 0/1 Register (TRIG1\_CHAIN\_1\_0)

### 15.4.1.18.1 Offset

Register	Offset
TRIG1_CHAIN_1_0	40h

### 15.4.1.18.2 Function

This register controls ETC\_TRIG Chain 0/1 configuration

### 15.4.1.18.3 Diagram

### 15.4.1.18.4 Fields

Field	Function

### 15.4.1.26 ETC\_TRIG2 Control Register (TRIG2\_CTRL)

#### 15.4.1.26.1 Offset

Register	Offset
TRIG2_CTRL	60h

#### 15.4.1.26.2 Function

ETC\_TRIG2 control register

This register controls various functions of the ETC\_TRIG2

### 15.4.1.26.3 Diagram

### 15.4.1.26.4 Fields

Field	Function
31-17 —	Reserved.
16 SYNC_MODE	TRIG mode control . 1'b0: Disable sync mode; 1'b1: Enable sync mode
15 —	Reserved.
14-12 TRIG_PRIORITY	External trigger priority, 7 is highest, 0 is lowest .
11 —	Reserved.
10-8 TRIG_CHAIN	TRIG chain length to the ADC. 0: Trig length is 1; ... 7: Trig length is 8;
7-5 —	Reserved.
4 TRIG_MODE	TRIG mode register. 1'b0: hardware trigger. 1'b1: software trigger.
3-1 —	Reserved.
0 SW_TRIG	Software write 1 as the TRIGGER. This register is self-clearing.

### 15.4.1.27 ETC\_TRIG2 Counter Register (TRIG2\_COUNTER)

#### 15.4.1.27.1 Offset

Register	Offset
TRIG2_COUNTER	64h

#### 15.4.1.27.2 Function

This register controls ETC\_TRIG2 counter

#### 15.4.1.27.3 Diagram

#### 15.4.1.27.4 Fields

Field	Function
31-16 SAMPLE_INTERVAL	TRIGGER sampling interval counter
15-0 INIT_DELAY	TRIGGER initial delay counter

### 15.4.1.28 ETC\_TRIG Chain 0/1 Register (TRIG2\_CHAIN\_1\_0)

### 15.4.1.28.1 Offset

Register	Offset
TRIG2_CHAIN_1_0	68h

### 15.4.1.28.2 Function

This register controls ETC\_TRIG Chain 0/1 configuration

### 15.4.1.42.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA1	Result DATA1
15-12 —	Reserved.
11-0 DATA0	Result DATA0

### 15.4.1.43 ETC\_TRIG Result Data 3/2 Register (TRIG3\_RESULT\_3\_2)

#### 15.4.1.43.1 Offset

Register	Offset
TRIG3_RESULT_3_2	A4h

#### 15.4.1.43.2 Function

This register contains the result data of ETC\_TRIG 3/2

#### 15.4.1.43.3 Diagram

### 15.4.1.43.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA3	Result DATA3
15-12 —	Reserved.
11-0 DATA2	Result DATA2

### 15.4.1.44 ETC\_TRIG Result Data 5/4 Register (TRIG3\_RESULT\_5\_4)

#### 15.4.1.44.1 Offset

Register	Offset
TRIG3_RESULT_5_4	A8h

#### 15.4.1.44.2 Function

This register contains the result data of ETC\_TRIG 5/4

#### 15.4.1.44.3 Diagram

### 15.4.1.44.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA5	Result DATA5
15-12 —	Reserved.
11-0 DATA4	Result DATA4

### 15.4.1.45 ETC\_TRIG Result Data 7/6 Register (TRIG3\_RESULT\_7\_6)

#### 15.4.1.45.1 Offset

Register	Offset
TRIG3_RESULT_7_6	ACh

#### 15.4.1.45.2 Function

This register contains the result data of ETC\_TRIG 7/6

#### 15.4.1.45.3 Diagram

### 15.4.1.45.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA7	Result DATA7
15-12 —	Reserved.
11-0 DATA6	Result DATA6

### 15.4.1.46 ETC\_TRIG4 Control Register (TRIG4\_CTRL)

#### 15.4.1.46.1 Offset

Register	Offset
TRIG4_CTRL	B0h

#### 15.4.1.46.2 Function

ETC\_TRIG4 control register

This register controls various functions of the ETC\_TRIG4

### 15.4.1.46.3 Diagram

### 15.4.1.46.4 Fields

Field	Function
31-17 —	Reserved.
16 SYNC_MODE	TRIG mode control . 1'b0: Disable sync mode; 1'b1: Enable sync mode
15 —	Reserved.
14-12 TRIG_PRIORITY	External trigger priority, 7 is highest, 0 is lowest .
11 —	Reserved.
10-8 TRIG_CHAIN	TRIG chain length to the ADC. 0: Trig length is 1; ... 7: Trig length is 8;
7-5 —	Reserved.
4 TRIG_MODE	TRIG mode register. 1'b0: hardware trigger. 1'b1: software trigger.
3-1 —	Reserved.
0 SW_TRIG	Software write 1 as the TRIGGER. This register is self-clearing.

### 15.4.1.47 ETC\_TRIG4 Counter Register (TRIG4\_COUNTER)

#### 15.4.1.47.1 Offset

Register	Offset
TRIG4_COUNTER	B4h

#### 15.4.1.47.2 Function

This register controls ETC\_TRIG4 counter

#### 15.4.1.47.3 Diagram

#### 15.4.1.47.4 Fields

Field	Function
31-16 SAMPLE_INTERVAL	TRIGGER sampling interval counter
15-0 INIT_DELAY	TRIGGER initial delay counter

### 15.4.1.48 ETC\_TRIG Chain 0/1 Register (TRIG4\_CHAIN\_1\_0)

### 15.4.1.48.1 Offset

Register	Offset
TRIG4_CHAIN_1_0	B8h

### 15.4.1.48.2 Function

This register controls ETC\_TRIG Chain 0/1 configuration

### 15.4.1.48.3 Diagram

### 15.4.1.48.4 Fields

Field	Function
31 —	Reserved.
30-29 IE1	CHAIN1 IE <ul style="list-style-type: none"> <li>• 2'b00: No interrupt when finished</li> <li>• 2'b01: Finished Interrupt on Done0</li> <li>• 2'b10: Finished Interrupt on Done1</li> <li>• 2'b11: Finished Interrupt on Done2</li> </ul>
28 B2B1	CHAIN1 B2B <ul style="list-style-type: none"> <li>• 1'b0: Disable B2B, wait until interval is reached</li> <li>• 1'b1: Enable B2B, back to back ADC trigger</li> </ul>
27-20 HWTS1	CHAIN1 HWTS ADC hardware trigger selection
19-16 CSEL1	CHAIN1 CSEL ADC channel selection
15	Reserved.

Table continues on the next page...

Field	Function
—	
14-13 IE0	CHAIN0 IE <ul style="list-style-type: none"> <li>• 2'b00: No interrupt when finished</li> <li>• 2'b01: Finished Interrupt on Done0</li> <li>• 2'b10: Finished Interrupt on Done1</li> <li>• 2'b11: Finished Interrupt on Done2</li> </ul>
12 B2B0	CHAIN0 B2B <ul style="list-style-type: none"> <li>• 1'b0: Disable B2B, wait until interval is reached</li> <li>• 1'b1: Enable B2B, back to back ADC trigger</li> </ul>
11-4 HWTS0	CHAIN0 HWTS ADC hardware trigger selection
3-0 CSEL0	CHAIN0 CSEL ADC channel selection

### 15.4.1.49 ETC\_TRIG Chain 2/3 Register (TRIG4\_CHAIN\_3\_2)

#### 15.4.1.49.1 Offset

Register	Offset
TRIG4_CHAIN_3_2	BCh

#### 15.4.1.49.2 Function

This register controls ETC\_TRIG Chain 2/3 configuration

#### 15.4.1.49.3 Diagram

### 15.4.1.49.4 Fields

Field	Function
31 —	Reserved.
30-29 IE3	CHAIN3 IE
28 B2B3	CHAIN3 B2B
27-20 HWTS3	CHAIN3 HWTS
19-16 CSEL3	CHAIN3 CSEL
15 —	Reserved.
14-13 IE2	CHAIN2 IE
12 B2B2	CHAIN2 B2B
11-4 HWTS2	CHAIN2 HWTS
3-0 CSEL2	CHAIN2 CSEL

### 15.4.1.50 ETC\_TRIG Chain 4/5 Register (TRIG4\_CHAIN\_5\_4)

#### 15.4.1.50.1 Offset

Register	Offset
TRIG4_CHAIN_5_4	C0h

#### 15.4.1.50.2 Function

This register controls ETC\_TRIG Chain 4/5 configuration

### 15.4.1.50.3 Diagram

### 15.4.1.50.4 Fields

Field	Function
31 —	Reserved.
30-29 IE5	CHAIN5 IE
28 B2B5	CHAIN5 B2B
27-20 HWTS5	CHAIN5 HWTS
19-16 CSEL5	CHAIN5 CSEL
15 —	Reserved.
14-13 IE4	CHAIN4 IE
12 B2B4	CHAIN4 B2B
11-4 HWTS4	CHAIN4 HWTS
3-0 CSEL4	CHAIN4 CSEL

### 15.4.1.51 ETC\_TRIG Chain 6/7 Register (TRIG4\_CHAIN\_7\_6)

#### 15.4.1.51.1 Offset

Register	Offset
TRIG4_CHAIN_7_6	C4h

#### 15.4.1.51.2 Function

This register controls ETC\_TRIG Chain 6/7 configuration

#### 15.4.1.51.3 Diagram

#### 15.4.1.51.4 Fields

Field	Function
31	Reserved.
—	
30-29 IE7	CHAIN7 IE
28 B2B7	CHAIN7 B2B
27-20 HWTS7	CHAIN7 HWTS
19-16 CSEL7	CHAIN7 CSEL

Table continues on the next page...

Field	Function
15 —	Reserved.
14-13 IE6	CHAIN6 IE
12 B2B6	CHAIN6 B2B
11-4 HWTS6	CHAIN6 HWTS
3-0 CSEL6	CHAIN6 CSEL

### 15.4.1.52 ETC\_TRIG Result Data 1/0 Register (TRIG4\_RESULT\_1\_0)

#### 15.4.1.52.1 Offset

Register	Offset
TRIG4_RESULT_1_0	C8h

#### 15.4.1.52.2 Function

This register contains the result data of ETC\_TRIG 1/0

#### 15.4.1.52.3 Diagram

### 15.4.1.52.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA1	Result DATA1
15-12 —	Reserved.
11-0 DATA0	Result DATA0

### 15.4.1.53 ETC\_TRIG Result Data 3/2 Register (TRIG4\_RESULT\_3\_2)

#### 15.4.1.53.1 Offset

Register	Offset
TRIG4_RESULT_3_2	CCh

#### 15.4.1.53.2 Function

This register contains the result data of ETC\_TRIG 3/2

#### 15.4.1.53.3 Diagram

### 15.4.1.53.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA3	Result DATA3
15-12 —	Reserved.
11-0 DATA2	Result DATA2

### 15.4.1.54 ETC\_TRIG Result Data 5/4 Register (TRIG4\_RESULT\_5\_4)

#### 15.4.1.54.1 Offset

Register	Offset
TRIG4_RESULT_5_4	D0h

#### 15.4.1.54.2 Function

This register contains the result data of ETC\_TRIG 5/4

#### 15.4.1.54.3 Diagram

### 15.4.1.54.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA5	Result DATA5
15-12 —	Reserved.
11-0 DATA4	Result DATA4

### 15.4.1.55 ETC\_TRIG Result Data 7/6 Register (TRIG4\_RESULT\_7\_6)

#### 15.4.1.55.1 Offset

Register	Offset
TRIG4_RESULT_7_6	D4h

#### 15.4.1.55.2 Function

This register contains the result data of ETC\_TRIG 7/6

#### 15.4.1.55.3 Diagram

### 15.4.1.55.4 Fields

Field	Function
31-28 —	Reserved.
27-16 DATA7	Result DATA7
15-12 —	Reserved.
11-0 DATA6	Result DATA6

### 15.4.1.56 ETC\_TRIG5 Control Register (TRIG5\_CTRL)

#### 15.4.1.56.1 Offset

Register	Offset
TRIG5_CTRL	D8h

#### 15.4.1.56.2 Function

ETC\_TRIG5 control register

This register controls various functions of the ETC\_TRIG5

### 15.4.1.56.3 Diagram

### 15.4.1.56.4 Fields

Field	Function
31-17 —	Reserved.
16 SYNC_MODE	TRIG mode control . 1'b0: Disable sync mode; 1'b1: Enable sync mode
15 —	Reserved.
14-12 TRIG_PRIORITY	External trigger priority, 7 is highest, 0 is lowest .
11 —	Reserved.
10-8 TRIG_CHAIN	TRIG chain length to the ADC. 0: Trig length is 1; ... 7: Trig length is 8;
7-5 —	Reserved.
4 TRIG_MODE	TRIG mode register. 1'b0: hardware trigger. 1'b1: software trigger.
3-1 —	Reserved.
0 SW_TRIG	Software write 1 as the TRIGGER

### 15.4.1.57 ETC\_TRIG5 Counter Register (TRIG5\_COUNTER)

#### 15.4.1.57.1 Offset

Register	Offset
TRIG5_COUNTER	DCh

#### 15.4.1.57.2 Function

This register controls ETC\_TRIG5 counter

#### 15.4.1.57.3 Diagram

#### 15.4.1.57.4 Fields

Field	Function
31-16 SAMPLE_INTERVAL	TRIGGER sampling interval counter
15-0 INIT_DELAY	TRIGGER initial delay counter

### 15.4.1.58 ETC\_TRIG Chain 0/1 Register (TRIG5\_CHAIN\_1\_0)

### 15.4.1.58.1 Offset

Register	Offset
TRIG5_CHAIN_1_0	E0h

### 15.4.1.58.2 Function

This register controls ETC\_TRIG Chain 0/1 configuration

### 15.4.1.58.3 Diagram

### 15.4.1.58.4 Fields

Field	Function
31 —	Reserved.
30-29 IE1	CHAIN1 IE <ul style="list-style-type: none"> <li>• 2'b00: No interrupt when finished</li> <li>• 2'b01: Finished Interrupt on Done0</li> <li>• 2'b10: Finished Interrupt on Done1</li> <li>• 2'b11: Finished Interrupt on Done2</li> </ul>
28 B2B1	CHAIN1 B2B <ul style="list-style-type: none"> <li>• 1'b0: Disable B2B, wait until interval is reached</li> <li>• 1'b1: Enable B2B, back to back ADC trigger</li> </ul>
27-20 HWTS1	CHAIN1 HWTS ADC hardware trigger selection
19-16 CSEL1	CHAIN1 CSEL ADC channel selection
15	Reserved.

Table continues on the next page...

Field	Function
—	
14-13 IE0	CHAIN0 IE <ul style="list-style-type: none"> <li>• 2'b00: No interrupt when finished</li> <li>• 2'b01: Finished Interrupt on Done0</li> <li>• 2'b10: Finished Interrupt on Done1</li> <li>• 2'b11: Finished Interrupt on Done2</li> </ul>
12 B2B0	CHAIN0 B2B <ul style="list-style-type: none"> <li>• 1'b0: Disable B2B, wait until interval is reached</li> <li>• 1'b1: Enable B2B, back to back ADC trigger</li> </ul>
11-4 HWTS0	CHAIN0 HWTS ADC hardware trigger selection
3-0 CSEL0	CHAIN0 CSEL ADC channel selection

### 15.4.1.59 ETC\_TRIG Chain 2/3 Register (TRIG5\_CHAIN\_3\_2)

#### 15.4.1.59.1 Offset

Register	Offset
TRIG5_CHAIN_3_2	E4h

#### 15.4.1.59.2 Function

This register controls ETC\_TRIG Chain 2/3 configuration

#### 15.4.1.59.3 Diagram

### 15.4.1.59.4 Fields

Field	Function
31 —	Reserved.
30-29 IE3	CHAIN3 IE
28 B2B3	CHAIN3 B2B

## 15.5 Application information

This section describes applications supported by the ADC\_ETC module.

# Chapter 16

## AHB to IP Bridge (AIPSTZ)

### 16.1 Overview

This section provides an overview of the AHB to IP Bridge (AIPSTZ). This particular peripheral is designed as the bridge between AHB bus and peripherals with the lower bandwidth IP Slave (IPS) buses.

#### 16.1.1 Features

The following list summarizes the key features of the bridge:

- The bridge supports the IPS slave bus signals. This interface is only meant for slave peripherals.
- The bridge supports 8-, 16-, and 32-bit IPS peripherals. (Accesses larger than the size of a peripheral are not supported, except to 32-bit memory.)
- The bridge supports a pair of IPS accesses for 64-bit and certain misaligned AHB transfers to 32-bit memory in 64-bit platforms.
- The bridge directly supports up to 32 16-Kbyte external IPS peripherals, and 2 global external IPS peripheral spaces. The bridge occupies 1 MBytes of total address space.
- The bridge provides configurable per-block and per-master access protections. Access permissions are based on bus master (e.g. DMA or core) privilege levels and resource domain. More details on the protection features and configuration can be found in the Security Reference Manual
- Peripheral read transactions require a minimum of 2 hclk clocks, and unbuffered write transactions require a minimum of 3 hclk clocks.
- The bridge uses one single asynchronous reset and one global clock.

## 16.2 Clocks

The following table describes the clock sources for AIPSTZ. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 16-1. AIPSTZ Clocks**

Clock name	Clock Root	Description
hclk	ahb_clk_root	Module clock

## 16.3 Functional Description

The AIPS bridge serves as a protocol translator between the AHB system bus and the IP bus.

Support is provided for generating a pair of 32-bit IP bus accesses when targeted by a 64-bit system bus access, or a misaligned access which crosses a 32-bit boundary. No other bus-sizing access support is provided.

The AHB to IP bridge is the interface between the AHB and on-chip IPS peripherals, which are sub-blocks containing readable/writable control and status registers.

The AHB master reads and writes these registers through the AIPSTZ. The bridge generates block enables, the block address, transfer attributes, byte enables and write data as inputs to the IPS peripherals. The bridge captures read data from the IPS interface and drives it on the AHB.

Each bridge that connects to the IPS (or peripherals) are referred as AIPS. The chip has three separate AIPS modules, and peripherals are grouped and assigned under each AIPS block. The list of peripherals are indicated as n-1, n-2, and n-3 for AIPS-1, AIPS-2, and AIPS-3 respectively.

AIPS occupies a 1-Mbyte portion of the address space. The register maps of the IPS peripherals are located on 16-Kbyte boundaries. Each IPS peripheral is allocated one 16-Kbyte block of the memory map, and is activated by one of the block enables from the bridge. Up to thirty-two 16-Kbyte external IPS peripherals may be implemented, occupying contiguous blocks of 16-Kbytes. Two global external IPS block enables are available for the remaining address space to allow for customization and expansion of addressed peripheral devices. In addition, a single "non-global" block enable is also asserted whenever any of the thirty-two non-global block enables is asserted.

The bridge is responsible for indicating to IPS peripherals if an access is in supervisor or user mode. It may block user mode accesses to certain IPS peripherals or it may allow the individual IPS peripherals to determine if user mode accesses are allowed. In addition, peripherals may be designated as write-protected.

The bridge supports the notion of "trusted" masters for security purposes. Masters may be individually designated as trusted for reads, trusted for writes, or trusted for both reads and writes, as well as being forced to look as though all accesses from a master are in user-mode privilege level. Refer to [AIPSTZ Memory Map/Register Definition](#) for more information.

The AIPSTZ prevents access to a peripheral if the transaction originated from a source from a resource domain that has been explicitly omitted. Resource domains are assigned in the RDC submodule. Please refer to the RDC chapter for programming details.

All peripheral devices are expected to only require aligned accesses equal to or smaller in size than the peripheral size. An exception to this rule is supported for 32-bit peripherals to allow memory to be placed on the IPS.

## 16.4 Access Protections

The AIPSTZ bridge provides programmable access protections for both masters and peripherals. It allows the privilege level of a master to be overridden, forcing it to user-mode privilege, and allows masters to be designated as trusted or untrusted.

Peripherals may require supervisor privilege level for access, may restrict access to a trusted master only, and may be write-protected. IP bus peripherals are subject to access control policies set in both CSU registers and AIPSTZ registers. An access is blocked if it is denied by either policy.

Masters and peripherals are assigned to one or more resource domains in the RDC submodule (see the RDC chapter for details). Depending on RDC programming, masters transactions through the AIPSTZ may or may not be allowed access to peripherals in different resource domains.

## 16.5 Access Support

Aligned 64-bit accesses, aligned and misaligned word and half word accesses, as well as byte accesses are supported for 32-bit peripherals. Misaligned accesses are supported to allow memory to be placed on the IPS.

Peripheral registers must not be misaligned, although no explicit checking is performed by the AIPS bridge. The bridge will perform two IPS transfers for 64-bit accesses, word accesses with byte offsets of 1, 2, or 3, and for half word accesses with a byte offset of 3. All other accesses will be performed with a single IPS transfer.

Only aligned half word and byte accesses are supported for 16-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

Only byte accesses are supported for 8-bit peripherals. All other accesses types are unsupported, and results of such accesses are undefined. They are not terminated with an error response.

## 16.6 Initialization Information

The AIPS bridge should be programmed before use.

The following registers should be initialized: The Master Privilege Registers (AIPSTZ\_MPRs), the Peripheral Access Control registers (AIPSTZ\_PACRs), and the Off-platform Peripheral Access Control registers (AIPSTZ\_OPACRs) described in [AIPSTZ Memory Map/Register Definition](#).

### 16.6.1 Security Block

The AIPSTZ contains a security block that is connected to each off-platform peripheral. This block filters accesses based on write/read, non-secure, and supervisor signals.

Each peripheral can be individually configured to allow or deny each of the following transactions as described in the table below:

**Table 16-2. Peripheral Access Configuration options**

Config Bit	Write	Non-Secure	Supervisor	Meaning
0	0	0	0	Secure User Read
1	0	0	1	Secure Supervisor Read
2	0	1	0	Non-Secure User Read
3	0	1	1	Non-Secure Supervisor Read
4	1	0	0	Secure User Write
5	1	0	1	Secure Supervisor Write
6	1	1	0	Non-Secure User Write
7	1	1	1	Non-Secure Supervisor Write

Each peripheral has a security configuration (`sec_config_X`) input for determining whether to allow or deny a given access type. These are 8-bit vectors, with each bit corresponding to one of the transactions above as listed in the Config Bit column of [Table 16-2](#). If the bit is asserted (1'b1), the transaction is allowed. If the bit is negated (1'b0), the transaction is not allowed.

For example, if peripheral 0 is configured as follows:

```
sec_config_0 [7:0] = 8'b0011_0011
```

This peripheral can only be accessed by secure transactions. Bits 0, 1, 4, and 5 are asserted and these bits refer to the four types of secure transactions. If an insecure transaction is attempted to this peripheral, it will result in an error.

Eight bits per peripheral across an entire system can result in a large number of configuration bits that must be assigned and controlled, most likely in a series of registers in another block. To reduce the number of register bits required predefined sets of security profiles can be defined and encapsulated in an external security translation block. The table below describes one set of security profiles that has been proposed for use with the AIPSTZ.

**Table 16-3. Security Levels**

CSU_SEC_LEVEL	Non-Secure User	Non-Secure Supervisor	Secure User	Secure Supervisor
0	RD+WR	RD+WR	RD+WR	RD+WR
1	NOT ALLOWED	RD+WR	RD+WR	RD+WR
2	Read Only	Read Only	RD+WR	RD+WR
3	NOT ALLOWED	Read Only	RD+WR	RD+WR
4	NOT ALLOWED	NOT ALLOWED	RD+WR	RD+WR
5	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	RD+WR
6	NOT ALLOWED	NOT ALLOWED	Read Only	Read Only
7	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED	NOT ALLOWED

Information regarding CSU is provided in the Security Reference Manual. Contact your NXP representative for information about obtaining this document.

A 3-bit input, 8-bit output translation block can be used such that only three register bits are required to set the security profile and the translation block will drive the correct 8-bit configuration vector. Each peripheral connected to the AIPSTZ would require this translation block. The top level AIPSTZ has this three bit input line ``csu_sec_level[2:0]'` corresponding to each peripheral X.

## 16.7 AIPSTZ Memory Map/Register Definition

The memory map for the AIPS SW-visible registers is shown in the table below.

The MPROT and OPACR fields are 4 bits in width. Some bits may be reserved depending on device.

**AIPSTZ memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page

### 16.7.1 Master Privilege Registers (AIPSTZx\_MPR)

Each AIPSTZ\_MPR specifies 16 4-bit fields defining the access privilege level associated with a bus master in the platform, as well as specifying whether write accesses from this master are bufferable shown in [Table 16-4](#)

The registers provide one field per bus master, where field 15 corresponds to master 15, field 14 to master 14,... field 0 to master 0 (typically the processor core). The master index allocation is shown in .

**Table 16-4. MPROT Field**

Bit	Field	Description
3	MBW	<b>Master Buffer Writes</b> - This bit determines whether the AIPSTZ is enabled to buffer writes from this master.
2	MTR	<b>Master Trusted for Reads</b> - This bit determines whether the master is trusted for read accesses.
1	MTW	<b>Master Trusted for Writes</b> - This bit determines whether the master is trusted for write accesses.
0	MPL	<b>Master Privilege Level</b> - This bit determines how the privilege level of the master is determined.

#### NOTE

The reset value is set to 0000\_0000\_7700\_0000, which makes master 0 and master 1 (Arm CORE) the trusted masters. Trusted software can change the settings after reset.

**Table 16-5. Master Index Allocation**

Master Index	Master Name	Comments
Master 0	Arm core	
Master 1	eDMA	
Master 2	DCP	
Master 3	Others	Share the same number allocation.
Master 4-15	Reserved	

Address: Base address + 0h offset

## 16.7.2 Off-Platform Peripheral Access Control Registers (AIPSTZx\_OPACR)

Each of the off-platform peripherals have an Off-platform Peripheral Access Control Register (AIPSTZ\_OPACR) which defines the access levels supported by the given block.

Each AIPSTZ\_OPACR has the following format shown in [Table 16-6](#)

**Table 16-6. OPAC Field**

Bit	Field	Description
3	BW	<b>Buffer Writes</b> - This bit determines whether write accesses to this peripheral are allowed to be buffered. <sup>1</sup>
2	SP	<b>Supervisor Protect</b> - This bit determines whether the peripheral requires supervisor privilege level for access.
1	WP	<b>Write Protect</b> - This bit determines whether the peripheral allows write accesses.
0	TP	<b>Trusted Protect</b> - This bit determines whether the peripheral allows accesses from an untrusted master.

1. Buffered writes are not available for AIPSTZ. This bit should be set to '0'.

# Chapter 17

## And-Or-Inverter (AOI)

### 17.1 Introduction

The AND/OR/INVERT module (known simply as the AOI module) supports the generation of a configurable number of EVENT signals. Each output EVENT<sub>n</sub> is a configurable and/or/invert function of four associated AOI inputs: A<sub>n</sub>, B<sub>n</sub>, C<sub>n</sub>, and D<sub>n</sub>.

This module is designed to be integrated in conjunction with one or more inter-peripheral crossbar switch (XBAR) modules. A crossbar switch is typically used to select the 4\*n AOI inputs from among available peripheral outputs and GPIO signals. The n EVENT<sub>n</sub> outputs from the AOI module are typically used as additional inputs to a second crossbar switch, adding to it the ability to connect to its outputs an arbitrary 4-input boolean function of its other inputs.

The AOI controller is a slave peripheral module connecting event input indicators from a variety of device modules and generating event output signals that can be routed to an inter-peripheral crossbar switch or other peripherals. Its programming model is accessed through the standard IPS (Sky Blue) slave interface. The module is designed to be very configurable in terms of the functionality of its integrated AOI functions.

#### 17.1.1 Overview

The AOI module supports a configurable number of event outputs, where each event output represents a user-programmed combinational boolean function based on four event inputs. The key features of this module include:

- Four dedicated inputs for each event output
- User-programmable combinational boolean function evaluation for each event output
- Memory-mapped device connected to a slave peripheral (IPS) bus
- Configurable number of event outputs

**NOTE**

The connections from the AOI module outputs to other functions is SoC-specific.

**Figure 17-1. Simplified AOI Block Diagram**

## 17.1.2 Features

The major features of the AOI module are summarized below:

- Highly programmable module for creating combinational boolean events for use as hardware triggers
  - Each channel has four event inputs and one output
  - Evaluates a combinational boolean expression as the sum of four products where each product term includes all four selected input sources available as true or complement values
  - Event output is formed as purely combinational logic and operates as a hardware trigger
- Memory-mapped device connected to the slave peripheral (IPS) bus
  - Programming model organized per channel for simplified software

## 17.1.3 Modes of Operation

The AOI module does not support any special modes of operation. As shown in [Figure 17-1](#), its operation is primarily controlled by the selected event inputs and outputs. Additionally, as a memory-mapped device located on the slave peripheral bus, it responds based strictly on memory address for accesses to its programming model.

The AOI module resides in the slave peripheral *bus clock domain*.

## 17.2 External Signal Description

The AOI module does not directly support any external interfaces. There may be package input signals (indirectly) connected to the module as event inputs, but since the *AOI does not include any input synchronization hardware*, this function must be handled before the event input signals are routed into the module.

## 17.3 Memory Map and Register Descriptions

The AOI module supports access to its programming model via a 16-bit peripheral bus connection. The module is designed to support 16-bit accesses only. Functionality for accesses of other widths is undefined.

The AOI module supports a specific number of event outputs. Each output EVENTn outputs a four-term AOI function of four binary inputs: An, Bn, Cn, and Dn. A pair of 16-bit registers configures this four-term AOI function: The two registers BFCRT01n and BFCRT23n define the configuration for the evaluation of the Boolean function defining EVENTn, where n is the event output channel number. The BFCRT01n register defines the configuration of product terms 0 and 1, and the BFCRT23n register defines the configuration of product terms 2 and 3.

The AOI module provides a universal Boolean function generator using a four-term sum of products expression with each product term containing true or complement values of the four selected event inputs (An, Bn, Cn, Dn). Specifically, the EVENTn output is defined by the following "4 x 4" Boolean expression:

$$\begin{aligned}
 \text{EVENTn} &= (0, \text{An}, \sim\text{An}, 1) \ \& \ (0, \text{Bn}, \sim\text{Bn}, 1) \ \& \ (0, \text{Cn}, \sim\text{Cn}, 1) \ \& \ (0, \text{Dn}, \sim\text{Dn}, 1) // \text{product term 0} \\
 &| \ (0, \text{An}, \sim\text{An}, 1) \ \& \ (0, \text{Bn}, \sim\text{Bn}, 1) \ \& \ (0, \text{Cn}, \sim\text{Cn}, 1) \ \& \ (0, \text{Dn}, \sim\text{Dn}, 1) // \text{product term 1} \\
 &| \ (0, \text{An}, \sim\text{An}, 1) \ \& \ (0, \text{Bn}, \sim\text{Bn}, 1) \ \& \ (0, \text{Cn}, \sim\text{Cn}, 1) \ \& \ (0, \text{Dn}, \sim\text{Dn}, 1) // \text{product term 2} \\
 &| \ (0, \text{An}, \sim\text{An}, 1) \ \& \ (0, \text{Bn}, \sim\text{Bn}, 1) \ \& \ (0, \text{Cn}, \sim\text{Cn}, 1) \ \& \ (0, \text{Dn}, \sim\text{Dn}, 1) // \text{product term 3}
 \end{aligned}$$

where each selected input of each product term can be configured to produce a logical 0 or 1 or pass the true or complement of the selected event input. Each product term uses 8 bits of configuration information, 2 bits for each of the four selected event inputs. The resulting logic provides a simple yet powerful Boolean function evaluation for defining an event output.

These AOI functions are combinational in nature and are intended to be sampled and used synchronously.

## 17.4 Functional Description

The AOI is a highly programmable module for creating combinational boolean outputs for use as hardware triggers. Each AOI output channel, as shown in [Figure 17-1](#), has one logic function:

- Evaluation of a combinational boolean expression as a sum of four products where each product term includes all four selected input sources available as true or complement values

A typical application of the AOI module is to be integrated with one or more inter-peripheral crossbar switch modules as illustrated in the following figure. The 20 external inputs are shared by two crossbar switch modules. The crossbar switch on the top is used to select the inputs to four 4-input AOI functions in the AOI module. The outputs of these four AOI functions are output from the AOI module and are added to the original 20 external inputs to provide a total of 24 inputs to the bottom crossbar switch. As a result,

the bottom crossbar can not only direct any of the original 20 external inputs to any of its outputs, it can also now direct any one of four 4-input AOI functions of those external inputs to any of its outputs.

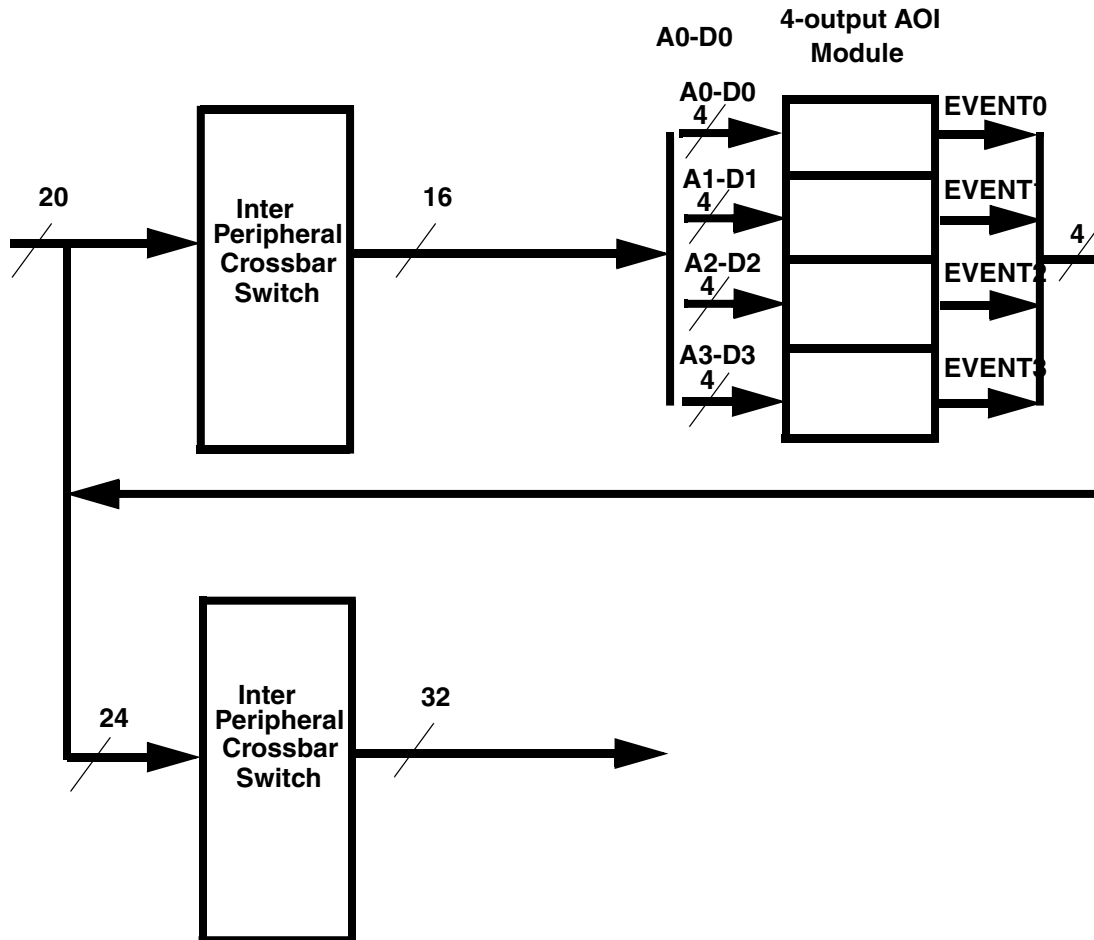

Figure 17-2. Integration Example of AOI with two Inter-Peripheral Crossbar Switches

### 17.4.1 Configuration Examples for the Boolean Function Evaluation

This section presents examples of the programming model configuration for simple boolean expressions.

## Functional Description

The AOI module provides a universal boolean function generator using a four-term sum of products expression with each product term containing true or complement values of the four selected event inputs (A, B, C, D). Specifically, the event output is defined by the following “4 x 4” boolean expression:

```
EVENTn
= (0, An, ~An, 1) & (0, Bn, ~Bn, 1) & (0, Cn, ~Cn, 1) & (0, Dn, ~Dn, 1) // product term 0
| (0, An, ~An, 1) & (0, Bn, ~Bn, 1) & (0, Cn, ~Cn, 1) & (0, Dn, ~Dn, 1) // product term 1
| (0, An, ~An, 1) & (0, Bn, ~Bn, 1) & (0, Cn, ~Cn, 1) & (0, Dn, ~Dn, 1) // product term 2
| (0, An, ~An, 1) & (0, Bn, ~Bn, 1) & (0, Cn, ~Cn, 1) & (0, Dn, ~Dn, 1) // product term 3
```

where each selected input term in each product term can be configured to produce a logical 0 or 1 or pass the true or complement of the selected event input. Each product term uses eight bits of configuration information, two bits for each of the four selected event inputs. The actual boolean expression implemented in each channel is:

```
EVENTn
= (PT0_AC[0] & A | PT0_AC[1] & ~A) // product term 0
  & (PT0_BC[0] & B | PT0_BC[1] & ~B)
  & (PT0_CC[0] & C | PT0_CC[1] & ~C)
  & (PT0_DC[0] & D | PT0_DC[1] & ~D)

| (PT1_AC[0] & A | PT1_AC[1] & ~A) // product term 1
  & (PT1_BC[0] & B | PT1_BC[1] & ~B)
  & (PT1_CC[0] & C | PT1_CC[1] & ~C)
  & (PT1_DC[0] & D | PT1_DC[1] & ~D)

| (PT2_AC[0] & A | PT2_AC[1] & ~A) // product term 2
  & (PT2_BC[0] & B | PT2_BC[1] & ~B)
  & (PT2_CC[0] & C | PT2_CC[1] & ~C)
  & (PT2_DC[0] & D | PT2_DC[1] & ~D)

| (PT3_AC[0] & A | PT3_AC[1] & ~A) // product term 3
  & (PT3_BC[0] & B | PT3_BC[1] & ~B)
  & (PT3_CC[0] & C | PT3_CC[1] & ~C)
  & (PT3_DC[0] & D | PT3_DC[1] & ~D)
```

where the bits of the combined {BFECRT01n,BFCRT23n} registers correspond to the  $PT\{0-3\}_{A,B,C,D}C[1:0]$  terms in the equation.

Consider the settings of the combined 32-bit {BFECRT01n,BFCRT23n} registers for several simple boolean expressions as shown in [Table 17-1](#).

**Table 17-1. IEVENT\_BFECRn Values for Simple Boolean Expressions**

Event Output Expression	PT0	PT1	PT2	PT3	{BFCRT01, BFCRT23}
A & B	A & B	0	0	0	01011111_00000000_00000000_00000000
A & B & C	A & B & C	0	0	0	01010111_00000000_00000000_00000000
(A & B & C) + D	A & B & C	D	0	0	01010111_11111101_00000000_00000000
A + B + C + D	A	B	C	D	01111111_11011111_11110111_11111101
(A & ~B) + (~A & B)	A & ~B	~A & B	0	0	01101111_10011111_00000000_00000000

As can be seen in these examples, the resulting logic provides a simple yet powerful boolean function evaluation for defining an event output.

## 17.4.2 AOI Timing Between Inputs and Outputs

Each EVENTn output of the AOI module is a combination function of its four dedicated inputs An, Bn, Cn, and Dn. Propagation through the AOI and any associated inter-peripheral crossbar switch modules is intended to be single bus clock cycle.

# Chapter 18

## Clock Controller Module (CCM)

### 18.1 Chip-specific CCM information

#### NOTE

The OCRAM clock cannot be turned off when CM7 Cache is running, on this device. See CCM\_CCGR3[CG14] bitfield.

#### NOTE

System STOP/WAIT status can be observed on pin. See CCM\_STOP/CCM\_WAIT in the "Muxing Options" table of the "External Signals and Pin Multiplexing" chapter, for pin muxing details.

### 18.2 Overview

The Clock Control Module (CCM) generates and controls clocks to the various modules in the design and manages low power modes. This module uses the available clock sources to generate the clock roots.

The Clock Controller Module controls the following functions:

- Uses the available clock sources to generate clock roots to various parts of the chip:
  - PLL1 also referenced as ARM PLL
  - PLL2 also referenced as System PLL
  - PLL3 also referenced as USB1 PLL
  - PLL4 also referenced as Audio PLL
  - PLL5 also referenced as Video PLL
  - PLL6 also referenced as ENET PLL
  - PLL7 also referenced as USB2 PLL (This PLL is only used by the USB UTM interface through a direct connection.)
- Uses programmable bits to control frequencies of the clock roots.

- Controls the low power mechanism.
- Provides control signals to LPCG for gating clocks.
- Provides handshake with SRC for reset performance.
- Provides handshake with GPC for support of power gating operations.

## 18.2.1 Features

The CCM includes these distinctive features:

- Provides root clock to SoC modules based on several source clocks.
- ARM core root clock is generated from a dedicated source clock.
- Includes separate dividers to control generation of core and bus root clocks (AXI, AHB, IPG).
- Includes separate dividers and clock source selectors for each serial root clock.
- Optional external clocks to bypass PLL clocks.
- Selects clock signals to output on CCM\_CLKO onto the pads for observability.
- Controllable registers are accessible via IP bus.
- Manages the Low Power Modes, namely RUN, WAIT and STOP. The gating of the peripheral clocks is programmable in RUN and WAIT modes.
- Manages frequency scaling procedure for ARM core clock by shifting between PLL sources, without loss of clocks.
- Manages frequency scaling procedure for peripheral root clock by programmable divider. The division is done on the fly without loss of clocks.
- Interface for the following IPs:
  - PLL - Interfaces for each PLL
  - LPCG - Low Power Clock Gating unit
  - SRC - System Reset Controller
  - GPC - General Power Controller

## 18.2.2 CCM Block Diagram

Figure 18-1. Block Diagram

CCM contains the following sub-blocks:

Table 18-1. CCM Sub-blocks

CCM_CLK_SRC_DIV Sub-block	Description
CCM_CLK_IGNITION	Manages the ignition process. This module starts its functionality once CCM comes out of reset. It manages the process that begins with starting the OSC, PLLs and finishes with creation of stable output root clocks after reset.
CCM_CLK_SWITCHER	Receives the clock outputs of the PLLs, together with the bypass clocks for the PLLs, and generates switcher clock outputs ( pll3_sw_clk) for the CCM_CLK_ROOT_GEN sub-module.
CCM_CLK_ROOT_GEN	Receives the main clocks (PLLs / PFDs) and generates the output root clocks.
CCM_CLK_LOGIC	Generates the clock enables. It generates the clock enable signals based on info from CCM_LPM and CCM_IP. The clock enables are used in LPCG to turn off and on the split clocks.

Table continues on the next page...

**Table 18-1. CCM Sub-blocks (continued)**

CCM_CLK_SRC_DIV Sub-block	Description
CCM_LPM	Manages the low power modes of the IC.
CCM_HND_SK	Manages the handshake when changing certain root clock dividers that require handshake.

## 18.3 External Signals

The following table describes the external signals of CCM:

**Table 18-2. CCM External Signals**

Signal	Description	Pad	Mode	Direction
CCM_CLKO1	Observability clock 1 output	GPIO_SD_B0_04	ALT6	O
CCM_CLKO2	Observability clock 2 output	GPIO_SD_B0_05	ALT6	O
CCM_PMIC_STBY_REQ	Signal coming from PMIC to indicate that the voltage started to change in PMIC_STBY_REQ. CCM will ignore this indication if CLPCR [BYPASS_PMIC_READY] is set.	PMIC_STBY_REQ	ALT0	I
CCM_PMIC_READY	Signal goes to STANBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage.	GPIO_AD_B0_12 GPIO_EMC_32 GPIO_AD_B1_08 GPIO_AD_B1_01 GPIO_SD_B1_03	ALT1 ALT3 ALT3 ALT4 ALT6	O O O O O

## 18.4 CCM Clock Tree

The following figures (Part 1 and Part 2) show the clock tree configuration and clock roots for CCM.

For detailed sub-block information, see:

- [Clock Switcher](#)
- [Clock Root Generator](#)
- [Low Power Clock Gating module \(LPCG\)](#)
- [System Clocks](#)

**NOTE**

The default frequency values (in MHz) for the PLLs and PFDs are shown in the Clock Tree diagram that follows. The PLLs and PFDs control registers may be reprogrammed according to the speed grade of the SoC being used, but should not exceed that maximum setting for that speed grade.

CLOCK SWITCHER

CLOCK ROOT GEN

SYSTEM CLOCKS

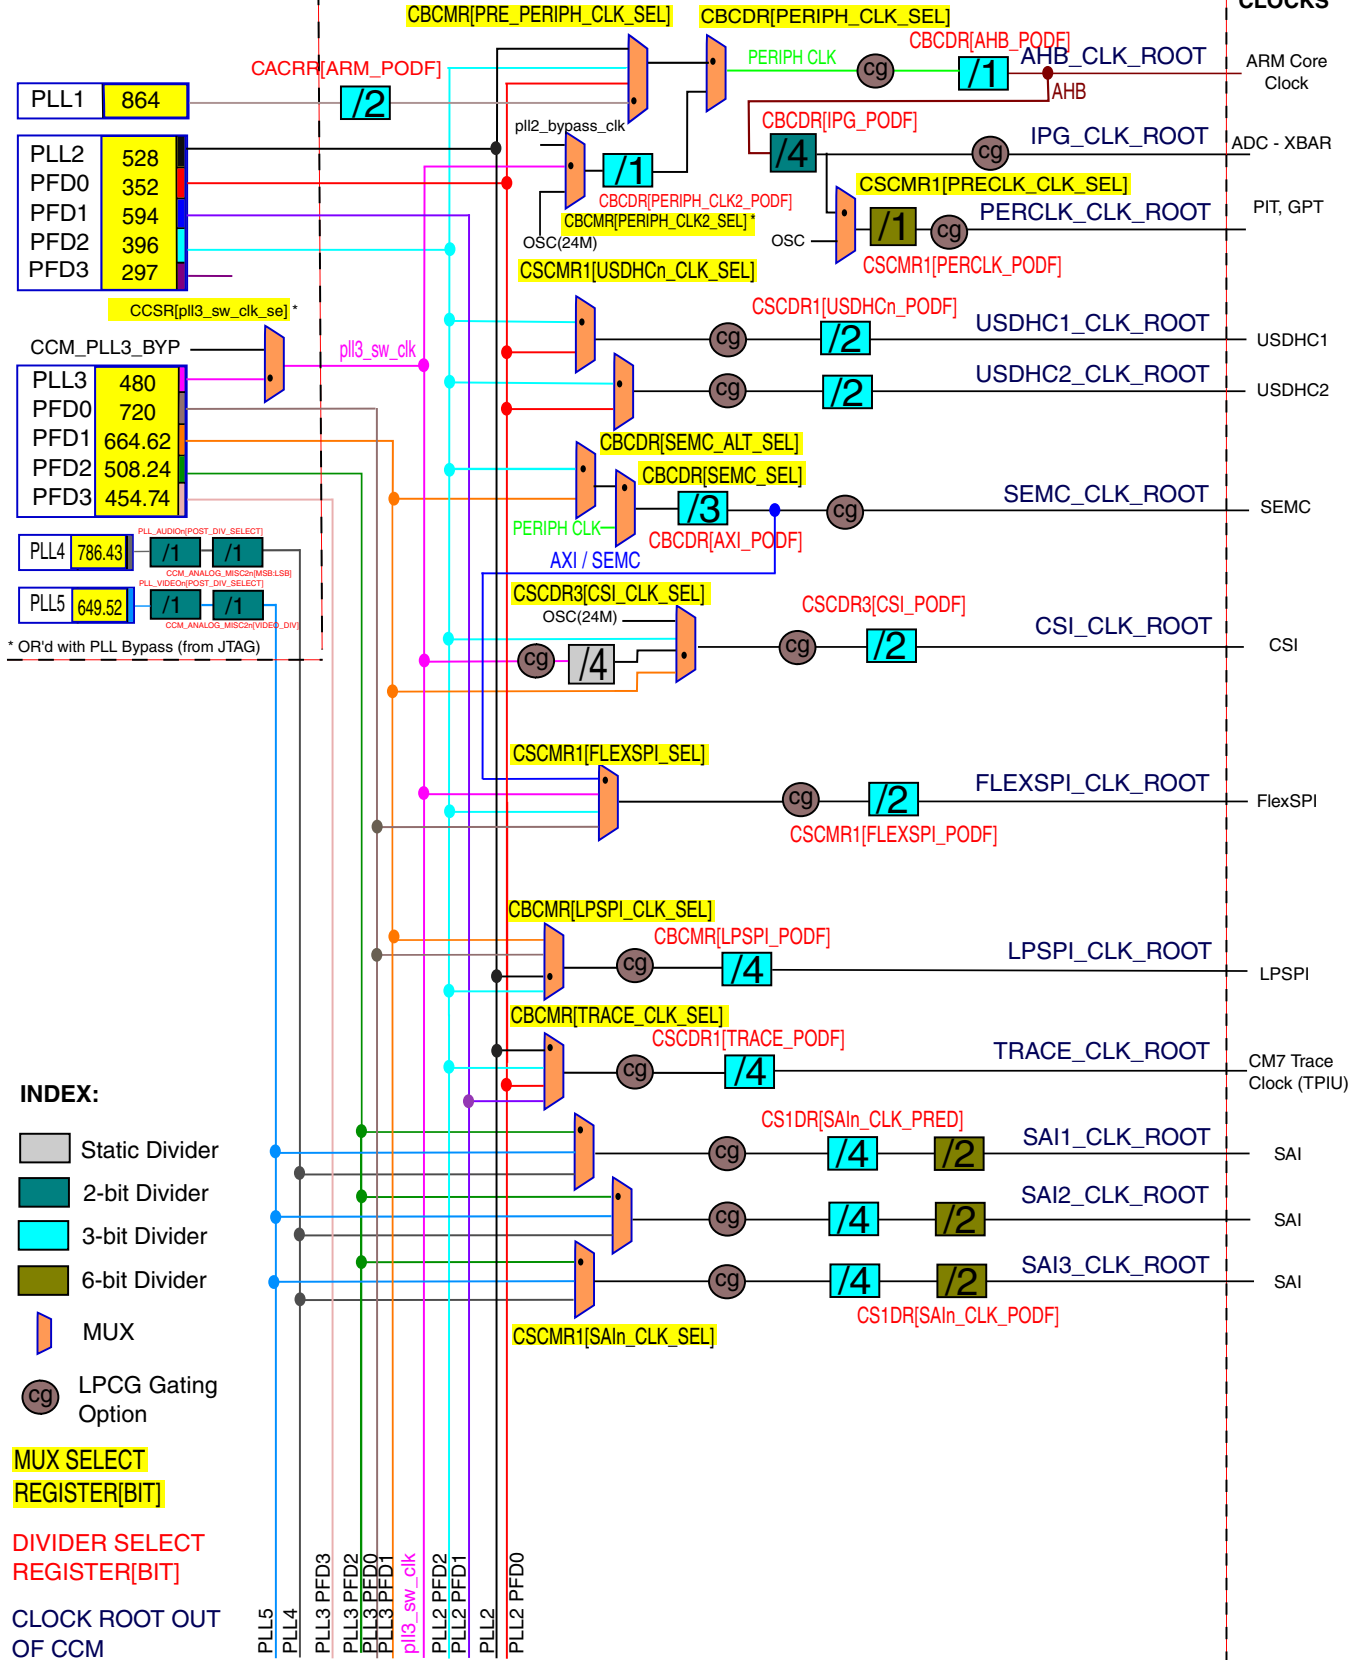

Figure 18-2. Clock Tree - Part 1

## 18.6 Functional Description

This section provides a complete functional description of the block.

### 18.6.1 Clock Generation

#### 18.6.1.1 External Low Frequency Clock - CKIL

The chip can use a 32 kHz or 32.768 kHz crystal as the external low-frequency source (XTALOSC). Throughout this chapter, the low-frequency crystal is referred to as the 32 kHz crystal.

This clock source should always be active when the chip is powered on. The 32 kHz entering the CCM are referred to as CKIL. CKIL is synchronized to IPG\_CLK and supplied to modules that need it.

##### 18.6.1.1.1 CKIL synchronizing to IPG\_CLK

CKIL is synchronized to ipg\_clk when the system is in functional mode. When the system is in STOP mode (when there is no IPG\_CLK) the CKIL synchronizer is bypassed, and raw CKIL is supplied to the system.

#### 18.6.1.2 External High Frequency Clock - CKIH and internal oscillator

The chip uses an internal oscillator to generate the reference clock (OSC). The internal oscillator is connected to the external crystal (XTALOSC) which generates the 24 MHz reference clock.

### 18.6.1.3 PLL reference clock

There are several PLLs in this chip.

PLL1 - ARM PLL (typical functional frequency )

PLL2 - System PLL (functional frequency 528 MHz)

PLL3 - USB1 PLL (functional frequency 480 MHz)

PLL4 - Audio PLL

PLL5 - Video PLL

PLL6 - ENET PLL

PLL7 - USB2 PLL (functional frequency 480 MHz)

Some of the PLLs are described in the sections below. See [CCM Analog Memory Map/ Register Definition](#) for register information.

#### 18.6.1.3.1 ARM PLL

This PLL synthesizes a low jitter clock from a 24 MHz reference clock. The clock output frequency for this PLL ranges from 650 MHz to 1.3 GHz. The output frequency is selected by a 7-bit register field CCM\_ANALOG\_PLL\_ARM[DIV\_SELECT].

PLL output frequency = Fref \* DIV\_SEL/2

#### NOTE

The upper frequency range may exceed the maximum frequency supported. Please see the datasheet for more information.

#### 18.6.1.3.2 USB PLLs

These PLLs synthesize a low jitter clock from the 24 MHz reference clock. USB1 PLL has 4 frequency-programmable PFD (phase fractional divider) outputs.

The output frequency of USB1 PLL is 480 MHz. Even though USB1 PLL has a DIV\_SELECT register field, this PLL should always be set to 480 MHz in normal operation. USB2 PLL is only used by the USB UTM interface through a direct connection.

### 18.6.1.3.3 System PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock. The PLL has one output clock, plus PFD outputs.

Although this PLL does have a DIV\_SELECT register field, it is intended that this PLL will only be run at the default frequency of 528 MHz.

### 18.6.1.3.4 Audio / Video PLL

The audio PLL and video PLL each synthesize a low jitter clock from a 24 MHz reference clock. The clock output frequency range for this PLL is from 650 MHz to 1.3 GHz. It has a Fractional-N synthesizer.

There are /1, /2, /4, /8, /16 post dividers for the Video PLL and /1, /2, /4 post dividers for the Audio PLL. The output frequency can be set by programming the fields in the CCM\_ANALOG\_PLL\_AUDIO, CCM\_ANALOG\_PLL\_VIDEO, and CCM\_ANALOG\_MISC2 register sets according to the following equation.

PLL output frequency = Fref \* (DIV\_SELECT + NUM/DENOM)

### 18.6.1.3.5 Ethernet PLL

This PLL synthesizes a low jitter clock from the 24 MHz reference clock.

The reference clocks generated by this PLL are:

- ref\_enetpll0 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll1 programmable to 25, 50, 100 and 125 MHz by setting CCM\_ANALOG\_PLL\_ENET[DIV\_SELECT] bitfield
- ref\_enetpll2 fixed at 25 MHz

### 18.6.1.4 Phase Fractional Dividers (PFD)

There are several PFD outputs from the System PLL and USB1 PLL.

Each PFD output generates a fractional multiplication of the associated PLL's VCO frequency. Where the output frequency is equal to  $F_{vco} * 18/N$ , N can range from 12-35. The PFDs allow for clock frequency changes without forcing the relock of the root PLL. This feature is useful in support of dynamic voltage and frequency scaling (DVFS). See [CCM Analog Memory Map/Register Definition](#).

When the related PLL is powered up from the power down state or made to go through a relock cycle due to PLL reprogramming, it is required that the related PFDx\_CLKGATE bit in CCM\_ANALOG\_PFD\_480n or CCM\_ANALOG\_PFD\_528n, be cycled on and off (1 to 0) after PLL lock. The PFDs can be in the clock gated state during PLL relock but must be un-clock gated only after lock is achieved. See the engineering bulletin, *Configuration of Phase Fractional Dividers (EB790)* at [www.nxp.com](http://www.nxp.com) for procedure details.

### 18.6.1.5 CCM internal clock generation

The clock generation is comprised of two sub-modules:

CCM\_CLK\_SWITCHER

CCM\_CLK\_ROOT\_GEN

#### 18.6.1.5.1 Clock Switcher

The Clock Switcher (CCM\_CLK\_SWITCHER) sub-module receives the PLL output clocks and the PLL bypass clocks.

[Figure 18-4](#) describes the generation of the three switcher clocks.

The figure also includes the Frequency Switch Control sub-module responsible for frequency change.

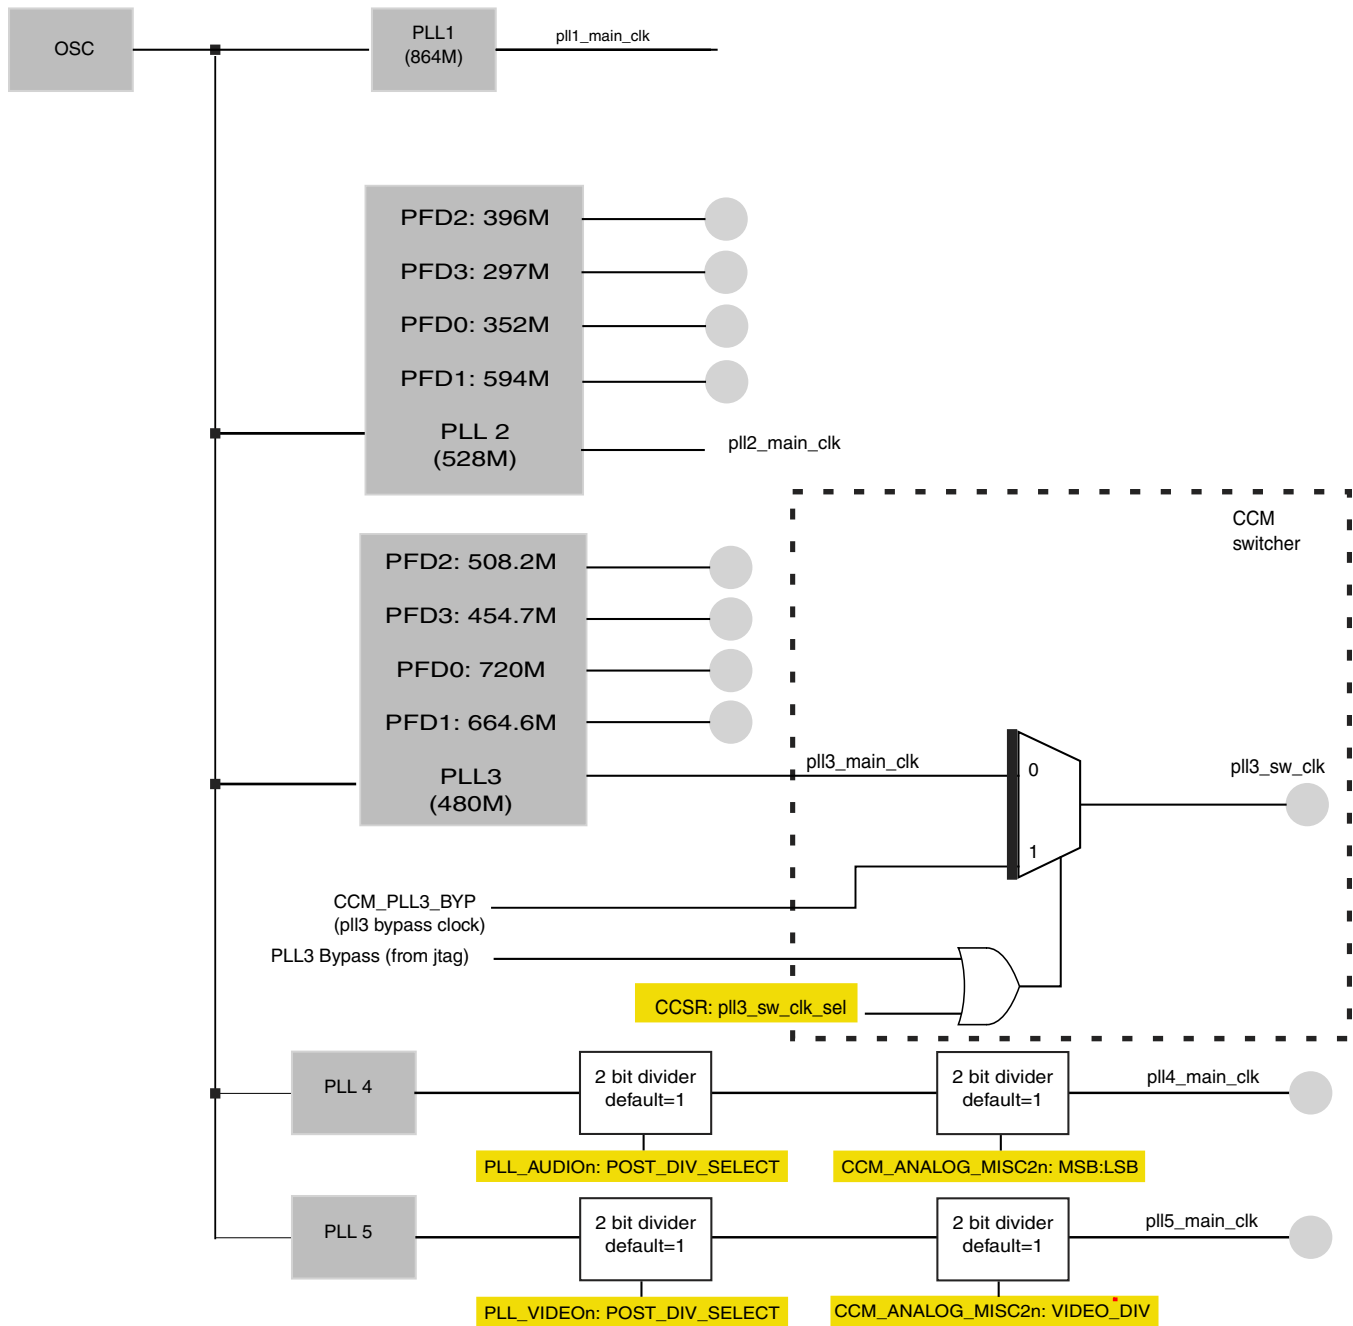

Figure 18-4. Switcher clock generation

### 18.6.1.5.2 PLL bypass procedure

In addition to PLL bypass options in `CCM_ANALOG` module, switcher and `clk_root_gen` sub-modules includes capability for each of the PLL clocks to be bypassed with an external bypass clock.

### 18.6.1.5.3 PLL clock change

In order to modify or stop the clock output of a specific PLL, all the clocks generated from the current PLL must be transitioned to the new PLL whose frequency is not being modified.

For clocks which can't be stopped (core and bus clocks), this should be done via the glitchless mux. Before changing the PLL setting, power it down. Power up the PLL after the change. See [Disabling / Enabling PLLs](#) for more information.

### 18.6.1.5.4 Clock Root Generator

The Clock Root Generator (CCM\_CLK\_ROOT\_GEN) sub-module generates the root clocks to be delivered to LPCG.

The following figures describe clock generation. The frequencies in parantheses are the default typical frequencies.

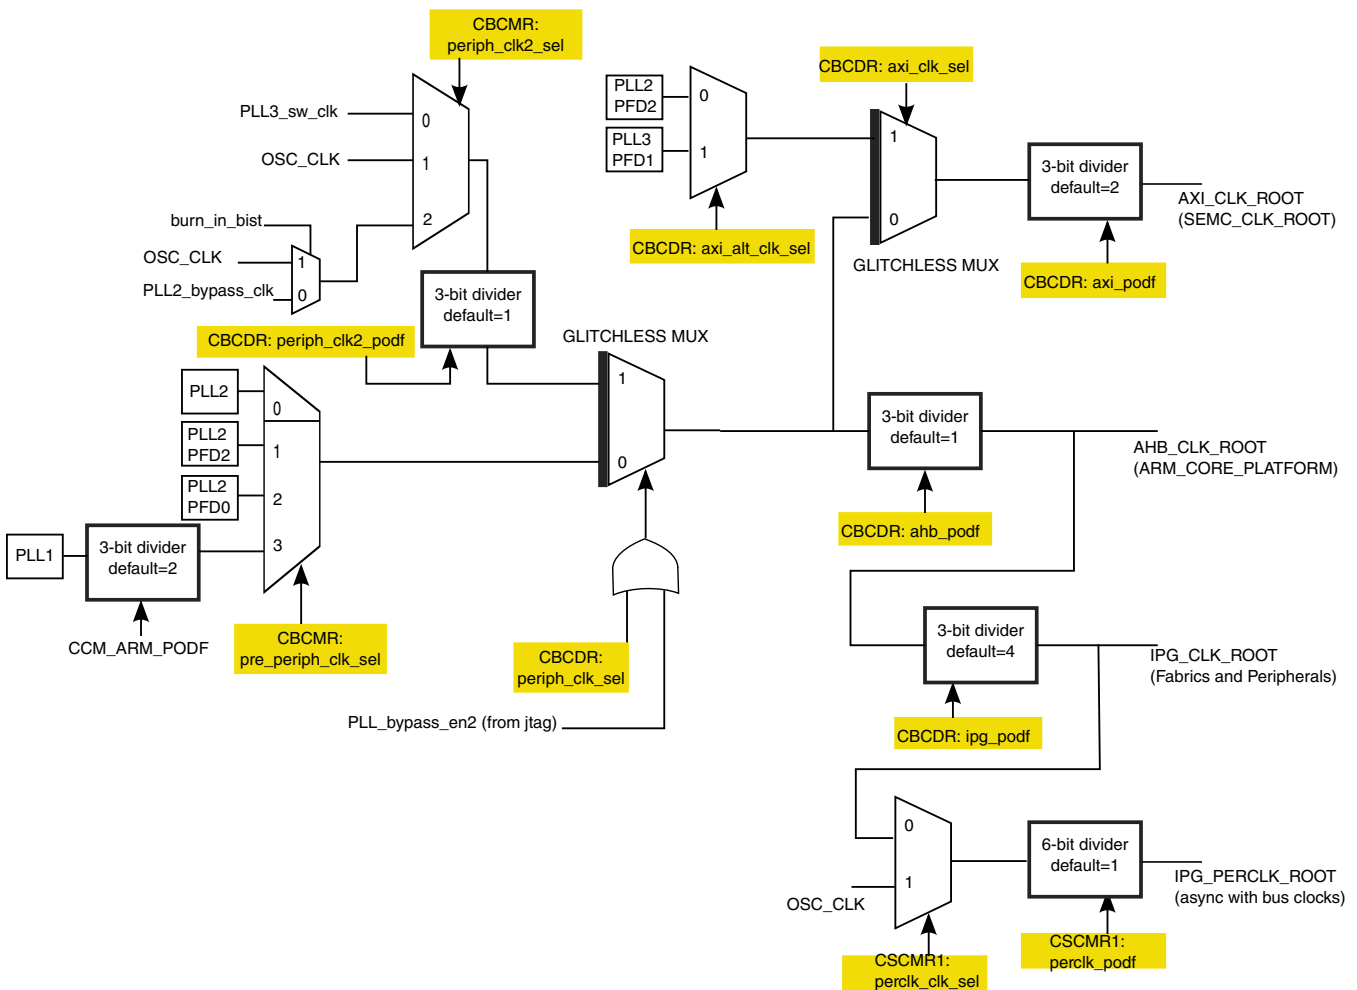

Figure 18-5. BUS clock generation

**NOTE**

All 6-bit PODF dividers found in the diagrams above can operate on low frequency.

**18.6.1.5.5 Divider change handshake**

Modifying the following dividers will start the handshake with MMDC.

- `periph_clk_sel`
- `periph2_clk_sel`
- `arm_podf`
- `ahb_podf`

The dividers listed above are designed with a handshake. For dividers without a handshake design, the following sequence must be performed when updating PODF value:

1. Gate the output clock off before updating PODF value.
2. Gate the output clock on after the PODF value is updated and stable.

To update the PODF value without gating the output clock off will cause unpredictable results such as no clock output.

**18.6.1.6 Disabling / Enabling PLLs**

PLL disabling and enabling is done via analog module.

Before disabling a PLL using the analog registers, software should first move all the clocks generated from that specific PLL to another source. This alternate source could be another PLL, or a PFD driven by another PLL. Alternatively, software can bypass the PLL and use the PLL reference clock (usually 24 MHz) as the output clock. Bypassing the PLL is done by setting the analog BYPASS bit in the control register for that PLL.

**18.6.1.7 Clock Switching Multiplexers**

There are a multitude of multiplexers available throughout the clock generation logic that provide alternate clock sources for the system clocks controlled by the CCM. The CCM uses several synchronous glitchless clock multiplexers as well as asynchronous glitchy clock multiplexers.

Synchronous muxes ensure there are no glitches between the transition of two asynchronous clocks and that there will be no pulses that are of a frequency higher than either input clock. For the synchronous multiplexer to work properly, both the current clock and the clock to be selected must remain active during the entire selection process.

## Functional Description

There are five glitchless (synchronous) muxes used in the CCM. The table below lists the muxes and the respective control bits.

**Table 18-5. Glitchless Multiplexers**

Glitchless Mux	Mux Select Bit	Handshake Bit
periph_clk_mux	CBCDR[periph_clk_sel]	CDHIPR[periph_clk_sel_busy]
semc_clk_mux	CBCDR[semc_clk_sel]	
pll3_sw_clk_mux	CCSR[pll3_sw_clk_sel]	

### NOTE

Any change of the `periph_clk_sel` and `periph2_clk_sel` sync mux select will involve handshake with the MMDC. Refer to the CCDCR and CDHIPR registers for the handshake bypass and busy bits.

For critical system bus clocks, changing the clock source can be done in the CCM using the glitchless clock muxes in [Figure 18-5](#). In the figure, the thick bar on the input side indicates the glitchless muxes. Those without the thick bar are regular muxes (not glitchless).

For example, before disabling PLL2, software can switch the `AHB_CLK_ROOT` away from the PLL2 or one of its PFDs by programming `CBCMR[PERIPH2_CLK2_SEL]` and `CBCDR[PERIPH2_CLK2_PODF]` to provide an appropriate frequency clock, then glitchlessly switch to it by programming `CBCDR[PERIPH2_CLK_SEL]`.

Asynchronous multiplexers or glitchy multiplexers, allow the clock to switch immediately after the multiplexer select changed. This immediate switch of two asynchronous clock domains can cause the output clock to glitch. Since both clock sources to the mux are asynchronous, switching the clocks from one source to the other can cause a glitch to be generated, regardless of the input clock source.

The output clocks to the mux are required to be gated before switching the source clock in the CCM clock mux. If the output clocks are not gated, clock glitches can propagate to the logic that follows the clock mux, causing the logic to behave unpredictably.

For serial clocks, software should first disable the module, then gate its clock in the LPCG. Then it should move the mux controlling the source of the clocks to another PLL, and reset the module and its clocks. Only then is it safe to disable the PLL. The mux for the serial clocks is not glitchless.

### 18.6.1.8 Low Power Clock Gating module (LPCG)

The LPCG module receives the root clocks and splits them to clock branches for each module. The clock branches are gated clocks.

The enables for those gates can come from four sources:

1. Clock enable signal from CCM - this signal is generated by configuring of the CGR bits in the CCM. It is based on the low power mode.
2. Clock enable signal from the module - this signal is generated by the module based on internal logic of the module. Not every enable signal from the module is used. For used clock enable signals from the module, CCM will generate an override signal based on a programable bit in CCM (CMEOR).
3. Clock enable signal from Reset controller (SRC) - this signal will enable the clock during the reset procedure. Please see the SRC chapter for details on the clock enable signal during reset procedure.
4. Hard-coded enable from fuse box.

These enable signals are ANDed to generate the enable signal for the gating cell.

The enable signal for the gating cell is synchronized with the clock it needs to gate in order to prevent glitches on the gated clock.

Notifications are generated for CCM to indicate when clock roots should be opened and closed. All notifications that correspond to the same clock root will be ORed to generate one notification signal to CCM for clock root gating.

The following figure describes the clock split inside the LPCG module. It describes the case of two modules; one module is without an enable signal and one is shown with an enable signal. SRC enable signals and sync flip flops are omitted from this figure.

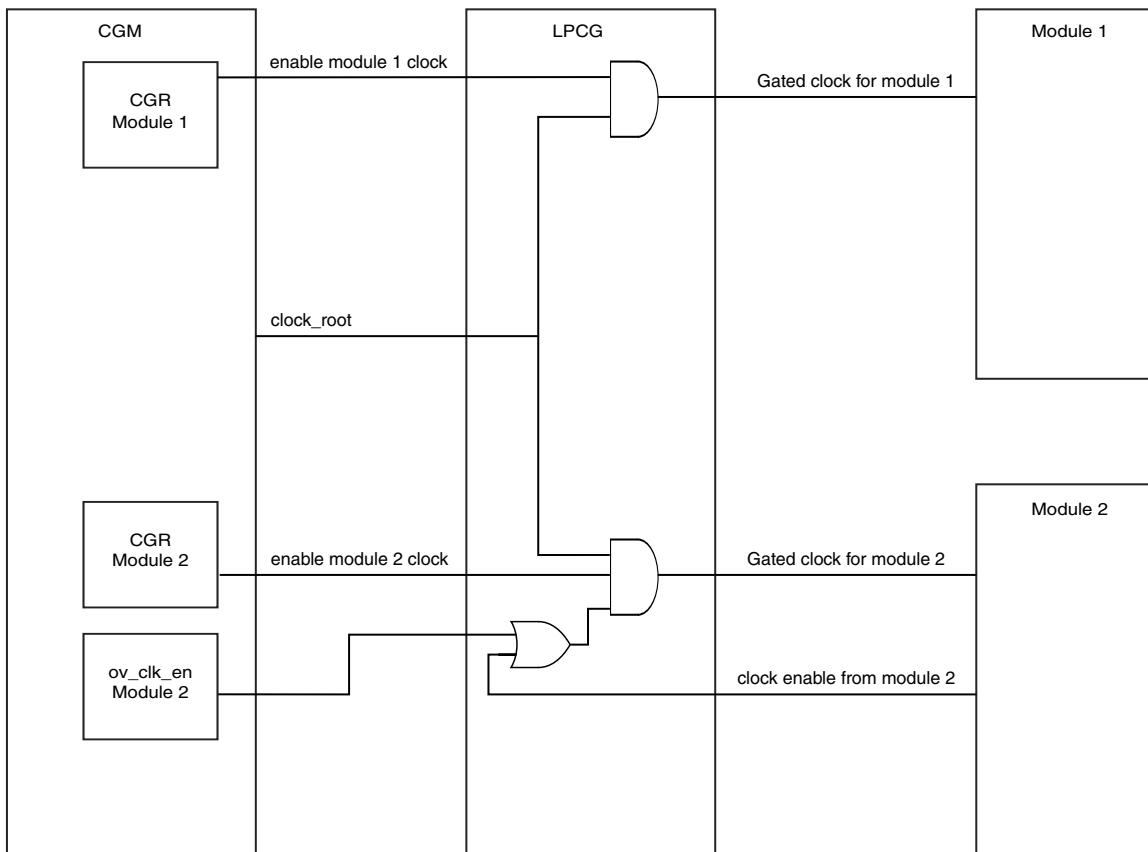

Figure 18-6. Clock split in LPCG

## 18.6.2 DVFS support

When performing DVFS, the frequency shift procedure for the ARM core clock domain can be performed by software.

CPU PLL frequency and CCM ARM clock divider is controlled by CCM and CPU power domain supply voltage value is controlled by CCM\_ANALOG module.

### NOTE

The frequency should be shifted down first and then voltage value reduced, and vice-versa, when shifting the frequency up.

### NOTE

CCM\_ANALOG will not control the voltage value in Bypass mode

### 18.6.3 Power modes

The chip supports 3 low power modes: RUN mode, WAIT mode, STOP mode.

#### 18.6.3.1 RUN mode

This is the normal/functional operating mode. In this mode, the CPU runs in its normal operational mode. Clocks to the modules can be gated by configuring the corresponding CCGRx bits.

#### 18.6.3.2 WAIT mode

In this mode the CPU clock is gated. All other clocks are functional and can be gated by programming their CGR bits when all ARM cores are in WFI, and L2 cache and SCU are idle.

##### 18.6.3.2.1 Entering WAIT mode

If the CLPCR[LPM] bit is set by software to WAIT mode, when CPU executes the next wait for interrupt (WFI) instruction, WAIT mode sequence will start.

As part of the WFI routine, alternative interrupt controller in GPC should be updated; the CPU platform interrupt controller will be disabled first by software and will be not functional, due to clock gating. Interrupts during WAIT mode are monitored by alternative interrupt controller.

After execution of the WFI routine, the CPU platform will assert idle signals for each component of the platform and CCM will gate clock to the platform.

The next actions can be programmed during WAIT mode:

1. CCM requests an acknowledge to close clocks to MMDC if its CGR bits indicate to close its clocks on WAIT mode, and if those clocks are not already closed in run mode. The request will be issued if the handshake is not bypassed by programming the CLPCR register. If the corresponding bits are set, the request signal will not be issued to the corresponding module and CCM will not wait for its acknowledge in the process of entering low power mode. Once CCM receives all the acknowledge signals needed, then it will enter WAIT mode.
2. Close the clocks to the modules which were defined to be shut at WAIT mode in the CCGR bits.

3. Observability to indicate WAIT mode.

Any enabled interrupt assertion will start the exit from WAIT mode.

### 18.6.3.2.2 Exiting WAIT mode

As soon as enabled interrupt is asserted, CPU supply will be restored if CPU SRPG was applied and clocks are enabled to CPU and other modules.

### 18.6.3.3 STOP mode

In this mode all system clocks are stopped, along with the CPU, system buses and all PLLs. Power gating can be applied for ARM platform. External supply voltage can be reduced to decrease leakage.

#### 18.6.3.3.1 Entering STOP mode

Procedure entering STOP mode is the same, as entering WAIT mode until the moment of disabling clocks to modules. (LPM bit should be configured to STOP mode.)

After clocks to modules are gated, the following actions will be taken:

- PLLs are disabled
- CCM\_PMIC\_STBY\_REQ asserted, if vstby bit is set
- osc\_en signal is negated
- osc\_pwrdsn is asserted, if sbyos bit is set

Counter will be triggered after CCM\_PMIC\_STBY\_REQ assertion to allow to external regulator or PMIC to decrease voltage until valid voltage range. On counter completion, stop\_mode signal will be asserted, that will trigger disabling analog elements in anatop.

CCM's low power state machine will remain in state STOP\_GPC until STOP mode is exited.

#### 18.6.3.3.2 Exiting STOP mode

As soon as an enabled interrupt is asserted, the CCM will begin the process of exiting STOP mode.

The following will take place:

1. If vstby bit was set, deassert PMIC\_STBY\_REQ to notify power management IC to change voltage from standby voltage to functional voltage.

2. If sbyos was set, and CCM closed either external oscillator or on board oscillator, then CCM will start oscillator by asserting ref\_en\_b signal and deasserting cosc\_pwrdown signal respectively.
3. After the number of cycles of CKILs defined in stby\_count bits, wait until PMIC functional voltage is ready. This is the notification from power management IC that the voltage is ready at its functional value. Only then will CCM continue the steps.
4. Start osc. If oscillator was started, wait until oscnt has finished its counting to make sure that oscillator is ready.
5. Start PLLs. Only the PLLs that were configured to be on prior to the entrance to STOP mode will be started.
6. CCM will request GPC to restore ARM power by GPC\_PUP\_REQ. If power was removed from the ARM platform, GPC will notify CCM by asserting signal GPC\_PUP\_ACK that power to ARM is back on, and its safe to exit from STOP mode. Only then will the CCM progress to the next step.
7. Once assertion of notification from src that the resets for the power gated modules has been finished, (src\_power\_gating\_reset\_done is set) negate the low power request signals to all modules and enable all module clocks including ARM clocks and CKIL sync, and return to run mode. (Clocks whose CCGR bits are not to be opened in RUN mode will not be opened; they will continued to be gated.)

Once the system is in run mode, negate signals ccm\_ipg\_stop and system\_in\_stop\_mode.

## 18.7 CCM Memory Map/Register Definition

### NOTE

The register reset values for CCM change depending on the boot configuration. See [Clocks at boot time](#) for more information.

## 18.7.1 CCM Control Register (CCM\_CCR)

The figure below represents the CCM Control Register (CCR), which contains bits to control general operation of CCM. The table below provides its field descriptions.

Address: 400F\_C000h base + 0h offset = 400F\_C000h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0				RBC_EN	REG_BYPASS_COUNT						0				
W	[Shaded]				RBC_EN	[Shaded]						[Shaded]				
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	1
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0			COSC_EN	0				OSCNT							
W	[Shaded]			COSC_EN	[Shaded]				[Shaded]							
Reset	0	0	0	1	0	0	0	0	0	1	1	1	1	1	1	1

### CCM\_CCR field descriptions

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 RBC_EN	Enable for REG_BYPASS_COUNTER. If enabled, analog_reg_bypass signal will be asserted after REG_BYPASS_COUNT clocks of CKIL, after standby voltage is requested. If standby voltage is not requested analog_reg_bypass won't be asserted, event if counter is enabled.  1 REG_BYPASS_COUNTER enabled. 0 REG_BYPASS_COUNTER disabled
26–21 REG_BYPASS_COUNT	Counter for analog_reg_bypass signal assertion after standby voltage request by PMIC_STBY_REQ. Should be zeroed and reconfigured after exit from low power mode.  REG_BYPASS_COUNT can also be used for holding off interrupts when the PGC unit is sending signals to power gate the core.  000000 no delay 000001 1 CKIL clock period delay 111111 63 CKIL clock periods delay
20–13 Reserved	This read-only field is reserved and always has the value 0.
12 COSC_EN	On chip oscillator enable bit - this bit value is reflected on the output cosc_en. The system will start with on chip oscillator enabled to supply source for the PLLs. Software can change this bit if a transition to the bypass PLL clocks was performed for all the PLLs. In cases that this bit is changed from '0' to '1' then CCM will enable the on chip oscillator and after counting oscnt ckil clock cycles it will notify that on chip

Table continues on the next page...

## CCM\_CCR field descriptions (continued)

Field	Description
	<p>oscillator is ready by a interrupt <code>cosc_ready</code> and by status bit <code>cosc_ready</code>. The <code>cosc_en</code> bit should be changed only when on chip oscillator is not chosen as the clock source.</p> <p>0   disable on chip oscillator 1   enable on chip oscillator</p>
11–8 Reserved	<p>This field is reserved. This read-only field is reserved and always has the value 0.</p>
OSCNT	<p>Oscillator ready counter value. These bits define value of 32KHz counter, that serve as counter for oscillator lock time. This is used for oscillator lock time. Current estimation is ~5ms. This counter will be used in ignition sequence and in wake from stop sequence if <code>sbyos</code> bit was defined, to notify that on chip oscillator output is ready for the <code>dpll_ip</code> to use and only then the gate in <code>dpll_ip</code> can be opened.</p> <p>00000000   count 1 ckil 11111111   count 256 ckil's</p>

### 18.7.2 CCM Status Register (CCM\_CSR)

The figure below represents the CCM status Register (CSR). The status bits are read-only bits. The table below provides its field descriptions.

Address: 400F\_C000h base + 8h offset = 400F\_C008h

**CCM\_CSR field descriptions**

Field	Description
31–6 Reserved	This read-only field is reserved and always has the value 0.

*Table continues on the next page...*

## CCM\_CSR field descriptions (continued)

Field	Description
5 COSC_READY	Status indication of on board oscillator. This bit will be asserted if on chip oscillator is enabled and on chip oscillator is not powered down, and if oscnt counter has finished counting.  0 on board oscillator is not ready. 1 on board oscillator is ready.
4 Reserved	This read-only field is reserved and always has the value 1.
3 CAMP2_READY	Status indication of CAMP2.  0 CAMP2 is not ready. 1 CAMP2 is ready.
2-1 Reserved	This read-only field is reserved and always has the value 0.
0 REF_EN_B	Status of the value of CCM_REF_EN_B output of ccm  0 value of CCM_REF_EN_B is '0' 1 value of CCM_REF_EN_B is '1'

### 18.7.3 CCM Clock Switcher Register (CCM\_CCSR)

The figure below represents the CCM Clock Switcher register (CCSR). The CCSR register contains bits to control the switcher sub-module dividers and multiplexers. The table below provides its field descriptions.

Address: 400F\_C000h base + Ch offset = 400F\_C00Ch

**CCM\_CCSR field descriptions**

Field	Description
31–9 Reserved	This read-only field is reserved and always has the value 0.
8 -	This field is reserved. Reserved
7–3 Reserved	This read-only field is reserved and always has the value 0.
2 Reserved	This read-only field is reserved and always has the value 0.
1 -	This field is reserved. Reserved

Table continues on the next page...

**CCM\_CCSR field descriptions (continued)**

Field	Description
0 PLL3_SW_CLK_SEL	Selects source to generate pll3_sw_clk. This bit should only be used for testing purposes.
0	pll3_main_clk
1	pll3 bypass clock

**18.7.4 CCM Arm Clock Root Register (CCM\_CACRR)**

The figure below represents the CCM Arm Clock Root register (CACRR). The CACRR register contains bits to control the ARM clock root generation. The table below provides its field descriptions.

Address: 400F\_C000h base + 10h offset = 400F\_C010h

**CCM\_CACRR field descriptions**

Field	Description
31–3 Reserved	This read-only field is reserved and always has the value 0.
ARM_PODF	<p>Divider for ARM clock root.</p> <p><b>NOTE:</b> If arm_freq_shift_divider is set to '1' then any new write to arm_podf will be held until arm_clk_switch_req signal is asserted.</p> <p>000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8</p>

## 18.7.5 CCM Bus Clock Divider Register (CCM\_CBCDR)

The figure below represents the CCM Bus Clock Divider Register (CBCDR). The CBCDR register contains bits to control the clock generation sub module dividers. The table below provides its field descriptions.

Address: 400F\_C000h base + 14h offset = 400F\_C014h

**CCM\_CBCDR field descriptions**

Field	Description
31–30 -	This field is reserved. Reserved
29–27 PERIPH_CLK2_PODF	Divider for periph_clk2_podf. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8

*Table continues on the next page...*

## CCM\_CBCDR field descriptions (continued)

Field	Description
26 -	This field is reserved. Reserved
25 PERIPH_CLK_SEL	Selector for peripheral main clock. <b>NOTE:</b> Alternative clock source should be used when PLL is relocked. For PLL relock procedure pls refer to the PLL chapter. <b>NOTE:</b> Any change of this sync mux select will involve handshake with the MMDC. Refer to the CCDCR and CDHIPR registers for the handshake bypass and busy bits. 0 derive clock from pre_periph_clk_sel 1 derive clock from periph_clk2_clk_divided
24–19 -	This field is reserved. Reserved
18–16 SEMC_PODF	Post divider for SEMC clock. <b>NOTE:</b> Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
15–13 -	This field is reserved. Reserved
12–10 AHB_PODF	Divider for AHB PODF. <b>NOTE:</b> Any change of this divider might involve handshake with EMI. See CDHIPR register for the handshake busy bits. 000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
9–8 IPG_PODF	Divider for ipg podf. 00 divide by 1 01 divide by 2 10 divide by 3 11 divide by 4

Table continues on the next page...

## CCM\_CBCDR field descriptions (continued)

Field	Description
7 SEMC_ALT_CLK_SEL	SEMC alternative clock select 0 PLL2 PFD2 will be selected as alternative clock for SEMC root clock 1 PLL3 PFD1 will be selected as alternative clock for SEMC root clock
6 SEMC_CLK_SEL	SEMC clock source select 0 Periph_clk output will be used as SEMC clock root 1 SEMC alternative clock will be used as SEMC clock root
5–3 -	This field is reserved. Reserved
-	This field is reserved. Reserved

## 18.7.6 CCM Bus Clock Multiplexer Register (CCM\_CBCMR)

The figure below represents the CCM Bus Clock Multiplexer Register (CBCMR). The CBCMR register contains bits to control the multiplexers that generate the bus clocks. The table below provides its field descriptions.

**NOTE**

Any change on the above multiplexer will have to be done while the module that its clock is affected is not functional and the respective clock is gated in LPCG. If the change will be done during operation of the module, then it is not guaranteed that the modules operation will not be harmed.

Address: 400F\_C000h base + 18h offset = 400F\_C018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

**18.7.14 CCM Serial Clock Divider Register 3 (CCM\_CSCDR3)**

The figure below represents the CCM Serial Clock Divider Register 3(CSCDR3). The CSCDR3 register contains bits to control the clock generation sub-module dividers. The table below provides its field descriptions.

Address: 400F\_C000h base + 3Ch offset = 400F\_C03Ch

**CCM\_CSCDR3 field descriptions**

Field	Description
31–19 Reserved	This read-only field is reserved and always has the value 0.
18–14 -	This field is reserved. Reserved
13–11 CSI_PODF	Post divider for csi_mclk. <b>NOTE:</b> Divider should be updated when output clock is gated.

*Table continues on the next page...*

## CCM\_CSCDR3 field descriptions (continued)

Field	Description
	000 divide by 1 001 divide by 2 010 divide by 3 011 divide by 4 100 divide by 5 101 divide by 6 110 divide by 7 111 divide by 8
10–9 CSI_CLK_SEL	Selector for csi_mclk multiplexer 00 derive clock from osc_clk (24M) 01 derive clock from PLL2 PFD2 10 derive clock from pll3_120M 11 derive clock from PLL3 PFD1
-	This field is reserved. Reserved

### 18.7.15 CCM Divider Handshake In-Process Register (CCM\_CDHIPR)

The figure below represents the CCM Divider Handshake In-Process Register (CDHIPR). The CDHIPR register contains read-only bits that indicate that CCM is in the process of updating dividers or muxes that might need handshake with modules.

Address: 400F\_C000h base + 48h offset = 400F\_C048h

**CCM\_CDHIPR field descriptions**

Field	Description
31–17 Reserved	This read-only field is reserved and always has the value 0.
16 ARM_PODF_ BUSY	Busy indicator for arm_podf. 0 divider is not busy and its value represents the actual division. 1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the arm_podf will be applied.
15–6 Reserved	This read-only field is reserved and always has the value 0.
5 PERIPH_CLK_ SEL_BUSY	Busy indicator for periph_clk_sel mux control. 0 mux is not busy and its value represents the actual division. 1 mux is busy with handshake process with module. The value read in the periph_clk_sel represents the previous value of select, and after the handshake periph_clk_sel value will be applied.
4 -	This field is reserved. Reserved

Table continues on the next page...

## CCM\_CDHIPR field descriptions (continued)

Field	Description
3 PERIPH2_CLK_ SEL_BUSY	<p>Busy indicator for periph2_clk_sel mux control.</p> <p>0 mux is not busy and its value represents the actual division.</p> <p>1 mux is busy with handshake process with module. The value read in the periph2_clk_sel represents the previous value of select, and after the handshake periph2_clk_sel value will be applied.</p>
2 -	<p>This field is reserved.</p> <p>Reserved</p>
1 AHB_PODF_ BUSY	<p>Busy indicator for ahb_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the ahb_podf will be applied.</p>
0 SEMC_PODF_ BUSY	<p>Busy indicator for semc_podf.</p> <p>0 divider is not busy and its value represents the actual division.</p> <p>1 divider is busy with handshake process with module. The value read in the divider represents the previous value of the division factor, and after the handshake the written value of the semc_podf will be applied.</p>

## 18.7.16 CCM Low Power Control Register (CCM\_CLPCR)

The figure below represents the CCM Low Power Control Register (CLPCR). The CLPCR register contains bits to control the low power modes operation. The table below provides its field descriptions.

Address: 400F\_C000h base + 54h offset = 400F\_C054h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	Reserved				COSC_PWRDOWN	STBY_COUNT		VSTBY	DIS_REF_OSC	SBYOS	ARM_CLK_DIS_ON_LPM	Reserved		Reserved	LPM	
W	Reserved				COSC_PWRDOWN	STBY_COUNT		VSTBY	DIS_REF_OSC	SBYOS	ARM_CLK_DIS_ON_LPM	Reserved		Reserved	LPM	
Reset	0	0	0	0	0	0	0	0	0	1	1	1	1	0	0	1

**CCM\_CLPCR field descriptions**

Field	Description
31–28 Reserved	This read-only field is reserved and always has the value 0.
27 MASK_L2CC_IDLE	Mask L2CC IDLE for entering low power mode. <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 L2CC IDLE is masked 0 L2CC IDLE is not masked
26 MASK_SCU_IDLE	Mask SCU IDLE for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 1 SCU IDLE is masked 0 SCU IDLE is not masked

Table continues on the next page...

## CCM\_CLPCR field descriptions (continued)

Field	Description
25–23 Reserved	This read-only field is reserved and always has the value 0.
22 MASK_CORE0_ WFI	Mask WFI of core0 for entering low power mode <b>NOTE:</b> Assertion of all bits[27:22] will generate low power mode request 0 WFI of core0 is not masked 1 WFI of core0 is masked
21 BYPASS_LPM_ HS0	Bypass low power mode handshake. <b>NOTE:</b> This bit should always be set to 1'b1 by software.
20 -	This field is reserved. Reserved
19 BYPASS_LPM_ HS1	Bypass low power mode handshake. <b>NOTE:</b> This bit should always be set to 1'b1 by software.
18–12 -	This field is reserved. Reserved
11 COSC_ PWRDOWN	In run mode, software can manually control powering down of on chip oscillator, i.e. generating '1' on cosc_pwrdown signal. If software manually powered down the on chip oscillator, then sbyos functionality for on chip oscillator will be bypassed.  The manual closing of onchip oscillator should be performed only in case the reference oscillator is not the source of all the clocks generation.  0 On chip oscillator will not be powered down, i.e. cosc_pwrdown = '0'. 1 On chip oscillator will be powered down, i.e. cosc_pwrdown = '1'.
10–9 STBY_COUNT	Standby counter definition. These two bits define, in the case of stop exit (if VSTBY bit was set). <b>NOTE:</b> Clock cycles ratio depends on pmic_delay_scaler, defined by CGPR[0] bit.  00 CCM will wait (1*pmic_delay_scaler)+1 ckil clock cycles 01 CCM will wait (3*pmic_delay_scaler)+1 ckil clock cycles 10 CCM will wait (7*pmic_delay_scaler)+1 ckil clock cycles 11 CCM will wait (15*pmic_delay_scaler)+1 ckil clock cycles
8 VSTBY	Voltage standby request bit. This bit defines if PMIC_STBY_REQ pin, which notifies external power management IC to move from functional voltage to standby voltage, will be asserted in STOP mode.  0 Voltage will not be changed to standby voltage after next entrance to STOP mode. ( PMIC_STBY_REQ will remain negated - '0') 1 Voltage will be requested to change to standby voltage after next entrance to stop mode. ( PMIC_STBY_REQ will be asserted - '1').
7 DIS_REF_OSC	dis_ref_osc - in run mode, software can manually control closing of external reference oscillator clock, i.e. generating '1' on CCM_REF_EN_B signal. If software closed manually the external reference clock, then sbyos functionality will be bypassed.  The manual closing of external reference oscillator should be performed only in case the reference oscillator is not the source of any clock generation.  <b>NOTE:</b> When returning from stop mode, the PMIC_STBY_REQ will be deasserted (if it was asserted when entering stop mode). See stby_count bits.

Table continues on the next page...

## CCM\_CLPCR field descriptions (continued)

Field	Description
	0 external high frequency oscillator will be enabled, i.e. CCM_REF_EN_B = '0'. 1 external high frequency oscillator will be disabled, i.e. CCM_REF_EN_B = '1'
6 SBYOS	Standby clock oscillator bit. This bit defines if <code>cosc_pwrdown</code> , which power down the on chip oscillator, will be asserted in STOP mode. This bit is discarded if <code>cosc_pwrdown</code> ='1' for the on chip oscillator.  0 On-chip oscillator will not be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will remain asserted - '0' and <code>cosc_pwrdown</code> will remain de asserted - '0') 1 On-chip oscillator will be powered down, after next entrance to STOP mode. (CCM_REF_EN_B will be deasserted - '1' and <code>cosc_pwrdown</code> will be asserted - '1'). When returning from STOP mode, external oscillator will be enabled again, on-chip oscillator will return to oscillator mode, and after <code>oscnt</code> count, CCM will continue with the exit from the STOP mode process.
5 ARM_CLK_DIS_ON_LPM	Define if ARM clocks ( <code>arm_clk</code> , <code>soc_mxclk</code> , <code>soc_pclk</code> , <code>soc_dbg_pclk</code> , <code>vl_wrck</code> ) will be disabled on wait mode. This is useful for debug mode, when the user still wants to simulate entering wait mode and still keep ARM clock functioning.  <b>NOTE:</b> Software should not enable ARM power gating in wait mode if this bit is cleared.  0 ARM clock enabled on wait mode. 1 ARM clock disabled on wait mode. .
4-3 -	This field is reserved. Reserved
2 -	This field is reserved. Reserved
LPM	Setting the low power mode that system will enter on next assertion of <code>dsm_request</code> signal.  00 Remain in run mode 01 Transfer to wait mode 10 Transfer to stop mode 11 Reserved

### 18.7.17 CCM Interrupt Status Register (CCM\_CISR)

The figure below represents the CCM Interrupt Status Register (CISR). This is a write one to clear register. Once a interrupt is generated, software should write one to clear it. The table below provides its field descriptions.

#### NOTE

CCM interrupt request 1 can be masked by CCM interrupt request 1 mask bit. CCM interrupt request 2 can be masked by CCM interrupt request 2 mask bit.

## CCM Memory Map/Register Definition

Address: 400F\_C000h base + 58h offset = 400F\_C058h

### CCM\_CGPR field descriptions

Field	Description
31–18 Reserved	This read-only field is reserved and always has the value 0.
17 INT_MEM_CLK_LPM	Control for the Deep Sleep signal to the ARM Platform memories with additional control logic based on the ARM WFI signal. Used to keep the ARM Platform memory clocks enabled if an interrupt is pending when entering low power mode.  <b>NOTE:</b> This bit should always be set when the CCM_CLPCR_LPM bits are set to 01(WAIT Mode) or 10 (STOP mode) without power gating. This bit does not have to be set for STOP mode entry.  0 Disable the clock to the ARM platform memories when entering Low Power Mode 1 Keep the clocks to the ARM platform memories enabled only if an interrupt is pending when entering Low Power Modes (WAIT and STOP without power gating)
16 FPL	Fast PLL enable.  0 Engage PLL enable default way. 1 Engage PLL enable 3 CKIL clocks earlier at exiting low power mode (STOP). Should be used only if 24MHz OSC was active in low power mode.

Table continues on the next page...

## CCM\_CGPR field descriptions (continued)

Field	Description
15–14 SYS_MEM_DS_CTRL	System memory DS control 00 Disable memory DS mode always 01 Enable memory (outside ARM platform) DS mode when system STOP and PLL are disabled 1x enable memory (outside ARM platform) DS mode when system is in STOP mode
13–9 Reserved	This read-only field is reserved and always has the value 1.
8–7 Reserved	This read-only field is reserved and always has the value 0.
6–5 Reserved	This read-only field is reserved and always has the value 1.
4 EFUSE_PROG_SUPPLY_GATE	Defines the value of the output signal cgpr_dout[4]. Gate of program supply for efuse programming 0 fuse programming supply voltage is gated off to the efuse module 1 allow fuse programming.
3–2 -	This field is reserved. Reserved
1 -	Reserved. Keep default value set to '1' for proper operation.
0 PMIC_DELAY_SCALER	Defines clock division of clock for stby_count (pmic delay counter) 0 clock is not divided 1 clock is divided /8

### 18.7.21 CCM Clock Gating Register 0 (CCM\_CCGR0)

CG(i) bits CCGR 0-6

These bits are used to turn on/off the clock to each module independently. The following table details the possible clock activity conditions for each module.

CGR value	Clock Activity Description
00	Clock is off during all modes. Stop enter hardware handshake is disabled.
01	Clock is on in run mode, but off in WAIT and STOP modes
10	Not applicable (Reserved).
11	Clock is on during all modes, except STOP mode.

Module should be stopped, before set its bits to "0"; clocks to the module will be stopped immediately.

The tables above show the register mappings for the different CGRs. The clock connectivity table should be used to match the "CCM output affected" to the actual clocks going into the modules.

## CCM Memory Map/Register Definition

The figure below represents the CCM Clock Gating Register 0 (CCM\_CCGR0). The clock gating Registers define the clock gating for power reduction of each clock (CG(i) bits). There are 7 CGR registers. The number of registers required is according to the number of peripherals in the system.

Address: 400F\_C000h base + 68h offset = 400F\_C068h

## CCM\_CCGR6 field descriptions (continued)

Field	Description
27–26 CG13	timer1 clocks (timer1_clk_enable)
25–24 CG12	lpi2c4 serial clock (lpi2c4_serial_clk_enable)
23–22 CG11	anadig clocks (anadig_clk_enable)
21–20 CG10	sim_per clock (sim_per_clk_enable)
19–18 CG9	aips_tz3 clock (aips_tz3_clk_enable)
17–16 CG8	timer4 clocks (timer4_clk_enable)
15–14 CG7	lpuart8 clocks (lpuart8_clk_enable)
13–12 CG6	trng clock (trng_clk_enable)
11–10 CG5	flexspi clocks (flexspi_clk_enable) <b>NOTE:</b> sim_ems_clk_enable must also be cleared, when flexspi_clk_enable is cleared.
9–8 CG4	ipmux4 clock (ipmux4_clk_enable)
7–6 CG3	dcdc clocks (dcdc_clk_enable)
5–4 CG2	usdhc2 clocks (usdhc2_clk_enable)
3–2 CG1	usdhc1 clocks (usdhc1_clk_enable)
CG0	usboh3 clock (usboh3_clk_enable)

## 18.7.28 CCM Module Enable Override Register (CCM\_CMEOR)

The follow figure represents the CCM Module Enable Override Register (CMEOR). The CMEOR register contains bits to override the clock enable signal from the module. This bit will be applicable only for modules whose clock enable signals are used. The following table provides its field descriptions.

Address: 400F\_C000h base + 88h offset = 400F\_C088h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
R	1	MOD_EN_OV_ CAN1_CPI	1	MOD_EN_OV_ CAN2_CPI	1													
W	[Reserved]																	
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
R	1											MOD_EN_OV_ TRNG	1	MOD_EN_USDHC	MOD_EN_OV_PIT	MOD_EN_OV_GPT	1	
W	[Reserved]											MOD_EN_OV_ TRNG	[Reserved]	MOD_EN_USDHC	MOD_EN_OV_PIT	MOD_EN_OV_GPT	[Reserved]	
Reset	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1		

### CCM\_CMEOR field descriptions

Field	Description
31 Reserved	This read-only field is reserved and always has the value 1.
30 MOD_EN_OV_ CAN1_CPI	Override clock enable signal from CAN1 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
29 Reserved	This read-only field is reserved and always has the value 1.
28 MOD_EN_OV_ CAN2_CPI	Override clock enable signal from CAN2 - clock will not be gated based on CAN's signal 'enable_clk_cpi'. 0 don't override module enable signal 1 override module enable signal
27-10 Reserved	This read-only field is reserved and always has the value 1.

Table continues on the next page...

## CCM\_CMEOR field descriptions (continued)

Field	Description
9 MOD_EN_OV_ TRNG	Override clock enable signal from TRNG 0 don't override module enable signal 1 override module enable signal
8 Reserved	This read-only field is reserved and always has the value 1.
7 MOD_EN_ USDHC	override clock enable signal from USDHC. 0 don't override module enable signal 1 override module enable signal
6 MOD_EN_OV_ PIT	Override clock enable signal from PIT - clock will not be gated based on PIT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
5 MOD_EN_OV_ GPT	Override clock enable signal from GPT - clock will not be gated based on GPT's signal 'ipg_enable_clk' . 0 don't override module enable signal 1 override module enable signal
Reserved	This read-only field is reserved and always has the value 1.

## 18.8 CCM Analog Memory Map/Register Definition

This section describes the registers for the analog PLLs. The registers which have the same description are grouped within { }. The register offsets for the various PLLs are:

- ARM PLL: {0h000, 0h004, 0h008, 0h00C}.
- USB1 PLL: {0h010, 0h014, 0h018, 0h01C}, {0h0F0, 0h0F4, 0h0F8, 0h0FC}.
- System PLL: {0h030, 0h034, 0h038, 0h03C}, 0h040, 0h050, 0h060, {0h100, 0h104, 0h108, 0h10C}.
- Audio / Video PLL: {0h070, 0h074, 0h078, 0h07C}, 0h080, 0h090, {0h0A0, 0h0A4, 0h0A8, 0h0AC}, 0h0B0, 0h0C0

### 18.8.1 Analog ARM PLL control Register (CCM\_ANALOG\_PLL\_ARMn)

The control register provides control for the system PLL.

Address: 400D\_8000h base + 0h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_ARMn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30-20 -	Always set to zero (0).
19 PLL_SEL	Reserved

Table continues on the next page...

## CCM\_ANALOG\_PLL\_ARMn field descriptions (continued)

Field	Description
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source.  <b>NOTE:</b> Changing the Bypass clock source also changes the PLL reference clock source.  0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for divider value: 54-108. $F_{out} = F_{in} * div\_select / 2.0$ .

## 18.8.2 Analog USB1 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB1n)

The control register provides control for USBPHY0 480MHz PLL.

Address: 400D\_8000h base + 10h offset + (4d × i), where i=0d to 3d

CCM\_ANALOG\_PLL\_USB1n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source.
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY0 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	Powers the 9-phase PLL outputs for USBPHYn. Additionally, the UTMI clock gate must be deasserted in the USBPHYn to enable USBn operation (clear CLKGATE bit in USBPHYn_CTRL). This bit will be set automatically when USBPHYn remote wakeup event occurs.  0 PLL outputs for USBPHYn off. 1 PLL outputs for USBPHYn on.
5–2 -	Always set to zero (0).
1 DIV_SELECT	This field controls the PLL loop divider. 0 - $F_{out}=F_{ref}*20$ ; 1 - $F_{out}=F_{ref}*22$ .

Table continues on the next page...

**CCM\_ANALOG\_PLL\_USB1*n* field descriptions (continued)**

Field	Description
0 -	This field is reserved. Reserved.

### 18.8.3 Analog USB2 480MHz PLL Control Register (CCM\_ANALOG\_PLL\_USB2n)

The control register provides control for USBPHY1 480MHz PLL.

Address: 400D\_8000h base + 20h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_USB2n field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–17 -	Always set to zero (0).
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the PLL clock output.
12 POWER	Powers up the PLL. This bit will be set automatically when USBPHY1 remote wakeup event happens.
11–7 -	Always set to zero (0).
6 EN_USB_CLKS	0: 8-phase PLL outputs for USBPHY1 are powered down. If set to 1, 8-phase PLL outputs for USBPHY1 are powered up. Additionally, the utmi clock gate must be deasserted in the USBPHY1 to enable USB0 operation (clear CLKGATE bit in USBPHY1_CTRL). This bit will be set automatically when USBPHY1 remote wakeup event happens.
5–2 -	Always set to zero (0).
1 DIV_SELECT	This field controls the PLL loop divider. 0 - $F_{out}=F_{ref}*20$ ; 1 - $F_{out}=F_{ref}*22$ .

Table continues on the next page...

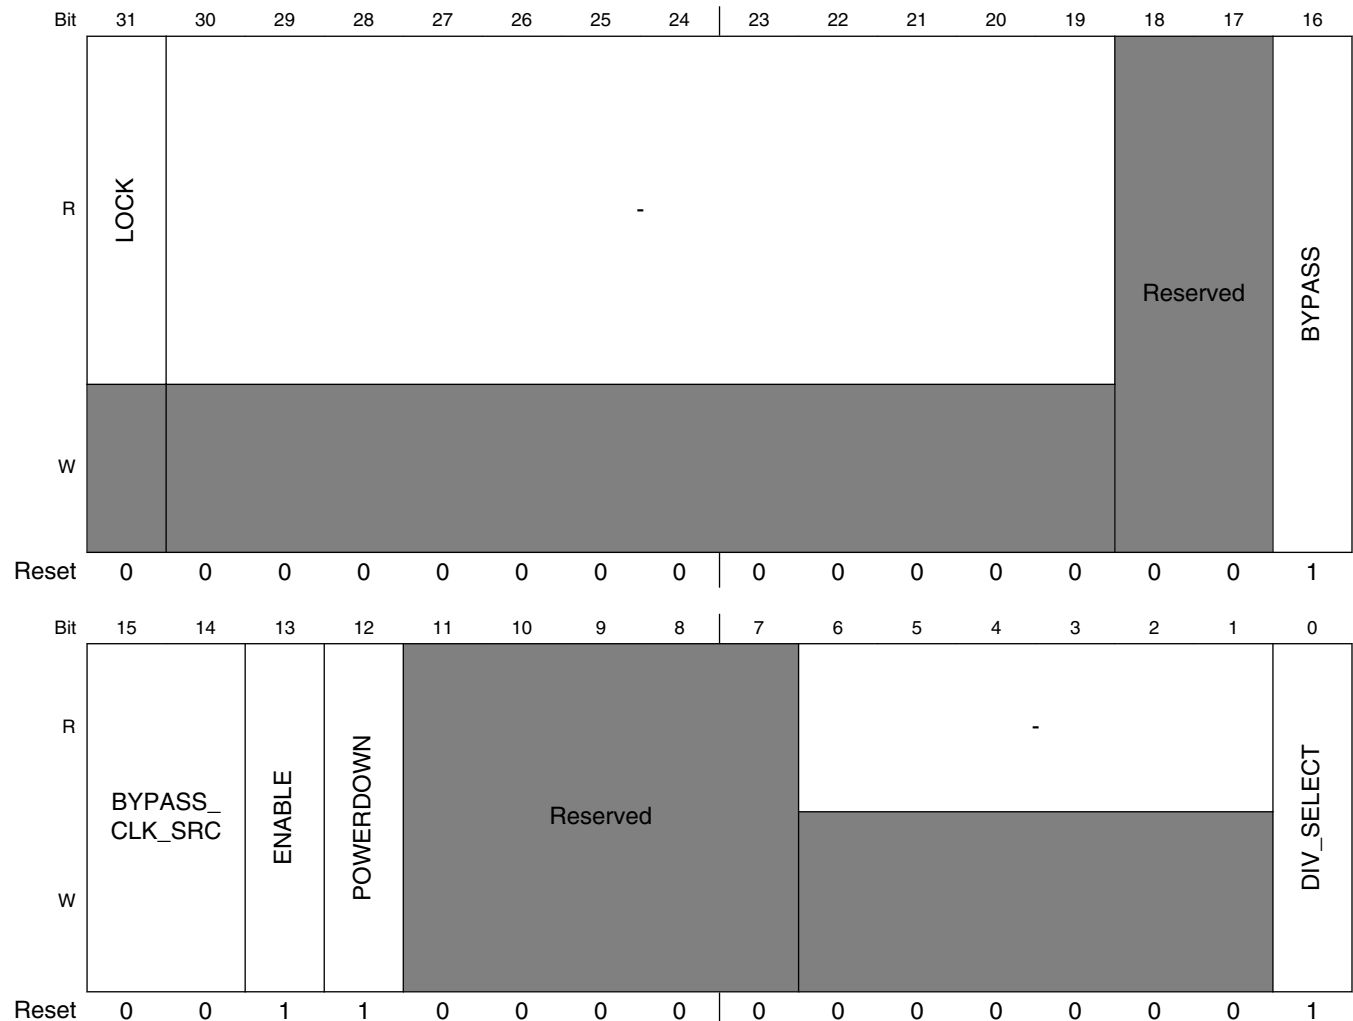

## CCM\_ANALOG\_PLL\_USB2n field descriptions (continued)

Field	Description
0	This field is reserved.
-	Reserved.

### 18.8.4 Analog System PLL Control Register (CCM\_ANALOG\_PLL\_SYSn)

The control register provides control for the 528MHz PLL.

Address: 400D\_8000h base + 30h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_SYSn field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–19 -	Always set to zero (0).
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source.
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–1 -	Always set to zero (0).
0 DIV_SELECT	This field controls the PLL loop divider. 0 - Fout=Fref*20; 1 - Fout=Fref*22.

### 18.8.5 528MHz System PLL Spread Spectrum Register (CCM\_ANALOG\_PLL\_SYS\_SS)

This register contains the 528 PLL spread spectrum controls.

Address: 400D\_8000h base + 40h offset = 400D\_8040h

**CCM\_ANALOG\_PLL\_SYS\_SS field descriptions**

Field	Description
31–16 STOP	Frequency change = stop/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.
15 ENABLE	Enable bit 0 — Spread spectrum modulation disabled 1 — Spread spectrum modulation enabled
STEP	Frequency change step = step/CCM_ANALOG_PLL_SYS_DENOM[B]*24MHz.

**18.8.6 Numerator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_NUM)**

This register contains the numerator of 528MHz PLL fractional loop divider (signed number).

Absolute value should be less than denominator

Address: 400D\_8000h base + 50h offset = 400D\_8050h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	-																A

**CCM\_ANALOG\_PLL\_SYS\_NUM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
A	30 bit numerator (A) of fractional loop divider (signed integer).

### 18.8.7 Denominator of 528MHz System PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_SYS\_DENOM)

This register contains the Denominator of 528MHz PLL fractional loop divider.

Address: 400D\_8000h base + 60h offset = 400D\_8060h

#### CCM\_ANALOG\_PLL\_SYS\_DENOM field descriptions

Field	Description
31-30 -	Always set to zero (0).
B	30 bit Denominator (B) of fractional loop divider (unsigned integer).

## 18.8.8 Analog Audio PLL control Register (CCM\_ANALOG\_PLL\_AUDION)

The control register provides control for the audio PLL.

Address: 400D\_8000h base + 70h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_PLL\_AUDION field descriptions

Field	Description
31 LOCK	1 - PLL is currently locked. 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 -	This field is reserved. Reserved
20–19 POST_DIV_SELECT	These bits implement a divider after the PLL, but before the enable and bypass mux. 00 — Divide by 4. 01 — Divide by 2. 10 — Divide by 1. 11 — Reserved
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable PLL output
12 POWERDOWN	Powers down the PLL.

Table continues on the next page...

**CCM\_ANALOG\_PLL\_AUDIO<sub>n</sub> field descriptions (continued)**

Field	Description
11–7 -	This field is reserved. Reserved.
DIV_SELECT	This field controls the PLL loop divider. Valid range for DIV_SELECT divider value: 27~54.

**18.8.9 Numerator of Audio PLL Fractional Loop Divider Register (CCM\_ANALOG\_PLL\_AUDIO\_NUM)**

This register contains the numerator (A) of Audio PLL fractional loop divider.(Signed number), absolute value should be less than denominator

Absolute value should be less than denominator

Address: 400D\_8000h base + 80h offset = 400D\_8080h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**CCM\_ANALOG\_PLL\_VIDEO\_DENOM field descriptions**

Field	Description
31–30 -	Always set to zero (0).
B	30 bit Denominator of fractional loop divider.

**18.8.14 Analog ENET PLL Control Register (CCM\_ANALOG\_PLL\_ENETn)**

The control register provides control for the ENET PLL.

Address: 400D\_8000h base + E0h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_PLL\_ENET $n$  field descriptions**

Field	Description
31 LOCK	1 - PLL is currently locked; 0 - PLL is not currently locked.
30–22 -	Always set to zero (0).
21 ENET_25M_ REF_EN	Enable the PLL providing ENET 25 MHz reference clock
20–19 -	This field is reserved. Reserved
18–17 -	This field is reserved. Reserved
16 BYPASS	Bypass the PLL.
15–14 BYPASS_CLK_ SRC	Determines the bypass source. 0x0 <b>REF_CLK_24M</b> — Select the 24MHz oscillator as source. 0x1 <b>CLK1</b> — Select the CLK1_N / CLK1_P as source. 0x2 <b>Reserved1</b> — 0x3 <b>Reserved2</b> —
13 ENABLE	Enable the ethernet clock output.
12 POWERDOWN	Powers down the PLL.
11–7 -	This field is reserved. Reserved.
6–2 -	Always set to zero (0).
DIV_SELECT	Controls the frequency of the ethernet reference clock.00 - 25MHz; 01 - 50MHz; 10 - 100MHz (not 50% duty cycle); 11 - 125MHz;

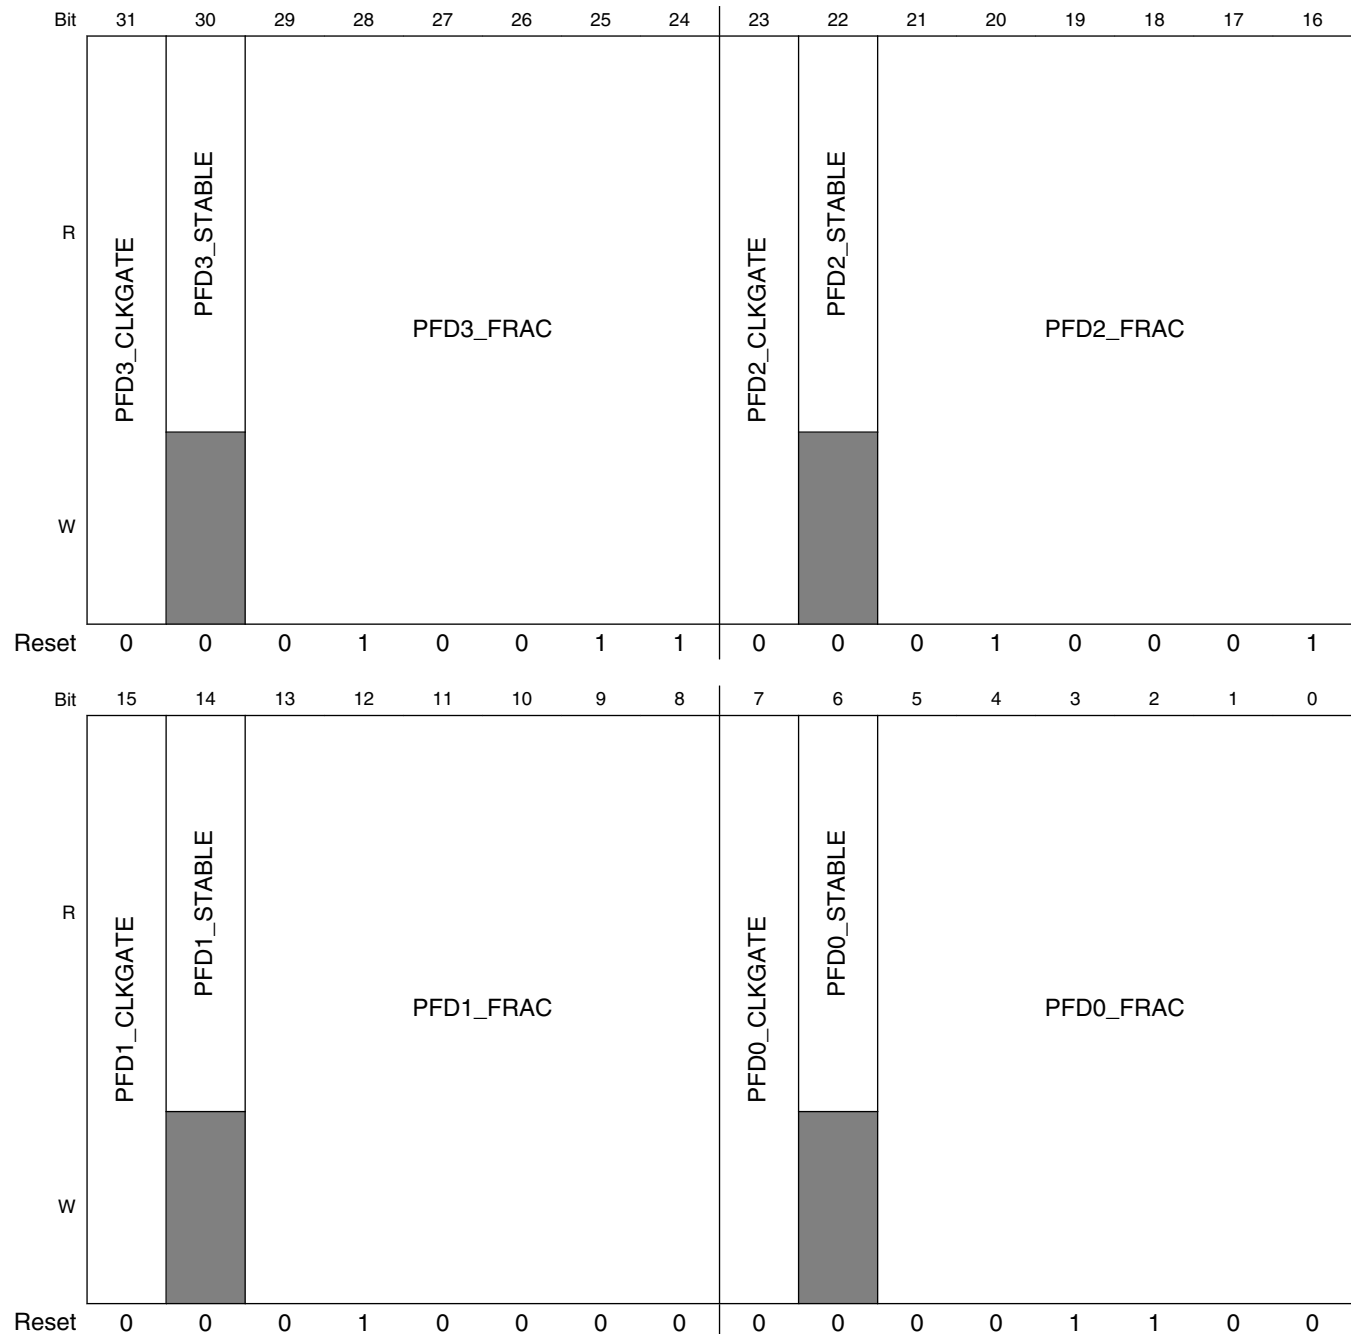

**18.8.15 480MHz Clock (PLL3) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_480 $n$ )**

The PFD\_480 control register provides control for PFD clock generation.

This register controls the 4-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

## CCM Analog Memory Map/Register Definition

Address: 400D\_8000h base + F0h offset + (4d × i), where i=0d to 3d

### CCM\_ANALOG\_PFD\_480n field descriptions

Field	Description
31 PFD3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL is powered down
30 PFD3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Table continues on the next page...

**CCM\_ANALOG\_PFD\_480n field descriptions (continued)**

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL is powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $480 \cdot 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

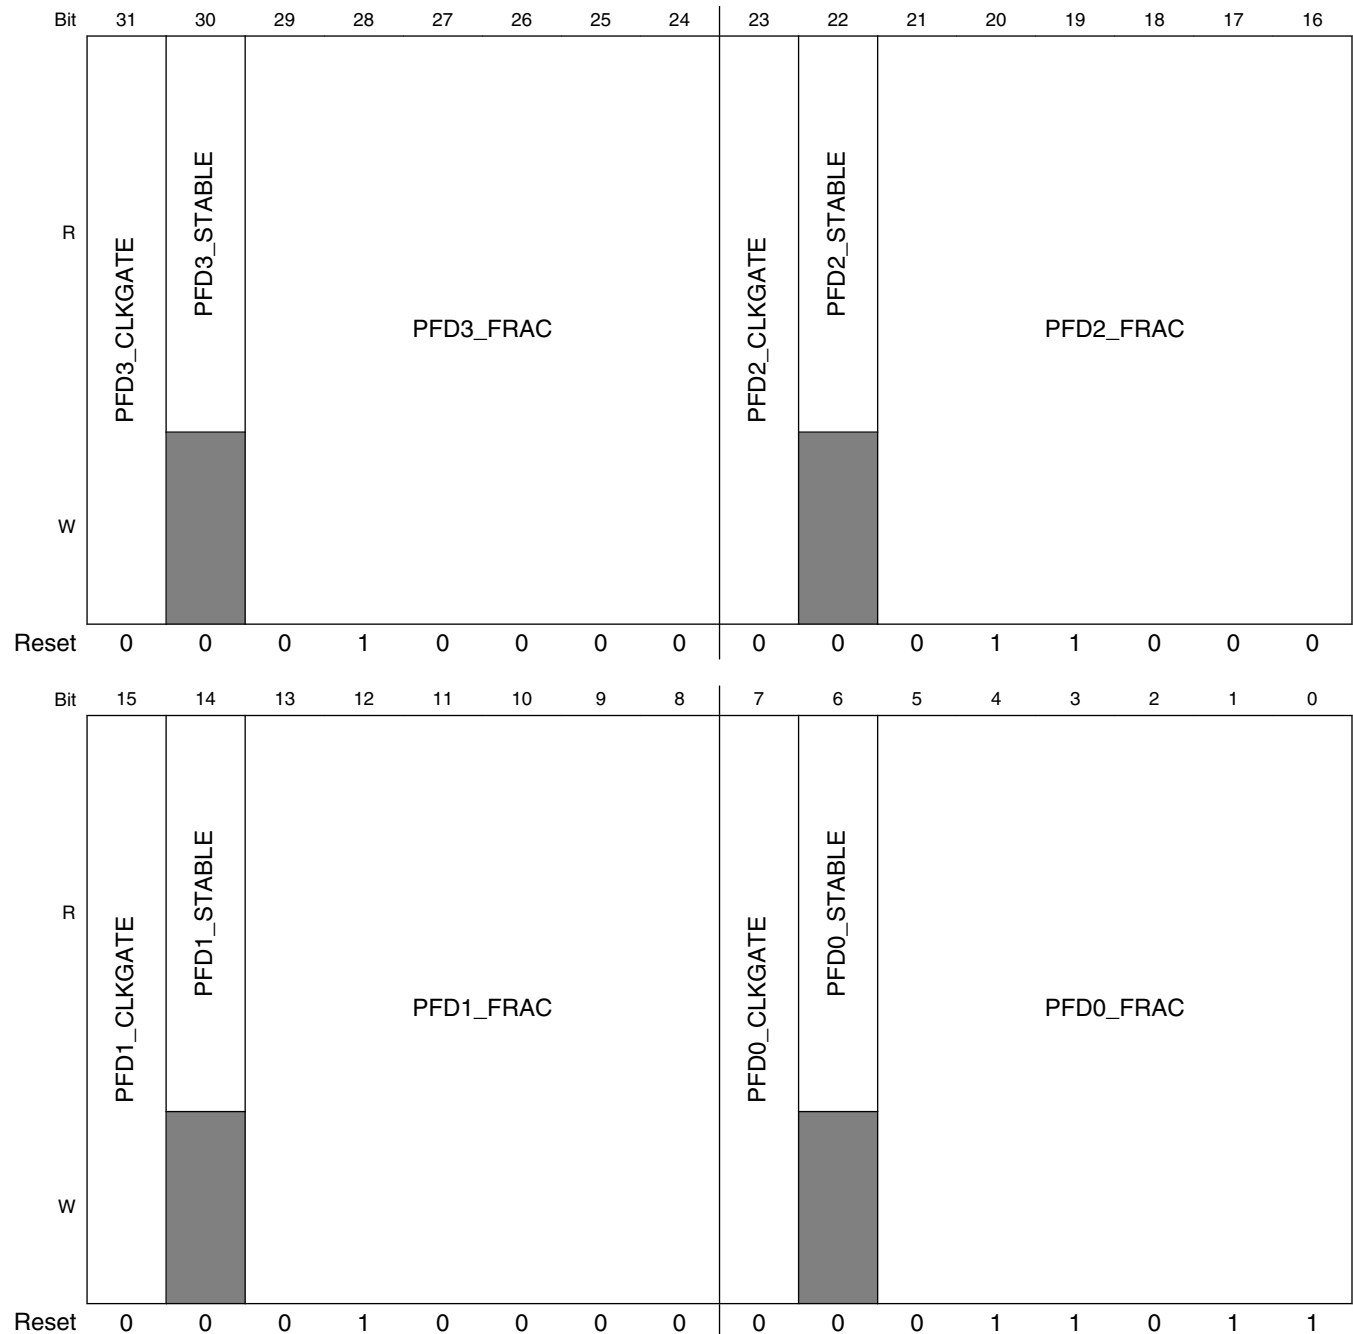

**18.8.16 528MHz Clock (PLL2) Phase Fractional Divider Control Register (CCM\_ANALOG\_PFD\_528n)**

The PFD\_528 control register provides control for PFD clock generation.

This register controls the 3-phase fractional clock dividers. The fractional clock frequencies are a product of the values in these registers.

## CCM Analog Memory Map/Register Definition

Address: 400D\_8000h base + 100h offset + (4d × i), where i=0d to 3d

### CCM\_ANALOG\_PFD\_528n field descriptions

Field	Description
31 PF3D3_CLKGATE	IO Clock Gate. If set to 1, the 3rd fractional divider clock (reference ref_pfd3) is off (power savings). 0: ref_pfd3 fractional divider clock is enabled. Need to assert this bit before PLL powered down
30 PF3D3_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit,

Field	Description
	program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
29–24 PFD3_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \cdot 18 / \text{PFD3\_FRAC}$ where PFD3_FRAC is in the range 12-35.
23 PFD2_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd2) is off (power savings). 0: ref_pfd2 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
22 PFD2_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
21–16 PFD2_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \cdot 18 / \text{PFD2\_FRAC}$ where PFD2_FRAC is in the range 12-35.
15 PFD1_CLKGATE	IO Clock Gate. If set to 1, the IO fractional divider clock (reference ref_pfd1) is off (power savings). 0: ref_pfd1 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
14 PFD1_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
13–8 PFD1_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \cdot 18 / \text{PFD1\_FRAC}$ where PFD1_FRAC is in the range 12-35.
7 PFD0_CLKGATE	If set to 1, the IO fractional divider clock (reference ref_pfd0) is off (power savings). 0: ref_pfd0 fractional divider clock is enabled.  Need to assert this bit before PLL powered down
6 PFD0_STABLE	This read-only bitfield is for DIAGNOSTIC PURPOSES ONLY since the fractional divider should become stable quickly enough that this field will never need to be used by either device driver or application code. The value inverts when the new programmed fractional divide value has taken effect. Read this bit, program the new value, and when this bit inverts, the phase divider clock output is stable. Note that the value will not invert when the fractional divider is taken out of or placed into clock-gated state.
PFD0_FRAC	This field controls the fractional divide value. The resulting frequency shall be $528 \cdot 18 / \text{PFD0\_FRAC}$ where PFD0_FRAC is in the range 12-35.

### 18.8.17 Miscellaneous Register 0 (CCM\_ANALOG\_MISC0n)

This register defines the control and status bits for miscellaneous analog blocks.

Address: 400D\_8000h base + 150h offset + (4d × i), where i=0d to 3d

**CCM\_ANALOG\_MISC0n field descriptions**

Field	Description
31 -	This field is reserved.
30 XTAL_24M_PWD	This field powers down the 24M crystal oscillator if set true. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
29 RTC_XTAL_SOURCE	This field indicates which chip source is being used for the rtc clock. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a> 0 Internal ring oscillator 1 RTC_XTAL
28-26 CLKGATE_DELAY	This field specifies the delay between powering up the XTAL 24MHz clock and releasing the clock to the digital logic inside the analog block. <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify. <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a> 000 0.5ms

Table continues on the next page...

## CCM\_ANALOG\_MISC0n field descriptions (continued)

Field	Description
	001 1.0ms 010 2.0ms 011 3.0ms 100 4.0ms 101 5.0ms 110 6.0ms 111 7.0ms
25 CLKGATE_CTRL	This bit allows disabling the clock gate (always ungated) for the xtal 24MHz clock that clocks the digital logic in the analog block.  <b>NOTE:</b> Do not change the field during a low power event. This is not a field that the user would normally need to modify.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>  0 <b>ALLOW_AUTO_GATE</b> — Allow the logic to automatically gate the clock when the XTAL is powered down. 1 <b>NO_AUTO_GATE</b> — Prevent the logic from ever gating off the clock.
24–17 -	This field is reserved. Always set to zero.
16 OSC_XTALOK_EN	This bit enables the detector that signals when the 24MHz crystal oscillator is stable.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
15 OSC_XTALOK	Status bit that signals that the output of the 24-MHz crystal oscillator is stable. Generated from a timer and active detection of the actual frequency.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>
14–13 OSC_I	This field determines the bias current in the 24MHz oscillator. The aim is to start up with the highest bias current, which can be decreased after startup if it is determined to be acceptable.  <b>NOTE:</b> Not related to CCM. See <a href="#">Crystal Oscillator (XTALOSC)</a>  00 <b>NOMINAL</b> — Nominal 01 <b>MINUS_12_5_PERCENT</b> — Decrease current by 12.5% 10 <b>MINUS_25_PERCENT</b> — Decrease current by 25.0% 11 <b>MINUS_37_5_PERCENT</b> — Decrease current by 37.5%
12 DISCON_HIGH_SNVS	This bit controls a switch from VDD_HIGH_IN to VDD_SNVS_IN.  0 Turn on the switch 1 Turn off the switch
11–10 STOP_MODE_CONFIG	Configure the analog behavior in stop mode.  00 All analog except rtc powered down on stop mode assertion. XtalOsc=on, RCOsc=off; 01 Certain analog functions such as certain regulators left up. XtalOsc=on, RCOsc=off; 10 XtalOsc=off, RCOsc=on, Old BG=on, New BG=off. 11 XtalOsc=off, RCOsc=on, Old BG=off, New BG=on.

Table continues on the next page...

## CCM\_ANALOG\_MISC0n field descriptions (continued)

Field	Description
9–8 -	This field is reserved. Reserved
7 REFTOP_ VBGUP	Status bit that signals the analog bandgap voltage is up and stable. 1 - Stable. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
6–4 REFTOP_ VBGADJ	<b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  000 Nominal VBG 001 VBG+0.78% 010 VBG+1.56% 011 VBG+2.34% 100 VBG-0.78% 101 VBG-1.56% 110 VBG-2.34% 111 VBG-3.12%
3 REFTOP_ SELFBIASOFF	Control bit to disable the self-bias circuit in the analog bandgap. The self-bias circuit is used by the bandgap during startup. This bit should be set after the bandgap has stabilized and is necessary for best noise performance of analog blocks using the outputs of the bandgap. <b>NOTE:</b> Value should be returned to zero before removing vddhigh_in or asserting bit 0 of this register (REFTOP_PWD) to assure proper restart of the circuit. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>  0 Uses coarse bias currents for startup 1 Uses bandgap-based bias currents for best performance.
2–1 -	This field is reserved.
0 REFTOP_PWD	Control bit to power-down the analog bandgap reference circuitry. <b>NOTE:</b> A note of caution, the bandgap is necessary for correct operation of most of the LDO, PLL, and other analog functions on the die. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>

### 18.8.18 Miscellaneous Register 1 (CCM\_ANALOG\_MISC1n)

This register defines the control and status bits for miscellaneous analog blocks. The LVDS1 and LVDS2 controls below control the behavior of the anaclk1/1b LVDS IO.

Address: 400D\_8000h base + 160h offset + (4d × i), where i=0d to 3d

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## CCM\_ANALOG\_MISC1n field descriptions

Field	Description
31 IRQ_DIG_BO	This status bit is set to one when when any of the digital regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
30 IRQ_ANA_BO	This status bit is set to one when when any of the analog regulator brownout interrupts assert. Check the regulator status bits to discover which regulator interrupt asserted. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
29 IRQ_TEMPHIGH	This status bit is set to one when the temperature sensor high interrupt asserts for high temperature. <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
28 IRQ_TEMPLOW	This status bit is set to one when the temperature sensor low interrupt asserts for low temperature. <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
27 IRQ_TEMP PANIC	This status bit is set to one when the temperature sensor panic interrupt asserts for a panic high temperature. <b>NOTE:</b> Not related to CCM. See <a href="#">Temperature Monitor (TEMPMON)</a>
26–18 -	This field is reserved. Reserved
17 PFD_528_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_528 clocks anytime the PLL_528 is unlocked or powered off.
16 PFD_480_ AUTOGATE_EN	This enables a feature that will clkgate (reset) all PFD_480 clocks anytime the USB1_PLL_480 is unlocked or powered off.
15–14 -	This field is reserved. Reserved
13 -	This field is reserved. Reserved
12 LVDSCLK1_ IBEN	This enables the LVDS input buffer for anack1/1b. Do not enable input and output buffers simultaneously.
11 -	This field is reserved. Reserved
10 LVDSCLK1_ OBEN	This enables the LVDS output buffer for anack1/1b. Do not enable input and output buffers simultaneously.
9–5 -	This field is reserved. Reserved
LVDS1_CLK_ SEL	This field selects the clk to be routed to anack1/1b.  00000 <b>ARM_PLL</b> — Arm PLL 00001 <b>SYS_PLL</b> — System PLL 00010 <b>PFD4</b> — ref_pfd4_clk == pll2_pfd0_clk

Field	Description
00011	<b>PFD5</b> — ref_pfd5_clk == pll2_pfd1_clk
00100	<b>PFD6</b> — ref_pfd6_clk == pll2_pfd2_clk
00101	<b>PFD7</b> — ref_pfd7_clk == pll2_pfd3_clk
00110	<b>AUDIO_PLL</b> — Audio PLL
00111	<b>VIDEO_PLL</b> — Video PLL
01001	<b>ETHERNET_REF</b> — ethernet ref clock (ENET_PLL)
01100	<b>USB1_PLL</b> — USB1 PLL clock
01101	<b>USB2_PLL</b> — USB2 PLL clock
01110	<b>PFD0</b> — ref_pfd0_clk == pll3_pfd0_clk
01111	<b>PFD1</b> — ref_pfd1_clk == pll3_pfd1_clk
10000	<b>PFD2</b> — ref_pfd2_clk == pll3_pfd2_clk
10001	<b>PFD3</b> — ref_pfd3_clk == pll3_pfd3_clk
10010	<b>XTAL</b> — xtal (24M)
10101 to 11111	ref_pfd7_clk == pll2_pfd3_clk

## 18.8.19 Miscellaneous Register 2 (CCM\_ANALOG\_MISC2n)

This register defines the control for miscellaneous analog blocks.

### NOTE

This register is shared with PMU.

Address: 400D\_8000h base + 170h offset + (4d × i), where i=0d to 3d

## CCM Analog Memory Map/Register Definition

### CCM\_ANALOG\_MISC2n field descriptions

Field	Description
31–30 VIDEO_DIV	<p>Post-divider for video. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_VIDEOOn[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4.</p> <p>00 divide by 1 (Default)            01 divide by 2            10 divide by 1            11 divide by 4</p>
29–28 REG2_STEP_TIME	<p>Number of clock periods (24MHz clock).</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>00 <b>64_CLOCKS</b> — 64            01 <b>128_CLOCKS</b> — 128            10 <b>256_CLOCKS</b> — 256            11 <b>512_CLOCKS</b> — 512</p>
27–26 REG1_STEP_TIME	<p>Number of clock periods (24MHz clock).</p>

Table continues on the next page...

## CCM\_ANALOG\_MISC2n field descriptions (continued)

Field	Description
	<p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>00 <b>64_CLOCKS</b> — 64            01 <b>128_CLOCKS</b> — 128            10 <b>256_CLOCKS</b> — 256            11 <b>512_CLOCKS</b> — 512</p>
25–24 REG0_STEP_ TIME	<p>Number of clock periods (24MHz clock).</p> <p><b>NOTE:</b> Not related to CCM. 23 AUDIO_DIV_ MSB	<p>MSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIO[POST_DIV_SELECT] to achieve division ratios of /1, /2, /4.</p> <p><b>NOTE:</b> MSB bit value pertains to the first bit, please program the LSB bit (bit 15) as well to change divider value for more information.</p> <p>00 divide by 1 (Default)            01 divide by 2            10 divide by 1            11 divide by 4</p>
22 REG2_OK	<p>Signals that the voltage is above the brownout level for the SOC supply. 1 = regulator output &gt; brownout_target</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
21 REG2_ENABLE_ BO	<p>Enables the brownout detection.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
20 -	This field is reserved.
19 REG2_BO_ STATUS	<p>Reg2 brownout status bit.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
18–16 REG2_BO_ OFFSET	<p>This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>100 Brownout offset = 0.100V            111 Brownout offset = 0.175V</p>

Table continues on the next page...

## CCM\_ANALOG\_MISC2n field descriptions (continued)

Field	Description
15 AUDIO_DIV_LSB	<p>LSB of Post-divider for Audio PLL. The output clock of the video PLL should be gated prior to changing this divider to prevent glitches. This divider is feed by PLL_AUDIO on [POST_DIV_SELECT] to achieve division ratios of /1, /2, /4.</p> <p><b>NOTE:</b> LSB bit value pertains to the last bit, please program the MSB bit (bit 23) as well, to change divider value for more information.</p> <p>00 divide by 1 (Default) 01 divide by 2 10 divide by 1 11 divide by 4</p>
14 REG1_OK	<p>GPU/VPU supply</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
13 REG1_ENABLE_BO	<p>Enables the brownout detection.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>
12 -	This field is reserved.
11 REG1_BO_STATUS	<p>Reg1 brownout status bit.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>1 Brownout, supply is below target minus brownout offset.</p>
10-8 REG1_BO_OFFSET	<p>This field defines the brown out voltage offset for the xPU power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. The reset brown-offset is 175mV below the programmed target code. Brownout target = OUTPUT_TRG - BO_OFFSET. Some steps may be irrelevant because of input supply limitations or load operation.</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p> <p>100 Brownout offset = 0.100V 111 Brownout offset = 0.175V</p>
7 PLL3_disable	<p>When USB is in low power suspend mode this Control bit is used to indicate if other system peripherals require the USB PLL3 clock when the SoC is not in low power mode. A user needs to set this bit if they want to optionally disable PLL3 while the SoC is not in any low power mode to save power. When the system does go into low power mode this bit setting would not have any affect.</p> <p><b>NOTE:</b> When USB is in low power suspend mode users would need to ensure PLL3 is not being used before setting this bit in RUN mode. Please refer to the correct PLL disabling procedure in <a href="#">Disabling / Enabling PLLs</a></p> <p>0 PLL3 is being used by peripherals and is enabled when SoC is not in any low power mode 1 PLL3 can be disabled when the SoC is not in any low power mode</p>
6 REG0_OK	<p>ARM supply</p> <p><b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a></p>

Table continues on the next page...

## CCM\_ANALOG\_MISC2n field descriptions (continued)

Field	Description
5 REG0_ENABLE_ BO	Enables the brownout detection. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a>
4 -	This field is reserved.
3 REG0_BO_ STATUS	Reg0 brownout status bit. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> 1 Brownout, supply is below target minus brownout offset.
REG0_BO_ OFFSET	This field defines the brown out voltage offset for the CORE power domain. IRQ_DIG_BO is also asserted. Single-bit increments reflect 25mV brownout voltage steps. Some steps may be irrelevant because of input supply limitations or load operation. <b>NOTE:</b> Not related to CCM. See <a href="#">Power Management Unit (PMU)</a> 100 Brownout offset = 0.100V 111 Brownout offset = 0.175V

# Chapter 19

## CMOS Sensor Interface (CSI)

### 19.1 Overview

This chapter presents the CMOS Sensor Interface (CSI) architecture, operation principles, and programming model.

The CSI enables the chip to connect directly to external CMOS image sensors. CMOS image sensors are separated into two classes, dumb and smart. Dumb sensors are those that support only traditional sensor timing (Vertical SYNC and Horizontal SYNC) and output only Bayer and statistics data, while smart sensors support CCIR656 video decoder formats and perform additional processing of the image (for example, image compression, image pre-filtering, and various data output formats).

The capabilities of the CSI include:

- Configurable interface logic to support most commonly available CMOS sensors.
- Support for CCIR656 video interface as well as traditional sensor interface.
- 8-bit / 10-bit / 16-bit data port for Bayer data input.
- Full control of 8-bit/pixel, 10-bit/pixel or 16-bit / pixel data format to 64-bit receive FIFO packing.
- Receive FIFO overrun protection mechanism.
- Embedded DMA controllers to transfer data from receive FIFO or statistic FIFO through AHB bus.
- Support 2D DMA transfer from the receive FIFO to the frame buffers in the external memory.
- Support double buffering two frames in the external memory.
- Single interrupt source to interrupt controller from maskable interrupt sources: Start of Frame, End of Frame, Change of Field, FIFO full, FIFO overrun, DMA transfer done, CCIR error and AHB bus response error.
- Configurable master clock frequency output to sensor.
- Statistic data generation for Auto Exposure (AE) and Auto White Balance (AWB) control of the camera (only for Bayer data and 8-bit/pixel format).

## 19.2 External Signals

The table below describes the external signals for the CSI. The external signals are tied between the CSI module and an external CMOS sensor.

**Table 19-1. CSI External Signals**

Signal	Description	Pad	Mode	Direction
DATA0	Data Sensor Signal 0, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA17	ALT3	I
		UART3_RX_DATA	ALT3	I
DATA1	Data Sensor Signal 1, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	LCD_DATA16	ALT3	I
		UART3_TX_DATA	ALT3	I
DATA2	Data Sensor Signal 2, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA00	ALT0	I
		UART1_TX_DATA	ALT3	I
DATA3	Data Sensor Signal 3 part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA01	ALT0	I
		UART1_RX_DATA	ALT3	I
DATA4	Data Sensor Signal 4, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA02	ALT0	I
		UART1_CTS_B	ALT3	I
DATA5	Data Sensor Signal 5, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA03	ALT0	I
		UART1_RTS_B	ALT3	I
DATA6	Data Sensor Signal 6, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA04	ALT0	I
		UART2_TX_DATA	ALT3	I
DATA7	Data Sensor Signal 7 part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA05	ALT0	I
		UART2_RX_DATA	ALT3	I
DATA8	Data Sensor Signal 8, part of 24-bit Sensor Data Bus (Bayer, YUV, YCrCb, RGB)	CSI_DATA06	ALT0	I

## 19.3 Clocks

The following table describes the clock sources for CSI. Please see [Clock Controller Module \(CCM\)](#) for clock setting, configuration and gating information.

**Table 19-2. CSI Clocks**

Clock name	Clock Root	Description
csi_hclk	ipg_clk_root	Module clock
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_s	ipg_clk_root	Peripheral access clock
ipg_clk_s_raw	ipg_clk_root	Peripheral raw data clock

## 19.4 Principles of Operation

The information found here describes the modes of operation of the sensor interface.

The CSI is designed to support generic sensor interface timing as well as CCIR656 video interface timing. Traditional CMOS sensors typically use VSYNC (SOF), HSYNC (BLANK), and PIXCLK signals to output Bayer or YUV data. Smart CMOS sensors, that come with on-chip imaging processing, usually support video mode transfer. They use an embedded timing codec to replace the VSYNC and HSYNC signal. The timing codec is defined by the CCIR656 standard.

The CSI can support connection with the sensor as follows.

- To connect with one 8-bit sensor, the sensor data interface should connect to CSI\_DATA[9:2].
- To connect with one 10-bit sensor, the sensor data interface should connect to CSI\_DATA[9:0].
- To connect with one 16-bit sensor, the sensor data interface should connect to CSI\_DATA[15:0].
- To connect with two 8-bit sensors, the sensor data interfaces should connect to CSI\_DATA[7:0] and CSI\_DATA[15:8].

## 19.4.1 Data Transfer with the Embedded DMA Controllers

The CSI has two embedded DMA controllers, one for the receive FIFO and the other for the statistic FIFO. It supports 2D DMA transfer from the receive FIFO to the frame buffers in the external memory and linear DMA transfer from the statistic FIFO.

To transfer data from the Rx FIFO to the external memory, the user should set the start address in the frame buffer where the transferred data is stored, the parameters of the frame buffers, and the parameters of the image coming from the sensor. The user can have two frame buffers in the external memory. Each one will store a frame of image coming from the sensor. The embedded DMA controller will first write the frame buffer1 and then frame buffer2. These two frame buffers will be written by turns. The start address should be aligned in double words and set in the CSIDMASA-FB1 and CSIDMASA-FB2 registers. In the CSIFBUF\_PARA register, the user should set the stride of the frame buffer to show how many double words to skip before starting to write the next row of the image. In the CSIIMAG\_PARA register, the user should set the width and height of the image coming from the sensor. The RxFF\_LEVEL and DMA\_REQ\_EN\_RFF bits in CSICR3 registers also need to be set before the data transfer starts. When the number of the data in the Rx FIFO reaches the trigger level, a DMA request will be sent to the embedded DMA controller and the data will be read out from the Rx FIFO and written through AHB bus into the external frame buffers. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_RFF bits in CSICR2 register. After all data in an image frame are transferred, the DMA\_TSF\_DONE\_FB1 or DMA\_TSF\_DONE\_FB2 bit will be set in CSISR register and the interrupt can be triggered if the corresponding enable bit is set in CSICR1 register. The DMA\_REFLASH\_RFF bit in CSICR3 can be used to activate or restart the embedded DMA controller.

The RxFIFO has the overrun protection mechanism in case the RxFIFO is overrun during data transfer. If the RxFIFO is full and more data needs to be received during the data transfer, the RxFIFO will be overwritten continuously and all 128 words of data in the RxFIFO before overrun occurred will be discarded; the corresponding 128 words memory space in the frame buffer will keep the previous values.

To transfer data from the statistic FIFO to the external memory, the user should set the start address of the external memory where the transferred data is stored and the total transfer sizes. The start address and the transfer sizes are all aligned in double words and should be set in the CSIDMASA-STATFIFO and CSIDMATS-STATFIFO registers. The STATFF\_LEVEL and DMA\_REQ\_EN\_SFF bits in CSICR3 registers should also be set before the data transfer starts. When the number of the data in the STATFIFO reaches the trigger level, a dma request will be sent to the embedded DMA controller and the data will be read out from the STATFIFO and written through AHB bus into the external memory. The burst type of transfer can be INCR4, INCR8 and INCR16 by setting DMA\_BURST\_TYPE\_SFF bits in CSICR2 register. After all expected data (defined by the total transfer sizes) are transferred, the DMA\_TSF\_DONE\_SFF bit will be set in CSISR register and an interrupt can be triggered if the SFF\_DMA\_DONE\_INTEN is enabled in CSICR1 register. The DMA\_REFLASH\_SFF bit in CSICR3 can be used to activate or re-start the embedded DMA controller.

## 19.4.2 Gated Clock Mode

VSYNC, HSYNC, and PIXCLK signals are used in gated clock mode.

A frame starts with an active edge on VSYNC, then HSYNC asserts and holds for the entire line. The Pixel clock is valid as long as HSYNC is asserted. Data is latched at the active edge of the valid pixel clocks. HSYNC deasserts at the end of line. Pixel clocks then become invalid and CSI stops receiving data from the stream. For the next line the HSYNC timing repeats. For the next frame the VSYNC timing repeats.

## 19.4.3 Non-Gated Clock Mode

In non-gated clock mode, only the VSYNC and PIXCLK signals are used; the HSYNC signal is ignored.

**Figure 19-1. Non-Gated Clock Mode Timing Diagram**

The overall timing of non-gated mode is the same as the gated-clock mode, except for the HSYNC signal. HSYNC signal is ignored by the CSI. All incoming pixel clocks are valid and cause data to be latched into RxFIFO. The PIXCLK signal is inactive (states low) until valid data is ready to be transmitted over the bus.

Figure 19-1 shows the timing of a typical sensor. Other sensors may have the slightly different timing from that shown. The CSI can be programmed to support rising/falling-edge triggered VSYNC, active-high/low HSYNC, and rising/falling-edge triggered PIXCLK.

### 19.4.4 CCIR656 Interlace Mode

In CCIR656 interlace mode, only the PIXCLK and CSI\_DATA[9:2] signals are used. The start of frame and blank signals are replaced by a timing codec which is embedded in the data stream. Each active line starts with an Start of Active Video (SAV) code and ends with an End of Active Video (EAV) code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, recovering VSYNC and HSYNC signals for internal use, such as statistical block control. Data is forwarded to the data receive and packing block in a sequential manner without reordering—that is, field 1 followed by field 2. The fields must be reordered in software to get back the original image.

Change of Field (COF) interrupt is triggered upon every field change. The interrupt service routine reads the status register to check for the current field.

According to the CCIR656 specification, the image must be in 625/50 PAL or 525/60 NTSC format. In addition, the image is interlaced into odd and even fields with vertical and horizontal blank data being filled into certain lines. Data must be in YCbCr422 format, each pixel contains 2 bytes, either Y + Cr or Y + Cb. These requirements are set for TV systems. The CSI module supports PAL and NTSC format only.

The following figure describes the frame structure in PAL system, showing vertical and horizontal blanking.

Figure 19-2. CCIR656 Interlace Mode (PAL)

The following figure describes the general timing for a single line, showing SAV and EAV.

Figure 19-3. CCIR656 General Line Timing

The coding tables recommended by the CCIR656 specification are shown below. It is used in the CCIR656 mode to decode the video stream. An interrupt is generated for SOF, which is decoded from the embedded timing codec.

**Table 19-4. Coding for SAV and EAV**

Data Bit Number	1st Byte 0xFF	2nd Byte 0x00	3rd Byte 0x00	4th Byte 0xXY
7 (MSB)	1	0	0	1
6	1	0	0	F
5	1	0	0	V
4	1	0	0	H
3	1	0	0	P3
2	1	0	0	P2
1	1	0	0	P1
0	1	0	0	P0

**Table 19-5. Codes with Protection bits for Error Detection/Correction**

F	V	H	P3	P2	P1	P0
0	0	0	0	0	0	0
0	0	1	1	1	0	1
0	1	0	1	0	1	1
0	1	1	0	1	1	0
1	0	0	0	1	1	1
1	0	1	1	0	1	0
1	1	0	1	1	0	0
1	1	1	0	0	0	1

**Table 19-6. Representations by F-Bit**

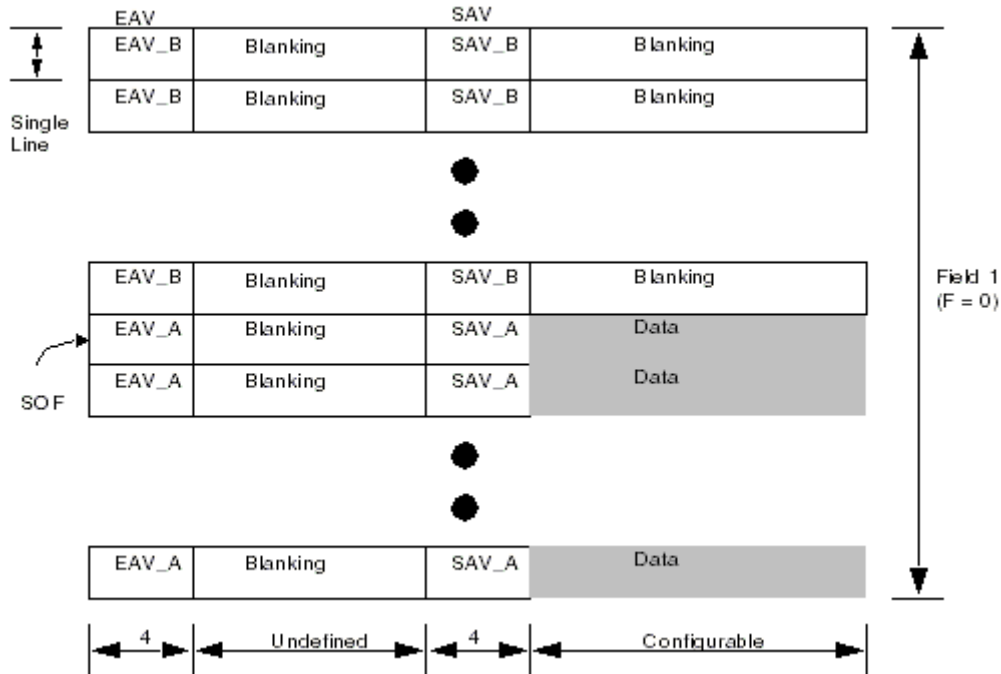

F-Bit	Representations
0	ODD FIELD (FIELD 1)
1	EVEN FIELD (FIELD 2)

### 19.4.5 CCIR656 Progressive Mode

For a CMOS camera system of VGA or CIF resolution, strict adherence to the interlace requirements stated in the CIR standard is not required.

The image is considered to have only 1 active field which is scanned in a progressive manner. This active field is regarded as field 1 and the F-bit in the timing codec is ignored by the decoder. Most sensors support CCIR timing in this mode (progressive) by default.

The following figure shows the typical flow of progressive mode.

**Figure 19-4. CCIR656 Progressive Mode (General Case)**

An interrupt is generated for SOF but not for COF. In the general case, when SOF information is retrieved from the embedded coding, it is known as internal VSYNC mode. In other cases, when the VSYNC signal is provided by the sensor, it is known as external VSYNC mode. The CSI can be operated in internal or external VSYNC mode.

### 19.4.6 Error Correction for CCIR656 Coding

According to the algorithm for CCIR coding, protection bits in the SAV and EAV are encoded in the way that allows a 1-bit error to be corrected, or a 2-bit error to be detected by the decoder. This feature is supported by the interlace mode CCIR decoder in CSI.

For the 1-bit error case, users can select the error to be corrected automatically, or simply shown as a status flag instead. For the 2-bit error case, because the decoder is unable to make a correction, the error would be shown as a status flag only.

An interrupt can be generated upon the detection of an error. This signal can be enabled or disabled without affecting the operation of the status bit.

## 19.5 Interrupt Generation

The information found here describes CSI events that generate interrupts.

### 19.5.1 Start Of Frame Interrupt (SOF\_INT)

The source of an SOF interrupt is dependent on the mode of operation.

In traditional mode, VSYNC signal is taken from sensor and SOF\_INT is generated at the rising or falling edge (programmable) of VSYNC.

In CCIR interlace mode, the SOF interrupt information is retrieved from the embedded coding and SOF\_INT is generated.

In CCIR progressive mode, there are two sources of an SOF interrupt:

- In *internal* VSYNC mode, SOF is retrieved from the embedded coding.
- In *external* VSYNC mode, VSYNC is taken from the sensor and SOF is generated at the rising edge of VSYNC.

### 19.5.2 End Of Frame Interrupt (EOF\_INT)

An EOF interrupt is generated when the frame ends and the complete frame data in RXFIFO is read.

The EOF event triggering works with the RX count register (CSIRXCNT). Software sets the RX count register to the frame size (in words). The CSI RX logic then counts the number of pixel data being received and compares it with the RX count. If the preset value is reached, an EOF interrupt is generated and the data in the RXFIFO are read. If a SOF event is detected before this happens, the EOF interrupt is not generated.

### 19.5.3 Change Of Field Interrupt (COF\_INT)

The Change of Field interrupt is only valid in CCIR Interlace mode. The COF interrupt is generated when the field toggles, either from field 1 to field 2, or field 2 to field 1.

Software should first check COF\_INT bit in the CSI Status Register (CSISTAT) before checking that F1\_INT or F2\_INT is turned on.

In PAL systems, the field changes at the beginning of the frame and coincides with SOF. For the first field, a COF interrupt is not generated, only an SOF. The COF interrupt is generated for the second field.

### 19.5.4 CCIR Error Interrupt (ECC\_INT)

The CCIR Error Interrupt is only valid for CCIR Interlace mode. An ECC interrupt is generated when an error is found on the SAV or EAV codes in the incoming stream. When this happens, the ECC\_INT status bit is set.

### 19.5.5 RxFIFO Full Interrupt (RxFF\_INT)

A RxFIFO full interrupt is generated when the number of data in RXFIFO reaches the water mark defined by RxFF\_LEVEL in CSICR3.

### 19.5.6 Statistic FIFO Full Interrupt (STATFF\_INT)

A StatFIFO full interrupt is generated when the number of data in STATFIFO reaches the water mark defined by STATFF\_LEVEL in CSICR3.

### 19.5.7 RxFIFO Overrun Interrupt (RFF\_OR\_INT)

A RxFIFO Overrun interrupt is generated when the RxFIFO has 128 words data and more data is being written in.

### 19.5.8 Statistic FIFO Overrun Interrupt (SFF\_OR\_INT)

A StatFIFO Overrun interrupt is generated when the STATFIFO has 64 words data and more data is being written in.

### 19.5.9 Frame Buffer1 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB1)

A DMA transfer done interrupt of frame buffer1 is generated when one frame of data are transferred from RxFIFO to the frame buffer1 in the external memory.

### 19.5.10 Frame Buffer2 DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_FB2)

A DMA transfer done interrupt of frame buffer2 is generated when one frame of data are transferred from RxFIFO to the frame buffer2 in the external memory.

### 19.5.11 Statistic FIFO DMA Transfer Done Interrupt (DMA\_TSF\_DONE\_SFF)

A StatFIFO DMA transfer done interrupt is generated when all the data are transferred from StatFIFO to the external memory. The transfer size is defined in the STATFIFO DMA Transfer Size Register.

### 19.5.12 AHB Bus Response Error Interrupt (HRESP\_ERR\_INT)

An AHB Bus response error interrupt is generated when a bus error is detected.

## 19.6 Data Packing Style

Careful attention to endianness is needed given the different port sizes at different stages of the image capture path.

To enable flexible packing of image data before storage in the FIFOs, the CSI module can swap data fields by use of the PACK\_DIR and the SWAP16\_EN bit in CSI Control Register 1 (CSICR1).

The CSI module accepts 8-bit, 10-bit or 16-bit data from the sensor by configuring PIXEL\_BIT bit in CSI Control Register 1 (CSICR1) and TWO\_8BIT\_SENSOR bit in CSI Control Register3 (CSICR3). The input data is packed according to the setting of PACK\_DIR bit. The packed data is stored in the RX FIFO according to the setting of the SWAP16\_EN bit.

For 10-bit per pixel data format, each pixel is expanded to 16 bits by appending 6 zeros bits to the most significant bit. For 16-bit data format, the data path can be a combination by two 8-bit sensors. One sensor is connected to the CSI\_DATA[7:0]. The other sensor is connected to CSI\_DATA[15:8].

## 19.6.1 RX FIFO Path

### 19.6.1.1 Bayer Data

Bayer data is a type of raw data from the image sensor. This byte-wide data must be converted to the RGB space or YUV space by software. The data path for Bayer data is from the CSI to memory. If the system is in little endian, then the `PACK_DIR` bit should be set to 0. 8-bit data format from a sensor is packed to 64 bits as `P7.P6.P5.P4.P3.P2.P1.P0`, where `P0` is the pixel coming in time slot 0 (first data) and `P3` is the pixel coming in time slot 3 (the last data in the 64-bit word). When the data is addressed as bytes by software, `P0` is transferred first, `P1` is transferred next, and so on. 10-bit data format is packed to 64 bits as `000000.P3.000000.P2.000000.P1.000000.P0`, where `P0` is the 10-bit data coming in time slot 0 (first pixel) and `P3` is the 10-bit data coming in time slot 3 (fourth pixel). 16-bit data, from two sensors, is packed to 64 bits as `P7.P6.P5.P4.P3.P2.P1.P0`, where `P0` and `P1` are the two 8-bit data coming in time slot 0 (`P0` is the first pixel of the sensor connected with `CSI_DATA[7:0]` and `P1` is the first pixel of the sensor connected with `CSI_DATA[15:8]`). `P2` and `P3` are the two 8-bit data coming in time slot 1 (second pixels of the two sensors).

### 19.6.1.2 RGB565 Data

RGB565 data is processed data from the image sensor, which can be put directly into the display buffer. The data is 16 bits wide. The data path is from CSI to memory to the display controller. On the sensor side, data must be transmitted as `P0` first, followed by `P1`, and so on. For each pixel, whether the MSB or LSB is sent first depends on the endianness of the sensor. Data is 16 bits wide with the MSB labeled `RG`, and the LSB labeled `GB`. `P0` is represented as `RG0` and `GB0`.

CSI receives data in one of the following sequence:

- `RG0, GB0, RG1, GB1`, while `RG0` comes out at time slot 0 (first data), and `GB1` comes out at time slot 3 (last data)
- `GB0, RG0, GB1, RG1`

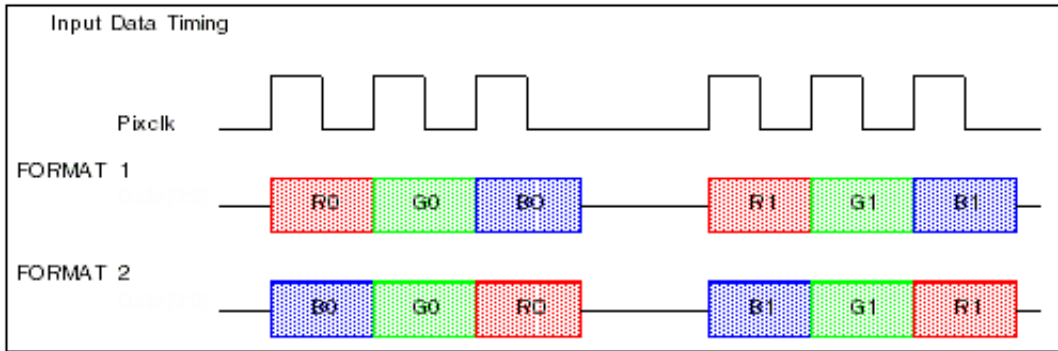

Using the first sequence as an example, and assuming the system is running in little endian, the data is presented as:

- 8-bit data from sensor: `RG0, GB0, RG1, GB1, ...`
- 64-bit data before storage in the CSI RX FIFO (`PACK_DIR` bit = 1):  
`RG0GB0RG1GB1RG2GB2RG3GB3`

- 64-bit data in CSI RX FIFO (SWAP16\_EN bit enabled):  
RG3GB3RG2GB2RG1GB1RG0GB0
- 64-bit transfer to system memory: RG3GB3RG2GB2RG1GB1RG0GB0
- 16-bit read by display controller: RG0GB0, RG1GB1

### 19.6.1.3 RGB888 Data

This is another kind of processed data from image sensor, which can be used for further image processing directly. Each of the data consist of 8-bit Red, 8-bit Green, and 8-bit Blue data. An example of timing scheme is shown in the following figure.

**Figure 19-5. Sample Timing Diagram for RGB888 8 bits/cycle Data**

An optional scheme to pack a dummy byte is provided. For every group of 3 bytes data, a dummy zero is packed to form a 32-bit word as shown in the following figure. The dummy zero can be packed at the LSB position or MSB position. Using RGB888A\_FORMAT\_SEL in CSI\_CSICR18[18] to determine to put the dummy bytes packed at LSB or MSB position.

## 19.6.2 STAT FIFO Path

Statistics only works for Bayer data in 8-bit per pixel format. It generates 16-bit statistical output from the 8-bit Bayer input (CSI\_DATA[13:6]). The outputs are Sum of Green (G), Sum of Red (R), Sum of Blue (B), and Auto Focus (F). Each output is 16-bits wide.

The settings of PACK\_DIR and SWAP16\_EN bits in the CSICR1 register have no effect on the input path. The PACK\_DIR only controls how the 16-bit stat output is packed into the 32-bit STAT FIFO.

When the PACK\_DIR bit = 1, the stat data is packed as:

First 32-bit: RG

Second 32-bit: BF

...

When the PACK\_DIR bit = 0, the stat data is packed as:

First 32-bit GR

Second 32-bit: FB

...

## 19.7 CSI Memory Map/Register Definition

All the 32-bit registers of the CSI module are summarized in the Memory Map below:

**CSI memory map**

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
402B_C000	CSI Control Register 1 (CSI_CSICR1)	32	R/W	4000_0800h	<a href="#">19.7.1/812</a>
402B_C004	CSI Control Register 2 (CSI_CSICR2)	32	R/W	0000_0000h	<a href="#">19.7.2/816</a>
402B_C008	CSI Control Register 3 (CSI_CSICR3)	32	R/W	0000_0000h	<a href="#">19.7.3/818</a>
402B_C00C	CSI Statistic FIFO Register (CSI_CSISTATFIFO)	32	R	0000_0000h	<a href="#">19.7.4/820</a>

### 19.7.1 CSI Control Register 1 (CSI\_CSICR1)

This register controls the sensor interface timing and interrupt generation. The interrupt enable bits in this register control the interrupt signals and the status bits. That means status bits will only function when the corresponding interrupt bits are enabled.

Address: 402B\_C000h base + 0h offset = 402B\_C000h

#### CSI\_CSICR1 field descriptions

Field	Description
31 SWAP16_EN	<p>SWAP 16-Bit Enable. This bit enables the swapping of 16-bit data. Data is packed from 8-bit or 10-bit to 32-bit first (according to the setting of PACK_DIR) and then swapped as 16-bit words before being put into the RX FIFO. The action of the bit only affects the RX FIFO and has no affect on the STAT FIFO.</p> <p><b>NOTE:</b> Example of swapping enabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x 33441122</p> <p><b>NOTE:</b> Example of swapping disabled: Data input to FIFO = 0x11223344 Data in RX FIFO = 0x11223344</p>

Table continues on the next page...

## CSI\_CSICR1 field descriptions (continued)

Field	Description
	0 Disable swapping 1 Enable swapping
30 EXT_VSYNC	External VSYNC Enable. This bit controls the operational VSYNC mode. <b>NOTE:</b> This only works when the CSI is in CCIR progressive mode. 0 Internal VSYNC mode 1 External VSYNC mode
29 EOF_INT_EN	End-of-Frame Interrupt Enable. This bit enables and disables the EOF interrupt. 0 EOF interrupt is disabled. 1 EOF interrupt is generated when RX count value is reached.
28 PrP_IF_EN	CSI-PrP Interface Enable. This bit controls the CSI to PrP bus. When enabled the RxFIFO is detached from the AHB bus and connected to PrP. All CPU reads or DMA accesses to the RxFIFO register are ignored. All CSI interrupts are also masked. 0 CSI to PrP bus is disabled 1 CSI to PrP bus is enabled
27 CCIR_MODE	CCIR Mode Select. This bit controls the CCIR mode of operation. This bit only works in CCIR interface mode. 0 Progressive mode is selected 1 Interlace mode is selected
26 COF_INT_EN	Change Of Image Field (COF) Interrupt Enable. This bit enables the COF interrupt. This bit works only in CCIR interlace mode which is when CCIR_EN = 1 and CCIR_MODE = 1. 0 COF interrupt is disabled 1 COF interrupt is enabled
25 SF_OR_INTEN	STAT FIFO Overrun Interrupt Enable. This bit enables the STATFIFO overrun interrupt. 0 STATFIFO overrun interrupt is disabled 1 STATFIFO overrun interrupt is enabled
24 RF_OR_INTEN	RxFIFO Overrun Interrupt Enable. This bit enables the RX FIFO overrun interrupt. 0 RxFIFO overrun interrupt is disabled 1 RxFIFO overrun interrupt is enabled
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 SFF_DMA_DONE_INTEN	STATFIFO DMA Transfer Done Interrupt Enable. This bit enables the interrupt of STATFIFO DMA transfer done. 0 STATFIFO DMA Transfer Done interrupt disable 1 STATFIFO DMA Transfer Done interrupt enable
21 STATFF_INTEN	STATFIFO Full Interrupt Enable. This bit enables the STAT FIFO interrupt. 0 STATFIFO full interrupt disable 1 STATFIFO full interrupt enable

Table continues on the next page...

## CSI\_CSICR1 field descriptions (continued)

Field	Description
20 FB2_DMA_ DONE_INTEN	Frame Buffer2 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer2 DMA transfer done.  0 Frame Buffer2 DMA Transfer Done interrupt disable 1 Frame Buffer2 DMA Transfer Done interrupt enable
19 FB1_DMA_ DONE_INTEN	Frame Buffer1 DMA Transfer Done Interrupt Enable. This bit enables the interrupt of Frame Buffer1 DMA transfer done.  0 Frame Buffer1 DMA Transfer Done interrupt disable 1 Frame Buffer1 DMA Transfer Done interrupt enable
18 RXFF_INTEN	RxFIFO Full Interrupt Enable. This bit enables the RxFIFO full interrupt.  0 RxFIFO full interrupt disable 1 RxFIFO full interrupt enable
17 SOF_POL	SOF Interrupt Polarity. This bit controls the condition that generates an SOF interrupt.  0 SOF interrupt is generated on SOF falling edge 1 SOF interrupt is generated on SOF rising edge
16 SOF_INTEN	Start Of Frame (SOF) Interrupt Enable. This bit enables the SOF interrupt.  0 SOF interrupt disable 1 SOF interrupt enable
15–12 Reserved	This field is reserved. Reserved.  This field is reserved.
11 HSYNC_POL	HSYNC Polarity Select. This bit controls the polarity of HSYNC.  This bit only works in gated-clock-that is, GCLK_MODE = 1 and CCIR_EN = 0.  0 HSYNC is active low 1 HSYNC is active high
10 CCIR_EN	CCIR656 Interface Enable. This bit selects the type of interface used. When the CCIR656 timing decoder is enabled, it replaces the function of timing interface logic.  0 Traditional interface is selected. Timing interface logic is used to latch data. 1 CCIR656 interface is selected.
9 Reserved	This field is reserved. This field is reserved.
8 FCC	FIFO Clear Control. This bit determines how the RxFIFO and STATFIFO are cleared. When Synchronous FIFO clear is selected the RxFIFO and STATFIFO are cleared, and STAT block is reset, on every SOF. FIFOs and STAT block restarts immediately after reset. For information on the operation when Asynchronous FIFO clear is selected, refer to the descriptions for the CLR_RXFIFO and CLR_STATFIFO bits.  0 Asynchronous FIFO clear is selected. 1 Synchronous FIFO clear is selected.
7 PACK_DIR	Data Packing Direction. This bit Controls how 8-bit/10-bit image data is packed into 32-bit RX FIFO, and how 16-bit statistical data is packed into 32-bit STAT FIFO.

*Table continues on the next page...*

## CSI\_CSICR1 field descriptions (continued)

Field	Description
	<p>0 Pack from LSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x44332211 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xB BBBBAAAA in STAT FIFO.</p> <p>1 Pack from MSB first. For image data, 0x11, 0x22, 0x33, 0x44, it will appear as 0x11223344 in RX FIFO. For stat data, 0xAAAA, 0xBBBB, it will appear as 0xAAAABBBB in STAT FIFO.</p>
6 CLR_STATFIFO	<p>Asynchronous STATFIFO Clear. This bit clears the STATFIFO and Reset STAT block.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 will clear STATFIFO and reset STAT block immediately, STATFIFO and STAT block then wait and restart after the arrival of next SOF.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
5 CLR_RXFIFO	<p>Asynchronous RXFIFO Clear. This bit clears the RXFIFO.</p> <p>This bit works only in async FIFO clear mode-that is, FCC = 0. Otherwise this bit is ignored.</p> <p>Writing 1 clears the RXFIFO immediately, RXFIFO restarts immediately after that.</p> <p>The bit is restored to 0 automatically after finish. Normally reads 0.</p>
4 GCLK_MODE	<p>Gated Clock Mode Enable. Controls if CSI is working in gated or non-gated mode.</p> <p>This bit works only in traditional mode-that is, CCIR_EN = 0. Otherwise this bit is ignored.</p> <p>0 Non-gated clock mode. All incoming pixel clocks are valid. HSYNC is ignored.</p> <p>1 Gated clock mode. Pixel clock signal is valid only when HSYNC is active.</p>
3 INV_DATA	<p>Invert Data Input. This bit enables or disables internal inverters on the data lines.</p> <p>0 CSI_D[7:0] data lines are directly applied to internal circuitry</p> <p>1 CSI_D[7:0] data lines are inverted before applied to internal circuitry</p>
2 INV_PCLK	<p>Invert Pixel Clock Input. This bit determines if the Pixel Clock (CSI_PIXCLK) is inverted before it is applied to the CSI module.</p> <p>0 CSI_PIXCLK is directly applied to internal circuitry</p> <p>1 CSI_PIXCLK is inverted before applied to internal circuitry</p>
1 REDGE	<p>Valid Pixel Clock Edge Select. Selects which edge of the CSI_PIXCLK is used to latch the pixel data.</p> <p>0 Pixel data is latched at the falling edge of CSI_PIXCLK</p> <p>1 Pixel data is latched at the rising edge of CSI_PIXCLK</p>
0 PIXEL_BIT	<p>Pixel Bit. This bit indicates the bayer data width for each pixel. This bit should be configured before activating or re-starting the embedded DMA controller.</p> <p>0 8-bit data for each pixel</p> <p>1 10-bit data for each pixel</p>

## 19.7.2 CSI Control Register 2 (CSI\_CSICR2)

This register provides the statistic block with data about which live view resolution is being used, and the starting sensor pixel of the Bayer pattern. It also contains the horizontal and vertical count used to determine the number of pixels to skip between the 64 x 64 blocks of statistics when generating statistics on live view image that are greater than 512 x 384.

Address: 402B\_C000h base + 4h offset = 402B\_C004h

**CSI\_CSICR2 field descriptions**

Field	Description
31–30 DMA_BURST_TYPE_RFF	Burst Type of DMA Transfer from RxFIFO. Selects the burst type of DMA transfer from RxFIFO. X0 INCR8 01 INCR4 11 INCR16
29–28 DMA_BURST_TYPE_SFF	Burst Type of DMA Transfer from STATFIFO. Selects the burst type of DMA transfer from STATFIFO. X0 INCR8 01 INCR4 11 INCR16

*Table continues on the next page...*

## CSI\_CSICR2 field descriptions (continued)

Field	Description
27 -	This field is reserved. Reserved. These bit is reserved and should read 0.
26 DRM	Double Resolution Mode. Controls size of statistics grid. 0 Stats grid of 8 x 6 1 Stats grid of 8 x 12
25–24 AFS	Auto Focus Spread. Selects which green pixels are used for auto-focus. 00 Abs Diff on consecutive green pixels 01 Abs Diff on every third green pixels 1x Abs Diff on every four green pixels
23 SCE	Skip Count Enable. Enables or disables the skip count feature. 0 Skip count disable 1 Skip count enable
22–21 -	This field is reserved. Reserved. These bits are reserved and should read 0.
20–19 BTS	Bayer Tile Start. Controls the Bayer pattern starting point. 00 GR 01 RG 10 BG 11 GB
18–16 LVRM	Live View Resolution Mode. Selects the grid size used for live view resolution. 0 512 x 384 1 448 x 336 2 384 x 288 3 384 x 256 4 320 x 240 5 288 x 216 6 400 x 300
15–8 VSC	Vertical Skip Count. Contains the number of rows to skip. SCE must be 1, otherwise VSC is ignored. 0-255 Number of rows to skip minus 1
HSC	Horizontal Skip Count. Contains the number of pixels to skip. SCE must be 1, otherwise HSC is ignored. 0-255 Number of pixels to skip minus 1

### 19.7.3 CSI Control Register 3 (CSI\_CSICR3)

This read/write register acts as an extension of the functionality of the CSI Control register 1, adding additional control and features.

Address: 402B\_C000h base + 8h offset = 402B\_C008h

#### CSI\_CSICR3 field descriptions

Field	Description
31–16 FRMCNT	Frame Counter. This is a 16-bit Frame Counter (Wraps around automatically after reaching the maximum)
15 FRMCNT_RST	Frame Count Reset. Resets the Frame Counter. (Cleared automatically after reset is done) 0 Do not reset 1 Reset frame counter immediately
14 DMA_REFLASH_RFF	Reflash DMA Controller for Rx FIFO. This bit reflash the embedded DMA controller for Rx FIFO. It should be reflashed before the embedded DMA controller starts to work. (Cleared automatically after reflashing is done) 0 No reflashing 1 Reflash the embedded DMA controller
13 DMA_REFLASH_SFF	Reflash DMA Controller for STATFIFO. This bit reflash the embedded DMA controller for STATFIFO. It should be reflashed before the embedded DMA controller starts to work. (Cleared automatically after reflashing is done) 0 No reflashing 1 Reflash the embedded DMA controller

Table continues on the next page...

## CSI\_CSICR3 field descriptions (continued)

Field	Description
12 DMA_REQ_EN_ RFF	DMA Request Enable for RxFIFO. This bit enables the dma request from RxFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
11 DMA_REQ_EN_ SFF	DMA Request Enable for STATFIFO. This bit enables the dma request from STATFIFO to the embedded DMA controller.  0 Disable the dma request 1 Enable the dma request
10–8 STATFF_LEVEL	STATFIFO Full Level. When the number of data in STATFIFO reach this level, STATFIFO full interrupt is generated, or STATFIFO DMA request is sent.  000 4 Double words 001 8 Double words 010 12 Double words 011 16 Double words 100 24 Double words 101 32 Double words 110 48 Double words 111 64 Double words
7 HRESP_ERR_ EN	Hresponse Error Enable. This bit enables the hresponse error interrupt.  0 Disable hresponse error interrupt 1 Enable hresponse error interrupt
6–4 RxFF_LEVEL	<b>RxFIFO Full Level.</b> When the number of data in RxFIFO reaches this level, a RxFIFO full interrupt is generated, or an RxFIFO DMA request is sent.  000 4 Double words 001 8 Double words 010 16 Double words 011 24 Double words 100 32 Double words 101 48 Double words 110 64 Double words 111 96 Double words
3 TWO_8BIT_ SENSOR	Two 8-bit Sensor Mode. This bit indicates one 16-bit sensor or two 8-bit sensors are connected to the 16-bit data ports. This bit should be set if there is one 16-bit sensor or two 8-bit sensors are connected. This bit should be configured before activating or restarting the embedded DMA controller.  0 Only one sensor is connected. 1 Two 8-bit sensors are connected or one 16-bit sensor is connected.
2 ZERO_PACK_ EN	Dummy Zero Packing Enable. This bit causes a dummy zero to be packed with every 3 incoming bytes, forming a 32-bit word. The dummy zero is always packed to the LSB position. This packing function is only available in 8-bit/pixel mode.  0 Zero packing disabled 1 Zero packing enabled

Table continues on the next page...

**CSI\_CSICR3 field descriptions (continued)**

Field	Description
1 ECC_INT_EN	<p>Error Detection Interrupt Enable. This bit enables and disables the error detection interrupt. This feature only works in CCIR interlace mode.</p> <p>0 No interrupt is generated when error is detected. Only the status bit ECC_INT is set. 1 Interrupt is generated when error is detected.</p>
0 ECC_AUTO_EN	<p>Automatic Error Correction Enable. This bit enables and disables the automatic error correction. If an error occurs and error correction is disabled only the ECC_INT status bit is set. This feature only works in CCIR interlace mode.</p> <p>0 Auto Error correction is disabled. 1 Auto Error correction is enabled.</p>

**19.7.4 CSI Statistic FIFO Register (CSI\_CSISTATFIFO)**

The StatFIFO is a read-only register containing statistic data from the sensor. Writing to this register has no effect.

Address: 402B\_C000h base + Ch offset = 402B\_C00Ch

**CSI\_CSISTATFIFO field descriptions**

Field	Description
STAT	Static data from sensor

## 19.7.5 CSI RX FIFO Register (CSI\_CSIRFIFO)

This read-only register contains received image data. Writing to this register has no effect.

Address: 402B\_C000h base + 10h offset = 402B\_C010h

### CSI\_CSIRFIFO field descriptions

Field	Description
IMAGE	Received image data

## 19.7.6 CSI RX Count Register (CSI\_CSIRXCNT)

This register works for EOF interrupt generation. It should be set to the number of words to receive that would generate an EOF interrupt.

There is an internal counter that counts the number of words read from the RX FIFO. Whenever the RX FIFO is being read, by either the CPU or the embedded DMA controller, the counter value is updated and compared with this register. If the values match, then an EOF interrupt is triggered.

Address: 402B\_C000h base + 14h offset = 402B\_C014h

### CSI\_CSIRXCNT field descriptions

Field	Description
31–22 -	This field is reserved. Reserved. These bits are reserved and should read 0.
RXCNT	RxFIFO Count. This 22-bit counter for RXFIFO is updated each time the RXFIFO is read by CPU or DMA. This counter should be set to the expected number of words to receive that would generate an EOF interrupt.

### 19.7.7 CSI Status Register (CSI\_CSISR)

This read/write register shows sensor interface status, and which kind of interrupt is being generated. The corresponding interrupt bits must be set for the status bit to function. Status bits should function normally even if the corresponding interrupt enable bits are not enabled.

Address: 402B\_C000h base + 18h offset = 402B\_C018h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R		-		BASEADDR_CHHANGE_ERROR	DMA_FIELD0_DONE	DMA_FIELD1_DONE	SF_OR_INT	RF_OR_INT	Reserved	DMA_TSF_DONE_SFF	STATFF_INT	DMA_TSF_DONE_FB2	DMA_TSF_DONE_FB1	RxFF_INT	EOF_INT	SOF_INT

W																
Reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0

CSI\_CSISR field descriptions

Field	Description
31-29 -	Reserved. These bits are reserved and should read 0.
28 BASEADDR_CHHANGE_ERROR	When using base address switching enable, this bit will be 1 when switching occur before DMA complete. This bit will be clear by writing 1. When this interrupt happens, follow the steps listed below. 1. Unassert the CSI enable, CSIx_CSICR18 bit31, 2. Reflash the DMA, assert the CSIX_CSICR3 bit 14, 3. Assert the CSI enable, CSIx_CSICR18 bit31.
27 DMA_FIELD0_DONE	When DMA field 0 is complete, this bit will be set to 1(clear by writing 1).

Table continues on the next page...

## CSI\_CSISR field descriptions (continued)

Field	Description
26 DMA_FIELD1_ DONE	When DMA field 0 is complete, this bit will be set to 1 (clear by writing 1).
25 SF_OR_INT	STATFIFO Overrun Interrupt Status. Indicates the overflow status of the STATFIFO register. (Cleared by writing 1)  0 STATFIFO has not overflowed. 1 STATFIFO has overflowed.
24 RF_OR_INT	RxFIFO Overrun Interrupt Status. Indicates the overflow status of the RxFIFO register. (Cleared by writing 1)  0 RxFIFO has not overflowed. 1 RxFIFO has overflowed.
23 -	This field is reserved. Reserved. This bit is reserved and should read 0.
22 DMA_TSF_ DONE_SFF	DMA Transfer Done from StatFIFO. Indicates that the dma transfer from StatFIFO is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by writing 1 or reflashing the StatFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
21 STATFF_INT	STATFIFO Full Interrupt Status. Indicates the number of data in the STATFIFO reaches the trigger level. (this bit is cleared automatically by reading the STATFIFO)  0 STATFIFO is not full. 1 STATFIFO is full.
20 DMA_TSF_ DONE_FB2	DMA Transfer Done in Frame Buffer2. Indicates that the DMA transfer from RxFIFO to Frame Buffer2 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
19 DMA_TSF_ DONE_FB1	DMA Transfer Done in Frame Buffer1. Indicates that the DMA transfer from RxFIFO to Frame Buffer1 is completed. It can trigger an interrupt if the corresponding enable bit is set in CSICR1. This bit can be cleared by by writing 1 or reflashing the RxFIFO dma controller in CSICR3. (Cleared by writing 1)  0 DMA transfer is not completed. 1 DMA transfer is completed.
18 RxFF_INT	RxFIFO Full Interrupt Status. Indicates the number of data in the RxFIFO reaches the trigger level. (this bit is cleared automatically by reading the RxFIFO)  0 RxFIFO is not full. 1 RxFIFO is full.
17 EOF_INT	End of Frame (EOF) Interrupt Status. Indicates when EOF is detected. (Cleared by writing 1)  0 EOF is not detected. 1 EOF is detected.
16 SOF_INT	Start of Frame Interrupt Status. Indicates when SOF is detected. (Cleared by writing 1)

*Table continues on the next page...*

## CSI\_CSISR field descriptions (continued)

Field	Description
	0 SOF is not detected. 1 SOF is detected.
15 F2_INT	CCIR Field 2 Interrupt Status. Indicates the presence of field 2 of video in CCIR mode. (Cleared automatically when current field does not match)  <b>NOTE:</b> Only works in CCIR Interlace mode.  0 Field 2 of video is not detected 1 Field 2 of video is about to start
14 F1_INT	CCIR Field 1 Interrupt Status. Indicates the presence of field 1 of video in CCIR mode. (Cleared automatically when current field does not match)  <b>NOTE:</b> Only works in CCIR Interlace mode.  0 Field 1 of video is not detected. 1 Field 1 of video is about to start.
13 COF_INT	Change Of Field Interrupt Status. Indicates that a change of the video field has been detected. Only works in CCIR Interlace mode. Software should read this bit first and then dispatch the new field from F1_INT and F2_INT. (Cleared by writing 1)  0 Video field has no change. 1 Change of video field is detected.
12–8 -	This field is reserved. Reserved. These bits are reserved and should read 0.
7 HRESP_ERR_INT	Hresponse Error Interrupt Status. Indicates that a hresponse error has been detected. (Cleared by writing 1)  0 No hresponse error. 1 Hresponse error is detected.
6–2 -	This field is reserved. Reserved. These bits are reserved and should read 0.
1 ECC_INT	CCIR Error Interrupt. This bit indicates an error has occurred. This only works in CCIR Interlace mode. (Cleared by writing 1)  0 No error detected 1 Error is detected in CCIR coding
0 DRDY	RXFIFO Data Ready. Indicates the presence of data that is ready for transfer in the RxFIFO. (Cleared automatically by reading FIFO)  0 No data (word) is ready 1 At least 1 datum (word) is ready in RXFIFO.

## 19.7.8 CSI DMA Start Address Register - for STATFIFO (CSI\_CSIDMASA\_STATFIFO)

This register provides the start address for the embedded DMA controller of STATFIFO. The embedded DMA controller will read data from STATFIFO and write it to the external memory from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 402B\_C000h base + 20h offset = 402B\_C020h

Bit	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	DMA_START_ADDR_SFF																
W	DMA_START_ADDR_SFF																
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	DMA_START_ADDR_SFF															Reserved	
W	DMA_START_ADDR_SFF															Reserved	
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

### CSI\_CSIDMASA\_STATFIFO field descriptions

Field	Description
31–2 DMA_START_ADDR_SFF	DMA Start Address for STATFIFO. Indicates the start address to write data. The embedded DMA controller will read data from STATFIFO and write it from this address through AHB bus. The address should be double words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

## 19.7.9 CSI DMA Transfer Size Register - for STATFIFO (CSI\_CSIDMATS\_STATFIFO)

This register provides the total transfer size for the embedded DMA controller of STATFIFO. This register should be configured before activating or restarting the embedded DMA controller.

Address: 402B\_C000h base + 24h offset = 402B\_C024h

**CSI\_CSIDMATS\_STATFIFO field descriptions**

Field	Description
DMA_TSF_SIZE_SFF	DMA Transfer Size for STATFIFO. Indicates how many words to be transferred by the embedded DMA controller. The size should be double words aligned.

**19.7.10 CSI DMA Start Address Register - for Frame Buffer1 (CSI\_CSIDMASA\_FB1)**

This register provides the start address in the frame buffer1 for the embedded DMA controller of RxFIFO. The embedded DMA controller will read data from RxFIFO and write it to the frame buffer1 from the start address. This register should be configured before activating or restarting the embedded DMA controller.

Address: 402B\_C000h base + 28h offset = 402B\_C028h

#### CSI\_CSIDMASA\_FB2 field descriptions

Field	Description
31–2 DMA_START_ADDR_FB2	DMA Start Address in Frame Buffer2. Indicates the start address to write data. The embedded DMA controller will read data from RxFIFO and write it from this address through AHB bus. The address should be double words aligned.
-	This field is reserved. Reserved. These bits are reserved and should read 0.

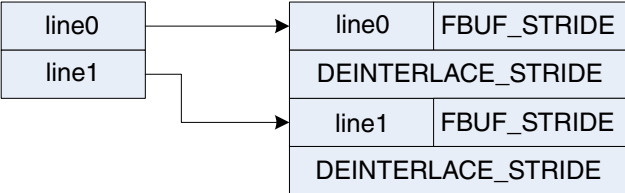

### 19.7.12 CSI Frame Buffer Parameter Register (CSI\_CSIFBUF\_PARA)

This register provides the stride of the frame buffer to show how many words to skip before starting to write the next row of the image. The width of the frame buffer minus the width of the image is the stride. This register should be configured before activating or restarting the embedded DMA controller.

Address: 402B\_C000h base + 30h offset = 402B\_C030h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### CSI\_CSIFBUF\_PARA field descriptions

Field	Description
31-16 DEINTERLACE_STRIDE	<p>DEINTERLACE_STRIDE is only used in the deinterlace mode. If line stride feature is supported in deinterlace mode, FBUF_STRIDE and DEINTERLACE_STRIDE need to be configured at the same time. DEINTERLACE_STRIDE is configured the same as line width. In normal line stride feature, only FBUF_STRIDE needs to be configured.</p> 
FBUF_STRIDE	<p>Frame Buffer Parameter. Indicates the stride of the frame buffer. The width of the frame buffer(in double words) minus the width of the image(in double words) is the stride. The stride should be double words aligned. The embedded DMA controller will skip the stride before starting to write the next row of the image.</p>

### 19.7.13 CSI Image Parameter Register (CSI\_CSIMAG\_PARA)

This register provides the width and the height of the image from the sensor. The width and height should be aligned in pixel. The width of the image multiplied by the height is the total pixel size that will be transferred in a frame by the embedded DMA controller. This register should be configured before activating or restarting the embedded DMA controller.

Address: 402B\_C000h base + 34h offset = 402B\_C034h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	IMAGE_WIDTH																IMAGE_HEIGHT															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CSI\_CSIMAG\_PARA field descriptions

Field	Description
31-16 IMAGE_WIDTH	<p>Image Width. Indicates how many pixels in a line of the image from the sensor.</p> <p>If the input data from the sensor is 8-bit/pixel format, the IMAGE_WIDTH should be a multiple of 8 pixels.</p> <p>If the input data from the sensor is 10-bit/pixel or 16-bit/pixel format, the IMAGE_WIDTH should be a multiple of 4 pixels.</p>
IMAGE_HEIGHT	<p>Image Height. Indicates how many pixels in a column of the image from the sensor.</p>

## 19.7.14 CSI Control Register 18 (CSI\_CSICR18)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 402B\_C000h base + 48h offset = 402B\_C048h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	CSI_ENABLE	Reserved												MASK_OPTION		Reserved	
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
R	AHB_HPROT				Reserved	RGB888A_FORMAT_SEL	BASEADDR_CHANGE_ERROR_IE	LAST_DMA_REQ_SEL	DMA_FIELD1_DONE_IE	FIELD0_DONE_IE	BASEADDR_SWITCH_SEL	BASEADDR_SWITCH_EN	PARALLEL24_EN	DEINTERLACE_EN	Reserved		
W																	
Reset	1	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	

### CSI\_CSICR18 field descriptions

Field	Description
31 CSI_ENABLE	CSI global enable signal. Only when this bit is 1, CSI can start to receive the data and store to memory.
30–20 -	This field is reserved.
19–18 MASK_OPTION	These bits used to choose the method to mask the CSI input. 00 Writing to memory from first completely frame, when using this option, the CSI_ENABLE should be 1. 01 Writing to memory when CSI_ENABLE is 1. 02 Writing to memory from second completely frame, when using this option, the CSI_ENABLE should be 1. 03 Writing to memory when data comes in, not matter the CSI_ENABLE is 1 or 0.
17–16 -	This field is reserved.

Table continues on the next page...

## CSI\_CSICR18 field descriptions (continued)

Field	Description
15–12 AHB_HPROT	Hprot value in AHB bus protocol.
11 -	This field is reserved.
10 RGB888A_ FORMAT_SEL	Output is 32-bit format. 0 {8'h0, data[23:0]} 1 {data[23:0], 8'h0}
9 BASEADDR_ CHANGE_ ERROR_IE	Base address change error interrupt enable signal.
8 LAST_DMA_ REQ_SEL	Choosing the last DMA request condition. 0 fifo_full_level 1 hburst_length
7 DMA_FIELD1_ DONE_IE	When in interlace mode, field 1 done interrupt enable. 0 Interrupt disabled 1 Interrupt enabled
6 FIELD0_DONE_ IE	In interlace mode, field 0 means interrupt enabled. 0 Interrupt disabled 1 Interrupt enabled
5 BASEADDR_ SWITCH_SEL	CSI 2 base addresses switching method. When using this bit, BASEADDR_SWITCH_EN is 1. 0 Switching base address at the edge of the vsync 1 Switching base address at the edge of the first data of each frame
4 BASEADDR_ SWITCH_EN	When this bit is enabled, CSI DMA will switch the base address according to BASEADDR_SWITCH_SEL rather than atomically by DMA completed.
3 PARALLEL24_ EN	When input is parallel rgb888/yuv444 24bit, this bit can be enabled.
2 DEINTERLACE_ EN	This bit is used to select the output method When input is standard CCIR656 video. 0 Deinterlace disabled 1 Deinterlace enabled
-	This field is reserved. Reserved.

## 19.7.15 CSI Control Register 19 (CSI\_CSICR19)

This read/write register acts as an extension of the functionality of the CSI Control register 1

Address: 402B\_C000h base + 4Ch offset = 402B\_C04Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved																DMA_RFIFO_HIGHEST_FIFO_LEVEL															
W	Reserved																DMA_RFIFO_HIGHEST_FIFO_LEVEL															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### CSI\_CSICR19 field descriptions

Field	Description
31–8 -	This field is reserved.
DMA_RFIFO_HIGHEST_FIFO_LEVEL	This byte stores the highest FIFO level achieved by CSI FIFO timely and will be clear by writing 8'ff to it.

# Chapter 20

## DCDC Converter (DCDC)

### 20.1 Introduction

This module is a synchronous buck mode DCDC converter with a single output.

### 20.2 Features

The DCDC module includes the following features:

- Buck mode, a single output
- PSWITCH pin to control DCDC to work or bypass DCDC
- Continuous conduction mode (CCM) and discontinuous conduction mode (DCM) operation
- Power-save mode operation
- Over current protection
- Over voltage protection
- Low voltage detection
- Internal oscillator to support the case when the crystal oscillator is not present as in the block diagram

## 20.3 Block diagram

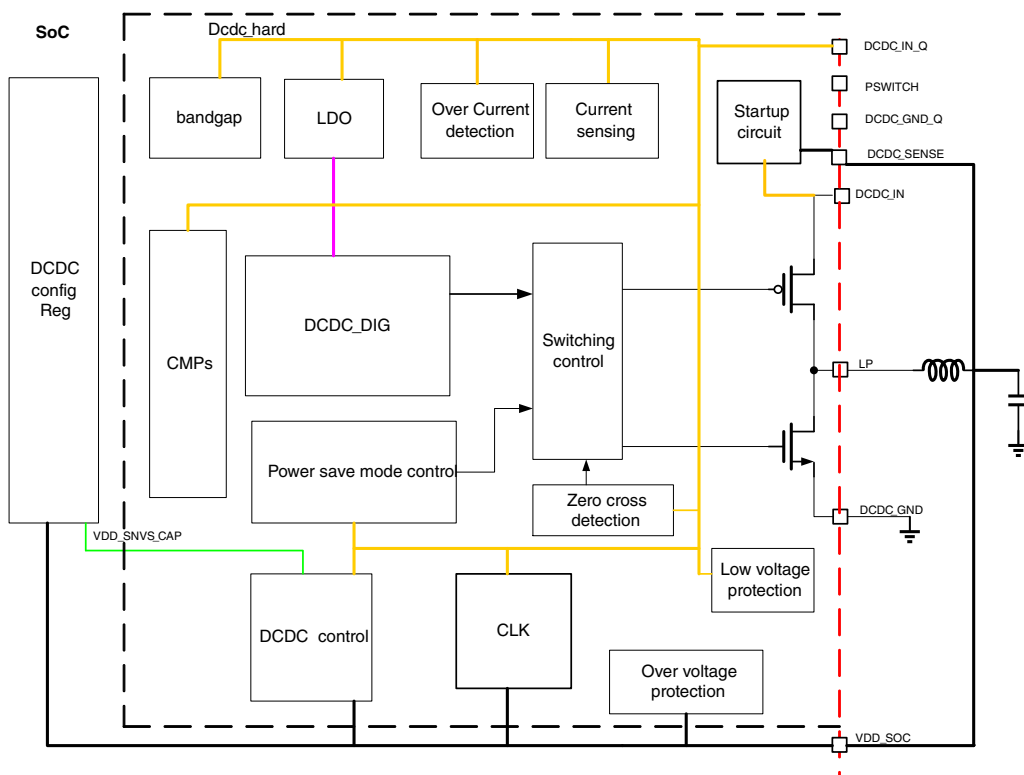

Figure 20-1. DCDC block diagram

## 20.4 Functional description

The DCDC converter is a synchronous step down converters with a single output. In run mode, it can operate on the continuous conduction mode or discontinuous conduction mode, depending on the level of the load current. And the discontinuous conduction mode need be enabled by the register configuration.

DCDC can also be configured to operate on power-save mode when the load current is less than 50 mA. During the power-save mode, the converter operates with reduced switching frequency in PFM mode and with a minimum quiescent current to maintain high efficiency.

DCDC also includes the following three protection functions:

- Over current protection. In run mode, DCDC will shut down when detecting abnormal large current in the P-type power switch. In power save mode, DCDC will stop charging inductor when detecting large current in the P-type power switch. The threshold is also different in run mode and in power save mode: the former is 1 A–2 A, and the latter is 200 mA–250 mA.
- Over voltage protection. DCDC will shut down when detecting the output voltage is too high.
- Low voltage detection. DCDC will shut down when detecting the input voltage is too low.

Another function of DCDC is that it can detect the peak current in the P-channel switch. When the peak current exceeds the threshold, DCDC will give an alert signal, and the threshold can be configured. By this way, DCDC can roughly detect the current loading.

## 20.5 Application information

### 20.5.1 Turn on DCDC

To turn on the DCDC, PSWITCH and PMIC\_ON\_REQ must be both high in the meantime.

#### NOTE

For safety purpose, over-voltage detector needs to be enabled, i.e. PWD\_HIGH\_VOLT\_DET=1'b0.

### 20.5.2 Target voltage adjustment

```
DISABLE_STEP=0x0
```

```
set TRG
```

#### NOTE

If setting disable\_step=0, the overshoot will be low when changing the target, but the settling time is longer. If setting disable\_step=1, the settling time is shorter, but the overshoot might be higher. The following settings can speed up the settling time: pwd\_cmp\_offset=0x0; loopctrl\_en\_rcscale=0x4.

### 20.5.3 Continuous conduction mode

`pwd_zcd=0x1`

`pwd_cmp_offset=0x0`

`loopctrl_en_rcscale=0x3`

### 20.5.4 Discontinuous conduction mode

`pwd_zcd=0x0`

`pwd_cmp_offset=0x0`

`loopctrl_en_rcscale=0x4`

`DCM_SET_CTRL=1'b1`

#### NOTE

Because discontinuous conduction mode can increase the efficiency of DCDC in case of low current loading, it is always recommended.

### 20.5.5 Power saving mode

Before entering this mode, set the target value of run mode the same as power saving mode, because DCDC will switch back to run mode if it detects the current loading is larger than about 50 mA (the threshold can be configured).

`PMIC_STBY_REQ=0x1`

## 20.6 Memory Map and register definition

This section includes the DCDC module memory map and detailed descriptions of all registers.

### 20.6.1 DCDC register descriptions

## 20.6.1.1 DCDC Memory map

DCDC base address: 4008\_0000h

Offset	Register	Width (In bits)	Access	Reset value
0h	<a href="#">DCDC Register 0 (REG0)</a>	32	RW	1403_0111h
4h	<a href="#">DCDC Register 1 (REG1)</a>	32	RW	111B_A29Ch
8h	<a href="#">DCDC Register 2 (REG2)</a>	32	RW	0000_0009h
Ch	<a href="#">DCDC Register 3 (REG3)</a>	32	RW	0000_010Eh

## 20.6.1.2 DCDC Register 0 (REG0)

### 20.6.1.2.1 Offset

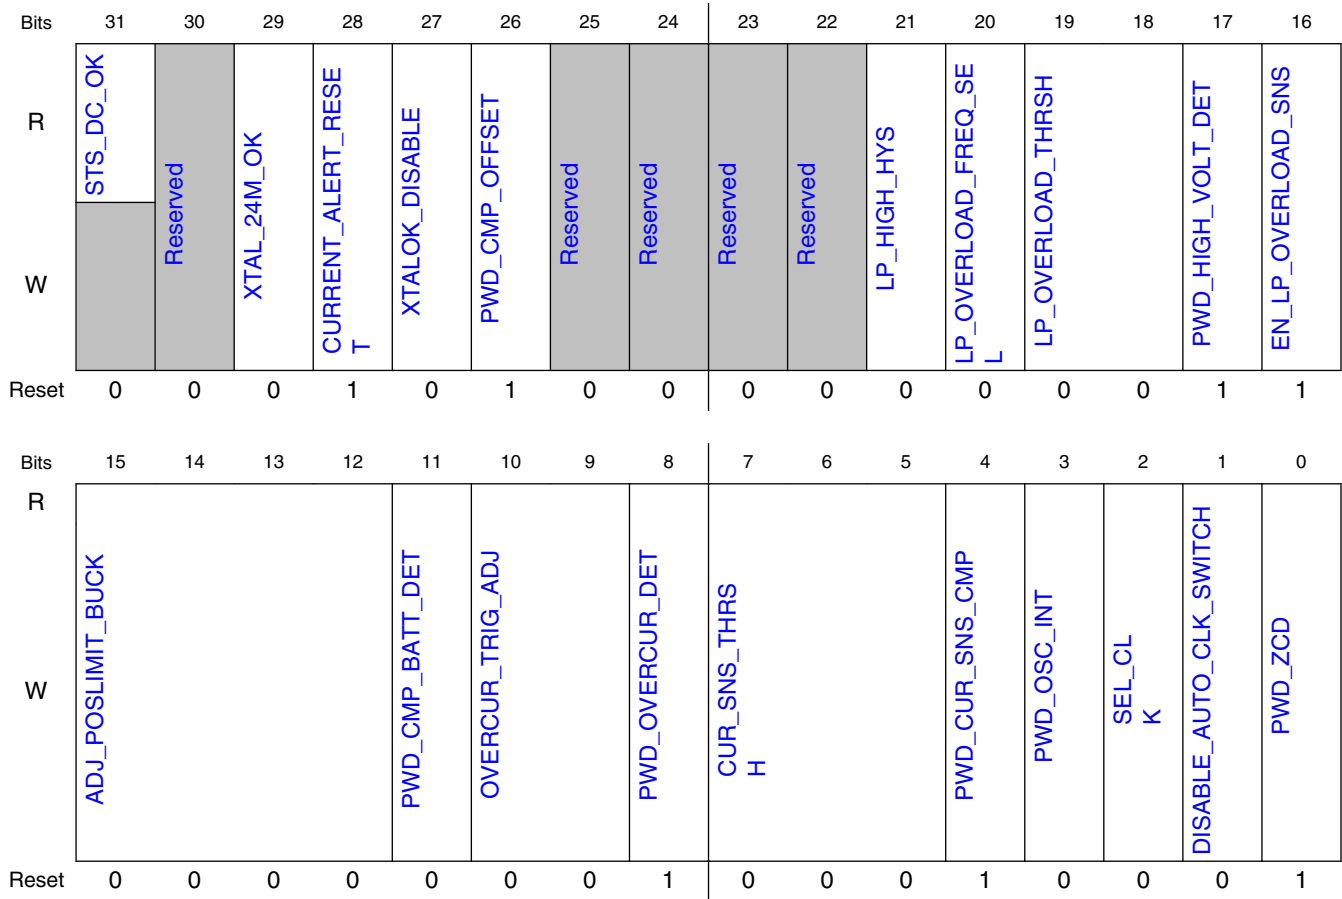

Register	Offset
REG0	0h

### 20.6.1.2.2 Function

DCDC register 0

This register controls various high-level functions of the DCDC

### 20.6.1.2.3 Diagram

### 20.6.1.2.4 Fields

Field	Function
31 STS_DC_OK	Status register to indicate DCDC status. 1'b1: DCDC already settled 1'b0: DCDC is settling
30 —	Reserved.
29 XTAL_24M_OK	set to 1 to switch internal ring osc to xtal 24M
28 CURRENT_ALERT_RESET	reset current alert signal
27 XTALOK_DISABLE	1'b1: Disable xtalok detection circuit 1'b0: Enable xtalok detection circuit
26	power down output range comparator

0x3	450 mA														
0x4	550 mA														
0x5	650 mA														
4 PWD_CUR_SNS_CMP	The power down signal of the current detector.														
3 PWD_OSC_INT	Power down internal osc. Only set this bit, when 24 MHz crystal osc is available														
2 SEL_CLK	select 24 MHz Crystal clock for DCDC, when dcdc_disable_auto_clk_switch is set.														
1 DISABLE_AUTO_CLK_SWITCH	Disable automatic clock switch from internal osc to xtal clock.														
0 PWD_ZCD	power down the zero cross detection function for discontinuous conductor mode														

### 20.6.1.3 DCDC Register 1 (REG1)

#### 20.6.1.3.1 Offset

Register	Offset
REG1	4h

#### 20.6.1.3.2 Function

DCDC register 1

This register controls various high-level functions of the DCDC

### 20.6.1.3.3 Diagram

### 20.6.1.3.4 Fields

Field	Function
31-29 —	Reserved.
28-24 VBG_TRIM	trim bandgap voltage
23 LOOPCTRL_EN_HYST	Enable hysteresis in switching converter common mode analog comparators. This feature will improve transient supply ripple and efficiency
22 —	Reserved.
21 LOOPCTRL_HST_THRESH	increase the threshold detection for common mode analog comparator
20-14 NEGLIMIT_IN	Negative duty cycle limit of DC-DC converter
13-12	set the current bias of low power comparator <ul style="list-style-type: none"> <li>• 0x0: 50 nA</li> <li>• 0x1: 100 nA</li> </ul>

Table continues on the next page...

## Memory Map and register definition

Field	Function
LP_CMP_ISRC_SEL	<ul style="list-style-type: none"><li>• 0x2: 200 nA</li><li>• 0x3: 400 nA</li></ul>
11-10 —	Reserved.
9 REG_RLOAD_SW	control the load resistor of the internal regulator of DCDC, the load resistor is connected as default "1", and need set to "0" to disconnect the load resistor
8-7 REG_FBK_SEL	select the feedback point of the internal regulator
6-0 POSLIMIT_BUCK_IN	Upper limit duty cycle limit in DC-DC converter.

### 20.6.1.4 DCDC Register 2 (REG2)

#### 20.6.1.4.1 Offset

Register	Offset
REG2	8h

#### 20.6.1.4.2 Function

DCDC register 2

This register controls various high-level functions of the DCDC

### 20.6.1.4.3 Diagram

### 20.6.1.4.4 Fields

Field	Function
31-29 —	Reserved.
28 DCM_SET_CTRL	Set high to improve the transition from heavy load to light load
27 DISABLE_PULSE_SKIP	Set to "0" : stop charging if the duty cycle is lower than what set by dcdc_neglimit_in
26 —	Reserved.
25-16 —	Reserved.
15 —	Reserved.
14	Reserved.

Table continues on the next page...

## Memory Map and register definition

Field	Function
—	
13 LOOPCTRL_HY ST_SIGN	Invert the sign of the hysteresis in DC-DC analog comparators.
12 LOOPCTRL_RC SCALE_THRSH	Increase the threshold detection for RC scale circuit.
11-9 LOOPCTRL_EN _RCSCALE	Enable analog circuit of DC-DC converter to respond faster under transient load conditions.
8-6 LOOPCTRL_DC _FF	Two's complement feed forward step in duty cycle in the switching DC-DC converter. Each time this field makes a transition from 0x0, the loop filter of the DC-DC converter is stepped once by a value proportional to the change. This can be used to force a certain control loop behavior, such as improving response under known heavy load transients.
5-2 LOOPCTRL_DC _R	Magnitude of proportional control parameter in the switching DC-DC converter control loop.
1-0 LOOPCTRL_DC _C	Ratio of integral control parameter to proportional control parameter in the switching DC-DC converter, and can be used to optimize efficiency and loop response.

### 20.6.1.5 DCDC Register 3 (REG3)

#### 20.6.1.5.1 Offset

Register	Offset

# Chapter 21

## Direct Memory Access Multiplexer (DMAMUX)

### 21.1 Chip-specific DMAMUX information

#### NOTE

On this device, only 32-bit write is supported for the DMA\_CH\_MUX registers.

### 21.2 Introduction

#### 21.2.1 Overview

The Direct Memory Access Multiplexer (DMAMUX) routes DMA sources, called slots, to any of the 32 DMA channels. This process is illustrated in the following figure.

Figure 21-1. DMAMUX block diagram

## 21.2.2 Features

The DMAMUX module provides these features:

- Up to 128 peripheral slots can be routed to 32 channels.
- 32 independently selectable DMA channel routers.
  - Each channel output can be individually configured to be Always On and not depend on any of the peripheral slots.
  - The first 4 channels additionally provide a trigger functionality.
- Each channel router can be assigned to one of the possible peripheral DMA slots.
- On every memory map configuration change for a any channel, this module signals to the DMA Controller to reset the internal state machine for that channel and it can accept a new request based on the new configuration.

### 21.2.3 Modes of operation

The following operating modes are available:

- Disabled mode

In this mode, the DMA channel is disabled. Because disabling and enabling of DMA channels is done primarily via the DMA configuration registers, this mode is used mainly as the reset state for a DMA channel in the DMA channel MUX. It may also be used to temporarily suspend a DMA channel while reconfiguration of the system takes place, for example, changing the period of a DMA trigger.

- Normal mode

In this mode, a DMA source is routed directly to the specified DMA channel. The operation of the DMAMUX in this mode is completely transparent to the system.

- Periodic Trigger mode

In this mode, a DMA source may only request a DMA transfer, such as when a transmit buffer becomes empty or a receive buffer becomes full, periodically.

Configuration of the period is done in the registers of the periodic interrupt timer (PIT). This mode is available only for channels 0 to 3.

## 21.3 External signal description

The DMAMUX has no external pins.

## 21.4 Memory map/register definition

This section provides a detailed description of all memory-mapped registers in the DMAMUX.

### 21.4.1 DMA\_CH\_MUX Register Descriptions

#### 21.4.1.1 DMA\_CH\_MUX Memory Map

Base address: 400E\_C000.

## Memory map/register definition

Offset	Register	Width (In bits)	Access	Reset value
0h - 7Ch	<a href="#">Channel a Configuration (CHCFG0 - CHCFG31)</a>	32	RW	0000000h

## 21.4.1.2 Channel a Configuration (CHCFGa)

### 21.4.1.2.1 Address

For a = 0 to 31:

Register	Offset
CHCFGa	0h + (a × 4h)

### 21.4.1.2.2 Function

Each of the DMA channels can be independently enabled/disabled and associated with one of the DMA slots (peripheral slots or always-on slots) in the system.

#### NOTE

Setting multiple CHCFG registers with the same source value will result in unpredictable behavior. This is true, even if a channel is disabled (ENBL==0).

Before changing the trigger or source settings, a DMA channel must be disabled via CHCFGn[ENBL].

### 21.4.1.2.3 Diagram

### 21.4.1.2.4 Fields

Field	Function
31 ENBL	DMA Mux Channel Enable Enables the channel for DMA Mux. The DMA has separate channel enables/disables, which should be used to disable or reconfigure a DMA channel. 0b - DMA Mux channel is disabled 1b - DMA Mux channel is enabled
30 TRIG	DMA Channel Trigger Enable Enables the periodic trigger capability for the triggered DMA channel. 0b - Triggering is disabled. If triggering is disabled and ENBL is set, the DMA Channel will simply route the specified source to the DMA channel. (Normal mode) 1b - Triggering is enabled. If triggering is enabled and ENBL is set, the DMA_CH_MUX is in Periodic Trigger mode.
29 A_ON	DMA Channel Always Enable Enables the DMA Channel to be always ON. If TRIG bit is set, the module will assert request on every trigger. 0b - DMA Channel Always ON function is disabled 1b - DMA Channel Always ON function is enabled
28-7 —	Reserved field
6-0 SOURCE	DMA Channel Source (Slot Number) Specifies which DMA source, if any, is routed to a particular DMA channel. See the chip-specific DMA_CH_MUX information for details about the peripherals and their slot numbers.

## 21.5 Functional description

The primary purpose of the DMAMUX is to provide flexibility in the system's use of the available DMA channels.

As such, configuration of the DMAMUX is intended to be a static procedure done during execution of the system boot code. However, if the procedure outlined in [Enabling and configuring sources](#) is followed, the configuration of the DMAMUX may be changed during the normal operation of the system.

Functionally, the DMAMUX channels may be divided into two classes:

- Channels that implement the normal routing functionality plus periodic triggering capability
- Channels that implement only the normal routing functionality

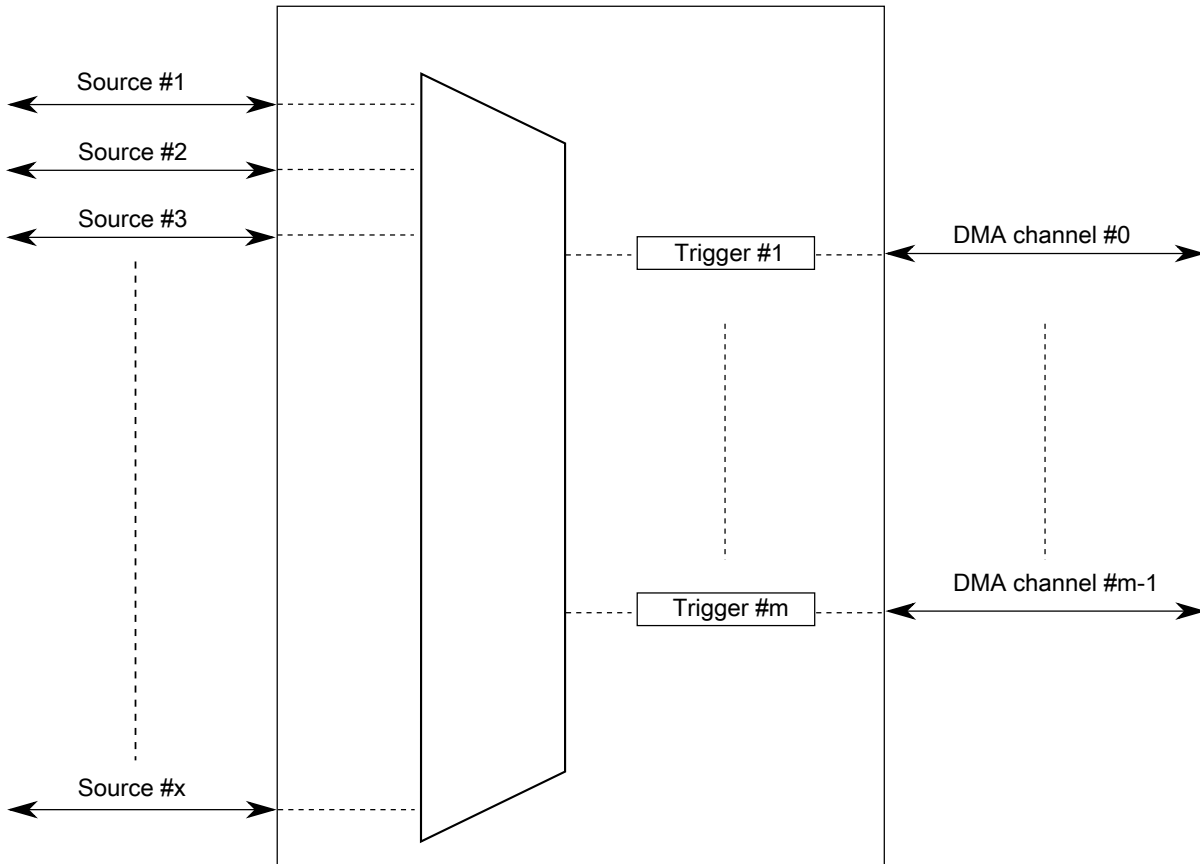

### 21.5.1 DMA channels with periodic triggering capability

Besides the normal routing functionality, the first 4 channels of the DMAMUX provide a special periodic triggering capability that can be used to provide an automatic mechanism to transmit bytes, frames, or packets at fixed intervals without the need for processor intervention.

The trigger is generated by the periodic interrupt timer (PIT); as such, the configuration of the periodic triggering interval is done via configuration registers in the PIT. See the section on periodic interrupt timer for more information on this topic.

**Note**

Because of the dynamic nature of the system (due to DMA channel priorities, bus arbitration, interrupt service routine lengths, etc.), the number of clock cycles between a trigger and the actual DMA transfer cannot be guaranteed.

**Figure 21-2. DMAMUX triggered channels**

The DMA channel triggering capability allows the system to schedule regular DMA transfers, usually on the transmit side of certain peripherals, without the intervention of the processor. This trigger works by gating the request from the peripheral to the DMA until a trigger event has been seen. This is illustrated in the following figure.

**Figure 21-3. DMAMUX channel triggering: normal operation**

After the DMA request has been serviced, the peripheral will negate its request, effectively resetting the gating mechanism until the peripheral reasserts its request and the next trigger event is seen. This means that if a trigger is seen, but the peripheral is not requesting a transfer, then that trigger will be ignored. This situation is illustrated in the following figure.

**Figure 21-4. DMAMUX channel triggering: ignored trigger**

This triggering capability may be used with any peripheral that supports DMA transfers, and is most useful for two types of situations:

- Periodically polling external devices on a particular bus

As an example, the transmit side of an SPI is assigned to a DMA channel with a trigger, as described above. After it has been set up, the SPI will request DMA transfers, presumably from memory, as long as its transmit buffer is empty. By using a trigger on this channel, the SPI transfers can be automatically performed every 5  $\mu$ s (as an example). On the receive side of the SPI, the SPI and DMA can be configured to transfer receive data into memory, effectively implementing a method to periodically read data from external devices and transfer the results into memory without processor intervention.

- Using the GPIO ports to drive or sample waveforms

By configuring the DMA to transfer data to one or more GPIO ports, it is possible to create complex waveforms using tabular data stored in on-chip memory. Conversely, using the DMA to periodically transfer data from one or more GPIO ports, it is possible to sample complex waveforms and store the results in tabular form in on-chip memory.

A more detailed description of the capability of each trigger, including resolution, range of values, and so on, may be found in the periodic interrupt timer section.

## **21.5.2 Always-enabled DMA sources**

In addition to the peripherals that can be used as DMA sources, each DMA Channel can be individually configured to function as an Always Enabled source. Unlike the peripheral DMA sources, where the peripheral controls the flow of data during DMA transfers, the always enabled channel provide no such "throttling" of the data transfers. These sources are most useful in the following cases:

- Performing DMA transfers to/from GPIO—Moving data from/to one or more GPIO pins, either unthrottled (that is, as fast as possible), or periodically (using the DMA triggering capability).
- Performing DMA transfers from memory to memory—Moving data from memory to memory, typically as fast as possible, sometimes with software activation.
- Performing DMA transfers from memory to the external bus, or vice-versa—Similar to memory to memory transfers, this is typically done as quickly as possible.
- Any DMA transfer that requires software activation—Any DMA transfer that should be explicitly started by software.

In cases where software should initiate the start of a DMA transfer, an always-enabled DMA channel can be used to provide maximum flexibility. When activating a DMA channel via software, subsequent executions of the minor loop require that a new start event be sent. This can either be a new software activation, or a transfer request from the DMA channel MUX. The options for doing this are:

- Transfer all data in a single minor loop.

By configuring the DMA to transfer all of the data in a single minor loop (that is, major loop counter = 1), no reactivation of the channel is necessary. The disadvantage to this option is the reduced granularity in determining the load that the DMA transfer will impose on the system. For this option, the DMA channel must be disabled in the DMA channel MUX.

- Use explicit software reactivation.

In this option, the DMA is configured to transfer the data using both minor and major loops, but the processor is required to reactivate the channel by writing to the DMA registers *after every minor loop*. For this option, the DMA channel must be disabled in the DMA channel MUX.

- Use an always-enabled DMA source.

In this option, the DMA is configured to transfer the data using both minor and major loops, and the DMA channel MUX does the channel reactivation. For this option, the DMA channel should be enabled and configured as "always enabled" channel. Note that the reactivation of the channel can be continuous (DMA triggering is disabled) or can use the DMA triggering capability. In this manner, it is possible to execute periodic transfers of packets of data from one source to another, without processor intervention.

### NOTE

When a channel is configured as "Always Enabled", then the peripheral DMA sources for that channel are ignored; i.e. SOURCE field has no effect.

## 21.6 Initialization/application information

This section provides instructions for initializing the DMA channel MUX.

### 21.6.1 Reset

The reset state of each individual bit is shown in [Memory map/register definition](#). In summary, after reset, all channels are disabled and must be explicitly enabled before use.

### 21.6.2 Enabling and configuring sources

To enable a source with periodic triggering:

1. Determine with which DMA channel the source will be associated. Note that only the first 4 DMA channels have periodic triggering capability.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] fields of the DMA channel.
3. Ensure that the DMA channel is properly configured in the DMA. The DMA channel may be enabled at this point.
4. Configure the corresponding timer.
5. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that the CHCFG[ENBL] and CHCFG[TRIG] fields are set.

### NOTE

The following is an example. See the chip configuration details for the number of this device's DMA channels that have triggering capability.

To configure source #5 transmit for use with DMA channel 1, with periodic triggering capability:

1. Write 0x00000000 to CHCFG1.
2. Configure channel 1 in the DMA, including enabling the channel.
3. Configure a timer for the desired trigger interval.
4. Write 0xC0000005 to CHCFG1.

The following code example illustrates steps 1 and 4 above:

```
void DMAMUX_Init(uint8_t DMA_CH, uint8_t DMAMUX_SOURCE)
{
    DMAMUX_0.CHCFG[DMA_CH].B.SOURCE = DMAMUX_SOURCE;
    DMAMUX_0.CHCFG[DMA_CH].B.ENBL   = 1;
    DMAMUX_0.CHCFG[DMA_CH].B.TRIG   = 1;
}
```

To enable a source without periodic triggering:

1. Determine with which DMA channel the source will be associated. Note that only the first 4 DMA channels have periodic triggering capability.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] fields of the DMA channel.
3. Ensure that the DMA channel is properly configured in the DMA. The DMA channel may be enabled at this point.
4. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that CHCFG[ENBL] is set while CHCFG[TRIG] is cleared.

### NOTE

The following is an example. See the chip configuration details for the number of this device's DMA channels that have triggering capability.

To configure source #5 transmit for use with DMA channel 1 with no periodic triggering capability :

1. Write 0x00000000 to CHCFG1.
2. Configure channel 1 in the DMA, including enabling the channel.
3. Write 0x80000005 to CHCFG1.

The following code example illustrates steps 1 and 3 above:

```
In File registers.h:
#define DMAMUX_BASE_ADDR      0x40021000/* Example only ! */
/* Following example assumes long is 32-bits */
volatile unsigned long *CHCFG0 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0000);
volatile unsigned long *CHCFG1 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0004);
volatile unsigned long *CHCFG2 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0008);
volatile unsigned long *CHCFG3 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x000C);
volatile unsigned long *CHCFG4 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0010);
volatile unsigned long *CHCFG5 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0014);
volatile unsigned long *CHCFG6 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0018);
volatile unsigned long *CHCFG7 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x001C);
volatile unsigned long *CHCFG8 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0020);
volatile unsigned long *CHCFG9 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0024);
volatile unsigned long *CHCFG10= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0028);
volatile unsigned long *CHCFG11= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x002C);
volatile unsigned long *CHCFG12= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0030);
volatile unsigned long *CHCFG13= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0034);
volatile unsigned long *CHCFG14= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0038);
volatile unsigned long *CHCFG15= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x003C);
```

```
In File main.c:
#include "registers.h"
:
:
*CHCFG1 = 0x00000000;
*CHCFG1 = 0x80000005;
```

### To disable a source:

A particular DMA source may be disabled by not writing the corresponding source value into any of the CHCFG registers. Additionally, some module-specific configuration may be necessary. See the appropriate section for more details.

### To switch the source of a DMA channel:

1. Disable the DMA channel in the DMA and reconfigure the channel for the new source.
2. Clear the CHCFG[ENBL] and CHCFG[TRIG] bits of the DMA channel.
3. Select the source to be routed to the DMA channel. Write to the corresponding CHCFG register, ensuring that the CHCFG[ENBL] and CHCFG[TRIG] fields are set.

To switch DMA channel 8 from source #5 transmit to source #7 transmit:

1. In the DMA configuration registers, disable DMA channel 8 and reconfigure it to handle the transfers to peripheral slot 7. This example assumes channel 8 doesn't have triggering capability.
2. Write 0x00000000 to CHCFG8.

- Write 0x80000007 to CHCFG8. (In this example, setting CHCFG[TRIG] would have no effect due to the assumption that channel 8 does not support the periodic triggering functionality.)

The following code example illustrates steps 2 and 3 above:

```
In File registers.h:
#define DMAMUX_BASE_ADDR      0x40021000/* Example only ! */
/* Following example assumes long is 32-bits */
volatile unsigned long *CHCFG0 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0000);
volatile unsigned long *CHCFG1 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0004);
volatile unsigned long *CHCFG2 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0008);
volatile unsigned long *CHCFG3 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x000C);
volatile unsigned long *CHCFG4 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0010);
volatile unsigned long *CHCFG5 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0014);
volatile unsigned long *CHCFG6 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0018);
volatile unsigned long *CHCFG7 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x001C);
volatile unsigned long *CHCFG8 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0020);
volatile unsigned long *CHCFG9 = (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0024);
volatile unsigned long *CHCFG10= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0028);
volatile unsigned long *CHCFG11= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x002C);
volatile unsigned long *CHCFG12= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0030);
volatile unsigned long *CHCFG13= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0034);
volatile unsigned long *CHCFG14= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x0038);
volatile unsigned long *CHCFG15= (volatile unsigned long *) (DMAMUX_BASE_ADDR+0x003C);

In File main.c:
#include "registers.h"
:
:
*CHCFG8 = 0x00000000;
*CHCFG8 = 0x80000007;
```

### 21.6.2.1 Configuration options

Table 21-1. Channel Configuration Options

ENBL	TRIG	A_ON	Function	Mode
0	X	X	DMA channel is disabled	Disabled Mode
1	0	0	DMA channel is enabled with no triggering (transparent)	Normal Mode
1	1	0	DMA channel is enabled with triggering	Periodic Trigger Mode
1	0	1	DMA channel is always enabled	Always On Mode
1	1	1	DMA channel is always enabled with triggering	Always On Trigger Mode

# Chapter 22

## Enhanced Direct Memory Access (eDMA)

### 22.1 Introduction

The enhanced direct memory access (eDMA) controller is a second-generation module capable of performing complex data transfers with minimal intervention from a host processor. The hardware microarchitecture includes:

- A DMA engine that performs:
  - Source address and destination address calculations
  - Data-movement operations
- Local memory containing transfer control descriptors for each of the 32 channels

#### 22.1.1 eDMA system block diagram

[Figure 22-1](#) illustrates the components of the eDMA system, including the eDMA module ("engine").

Figure 22-1. eDMA system block diagram

### 22.1.2 Block parts

The eDMA module is partitioned into two major modules: the eDMA engine and the transfer-control descriptor local memory.

The eDMA engine is further partitioned into four submodules:

Table 22-1. eDMA engine submodules

Submodule	Function
Address path	<p>This block implements registered versions of two channel transfer control descriptors, channel x and channel y, and manages all master bus-address calculations. All the channels provide the same functionality. This structure allows data transfers associated with one channel to be preempted after the completion of a read/write sequence if a higher priority channel activation is asserted while the first channel is active. After a channel is activated, it runs until the minor loop is completed, unless preempted by a higher priority channel. This provides a mechanism (enabled by DCHPRI<sub>n</sub>[ECP]) where a large data move operation can be preempted to minimize the time another channel is blocked from execution.</p> <p>When any channel is selected to execute, the contents of its TCD are read from local memory and loaded into the address path channel x registers for a normal start and into channel y registers for a preemption start. After the minor loop completes execution, the address path hardware writes</p>

Table continues on the next page...

**Table 22-1. eDMA engine submodules (continued)**

Submodule	Function
	the new values for the TCDn_{SADDR, DADDR, CITER} back to local memory. If the major iteration count is exhausted, additional processing is performed, including the final address pointer updates, reloading the TCDn_CITER field, and a possible fetch of the next TCDn from memory as part of a scatter/gather operation.
Data path	This block implements the bus master read/write datapath. It includes a data buffer and the necessary multiplex logic to support any required data alignment. The internal read data bus is the primary input, and the internal write data bus is the primary output.  The address and data path modules directly support the 2-stage pipelined internal bus. The address path module represents the 1st stage of the bus pipeline (address phase), while the data path module implements the 2nd stage of the pipeline (data phase).
Program model/channel arbitration	This block implements the first section of the eDMA programming model as well as the channel arbitration logic. The programming model registers are connected to the internal peripheral bus. The eDMA peripheral request inputs and interrupt request outputs are also connected to this block (via control logic).
Control	This block provides all the control functions for the eDMA engine. For data transfers where the source and destination sizes are equal, the eDMA engine performs a series of source read/destination write operations until the number of bytes specified in the minor loop byte count has moved. For descriptors where the sizes are not equal, multiple accesses of the smaller size data are required for each reference of the larger size. As an example, if the source size references 16-bit data and the destination is 32-bit data, two reads are performed, then one 32-bit write.

The transfer-control descriptor local memory is further partitioned into:

**Table 22-2. Transfer control descriptor memory**

Submodule	Description
Memory controller	This logic implements the required dual-ported controller, managing accesses from the eDMA engine as well as references from the internal peripheral bus. As noted earlier, in the event of simultaneous accesses, the eDMA engine is given priority and the peripheral transaction is stalled.
Memory array	TCD storage for each channel's transfer profile.

### 22.1.3 Features

The eDMA is a highly programmable data-transfer engine optimized to minimize any required intervention from the host processor. It is intended for use in applications where the data size to be transferred is statically known and not defined within the transferred data itself. The eDMA module features:

- All data movement via dual-address transfers: read from source, write to destination
  - Programmable source and destination addresses and transfer size
  - Support for enhanced addressing modes

- 32-channel implementation that performs complex data transfers with minimal intervention from a host processor
  - Internal data buffer, used as temporary storage to support 16- and 32-byte transfers
  - Connections to the crossbar switch for bus mastering the data movement
- Transfer control descriptor (TCD) organized to support two-deep, nested transfer operations
  - 32-byte TCD stored in local memory for each channel
  - An inner data transfer loop defined by a minor byte transfer count
  - An outer data transfer loop defined by a major iteration count
- Channel activation via one of three methods:
  - Explicit software initiation
  - Initiation via a channel-to-channel linking mechanism for continuous transfers
  - Peripheral-paced hardware requests, one per channel
- Fixed-priority and round-robin channel arbitration
- Channel completion reported via programmable interrupt requests
  - One interrupt per channel, which can be asserted at completion of major iteration count
  - Programmable error terminations per channel and logically summed together to form one error interrupt to the interrupt controller
- Programmable support for scatter/gather DMA processing
- Support for complex data structures

In the discussion of this module,  $n$  is used to reference the channel number.

## 22.2 Modes of operation

The eDMA operates in the following modes:

**Table 22-3. Modes of operation**

Mode	Description
Normal	In Normal mode, the eDMA transfers data between a source and a destination. The source and destination can be a memory block or an I/O block capable of operation with the eDMA.  A service request initiates a transfer of a specific number of bytes (NBYTES) as specified in the transfer control descriptor (TCD). The minor loop is the sequence of read-write operations that transfers these NBYTES per service request. Each service request executes one iteration of the major loop, which transfers NBYTES of data.
Debug	DMA operation is configurable in Debug mode via the control register: <ul style="list-style-type: none"> <li>• If CR[EDBG] is cleared, the DMA continues to operate.</li> <li>• If CR[EDBG] is set, the eDMA stops transferring data. If Debug mode is entered while a channel is active, the eDMA continues operation until the channel retires.</li> </ul>
Wait	Before entering Wait mode, the DMA attempts to complete its current transfer. After the transfer completes, the device enters Wait mode.

## 22.3 Memory map/register definition

The eDMA's programming model is partitioned into two regions:

- The first region defines a number of registers providing control functions
- The second region corresponds to the local transfer control descriptor (TCD) memory

### 22.3.1 TCD memory

Each channel requires a 32-byte transfer control descriptor for defining the desired data movement operation. The channel descriptors are stored in the local memory in sequential order: channel 0, channel 1, ... channel 31. Each TCD<sub>*n*</sub> definition is presented as 11 registers of 16 or 32 bits.

### 22.3.2 TCD initialization

Prior to activating a channel, you must initialize its TCD with the appropriate transfer profile.

### 22.3.3 TCD structure

### 22.3.4 Reserved memory and bit fields

- Reading reserved bits in a register returns the value of zero.
- Writes to reserved bits in a register are ignored.
- Reading or writing a reserved memory location generates a bus error.

### 22.3.5 DMA Register Descriptions

#### 22.3.5.1 DMA Memory Map

Base address: 400E\_8000.

Offset	Register	Width (In bits)	Access	Reset value
0h	<a href="#">Control (CR)</a>	32	RW	See register description.

## 22.3.5.2 Control (CR)

### 22.3.5.2.1 Address

Register	Offset
CR	0h

### 22.3.5.2.2 Function

The CR defines the basic operating configuration of the DMA. The DMA arbitrates channel service requests in two groups of 16 channels each:

- Group 1 contains channels 31-16
- Group 0 contains channels 15-0

Arbitration within a group can be configured to use either a fixed-priority or a round-robin scheme. For fixed-priority arbitration, the highest priority channel requesting service is selected to execute. The channel priority registers assign the priorities; see the DCHPRIn registers. For round-robin arbitration, the channel priorities are ignored and channels within each group are cycled through (from high to low channel number) without regard to priority.

#### NOTE

For correct operation, writes to the CR register must be performed only when the DMA channels are inactive; that is, when TCDn\_CSR[ACTIVE] bits are cleared.

The group priorities operate in a similar fashion. In group fixed priority arbitration mode, channel service requests in the highest priority group are executed first, where priority level 1 is the highest and priority level 0 is the lowest. The group priorities are assigned in the GRPnPRI fields of the DMA Control Register (CR). All group priorities must have unique values prior to any channel service requests occurring; otherwise, a configuration error will be reported. For group round robin arbitration, the group priorities are ignored and the groups are cycled through (from high to low group number) without regard to priority.

Minor loop offsets are address offset values added to the final source address (TCDn\_SADDR) or destination address (TCDn\_DADDR) upon minor loop completion. When minor loop offsets are enabled, the minor loop offset (MLOFF) is added to the final source address (TCDn\_SADDR), to the final destination address (TCDn\_DADDR), or to both prior to the addresses being written back into the TCD. If the major loop is complete, the minor loop offset is ignored and the major loop address offsets (TCDn\_SLAST and TCDn\_DLAST\_SGA) are used to compute the next TCDn\_SADDR and TCDn\_DADDR values.

When minor loop mapping is enabled (EMLM is 1), TCDn word2 is redefined. A portion of TCDn word2 is used to specify multiple fields: a source enable bit (SMLOE) to specify the minor loop offset should be applied to the source address (TCDn\_SADDR) upon minor loop completion, a destination enable bit (DMLOE) to specify the minor loop offset should be applied to the destination address (TCDn\_DADDR) upon minor loop completion, and the sign extended minor loop offset value (MLOFF). The same offset value (MLOFF) is used for both source and destination minor loop offsets. When either minor loop offset is enabled (SMLOE set or DMLOE set), the NBYTES field is reduced to 10 bits. When both minor loop offsets are disabled (SMLOE cleared and DMLOE cleared), the NBYTES field is a 30-bit vector.

When minor loop mapping is disabled (EMLM is 0), all 32 bits of TCDn word2 are assigned to the NBYTES field.

### 22.3.5.2.3 Diagram

### 22.3.5.2.4 Fields

Field	Function
31 ACTIVE	DMA Active Status 0b - eDMA is idle.

Table continues on the next page...

Field	Function
	1b - eDMA is executing a channel.
30-24 —	eDMA version number Reserved
23-18 —	Reserved
17 CX	Cancel Transfer  0b - Normal operation 1b - Cancel the remaining data transfer. Stop the executing channel and force the minor loop to finish. The cancel takes effect after the last write of the current read/write sequence. The CX bit clears itself after the cancel has been honored. This cancel retires the channel normally as if the minor loop was completed.
16 ECX	Error Cancel Transfer  0b - Normal operation 1b - Cancel the remaining data transfer in the same fashion as the CX bit. Stop the executing channel and force the minor loop to finish. The cancel takes effect after the last write of the current read/write sequence. The ECX bit clears itself after the cancel is honored. In addition to cancelling the transfer, ECX treats the cancel as an error condition, thus updating the Error Status register (DMAx_ES) and generating an optional error interrupt.
15-11 —	Reserved
10 GRP1PRI	Channel Group 1 Priority Group 1 priority level when fixed priority group arbitration is enabled.
9 —	Reserved
8 GRP0PRI	Channel Group 0 Priority Group 0 priority level when fixed priority group arbitration is enabled.
7 EMLM	Enable Minor Loop Mapping  0b - Disabled. TCDn.word2 is defined as a 32-bit NBYTES field. 1b - Enabled. TCDn.word2 is redefined to include individual enable fields, an offset field, and the NBYTES field. The individual enable fields allow the minor loop offset to be applied to the source address, the destination address, or both. The NBYTES field is reduced when either offset is enabled.
6 CLM	Continuous Link Mode  <b>NOTE:</b> Do not use continuous link mode with a channel linking to itself if there is only one minor loop iteration per service request, for example, if the channel's NBYTES value is the same as either the source or destination size. The same data transfer profile can be achieved by simply increasing the NBYTES value, which provides more efficient, faster processing. 0b - A minor loop channel link made to itself goes through channel arbitration before being activated again. 1b - A minor loop channel link made to itself does not go through channel arbitration before being activated again. Upon minor loop completion, the channel activates again if that channel has a minor loop channel link enabled and the link channel is itself. This effectively applies the minor loop offsets and restarts the next minor loop.
5 HALT	Halt DMA Operations  0b - Normal operation 1b - Stall the start of any new channels. Executing channels are allowed to complete. Channel execution resumes when this bit is cleared.

*Table continues on the next page...*

## Memory map/register definition

Field	Function
4 HOE	Halt On Error 0b - Normal operation 1b - Any error causes the HALT bit to set. Subsequently, all service requests are ignored until the HALT bit is cleared.
3 ERGA	Enable Round Robin Group Arbitration 0b - Fixed priority arbitration is used for selection among the groups. 1b - Round robin arbitration is used for selection among the groups.
2 ERCA	Enable Round Robin Channel Arbitration 0b - Fixed priority arbitration is used for channel selection within each group. 1b - Round robin arbitration is used for channel selection within each group.
1 EDBG	Enable Debug 0b - When in debug mode, the DMA continues to operate. 1b - When in debug mode, the DMA stalls the start of a new channel. Executing channels are allowed to complete. Channel execution resumes when the system exits debug mode or the EDBG bit is cleared.
0 —	Reserved Reserved

### 22.3.5.3 Error Status (ES)

#### 22.3.5.3.1 Address

Register	Offset
ES	4h

#### 22.3.5.3.2 Function

The ES provides information concerning the last recorded channel error. Channel errors can be caused by:

- A configuration error, that is:
  - An illegal setting in the transfer-control descriptor, or
  - An illegal priority register setting in fixed-arbitration
- An error termination to a bus master read or write cycle
- A cancel transfer with error bit that will be set when a transfer is canceled via the corresponding cancel transfer control bit

See [Fault reporting and handling](#) for more details.

### 22.3.5.3.4 Fields

Field	Function
31 VLD	VLD Logical OR of all ERR status bits 0b - No ERR bits are set. 1b - At least one ERR bit is set indicating a valid error exists that has not been cleared.
30-17 —	Reserved
16 ECX	Transfer Canceled 0b - No canceled transfers 1b - The last recorded entry was a canceled transfer by the error cancel transfer input
15 GPE	Group Priority Error 0b - No group priority error 1b - The last recorded error was a configuration error among the group priorities. All group priorities are not unique.
14 CPE	Channel Priority Error 0b - No channel priority error 1b - The last recorded error was a configuration error in the channel priorities within a group. Channel priorities within a group are not unique.
13 —	Reserved
12-8 ERRCHN	Error Channel Number or Canceled Channel Number The channel number of the last recorded error, excluding GPE and CPE errors, or last recorded error canceled transfer.
7 SAE	Source Address Error 0b - No source address configuration error. 1b - The last recorded error was a configuration error detected in the TCDn_SADDR field. TCDn_SADDR is inconsistent with TCDn_ATTR[SSIZE].
6 SOE	Source Offset Error 0b - No source offset configuration error

Table continues on the next page...

## Memory map/register definition

Field	Function
	1b - The last recorded error was a configuration error detected in the TCDn_SOFF field. TCDn_SOFF is inconsistent with TCDn_ATTR[SSIZE].
5 DAE	Destination Address Error 0b - No destination address configuration error 1b - The last recorded error was a configuration error detected in the TCDn_DADDR field. TCDn_DADDR is inconsistent with TCDn_ATTR[DSIZE].
4 DOE	Destination Offset Error 0b - No destination offset configuration error 1b - The last recorded error was a configuration error detected in the TCDn_DOFF field. TCDn_DOFF is inconsistent with TCDn_ATTR[DSIZE].
3 NCE	NBYTES/CITER Configuration Error 0b - No NBYTES/CITER configuration error 1b - The last recorded error was a configuration error detected in the TCDn_NBYTES or TCDn_CITER fields. TCDn_NBYTES is not a multiple of TCDn_ATTR[SSIZE] and TCDn_ATTR[DSIZE], or TCDn_CITER[CITER] is equal to zero, or TCDn_CITER[ELINK] is not equal to TCDn_BITER[ELINK]
2 SGE	Scatter/Gather Configuration Error 0b - No scatter/gather configuration error 1b - The last recorded error was a configuration error detected in the TCDn_DLASTSGA field. This field is checked at the beginning of a scatter/gather operation after major loop completion if TCDn_CSR[ESG] is enabled. TCDn_DLASTSGA is not on a 32 byte boundary.
1 SBE	Source Bus Error 0b - No source bus error 1b - The last recorded error was a bus error on a source read
0 DBE	Destination Bus Error 0b - No destination bus error 1b - The last recorded error was a bus error on a destination write

## 22.3.5.4 Enable Request (ERQ)

### 22.3.5.4.1 Address

Register	Offset
ERQ	Ch

### 22.3.5.4.2 Function

The ERQ register provides a bit map for the 32 channels to enable the request signal for each channel. The state of any given channel enable is directly affected by writes to this register; it is also affected by writes to the SERQ and CERQ registers. These registers are provided so the request enable for a single channel can easily be modified without needing to perform a read-modify-write sequence to this register.

DMA request input signals and this enable request flag must be asserted before a channel's hardware service request is accepted. The state of the DMA enable request flag does not affect a channel service request made explicitly through software or a linked channel request.

### 22.3.5.5 Enable Error Interrupt (EEI)

### 22.3.5.5.1 Address

Register	Offset
EEI	14h

### 22.3.5.5.2 Function

The EEI register provides a bit map for the 32 channels to enable the error interrupt signal for each channel. The state of any given channel's error interrupt enable is directly affected by writes to this register; it is also affected by writes to the SEEI and CEEI. These registers are provided so that the error interrupt enable for a single channel can easily be modified without the need to perform a read-modify-write sequence to the EEI register.

The DMA error indicator and the error interrupt enable flag must be asserted before an error interrupt request for a given channel is asserted to the interrupt controller.

## 22.3.5.6 Clear Enable Error Interrupt (CEEI)

### 22.3.5.6.1 Address

Register	Offset
CEEI	18h

### 22.3.5.6.2 Function

The CEEI provides a simple memory-mapped mechanism to clear a given bit in the EEI to disable the error interrupt for a given channel. The data value on a register write causes the corresponding bit in the EEI to be cleared. Setting the CAEE bit provides a global clear function, forcing the EEI contents to be cleared, disabling all DMA request inputs.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

### 22.3.5.6.3 Diagram

Bits	7	6	5	4	3	2	1	0

## 22.3.5.7 Set Enable Error Interrupt (SEEI)

### 22.3.5.7.1 Address

Register	Offset
SEEI	19h

### 22.3.5.7.2 Function

The SEEI provides a simple memory-mapped mechanism to set a given bit in the EEI to enable the error interrupt for a given channel. The data value on a register write causes the corresponding bit in the EEI to be set. Setting the SAEI bit provides a global set function, forcing the entire EEI contents to be set.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

*Table continues on the next page...*

Field	Function
NOP	0b - Normal operation 1b - No operation, ignore the other bits in this register
6 SAEE	Sets All Enable Error Interrupts 0b - Set only the EEI bit specified in the SEEI field. 1b - Sets all bits in EEI
5 —	Reserved
4-0 SEEI	Set Enable Error Interrupt Sets the corresponding bit in EEI

### 22.3.5.8 Clear Enable Request (CERQ)

#### 22.3.5.8.1 Address

Register	Offset
CERQ	1Ah

#### 22.3.5.8.2 Function

The CERQ provides a simple memory-mapped mechanism to clear a given bit in the ERQ to disable the DMA request for a given channel. The data value on a register write causes the corresponding bit in the ERQ to be cleared. Setting the CAER bit provides a global clear function, forcing the entire contents of the ERQ to be cleared, disabling all DMA request inputs.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

#### 22.3.5.8.3 Diagram

### 22.3.5.8.4 Fields

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 CAER	Clear All Enable Requests 0b - Clear only the ERQ bit specified in the CERQ field 1b - Clear all bits in ERQ
5 —	Reserved
4-0 CERQ	Clear Enable Request Clears the corresponding bit in ERQ.

### 22.3.5.9 Set Enable Request (SERQ)

#### 22.3.5.9.1 Address

Register	Offset
SERQ	1Bh

#### 22.3.5.9.2 Function

The SERQ provides a simple memory-mapped mechanism to set a given bit in the ERQ to enable the DMA request for a given channel. The data value on a register write causes the corresponding bit in the ERQ to be set. Setting the SAER bit provides a global set function, forcing the entire contents of ERQ to be set.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

### 22.3.5.9.3 Diagram

Bits	7	6	5	4	3	2	1	0
R	0	0			0

### 22.3.5.9.4 Fields

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 SAER	Set All Enable Requests 0b - Set only the ERQ bit specified in the SERQ field 1b - Set all bits in ERQ
5 —	Reserved
4-0 SERQ	Set Enable Request Sets the corresponding bit in ERQ.

## 22.3.5.10 Clear DONE Status Bit (CDNE)

### 22.3.5.10.1 Address

Register	Offset
CDNE	1Ch

### 22.3.5.10.2 Function

The CDNE provides a simple memory-mapped mechanism to clear the DONE bit in the TCD of the given channel. The data value on a register write causes the DONE bit in the corresponding transfer control descriptor to be cleared. Setting the CADN bit provides a global clear function, forcing all DONE bits to be cleared.

## Memory map/register definition

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

### 22.3.5.10.3 Diagram

Bits	7	6	5	4	3	2	1	0
R	0	0				0		
W	NOP	CADN	0			CDNE

### 22.3.5.10.4 Fields

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 CADN	Clears All DONE Bits 0b - Clears only the TCDn_CSR[DONE] bit specified in the CDNE field 1b - Clears all bits in TCDn_CSR[DONE]
5 —	Reserved
4-0 CDNE	Clear DONE Bit Clears the corresponding bit in TCDn_CSR[DONE]

## 22.3.5.11 Set START Bit (SSRT)

### 22.3.5.11.1 Address

Register	Offset
SSRT	1Dh

### 22.3.5.11.2 Function

The SSRT provides a simple memory-mapped mechanism to set the START bit in the TCD of the given channel. The data value on a register write causes the START bit in the corresponding transfer control descriptor to be set. Setting the SAST bit provides a global set function, forcing all START bits to be set.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

### 22.3.5.11.3 Diagram

### 22.3.5.11.4 Fields

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 SAST	Set All START Bits (activates all channels) 0b - Set only the TCDn_CSR[START] bit specified in the SSRT field 1b - Set all bits in TCDn_CSR[START]
5 —	Reserved
4-0 SSRT	Set START Bit Sets the corresponding bit in TCDn_CSR[START]

### 22.3.5.12 Clear Error (CERR)

### 22.3.5.12.1 Address

Register	Offset
CERR	1Eh

### 22.3.5.12.2 Function

The CERR provides a simple memory-mapped mechanism to clear a given bit in the ERR to disable the error condition flag for a given channel. The given value on a register write causes the corresponding bit in the ERR to be cleared. Setting the CAEI bit provides a global clear function, forcing the ERR contents to be cleared, clearing all channel error indicators. If the NOP bit is set, the command is ignored. This allows you to write multiple-byte registers as a 32-bit word. Reads of this register return all zeroes.

### 22.3.5.12.3 Diagram

Bits	7	6	5	4	3	2	1	0
R	0	0				0		
W	NOP	CAEI	0			CERR

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 CAEI	Clear All Error Indicators 0b - Clear only the ERR bit specified in the CERR field 1b - Clear all bits in ERR
5 —	Reserved
4-0 CERR	Clear Error Indicator Clears the corresponding bit in ERR

### 22.3.5.13 Clear Interrupt Request (CINT)

### 22.3.5.13.1 Address

Register	Offset
CINT	1Fh

### 22.3.5.13.2 Function

The CINT provides a simple, memory-mapped mechanism to clear a given bit in the INT to disable the interrupt request for a given channel. The given value on a register write causes the corresponding bit in the INT to be cleared. Setting the CAIR bit provides a global clear function, forcing the entire contents of the INT to be cleared, disabling all DMA interrupt requests.

If the NOP bit is set, the command is ignored. This allows you to set a single, byte-wide register with a 32-bit write while not affecting the other registers addressed in the write. In such a case the other three bytes of the word would all have their NOP bit set so that that these register will not be affected by the write.

Reads of this register return all zeroes.

### 22.3.5.13.3 Diagram

Bits	7	6	5	4	3	2	1	0
R	0	0				0		
W	NOP	CAIR	0			CINT

### 22.3.5.13.4 Fields

Field	Function
7 NOP	No Op enable 0b - Normal operation 1b - No operation, ignore the other bits in this register
6 CAIR	Clear All Interrupt Requests 0b - Clear only the INT bit specified in the CINT field 1b - Clear all bits in INT
5 —	Reserved
4-0 CINT	Clear Interrupt Request Clears the corresponding bit in INT

## 22.3.5.14 Interrupt Request (INT)

### 22.3.5.14.1 Address

Register	Offset
INT	24h

### 22.3.5.14.2 Function

The INT register provides a bit map for the 32 channels signaling the presence of an interrupt request for each channel. Depending on the appropriate bit setting in the transfer-control descriptors, the eDMA engine generates an interrupt on data transfer completion. The outputs of this register are directly routed to the interrupt controller. During the interrupt-service routine associated with any given channel, it is the software's responsibility to clear the appropriate bit, negating the interrupt request. Typically, a write to the CINT register in the interrupt service routine is used for this purpose.

The state of any given channel's interrupt request is directly affected by writes to this register; it is also affected by writes to the CINT register. On writes to INT, a 1 in any bit position clears the corresponding channel's interrupt request. A zero in any bit position has no affect on the corresponding channel's current interrupt status. The CINT register is provided so the interrupt request for a single channel can easily be cleared without the need to perform a read-modify-write sequence to the INT register.

### 22.3.5.15 Error (ERR)

#### 22.3.5.15.1 Address

Register	Offset
ERR	2Ch

#### 22.3.5.15.2 Function

The ERR register provides a bit map for the 32 channels, signaling the presence of an error for each channel. The eDMA engine signals the occurrence of an error condition by setting the appropriate bit in this register. The outputs of this register are enabled by the contents of the EEI register, then logically summed across groups of 16 and 32 channels to form several group error interrupt requests, which are then routed to the interrupt controller. During the execution of the interrupt-service routine associated with any DMA errors, it is software's responsibility to clear the appropriate bit, negating the error-interrupt request. Typically, a write to the CERR in the interrupt-service routine is used for this purpose. The normal DMA channel completion indicators (setting the transfer control descriptor DONE flag and the possible assertion of an interrupt request) are not affected when an error is detected.

The contents of this register can also be polled because a non-zero value indicates the presence of a channel error regardless of the state of the EEI fields. The state of any given channel's error indicators is affected by writes to this register; it is also affected by writes to the CERR. On writes to the ERR, a one in any bit position clears the corresponding

## Memory map/register definition

channel's error status. A zero in any bit position has no affect on the corresponding channel's current error status. The CERR is provided so the error indicator for a single channel can easily be cleared.

## 22.3.5.16 Hardware Request Status (HRS)

### 22.3.5.16.1 Address

Register	Offset
HRS	34h

### 22.3.5.16.2 Function

The HRS register provides a bit map for the DMA channels, signaling the presence of a hardware request for each channel. The hardware request status bits reflect the current state of the register and qualified (via the ERQ fields) DMA request signals as seen by the DMA's arbitration logic. This view into the hardware request signals may be used for debug purposes.

#### NOTE

These bits reflect the state of the request as seen by the arbitration logic. Therefore, this status is affected by the ERQ bits.

### 22.3.5.16.3 Diagram

## 22.3.5.18 Channel n Priority (DCHPRI3)

### 22.3.5.18.1 Address

Register	Offset
DCHPRI3	100h

### 22.3.5.18.2 Function

When fixed-priority channel arbitration is enabled ( $CR[ERCA] = 0$ ), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, etc. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRI<sub>n</sub> register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRI<sub>n</sub> registers. The group priority is assigned in the DMA control register.

### 22.3.5.18.3 Diagram

### 22.3.5.18.4 Fields

Field	Function
7 ECP	Enable Channel Preemption. This field resets to 0. 0b - Channel n cannot be suspended by a higher priority channel's service request. 1b - Channel n can be temporarily suspended by the service request of a higher priority channel.
6 DPA	Disable Preempt Ability. This field resets to 0. 0b - Channel n can suspend a lower priority channel. 1b - Channel n cannot suspend any channel, regardless of channel priority.
5-4 GRPPRI	Channel n Current Group Priority Group priority assigned to this channel group when fixed-priority arbitration is enabled. This field is read-only; writes are ignored. <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, $DCHPRI31[GRPPRI] = 0b01$ and $DCHPRI31[CHPRI] = 0b1111$ .
3-0 CHPRI	Channel n Arbitration Priority Channel priority when fixed-priority arbitration is enabled <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, $DCHPRI31[GRPPRI] = 0b01$ and $DCHPRI31[CHPRI] = 0b01111$ .

## 22.3.5.19 Channel n Priority (DCHPRI2)

### 22.3.5.19.1 Address

Register	Offset
DCHPRI2	101h

### 22.3.5.19.2 Function

When fixed-priority channel arbitration is enabled ( $CR[ERCA] = 0$ ), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, etc. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRI<sub>n</sub> register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRI<sub>n</sub> registers. The group priority is assigned in the DMA control register.

### 22.3.5.19.3 Diagram

6 DPA	Disable Preempt Ability. This field resets to 0. 0b - Channel n can suspend a lower priority channel. 1b - Channel n cannot suspend any channel, regardless of channel priority.
5-4 GRPPRI	Channel n Current Group Priority Group priority assigned to this channel group when fixed-priority arbitration is enabled. This field is read-only; writes are ignored. <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, DCHPRI31[GRPPRI] = 0b01 and DCHPRI31[CHPRI] equals 0b1111.
3-0 CHPRI	Channel n Arbitration Priority Channel priority when fixed-priority arbitration is enabled <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, DCHPRI31[GRPPRI] = 0b01 and DCHPRI31[CHPRI] = 0b01111.

## 22.3.5.21 Channel n Priority (DCHPRI0)

### 22.3.5.21.1 Address

Register	Offset
DCHPRI0	103h

### 22.3.5.21.2 Function

When fixed-priority channel arbitration is enabled ( $CR[ERCA] = 0$ ), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, etc. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRIn register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRIn registers. The group priority is assigned in the DMA control register.

### 22.3.5.21.3 Diagram

### 22.3.5.34.1 Address

Register	Offset
DCHPRI19	110h

### 22.3.5.34.2 Function

When fixed-priority channel arbitration is enabled ( $CR[ERCA] = 0$ ), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, etc. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRI<sub>n</sub> register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRI<sub>n</sub> registers. The group priority is assigned in the DMA control register.

### 22.3.5.34.3 Diagram

### 22.3.5.34.4 Fields

Field	Function
7 ECP	Enable Channel Preemption. This field resets to 0. 0b - Channel n cannot be suspended by a higher priority channel's service request. 1b - Channel n can be temporarily suspended by the service request of a higher priority channel.
6 DPA	Disable Preempt Ability. This field resets to 0. 0b - Channel n can suspend a lower priority channel. 1b - Channel n cannot suspend any channel, regardless of channel priority.
5-4 GRPPRI	Channel n Current Group Priority Group priority assigned to this channel group when fixed-priority arbitration is enabled. This field is read-only; writes are ignored. <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, $DCHPRI31[GRPPRI] = 0b01$ and $DCHPRI31[CHPRI] = 0b1111$ .
3-0 CHPRI	Channel n Arbitration Priority Channel priority when fixed-priority arbitration is enabled <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, $DCHPRI31[GRPPRI] = 0b01$ and $DCHPRI31[CHPRI] = 0b01111$ .

When read, the GRPPRI bits of the DCHPRI<sub>n</sub> register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRI<sub>n</sub> registers. The group priority is assigned in the DMA control register.

### 22.3.5.47.3 Diagram

### 22.3.5.47.4 Fields

Field	Function
7 ECP	Enable Channel Preemption. This field resets to 0. 0b - Channel n cannot be suspended by a higher priority channel's service request. 1b - Channel n can be temporarily suspended by the service request of a higher priority channel.
6 DPA	Disable Preempt Ability. This field resets to 0. 0b - Channel n can suspend a lower priority channel. 1b - Channel n cannot suspend any channel, regardless of channel priority.
5-4 GRPPRI	Channel n Current Group Priority Group priority assigned to this channel group when fixed-priority arbitration is enabled. This field is read-only; writes are ignored.

*Table continues on the next page...*

## Memory map/register definition

Field	Function
	<b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, DCHPRI31[GRPPRI] = 0b01 and DCHPRI31[CHPRI] equals 0b1111.
3-0 CHPRI	Channel n Arbitration Priority Channel priority when fixed-priority arbitration is enabled <b>NOTE:</b> Reset value for the group and channel priority fields, GRPPRI and CHPRI, is equal to the corresponding channel number for each priority register, that is, DCHPRI31[GRPPRI] = 0b01 and DCHPRI31[CHPRI] = 0b01111.

## 22.3.5.48 Channel n Priority (DCHPRI29)

### 22.3.5.48.1 Address

Register	Offset
DCHPRI29	11Eh

### 22.3.5.48.2 Function

When fixed-priority channel arbitration is enabled ( $CR[ERCA] = 0$ ), the contents of these registers define the unique priorities associated with each channel within a group. The channel priorities are evaluated by numeric value; for example, 0 is the lowest priority, 1 is the next higher priority, then 2, 3, etc. Software must program the channel priorities with unique values; otherwise, a configuration error is reported. The range of the priority value is limited to the values of 0 through 15. When read, the GRPPRI bits of the DCHPRI<sub>n</sub> register reflect the current priority level of the group of channels in which the corresponding channel resides. GRPPRI bits are not affected by writes to the DCHPRI<sub>n</sub> registers. The group priority is assigned in the DMA control register.

### 22.3.5.48.3 Diagram

### 22.3.5.50.3 Fields

Field	Function
31-0	Source Address
SADDR	Memory address pointing to the source data.

## 22.3.5.51 TCD Signed Source Address Offset (TCDa\_SOFF)

### 22.3.5.51.1 Address

For a = 0 to 31:

Register	Offset
TCDa_SOFF	1004h + (a × 20h)

### 22.3.5.51.2 Diagram

### 22.3.5.51.3 Fields

Field	Function
15-0	Source address signed offset
SOFF	Sign-extended offset applied to the current source address to form the next-state value as each source read is completed.

### 22.3.5.52 TCD Transfer Attributes (TCDa\_ATTR)

#### 22.3.5.52.1 Address

For a = 0 to 31:

Register	Offset
TCDa_ATTR	1006h + (a × 20h)

#### 22.3.5.52.2 Diagram

#### 22.3.5.52.3 Fields

Field	Function
15-11 SMOD	Source Address Modulo  00000b - Source address modulo feature is disabled 00001-11111b - This value defines a specific address range specified to be the value after SADDR + SOFF calculation is performed on the original register value. Setting this field provides the ability to implement a circular data queue easily. For data queues requiring power-of-2 size bytes, the queue should start at a 0-modulo-size address and the SMOD field should be set to the appropriate value for the queue, freezing the desired number of upper address bits. The value programmed into this field specifies the number of lower address bits allowed to change. For a circular queue application, the SOFF is typically set to the transfer size to implement post-increment addressing with the SMOD function constraining the addresses to a 0-modulo-size range.
10-8 SSIZE	Source data transfer size  <b>NOTE:</b> Using a Reserved value causes a configuration error. 000b - 8-bit 001b - 16-bit

Table continues on the next page...

Field	Function
	010b - 32-bit 011b - 64-bit 100b - Reserved 101b - 32-byte burst (4 beats of 64 bits) 110b - Reserved 111b - Reserved
7-3 DMOD	Destination Address Modulo See the SMOD definition
2-0 DSIZE	Destination data transfer size See the SSIZE definition

### 22.3.5.53 TCD Minor Byte Count (Minor Loop Mapping Disabled) (TCDa\_NBYTES\_MLNO)

#### 22.3.5.53.1 Address

Register	Offset
TCD0_NBYTES_MLNO	1008h
TCD1_NBYTES_MLNO	1028h

TCD28_NBYTES_MLNO	1388h
TCD29_NBYTES_MLNO	13A8h
TCD30_NBYTES_MLNO	13C8h
TCD31_NBYTES_MLNO	13E8h

### 22.3.5.53.2 Function

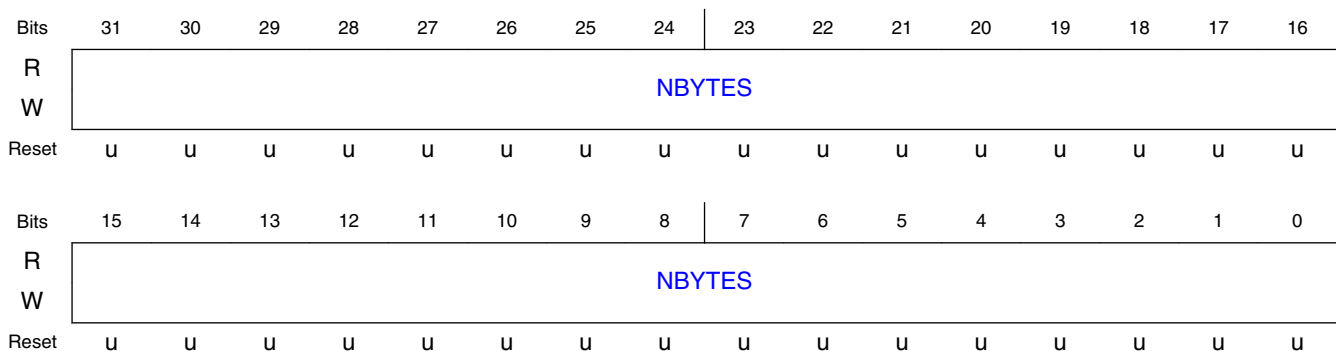

This register, or one of the next two registers (TCD\_NBYTES\_MLOFFNO, TCD\_NBYTES\_MLOFFYES), defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, enabled but not used for this channel, or enabled and used.

TCD word 2 is defined as follows if:

- Minor loop mapping is disabled ( $CR[EMLM] = 0$ )

If minor loop mapping is enabled, see the TCD\_NBYTES\_MLOFFNO and TCD\_NBYTES\_MLOFFYES register descriptions for the definition of TCD word 2.

### 22.3.5.53.3 Diagram

### 22.3.5.53.4 Fields

Field	Function
31-0 NBYTES	<p>Minor Byte Transfer Count</p> <p>Number of bytes to be transferred in each service request of the channel. As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes perform until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption. After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.</p> <p><b>NOTE:</b> An NBYTES value of 0x0000_0000 is interpreted as a 4 GB transfer.</p>

### 22.3.5.54 TCD Signed Minor Loop Offset (Minor Loop Mapping Enabled and Offset Disabled) (TCDa\_NBYTES\_MLOFFNO)

#### 22.3.5.54.1 Address

Register	Offset

TCD30_NBYTES_MLO FFNO	13C8h
TCD31_NBYTES_MLO FFNO	13E8h

### 22.3.5.54.2 Function

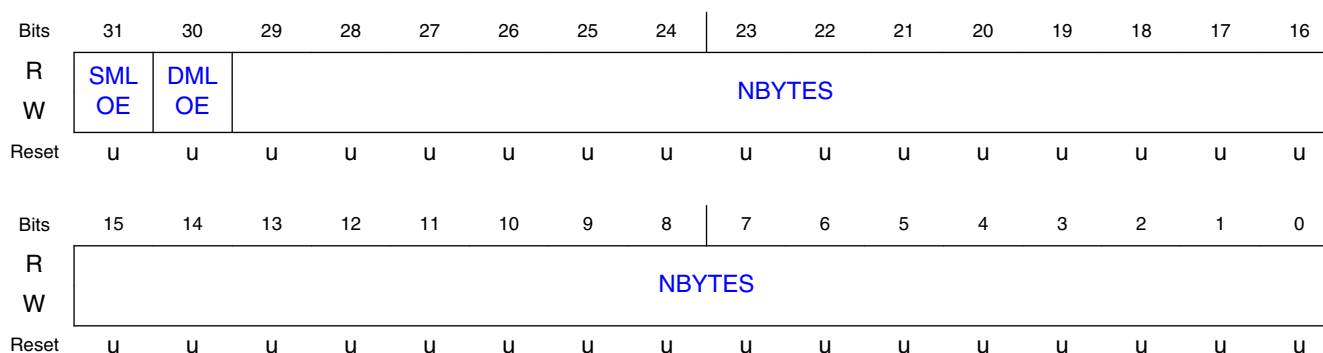

One of three registers (this register, TCD\_NBYTES\_MLNO, or TCD\_NBYTES\_MLOFFYES), defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, enabled but not used for this channel, or enabled and used.

TCD word 2 is defined as follows if:

- Minor loop mapping is enabled ( $CR[EMLM] = 1$ ) and
- $SMLOE = 0$  and  $DMLOE = 0$

If minor loop mapping is enabled and  $SMLOE$  or  $DMLOE$  is set, then refer to the TCD\_NBYTES\_MLOFFYES register description. If minor loop mapping is disabled, then refer to the TCD\_NBYTES\_MLNO register description.

### 22.3.5.54.3 Diagram

### 22.3.5.54.4 Fields

Field	Function
31	Source Minor Loop Offset Enable
SMLOE	Selects whether the minor loop offset is applied to the source address upon minor loop completion. 0b - The minor loop offset is not applied to the SADDR 1b - The minor loop offset is applied to the SADDR
30	Destination Minor Loop Offset enable
DMLOE	Selects whether the minor loop offset is applied to the destination address upon minor loop completion. 0b - The minor loop offset is not applied to the DADDR 1b - The minor loop offset is applied to the DADDR
29-0	Minor Byte Transfer Count
NBYTES	Number of bytes to be transferred in each service request of the channel.

## Memory map/register definition

Field	Function
	As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes perform until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption. After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.

### 22.3.5.55.2 Function

One of three registers (this register, TCD\_NBYTES\_MLNO, or TCD\_NBYTES\_MLOFFNO), defines the number of bytes to transfer per request. Which register to use depends on whether minor loop mapping is disabled, enabled but not used for this channel, or enabled and used.

TCD word 2 is defined as follows if:

- Minor loop mapping is enabled ( $CR[EMLM] = 1$ ) and
- Minor loop offset is enabled ( $SMLOE$  or  $DMLOE = 1$ )

## Memory map/register definition

If minor loop mapping is enabled and SMLOE and DMLOE are cleared, then refer to the TCD\_NBYTES\_MLOFFNO register description. If minor loop mapping is disabled, then refer to the TCD\_NBYTES\_MLNO register description.

### 22.3.5.55.3 Diagram

### 22.3.5.55.4 Fields

Field	Function
31 SMLOE	Source Minor Loop Offset Enable Selects whether the minor loop offset is applied to the source address upon minor loop completion. 0b - The minor loop offset is not applied to the SADDR 1b - The minor loop offset is applied to the SADDR
30 DMLOE	Destination Minor Loop Offset enable Selects whether the minor loop offset is applied to the destination address upon minor loop completion. 0b - The minor loop offset is not applied to the DADDR 1b - The minor loop offset is applied to the DADDR
29-10 MLOFF	If SMLOE or DMLOE is set, this field represents a sign-extended offset applied to the source or destination address to form the next-state value after the minor loop completes.
9-0 NBYTES	Minor Byte Transfer Count Number of bytes to be transferred in each service request of the channel.  As a channel activates, the appropriate TCD contents load into the eDMA engine, and the appropriate reads and writes perform until the minor byte transfer count has transferred. This is an indivisible operation and cannot be halted. It can, however, be stalled by using the bandwidth control field, or via preemption. After the minor count is exhausted, the SADDR and DADDR values are written back into the TCD memory, the major iteration count is decremented and restored to the TCD memory. If the major iteration count is completed, additional processing is performed.

### 22.3.5.56 TCD Last Source Address Adjustment (TCDa\_SLAST)

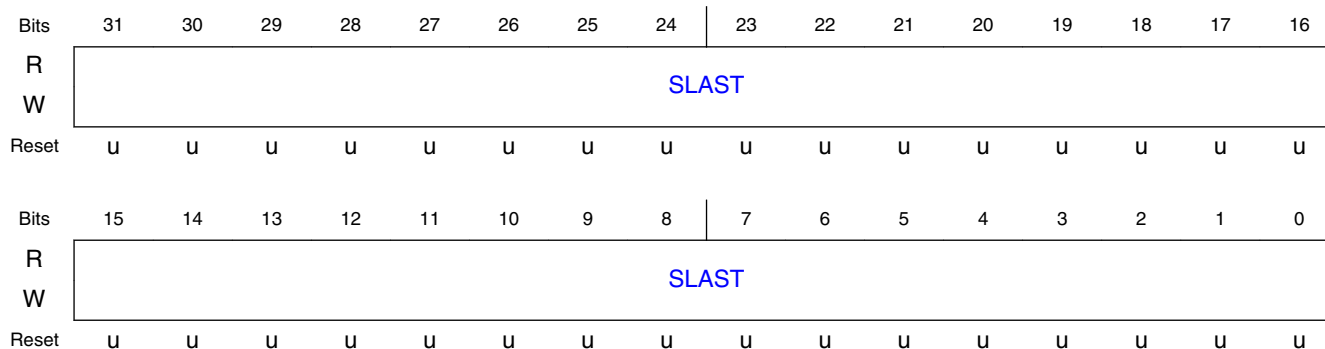

### 22.3.5.56.1 Address

For a = 0 to 31:

Register	Offset
TCDa_SLAST	100Ch + (a × 20h)

### 22.3.5.56.2 Diagram

### 22.3.5.56.3 Fields

Field	Function
31-0	Last Source Address Adjustment
SLAST	Adjustment value added to the source address at the completion of the major iteration count. This value can be applied to restore the source address to the initial value, or adjust the address to reference the next data structure.  This register uses two's complement notation; the overflow bit is discarded.

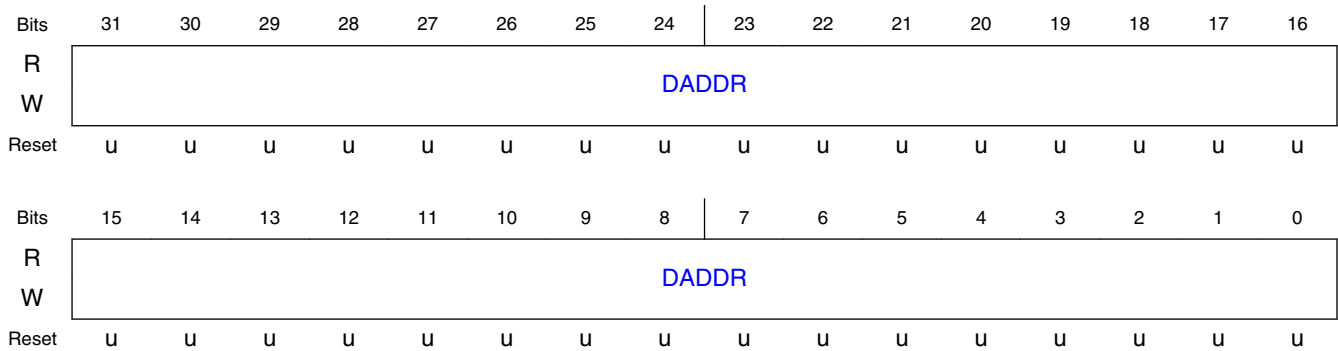

## 22.3.5.57 TCD Destination Address (TCDa\_DADDR)

### 22.3.5.57.1 Address

For a = 0 to 31:

Register	Offset
TCDa_DADDR	1010h + (a × 20h)

TCD31_CITER_ELIN KNO	13F6h

### 22.3.5.59.2 Function

This register contains the minor-loop channel-linking configuration and the channel's current iteration count. It is the same register as [TCD Current Minor Loop Link, Major Loop Count \(Channel Linking Enabled\) \(TCDa\\_CITER\\_ELINKYES\)](#), but its fields are defined differently based on the state of the ELINK field. If the ELINK field is cleared, this register is defined as follows.

### 22.3.5.59.3 Diagram

### 22.3.5.59.4 Fields

Field	Function
15 ELINK	<p>Enable channel-to-channel linking on minor-loop complete</p> <p>As the channel completes the minor loop, this flag enables linking to another channel, defined by the LINKCH field. The link target channel initiates a channel service request via an internal mechanism that sets the TCDn_CSR[START] bit of the specified channel.</p> <p>If channel linking is disabled, the CITER value is extended to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> This bit must be equal to the BITER[ELINK] bit; otherwise, a configuration error is reported.            0b - The channel-to-channel linking is disabled            1b - The channel-to-channel linking is enabled</p>
14-0 CITER	<p>Current Major Iteration Count</p> <p>This field is the current major loop count for the channel. It is decremented each time the minor loop is completed and updated in the transfer control descriptor memory. After the major iteration count is exhausted, the channel performs a number of operations, for example, final source and destination address calculations, optionally generating an interrupt to signal channel completion before reloading the CITER field from the Beginning Iteration Count (BITER) field.</p> <p><b>NOTE:</b> When the CITER field is initially loaded by software, it must be set to the same value as that contained in the BITER field.</p> <p><b>NOTE:</b> If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</p>

### 22.3.5.60.2 Function

This register contains the minor-loop channel-linking configuration and the channel's current iteration count. It is the same register as [TCD Current Minor Loop Link, Major Loop Count \(Channel Linking Disabled\) \(TCDa\\_CITER\\_ELINKNO\)](#), but its fields are defined differently based on the state of the ELINK field. If the ELINK field is set, this register is defined as follows.

### 22.3.5.60.3 Diagram

### 22.3.5.60.4 Fields

Field	Function
15 ELINK	<p>Enable channel-to-channel linking on minor-loop complete</p> <p>As the channel completes the minor loop, this flag enables linking to another channel, defined by the LINKCH field. The link target channel initiates a channel service request via an internal mechanism that sets the TCDn_CSR[START] bit of the specified channel.</p> <p>If channel linking is disabled, the CITER value is extended to 15 bits in place of a link channel number. If the major loop is exhausted, this link mechanism is suppressed in favor of the MAJORELINK channel linking.</p> <p><b>NOTE:</b> This bit must be equal to the BITER[ELINK] bit; otherwise, a configuration error is reported.</p> <p>0b - The channel-to-channel linking is disabled 1b - The channel-to-channel linking is enabled</p>
14 —	Reserved
13-9 LINKCH	<p>Minor Loop Link Channel Number</p> <p>If channel-to-channel linking is enabled (ELINK = 1), then after the minor loop is exhausted, the eDMA engine initiates a channel service request to the channel defined by this field by setting that channel's TCDn_CSR[START] bit.</p>
8-0 CITER	Current Major Iteration Count

## Memory map/register definition

Field	Function
	<p>This field is the current major loop count for the channel. It is decremented each time the minor loop is completed and updated in the transfer control descriptor memory. After the major iteration count is exhausted, the channel performs a number of operations, for example, final source and destination address calculations, optionally generating an interrupt to signal channel completion before reloading the CITER field from the Beginning Iteration Count (BITER) field.</p> <p><b>NOTE:</b> When the CITER field is initially loaded by software, it must be set to the same value as that contained in the BITER field.</p> <p><b>NOTE:</b> If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.</p>

### 22.3.5.61 TCD Last Destination Address Adjustment/Scatter Gather Address (TCDa\_DLASTSGA)

#### 22.3.5.61.1 Address

For a = 0 to 31:

Register	Offset
TCDa_DLASTSGA	1018h + (a × 20h)

#### 22.3.5.61.2 Diagram

#### 22.3.5.61.3 Fields

Field	Function
31-0	DLASTSGA
DLASTSGA	<p>Destination last address adjustment or the memory address for the next transfer control descriptor to be loaded into this channel (scatter/gather).</p> <p>If (TCDn_CSR[ESG] = 0) then:</p>

Field	Function
	<ul style="list-style-type: none"> <li>Adjustment value added to the destination address at the completion of the major iteration count. This value can apply to restore the destination address to the initial value or adjust the address to reference the next data structure.</li> <li>This field uses two's complement notation for the final destination address adjustment.</li> </ul> <p>Otherwise:</p> <ul style="list-style-type: none"> <li>This address points to the beginning of a 0-modulo-32-byte region containing the next transfer control descriptor to be loaded into this channel. This channel reload is performed as the major iteration count completes. The scatter/gather address must be 0-modulo-32-byte, otherwise a configuration error is reported.</li> </ul>

## 22.3.5.62 TCD Control and Status (TCDa\_CSR)

### 22.3.5.62.1 Address

For a = 0 to 31:

Register	Offset
TCDa_CSR	101Ch + (a × 20h)

### 22.3.5.62.2 Diagram

### 22.3.5.62.3 Fields

Field	Function
15-14 BWC	<p>Bandwidth Control</p> <p>Throttles the amount of bus bandwidth consumed by the eDMA. Generally, as the eDMA processes the minor loop, it continuously generates read/write sequences until the minor count is exhausted. This field forces the eDMA to stall after the completion of each read/write access to control the bus request bandwidth seen by the crossbar switch.</p> <p><b>NOTE:</b> If the source and destination sizes are equal, this field is ignored between the first and second transfers and after the last write of each minor loop. This behavior is a side effect of reducing start-up latency.</p>

Table continues on the next page...

## Memory map/register definition

Field	Function
	00b - No eDMA engine stalls. 01b - Reserved 10b - eDMA engine stalls for 4 cycles after each R/W. 11b - eDMA engine stalls for 8 cycles after each R/W.
13 —	Reserved
12-8 MAJORLINKCH	Major Loop Link Channel Number If (MAJORELINK = 0) then: <ul style="list-style-type: none"> <li>No channel-to-channel linking, or chaining, is performed after the major loop counter is exhausted.</li> </ul> Otherwise: <ul style="list-style-type: none"> <li>After the major loop counter is exhausted, the eDMA engine initiates a channel service request at the channel defined by this field by setting that channel's TCDn_CSR[START] bit.</li> </ul>
7 DONE	Channel Done This flag indicates the eDMA has completed the major loop. The eDMA engine sets it as the CITER count reaches zero. The software clears it, or the hardware when the channel is activated. <b>NOTE:</b> This bit must be cleared to write the MAJORELINK or ESG bits.
6 ACTIVE	Channel Active This flag signals the channel is currently in execution. It is set when channel service begins, and is cleared by the eDMA as the minor loop completes or when any error condition is detected.
5 MAJORELINK	Enable channel-to-channel linking on major loop complete As the channel completes the major loop, this flag enables the linking to another channel, defined by MAJORLINKCH. The link target channel initiates a channel service request via an internal mechanism that sets the TCDn_CSR[START] bit of the specified channel. <b>NOTE:</b> To support the dynamic linking coherency model, this field is forced to zero when written to while the TCDn_CSR[DONE] bit is set. 0b - The channel-to-channel linking is disabled. 1b - The channel-to-channel linking is enabled.
4 ESG	Enable Scatter/Gather Processing As the channel completes the major loop, this flag enables scatter/gather processing in the current channel. If enabled, the eDMA engine uses DLASTSGA as a memory pointer to a 0-modulo-32 address containing a 32-byte data structure loaded as the transfer control descriptor into the local memory. <b>NOTE:</b> To support the dynamic scatter/gather coherency model, this field is forced to zero when written to while the TCDn_CSR[DONE] bit is set. 0b - The current channel's TCD is normal format. 1b - The current channel's TCD specifies a scatter gather format. The DLASTSGA field provides a memory pointer to the next TCD to be loaded into this channel after the major loop completes its execution.
3 DREQ	Disable Request If this flag is set, the eDMA hardware automatically clears the corresponding ERQ bit when the current major iteration count reaches zero. 0b - The channel's ERQ bit is not affected. 1b - The channel's ERQ bit is cleared when the major loop is complete.
2 INTHALF	Enable an interrupt when major counter is half complete.

Table continues on the next page...

Field	Function
	<p>If this flag is set, the channel generates an interrupt request by setting the appropriate bit in the INT register when the current major iteration count reaches the halfway point. Specifically, the comparison performed by the eDMA engine is (CITER == (BITER &gt;&gt; 1)). This halfway point interrupt request is provided to support double-buffered, also known as ping-pong, schemes or other types of data movement where the processor needs an early indication of the transfer's progress.</p> <p><b>NOTE:</b> If BITER = 1, do not use INTHALF. Use INTMAJOR instead.  0b - The half-point interrupt is disabled.  1b - The half-point interrupt is enabled.</p>
1 INTMAJOR	<p>Enable an interrupt when major iteration count completes.</p> <p>If this flag is set, the channel generates an interrupt request by setting the appropriate bit in the INT when the current major iteration count reaches zero.  0b - The end-of-major loop interrupt is disabled.  1b - The end-of-major loop interrupt is enabled.</p>
0 START	<p>Channel Start</p> <p>If this flag is set, the channel is requesting service. The eDMA hardware automatically clears this flag after the channel begins execution.  0b - The channel is not explicitly started.  1b - The channel is explicitly started via a software initiated service request.</p>

## Functional description

Field	Function
	<b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.
8-0 BITER	Starting major iteration count  As the transfer control descriptor is first loaded by software, this 9-bit (ELINK = 1) or 15-bit (ELINK = 0) field must be equal to the value in the CITER field. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field.  <b>NOTE:</b> When the software loads the TCD, this field must be set equal to the corresponding CITER field; otherwise, a configuration error is reported. As the major iteration count is exhausted, the contents of this field are reloaded into the CITER field. If the channel is configured to execute a single service request, the initial values of BITER and CITER should be 0x0001.

## 22.4 Functional description

The operation of the eDMA is described in the following subsections.

### 22.4.1 eDMA basic data flow

The basic flow of a data transfer can be partitioned into three segments.

As shown in the following diagram, the first segment involves the channel activation:

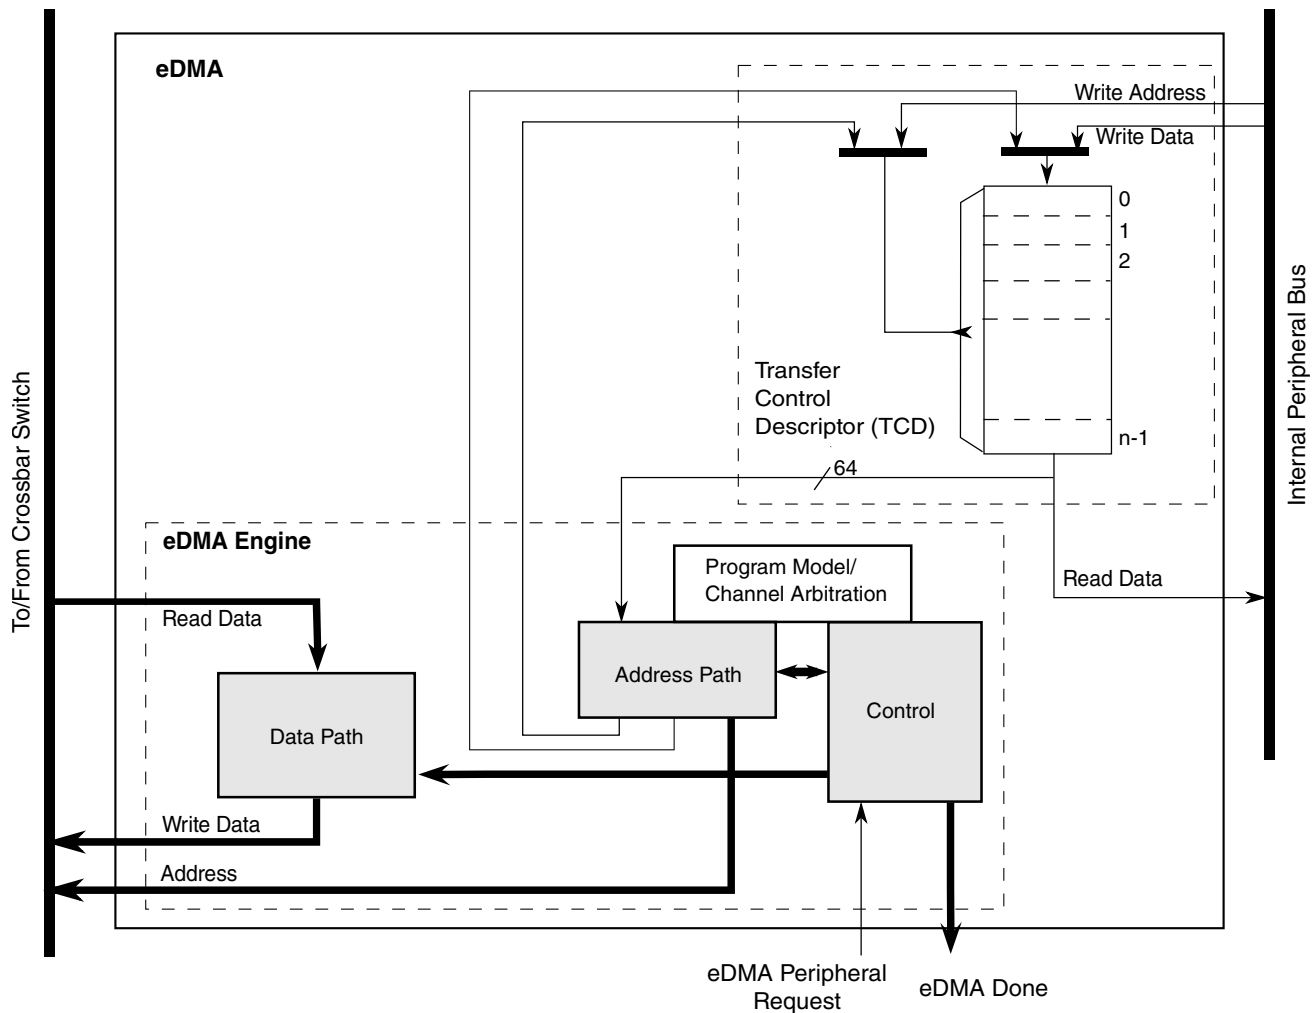

**Figure 22-2. eDMA operation, part 1**

This example uses the assertion of the eDMA peripheral request signal to request service for channel  $n$ . Channel activation via software and the  $TCD_n\_CSR[START]$  bit follows the same basic flow as peripheral requests. The eDMA request input signal is registered internally and then routed through the eDMA engine: first through the control module, then into the program model and channel arbitration. In the next cycle, the channel arbitration performs, using the fixed-priority or round-robin algorithm. After arbitration is complete, the activated channel number is sent through the address path and converted into the required address to access the local memory for  $TCD_n$ . Next, the TCD memory is accessed and the required descriptor read from the local memory and loaded into the eDMA engine address path channel  $x$  or  $y$  registers. The TCD memory is 64 bits wide to minimize the time needed to fetch the activated channel descriptor and load it into the address path channel  $x$  or  $y$  registers.

The following diagram illustrates the second part of the basic data flow:

**Figure 22-3. eDMA operation, part 2**

The modules associated with the data transfer (address path, data path, and control) sequence through the required source reads and destination writes to perform the actual data movement. The source reads are initiated and the fetched data is temporarily stored in the data path block until it is gated onto the internal bus during the destination write. This source read/destination write processing continues until the minor byte count has transferred.

After the minor byte count has moved, the final phase of the basic data flow is performed. In this segment, the address path logic performs the required updates to certain fields in the appropriate TCD, for example, SADDR, DADDR, CITER. If the major iteration count is exhausted, additional operations are performed. These include the final address adjustments and reloading of the BITER field into the CITER. Assertion of an optional interrupt request also occurs at this time, as does a possible fetch of a new TCD from memory using the scatter/gather address pointer included in the descriptor (if scatter/gather is enabled). The updates to the TCD memory and the assertion of an interrupt request are shown in the following diagram.

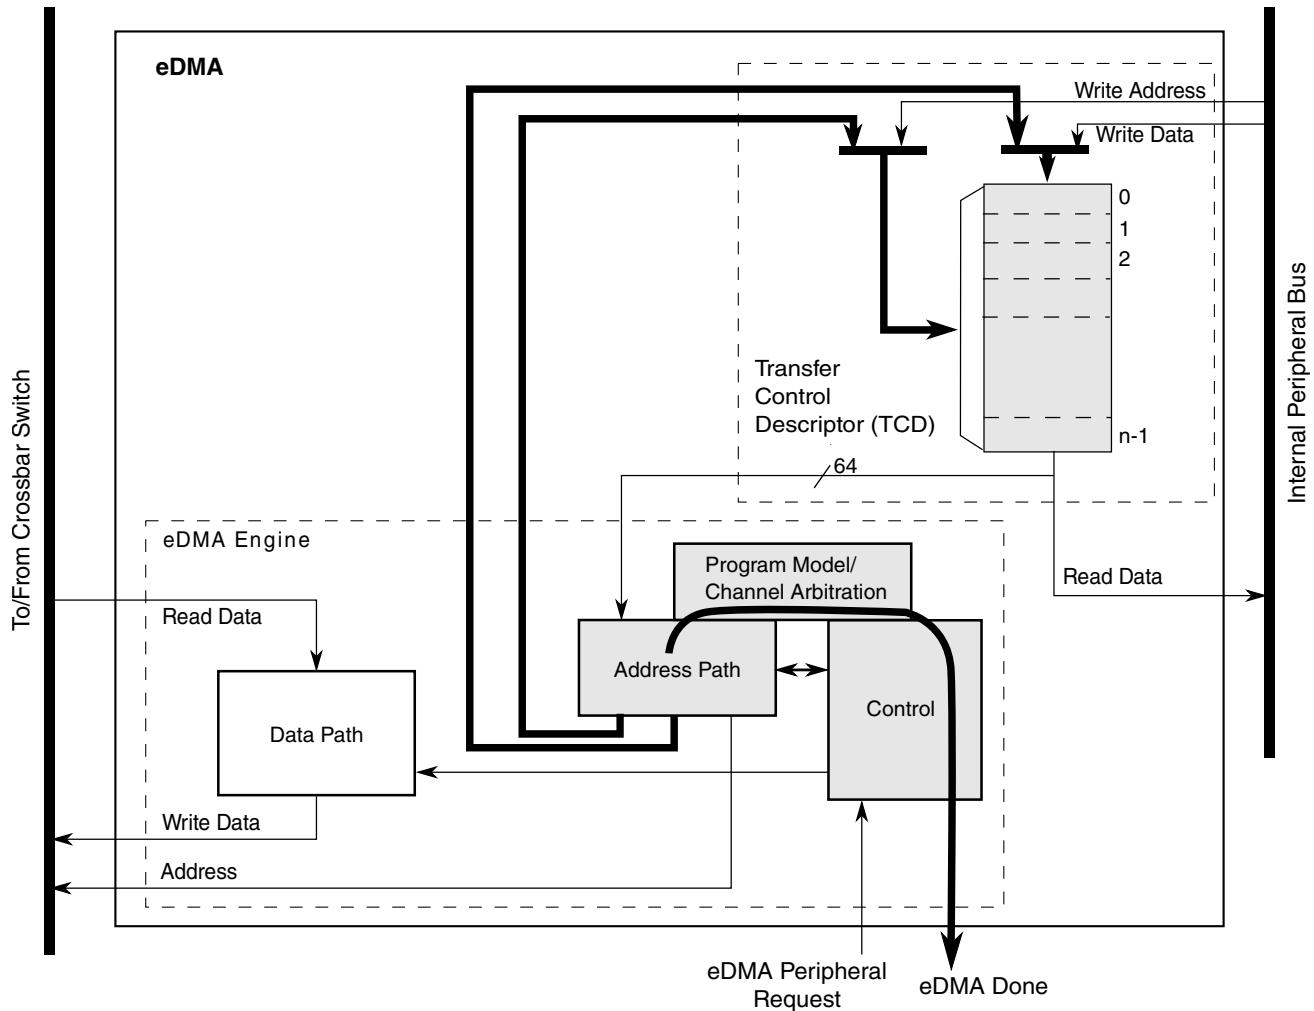

Figure 22-4. eDMA operation, part 3

## 22.4.2 Fault reporting and handling

Channel errors are reported in the Error Status register (DMAx\_ES) and can be caused by:

- A configuration error, which is an illegal setting in the transfer-control descriptor or an illegal priority register setting in Fixed-Arbitration mode, or
- An error termination to a bus master read or write cycle

A configuration error is reported when the starting source or destination address, source or destination offsets, minor loop byte count, or the transfer size represent an inconsistent state. Each of these possible causes are detailed below:

- The addresses and offsets must be aligned on 0-modulo-transfer-size boundaries.
- The minor loop byte count must be a multiple of the source and destination transfer sizes.

- All source reads and destination writes must be configured to the natural boundary of the programmed transfer size respectively.
- In fixed arbitration mode, a configuration error is caused by any two channel priorities being equal. All channel priority levels must be unique when fixed arbitration mode is enabled.

### **NOTE**

When two channels have the same priority, a channel priority error exists and will be reported in the Error Status register. However, the channel number will not be reported in the Error Status register. When all of the channel priorities within a group are not unique, the channel number selected by arbitration is undetermined.

To aid in Channel Priority Error (CPE) debug, set the Halt On Error bit in the DMA's Control Register. If all of the channel priorities within a group are not unique, the DMA will be halted after the CPE error is recorded. The DMA will remain halted and will not process any channel service requests. Once all of the channel priorities are set to unique numbers, the DMA may be enabled again by clearing the Halt bit.

- If a scatter/gather operation is enabled upon channel completion, a configuration error is reported if the scatter/gather address (DLAST\_SGA) is not aligned on a 32-byte boundary.
- If minor loop channel linking is enabled upon channel completion, a configuration error is reported when the link is attempted if the TCDn\_CITER[E\_LINK] bit does not equal the TCDn\_BITER[E\_LINK] bit.

If enabled, all configuration error conditions, except the scatter/gather and minor-loop link errors, report as the channel activates and asserts an error interrupt request. A scatter/gather configuration error is reported when the scatter/gather operation begins at major loop completion when properly enabled. A minor loop channel link configuration error is reported when the link operation is serviced at minor loop completion.

If a system bus read or write is terminated with an error, the data transfer is stopped and the appropriate bus error flag set. In this case, the state of the channel's transfer control descriptor is updated by the eDMA engine with the current source address, destination address, and current iteration count at the point of the fault. When a system bus error occurs, the channel terminates after the next transfer. Due to pipeline effect, the next transfer is already in progress when the bus error is received by the eDMA. If a bus error

occurs on the last read prior to beginning the write sequence, the write executes using the data captured during the bus error. If a bus error occurs on the last write prior to switching to the next read sequence, the read sequence executes before the channel terminates due to the destination bus error.

A transfer may be cancelled by software with the CR[CX] bit. When a cancel transfer request is recognized, the DMA engine stops processing the channel. The current read-write sequence is allowed to finish. If the cancel occurs on the last read-write sequence of a major or minor loop, the cancel request is discarded and the channel retires normally.

The error cancel transfer is the same as a cancel transfer except the Error Status register (DMAx\_ES) is updated with the cancelled channel number and ECX is set. The TCD of a cancelled channel contains the source and destination addresses of the last transfer saved in the TCD. If the channel needs to be restarted, you must re-initialize the TCD because the aforementioned fields no longer represent the original parameters. When a transfer is cancelled by the error cancel transfer mechanism, the channel number is loaded into DMA\_ES[ERRCHN] and ECX and VLD are set. In addition, an error interrupt may be generated if enabled.

### NOTE

The cancel transfer request allows the user to stop a large data transfer in the event the full data transfer is no longer needed. The cancel transfer bit does not abort the channel. It simply stops the transferring of data and then retires the channel through its normal shutdown sequence. The application software must handle the context of the cancel. If an interrupt is desired (or not), then the interrupt should be enabled (or disabled) before the cancel request. The application software must clean up the transfer control descriptor since the full transfer did not occur.

The occurrence of any error causes the eDMA engine to stop normal processing of the active channel immediately (it goes to its error processing states and the transaction to the system bus still has pipeline effect), and the appropriate channel bit in the eDMA error register is asserted. At the same time, the details of the error condition are loaded into the Error Status register (DMAx\_ES). The major loop complete indicators, setting the transfer control descriptor DONE flag and the possible assertion of an interrupt request, are not affected when an error is detected. After the error status has been updated, the eDMA engine continues operating by servicing the next appropriate channel. A channel that experiences an error condition is not automatically disabled. If a channel is terminated by an error and then issues another service request before the error is fixed, that channel executes and terminates with the same error condition.

### 22.4.3 Channel preemption

Channel preemption is enabled on a per-channel basis by setting the DCHPRIn[ECP] bit. Channel preemption allows the executing channel's data transfers to temporarily suspend in favor of starting a higher priority channel. After the preempting channel has completed all its minor loop data transfers, the preempted channel is restored and resumes execution. After the restored channel completes one read/write sequence, it is again eligible for preemption. If any higher priority channel is requesting service, the restored channel is suspended and the higher priority channel is serviced. Nested preemption, that is, attempting to preempt a preempting channel, is not supported. After a preempting channel begins execution, it cannot be preempted. Preemption is available only when fixed arbitration is selected.

A channel's ability to preempt another channel can be disabled by setting DCHPRIn[DPA]. When a channel's preempt ability is disabled, that channel cannot suspend a lower priority channel's data transfer, regardless of the lower priority channel's ECP setting. This allows for a pool of low priority, large data-moving channels to be defined. These low priority channels can be configured to not preempt each other, thus preventing a low priority channel from consuming the preempt slot normally available to a true, high priority channel.

### 22.4.4 Performance

This section addresses the performance of the eDMA module, focusing on two separate metrics:

- In the traditional data movement context, performance is best expressed as the peak data transfer rates achieved using the eDMA. In most implementations, this transfer rate is limited by the speed of the source and destination address spaces.
- In a second context where device-paced movement of single data values to/from peripherals is dominant, a measure of the requests that can be serviced in a fixed time is a more relevant metric. In this environment, the speed of the source and destination address spaces remains important. However, the microarchitecture of the eDMA also factors significantly into the resulting metric.

#### 22.4.4.1 Peak transfer rates

The peak transfer rates for several different source and destination transfers are shown in the following tables. These tables assume:

- Internal SRAM can be accessed with zero wait-states when viewed from the system bus data phase
- All internal peripheral bus reads require two wait-states, and internal peripheral bus writes three wait-states, when viewed from the system bus data phase
- All internal peripheral bus accesses are 32-bits in size

### NOTE

All architectures will not meet the assumptions listed above.  
See the SRAM configuration section for more information.

This table compares peak transfer rates based on different possible system speeds. Specific chips/devices may not support all system speeds listed.

**Table 22-4. eDMA peak transfer rates (Mbytes/sec)**

System Speed, Width	Internal SRAM-to-Internal SRAM	32 bit internal peripheral bus-to-Internal SRAM	Internal SRAM-to-32 bit internal peripheral bus
66.7 MHz, 64 bit	266.7	66.6	53.3
83.3 MHz, 64 bit	333.3	83.3	66.7
100.0 MHz, 64 bit	400.0	100.0	80.0
133.3 MHz, 64 bit	533.3	133.3	106.7
150.0 MHz, 64 bit	600.0	150.0	120.0

Internal-SRAM-to-internal-SRAM transfers occur at the core's datapath width. For all transfers involving the internal peripheral bus, 32-bit transfer sizes are used. In all cases, the transfer rate includes the time to read the source plus the time to write the destination.

#### 22.4.4.2 Peak request rates

The second performance metric is a measure of the number of DMA requests that can be serviced in a given amount of time. For this metric, assume that the peripheral request causes the channel to move a single internal peripheral bus-mapped operand to/from internal SRAM. The same timing assumptions used in the previous example apply to this calculation. In particular, this metric also reflects the time required to activate the channel.

The eDMA design supports the following hardware service request sequence. Note that the exact timing from Cycle 7 is a function of the response times for the channel's read and write accesses. In the case of an internal peripheral bus read and internal SRAM write, the combined data phase time is 4 cycles. For an SRAM read and internal peripheral bus write, it is 5 cycles.

Table 22-5. Hardware service request process

Cycle		Description
With internal peripheral bus read and internal SRAM write	With SRAM read and internal peripheral bus write	
1		eDMA peripheral request is asserted.
2		The eDMA peripheral request is registered locally in the eDMA module and qualified. TCD <sub>n</sub> _CSR[START] bit initiated requests start at this point with the registering of the user write to TCD <sub>n</sub> word 7.
3		Channel arbitration begins.
4		Channel arbitration completes. The transfer control descriptor local memory read is initiated.
5–6		The first two parts of the activated channel's TCD is read from the local memory. The memory width to the eDMA engine is 64 bits, so the entire descriptor can be accessed in four cycles
7		The first system bus read cycle is initiated, as the third part of the channel's TCD is read from the local memory. Depending on the state of the crossbar switch, arbitration at the system bus may insert an additional cycle of delay here.
8–11	8–12	The last part of the TCD is read in. This cycle represents the first data phase for the read, and the address phase for the destination write.
12	13	This cycle represents the data phase of the last destination write.
13	14	The eDMA engine completes the execution of the inner minor loop and prepares to write back the required TCD <sub>n</sub> fields into the local memory. The TCD <sub>n</sub> word 7 is read and checked for channel linking or scatter/gather requests.
14	15	The appropriate fields in the first part of the TCD <sub>n</sub> are written back into the local memory.
15	16	The fields in the second part of the TCD <sub>n</sub> are written back into the local memory. This cycle coincides with the next channel arbitration cycle start.
16	17	The next channel to be activated performs the read of the first part of its TCD from the local memory. This is equivalent to Cycle 4 for the first channel's service request.

Assuming zero wait states on the system bus, DMA requests can be processed every 9 cycles. Assuming an average of the access times associated with internal peripheral bus-to-SRAM (4 cycles) and SRAM-to-internal peripheral bus (5 cycles), DMA requests can be processed every 11.5 cycles ( $4 + (4+5)/2 + 3$ ). This is the time from Cycle 4 to Cycle  $x + 5$ . The resulting peak request rate, as a function of the system frequency, is shown in the following table.

**Table 22-6. eDMA peak request rate (MReq/sec)**

System frequency (MHz)	Request rate with zero wait states	Request rate with wait states
66.6	7.4	5.8
83.3	9.2	7.2
100.0	11.1	8.7
133.3	14.8	11.6
150.0	16.6	13.0

A general formula to compute the peak request rate with overlapping requests is:

$$\text{PEAKreq} = \text{freq} / [ \text{entry} + (1 + \text{read\_ws}) + (1 + \text{write\_ws}) + \text{exit} ]$$

where:

**Table 22-7. Peak request formula operands**

Operand	Description
PEAKreq	Peak request rate
freq	System frequency
entry	Channel startup (4 cycles)
read_ws	Wait states seen during the system bus read data phase
write_ws	Wait states seen during the system bus write data phase
exit	Channel shutdown (3 cycles)

### 22.4.4.3 eDMA performance example

Consider a system with the following characteristics:

- Internal SRAM can be accessed with one wait-state when viewed from the system bus data phase
- All internal peripheral bus reads require two wait-states, and internal peripheral bus writes three wait-states viewed from the system bus data phase
- System operates at 150 MHz

For an SRAM to internal peripheral bus transfer,

$$\text{PEAKreq} = 150 \text{ MHz} / [ 4 + (1 + 1) + (1 + 3) + 3 ] \text{ cycles} = 11.5 \text{ Mreq/sec}$$

For an internal peripheral bus to SRAM transfer,

$$\text{PEAKreq} = 150 \text{ MHz} / [ 4 + (1 + 2) + (1 + 1) + 3 ] \text{ cycles} = 12.5 \text{ Mreq/sec}$$

Assuming an even distribution of the two transfer types, the average peak request rate would be:

$$\text{PEAKreq} = (11.5 \text{ Mreq/sec} + 12.5 \text{ Mreq/sec}) / 2 = 12.0 \text{ Mreq/sec}$$

The minimum number of cycles to perform a single read/write, zero wait states on the system bus, from a cold start where no channel is executing and eDMA is idle are:

- 11 cycles for a software, that is, a TCD<sub>n</sub>\_CSR[START] bit, request
- 12 cycles for a hardware, that is, an eDMA peripheral request signal, request

Two cycles account for the arbitration pipeline and one extra cycle on the hardware request resulting from the internal registering of the eDMA peripheral request signals. For the peak request rate calculations above, the arbitration and request registering is absorbed in or overlaps the previous executing channel.

### **Note**

When channel linking or scatter/gather is enabled, a two cycle delay is imposed on the next channel selection and startup. This allows the link channel or the scatter/gather channel to be eligible and considered in the arbitration pool for next channel selection.

## **22.5 Initialization/application information**

The following sections discuss initialization of the eDMA and programming considerations.

### **22.5.1 eDMA initialization**

To initialize the eDMA:

1. Write to the CR if a configuration other than the default is desired.
2. Write the channel priority levels to the DCHPRI<sub>n</sub> registers if a configuration other than the default is desired.
3. Enable error interrupts in the EEI register if so desired.
4. Write the 32-byte TCD for each channel that may request service.

5. Enable any hardware service requests via the ERQ register.
6. Request channel service via either:
  - Software: setting the TCD<sub>n</sub>\_CSR[START]
  - Hardware: slave device asserting its eDMA peripheral request signal

After any channel requests service, a channel is selected for execution based on the arbitration and priority levels written into the programmer's model. The eDMA engine reads the entire TCD, including the TCD control and status fields, as shown in the following table, for the selected channel into its internal address path module.

As the TCD is read, the first transfer is initiated on the internal bus, unless a configuration error is detected. Transfers from the source, as defined by TCD<sub>n</sub>\_SADDR, to the destination, as defined by TCD<sub>n</sub>\_DADDR, continue until the number of bytes specified by TCD<sub>n</sub>\_NBYTES are transferred.

When the transfer is complete, the eDMA engine's local TCD<sub>n</sub>\_SADDR, TCD<sub>n</sub>\_DADDR, and TCD<sub>n</sub>\_CITER are written back to the main TCD memory and any minor loop channel linking is performed, if enabled. If the major loop is exhausted, further post processing executes, such as interrupts, major loop channel linking, and scatter/gather operations, if enabled.

**Table 22-8. TCD Control and Status fields**

TCD <sub>n</sub> _CSR field name	Description
START	Control bit to start channel explicitly when using a software initiated DMA service (Automatically cleared by hardware)
ACTIVE	Status bit indicating the channel is currently in execution
DONE	Status bit indicating major loop completion (cleared by software when using a software initiated DMA service)
D_REQ	Control bit to disable DMA request at end of major loop completion when using a hardware initiated DMA service
BWC	Control bits for throttling bandwidth control of a channel
E_SG	Control bit to enable scatter-gather feature
INT_HALF	Control bit to enable interrupt when major loop is half complete
INT_MAJ	Control bit to enable interrupt when major loop completes

The following figure shows how each DMA request initiates one minor-loop transfer, or iteration, without CPU intervention. DMA arbitration can occur after each minor loop, and one level of minor loop DMA preemption is allowed. The number of minor loops in a major loop is specified by the beginning iteration count (BITER).

Figure 22-5. Example of multiple loop iterations

The following figure lists the memory array terms and how the TCD settings interrelate.

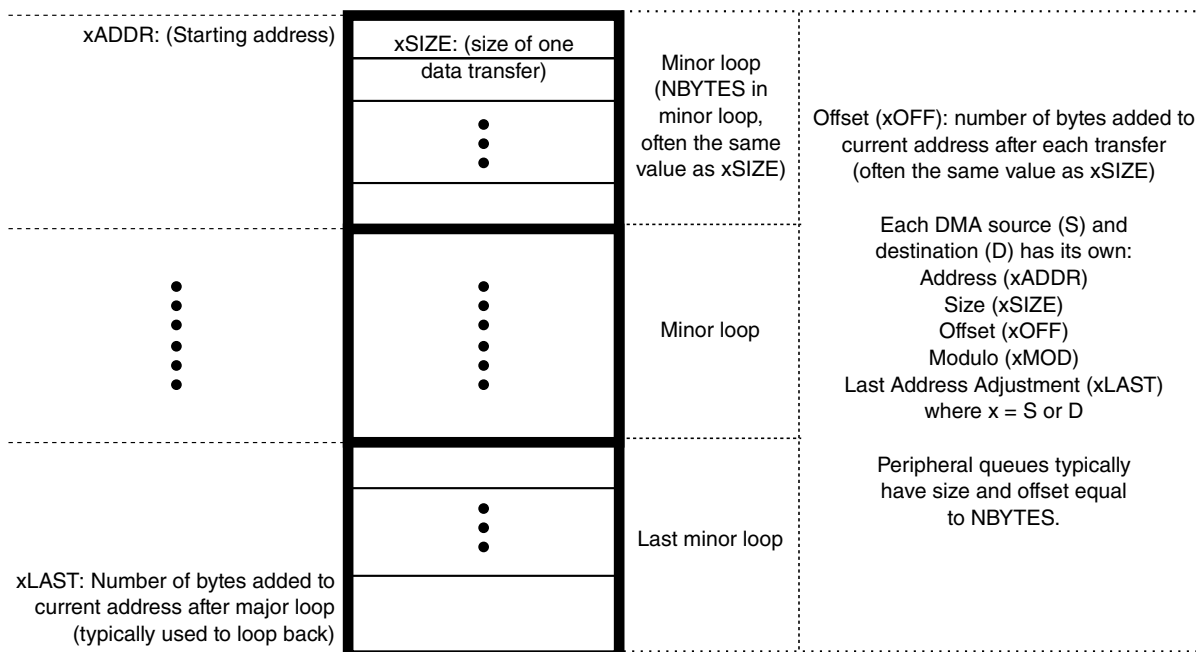

Figure 22-6. Memory array terms

## 22.5.2 Programming errors

The eDMA performs various tests on the transfer control descriptor to verify consistency in the descriptor data. Most programming errors are reported on a per channel basis with the exception of channel priority error (ES[CPE]).

For all error types other than group or channel priority errors, the channel number causing the error is recorded in the Error Status register (DMAx\_ES). If the error source is not removed before the next activation of the problem channel, the error is detected and recorded again.

Channel priority errors are identified within a group once that group has been selected as the active group. For example:

1. The eDMA is configured for fixed group and fixed channel arbitration modes.
2. Group 1 is the highest priority and all channels are unique in that group.
3. Group 0 is the next highest priority and has two channels with the same priority level.
4. If Group 1 has any service requests, those requests will be executed.
5. After all of Group 1 requests have completed, Group 0 will be the next active group.
6. If Group 0 has a service request, then an undefined channel in Group 0 will be selected and a channel priority error will occur.
7. This repeats until the all of Group 0 requests have been removed or a higher priority Group 1 request comes in.

In this sequence, for item 2, the eDMA acknowledge lines will assert only if the selected channel is requesting service via the eDMA peripheral request signal. If interrupts are enabled for all channels, the user will get an error interrupt, but the channel number for the ERR register and the error interrupt request line may be wrong because they reflect the selected channel. A group priority error is global and any request in any group will cause a group priority error.

If priority levels are not unique, when any channel requests service, a channel priority error is reported. The highest channel/group priority with an active request is selected, but the lowest numbered channel with that priority is selected by arbitration and executed by the eDMA engine. The hardware service request handshake signals, error interrupts, and error reporting is associated with the selected channel.

### 22.5.3 Arbitration mode considerations

This section discusses arbitration considerations for the eDMA.

### 22.5.3.1 Fixed group arbitration, Fixed channel arbitration

In this mode, the channel service request from the highest priority channel in the highest priority group is selected to execute. If the eDMA is programmed so that the channels within one group use "fixed" priorities, and that group is assigned the highest "fixed" priority of all groups, that group can take all the bandwidth of the eDMA controller. That is, no other groups will be serviced if there is always at least one DMA request pending on a channel in the highest priority group when the controller arbitrates the next DMA request. The advantage of this scenario is that latency can be small for channels that need to be serviced quickly. Preemption is available in this scenario only.

### 22.5.3.2 Fixed group arbitration, Round-robin channel arbitration

The highest priority group with a request will be serviced. Lower priority groups will be serviced if no pending requests exist in the higher priority groups.

Within each group, channels are serviced starting with the highest channel number and rotating through to the lowest channel number without regard to the channel priority levels assigned within the group.

This scenario could cause the same bandwidth consumption problem as indicated in [Fixed group arbitration, Fixed channel arbitration](#), but all the channels in the highest priority group will be serviced. Service latency will be short on the highest priority group, but could potentially be very much longer as the group priority decreases.

## 22.5.4 Performing DMA transfers

This section presents examples on how to perform DMA transfers with the eDMA.

### 22.5.4.1 Single request

To perform a simple transfer of  $n$  bytes of data with one activation, set the major loop to one ( $TCDn\_CITER = TCDn\_BITER = 1$ ). The data transfer begins after the channel service request is acknowledged and the channel is selected to execute. After the transfer is complete, the  $TCDn\_CSR[DONE]$  bit is set and an interrupt generates if properly enabled.

For example, the following TCD entry is configured to transfer 16 bytes of data. The eDMA is programmed for one iteration of the major loop transferring 16 bytes per iteration. The source memory has a byte wide memory port located at 0x1000. The destination memory has a 32-bit port located at 0x2000. The address offsets are

programmed in increments to match the transfer size: one byte for the source and four bytes for the destination. The final source and destination addresses are adjusted to return to their beginning values.

```
TCDn_CITER = TCDn_BITER = 1
TCDn_NBYTES = 16
TCDn_SADDR = 0x1000
TCDn_SOFF = 1
TCDn_ATTR[SSIZE] = 0
TCDn_SLAST = -16
TCDn_DADDR = 0x2000
TCDn_DOFF = 4
TCDn_ATTR[DSIZE] = 2
TCDn_DLAST_SGA = -16
TCDn_CSR[INT_MAJ] = 1
TCDn_CSR[START] = 1 (Should be written last after all other fields have been initialized)
All other TCDn fields = 0
```

This generates the following event sequence:

1. User write to the TCDn\_CSR[START] bit requests channel service.
2. The channel is selected by arbitration for servicing.
3. eDMA engine writes: TCDn\_CSR[DONE] = 0, TCDn\_CSR[START] = 0, TCDn\_CSR[ACTIVE] = 1.
4. eDMA engine reads: channel TCD data from local memory to internal register file.
5. The source-to-destination transfers are executed as follows:
  - a. Read byte from location 0x1000, read byte from location 0x1001, read byte from 0x1002, read byte from 0x1003.
  - b. Write 32-bits to location 0x2000 → first iteration of the minor loop.
  - c. Read byte from location 0x1004, read byte from location 0x1005, read byte from 0x1006, read byte from 0x1007.
  - d. Write 32-bits to location 0x2004 → second iteration of the minor loop.
  - e. Read byte from location 0x1008, read byte from location 0x1009, read byte from 0x100A, read byte from 0x100B.
  - f. Write 32-bits to location 0x2008 → third iteration of the minor loop.
  - g. Read byte from location 0x100C, read byte from location 0x100D, read byte from 0x100E, read byte from 0x100F.
  - h. Write 32-bits to location 0x200C → last iteration of the minor loop → major loop complete.

6. The eDMA engine writes:  $TCDn\_SADDR = 0x1000$ ,  $TCDn\_DADDR = 0x2000$ ,  $TCDn\_CITER = 1$  ( $TCDn\_BITER$ ).
7. The eDMA engine writes:  $TCDn\_CSR[ACTIVE] = 0$ ,  $TCDn\_CSR[DONE] = 1$ ,  $INT[n] = 1$ .
8. The channel retires and the eDMA goes idle or services the next channel.

### 22.5.4.2 Multiple requests

The following example transfers 32 bytes via two hardware requests, but is otherwise the same as the previous example. The only fields that change are the major loop iteration count and the final address offsets. The eDMA is programmed for two iterations of the major loop transferring 16 bytes per iteration. After the channel's hardware requests are enabled in the ERQ register, the slave device initiates channel service requests.

```
TCDn_CITER = TCDn_BITER = 2
TCDn_SLAST = -32
TCDn_DLAST_SGA = -32
```

This would generate the following sequence of events:

1. First hardware, that is, eDMA peripheral, request for channel service.
2. The channel is selected by arbitration for servicing.
3. eDMA engine writes:  $TCDn\_CSR[DONE] = 0$ ,  $TCDn\_CSR[START] = 0$ ,  $TCDn\_CSR[ACTIVE] = 1$ .
4. eDMA engine reads: channel  $TCDn$  data from local memory to internal register file.
5. The source to destination transfers are executed as follows:
  - a. Read byte from location  $0x1000$ , read byte from location  $0x1001$ , read byte from  $0x1002$ , read byte from  $0x1003$ .
  - b. Write 32-bits to location  $0x2000$  → first iteration of the minor loop.
  - c. Read byte from location  $0x1004$ , read byte from location  $0x1005$ , read byte from  $0x1006$ , read byte from  $0x1007$ .
  - d. Write 32-bits to location  $0x2004$  → second iteration of the minor loop.
  - e. Read byte from location  $0x1008$ , read byte from location  $0x1009$ , read byte from  $0x100A$ , read byte from  $0x100B$ .
  - f. Write 32-bits to location  $0x2008$  → third iteration of the minor loop.

- g. Read byte from location 0x100C, read byte from location 0x100D, read byte from 0x100E, read byte from 0x100F.
  - h. Write 32-bits to location 0x200C → last iteration of the minor loop.
6. eDMA engine writes:  $TCDn\_SADDR = 0x1010$ ,  $TCDn\_DADDR = 0x2010$ ,  $TCDn\_CITER = 1$ .
  7. eDMA engine writes:  $TCDn\_CSR[ACTIVE] = 0$ .
  8. The channel retires → one iteration of the major loop. The eDMA goes idle or services the next channel.
  9. Second hardware, that is, eDMA peripheral, requests channel service.
  10. The channel is selected by arbitration for servicing.
  11. eDMA engine writes:  $TCDn\_CSR[DONE] = 0$ ,  $TCDn\_CSR[START] = 0$ ,  $TCDn\_CSR[ACTIVE] = 1$ .
  12. eDMA engine reads: channel TCD data from local memory to internal register file.
  13. The source to destination transfers are executed as follows:
    - a. Read byte from location 0x1010, read byte from location 0x1011, read byte from 0x1012, read byte from 0x1013.
    - b. Write 32-bits to location 0x2010 → first iteration of the minor loop.
    - c. Read byte from location 0x1014, read byte from location 0x1015, read byte from 0x1016, read byte from 0x1017.
    - d. Write 32-bits to location 0x2014 → second iteration of the minor loop.
    - e. Read byte from location 0x1018, read byte from location 0x1019, read byte from 0x101A, read byte from 0x101B.
    - f. Write 32-bits to location 0x2018 → third iteration of the minor loop.
    - g. Read byte from location 0x101C, read byte from location 0x101D, read byte from 0x101E, read byte from 0x101F.
    - h. Write 32-bits to location 0x201C → last iteration of the minor loop → major loop complete.
  14. eDMA engine writes:  $TCDn\_SADDR = 0x1000$ ,  $TCDn\_DADDR = 0x2000$ ,  $TCDn\_CITER = 2$  ( $TCDn\_BITER$ ).
  15. eDMA engine writes:  $TCDn\_CSR[ACTIVE] = 0$ ,  $TCDn\_CSR[DONE] = 1$ ,  $INT[n] = 1$ .

16. The channel retires → major loop complete. The eDMA goes idle or services the next channel.

### 22.5.4.3 Using the modulo feature

The modulo feature of the eDMA provides the ability to implement a circular data queue in which the size of the queue is a power of 2. MOD is a 5-bit field for the source and destination in the TCD, and it specifies which lower address bits increment from their original value after the address+offset calculation. All upper address bits remain the same as in the original value. A setting of 0 for this field disables the modulo feature.

The following table shows how the transfer addresses are specified based on the setting of the MOD field. Here a circular buffer is created where the address wraps to the original value while the 28 upper address bits (0x1234567x) retain their original value. In this example the source address is set to 0x12345670, the offset is set to 4 bytes and the MOD field is set to 4, allowing for a 2<sup>4</sup> byte (16-byte) size queue.

**Table 22-9. Modulo example**

Transfer Number	Address
1	0x12345670
2	0x12345674
3	0x12345678
4	0x1234567C
5	0x12345670
6	0x12345674

## 22.5.5 Monitoring transfer descriptor status

This section discusses how to monitor eDMA status.

### 22.5.5.1 Testing for minor loop completion

There are two methods to test for minor loop completion when using software initiated service requests. The first is to read the TCD<sub>n</sub>\_CITER field and test for a change. Another method may be extracted from the sequence shown below. The second method is to test the TCD<sub>n</sub>\_CSR[START] bit and the TCD<sub>n</sub>\_CSR[ACTIVE] bit. The minor-loop-

complete condition is indicated by both bits reading zero after the `TCDn_CSR[START]` was set. Polling the `TCDn_CSR[ACTIVE]` bit may be inconclusive, because the active status may be missed if the channel execution is short in duration.

The TCD status bits execute the following sequence for a software activated channel:

Stage	TCDn_CSR bits			State
	START	ACTIVE	DONE	
1	1	0	0	Channel service request via software
2	0	1	0	Channel is executing
3a	0	0	0	Channel has completed the minor loop and is idle
3b	0	0	1	Channel has completed the major loop and is idle

The best method to test for minor-loop completion when using hardware, that is, peripheral, initiated service requests is to read the `TCDn_CITER` field and test for a change. The hardware request and acknowledge handshake signals are not visible in the programmer's model.

The TCD status bits execute the following sequence for a hardware-activated channel:

Stage	TCDn_CSR bits			State
	START	ACTIVE	DONE	
1	0	0	0	Channel service request via hardware (peripheral request asserted)
2	0	1	0	Channel is executing
3a	0	0	0	Channel has completed the minor loop and is idle
3b	0	0	1	Channel has completed the major loop and is idle

For both activation types, the major-loop-complete status is explicitly indicated via the `TCDn_CSR[DONE]` bit.

The `TCDn_CSR[START]` bit is cleared automatically when the channel begins execution regardless of how the channel activates.

### 22.5.5.2 Reading the transfer descriptors of active channels

The eDMA reads back the true `TCDn_SADDR`, `TCDn_DADDR`, and `TCDn_NBYTES` values if read while a channel executes. The true values of the `SADDR`, `DADDR`, and `NBYTES` are the values the eDMA engine currently uses in its internal register file and not the values in the TCD local memory for that channel. The addresses, `SADDR` and

DADDR, and NBYTES, which decrement to zero as the transfer progresses, can give an indication of the progress of the transfer. All other values are read back from the TCD local memory.

### 22.5.5.3 Checking channel preemption status

Preemption is available only when fixed arbitration is selected for both group and channel arbitration modes. A preemptive situation is one in which a preempt-enabled channel runs and a higher priority request becomes active. When the eDMA engine is not operating in fixed group, fixed channel arbitration mode, the determination of the actively running relative priority outstanding requests become undefined. Channel and/or group priorities are treated as equal, that is, constantly rotating, when Round-Robin Arbitration mode is selected.

The `TCDn_CSR[ACTIVE]` bit for the preempted channel remains asserted throughout the preemption. The preempted channel is temporarily suspended while the preempting channel executes one major loop iteration. If two `TCDn_CSR[ACTIVE]` bits are set simultaneously in the global TCD map, a higher priority channel is actively preempting a lower priority channel.

### 22.5.6 Channel Linking

Channel linking (or chaining) is a mechanism where one channel sets the `TCDn_CSR[START]` bit of another channel (or itself), therefore initiating a service request for that channel. When properly enabled, the EDMA engine automatically performs this operation at the major or minor loop completion.

The minor loop channel linking occurs at the completion of the minor loop (or one iteration of the major loop). The `TCDn_CITER[E_LINK]` field determines whether a minor loop link is requested. When enabled, the channel link is made after each iteration of the major loop except for the last. When the major loop is exhausted, only the major loop channel link fields are used to determine if a channel link should be made. For example, the initial fields of:

```
TCDn_CITER[E_LINK] = 1
TCDn_CITER[LINKCH] = 0xC
TCDn_CITER[CITER] value = 0x4
TCDn_CSR[MAJOR_E_LINK] = 1
TCDn_CSR[MAJOR_LINKCH] = 0x7
```

executes as:

1. Minor loop done → set `TCD12_CSR[START]` bit

2. Minor loop done → set TCD12\_CSR[START] bit
3. Minor loop done → set TCD12\_CSR[START] bit
4. Minor loop done, major loop done → set TCD7\_CSR[START] bit

When minor loop linking is enabled ( $TCDn\_CITER[E\_LINK] = 1$ ), the  $TCDn\_CITER[CITER]$  field uses a nine bit vector to form the current iteration count. When minor loop linking is disabled ( $TCDn\_CITER[E\_LINK] = 0$ ), the  $TCDn\_CITER[CITER]$  field uses a 15-bit vector to form the current iteration count. The bits associated with the  $TCDn\_CITER[LINKCH]$  field are concatenated onto the CITER value to increase the range of the CITER.

### Note

The  $TCDn\_CITER[E\_LINK]$  bit and the  $TCDn\_BITER[E\_LINK]$  bit must equal or a configuration error is reported. The CITER and BITER vector widths must be equal to calculate the major loop, half-way done interrupt point.

The following table summarizes how a DMA channel can link to another DMA channel, i.e, use another channel's TCD, at the end of a loop.

**Table 22-10. Channel Linking Parameters**

Desired Link Behavior	TCD Control Field Name	Description
Link at end of Minor Loop	CITER[E_LINK]	Enable channel-to-channel linking on minor loop completion (current iteration)
	CITER[LINKCH]	Link channel number when linking at end of minor loop (current iteration)
Link at end of Major Loop	CSR[MAJOR_E_LINK]	Enable channel-to-channel linking on major loop completion
	CSR[MAJOR_LINKCH]	Link channel number when linking at end of major loop

## 22.5.7 Dynamic programming

This section provides recommended methods to change the programming model during channel execution.

### 22.5.7.1 Dynamically changing the channel priority

The following two options are recommended for dynamically changing channel priority levels:

1. Switch to Round-Robin Channel Arbitration mode, change the channel priorities, then switch back to Fixed Arbitration mode,
2. Disable all the channels, change the channel priorities, then enable the appropriate channels.

### 22.5.7.2 Dynamic channel linking

Dynamic channel linking is the process of setting the `TCDn_CSR[MAJORELINK]` bit during channel execution (see the diagram in [TCD structure](#)). This bit is read from the TCD local memory at the end of channel execution, thus allowing the user to enable the feature during channel execution.

Because the user is allowed to change the configuration during execution, a coherency model is needed. Consider the scenario where the user attempts to execute a dynamic channel link by enabling the `TCDn_CSR[MAJORELINK]` bit at the same time the eDMA engine is retiring the channel. The `TCDn_CSR[MAJORELINK]` would be set in the programmer's model, but it would be unclear whether the actual link was made before the channel retired.

The following coherency model is recommended when executing a dynamic channel link request.

1. Write 1 to the `TCDn_CSR[MAJORELINK]` bit.
2. Read back the `TCDn_CSR[MAJORELINK]` bit.
3. Test the `TCDn_CSR[MAJORELINK]` request status:
  - If `TCDn_CSR[MAJORELINK] = 1`, the dynamic link attempt was successful.
  - If `TCDn_CSR[MAJORELINK] = 0`, the attempted dynamic link did not succeed (the channel was already retiring).

For this request, the TCD local memory controller forces the `TCDn_CSR[MAJORELINK]` bit to zero on any writes to a channel's `TCD.word7` after that channel's `TCD.done` bit is set, indicating the major loop is complete.

#### NOTE

The user must clear the `TCDn_CSR[DONE]` bit before writing the `TCDn_CSR[MAJORELINK]` bit. The `TCDn_CSR[DONE]` bit is cleared automatically by the eDMA engine after a channel begins execution.

### 22.5.7.3 Dynamic scatter/gather

Scatter/gather is the process of automatically loading a new TCD into a channel. It allows a DMA channel to use multiple TCDs; this enables a DMA channel to scatter the DMA data to multiple destinations or gather it from multiple sources. When scatter/gather is enabled and the channel has finished its major loop, a new TCD is fetched from system memory and loaded into that channel's descriptor location in eDMA programmer's model, thus replacing the current descriptor.

Because the user is allowed to change the configuration during execution, a coherency model is needed. Consider the scenario where the user attempts to execute a dynamic scatter/gather operation by enabling the `TCDn_CSR[ESG]` bit at the same time the eDMA engine is retiring the channel. The ESG bit would be set in the programmer's model, but it would be unclear whether the actual scatter/gather request was honored before the channel retired.

Two methods for this coherency model are shown in the following subsections. Method 1 has the advantage of reading the MAJORLINKCH field and the ESG bit with a single read. For both dynamic channel linking and scatter/gather requests, the TCD local memory controller forces the TCD MAJOR.E\_LINK and E\_SG bits to zero on any writes to a channel's TCD word 7 if that channel's TCD.DONE bit is set indicating the major loop is complete.

#### NOTE

The user must clear the `TCDn_CSR[DONE]` bit before writing the MAJORELINK or ESG bits. The `TCDn_CSR[DONE]` bit is cleared automatically by the eDMA engine after a channel begins execution.

#### 22.5.7.3.1 Method 1 (channel not using major loop channel linking)

For a channel not using major loop channel linking, the coherency model described here may be used for a dynamic scatter/gather request.

When the `TCDn_CSR[MAJORELINK]` bit is zero, the `TCDn_CSR[MAJORLINKCH]` field is not used by the eDMA. In this case, the MAJORLINKCH field may be used for other purposes. This method uses the MAJORLINKCH field as a TCD identification (ID).

1. When the descriptors are built, write a unique TCD ID in the `TCDn_CSR[MAJORLINKCH]` field for each TCD associated with a channel using dynamic scatter/gather.
2. Write 1b to the `TCDn_CSR[DREQ]` bit.

Should a dynamic scatter/gather attempt fail, setting the DREQ bit will prevent a future hardware activation of this channel. This stops the channel from executing with a destination address (DADDR) that was calculated using a scatter/gather address (written in the next step) instead of a dlast final offset value.

3. Write the [TCDn\\_DLASTSGA](#) register with the scatter/gather address.
4. Write 1b to the TCDn\_CSR[ESG] bit.
5. Read back the 16 bit TCD control/status field.
6. Test the ESG request status and MAJORLINKCH value in the TCDn\_CSR register:

If ESG = 1b, the dynamic link attempt was successful.

If ESG = 0b and the MAJORLINKCH (ID) did not change, the attempted dynamic link did not succeed (the channel was already retiring).

If ESG = 0b and the MAJORLINKCH (ID) changed, the dynamic link attempt was successful (the new TCD's E\_SG value cleared the ESG bit).

### 22.5.7.3.2 Method 2 (channel using major loop channel linking)

For a channel using major loop channel linking, the coherency model described here may be used for a dynamic scatter/gather request. This method uses the TCD.DLAST\_SGA field as a TCD identification (ID).

1. Write 1b to the [TCDn\\_CSR\[DREQ\]](#) bit.

Should a dynamic scatter/gather attempt fail, setting the DREQ bit will prevent a future hardware activation of this channel. This stops the channel from executing with a destination address (DADDR) that was calculated using a scatter/gather address (written in the next step) instead of a dlast final offset value.

2. Write the [TCDn\\_DLASTSGA](#) register with the scatter/gather address.
3. Write 1b to the TCDn\_CSR[ESG] bit.
4. Read back the ESG bit.
5. Test the ESG request status:

If ESG = 1b, the dynamic link attempt was successful.

If ESG = 0b, read the 32 bit TCDn\_DLASTSGA field.

If ESG = 0b and the TCDn\_DLASTSGA did not change, the attempted dynamic link did not succeed (the channel was already retiring).

If ESG = 0b and the TCDn\_DLASTSGA changed, the dynamic link attempt was successful (the new TCD's E\_SG value cleared the ESG bit).

# Chapter 23

## Quadrature Decoder (ENC)

### 23.1 Introduction

The enhanced quadrature encoder/decoder module interfaces to position/speed sensors that are used in industrial motor control applications. Using 5 input signals (PHASEA, PHASEB, INDEX, TRIGGER, and HOME) from those position/speed sensors, the quadrature decoder module decodes shaft position, revolution count, and speed.

#### 23.1.1 Features

- Includes logic to decode quadrature signals
- Inputs can be connected to a general purpose timer to make low speed velocity measurements
- Configurable digital filter for inputs
- Quadrature decoder filter can be bypassed
- 32-bit position counter capable of modulo counting
- Position counter can be initialized by software or external events
- 16-bit position difference register
- Compare function can indicate when shaft has reached a defined position
- A watchdog timer can detect a non-rotating shaft condition
- Preloadable 16-bit revolution counter
- Maximum count frequency equals the peripheral clock rate

#### 23.1.2 System Block Diagram

The next figure shows the block diagram of the quadrature decoder module integrated into an SoC.

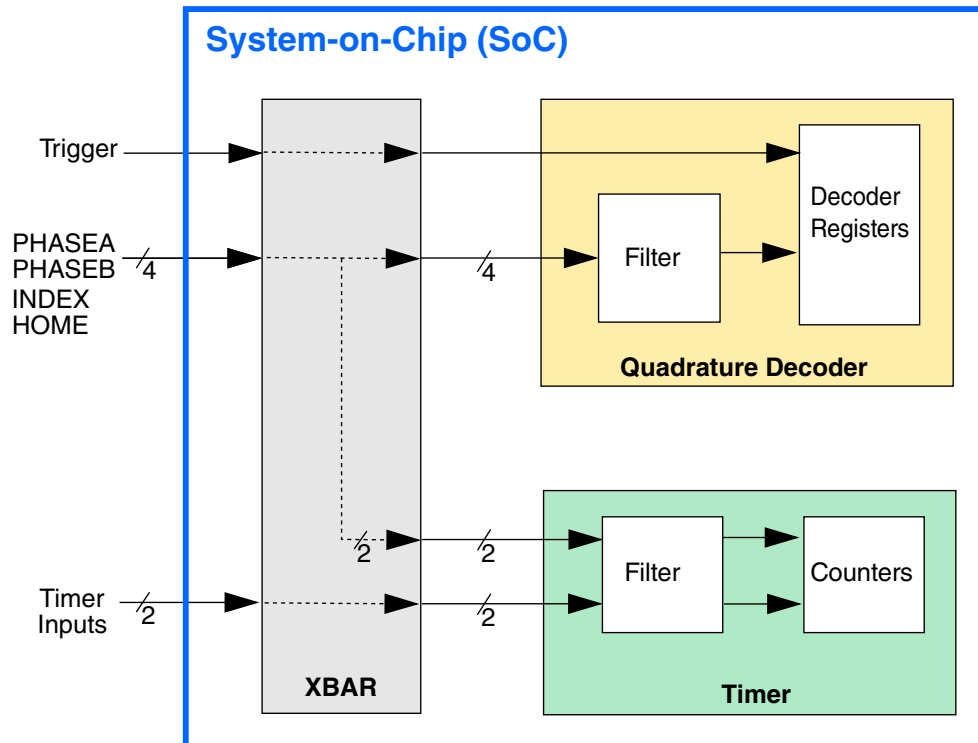

Figure 23-1. System Block Diagram

### 23.1.3 Decoder Block Diagram

Figure 23-2. Quadrature Decoder Block Diagram

### 23.1.3.1 Glitch Filter

Because the quadrature decoder logic must sense signal transitions, the signal inputs are first run through a glitch filter. This glitch filter has a digital delay line, which samples multiple time points on the signal and verifies a stable new signal state, before outputting this new signal state to the internal quadrature decoder logic. To adapt to a variety of signal bandwidths, the sample rate of this delay line is programmable.

### 23.1.3.2 Edge Detect State Machine

The edge detect state machine looks for changes in the 4 possible states of the filtered PHASEA and PHASEB inputs, which are used to calculate the direction of motion. This information is formatted as Count\_Up and Count\_Down signals. These signals are routed into up to 3 up/down counters:

- Position counter
- Revolution counter
- Position difference counter

### 23.1.3.3 Position Counter

The 32-bit position counter calculates up or down on every count pulse, generated by the difference of PHASEA and PHASEB. The position counter acts as an integration\_info, whose count value is proportional to position. The direction of the count is determined by the Count\_Up and Count\_Down signals. Position counters may be initialized to a predetermined value by one of 3 different methods:

- Software-triggered event
- INDEX signal transition
- HOME signal transition

The INDEX and HOME signals can be programmed to interrupt the processor. Whenever the position counters (UPOS or LPOS) are read, a snapshot of the

- position counter
- position difference counter
- revolution counter

are each placed into their respective hold registers.

### 23.1.3.4 Position Difference Counter

The 16-bit position difference counter contains the position difference value occurring between each read of the position register. The position register counts up or down on every count pulse. The position difference counter acts as a differentiator, whose count value is proportional to the change in position since the last time the position counter was read.

When the position register, the position difference counter, or the revolution counter is read, the position difference of the counter's contents is copied into the position difference hold register (POSDH) and the position difference counter is cleared.

### 23.1.3.5 Position Difference Counter Hold

The Position Difference Counter Hold register stores a copy of the position difference counter at the time that the position register was read. When the position register is read, the position difference of the counter's contents is copied into the position difference hold register (POSDH), and the position difference counter is cleared.

### 23.1.3.6 Revolution Counter

The 16-bit up/down revolution counter is intended to count or integrate revolutions by counting index pulses. The direction of the count is determined by the Count\_Up and Count\_Down signals, determined by the Phase A and B inputs. A different count direction on the rising and falling edges of the index pulse indicates that the quadrature encoder changed direction on the index pulse.

### 23.1.3.7 Watchdog Timer

The watchdog timer ensures that the algorithm is indicating motion in the shaft; 2 successive counts indicate proper operation and will reset the timer.

- The timeout value is programmable.
- When a timeout occurs, an interrupt to the processor can be generated.

### 23.1.3.8 Pulse Accumulator Functionality

The logic can be programmed to integrate only selected transitions of the PHASEA signal. In this way, the position counter can be used as a pulse accumulator.

- The count direction is up.
- The pulse accumulator can also optionally be initialized by the INDEX input.

## 23.2 Signal Descriptions

Four external signals are multiplexed to the four pins (PHASEA, PHASEB, INDEX, HOME) of a quad timer module. Two internal signals (TRIGGER, POSMATCH) can be connected to other SoC resources.

**Table 23-1. Signals**

Signal		Description
PHASEA	Phase A Input	<p>The PHASEA input can be connected to one of the phases from a two-phase shaft quadrature encoder output. PHASEA and PHASEB are used by the quadrature decoder module to indicate a decoder increment has passed, and to calculate its direction.</p> <ul style="list-style-type: none"> <li>• When the quadrature decoder module is used as a single phase pulse accumulator, PHASEA can also be used as the single input.</li> <li>• The PHASEA input can be an input capture channel for one of the timer modules (in the SoC), which can be connected to using a crossbar switch.</li> </ul> <p>Direction for two-phase shaft quadrature encoder output:</p> <ul style="list-style-type: none"> <li>• PHASEA is the leading phase for a shaft rotating in the positive direction.</li> <li>• PHASEA is the trailing phase for a shaft rotating in the negative direction.</li> </ul>

*Table continues on the next page...*

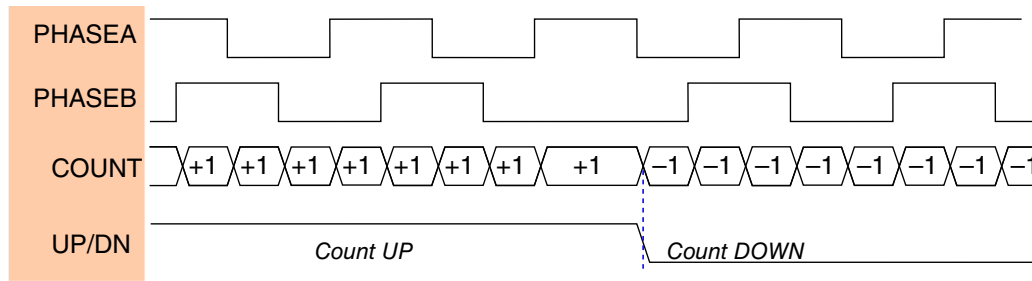

**Table 23-1. Signals (continued)**

Signal		Description
PHASEB	Phase B Input	<p>The PHASEB input can be connected to the other phase from a two-phase shaft quadrature encoder output.</p> <ul style="list-style-type: none"> <li>The PHASEB input can be an input capture channel for one of the timer modules (in the SoC), which can be connected to using a crossbar switch.</li> </ul> <p>Direction for two-phase shaft quadrature encoder output:</p> <ul style="list-style-type: none"> <li>PHASEB is the trailing phase for a shaft rotating in the positive direction.</li> <li>PHASEB is the leading phase for a shaft rotating in the negative direction.</li> </ul>
INDEX	Index Input	<ul style="list-style-type: none"> <li>Normally connected to the index pulse output of a quadrature encoder, the INDEX pulse can optionally reset the position counter and the pulse accumulator of the quadrature decoder module. The INDEX pulse also causes a change of state on the revolution counter. The direction of this state change (increment or decrement) is calculated from the PHASEA and PHASEB inputs.</li> <li>The INDEX input can be an input capture channel for one of the timer modules (in the SoC), which can be connected to using a crossbar switch.</li> </ul>
HOME	Home Switch Input	<p>The HOME input can be used by the quadrature decoder and the timer module.</p> <ul style="list-style-type: none"> <li>The HOME input can be used to trigger the initialization of the position counters (UPOS and LPOS). Often the HOME signal is connected to a sensor on the motor or machine, sending notification that it has reached a defined home position.</li> <li>The HOME signal can be connected to the timer module (in the SoC) using a crossbar switch.</li> </ul>
TRIGGER	Trigger Input	<p>The TRIGGER input can be used</p> <ul style="list-style-type: none"> <li>to clear the position counters (UPOS and LPOS)</li> <li>to take a snapshot of the POS, REV, and POSD registers</li> <li>to indicate an elapsed time period, by connecting the TRIGGER input signal to a periodic pulse generator or timer</li> </ul>
POSMATCH	Position Match Output	<ul style="list-style-type: none"> <li>To record the time at which the position of the shaft matches a user-defined compare value (COMP), the POSMATCH output can be used to trigger a timer channel.</li> <li>Alternatively, to record the time at which the position information was read, (when the position counters (UPOS and LPOS), revolution counter (REV), or position difference counter (POSD) registers are read) the POSMATCH output can be used to trigger a timer channel.</li> </ul>

## 23.3 Functional Description

The next timing diagram shows the basic operation of a quadrature incremental position quadrature decoder.

**Figure 23-3. Quadrature Decoder Signals**

### 23.3.1 Positive versus Negative Direction

A typical quadrature encoder has 3 outputs: PHASEA signal, PHASEB signal, INDEX pulse (not shown).

- If PHASEA leads PHASEB, then motion is in the positive direction.
- If PHASEA trails PHASEB, then motion is in the negative direction.

Transitions on these phases can be integrated to yield position or differentiated to yield velocity. The quadrature decoder is designed to perform these functions in hardware.

### 23.3.2 Prescaler for Slow or Fast Speed Measurement

- For applications with a fast moving shaft encoder, the speed can be computed by calculating the change in the position counter per unit time, or by reading the position difference counter register (POSD) and calculating speed.
- For applications with slow motor speeds and low line count quadrature encoders, the timer module enables high resolution velocity measurements by measuring the time period between quadrature phases.
  - The timer module uses a 16-bit free running counter operated from a prescaled version of the IPBus clock.
  - The prescaler divides the IPBus clock by values ranging from 1 to 128. A 60 MHz IPBus clock frequency would yield a resolution of from 17 ns to 2.1  $\mu$ s and a maximum count period of from 1.09 ms to 140 ms. For example, with a 1000-tooth decoder, speeds could be calculated down to 0.11 rpm using a prescaler.

### 23.3.3 Holding Registers and Initializing Registers

Hold registers are associated with 3 types of counters:

- Position
- Position difference
- Revolution

When any of the counter registers is read, the contents of each counter register is written to the corresponding hold register. Taking a snapshot of the counters' values provides a consistent view of a system's position and the velocity to be attained. To capture a time stamp of when these registers are read, use the POSMATCH output with a timer channel.

The position counter is 32 bits wide. To ensure that the position counter can be reliably initialized with two 16-bit accesses, two registers (an upper and a lower initialization register) are provided. The upper initialization register (UNIT) and lower initialization register (LINIT) should be loaded with the desired value. Next, the position counter can be loaded by writing 1 to the Software-Triggered Initialization of Position Counters UPOS and LPOS bit (CTRL[SWIP]). Alternatively, either the INDEX-Triggered Initialization of Position Counters UPOS and LPOS bit (CTRL[XIP]) or the Enable HOME to Initialize Position Counters UPOS and LPOS bit (CTRL[HIP]) can enable the position counter to be initialized in response to a HOME or INDEX signal transition.

## 23.4 Resets

There are no special requirements. This module is reset by any system reset.

## 23.5 Clocks

The IPBus clock is the only clock required by this module in normal operation.

## 23.6 Interrupts

The following table lists the module interrupts.

**Table 23-2. Interrupt Summary**

Core Interrupt	Interrupt Flag	Interrupt Enable	Description
ipi_int_home	CTRL[HIRQ]	CTRL[HIE]	HOME signal transition interrupt
ipi_int_index	CTRL[XIRQ]	CTRL[XIE]	INDEX signal transition interrupt or roll-over/ under interrupt

*Table continues on the next page...*

**Table 23-2. Interrupt Summary (continued)**

Core Interrupt	Interrupt Flag	Interrupt Enable	Description
	CTRL2[ROIRQ]	CTRL2[ROIE]	
	CTRL2[RUIRQ]	CTRL2[RUIE]	
ipi_int_wdog	CTRL[DIRQ]	CTRL[DIE]	Watchdog timeout interrupt
ipi_int_comp	CTRL[CMPIRQ]	CTRL[CMPIE]	Compare match interrupt

## 23.7 ENC register descriptions

The address of a register is the sum of a base address and an address offset.

- Base address is defined at the MCU level
- Address offset is defined at the module level

For the base address, see the specific chip documentation. All memory locations base and offsets are given in hex.

### 23.7.1 ENC Memory map

ENC base address: 403C\_8000h

## 23.7.2 Control Register (CTRL)

### 23.7.2.1 Offset

Register	Offset
CTRL	0h

### 23.7.2.2 Diagram

### 23.7.2.3 Fields

Field	Function
15 HIRQ	<p>HOME Signal Transition Interrupt Request</p> <p>HOME Signal Transition Interrupt Request is set when a transition on the HOME signal occurs, according to the Use Negative Edge of HOME Input bit (CTRL[HNE]). If HOME Signal Transition Interrupt Request bit is set and HOME Interrupt Enable bit (CTRL[HIE]) is set, then a HOME interrupt occurs.</p> <ul style="list-style-type: none"> <li>HOME Signal Transition Interrupt Request bit will remain set until it is cleared by software</li> <li>Write a one to this bit (HIRQ) to clear it</li> </ul> <p>0b - No interrupt</p>

Table continues on the next page...

Field	Function
	1b - HOME signal transition interrupt request (a transition on the HOME signal has occurred)
14 HIE	HOME Interrupt Enable Enables/disables HOME signal interrupts. 0b - Disabled 1b - Enabled
13 HIP	Enable HOME to Initialize Position Counters UPOS and LPOS Enables the position counter to be initialized by the HOME signal. 0b - No action 1b - HOME signal initializes the position counter
12 HNE	Use Negative Edge of HOME Input Selects using the positive/negative edge of the HOME input. 0b - Use positive-going edge-to-trigger initialization of position counters UPOS and LPOS 1b - Use negative-going edge-to-trigger initialization of position counters UPOS and LPOS
11 SWIP	Software-Triggered Initialization of Position Counters UPOS and LPOS Writing 1 to Software-Triggered Initialization of Position Counters bit will transfer the UINIT and LINIT contents to UPOS and LPOS (thereby initializing those counters). <ul style="list-style-type: none"> <li>Software-Triggered Initialization of Position Counters bit is always read as 0.</li> </ul> 0b - No action 1b - Initialize position counter (using upper and lower initialization registers, UINIT and LINIT)
10 REV	Enable Reverse Direction Counting Selects the direction of the count (how the quadrature signal is interpreted). 0b - Count normally 1b - Count in the reverse direction
9 PH1	Enable Signal Phase Count Mode Bypass/use the quadrature decoder logic. 0b - Use the standard quadrature decoder, where PHASEA and PHASEB represent a two-phase quadrature signal. 1b - Bypass the quadrature decoder. A positive transition of the PHASEA input generates a count signal. The PHASEB input and the REV bit control the counter direction: If CTRL[REV] = 0, PHASEB = 0, then count up If CTRL[REV] = 1, PHASEB = 1, then count up If CTRL[REV] = 0, PHASEB = 1, then count down If CTRL[REV] = 1, PHASEB = 0, then count down
8 XIRQ	INDEX Pulse Interrupt Request INDEX Pulse Interrupt Request is set when an INDEX interrupt occurs. <ul style="list-style-type: none"> <li>INDEX Pulse Interrupt Request will remain set until cleared by software</li> <li>Write 1 to this bit (XIRQ) to clear it</li> </ul> 0b - INDEX pulse interrupt has not occurred 1b - INDEX pulse interrupt has occurred
7 XIE	INDEX Pulse Interrupt Enable Enables/disables INDEX pulse interrupts. 0b - Disabled 1b - Enabled
6 XIP	INDEX Triggered Initialization of Position Counters UPOS and LPOS Enables/disables the position counter to be initialized by the INDEX pulse. 0b - INDEX pulse does not initialize the position counter 1b - INDEX pulse initializes the position counter
5	Use Negative Edge of INDEX Pulse

*Table continues on the next page...*

## ENC register descriptions

Field	Function
XNE	Selects the positive/negative edge of the INDEX pulse used to initialize the position counter. 0b - Use positive edge of INDEX pulse 1b - Use negative edge of INDEX pulse
4 DIRQ	Watchdog Timeout Interrupt Request Watchdog Timeout Interrupt Request is set when a watchdog timeout interrupt occurs. <ul style="list-style-type: none"> <li>• Watchdog Timeout Interrupt Request will remain set until cleared by software</li> <li>• Write a one to this bit (DIRQ) to clear it</li> <li>• Watchdog Timeout Interrupt Request bit is also cleared when Watchdog Enable (CTRL[WDE]) is disabled (=0)</li> </ul> 0b - No Watchdog timeout interrupt has occurred 1b - Watchdog timeout interrupt has occurred
3 DIE	Watchdog Timeout Interrupt Enable Enables/disables watchdog timeout interrupts. 0b - Disabled 1b - Enabled
2 WDE	Watchdog Enable Enables/disables the watchdog timer that is monitoring the PHASEA and PHASEB inputs for motor movement. 0b - Disabled 1b - Enabled
1 CMPIRQ	Compare Interrupt Request Compare Interrupt Request is set when the counter matches the COMP value. <ul style="list-style-type: none"> <li>• Compare Interrupt Request remains set until cleared by software</li> <li>• Write 1 to this bit (CMPIRQ) to clear it</li> </ul> 0b - No match has occurred (the counter does not match the COMP value) 1b - COMP match has occurred (the counter matches the COMP value)
0 CMPIE	Compare Interrupt Enable Enables/disables compare interrupts. 0b - Disabled 1b - Enabled

## 23.7.3 Input Filter Register (FILT)

### 23.7.3.1 Offset

Register	Offset
FILT	2h

### 23.7.3.2 Function

The Input Filter Register sets the values of the input filter sample period (FILT\_PER) and the input filter sample count (FILT\_CNT).

- The Input Filter Sample Period (FILT\_PER) should be set so that the sampling period is larger than the period of the expected noise. Doing this means that a noise spike will only corrupt one sample.
- The Input Filter Sample Count (FILT\_CNT) should be chosen to reduce the probability of noisy samples causing an incorrect transition to be recognized. The probability of an incorrect transition is defined as the probability of an incorrect sample raised to the power of  $FILT\_CNT+3$ .

The values of the Input Filter Sample Period (FILT\_PER) and the Input Filter Sample Count (FILT\_CNT) must also be traded off against the desire for minimal latency in recognizing valid input transitions. Turning on the input filter (setting the Input Filter Sample Period (FILT\_PER) to a non-zero value) introduces a latency of  $((FILT\_CNT + 3) * FILT\_PER + 2)$  IPBus clock periods.

The filter latency can be measured:

- Drive the quadrature decoder inputs (PHASEA, PHASEB, INDEX, HOME)
- Monitor the filtered output in the Input Monitor Register (IMR)
- Determine how many IPBus clock cycles that it takes before the output shows up, by using the following equations, where  $f$  is FILT\_PER and  $s$  is FILT\_CNT.
  - $DELAY$  (IPBus clock cycles) =  $f * (s+3) + 1$  (to read the filtered output)
  - $DELAY$  (IPBus clock cycles) =  $f * (s+3) + 2$  (to monitor the output in the IMR)

One more additional IPBus clock cycle is needed to read the filtered output, and 2 more IPBus clock cycles are needed to monitor the filtered output in the IMR. The sample rate is set when it reaches the number  $f$ . The following examples use the preceding equations:

- Example: when  $f = 0$ , the filter is bypassed:  $DELAY = 1$  or  $2$  clock cycles.
- Example: when  $f = 5$  and  $s = 2$ :  $DELAY = 5 * (2+3) + (1 \text{ or } 2) = 26$  or  $27$  clock cycles.

### 23.7.3.3 Diagram

### 23.7.3.4 Fields

Field	Function
15-11 —	Reserved
10-8 FILT_CNT	<p>Input Filter Sample Count</p> <p>The Input Filter Sample Count represents the number of consecutive samples that must agree, before the input filter accepts an input transition.</p> <ul style="list-style-type: none"> <li>• A value of 0x0 represents 3 samples</li> <li>• A value of 0x7 represents 10 samples</li> </ul> <p>The value of the Input Filter Sample Count (FILT_CNT) affects the input latency.</p>
7-0 FILT_PER	<p>Input Filter Sample Period</p> <p>The Input Filter Sample Period represents the sampling period (in IPBus clock cycles) of the decoder input signals. Each input is sampled multiple times at the rate specified by the Input Filter Sample Period.</p> <ul style="list-style-type: none"> <li>• If FILT_PER is 0x00 (default), then the input filter is bypassed. Bypassing the digital filter enables the position/position difference counters to operate with count rates up to the IPBus frequency.</li> <li>• The value of the Input Filter Sample Period (FILT_PER) affects the input latency.</li> <li>• When changing the Input Filter Sample Period (FILT_PER) from a non-zero value to another non-zero value, write a value of 0 first, to clear the filter.</li> </ul>

## 23.7.4 Watchdog Timeout Register (WTR)

### 23.7.4.1 Offset

Register	Offset
WTR	4h

### 23.7.4.2 Function

The Watchdog Timeout Register stores the timeout count for the quadrature decoder module watchdog timer. This quadrature decoder module watchdog timer is separate from any other watchdog timer(s) that may also be in the device.

### 23.7.4.3 Diagram

### 23.7.4.4 Fields

Field	Function
15-0	WDOG
WDOG	WDOG[15:0] is a binary representation of the number of clock cycles, plus one clock cycle that the watchdog timer counts before timing out (and optionally generating an interrupt).

## 23.7.5 Position Difference Counter Register (POSD)

### 23.7.5.1 Offset

Register	Offset
POSD	6h

### 23.7.5.2 Function

The Position Difference Counter Register contains the position change in value occurring between each read of the Position Register. The value of the Position Difference Counter Register can be used to calculate velocity.

- The 16-bit Position Difference Counter computes up or down on every count pulse.
- This Position Difference Counter acts as a differentiator, whose count value is proportional to the change in position since the last time that the Position Counter was read.
- When the Position Registers (UPOS or LPOS), the Position Difference Counter (POSD), or the Revolution Counter (REV) is read, the Position Difference Counter's contents are copied into the Position Difference Hold Register (POSDH) and the Position Difference Counter is cleared.

## 23.7.15 Input Monitor Register (IMR)

### 23.7.15.1 Offset

Register	Offset
IMR	1Ah

### 23.7.15.2 Function

The Input Monitor Register contains the values of the raw and filtered PHASEA, PHASEB, INDEX, and HOME input signals. The reset value depends on the values of the raw and filtered values of PHASEA, PHASEB, INDEX, and HOME input signals:

- If these input pins are connected to a pull-up, then bits 0–7 of the IMR are all ones.
- If these input pins are connected to a pull-down device, then bits 0–7 of the Input Monitor Register (IMR) are all zeros.

### 23.7.15.3 Diagram

4 FHOM	FHOM Filtered version of HOME input
3 PHA	PHA Raw PHASEA input
2 PHB	PHB Raw PHASEB input
1 INDEX	INDEX Raw INDEX input
0 HOME	HOME The raw HOME input

### 23.7.16 Test Register (TST)

### 23.7.16.1 Offset

Register	Offset
TST	1Ch

### 23.7.16.2 Function

The Test Register controls and sets the frequency of a quadrature signal generator; it provides a quadrature test signal to the inputs of the quadrature decoder module.

- The TEST\_COUNT value is counted down to zero when the test module is enabled (TEN = 1) and the count is enabled (TCE = 1).
- Each count value of one represents a single quadrature cycle interpreted as a count of one by the position counter (UPOS and LPOS) if it is enabled (TEN = 1, TCE = 1).
- Repeated writing of new values to TEST\_COUNT can cause an extra phase transition and therefore an extra count by the Position Counter.
- The period field determines the length (in IPBus clock cycles) of each quadrature cycle phase.

The Test Register is a factory test feature; however, it can also be useful in customer software development and testing.

### 23.7.16.3 Diagram

### 23.7.16.4 Fields

Field	Function
15 TEN	Test Mode Enable Connects the test module to inputs of the quadrature decoder module. 0b - Disabled 1b - Enabled

# Chapter 24

## 10/100-Mbps Ethernet MAC (ENET)

### 24.1 Introduction

The MAC-NET core, in conjunction with a 10/100-Mbit/s MAC, implements layer 3 network acceleration functions. These functions are designed to accelerate the processing of various common networking protocols, such as IP, TCP, UDP, and ICMP, providing wire speed services to client applications.

### 24.2 Overview

The core implements a dual-speed 10/100-Mbit/s Ethernet MAC compliant with the IEEE802.3-2002 standard. The MAC layer provides compatibility with half- or full-duplex 10/100-Mbit/s Ethernet LANs.

The MAC operation is fully programmable and can be used in Network Interface Card (NIC), bridging, or switching applications. The core implements the remote network monitoring (RMON) counters according to IETF RFC 2819.

The core also implements a hardware acceleration block to optimize the performance of network controllers providing TCP/IP, UDP, and ICMP protocol services. The acceleration block performs critical functions in hardware, which are typically implemented with large software overhead.

The core implements programmable embedded FIFOs that can provide buffering on the receive path for lossless flow control.

Advanced power management features are available with magic packet detection and programmable power-down modes.

A unified DMA (uDMA), internal to the ENET module, optimizes data transfer between the ENET core and the SoC, and supports an enhanced buffer descriptor programming model to support IEEE 1588 functionality.

The programmable Ethernet MAC with IEEE 1588 integrates a standard IEEE 802.3 Ethernet MAC with a time-stamping module. The IEEE 1588 standard provides accurate clock synchronization for distributed control nodes for industrial automation applications.

## 24.2.1 Features

The MAC-NET core includes the following features.

### 24.2.1.1 Ethernet MAC features

- Implements the full 802.3 specification with preamble/SFD generation, frame padding generation, CRC generation and checking
- Supports zero-length preamble
- Dynamically configurable to support 10/100-Mbit/s operation
- Supports 10/100 Mbit/s full-duplex and configurable half-duplex operation
- Compliant with the AMD magic packet detection with interrupt for node remote power management
- Seamless interface to commercial ethernet PHY devices via one of the following:
  - a 4-bit Media Independent Interface (MII) operating at 2.5/25 MHz.
  - a 4-bit non-standard MII-Lite (MII without the CRS and COL signals) operating at 2.5/25 MHz.
  - a 2-bit Reduced MII (RMII) operating at 50 MHz.
- Simple 64-Bit FIFO user-application interface
- CRC-32 checking at full speed with optional forwarding of the frame check sequence (FCS) field to the client
- CRC-32 generation and append on transmit or forwarding of user application provided FCS selectable on a per-frame basis
- In full-duplex mode:
  - Implements automated pause frame (802.3 x31A) generation and termination, providing flow control without user application intervention
  - Pause quanta used to form pause frames — dynamically programmable
  - Pause frame generation additionally controllable by user application offering flexible traffic flow control
  - Optional forwarding of received pause frames to the user application
  - Implements standard flow-control mechanism
- In half-duplex mode: provides full collision support, including jamming, backoff, and automatic retransmission
- Supports VLAN-tagged frames according to IEEE 802.1Q
- Programmable MAC address: Insertion on transmit; discards frames with mismatching destination address on receive (except broadcast and pause frames)

- Programmable promiscuous mode support to omit MAC destination address checking on receive
- Multicast and unicast address filtering on receive based on 64-entry hash table, reducing higher layer processing load
- Programmable frame maximum length providing support for any standard or proprietary frame length
- Statistics indicators for frame traffic and errors (alignment, CRC, length) and pause frames providing for IEEE 802.3 basic and mandatory management information database (MIB) package and remote network monitoring (RFC 2819)
- Simple handshake user application FIFO interface with fully programmable depth and threshold levels
- Provides separate status word for each received frame on the user interface providing information such as frame length, frame type, VLAN tag, and error information
- Multiple internal loopback options
- MDIO master interface for PHY device configuration and management supports two programmable MDIO base addresses, and standard (IEEE 802.3 Clause 22) and extended (Clause 45) MDIO frame formats
- Supports legacy FEC buffer descriptors
- Interrupt coalescing reduces the number of interrupts generated by the MAC, reducing CPU loading

### 24.2.1.2 IP protocol performance optimization features

- Operates on TCP/IP and UDP/IP and ICMP/IP protocol data or IP header only
- Enables wire-speed processing
- Supports IPv4 and IPv6
- Transparent passing of frames of other types and protocols
- Supports VLAN tagged frames according to IEEE 802.1q with transparent forwarding of VLAN tag and control field
- Automatic IP-header and payload (protocol specific) checksum calculation and verification on receive
- Automatic IP-header and payload (protocol specific) checksum generation and automatic insertion on transmit configurable on a per-frame basis
- Supports IP and TCP, UDP, ICMP data for checksum generation and checking
- Supports full header options for IPv4 and TCP protocol headers

- Provides IPv6 support to datagrams with base header only — datagrams with extension headers are passed transparently unmodified/unchecked
- Provides statistics information for received IP and protocol errors
- Configurable automatic discard of erroneous frames
- Configurable automatic host-to-network (RX) and network-to-host (TX) byte order conversion for IP and TCP/UDP/ICMP headers within the frame
- Configurable padding remove for short IP datagrams on receive
- Configurable Ethernet payload alignment to allow for 32-bit word-aligned header and payload processing
- Programmable store-and-forward operation with clock and rate decoupling FIFOs

### **24.2.1.3 IEEE 1588 features**

- Supports all IEEE 1588 frames.
- Allows reference clock to be chosen independently of network speed.
- Software-programmable precise time-stamping of ingress and egress frames
- Timer monitoring capabilities for system calibration and timing accuracy management
- Precise time-stamping of external events with programmable interrupt generation
- Programmable event and interrupt generation for external system control
- Supports hardware- and software-controllable timer synchronization.
- Provides a 4-channel IEEE 1588 timer. Each channel supports input capture and output compare using the 1588 counter.

## 24.2.2 Block diagram

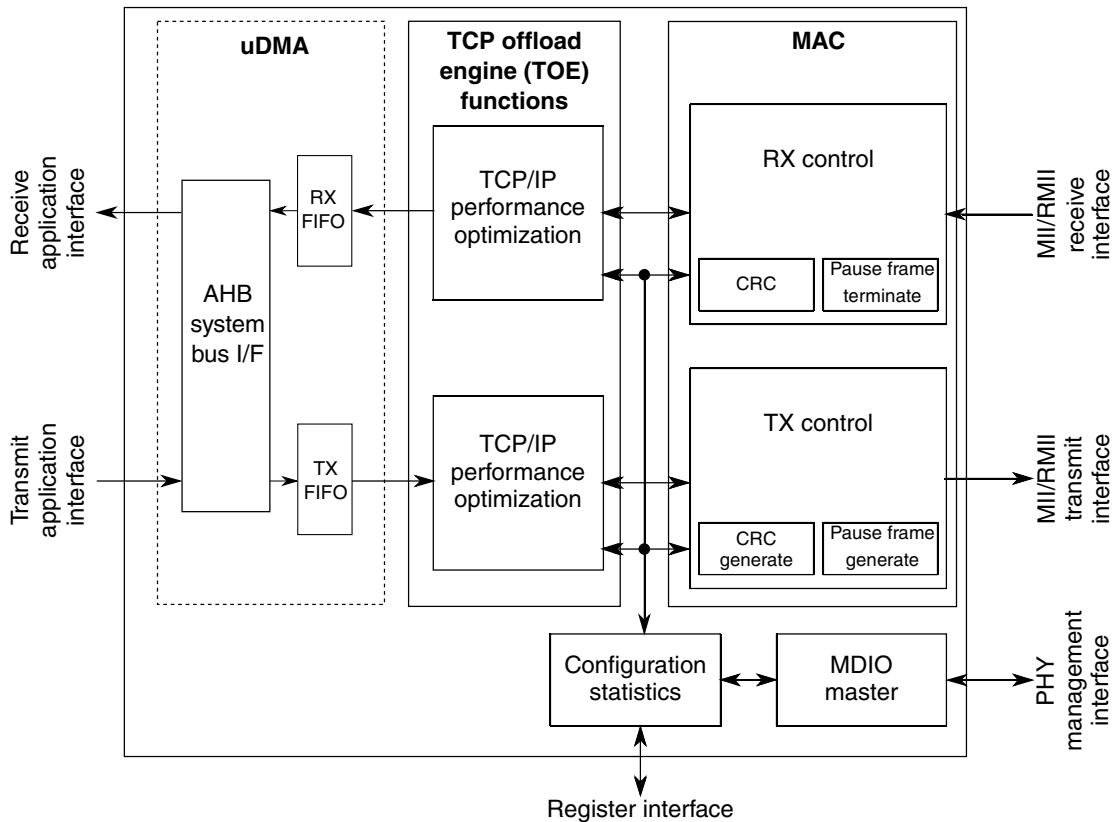

Figure 24-1. Ethernet MAC-NET core block diagram

## 24.3 External Signals

The table found here describes the external signals of ENET.

Table 24-1. ENET External Signals

Signal	Description	Mode	Pad	Mode	Direction
ENET_MDC	Output clock provides a timing reference to the PHY for data transfers on the MDIO signal.	MII/RMII/RGMII	GPIO_B1_14	ALT0	O
			GPIO_AD_B1_04	ALT1	
			GPIO_EMC_40	ALT4	
ENET_MDIO	Transfers control information between the external PHY and the media-access controller. Data is synchronous to	MII/RMII/RGMII	GPIO_B1_15	ALT0	IO
			GPIO_AD_B1_05	ALT1	
			GPIO_EMC_41	ALT4	

Table continues on the next page...

**Table 24-1. ENET External Signals (continued)**

Signal	Description	Mode	Pad	Mode	Direction
	MDC. This signal is an input after reset.				
ENET_TX_DATA0	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	GPIO_B1_07	ALT3	I
			GPIO_EMC_22	ALT3	
ENET_TX_DATA1	Serial output Ethernet data. Only valid during TX_EN assertion.	MII/RMII	GPIO_EMC_21	ALT3	I
			GPIO_B1_08	ALT3	
ENET_TX_DATA2	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	GPIO_AD_B0_05	ALT2	I
ENET_TX_DATA3	Serial output Ethernet data. Only valid during TX_EN assertion.	MII	GPIO_AD_B0_04	ALT2	I
ENET_TX_ER	When asserted for one or more clock cycles while TXEN is also asserted, PHY sends one or more illegal symbols.	MII/RMII	GPIO_AD_B0_07	ALT2	I
ENET_TX_EN	Indicates when valid nibbles are present on the MII. This signal is asserted with the first nibble of a preamble and is deasserted before the first TX_CLK following the final nibble of the frame.	MII/RMII	GPIO_B1_09	ALT3	I
			GPIO_EMC_24	ALT3	
ENET_TX_CLK	Input clock In MII mode, provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER. IN RGMII mode, provides the external 125 MHz reference clock input.	MII/RGMII	GPIO_B1_10	ALT3	I
			GPIO_EMC_25	ALT3	
ENET_RX_DATA0	Contains the Ethernet input data transferred from the PHY to the media-access controller	MII/RMII	GPIO_EMC_20	ALT3	I
			GPIO_B1_04	ALT3	

Table continues on the next page...

**Table 24-1. ENET External Signals (continued)**

Signal	Description	Mode	Pad	Mode	Direction
	when RX_EN is asserted.				
ENET_RX_DATA1	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII/RMII	GPIO_EMC_19 GPIO_B1_05	ALT3 ALT3	I
ENET_RX_DATA3	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	GPIO_AD_B0_08	ALT2	I
ENET_RX_DATA2	Contains the Ethernet input data transferred from the PHY to the media-access controller when RX_EN is asserted.	MII	GPIO_AD_B0_09	ALT2	I
ENET_RX_ER	When asserted with RXDV, indicates the PHY detects an error in the current frame.	MII/RMII	GPIO_B1_11 GPIO_EMC_26	ALT3 ALT3	I
ENET_RX_EN	Asserting this input indicates the PHY has valid nibbles present on the MII. RX_EN must remain asserted from the first recovered nibble of the frame through to the last nibble. Asserting RX_EN must start no later than the SFD and exclude any EOF. In RMII mode, this pin also generates the CRS signal.	MII/RMII	GPIO_EMC_23 GPIO_B1_06	ALT3 ALT3	I
ENET_RX_CLK	Input clock In MII mode, provides a timing reference for TX_EN, TX_DATA[3:0], and TX_ER. IN RGMII mode, provides the external 125 MHz	MII	GPIO_AD_B0_06	ALT2	I

ENET_1588_EVENT T3_IN	Capture/compare block input/output event bus signal. When configured for capture and a rising edge is detected, the current timer value is latched and transferred into the corresponding ENET_TCCRn register for inspection by software. When configured for compare, the corresponding signal 1588_EVENT is asserted for one cycle when the timer reaches the compare value programmed in register ENET_TCCRn. An interrupt or DMA request can be triggered if the corresponding bit in ENET_TCSRn[TIE] or ENET_TCSRn[TDRE] is set.	MII/RMII/RGMII	GPIO_AD_B0_08	ALT7	I

## 24.4 Clocks

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

## 24.5 Memory map/register definition

ENET registers must be read or written with 32-bit accesses. Non-32 bit accesses will terminate with an error.

Reserved bits should be written with 0 and ignored on read. Unused registers read zero and a write has no effect.

This table shows Ethernet registers organization.

**Table 24-2. Register map summary**

Offset Address	Section	Description
0x0000 – 0x01FF	Configuration	Core control and status registers
0x0200 – 0x03FF	Statistics counters	MIB and Remote Network Monitoring (RFC 2819) registers
0x0400 – 0x0430	1588 control	1588 adjustable timer (TSM) and 1588 frame control
0x0600 – 0x07FC	Capture/Compare block	Registers for the Capture/Compare block

### ENET memory map

Absolute address (hex)	Register name	Width (in bits)	Access	Reset value	Section/page
402D_8004	Interrupt Event Register (ENET_EIR)	32	w1c	0000_0000h	<a href="#">24.5.1/1065</a>
402D_8008	Interrupt Mask Register (ENET_EIMR)	32	R/W	0000_0000h	<a href="#">24.5.2/1067</a>
402D_8010	Receive Descriptor Active Register (ENET_RDAR)	32	R/W	0000_0000h	<a href="#">24.5.3/1070</a>
402D_8014	Transmit Descriptor Active Register (ENET_TDAR)	32	R/W	0000_0000h	<a href="#">24.5.4/1071</a>
402D_8024	Ethernet Control Register (ENET_ECR)	32	R/W	<a href="#">See section</a>	<a href="#">24.5.5/1072</a>

## 24.5.1 Interrupt Event Register (ENET\_EIR)

When an event occurs that sets a bit in EIR, an interrupt occurs if the corresponding bit in the interrupt mask register (EIMR) is also set. Writing a 1 to an EIR bit clears it; writing 0 has no effect. This register is cleared upon hardware reset.

### NOTE

TxBD[INT] and RxBD[INT] must be set to 1 to allow setting the corresponding EIR register flags in enhanced mode, ENET\_ECR[EN1588] = 1. Legacy mode does not require these flags to be enabled.

Address: 402D\_8000h base + 4h offset = 402D\_8004h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

### ENET\_EIR field descriptions

Field	Description
31 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
30 BABR	Babbling Receive Error Indicates a frame was received with length in excess of RCR[MAX_FL] bytes.
29 BABT	Babbling Transmit Error

Table continues on the next page...

## ENET\_EIR field descriptions (continued)

Field	Description
	Indicates the transmitted frame length exceeds RCR[MAX_FL] bytes. Usually this condition is caused when a frame that is too long is placed into the transmit data buffer(s). Truncation does not occur.
28 GRA	Graceful Stop Complete  This interrupt is asserted after the transmitter is put into a pause state after completion of the frame currently being transmitted. See Graceful Transmit Stop (GTS) for conditions that lead to graceful stop.  <b>NOTE:</b> The GRA interrupt is asserted only when the TX transitions into the stopped state. If this bit is cleared by writing 1 and the TX is still stopped, the bit is not set again.
27 TXF	Transmit Frame Interrupt  Indicates a frame has been transmitted and the last corresponding buffer descriptor has been updated.
26 TXB	Transmit Buffer Interrupt  Indicates a transmit buffer descriptor has been updated.
25 RXF	Receive Frame Interrupt  Indicates a frame has been received and the last corresponding buffer descriptor has been updated.
24 RXB	Receive Buffer Interrupt  Indicates a receive buffer descriptor is not the last in the frame has been updated.
23 MII	MII Interrupt.  Indicates that the MII has completed the data transfer requested.
22 EBERR	Ethernet Bus Error  Indicates a system bus error occurred when a uDMA transaction is underway. When this bit is set, ECR[ETHEREN] is cleared, halting frame processing by the MAC. When this occurs, software must ensure proper actions, possibly resetting the system, to resume normal operation.
21 LC	Late Collision  Indicates a collision occurred beyond the collision window (slot time) in half-duplex mode. The frame truncates with a bad CRC and the remainder of the frame is discarded.
20 RL	Collision Retry Limit  Indicates a collision occurred on each of 16 successive attempts to transmit the frame. The frame is discarded without being transmitted and transmission of the next frame commences. This error can only occur in half-duplex mode.
19 UN	Transmit FIFO Underrun  Indicates the transmit FIFO became empty before the complete frame was transmitted.  <b>NOTE:</b> In situations where the device has various masters generating high traffic, a FIFO underrun can occur on the transmit FIFO. To avoid transmit FIFO underrun, store and forward can be enabled in ENET_TFWR[STRFWD]. See <a href="#">STRFWD</a> . Also, a higher priority can be set for ENET traffic using available means on the central bus fabric connecting the ENET module.
18 PLR	Payload Receive Error  Indicates a frame was received with a payload length error. See Frame Length/Type Verification: Payload Length Check for more information.
17 WAKEUP	Node Wakeup Request Indication

Table continues on the next page...

## ENET\_EIR field descriptions (continued)

Field	Description
	Read-only status bit to indicate that a magic packet has been detected. Will act only if ECR[MAGICEN] is set.
16 TS_AVAIL	Transmit Timestamp Available  Indicates that the timestamp of the last transmitted timing frame is available in the ATSTMP register.
15 TS_TIMER	Timestamp Timer  The adjustable timer reached the period event. A period event interrupt can be generated if ATCR[PEREN] is set and the timer wraps according to the periodic setting in the ATPER register. Set the timer period value before setting ATCR[PEREN].
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

## 24.5.2 Interrupt Mask Register (ENET\_EIMR)

EIMR controls which interrupt events are allowed to generate actual interrupts. A hardware reset clears this register. If the corresponding bits in the EIR and EIMR registers are set, an interrupt is generated. The interrupt signal remains asserted until a 1 is written to the EIR field (write 1 to clear) or a 0 is written to the EIMR field.

Address: 402D\_8000h base + 8h offset = 402D\_8008h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

## ENET\_EIMR field descriptions

Field	Description
31 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
30 BABR	BABR Interrupt Mask  Corresponds to interrupt source EIR[BABR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.  0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
29 BABT	BABT Interrupt Mask  Corresponds to interrupt source EIR[BABT] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR BABT field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.  0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
28 GRA	GRA Interrupt Mask  Corresponds to interrupt source EIR[GRA] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR GRA field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.  0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
27 TXF	TXF Interrupt Mask  Corresponds to interrupt source EIR[TXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.  0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
26 TXB	TXB Interrupt Mask  Corresponds to interrupt source EIR[TXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.  0 The corresponding interrupt source is masked. 1 The corresponding interrupt source is not masked.
25 RXF	RXF Interrupt Mask  Corresponds to interrupt source EIR[RXF] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXF field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.

*Table continues on the next page...*

## ENET\_EIMR field descriptions (continued)

Field	Description
24 RXB	<p>RXB Interrupt Mask</p> <p>Corresponds to interrupt source EIR[RXB] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RXB field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
23 MII	<p>MII Interrupt Mask</p> <p>Corresponds to interrupt source EIR[MII] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR MII field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
22 EBERR	<p>EBERR Interrupt Mask</p> <p>Corresponds to interrupt source EIR[EBERR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR EBERR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
21 LC	<p>LC Interrupt Mask</p> <p>Corresponds to interrupt source EIR[LC] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR LC field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
20 RL	<p>RL Interrupt Mask</p> <p>Corresponds to interrupt source EIR[RL] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR RL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
19 UN	<p>UN Interrupt Mask</p> <p>Corresponds to interrupt source EIR[UN] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR UN field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
18 PLR	<p>PLR Interrupt Mask</p> <p>Corresponds to interrupt source EIR[PLR] and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR PLR field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
17 WAKEUP	<p>WAKEUP Interrupt Mask</p> <p>Corresponds to interrupt source EIR[WAKEUP] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR WAKEUP field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.</p>
16 TS_AVAIL	<p>TS_AVAIL Interrupt Mask</p> <p>Corresponds to interrupt source EIR[TS_AVAIL] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting</p>

*Table continues on the next page...*

### ENET\_EIMR field descriptions (continued)

Field	Description
	source. The corresponding EIR TS_AVAIL field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
15 TS_TIMER	TS_TIMER Interrupt Mask  Corresponds to interrupt source EIR[TS_TIMER] register and determines whether an interrupt condition can generate an interrupt. At every module clock, the EIR samples the signal generated by the interrupting source. The corresponding EIR TS_TIMER field reflects the state of the interrupt signal even if the corresponding EIMR field is cleared.
14–13 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
12 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
11–9 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.

### 24.5.3 Receive Descriptor Active Register (ENET\_RDAR)

RDAR is a command register, written by the user, to indicate that the receive descriptor ring has been updated, that is, that the driver produced empty receive buffers with the empty bit set.

Address: 402D\_8000h base + 10h offset = 402D\_8010h

## ENET\_RDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 RDAR	Receive Descriptor Active  Always set to 1 when this register is written, regardless of the value written. This field is cleared by the MAC device when no additional empty descriptors remain in the receive ring. It is also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 24.5.4 Transmit Descriptor Active Register (ENET\_TDAR)

The TDAR is a command register that the user writes to indicate that the transmit descriptor ring has been updated, that is, that transmit buffers have been produced by the driver with the ready bit set in the buffer descriptor.

The TDAR register is cleared at reset, when ECR[ETHEREN] transitions from set to cleared, or when ECR[RESET] is set.

Address: 402D\_8000h base + 14h offset = 402D\_8014h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0							TDAR	0							
W	[Shaded]								[Shaded]							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ENET\_TDAR field descriptions

Field	Description
31–25 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
24 TDAR	Transmit Descriptor Active  Always set to 1 when this register is written, regardless of the value written. This bit is cleared by the MAC device when no additional ready descriptors remain in the transmit ring. Also cleared when ECR[ETHEREN] transitions from set to cleared or when ECR[RESET] is set.

Table continues on the next page...

### ENET\_TDAR field descriptions (continued)

Field	Description
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 24.5.5 Ethernet Control Register (ENET\_ECR)

ECR is a read/write user register, though hardware may also alter fields in this register. It controls many of the high level features of the Ethernet MAC, including legacy FEC support through the EN1588 field.

Address: 402D\_8000h base + 24h offset = 402D\_8024h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	Reserved														Reserved	
W	Reserved														Reserved	
Reset	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	Reserved				Reserved	Reserved	Reserved	DBSWP	Reserved	DBGEN	0	EN1588	SLEEP	MAGICEN	ETHEREN	RESET
W	Reserved				Reserved	Reserved	Reserved	DBSWP	Reserved	DBGEN	0	EN1588	SLEEP	MAGICEN	ETHEREN	RESET
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_ECR field descriptions

Field	Description
31–18 Reserved	This field is reserved. Always write 0111000000000b to this field.
17–12 Reserved	This field is reserved. Always write 0 to this field.
11 Reserved	This field is reserved. Always write 0 to this field.
10 Reserved	This field is reserved. Always write 0 to this field.
9 Reserved	This field is reserved. Always write 0 to this field.
8 DBSWP	Descriptor Byte Swapping Enable Swaps the byte locations of the buffer descriptors. <b>NOTE:</b> This field must be written to 1 after reset.  0 The buffer descriptor bytes are not swapped to support big-endian devices. 1 The buffer descriptor bytes are swapped to support little-endian devices.

Table continues on the next page...

## ENET\_ECR field descriptions (continued)

Field	Description
7 Reserved	This field is reserved. Always write 0 to this field.
6 DBGEN	Debug Enable Enables the MAC to enter hardware freeze mode when the device enters debug mode.  0 MAC continues operation in debug mode. 1 MAC enters hardware freeze mode when the processor is in debug mode.
5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 EN1588	EN1588 Enable Enables enhanced functionality of the MAC.  0 Legacy FEC buffer descriptors and functions enabled. 1 Enhanced frame time-stamping functions enabled.
3 SLEEP	Sleep Mode Enable  0 Normal operating mode. 1 Sleep mode.
2 MAGICEN	Magic Packet Detection Enable Enables/disables magic packet detection.  <b>NOTE:</b> MAGICEN is relevant only if the SLEEP field is set. If MAGICEN is set, changing the SLEEP field enables/disables sleep mode and magic packet detection.  <b>NOTE:</b> EIMR[WAKEUP] must be written to one if Magic packet wakeup is programmed to wake up the chip from low power mode.  0 Magic detection logic disabled. 1 The MAC core detects magic packets and asserts EIR[WAKEUP] when a frame is detected.
1 ETHEREN	Ethernet Enable Enables/disables the Ethernet MAC. When the MAC is disabled, the buffer descriptors for an aborted transmit frame are not updated. The uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers. Hardware clears this field under the following conditions: <ul style="list-style-type: none"> <li>• RESET is set by software</li> <li>• An error condition causes the EBERR field to set.</li> </ul> <b>NOTE:</b> <ul style="list-style-type: none"> <li>• ETHEREN must be set at the very last step during ENET configuration/setup/initialization, only <i>after</i> all other ENET-related registers have been configured.</li> <li>• If ETHEREN is cleared to 0 by software then next time ETHEREN is set, the EIR interrupts must cleared to 0 due to previous pending interrupts.</li> </ul> 0 Reception immediately stops and transmission stops after a bad CRC is appended to any currently transmitted frame. 1 MAC is enabled, and reception and transmission are possible.
0 RESET	Ethernet MAC Reset When this field is set, it clears the ETHEREN field.

## 24.5.6 MII Management Frame Register (ENET\_MMFR)

Writing to MMFR triggers a management frame transaction to the PHY device unless MSCR is programmed to zero.

If MSCR is changed from zero to non-zero during a write to MMFR, an MII frame is generated with the data previously written to the MMFR. This allows MMFR and MSCR to be programmed in either order if MSCR is currently zero.

If the MMFR register is written while frame generation is in progress, the frame contents are altered. Software must use the EIR[MII] interrupt indication to avoid writing to the MMFR register while frame generation is in progress.

Address: 402D\_8000h base + 40h offset = 402D\_8040h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W	ST	OP	PA			RA			TA	DATA																						
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_MMFR field descriptions

Field	Description
31–30 ST	Start Of Frame Delimiter See <a href="#">Table 24-40</a> (Clause 22) or <a href="#">Table 24-42</a> (Clause 45) for correct value.
29–28 OP	Operation Code See <a href="#">Table 24-40</a> (Clause 22) or <a href="#">Table 24-42</a> (Clause 45) for correct value.
27–23 PA	PHY Address See <a href="#">Table 24-40</a> (Clause 22) or <a href="#">Table 24-42</a> (Clause 45) for correct value.
22–18 RA	Register Address See <a href="#">Table 24-40</a> (Clause 22) or <a href="#">Table 24-42</a> (Clause 45) for correct value.
17–16 TA	Turn Around This field must be programmed to 10 to generate a valid MII management frame.
DATA	Management Frame Data This is the field for data to be written to or read from the PHY register.

## 24.5.7 MII Speed Control Register (ENET\_MSCR)

MSCR provides control of the MII clock (MDC pin) frequency and allows a preamble drop on the MII management frame.

The MII\_SPEED field must be programmed with a value to provide an MDC frequency of less than or equal to 2.5 MHz to be compliant with the IEEE 802.3 MII specification. The MII\_SPEED must be set to a non-zero value to source a read or write management frame. After the management frame is complete, the MSCR register may optionally be cleared to turn off MDC. The MDC signal generated has a 50% duty cycle except when MII\_SPEED changes during operation. This change takes effect following a rising or falling edge of MDC.

For example, if the internal module clock (that is, peripheral bus clock) is 25 MHz, programming MII\_SPEED to 0x4 results in an MDC as given in the following equation:

$$\text{MII clock frequency} = 25 \text{ MHz} / ((4 + 1) \times 2) = 2.5 \text{ MHz}$$

The following table shows the optimum values for MII\_SPEED as a function of IPS bus clock frequency.

**Table 24-3. Programming Examples for MSCR**

Internal module clock frequency	MSCR [MII_SPEED]	MDC frequency
25 MHz	0x4	2.50 MHz
33 MHz	0x6	2.36 MHz
40 MHz	0x7	2.50 MHz
50 MHz	0x9	2.50 MHz
66 MHz	0xD	2.36 MHz

Address: 402D\_8000h base + 44h offset = 402D\_8044h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0					HOLDTIME			DIS_	MII_SPEED					0	
W									PRE							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_MSCR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10–8 HOLDTIME	Hold time On MDIO Output  IEEE802.3 clause 22 defines a minimum of 10 ns for the hold time on the MDIO output. Depending on the host bus frequency, the setting may need to be increased.  000 1 internal module clock cycle 001 2 internal module clock cycles

Table continues on the next page...

## ENET\_MSCR field descriptions (continued)

Field	Description
	010 3 internal module clock cycles 111 8 internal module clock cycles
7 DIS_PRE	Disable Preamble  Enables/disables prepending a preamble to the MII management frame. The MII standard allows the preamble to be dropped if the attached PHY devices do not require it.  0 Preamble enabled. 1 Preamble (32 ones) is not prepended to the MII management frame.
6-1 MII_SPEED	MII Speed  Controls the frequency of the MII management interface clock (MDC) relative to the internal module clock. A value of 0 in this field turns off MDC and leaves it in low voltage state. Any non-zero value results in the MDC frequency of:  $1/((\text{MII\_SPEED} + 1) \times 2)$ of the internal module clock frequency
0 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

### 24.5.8 MIB Control Register (ENET\_MIBC)

MIBC is a read/write register controlling and observing the state of the MIB block. Access this register to disable the MIB block operation or clear the MIB counters. The MIB\_DIS field resets to 1.

Address: 402D\_8000h base + 64h offset = 402D\_8064h

**ENET\_MIBC field descriptions**

Field	Description
31 MIB_DIS	Disable MIB Logic If this control field is set, 0 MIB logic is enabled. 1 MIB logic is disabled. The MIB logic halts and does not update any MIB counters.

*Table continues on the next page...*

**ENET\_MIBC field descriptions (continued)**

<b>Field</b>	<b>Description</b>
30 MIB_IDLE	MIB Idle  0 The MIB block is updating MIB counters. 1 The MIB block is not currently updating any MIB counters.
29 MIB_CLEAR	MIB Clear  <b>NOTE:</b> This field is not self-clearing. To clear the MIB counters set and then clear this field.  0 See note above. 1 All statistics counters are reset to 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 24.5.9 Receive Control Register (ENET\_RCR)

Address: 402D\_8000h base + 84h offset = 402D\_8084h

**ENET\_RCR field descriptions**

Field	Description
31 GRS	Graceful Receive Stopped Read-only status indicating that the MAC receive datapath is stopped.
30 NLC	Payload Length Check Disable Enables/disables a payload length check. 0 The payload length check is disabled. 1 The core checks the frame's payload length with the frame length/type field. Errors are indicated in the EIR[PLR] field.
29-16 MAX_FL	Maximum Frame Length

Table continues on the next page...

## ENET\_RCR field descriptions (continued)

Field	Description
	Resets to decimal 1518. Length is measured starting at DA and includes the CRC at the end of the frame. Transmit frames longer than MAX_FL cause the BABT interrupt to occur. Receive frames longer than MAX_FL cause the BABR interrupt to occur and set the LG field in the end of frame receive buffer descriptor. The recommended default value to be programmed is 1518 or 1522 if VLAN tags are supported.
15 CFEN	MAC Control Frame Enable Enables/disables the MAC control frame.  0 MAC control frames with any opcode other than 0x0001 (pause frame) are accepted and forwarded to the client interface. 1 MAC control frames with any opcode other than 0x0001 (pause frame) are silently discarded.
14 CRCFWD	Terminate/Forward Received CRC Specifies whether the CRC field of received frames is transmitted or stripped. <b>NOTE:</b> If padding function is enabled (PADEN = 1), CRCFWD is ignored and the CRC field is checked and always terminated and removed.  0 The CRC field of received frames is transmitted to the user application. 1 The CRC field is stripped from the frame.
13 PAUFWD	Terminate/Forward Pause Frames Specifies whether pause frames are terminated or forwarded.  0 Pause frames are terminated and discarded in the MAC. 1 Pause frames are forwarded to the user application.
12 PADEN	Enable Frame Padding Remove On Receive Specifies whether the MAC removes padding from received frames.  0 No padding is removed on receive by the MAC. 1 Padding is removed from received frames.
11–10 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
9 RMII_10T	Enables 10-Mbit/s mode of the RMII .  0 100-Mbit/s operation. 1 10-Mbit/s operation.
8 RMII_MODE	RMII Mode Enable Specifies whether the MAC is configured for MII mode or RMII operation .  0 MAC configured for MII mode. 1 MAC configured for RMII operation.
7 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
6 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
5 FCE	Flow Control Enable

Table continues on the next page...

**ENET\_RCR field descriptions (continued)**

<b>Field</b>	<b>Description</b>
	If set, the receiver detects PAUSE frames. Upon PAUSE frame detection, the transmitter stops transmitting data frames for a given duration.
4 BC_REJ	Broadcast Frame Reject  If set, frames with destination address (DA) equal to 0xFFFF_FFFF_FFFF are rejected unless the PROM field is set. If BC_REJ and PROM are set, frames with broadcast DA are accepted and the MISS (M) is set in the receive buffer descriptor.
3 PROM	Promiscuous Mode  All frames are accepted regardless of address matching.  0 Disabled. 1 Enabled.
2 MII_MODE	Media Independent Interface Mode  This field must always be set.  0 Reserved. 1 MII or RMII mode, as indicated by the RMII_MODE field.
1 DRT	Disable Receive On Transmit  0 Receive path operates independently of transmit (i.e., full-duplex mode). Can also be used to monitor transmit activity in half-duplex mode. 1 Disable reception of frames while transmitting. (Normally used for half-duplex mode.)
0 LOOP	Internal Loopback  This is an MII internal loopback, therefore MII_MODE must be written to 1 and RMII_MODE must be written to 0.  0 Loopback disabled. 1 Transmitted frames are looped back internal to the device and transmit MII output signals are not asserted. DRT must be cleared.

## 24.5.10 Transmit Control Register (ENET\_TCR)

TCR is read/write and configures the transmit block. This register is cleared at system reset. FDEN can only be modified when ECR[ETHEREN] is cleared.

Address: 402D\_8000h base + C4h offset = 402D\_80C4h

**ENET\_TCR field descriptions**

Field	Description
31–11 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
10 Reserved	This field is reserved. This field is read/write and must be set to 0.
9 CRCFWD	Forward Frame From Application With CRC

*Table continues on the next page...*

## ENET\_TCR field descriptions (continued)

Field	Description
	<p>0 TxBD[TC] controls whether the frame has a CRC from the application.</p> <p>1 The transmitter does not append any CRC to transmitted frames, as it is expecting a frame with CRC from the application.</p>
8 ADDINS	<p>Set MAC Address On Transmit</p> <p>0 The source MAC address is not modified by the MAC.</p> <p>1 The MAC overwrites the source MAC address with the programmed MAC address according to ADDSEL.</p>
7–5 ADDSEL	<p>Source MAC Address Select On Transmit</p> <p>If ADDINS is set, indicates the MAC address that overwrites the source MAC address.</p> <p>000 Node MAC address programmed on PADDR1/2 registers.</p> <p>100 Reserved.</p> <p>101 Reserved.</p> <p>110 Reserved.</p>
4 RFC_PAUSE	<p>Receive Frame Control Pause</p> <p>This status field is set when a full-duplex flow control pause frame is received and the transmitter pauses for the duration defined in this pause frame. This field automatically clears when the pause duration is complete.</p>
3 TFC_PAUSE	<p>Transmit Frame Control Pause</p> <p>Pauses frame transmission. When this field is set, EIR[GRA] is set. With transmission of data frames stopped, the MAC transmits a MAC control PAUSE frame. Next, the MAC clears TFC_PAUSE and resumes transmitting data frames. If the transmitter pauses due to user assertion of GTS or reception of a PAUSE frame, the MAC may continue transmitting a MAC control PAUSE frame.</p> <p>0 No PAUSE frame transmitted.</p> <p>1 The MAC stops transmission of data frames after the current transmission is complete.</p>
2 FDEN	<p>Full-Duplex Enable</p> <p>If this field is set, frames transmit independent of carrier sense and collision inputs. Only modify this bit when ECR[ETHEREN] is cleared.</p>
1 Reserved	<p>This field is reserved.</p> <p>This write-only field is reserved. It must always be written with the value 0.</p>
0 GTS	<p>Graceful Transmit Stop</p> <p>When this field is set, MAC stops transmission after any frame currently transmitted is complete and EIR[GRA] is set. If frame transmission is not currently underway, the GRA interrupt is asserted immediately. After transmission finishes, clear GTS to restart. The next frame in the transmit FIFO is then transmitted. If an early collision occurs during transmission when GTS is set, transmission stops after the collision. The frame is transmitted again after GTS is cleared. There may be old frames in the transmit FIFO that transmit when GTS is reasserted. To avoid this, clear ECR[ETHEREN] following the GRA interrupt.</p>

### 24.5.11 Physical Address Lower Register (ENET\_PALR)

PALR contains the lower 32 bits (bytes 0, 1, 2, 3) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 0 through 3 of the six-byte source address field when transmitting PAUSE frames.

Address: 402D\_8000h base + E4h offset = 402D\_80E4h

#### ENET\_PALR field descriptions

Field	Description
PADDR1	Pause Address  Bytes 0 (bits 31:24), 1 (bits 23:16), 2 (bits 15:8), and 3 (bits 7:0) of the 6-byte individual address are used for exact match and the source address field in PAUSE frames.

### 24.5.12 Physical Address Upper Register (ENET\_PAUR)

PAUR contains the upper 16 bits (bytes 4 and 5) of the 48-bit address used in the address recognition process to compare with the destination address (DA) field of receive frames with an individual DA. In addition, this register is used in bytes 4 and 5 of the six-byte source address field when transmitting PAUSE frames. Bits 15:0 of PAUR contain a constant type field (0x8808) for transmission of PAUSE frames.

Address: 402D\_8000h base + E8h offset = 402D\_80E8h

#### ENET\_PAUR field descriptions

Field	Description
31-16 PADDR2	Bytes 4 (bits 31:24) and 5 (bits 23:16) of the 6-byte individual address used for exact match, and the source address field in PAUSE frames.
TYPE	Type Field In PAUSE Frames  These fields have a constant value of 0x8808.

### 24.5.13 Opcode/Pause Duration Register (ENET\_OPD)

OPD is read/write accessible. This register contains the 16-bit opcode and 16-bit pause duration fields used in transmission of a PAUSE frame. The opcode field is a constant value, 0x0001. When another node detects a PAUSE frame, that node pauses transmission for the duration specified in the pause duration field. The lower 16 bits of this register are not reset and you must initialize it.

Address: 402D\_8000h base + ECh offset = 402D\_80ECh

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	OPCODE																PAUSE_DUR															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### ENET\_OPD field descriptions

Field	Description
31–16 OPCODE	Opcode Field In PAUSE Frames These fields have a constant value of 0x0001.
PAUSE_DUR	Pause Duration Pause duration field used in PAUSE frames.

### 24.5.14 Transmit Interrupt Coalescing Register (ENET\_TXIC)

See [Interrupt coalescence](#) for more information.

Address: 402D\_8000h base + F0h offset = 402D\_80F0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
R	ICEN	ICCS	Reserved	ICFT								Reserved					
W																	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	ICTT															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

#### ENET\_TXIC field descriptions

Field	Description
31 ICEN	Interrupt Coalescing Enable

Table continues on the next page...

**ENET\_TXIC field descriptions (continued)**

Field	Description
	0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.
30 ICCS	Interrupt Coalescing Timer Clock Source Select  0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0.  This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold  This value determines the number of frames needed to be transmitted for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0.  This field is reserved.
ICTT	Interrupt coalescing timer threshold  Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after transmitting a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame transmission defined by ICFT and starts again upon transmission of the next first frame. Must be greater than zero to avoid unpredictable behavior.

**24.5.15 Receive Interrupt Coalescing Register (ENET\_RXIC)**

See [Interrupt coalescence](#) for more information.

Address: 402D\_8000h base + 100h offset = 402D\_8100h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_RXIC field descriptions**

Field	Description
31 ICEN	Interrupt Coalescing Enable  0 Disable Interrupt coalescing. 1 Enable Interrupt coalescing.

*Table continues on the next page...*

**ENET\_RXIC field descriptions (continued)**

Field	Description
30 ICCS	Interrupt Coalescing Timer Clock Source Select  0 Use MII/GMII TX clocks. 1 Use ENET system clock.
29–28 Reserved	This field must be set to 0.  This field is reserved.
27–20 ICFT	Interrupt coalescing frame count threshold  This value determines the number of frames needed to be received for raising an interrupt. Frame counter restarts after reaching this threshold value or after the expiring of the coalescing timer. Must be greater than zero to avoid unpredictable behavior.
19–16 Reserved	This field must be set to 0.  This field is reserved.
ICTT	Interrupt coalescing timer threshold  Interrupt coalescing timer threshold in units of 64 clock periods. This value determines the maximum amount of time after receiving a frame before raising an interrupt. The threshold timer is disabled after expiring or number of frame reception defined by ICFT and starts again upon reception of the next first frame. Must be greater than zero to avoid unpredictable behavior.

**24.5.16 Descriptor Individual Upper Address Register (ENET\_IAUR)**

IAUR contains the upper 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the destination address (DA) field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 402D\_8000h base + 118h offset = 402D\_8118h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R																																
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_IAUR field descriptions**

Field	Description
IADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR1 contains hash index bit 63. Bit 0 of IADDR1 contains hash index bit 32.

## 24.5.17 Descriptor Individual Lower Address Register (ENET\_IALR)

IALR contains the lower 32 bits of the 64-bit individual address hash table. The address recognition process uses this table to check for a possible match with the DA field of receive frames with an individual DA. This register is not reset and you must initialize it.

Address: 402D\_8000h base + 11Ch offset = 402D\_811Ch

### ENET\_IALR field descriptions

Field	Description
IADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a unicast address. Bit 31 of IADDR2 contains hash index bit 31. Bit 0 of IADDR2 contains hash index bit 0.

## 24.5.18 Descriptor Group Upper Address Register (ENET\_GAUR)

GAUR contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 402D\_8000h base + 120h offset = 402D\_8120h

### ENET\_GAUR field descriptions

Field	Description
GADDR1	Contains the upper 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR1 contains hash index bit 63. Bit 0 of GADDR1 contains hash index bit 32.

## 24.5.19 Descriptor Group Lower Address Register (ENET\_GALR)

GALR contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. You must initialize this register.

Address: 402D\_8000h base + 124h offset = 402D\_8124h

### ENET\_GALR field descriptions

Field	Description
GADDR2	Contains the lower 32 bits of the 64-bit hash table used in the address recognition process for receive frames with a multicast address. Bit 31 of GADDR2 contains hash index bit 31. Bit 0 of GADDR2 contains hash index bit 0.

## 24.5.20 Transmit FIFO Watermark Register (ENET\_TFWR)

If TFWR[STRFWD] is cleared, TFWR[TFWR] controls the amount of data required in the transmit FIFO before transmission of a frame can begin. This allows you to minimize transmit latency (TFWR = 00 or 01) or allow for larger bus access latency (TFWR = 11) due to contention for the system bus. Setting the watermark to a high value minimizes the risk of transmit FIFO underrun due to contention for the system bus. The byte counts associated with the TFWR field may need to be modified to match a given system requirement, for example, worst-case bus access latency by the transmit data uDMA channel.

When the FIFO level reaches the value the TFWR field and when the STR\_FWD is set to '0', the MAC transmit control logic starts frame transmission even before the end-of-frame is available in the FIFO (cut-through operation).

If a complete frame has a size smaller than the threshold programmed with TFWR, the MAC also transmits the Frame to the line.

To enable store and forward on the Transmit path, set STR\_FWD to '1'. In this case, the MAC starts to transmit data only when a complete frame is stored in the Transmit FIFO.

## Memory map/register definition

Address: 402D\_8000h base + 144h offset = 402D\_8144h

### ENET\_TFWR field descriptions

Field	Description
31–9 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
8 STRFWD	Store And Forward Enable  0 Reset. The transmission start threshold is programmed in TFWR[TFWR]. 1 Enabled.
7–6 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TFWR	Transmit FIFO Write  If TFWR[STRFWD] is cleared, this field indicates the number of bytes, in steps of 64 bytes, written to the transmit FIFO before transmission of a frame begins.  <b>NOTE:</b> If a frame with less than the threshold is written, it is still sent independently of this threshold setting. The threshold is relevant only if the frame is larger than the threshold given.  000000 64 bytes written. 000001 64 bytes written. 000010 128 bytes written. 000011 192 bytes written. ... .. 011111 1984 bytes written.

## 24.5.21 Receive Descriptor Ring Start Register (ENET\_RDSR)

RDSR points to the beginning of the circular receive buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

### NOTE

This register must be initialized prior to operation

Address: 402D\_8000h base + 180h offset = 402D\_8180h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R	R_DES_START															0
W	R_DES_START														0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_RDSR field descriptions**

Field	Description
31–3 R_DES_START	Pointer to the beginning of the receive buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

## 24.5.22 Transmit Buffer Descriptor Ring Start Register (ENET\_TDSR)

TDSR provides a pointer to the beginning of the circular transmit buffer descriptor queue in external memory. This pointer must be 64-bit aligned (bits 2–0 must be zero); however, for optimal performance the pointer should be 512-bit aligned, that is, evenly divisible by 64.

**NOTE**

This register must be initialized prior to operation.

Address: 402D\_8000h base + 184h offset = 402D\_8184h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	X_DES_START															
W	X_DES_START															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	X_DES_START															0
W	X_DES_START														0	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

**ENET\_TDSR field descriptions**

Field	Description
31–3 X_DES_START	Pointer to the beginning of the transmit buffer descriptor queue.
2 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

**24.5.23 Maximum Receive Buffer Size Register (ENET\_MRBR)**

The MRBR is a user-programmable register that dictates the maximum size of all receive buffers. This value should take into consideration that the receive CRC is always written into the last receive buffer.

- R\_BUF\_SIZE is concatenated with the four least-significant bits of this register and are used as the maximum receive buffer size.
- To allow one maximum size frame per buffer, MRBR must be set to RCR[MAX\_FL] or larger.
- To properly align the buffer, MRBR must be evenly divisible by 64. To ensure this, set the lower two bits of R\_BUF\_SIZE to zero. The lower four bits of this register are already set to zero by the device.
- To minimize bus usage (descriptor fetches), set MRBR greater than or equal to 256 bytes.

**NOTE**

This register must be initialized before operation.

Address: 402D\_8000h base + 188h offset = 402D\_8188h

**ENET\_MRBR field descriptions**

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13–4 R_BUF_SIZE	Receive buffer size in bytes. This value, concatenated with the four least-significant bits of this register (which are always zero), is the effective maximum receive buffer size.
Reserved	This field, which is always zero, is the four least-significant bits of the maximum receive buffer size.  This field is reserved. This read-only field is reserved and always has the value 0.

## 24.5.24 Receive FIFO Section Full Threshold (ENET\_RSFL)

Address: 402D\_8000h base + 190h offset = 402D\_8190h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																RX_SECTION_FULL															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RSFL field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_FULL	Value Of Receive FIFO Section Full Threshold  Value, in 64-bit words, of the receive FIFO section full threshold. Clear this field to enable store and forward on the RX FIFO. When programming a value greater than 0 (cut-through operation), it must be greater than RAEM[RX_ALMOST_EMPTY].  When the FIFO level reaches the value in this field, data is available in the Receive FIFO (cut-through operation).

## 24.5.25 Receive FIFO Section Empty Threshold (ENET\_RSEM)

Address: 402D\_8000h base + 194h offset = 402D\_8194h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0											STAT_SECTION_EMPTY				0				RX_SECTION_EMPTY												
W	0											0				0																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RSEM field descriptions

Field	Description
31–21 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
20–16 STAT_SECTION_EMPTY	RX Status FIFO Section Empty Threshold  Defines number of frames in the receive FIFO, independent of its size, that can be accepted. If the limit is reached, reception will continue normally, however a pause frame will be triggered to indicate a possible congestion to the remote device to avoid FIFO overflow. A value of 0 disables automatic pause frame generation
15–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_SECTION_EMPTY	Value Of The Receive FIFO Section Empty Threshold

Table continues on the next page...

**ENET\_RSEM field descriptions (continued)**

Field	Description
	<p>Value, in 64-bit words, of the receive FIFO section empty threshold. When the FIFO has reached this level, a pause frame will be issued.</p> <p>A value of 0 disables automatic pause frame generation.</p> <p>When the FIFO level goes below the value programmed in this field, an XON pause frame is issued to indicate the FIFO congestion is cleared to the remote Ethernet client.</p> <p><b>NOTE:</b> The section-empty threshold indications from both FIFOs are OR'ed to cause XOFF pause frame generation.</p>

**24.5.26 Receive FIFO Almost Empty Threshold (ENET\_RAEM)**

Address: 402D\_8000h base + 198h offset = 402D\_8198h

**ENET\_RAEM field descriptions**

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
RX_ALMOST_EMPTY	<p>Value Of The Receive FIFO Almost Empty Threshold</p> <p>Value, in 64-bit words, of the receive FIFO almost empty threshold. When the FIFO level reaches the value programmed in this field and the end-of-frame has not been received for the frame yet, the core receive read control stops FIFO read (and subsequently stops transferring data to the MAC client application). It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO. A minimum value of 4 should be set.</p>

**24.5.27 Receive FIFO Almost Full Threshold (ENET\_RAFL)**

Address: 402D\_8000h base + 19Ch offset = 402D\_819Ch

**ENET\_RAFL field descriptions**

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.

Table continues on the next page...

**ENET\_RAFL field descriptions (continued)**

Field	Description
RX_ALMOST_FULL	Value Of The Receive FIFO Almost Full Threshold  Value, in 64-bit words, of the receive FIFO almost full threshold. When the FIFO level comes close to the maximum, so that there is no more space for at least RX_ALMOST_FULL number of words, the MAC stops writing data in the FIFO and truncates the received frame to avoid FIFO overflow. The corresponding error status will be set when the frame is delivered to the application. A minimum value of 4 should be set.

**24.5.28 Transmit FIFO Section Empty Threshold (ENET\_TSEM)**

Address: 402D\_8000h base + 1A0h offset = 402D\_81A0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_SECTION_EMPTY															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	

**ENET\_TSEM field descriptions**

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_SECTION_EMPTY	Value Of The Transmit FIFO Section Empty Threshold  Value, in 64-bit words, of the transmit FIFO section empty threshold. See <a href="#">Transmit FIFO</a> for more information.

**24.5.29 Transmit FIFO Almost Empty Threshold (ENET\_TAEM)**

Address: 402D\_8000h base + 1A4h offset = 402D\_81A4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TX_ALMOST_EMPTY															
W	0																0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	

**ENET\_TAEM field descriptions**

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_EMPTY	Value of Transmit FIFO Almost Empty Threshold  Value, in 64-bit words, of the transmit FIFO almost empty threshold.

*Table continues on the next page...*

### ENET\_TAEM field descriptions (continued)

Field	Description
	When the FIFO level reaches the value programmed in this field, and no end-of-frame is available for the frame, the MAC transmit logic, to avoid FIFO underflow, stops reading the FIFO and transmits a frame with an MII error indication. See <a href="#">Transmit FIFO</a> for more information.  A minimum value of 4 should be set.

## 24.5.30 Transmit FIFO Almost Full Threshold (ENET\_TAFL)

Address: 402D\_8000h base + 1A8h offset = 402D\_81A8h

### ENET\_TAFL field descriptions

Field	Description
31–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TX_ALMOST_FULL	Value Of The Transmit FIFO Almost Full Threshold  Value, in 64-bit words, of the transmit FIFO almost full threshold. A minimum value of six is required . A recommended value of at least 8 should be set allowing a latency of two clock cycles to the application. If more latency is required the value can be increased as necessary (latency = TAFL - 5).  When the FIFO level comes close to the maximum, so that there is no more space for at least TX_ALMOST_FULL number of words, the pin ff_tx_rdy is deasserted. If the application does not react on this signal, the FIFO write control logic, to avoid FIFO overflow, truncates the current frame and sets the error status. As a result, the frame will be transmitted with an GMII/MII error indication. See <a href="#">Transmit FIFO</a> for more information.  <b>NOTE:</b> A FIFO overflow is a fatal error and requires a global reset on the transmit datapath or at least deassertion of ETHEREN.

## 24.5.31 Transmit Inter-Packet Gap (ENET\_TIPG)

Address: 402D\_8000h base + 1ACh offset = 402D\_81ACh

### ENET\_TIPG field descriptions

Field	Description
31–5 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
IPG	Transmit Inter-Packet Gap  Indicates the IPG, in bytes, between transmitted frames. Valid values range from 8 to 26. If the written value is less than 8 or greater than 26, the internal (effective) IPG is 12.  <b>NOTE:</b> The IPG value read will be the value that was written, even if it is out of range.

### 24.5.32 Frame Truncation Length (ENET\_FTRL)

Address: 402D\_8000h base + 1B0h offset = 402D\_81B0h

### ENET\_FTRL field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TRUNC_FL	Frame Truncation Length  Indicates the value a receive frame is truncated, if it is greater than this value. Must be greater than or equal to RCR[MAX_FL].  <b>NOTE:</b> Truncation happens at TRUNC_FL. However, when truncation occurs, the application (FIFO) may receive less data, guaranteeing that it never receives more than the set limit.

### 24.5.33 Transmit Accelerator Function Configuration (ENET\_TACC)

TACC controls accelerator actions when sending frames. The register can be changed before or after each frame, but it must remain unmodified during frame writes into the transmit FIFO.

The TFWR[STRFWD] field must be set to use the checksum feature.

## Memory map/register definition

Address: 402D\_8000h base + 1C0h offset = 402D\_81C0h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	[Reserved]															
W	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	[Reserved]											PROCHK	IPCHK	[Reserved]	SHIFT16	
W	0											PROCHK	IPCHK	0	SHIFT16	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_TACC field descriptions

Field	Description
31–5 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
4 PROCHK	Enables insertion of protocol checksum.  0 Checksum not inserted. 1 If an IP frame with a known protocol is transmitted, the checksum is inserted automatically into the frame. The checksum field must be cleared. The other frames are not modified.
3 IPCHK	Enables insertion of IP header checksum.  0 Checksum is not inserted. 1 If an IP frame is transmitted, the checksum is inserted automatically. The IP header checksum field must be cleared. If a non-IP frame is transmitted the frame is not modified.
2–1 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
0 SHIFT16	TX FIFO Shift-16  0 Disabled. 1 Indicates to the transmit data FIFO that the written frames contain two additional octets before the frame data. This means the actual frame begins at bit 16 of the first word written into the FIFO. This function allows putting the frame payload on a 32-bit boundary in memory, as the 14-byte Ethernet header is extended to a 16-byte header.

## 24.5.34 Receive Accelerator Function Configuration (ENET\_RACC)

Address: 402D\_8000h base + 1C4h offset = 402D\_81C4h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

W	0															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R									SHIFT16	LINEDIS				PRODIS	IPDIS	PADREM
W	0								SHIFT16	LINEDIS	0			PRODIS	IPDIS	PADREM
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RACC field descriptions

Field	Description
31–8 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
7 SHIFT16	RX FIFO Shift-16  When this field is set, the actual frame data starts at bit 16 of the first word read from the RX FIFO aligning the Ethernet payload on a 32-bit boundary.  <b>NOTE:</b> This function only affects the FIFO storage and has no influence on the statistics, which use the actual length of the frame received.  0 Disabled. 1 Instructs the MAC to write two additional bytes in front of each frame received into the RX FIFO.
6 LINEDIS	Enable Discard Of Frames With MAC Layer Errors  0 Frames with errors are not discarded. 1 Any frame received with a CRC, length, or PHY error is automatically discarded and not forwarded to the user application interface.
5–3 Reserved	This field is reserved. This write-only field is reserved. It must always be written with the value 0.
2 PRODIS	Enable Discard Of Frames With Wrong Protocol Checksum  0 Frames with wrong checksum are not discarded. 1 If a TCP/IP, UDP/IP, or ICMP/IP frame is received that has a wrong TCP, UDP, or ICMP checksum, the frame is discarded. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
1 IPDIS	Enable Discard Of Frames With Wrong IPv4 Header Checksum

Table continues on the next page...

### ENET\_RACC field descriptions (continued)

Field	Description
	0 Frames with wrong IPv4 header checksum are not discarded. 1 If an IPv4 frame is received with a mismatching header checksum, the frame is discarded. IPv6 has no header checksum and is not affected by this setting. Discarding is only available when the RX FIFO operates in store and forward mode (RSFL cleared).
0 PADREM	Enable Padding Removal For Short IP Frames  0 Padding not removed. 1 Any bytes following the IP payload section of the frame are removed from the frame.

### 24.5.35 Reserved Statistic Register (ENET\_RMON\_T\_DROP)

Address: 402D\_8000h base + 200h offset = 402D\_8200h

#### ENET\_RMON\_T\_DROP field descriptions

Field	Description
Reserved	This read-only field always has the value 0.  This field is reserved.

### 24.5.36 Tx Packet Count Statistic Register (ENET\_RMON\_T\_PACKETS)

Address: 402D\_8000h base + 204h offset = 402D\_8204h

#### ENET\_RMON\_T\_PACKETS field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Packet count  Transmit packet count

## 24.5.37 Tx Broadcast Packets Statistic Register (ENET\_RMON\_T\_BC\_PKT)

### RMON Tx Broadcast Packets

Address: 402D\_8000h base + 208h offset = 402D\_8208h

### ENET\_RMON\_T\_FRAG field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of packets less than 64 bytes with bad CRC

### 24.5.43 Tx Packets Greater Than MAX\_FL bytes and Bad CRC Statistic Register (ENET\_RMON\_T\_JAB)

Address: 402D\_8000h base + 220h offset = 402D\_8220h

#### ENET\_RMON\_T\_JAB field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of transmit packets greater than MAX_FL bytes and bad CRC

### 24.5.44 Tx Collision Count Statistic Register (ENET\_RMON\_T\_COL)

Address: 402D\_8000h base + 224h offset = 402D\_8224h

#### ENET\_RMON\_T\_COL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of transmit collisions

## 24.5.45 Tx 64-Byte Packets Statistic Register (ENET\_RMON\_T\_P64)

Address: 402D\_8000h base + 228h offset = 402D\_8228h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_T\_P64 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 64-byte transmit packets

## 24.5.46 Tx 65- to 127-byte Packets Statistic Register (ENET\_RMON\_T\_P65TO127)

Address: 402D\_8000h base + 22Ch offset = 402D\_822Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																TXPKTS															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_T\_P65TO127 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 65- to 127-byte transmit packets

### 24.5.47 Tx 128- to 255-byte Packets Statistic Register (ENET\_RMON\_T\_P128TO255)

Address: 402D\_8000h base + 230h offset = 402D\_8230h

#### ENET\_RMON\_T\_P128TO255 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 128- to 255-byte transmit packets

### 24.5.48 Tx 256- to 511-byte Packets Statistic Register (ENET\_RMON\_T\_P256TO511)

Address: 402D\_8000h base + 234h offset = 402D\_8234h

#### ENET\_RMON\_T\_P256TO511 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of 256- to 511-byte transmit packets

### 24.5.51 Tx Packets Greater Than 2048 Bytes Statistic Register (ENET\_RMON\_T\_P\_GTE2048)

Address: 402D\_8000h base + 240h offset = 402D\_8240h

#### ENET\_RMON\_T\_P\_GTE2048 field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
TXPKTS	Number of transmit packets greater than 2048 bytes

### 24.5.52 Tx Octets Statistic Register (ENET\_RMON\_T\_OCTETS)

Address: 402D\_8000h base + 244h offset = 402D\_8244h

#### ENET\_RMON\_T\_OCTETS field descriptions

Field	Description
TXOCTS	Number of transmit octets

### 24.5.53 Reserved Statistic Register (ENET\_IEEE\_T\_DROP)

Address: 402D\_8000h base + 248h offset = 402D\_8248h

## ENET\_IEEE\_T\_DROP field descriptions

Field	Description
Reserved	This read-only field always has the value 0.  This field is reserved.

### 24.5.54 Frames Transmitted OK Statistic Register (ENET\_IEEE\_T\_FRAME\_OK)

Address: 402D\_8000h base + 24Ch offset = 402D\_824Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ENET\_IEEE\_T\_1COL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with one collision

### 24.5.56 Frames Transmitted with Multiple Collisions Statistic Register (ENET\_IEEE\_T\_MCOL)

Address: 402D\_8000h base + 254h offset = 402D\_8254h

#### ENET\_IEEE\_T\_MCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with multiple collisions

### 24.5.57 Frames Transmitted after Deferral Delay Statistic Register (ENET\_IEEE\_T\_DEF)

Address: 402D\_8000h base + 258h offset = 402D\_8258h

#### ENET\_IEEE\_T\_DEF field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with deferral delay

## 24.5.58 Frames Transmitted with Late Collision Statistic Register (ENET\_IEEE\_T\_LCOL)

Address: 402D\_8000h base + 25Ch offset = 402D\_825Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_T\_LCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with late collision

## 24.5.59 Frames Transmitted with Excessive Collisions Statistic Register (ENET\_IEEE\_T\_EXCOL)

Address: 402D\_8000h base + 260h offset = 402D\_8260h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_IEEE\_T\_EXCOL field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with excessive collisions

### 24.5.60 Frames Transmitted with Tx FIFO Underrun Statistic Register (ENET\_IEEE\_T\_MACERR)

Address: 402D\_8000h base + 264h offset = 402D\_8264h

#### ENET\_IEEE\_T\_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with transmit FIFO underrun

### 24.5.61 Frames Transmitted with Carrier Sense Error Statistic Register (ENET\_IEEE\_T\_CSERR)

Address: 402D\_8000h base + 268h offset = 402D\_8268h

#### ENET\_IEEE\_T\_CSERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames transmitted with carrier sense error

### 24.5.62 Reserved Statistic Register (ENET\_IEEE\_T\_SQE)

Address: 402D\_8000h base + 26Ch offset = 402D\_826Ch

## ENET\_IEEE\_T\_SQE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	This read-only field is reserved and always has the value 0.  <b>NOTE:</b> Counter not implemented as no SQE information is available.

### 24.5.63 Flow Control Pause Frames Transmitted Statistic Register (ENET\_IEEE\_T\_FDXFC)

Address: 402D\_8000h base + 270h offset = 402D\_8270h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

## ENET\_IEEE\_T\_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames transmitted

### 24.5.64 Octet Count for Frames Transmitted w/o Error Statistic Register (ENET\_IEEE\_T\_OCTETS\_OK)

Address: 402D\_8000h base + 274h offset = 402D\_8274h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	COUNT																															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

## ENET\_IEEE\_T\_OCTETS\_OK field descriptions

Field	Description
COUNT	Octet count for frames transmitted without error  <b>NOTE</b> Counts total octets (includes header and FCS fields).

### 24.5.65 Rx Packet Count Statistic Register (ENET\_RMON\_R\_PACKETS)

Address: 402D\_8000h base + 284h offset = 402D\_8284h

#### ENET\_RMON\_R\_PACKETS field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of packets received

### 24.5.66 Rx Broadcast Packets Statistic Register (ENET\_RMON\_R\_BC\_PKT)

Address: 402D\_8000h base + 288h offset = 402D\_8288h

#### ENET\_RMON\_R\_BC\_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive broadcast packets

## 24.5.67 Rx Multicast Packets Statistic Register (ENET\_RMON\_R\_MC\_PKT)

Address: 402D\_8000h base + 28Ch offset = 402D\_828Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_R\_MC\_PKT field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive multicast packets

## 24.5.68 Rx Packets with CRC/Align Error Statistic Register (ENET\_RMON\_R\_CRC\_ALIGN)

Address: 402D\_8000h base + 290h offset = 402D\_8290h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																COUNT															
W	[Shaded]																															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### ENET\_RMON\_R\_CRC\_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with CRC or align error

### 24.5.69 Rx Packets with Less Than 64 Bytes and Good CRC Statistic Register (ENET\_RMON\_R\_UNDERSIZE)

Address: 402D\_8000h base + 294h offset = 402D\_8294h

#### ENET\_RMON\_R\_UNDERSIZE field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of receive packets with less than 64 bytes and good CRC

### ENET\_IEEE\_R\_ALIGN field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of frames received with alignment error

### 24.5.86 Receive FIFO Overflow Count Statistic Register (ENET\_IEEE\_R\_MACERR)

Address: 402D\_8000h base + 2D8h offset = 402D\_82D8h

#### ENET\_IEEE\_R\_MACERR field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Receive FIFO overflow count

### 24.5.87 Flow Control Pause Frames Received Statistic Register (ENET\_IEEE\_R\_FDXFC)

Address: 402D\_8000h base + 2DCh offset = 402D\_82DCh

#### ENET\_IEEE\_R\_FDXFC field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
COUNT	Number of flow-control pause frames received

## 24.5.88 Octet Count for Frames Received without Error Statistic Register (ENET\_IEEE\_R\_OCTETS\_OK)

Address: 402D\_8000h base + 2E0h offset = 402D\_82E0h

### ENET\_IEEE\_R\_OCTETS\_OK field descriptions

Field	Description
COUNT	Number of octets for frames received without error  <b>NOTE:</b> Counts total octets (includes header and FCS fields). Does not increment for the broadcast frames when broadcast reject is enabled and promiscuous mode is disabled within the receive control register (RCR).

## 24.5.89 Adjustable Timer Control Register (ENET\_ATCR)

ATCR command fields can trigger the corresponding events directly. It is not necessary to preserve any of the configuration fields when a command field is set in the register, that is, no read-modify-write is required.

### NOTE

The CAPTURE and RESTART fields and bits 12 and 10 must be 0 in order to write to the other fields in this register.

Address: 402D\_8000h base + 400h offset = 402D\_8400h

## ENET\_ATCR field descriptions

Field	Description
31–14 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
13 SLAVE	Enable Timer Slave Mode  0 The timer is active and all configuration fields in this register are relevant. 1 The internal timer is disabled and the externally provided timer value is used. All other fields, except CAPTURE, in this register have no effect. CAPTURE can still be used to capture the current timer value.
12 Reserved	This field is reserved. Always write 0 to this field.
11 CAPTURE	Capture Timer Value  When this field is set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes.  0 No effect. 1 The current time is captured and can be read from the ATVR register.
10 Reserved	This field is reserved. Always write 0 to this field.
9 RESTART	Reset Timer  Resets the timer to zero. This has no effect on the counter enable. If the counter is enabled when this field is set, the timer is reset to zero and starts counting from there. When set, all other fields are ignored during a write. This field automatically clears to 0 after the command completes. RESTART should be used when the timer is enabled.
8 Reserved	This field is reserved.
7 PINPER	Enables event signal output assertion on period event.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.  0 Disable. 1 Enable.
6 Reserved	This field is reserved.
5 Reserved	This field is reserved.  <b>NOTE:</b> This field must be written always with one.
4 PEREN	Enable Periodical Event  0 Disable. 1 A period event interrupt can be generated (EIR[TS_TIMER]) and the event signal output is asserted when the timer wraps around according to the periodic setting ATPER. The timer period value must be set before setting this bit.  <b>NOTE:</b> Not all devices contain the event signal output. See the chip configuration details.
3 OFFRST	Reset Timer On Offset Event  0 The timer is not affected and no action occurs, besides clearing OFFEN, when the offset is reached. 1 If OFFEN is set, the timer resets to zero when the offset setting is reached. The offset event does not cause a timer interrupt.

Table continues on the next page...

## 24.5.92 Timer Period Register (ENET\_ATPER)

Address: 402D\_8000h base + 40Ch offset = 402D\_840Ch

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENET\_ATPER field descriptions

Field	Description
PERIOD	<p>Value for generating periodic events. Each instance the timer reaches this value, the period event occurs and the timer restarts. If the increment value in ATINC is given in true nanoseconds, this value is also given in true nanoseconds. The value should be initialized to 1,000,000,000 (1×10<sup>9</sup>) to represent a timer wrap around of one second. The increment value set in ATINC should be set to the true nanoseconds of the period of clock ts_clk, hence implementing a true 1 second counter.</p> <p><b>NOTE:</b> The value of PERIOD has the following constraint:  <math>2^{32} - \text{ENET\_ATINC}[\text{INC\_COR}] - 3 \times \text{ENET\_ATINC}[\text{INC}] \geq \text{PERIOD} &gt; 0.</math></p>

## 24.5.93 Timer Correction Register (ENET\_ATCOR)

Address: 402D\_8000h base + 410h offset = 402D\_8410h

### ENET\_ATINC field descriptions

Field	Description
31–15 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
14–8 INC_CORR	Correction Increment Value  This value is added every time the correction timer expires (every clock cycle given in ATCOR). A value less than INC slows down the timer. A value greater than INC speeds up the timer.
7 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
INC	Clock Period Of The Timestamping Clock (ts_clk) In Nanoseconds  The timer increments by this amount each clock cycle. For example, set to 10 for 100 MHz, 8 for 125 MHz, 5 for 200 MHz.  <b>NOTE:</b> For highest precision, use a value that is an integer fraction of the period set in ATPER.

## 24.5.95 Timestamp of Last Transmitted Frame (ENET\_ATSTMP)

Address: 402D\_8000h base + 418h offset = 402D\_8418h

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

### ENET\_TCSRn field descriptions

Field	Description
31–16 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
15–11 TPWC	<p>Timer PulseWidth Control</p> <p>Specifies the pulse width associated with TMODE values of 1110 or 11X1. Updating this field takes a few cycles to register because it is synchronized to the 1588 clock. When changing this field:</p> <ol style="list-style-type: none"> <li>1. Always disable the channel and read the TMODE field to verify that the channel is disabled.</li> <li>2. Set TPWC to the desired value.</li> <li>3. Reenable the channel.</li> </ol> <p>00000 Pulse width is one 1588-clock cycle.            00001 Pulse width is two 1588-clock cycles.            00010 Pulse width is three 1588-clock cycles.            00011 Pulse width is four 1588-clock cycles.            ... ..            11111 Pulse width is 32 1588-clock cycles.</p>
10–8 Reserved	This field is reserved. This read-only field is reserved and always has the value 0.
7 TF	<p>Timer Flag</p> <p>Sets when input capture or output compare occurs. This flag is double buffered between the module clock and 1588 clock domains. When this field is 1, it can be cleared to 0 by writing 1 to it.</p> <p>0 Input Capture or Output Compare has not occurred.            1 Input Capture or Output Compare has occurred.</p>
6 TIE	<p>Timer Interrupt Enable</p> <p>0 Interrupt is disabled            1 Interrupt is enabled</p>
5–2 TMODE	Timer Mode

Table continues on the next page...

**ENET\_TCSRn field descriptions (continued)**

Field	Description
	<p>Updating the Timer Mode field takes a few cycles to register because it is synchronized to the 1588 clock. The version of Timer Mode returned on a read is from the 1588 clock domain. When changing Timer Mode, always disable the channel and read this register to verify the channel is disabled first.</p> <p>0000 Timer Channel is disabled.</p> <p>0001 Timer Channel is configured for Input Capture on rising edge.</p> <p>0010 Timer Channel is configured for Input Capture on falling edge.</p> <p>0011 Timer Channel is configured for Input Capture on both edges.</p> <p>0100 Timer Channel is configured for Output Compare - software only.</p> <p>0101 Timer Channel is configured for Output Compare - toggle output on compare.</p> <p>0110 Timer Channel is configured for Output Compare - clear output on compare.</p> <p>0111 Timer Channel is configured for Output Compare - set output on compare.</p> <p>1000 Reserved</p> <p>1010 Timer Channel is configured for Output Compare - clear output on compare, set output on overflow.</p> <p>10X1 Timer Channel is configured for Output Compare - set output on compare, clear output on overflow.</p> <p>110X Reserved</p> <p>1110 Timer Channel is configured for Output Compare - pulse output low on compare for 1 to 32 1588-clock cycles as specified by TPWC.</p> <p>1111 Timer Channel is configured for Output Compare - pulse output high on compare for 1 to 32 1588-clock cycles as specified by TPWC.</p>
1 Reserved	<p>This field is reserved.</p> <p>This read-only field is reserved and always has the value 0.</p>
0 TDRE	<p>Timer DMA Request Enable</p> <p>0 DMA request is disabled</p> <p>1 DMA request is enabled</p>

**24.5.98 Timer Compare Capture Register (ENET\_TCCRn)**

Address: 402D\_8000h base + 60Ch offset + (8d × i), where i=0d to 3d

**ENET\_TCCRn field descriptions**

Field	Description
TCC	<p>Timer Capture Compare</p> <p>This register is double buffered between the module clock and 1588 clock domains.</p> <p>When configured for compare, the 1588 clock domain updates with the value in the module clock domain whenever the Timer Channel is first enabled and on each subsequent compare. Write to this register with the first compare value before enabling the Timer Channel. When the Timer Channel is enabled, write the second compare value either immediately, or at least before the first compare occurs. After each compare, write the next compare value before the previous compare occurs and before clearing the Timer Flag.</p>

**ENET\_TCCR<sub>n</sub> field descriptions (continued)**

Field	Description
	<p>The compare occurs one 1588 clock cycle after the IEEE 1588 Counter increments past the compare value in the 1588 clock domain. If the compare value is less than the value of the 1588 Counter when the Timer Channel is first enabled, then the compare does not occur until following the next overflow of the 1588 Counter. If the compare value is greater than the IEEE 1588 Counter when the 1588 Counter overflows, or the compare value is less than the value of the IEEE 1588 Counter after the overflow, then the compare occurs one 1588 clock cycle following the overflow.</p> <p>When configured for capture, the value of the IEEE 1588 Counter is captured into the 1588 clock domain and then updated into the module clock domain, provided the Timer Flag is clear. Always read the capture value before clearing the Timer Flag.</p>

## 24.6 Functional description

This section provides a complete functional description of the MAC-NET core.

### 24.6.1 Ethernet MAC frame formats

The IEEE 802.3 standard defines the Ethernet frame format as follows:

- Minimum length of 64 bytes
- Maximum length of 1518 bytes excluding the preamble and the start frame delimiter (SFD) bytes

An Ethernet frame consists of the following fields:

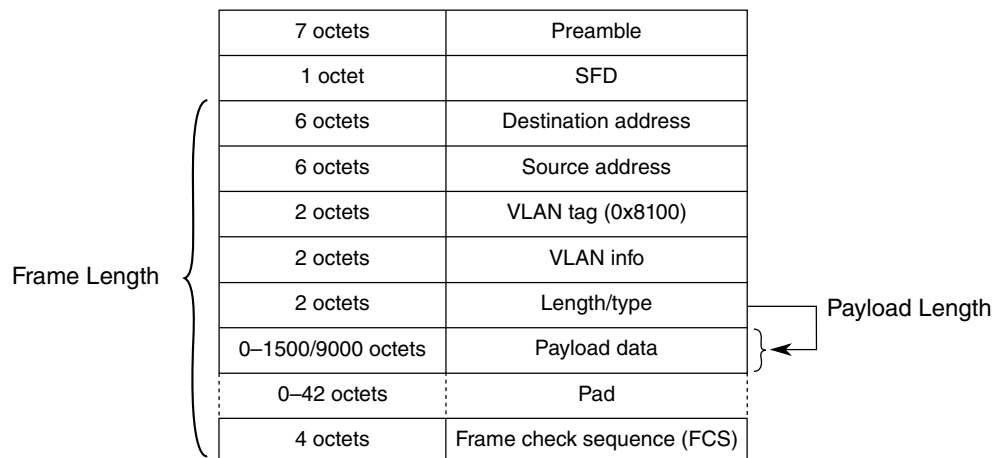

- Seven bytes preamble
- Start frame delimiter (SFD)
- Two address fields
- Length or type field
- Data field
- Frame check sequence (CRC value)

## Functional description

**Figure 24-2. MAC frame format overview**

Optionally, MAC frames can be VLAN-tagged with an additional four-byte field inserted between the MAC source address and the type/length field. VLAN tagging is defined by the IEEE P802.1q specification. VLAN-tagged frames have a maximum length of 1522 bytes, excluding the preamble and the SFD bytes.

**Figure 24-3. VLAN-tagged MAC frame format overview**

**Table 24-4. MAC frame definition**

Term	Description
Frame length	Defines the length, in octets, of the complete frame without preamble and SFD. A frame has a valid length if it contains at least 64 octets and does not exceed the programmed maximum length.
Payload length	The length/type field indicates the length of the frame's payload section. The most significant byte is sent/received first. <ul style="list-style-type: none"> <li>If the length/type field is set to a value less than 46, the payload is padded so that the minimum frame length requirement (64 bytes) is met. For VLAN-tagged frames, a value less than 42 indicates a padded frame.</li> <li>If the length/type field is set to a value larger than the programmed frame maximum length (e.g. 1518) it is interpreted as a type field.</li> </ul>
Destination and source address	48-bit MAC addresses. The least significant byte is sent/received first and the first two least significant bits of the MAC address distinguish MAC frames, as detailed in <a href="#">MAC address check</a> .

## Note

Although the IEEE specification defines a maximum frame length, the MAC core provides the flexibility to program any value for the frame maximum length.

### 24.6.1.1 Pause Frames

The receiving device generates a pause frame to indicate a congestion to the emitting device, which should stop sending data.

Pause frames are indicated by the length/type set to 0x8808. The two first bytes of a pause frame following the type, defines a 16-bit opcode field set to 0x0001 always. A 16-bit pause quanta is defined in the frame payload bytes 2 (P1) and 3 (P2) as defined in the following table. The P1 pause quanta byte is the most significant.

**Table 24-5. Pause Frame Format (Values in Hex)**

1	2	3	4	5	6	7	8	9	10	11	12	13	14
55	55	55	55	55	55	55	D5	01	80	C2	00	00	01
Preamble							SFD	Multicast Destination Address					
15	16	17	18	19	20	21	22	23	24	25	26	27–68	
00	00	00	00	00	00	88	08	00	01	hi	lo	00	
Source Address						Type		Opcode		P1	P2	pad (42)	
69	70	71	72										
26	6B	AE	0A										
CRC-32													

There is no payload length field found within a pause frame and a pause frame is always padded with 42 bytes (0x00).

If a pause frame with a pause value greater than zero (XOFF condition) is received, the MAC stops transmitting data as soon the current frame transfer is completed. The MAC stops transmitting data for the value defined in pause quanta. One pause quanta fraction refers to 512 bit times.

If a pause frame with a pause value of zero (XON condition) is received, the transmitter is allowed to send data immediately (see [Full-duplex flow control operation](#) for details).

### 24.6.1.2 Magic packets

A magic packet is a unicast, multicast, or broadcast packet, which carries a defined sequence in the payload section.

Magic packets are received and inspected only under specific conditions as described in [Magic packet detection](#).

The defined sequence to decode a magic packet is formed with a synchronization stream which consists of six consecutive 0xFF bytes, and is followed by sequence of sixteen consecutive unicast MAC addresses of the node to be awakened.

This sequence can be located anywhere in the magic packet payload. The magic packet is formed with a standard Ethernet header, optional padding, and CRC.

## 24.6.2 IP and higher layers frame format

The following sections use the term datagram to describe the protocol specific data unit that is found within the payload section of its container entity.

For example, an IP datagram specifies the payload section of an Ethernet frame. A TCP datagram specifies the payload section within an IP datagram.

### 24.6.2.1 Ethernet types

IP datagrams are carried in the payload section of an Ethernet frame. The Ethernet frame type/length field discriminates several datagram types.

The following table lists the types of interest:

**Table 24-6. Ethernet type value examples**

Type	Description
0x8100	VLAN-tagged frame. The actual type is found 4 octets later in the frame.
0x0800	IPv4
0x0806	ARP
0x86DD	IPv6

### 24.6.2.2 IPv4 datagram format

The following figure shows the IP Version 4 (IPv4) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words. The first byte sent/received is the leftmost byte of the first word (in other words, version/IHL field).

The IP header can contain further options, which are always padded if necessary to guarantee the payload following the header is aligned to a 32-bit boundary.

The IP header is immediately followed by the payload, which can contain further protocol headers (for example, TCP or UDP, as indicated by the protocol field value). The complete IP datagram is transported in the payload section of an Ethernet frame.

**Table 24-7. IPv4 header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Version				IHL				TOS				Length																			
Fragment ID								Flags				Fragment offset																			
TTL				Protocol				Header checksum																							
Source address																Destination address															
Options																															

**Table 24-8. IPv4 header fields**

Field name	Description
Version	4-bit IP version information. 0x4 for IPv4 frames.
IHL	4-bit Internet header length information. Determines number of 32-bit words found within the IP header. If no options are present, the default value is 0x5.
TOS	Type of service/DiffServ field.
Length	Total length of the datagram in bytes, including all octets of header and payload.
Fragment ID, flags, fragment offset	Fields used for IP fragmentation.
TTL	Time-to-live. In effect, is decremented at each router arrival. If zero, datagram must be discarded.
Protocol	Identifier of protocol that follows in the datagram.
Header checksum	Checksum of IP header. For computational purposes, this field's value is zero.
Source address	Source IP address.
Destination address	Destination IP address.

### 24.6.2.3 IPv6 datagram format

The following figure shows the IP version 6 (IPv6) header, which is located at the beginning of an IP datagram. It is organized in 32-bit words and has a fixed length of ten words (40 bytes). The next header field identifies the type of the header that follows the IPv6 header. It is defined similar to the protocol identifier within IPv4, with new definitions for identifying extension headers. These headers can be inserted between the IPv6 header and the protocol header, which will shift the protocol header accordingly. The accelerator currently only supports IPv6 without extension headers (in other words, the next header specifies TCP, UDP, or IMCP).

## Functional description

The first byte sent/received is the leftmost byte of the first word (in other words, version/traffic class fields).

**Figure 24-4. IPv6 header format**

**Table 24-9. IPv6 header fields**

Field name	Description
Version	4-bit IP version information. 0x6 for all IPv6 frames.
Traffic class	8-bit field defining the traffic class.
Flow label	20-bit flow label identifying frames of the same flow.
Payload length	16-bit length of the datagram payload in bytes. It includes all octets following the IPv6 header.
Next header	Identifies the header that follows the IPv6 header. This can be the protocol header or any IPv6 defined extension header.
Hop limit	Hop counter, decremented by one by each station that forwards the frame. If hop limit is 0 the frame must be discarded.
Source address	128-bit IPv6 source address.
Destination address	128-bit IPv6 destination address.

### 24.6.2.4 Internet Control Message Protocol (ICMP) datagram format

An internet control message protocol (ICMP) is found following the IP header, if the protocol identifier is 1. The ICMP datagram has a four-octet header followed by additional message data.

**Table 24-10. ICMP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Type				Code								Checksum																			
ICMP message data																															

**Table 24-11. IP header fields**

Field name	Description
Type	8-bit type information
Code	8-bit code that is related to the message type
Checksum	16-bit one's complement checksum over the complete ICMP datagram

### 24.6.2.5 User Datagram Protocol (UDP) datagram format

A user datagram protocol header is found after the IP header, when the protocol identifier is 17.

The payload of the datagram is after the UDP header. The header byte order follows the conventions given for the IP header above.

**Table 24-12. UDP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source port																Destination port															
Length																Checksum															

**Table 24-13. UDP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Length	Length of user data which immediately follows the header, including the UDP header (that is, minimum value is 8)
Checksum	Checksum over the complete datagram and some IP header information

### 24.6.2.6 TCP datagram format

A TCP header is found following the IP header, when the protocol identifier has a value of 6.

The TCP payload immediately follows the TCP header.

**Table 24-14. TCP header format**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source port																Destination port															

*Table continues on the next page...*

**Table 24-14. TCP header format (continued)**

Sequence number			
Acknowledgement number			
Offset	Reserved	Flags	Window
Checksum		Urgent pointer	
Options			

**Table 24-15. TCP header fields**

Field name	Description
Source port	Source application port
Destination port	Destination application port
Sequence number	Transmit sequence number
Ack. number	Receive sequence number
Offset	Data offset, which is number of 32-bit words within TCP header — if no options selected, defaults to value of 5
Flags	URG, ACK, PSH, RST, SYN, FIN flags
Window	TCP receive window size information
Checksum	Checksum over the complete datagram (TCP header and data) and IP header information
Options	Additional 32-bit words for protocol options

### 24.6.3 IEEE 1588 message formats

The following sections describe the IEEE 1588 message formats.

#### 24.6.3.1 Transport encapsulation

The precision time protocol (PTP) datagrams are encapsulated in Ethernet frames using the UDP/IP transport mechanism, or optionally, with the newer 1588v2 directly in Ethernet frames (layer 2).

Typically, multicast addresses are used to allow efficient distribution of the synchronization messages.

##### 24.6.3.1.1 UDP/IP

The 1588 messages (v1 and v2) can be transported using UDP/IP multicast messages.

Table 24-16 shows IP multicast groups defined for PTP. The table also shows their respective MAC layer multicast address mapping according to RFC 1112 (last three octets of IP follow the fixed value of 01-00-5E).

**Table 24-16. UDP/IP multicast domains**

Name	IP Address	MAC Address mapping
DefaultPTPdomain	224.0.1.129	01-00-5E-00-01-81
AlternatePTPdomain1	224.0.1.130	01-00-5E-00-01-82
AlternatePTPdomain2	224.0.1.131	01-00-5E-00-01-83
AlternatePTPdomain3	224.0.1.132	01-00-5E-00-01-84

**Table 24-17. UDP port numbers**

Message type	UDP port	Note
Event	319	Used for SYNC and DELAY_REQUEST messages
General	320	All other messages (for example, follow-up, delay-response)

### 24.6.3.1.2 Native Ethernet (PTPv2)

In addition to using UDP/IP frames, IEEE 1588v2 defines a native Ethernet frame format that uses ethertype = 0x88F7. The payload of the Ethernet frame immediately contains the PTP datagram, starting with the PTPv2 header.

Besides others, version 2 adds a peer delay mechanism to allow delay measurements between individual point-to-point links along a path over multiple nodes. The following multicast domains are also defined in PTPv2.

**Table 24-18. PTPv2 multicast domains**

Name	MAC address
Normal messages	01-1B-19-00-00-00
Peer delay messages	01-80-C2-00-00-0E

### 24.6.3.2 PTP header

All PTP frames contain a common header that determines the protocol version and the type of message, which defines the remaining content of the message.

All multi-octet fields are transmitted in big-endian order (the most significant byte is transmitted/received first).

## Functional description

The last four bits of versionPTP are at the same position (second byte) for PTPv1 and PTPv2 headers. This allows accurate identification by inspecting the first two bytes of the message.

### 24.6.3.2.1 PTPv1 header

Table 24-19. Common PTPv1 message header

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	2	versionPTP = 0x0001							
2	2	versionNetwork							
4	16	subdomain							
20	1	messageType							
21	1	sourceCommunicationTechnology							
22	6	sourceUuid							
28	2	sourcePortId							
30	2	sequenceId							
32	1	control							
33	1	0x00							
34	2	flags							
36	4	reserved							

The type of message is encoded in the messageType and control fields as shown in [Table 24-20](#) :

Table 24-20. PTPv1 message type identification

messageType	control	Message Name	Message
0x01	0x0	SYNC	Event message
0x01	0x1	DELAY_REQ	Event message
0x02	0x2	FOLLOW_UP	General message
0x02	0x3	DELAY_RESP	General message
0x02	0x4	MANAGEMENT	General message
other	other	—	Reserved

The field sequenceId is used to non-ambiguously identify a message.

### 24.6.3.2.2 PTPv2 header

**Table 24-21. Common PTPv2 message header**

Offset	Octets	Bits							
		7	6	5	4	3	2	1	0
0	1	transportSpecific				messageId			
1	1	reserved				versionPTP = 0x2			
2	2	messageLength							
4	1	domainNumber							
5	1	reserved							
6	2	flags							
8	8	correctionField							
16	4	reserved							
20	10	sourcePortIdentity							
30	2	sequenceId							
32	1	control							
33	1	logMeanMessageInterval							

The type of message is encoded in the field messageId as follows:

**Table 24-22. PTPv2 message type identification**

messageId	Message name	Message
0x0	SYNC	Event message
0x1	DELAY_REQ	Event message
0x2	PATH_DELAY_REQ	Event message
0x3	PATH_DELAY_RESP	Event message
0x4–0x7	—	Reserved
0x8	FOLLOW_UP	General message
0x9	DELAY_RESP	General message
0xa	PATH_DELAY_FOLLOW_UP	General message
0xb	ANNOUNCE	General message
0xc	SIGNALING	General message
0xd	MANAGEMENT	General message

The PTPv2 flags field contains further details on the type of message, especially if one-step or two-step implementations are used. The one- or two-step implementation is controlled by the TWO\_STEP bit in the first octet of the flags field as shown below. Reserved bits are cleared.

**Table 24-23. PTPv2 message flags field definitions**

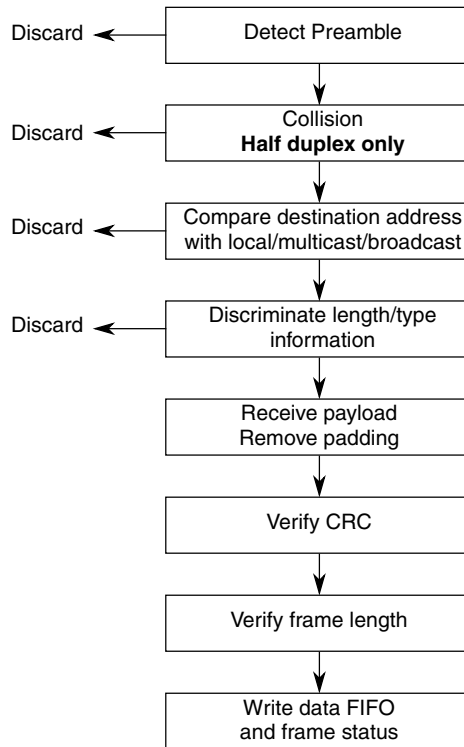

Bit	Name	Description
0	ALTERNATE_MASTER	See IEEE 1588 Clause 17.4
1	TWO_STEP	1 Two-step clock 0 One-step clock
2	UNICAST	1 Transport layer address uses a unicast destination address 0 Multicast is used
3	—	Reserved
4	—	Reserved
5	Profile specific	
6	Profile specific	
7	—	Reserved

## 24.6.4 MAC receive

The MAC receive engine performs the following tasks:

- Check frame framing
- Remove frame preamble and frame SFD field
- Discard frame based on frame destination address field
- Terminate pause frames
- Check frame length
- Remove payload padding if it exists
- Calculate and verify CRC-32
- Write received frames in the core receive FIFO

If the MAC is programmed to operate in half-duplex mode, it will also check if the frame is received with a collision.

**Figure 24-5. MAC receive flow**

#### 24.6.4.1 Collision detection in half-duplex mode

If the packet is received with a collision detected during reception of the first 64 bytes, the packet is discarded (if frame size was less than ~14 octets) or transmitted to the user application with an error and RxBD[CE] set.

#### 24.6.4.2 Preamble processing

The IEEE 802.3 standard allows a maximum size of 56 bits (seven bytes) for the preamble, while the MAC core allows any preamble length, including zero length preamble.

The MAC core checks for the start frame delimiter (SFD) byte. If the next byte of the preamble, which is different from 0x55, is not 0xD5, the frame is discarded.

Although the IEEE specification dictates that the inner-packet gap should be at least 96 bits, the MAC core is designed to accept frames separated by only 64 10/100-Mbit/s operation (MII) bits.

The MAC core removes the preamble and SFD bytes.

### 24.6.4.3 MAC address check

The destination address bit 0 differentiates between multicast and unicast addresses.

- If bit 0 is 0, the MAC address is an individual (unicast) address.
- If bit 0 is 1, the MAC address defines a group (multicast) address.
- If all 48 bits of the MAC address are set, it indicates a broadcast address.

#### 24.6.4.3.1 Unicast address check

If a unicast address is received, the destination MAC address is compared to the node MAC address programmed by the host in the PADDR1/2 registers.

If the destination address matches any of the programmed MAC addresses, the frame is accepted.

If Promiscuous mode is enabled ( $RCR[PROM] = 1$ ) no address checking is performed and all unicast frames are accepted.

#### 24.6.4.3.2 Multicast and unicast address resolution

The hash table algorithm used in the group and individual hash filtering operates as follows.

- The 48-bit destination address is mapped into one of 64 bits, represented by 64 bits in  $ENETn\_GAUR/GALR$  (group address hash match) or  $ENETn\_IAUR/IALR$  (individual address hash match).
- This mapping is performed by passing the 48-bit address through the on-chip 32-bit CRC generator and selecting the six most significant bits of the CRC-encoded result to generate a number between 0 and 63.
- The msb of the CRC result selects  $ENETn\_GAUR$  (msb = 1) or  $ENETn\_GALR$  (msb = 0).
- The five lsbs of the hash result select the bit within the selected register.
- If the CRC generator selects a bit set in the hash table, the frame is accepted; else, it is rejected.

For example, if eight group addresses are stored in the hash table and random group addresses are received, the hash table prevents roughly 56/64 (or 87.5%) of the group address frames from reaching memory. Those that do reach memory must be further filtered by the processor to determine if they truly contain one of the eight desired addresses.

The effectiveness of the hash table declines as the number of addresses increases.

The user must initialize the hash table registers. Use this CRC32 polynomial to compute the hash:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

If Promiscuous mode is enabled ( $ENETn\_RCR[PROM] = 1$ ) all unicast and multicast frames are accepted regardless of  $ENETn\_GAUR/GALR$  and  $ENETn\_IAUR/IALR$  settings.

#### 24.6.4.3.3 Broadcast address reject

All broadcast frames are accepted if  $BC\_REJ$  is cleared or  $ENETn\_RCR[PROM]$  is set. If  $PROM$  is cleared when  $ENETn\_RCR[BC\_REJ]$  is set, all broadcast frames are rejected.

**Table 24-24. Broadcast address reject programming**

PROM	BC_REJ	Broadcast frames
0	0	Accepted
0	1	Rejected
1	0	Accepted
1	1	Accepted

#### 24.6.4.3.4 Miss-bit implementation

For higher layer filtering purposes,  $RxBD[M]$  indicates an address miss when the MAC operates in promiscuous mode and accepts a frame that would otherwise be rejected.

If a group/individual hash or exact match does not occur and Promiscuous mode is enabled ( $RCR[PROM] = 1$ ), the frame is accepted and the M bit is set in the buffer descriptor; otherwise, the frame is rejected.

This means the status bit is set in any of the following conditions during Promiscuous mode:

- A broadcast frame is received when  $BC\_REJ$  is set
- A unicast is received that does not match either:

- Node address (PALR[PADDR1] and PAUR[PADDR2])
- Hash table for unicast (IAUR[IADDR1] and IALR[IADDR2])
- A multicast is received that does not match the GAUR[GADDR1] and GALR[GADDR2] hash table entries

#### 24.6.4.4 Frame length/type verification: payload length check

If the length/type is less than 0x600 and NLC is set, the MAC checks the payload length and reports any error in the frame status word and interrupt bit PLR.

If the length/type is greater than or equal to 0x600, the MAC interprets the field as a type and no payload length check is performed.

The length check is performed on VLAN and stacked VLAN frames. If a padded frame is received, no length check can be performed due to the extended frame payload because padded frames can never have a payload length error.

#### 24.6.4.5 Frame length/type verification: frame length check

When the receive frame length exceeds MAX\_FL bytes, the BABR interrupt is generated and the RxBD[LG] bit is set.

The frame is not truncated unless the frame length exceeds the value programmed in ENET $n$ \_FTRL[TRUNC\_FL]. If the frame is truncated, RxBD[TR] is set. In addition, a truncated frame always has the CRC error indication set (RxBD[CR]).

#### 24.6.4.6 VLAN frames processing

VLAN frames have a length/type field set to 0x8100 immediately followed by a 16-Bit VLAN control information field.

VLAN-tagged frames are received as normal frames because the VLAN tag is not interpreted by the MAC function, and are pushed complete with the VLAN tag to the user application. If the length/type field of the VLAN-tagged frame, which is found four octets later in the frame, is less than 42, the padding is removed. In addition, the frame status word (RxBD[NO]) indicates that the current frame is VLAN tagged.

### 24.6.4.7 Pause frame termination

The receive engine terminates pause frames and does not transfer them to the receive FIFO. The quanta is extracted and sent to the MAC transmit path via a small internal clock rate decoupling asynchronous FIFO.

The quanta is written only if a correct CRC and frame length are detected by the control state machine. If not, the quanta is discarded and the MAC transmit path is not paused.

Good pause frames are ignored if ENET $n$ \_RCR[FCE] is cleared and are forwarded to the client interface when ENET $n$ \_RCR[PAUFWD] is set.

### 24.6.4.8 CRC check

The CRC-32 field is checked and forwarded to the core FIFO interface if ENET $n$ \_RCR[CRCFWD] is cleared and ENET $n$ \_RCR[PADEN] is cleared.

When CRCFWD is set (regardless of PADEN), the CRC-32 field is checked and terminated (not transmitted to the FIFO).

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the frame check sequence (FCS) field with the  $x^{31}$  term as right-most bit of the first octet. The CRC bits are thus received in the following order:  $x^{31}, x^{30}, \dots, x^1, x^0$ .

If a CRC error is detected, the frame is marked invalid and RxBD[CR] is set.

### 24.6.4.9 Frame padding removal

When a frame is received with a payload length field set to less than 46 (42 for VLAN-tagged frames and 38 for frames with stacked VLANs), the zero padding can be removed before the frame is written into the data FIFO depending on the setting of ENET $n$ \_RCR[PADEN].

#### Note

If a frame is received with excess padding (in other words, the length field is set as mentioned above, but the frame has more than 64 octets) and padding removal is enabled, then the

padding is removed as normal and no error is reported if the frame is otherwise correct (for example: good CRC, less than maximum length, and no other error).

## 24.6.5 MAC transmit

Frame transmission starts when the transmit FIFO holds enough data.

After a transfer starts, the MAC transmit function performs the following tasks:

- Generates preamble and SFD field before frame transmission
- Generates XOFF pause frames if the receive FIFO reports a congestion or if `ENETn_TCR[TFC_PAUSE]` is set with `ENETn_OPD[PAUSE_DUR]` set to a non-zero value
- Generates XON pause frames if the receive FIFO congestion condition is cleared or if `TFC_PAUSE` is set with `PAUSE_DUR` cleared
- Suspends Ethernet frame transfer (XOFF) if a non-zero pause quanta is received from the MAC receive path
- Adds padding to the frame if required
- Calculates and appends CRC-32 to the transmitted frame
- Sends the frame with correct inter-packet gap (IPG) (deferring)

When the MAC is configured to operate in half-duplex mode, the following additional tasks are performed:

- Collision detection
- Frame retransmit after back-off timer expires

**Figure 24-6. Frame transmit overview**

### 24.6.5.1 Frame payload padding

The IEEE specification defines a minimum frame length of 64 bytes.

If the frame sent to the MAC from the user application has a size smaller than 60 bytes, the MAC automatically adds padding bytes (0x00) to comply with the Ethernet minimum frame length specification. Transmit padding is always performed and cannot be disabled.

If the MAC is not allowed to append a CRC ( $\text{TxBD}[\text{TC}] = 1$ ), the user application is responsible for providing frames with a minimum length of 64 octets.

### 24.6.5.2 MAC address insertion

On each frame received from the core transmit FIFO interface, the source MAC address is either:

- Replaced by the address programmed in the PADDR1/2 fields ( $\text{ENET}_n\text{TCR}[\text{ADDINS}] = 1$ )
- Transparently forwarded to the Ethernet line ( $\text{ENET}_n\text{TCR}[\text{ADDINS}] = 0$ )

### 24.6.5.3 CRC-32 generation

The CRC-32 field is optionally generated and appended at the end of a frame.

The CRC polynomial, as specified in the 802.3 standard, is:

- $FCS(x) = x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x^1 + 1$

The 32 bits of the CRC value are placed in the FCS field so that the  $x^{31}$  term is the right-most bit of the first octet. The CRC bits are thus transmitted in the following order:  $x^{31}$ ,  $x^{30}$ , ...,  $x^1$ ,  $x^0$ .

#### **24.6.5.4 Inter-packet gap (IPG)**

In full-duplex mode, after frame transmission and before transmission of a new frame, an IPG (programmed in `ENETn_TIPG`) is maintained. The minimum IPG can be programmed between 8 and 26 byte-times (64 and 208 bit-times).

In half-duplex mode, the core constantly monitors the line. Actual transmission of the data onto the network occurs only if it has been idle for a 96-bit time period, and any back-off time requirements have been satisfied. In accordance with the standard, the core begins to measure the IPG from CRS de-assertion.

#### **24.6.5.5 Collision detection and handling — half-duplex operation only**

A collision occurs on a half-duplex network when concurrent transmissions from two or more nodes take place. During transmission, the core monitors the line condition and detects a collision when the PHY device asserts COL.

When the core detects a collision while transmitting, it stops transmission of the data and transmits a 32-bit jam pattern. If the collision is detected during the preamble or the SFD transmission, the jam pattern is transmitted after completing the SFD, which results in a minimum 96-bit fragment. The jam pattern is a fixed pattern that is not compared to the actual frame CRC, and has a very low probability (0.532) of having a jam pattern identical to the CRC.

If a collision occurs before transmission of 64 bytes (including preamble and SFD), the MAC core waits for the backoff period and retransmits the packet data (stored in a 64-byte re-transmit buffer) that has already been sent on the line. The backoff period is generated from a pseudo-random process (truncated binary exponential backoff).

If a collision occurs after transmission of 64 bytes (including preamble and SFD), the MAC discards the remainder of the frame, optionally sets the LC interrupt bit, and sets `TxBD[LCE]`.

**Figure 24-7. Packet re-transmit overview**

The backoff time is represented by an integer multiple of slot times. One slot is equal to a 512-bit time period. The number of the delay slot times, before the  $n^{\text{th}}$  re-transmission attempt, is chosen as a uniformly-distributed random integer in the range:

- $0 < r < 2^k$
- $k = \min(n, N)$ ; where  $n$  is the number of retransmissions and  $N = 10$

For example, after the first collision, the backoff period is 0 or 1 slot time. If a collision occurs on the first retransmission, the backoff period is 0, 1, 2, or 3, and so on.

The maximum backoff time (in 512-bit time slots) is limited by  $N = 10$  as specified in the IEEE 802.3 standard.

If a collision occurs after 16 consecutive retransmissions, the core reports an excessive collision condition (ENET $n$ \_EIR[RL] interrupt field and TxBD[EE]) and discards the current packet from the FIFO.

In networks violating the standard requirements, a collision may occur after transmission of the first 64 bytes. In this case, the core stops the current packet transmission and discards the rest of the packet from the transmit FIFO. The core resumes transmission with the next packet available in the core transmit FIFO.

### warning

Ethernet PHYs that support the SQE Test, or "heartbeat," feature must disable this feature. When this feature is enabled,

the PHY asserts the collision signal after a frame is transmitted to indicate to the ENET that the PHY's collision logic is working. This may cause data corruption in the next frame from the ENET. This corrupted frame contains up to 21 zero bytes which start somewhere within the MAC destination address field. The ENET, however, will still generate a good FCS (CRC-32) but with corrupted data.

## 24.6.6 Full-duplex flow control operation

Three conditions are handled by the core's flow control engine:

- Remote device congestion — The remote device connected to the same Ethernet segment as the core reports congestion and requests that the core stop sending data.
- Core FIFO congestion — When the core's receive FIFO reaches a user-programmable threshold (RX section empty), the core sends a pause frame back to the remote device requesting the data transfer to stop.
- Local device congestion — Any device connected to the core can request (typically, via the host processor) the remote device to stop transmitting data.

### 24.6.6.1 Remote device congestion

When the MAC transmit control gets a valid pause quanta from the receive path and if `ENETn_RCR[FCE]` is set, the MAC transmit logic:

- Completes the transfer of the current frame.
- Stops sending data for the amount of time specified by the pause quanta in 512 bit time increments.
- Sets `ENETn_TCR[RFC_PAUSE]`.

Frame transfer resumes when the time specified by the quanta expires and if no new quanta value is received, or if a new pause frame with a quanta value set to 0x0000 is received. The MAC also resets `RFC_PAUSE` to zero.

If `ENETn_RCR[FCE]` cleared, the MAC ignores received pause frames.

Optionally and independent of `ENETn_RCR[FCE]`, pause frames are forwarded to the client interface if `PAUFWD` is set.

### 24.6.6.2 Local device/FIFO congestion

The MAC transmit engine generates pause frames when the local receive FIFO is not able to receive more than a pre-defined number of words (FIFO programmable threshold) or when pause frame generation is requested by the local host processor.

- To generate a pause frame, the host processor sets ENET $n$ \_TCR[TFC\_PAUSE]. A single pause frame is generated when the current frame transfer is completed and TFC\_PAUSE is automatically cleared. Optionally, an interrupt is generated.
- An XOFF pause frame is generated when the receive FIFO asserts its section empty flag (internal). An XOFF pause frame is generated automatically, when the current frame transfer completes.
- An XON pause frame is generated when the receive FIFO deasserts its section empty flag (internal). An XON pause frame is generated automatically, when the current frame transfer completes.

When an XOFF pause frame is generated, the pause quanta (payload byte P1 and P2) is filled with the value programmed in ENET $n$ \_OPD[PAUSE\_DUR].

**Figure 24-8. Pause frame generation overview**

#### Note

Although the flow control mechanism should prevent any FIFO overflow on the MAC core receive path, the core receive FIFO is protected. When an overflow is detected on the receive FIFO, the current frame is truncated with an error indication set in the frame status word. The frame should subsequently be discarded by the user application.

## 24.6.7 Magic packet detection

Magic packet detection wakes a node that is put in power-down mode by the node management agent. Magic packet detection is supported only if the MAC is configured in sleep mode.

### 24.6.7.1 Sleep mode

To put the MAC in Sleep mode, set ENET $n$ \_ECR[SLEEP]. At the same time ENET $n$ \_ECR[MAGICEN] should also be set to enable magic packet detection.

In addition, if ENET is enabled, write 1 to ENET $n$ \_ECR[SLEEP] before entering into low power mode.

When the MAC is in Sleep mode:

- The transmit logic is disabled.
- The FIFO receive/transmit functions are disabled.
- The receive logic is kept in Normal mode, but it ignores all traffic from the line except magic packets. They are detected so that a remote agent can wake the node.

### 24.6.7.2 Magic packet detection

The core is designed to detect magic packets (see [Magic packets](#)) with the destination address set to:

- Any multicast address
- The broadcast address
- The unicast address programmed in PADDR1/2

When a magic packet is detected, EIR[WAKEUP] is set and none of the statistic registers are incremented.

### 24.6.7.3 Wakeup

When a magic packet is detected, indicated by ENET $n$ \_EIR[WAKEUP], ENET $n$ \_ECR[SLEEP] should be cleared to resume normal operation of the MAC. Clearing the SLEEP bit automatically masks ENET $n$ \_ECR[MAGICEN], disabling magic packet detection.

## 24.6.8 IP accelerator functions

The following sections describe the IP accelerator functions.

### 24.6.8.1 Checksum calculation

The IP and ICMP, TCP, UDP checksums are calculated with one's complement arithmetic summing up 16-bit values.

- For ICMP, the checksum is calculated over the complete ICMP datagram, in other words without IP header.
- For TCP and UDP, the checksums contain the header and data sections and values from the IP header, which can be seen as a pseudo-header that is not actually present in the data stream.

**Table 24-25. IPv4 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
Zero				Protocol				TCP/UDP length																							

**Table 24-26. IPv6 pseudo-header for checksum calculation**

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Source address																															
Destination address																															
TCP/UDP length																															
Zero												Next header																			

The TCP/UDP length value is the length of the TCP or UDP datagram, which is equal to the payload of an IP datagram. It is derived by subtracting the IP header length from the complete IP datagram length that is given in the IP header (IPv4), or directly taken from the IP header (IPv6). The protocol field is the corresponding value from the IP header. The Zero fields are all zeroes.

For IPv6, the complete 128-bit addresses are considered. The next header value identifies the upper layer protocol as either TCP or UDP. It may differ from the next header value of the IPv6 header if extension headers are inserted before the protocol header.

The checksum calculation uses 16-bit words in network byte order: The first byte sent/received is the MSB, and the second byte sent/received is the LSB of the 16-bit value to add to the checksum. If the frame ends on an odd number of bytes, a zero byte is appended for checksum calculation only, and is not actually transmitted.

### 24.6.8.2 Additional padding processing

According to IEEE 802.3, any Ethernet frame must have a minimum length of 64 octets.

The MAC usually removes padding on receive when a frame with length information is received. Because IP frames have a type value instead of length, the MAC does not remove padding for short IP frames, as it is not aware of the frame contents.

The IP accelerator function can be configured to remove the Ethernet padding bytes that might follow the IP datagram.

On transmit, the MAC automatically adds padding as necessary to fill any frame to a 64-byte length.

### 24.6.8.3 32-bit Ethernet payload alignment

The data FIFOs allow inserting two additional arbitrary bytes in front of a frame. This extends the 14-byte Ethernet header to a 16-byte header, which leads to alignment of the Ethernet payload, following the Ethernet header, on a 32-bit boundary.

This function can be enabled for transmit and receive independently with the corresponding SHIFT16 bits in the ENET $n$ \_TACC and ENET $n$ \_RACC registers.

When enabled, the valid frame data is arranged as shown in [Table 24-27](#).

**Table 24-27. 64-bit interface data structure with SHIFT16 enabled**

63	56	55	48	47	40	39	32	31	24	23	16	15	8	7	0
----	----	----	----	----	----	----	----	----	----	----	----	----	---	---	---

*Table continues on the next page...*

**Table 24-27. 64-bit interface data structure with SHIFT16 enabled (continued)**

Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	Any value	Any value
Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	Byte 7	Byte 6
...							

### 24.6.8.3.1 Receive processing

When `ENETn_RACC[SHIFT16]` is set, each frame is received with two additional bytes in front of the frame.

The user application must ignore these first two bytes and find the first byte of the frame in bits 23–16 of the first word from the RX FIFO.

#### Note

SHIFT16 must be set during initialization and kept set during the complete operation, because it influences the FIFO write behavior.

### 24.6.8.3.2 Transmit processing

When `ENETn_TACC[SHIFT16]` is set, the first two bytes of the first word written (bits 15–0) are discarded immediately by the FIFO write logic.

The SHIFT16 bit can be enabled/disabled for each frame individually if required, but can be changed only between frames.

### 24.6.8.4 Received frame discard

Because the receive FIFO must be operated in store and forward mode (`ENETn_RSFL` cleared), received frames can be discarded based on the following errors:

- The MAC function receives the frame with an error:
  - The frame has an invalid payload length
  - Frame length is greater than `MAX_FL`
  - Frame received with a CRC-32 error
  - Frame truncated due to receive FIFO overflow
  - Frame is corrupted as PHY signaled an error (`RX_ERR` asserted during reception)

## Functional description

- An IP frame is detected and the IP header checksum is wrong
- An IP frame with a valid IP header and a valid IP header checksum is detected, the protocol is known but the protocol-specific checksum is wrong

If one of the errors occurs and the IP accelerator function is configured to discard frames (ENET $n$ \_RACC), the frame is automatically discarded. Statistics are maintained normally and are not affected by this discard function.

### 24.6.8.5 IPv4 fragments

When an IPv4 IP fragment frame is received, only the IP header is inspected and its checksum verified. 32-bit alignment operates the same way on fragments as it does on normal IP frames, as specified above.

The IP fragment frame payload is not inspected for any protocol headers. As such, a protocol header would only exist in the very first fragment. To assist in protocol-specific checksum verification, the one's-complement sum is calculated on the IP payload (all bytes following the IP header) and provided with the frame status word.

The frame fragment status field (RxB $D$ [FRAG]) is set to indicate a fragment reception, and the one's-complement sum of the IP payload is available in RxB $D$ [Payload checksum].

#### Note

After all fragments have been received and reassembled, the application software can take advantage of the payload checksum delivered with the frame's status word to calculate the protocol-specific checksum of the datagram.

For example, if a TCP payload is delivered by multiple IP fragments, the application software can calculate the pseudo-header checksum value from the first fragment, and add the payload checksums delivered with the status for all fragments to verify the TCP datagram checksum.

### 24.6.8.6 IPv6 support

The following sections describe the IPv6 support.

### 24.6.8.6.1 Receive processing

An Ethernet frame of type 0x86DD identifies an IP Version 6 frame (IPv6) frame. If an IPv6 frame is received, the first IP header is inspected (first ten words), which is available in every IPv6 frame.

If the receive SHIFT16 function is enabled, the IP header is aligned on a 32-bit boundary allowing more efficient processing (see [32-bit Ethernet payload alignment](#)).

For TCP and UDP datagrams, the pseudo-header checksum calculation is performed and verified.

To assist in protocol-specific checksum verification, the one's-complement sum is always calculated on the IP payload (all bytes following the IP header) and provided with the frame status word. For example, if extension headers were present, their sums can be subtracted in software from the checksum to isolate the TCP/UDP datagram checksum, if required.

### 24.6.8.6.2 Transmit processing

For IPv6 transmission, the SHIFT16 function is supported to process 32-bit aligned datagrams.

IPv6 has no IP header checksum; therefore, the IP checksum insertion configuration is ignored.

The protocol checksum is inserted only if the next header of the IP header is a known protocol (TCP, UDP, or ICMP). If a known protocol is detected, the checksum over all bytes following the IP header is calculated and inserted in the correct position.

The pseudo-header checksum calculation is performed for TCP and UDP datagrams accordingly.

## 24.6.9 Resets and stop controls

The following sections describe the resets and stop controls.

### 24.6.9.1 Hardware reset

To reset the Ethernet module, set ENET $n$ \_ECR[RESET].

### 24.6.9.2 Soft reset

When `ENETn_ECR[ETHER_EN]` is cleared during operation, the following occurs:

- uDMA, buffer descriptor, and FIFO control logic are reset, including the buffer descriptor and FIFO pointers.
- A currently ongoing transmit is terminated by asserting TXER to the PHY.
- A currently ongoing transmit FIFO write from the application is terminated by stopping the write to the FIFO, and all further data from the application is ignored. All subsequent writes are ignored until re-enabled.
- A currently ongoing receive FIFO read is terminated. The RxBD has arbitrary values in this case.

### 24.6.9.3 Hardware freeze

When the processor enters debug mode and `ECR[DBGEN]` is set, the MAC enters a freeze state where it stops all transmit and receive activities gracefully.

The following happens when the MAC enters hardware freeze:

- A currently ongoing receive transaction on the receive application interface is completed as normal. No further frames are read from the FIFO.
- A currently ongoing transmit transaction on the transmit application interface is completed as normal (in other words, until writing end-of-packet (EOP)).
- A currently ongoing frame receive is completed normally, after which no further frames are accepted from the MII.
- A currently ongoing frame transmit is completed normally, after which no further frames are transmitted.

### 24.6.9.4 Graceful stop

During a graceful stop, any currently ongoing transactions are completed normally and no further frames are accepted. The MAC can resume from a graceful stop without the need for a reset (for example, clearing `ETHER_EN` is not required).

The following conditions lead to a graceful stop of the MAC transmit or receive datapaths.

#### 24.6.9.4.1 Graceful transmit stop (GTS)

When gracefully stopped, the MAC is no longer reading frame data from the transmit FIFO and has completed any ongoing transmission.

In any of the following conditions, the transmit datapath stops after an ongoing frame transmission has been completed normally.

- ENET $n$ \_TCR[GTS] is set by software.
- ENET $n$ \_TCR[TFC\_PAUSE] is set by software requesting a pause frame transmission. The status (and register bit) is cleared after the pause frame has been sent.
- A pause frame was received stopping the transmitter. The stopped situation is terminated when the pause timer expires or a pause frame with zero quanta is received.
- MAC is placed in Sleep mode by software or the processor entering Stop mode (see [Sleep mode](#)).
- The MAC is in Hardware Freeze mode.

When the transmitter has reached its stopped state, the following events occur:

- The GRA interrupt is asserted, when transitioned into stopped.
- In Hardware Freeze mode, the GRA interrupt does not wait for the application write completion and asserts when the transmit state machine (in other words, line side of TX FIFO) reaches its stopped state.

#### 24.6.9.4.2 Graceful receive stop (GRS)

When gracefully stopped, the MAC is no longer writing frames into the receive FIFO.

The receive datapath stops after any ongoing frame reception has been completed normally, if any of the following conditions occur:

- MAC is placed in Sleep mode either by the software or the processor is in Stop mode). The MAC continues to receive frames and search for magic packets if enabled (see [Magic packet detection](#)). However, no frames are written into the receive FIFO, and therefore are not forwarded to the application.
- The MAC is in Hardware Freeze mode. The MAC does not accept any frames from the MII.

When the receive datapath is stopped, the following events occur:

- If the RX is in the stopped state, RCR[GRS] is set
- The GRA interrupt is asserted when the transmitter and receiver are stopped
- Any ongoing receive transaction to the application (RX FIFO read) continues normally until the frame end of package (EOP) is reached. After this, the following occurs:
  - When Sleep mode is active, all further frames are discarded, flushing the RX FIFO
  - In Hardware Freeze mode, no further frames are delivered to the application and they stay in the receive FIFO.

### **Note**

The assertion of GRS does not wait for an ongoing FIFO read transaction on the application side of the FIFO (FIFO read).

#### **24.6.9.4.3 Graceful stop interrupt (GRA)**

The graceful stopped interrupt (GRA) is asserted for the following conditions:

- In Sleep mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- In Hardware Freeze mode, the interrupt asserts only after both TX and RX datapaths are stopped.
- The MAC transmit datapath is stopped for any other condition (GTS, TFC\_PAUSE, pause received).

The GRA interrupt is triggered only once when the stopped state is entered. If the interrupt is cleared while the stop condition persists, no further interrupt is triggered.

## 24.6.10 IEEE 1588 functions

To allow for IEEE 1588 or similar time synchronization protocol implementations, the MAC is combined with a time-stamping module to support precise time-stamping of incoming and outgoing frames. Set `ENETn_ECR[EN1588]` to enable 1588 support.

Figure 24-9. IEEE 1588 functions overview

### 24.6.10.1 Adjustable timer module

The adjustable timer module (TSM) implements the free-running counter (FRC), which generates the timestamps. The FRC operates with the time-stamping clock, which can be set to any value depending on your system requirements.

Through dedicated correction logic, the timer can be adjusted to allow synchronization to a remote master and provide a synchronized timing reference to the local system. The timer can be configured to cause an interrupt after a fixed time period, to allow synchronization of software timers or perform other synchronized system functions.

The timer is typically used to implement a period of one second; hence, its value ranges from 0 to  $(1 \times 10^9) - 1$ . The period event can trigger an interrupt, and software can maintain the seconds and hours time values as necessary.

#### 24.6.10.1.1 Adjustable timer implementation

The adjustable timer consists of a programmable counter/accumulator and a correction counter. The periods of both counters and their increment rates are freely configurable, allowing very fine tuning of the timer.

**Figure 24-10. Adjustable timer implementation detail**

The counter produces the current time. During each time-stamping clock cycle, a constant value is added to the current time as programmed in  $ENET_n\_ATINC$ . The value depends on the chosen time-stamping clock frequency. For example, if it operates at 125 MHz, setting the increment to eight represents 8 ns.

The period, configured in  $ENET_n\_ATPER$ , defines the modulo when the counter wraps. In a typical implementation, the period is set to  $1 \times 10^9$  so that the counter wraps every second, and hence all timestamps represent the absolute nanoseconds within the one second period. When the period is reached, the counter wraps to start again respecting the period modulo. This means it does not necessarily start from zero, but instead the counter is loaded with the value  $(Current + Inc - (1 \times 10^9))$ , assuming the period is set to  $1 \times 10^9$ .

The correction counter operates fully independently, and increments by one with each time-stamping clock cycle. When it reaches the value configured in  $ENET_n\_ATCOR$ , it restarts and instructs the timer once to increment by the correction value, instead of the normal value.

The normal and correction increments are configured in  $ENET_n\_ATINC$ . To speed up the timer, set the correction increment more than the normal increment value. To slow down the timer, set the correction increment less than the normal increment value.

The correction counter only defines the distance of the corrective actions, not the amount. This allows very fine corrections and low jitter (in the range of 1 ns) independent of the chosen clock frequency.

By enabling slave mode ( $ENET_n\_ATCR[SLAVE] = 1$ ), the timer is ignored and the current time is externally provided from one of the external modules. See the Chip Configuration details for which clock source is used. This is useful if multiple modules

within the system must operate from a single timer. When slave mode is enabled, you still must set ENET $n$ \_ATINC[INC] to the value of the master, since it is used for internal comparisons.

### 24.6.10.2 Transmit timestamping

Only 1588 event frames need to be time-stamped on transmit. The client application (for example, the MAC driver) should detect 1588 event frames and set TxBD[TS] together with the frame.

If TxBD[TS] is set, the MAC records the timestamp for the frame in ENET $n$ \_ATSTMP. ENET $n$ \_EIR[TS\_AVAIL] is set to indicate that a new timestamp is available.

Software implements a handshaking procedure by setting TxBD[TS] when it transmits the frame for which a timestamp is needed, and then waits for ENET $n$ \_EIR[TS\_AVAIL] to determine when the timestamp is available. The timestamp is then read from ENET $n$ \_ATSTMP. This is done for all event frames. Other frames do not use TxBD[TS] and, therefore, do not interfere with the timestamp capture.

### 24.6.10.3 Receive timestamping

When a frame is received, the MAC latches the value of the timer when the frame's start of frame delimiter (SFD) field is detected, and provides the captured timestamp on RxBD[1588 timestamp]. This is done for all received frames.

### 24.6.10.4 Time synchronization

The adjustable timer module is available to synchronize the local clock of a node to a remote master. It implements a free running 32-bit counter, and also contains an additional correction counter.

The correction counter increases or decreases the rate of the free running counter, enabling very fine granular changes of the timer for synchronization, yet adding only very low jitter when performing corrections.

The application software implements, in a slave scenario, the required control algorithm, setting the correction to compensate for local oscillator drifts and locking the timer to the remote master clock on the network.

The timer and all timestamp-related information should be configured to show the true nanoseconds value of a second (in other words, the timer is configured to have a period of one second). Hence, the values range from 0 to  $(1 \times 10^9) - 1$ . In this application, the seconds counter is implemented in software using an interrupt function that is executed when the nanoseconds counter wraps at  $1 \times 10^9$ .

## **24.6.10.5 Input Capture and Output Compare**

The Input Capture Output Compare block can be used to provide precise hardware timing for input and output events.

### **24.6.10.5.1 Input capture**

The  $TCCR_n$  capture registers latch the time value when the corresponding external event occurs. An event can be a rising-, falling-, or either-edge of one of the  $1588\_TMR_n$  signals. An event will cause the corresponding  $TCSR_n[TF]$  timer flag to be set, indicating that an input capture has occurred. If the corresponding interrupt is enabled with the  $TCSR_n[TIE]$  field, an interrupt can be generated.

### **24.6.10.5.2 Output compare**

The  $TCCR_n$  compare registers are loaded with the time at which the corresponding event should occur. When the ENET free-running counter value matches the output compare reference value in the  $TCCR_n$  register, the corresponding flag,  $TCSR_n[TF]$ , is set, indicating that an output compare has occurred. The corresponding interrupt, if enabled by  $TCSR_n[TIE]$ , will be generated. The corresponding  $1588\_TMR_n$  output signal will be asserted according to  $TCSR_n[TMODE]$ .

#### **NOTE**

If  $TCSR_n[TMODE]$  is set to 10X1b or 1010b then the timer output pin toggle-on-overflow will occur only when PINPER, PEREN, and EN bits of the ATCR register are one.

### **24.6.10.5.3 DMA requests**

A DMA request can be enabled by setting  $TCSR_n[TDRE]$ . The corresponding DMA request is generated when the  $TCSR_n[TF]$  timer flag is set. When the DMA has completed, the corresponding  $TCSR_n[TF]$  flag is cleared.

## 24.6.11 FIFO thresholds

The core FIFO thresholds are fully programmable to dynamically change the FIFO operation.

For example, store and forward transfer can be enabled by a simple change in the FIFO threshold registers.

The thresholds are defined in 64-bit words.

The receive and transmit FIFOs both have a depth of 256 words.

### 24.6.11.1 Receive FIFO

Four programmable thresholds are available, which can be set to any value to control the core operation as follows.

**Table 24-28. Receive FIFO thresholds definition**

Register	Description
ENET $n$ _RSFL [RX_SECTION_F ULL]	<p>When the FIFO level reaches the ENET<math>n</math>_RSFL value, the MAC status signal is asserted to indicate that data is available in the receive FIFO (cut-through operation). Once asserted, if the FIFO empties below the threshold set with ENET<math>n</math>_RAEM and if the end-of-frame is not yet stored in the FIFO, the status signal is deasserted again.</p> <p>If a frame has a size smaller than the threshold (in other words, an end-of-frame is available for the frame), the status is also asserted.</p> <p>To enable store and forward on the receive path, clear ENET<math>n</math>_RSFL. The MAC status signal is asserted only when a complete frame is stored in the receive FIFO.</p> <p>When programming a non-zero value to ENET<math>n</math>_RSFL (cut-through operation) it should be greater than ENET<math>n</math>_RAEM.</p>
ENET $n$ _RAEM [RX_ALMOST_E MPTY]	<p>When the FIFO level reaches the ENET<math>n</math>_RAEM value, and the end-of-frame has not been received, the core receive read control stops the FIFO read (and subsequently stops transferring data to the MAC client application).</p> <p>It continues to deliver the frame, if again more data than the threshold or the end-of-frame is available in the FIFO.</p> <p>Set ENET<math>n</math>_RAEM to a minimum of six.</p>
ENET $n$ _RAFL [RX_ALMOST_F ULL]	<p>When the FIFO level approaches the maximum and there is no more space remaining for at least ENET<math>n</math>_RAFL number of words, the MAC control logic stops writing data in the FIFO and truncates the receive frame to avoid FIFO overflow.</p> <p>The corresponding error status is set when the frame is delivered to the application.</p> <p>Set ENET<math>n</math>_RAFL to a minimum of 4.</p>
ENET $n$ _RSEM [RX_SECTION_E MPTY]	<p>When the FIFO level reaches the ENET<math>n</math>_RSEM value, an indication is sent to the MAC transmit logic, which generates an XOFF pause frame. This indicates FIFO congestion to the remote Ethernet client.</p> <p>When the FIFO level goes below the value programmed in ENET<math>n</math>_RSEM, an indication is sent to the MAC transmit logic, which generates an XON pause frame. This indicates the FIFO congestion is cleared to the remote Ethernet client.</p> <p>Clearing ENET<math>n</math>_RSEM disables any pause frame generation.</p>

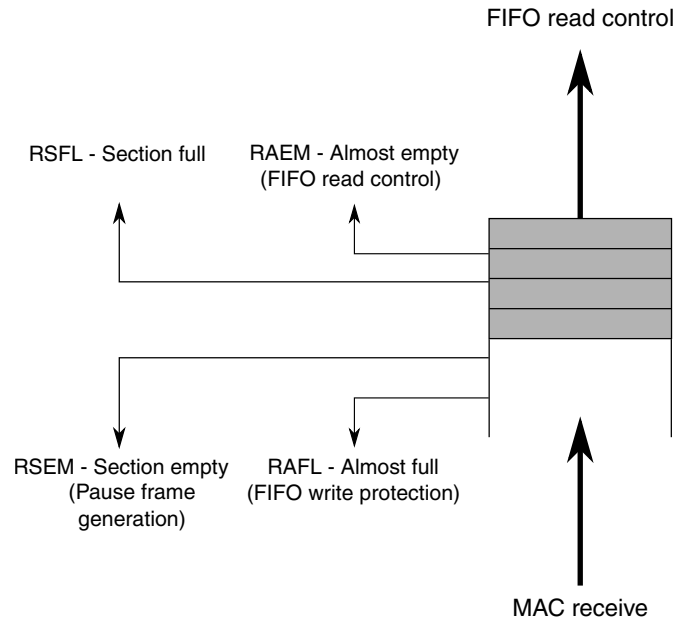

Figure 24-11. Receive FIFO overview

### 24.6.11.2 Transmit FIFO

Four programmable thresholds are available which control the core operation as described below.

Table 24-29. Transmit FIFO thresholds definition

Register	Description
ENET <sub>n</sub> _TAEM [TX_ALMOST_EMPTY]	When the FIFO level reaches the ENET <sub>n</sub> _TAEM value and no end-of-frame is available for the frame, the MAC transmit logic avoids a FIFO underflow by stopping FIFO reads and transmitting the Ethernet frame with an MII error indication. Set ENET <sub>n</sub> _TAEM to a minimum of 4.
ENET <sub>n</sub> _TAFL [TX_ALMOST_FULL]	When the FIFO level approaches the maximum, so that there is no more space for at least ENET <sub>n</sub> _TAFL number of words, the MAC deasserts its control signal to the application. If the application does not react on this signal, the FIFO write control logic avoids FIFO overflow by truncating the current frame and setting the error status. As a result, the frame is transmitted with an MII error indication. Set ENET <sub>n</sub> _TAFL to a minimum of 4. Larger values allow more latency for the application to react on the MAC control signal deassertion, before the frame is truncated. A typical setting is 8, which offers 3–4 clock cycles of latency to the application to react on the MAC control signal deassertion.
ENET <sub>n</sub> _TSEM [TX_SECTION_EMPTY]	When the FIFO level reaches the ENET <sub>n</sub> _TSEM value, a MAC status signal is deasserted to indicate that the transmit FIFO is getting full. This gives the ENET module an indication to slow or stop its write transaction to avoid a buffer overflow. This is a pure indication function to the application. It has no effect within the MAC. When ENET <sub>n</sub> _TSEM is 0, the signal is never deasserted.
ENET <sub>n</sub> _TFWR	When the FIFO level reaches the ENET <sub>n</sub> _TFWR value and when STRFWD is cleared, the MAC transmit control logic starts frame transmission before the end-of-frame is available in the FIFO (cut-through operation).

**Table 24-29. Transmit FIFO thresholds definition**

Register	Description
	<p>If a complete frame has a size smaller than the ENET<sub>n</sub>_TFWR threshold, the MAC also transmits the frame to the line.</p> <p>To enable store and forward on the transmit path, set STRFWD. In this case, the MAC starts to transmit data only when a complete frame is stored in the transmit FIFO.</p>

**Figure 24-12. Transmit FIFO overview**

## 24.6.12 Loopback options

The core implements external and internal loopback options, which are controlled by the ENET<sub>n</sub>\_RCR register fields found here.

The core implements external and internal loopback options, which are controlled by the following ENET<sub>n</sub>\_RCR register fields:

**Table 24-30. Loopback options**

Register field	Description
LOOP	<p>Internal MII loopback. The MAC transmit is returned to the MAC receive. No data is transmitted to the external interfaces.</p> <p>In MII internal loopback, MII_TXCLK and MII_RXCLK must be provided with a clock signal (2.5 MHz for 10 Mbit/s, and 25 MHz for 100 Mbit/s)</p>

Figure 24-13. Loopback options

### 24.6.13 Legacy buffer descriptors

To support the Ethernet controller on previous chips, legacy FEC buffer descriptors are available. To enable legacy support, write 0 to ENETn\_ECR[1588EN].

**NOTE**

- The legacy buffer descriptor tables show the byte order for little-endian chips. DBSWP must be set to 1 after reset to enable little-endian mode.

#### 24.6.13.1 Legacy receive buffer descriptor

The following table shows the legacy FEC receive buffer descriptor. Table 24-34 contains the descriptions for each field.

Table 24-31. Legacy FEC receive buffer descriptor (RxBD)

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data length															
Offset + 2	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 4	Rx data buffer pointer — low halfword															
Offset + 6	Rx data buffer pointer — high halfword															

### 24.6.13.2 Legacy transmit buffer descriptor

The following table shows the legacy FEC transmit buffer descriptor. [Table 24-36](#) contains the descriptions for each field.

**Table 24-32. Legacy FEC transmit buffer descriptor (TxBD)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data Length															
Offset + 2	R	TO1	W	TO2	L	TC	ABC <sup>1</sup>	—	—	—	—	—	—	—	—	—
Offset + 4	Tx Data Buffer Pointer — low halfword															
Offset + 6	Tx Data Buffer Pointer — high halfword															

1. This field is not supported by the uDMA.

### 24.6.14 Enhanced buffer descriptors

This section provides a description of the enhanced operation of the driver/uDMA via the buffer descriptors.

It is followed by a detailed description of the receive and transmit descriptor fields. To enable the enhanced features, set ENET $n$ \_ECR[1588EN].

#### NOTE

The enhanced buffer descriptor tables show the byte order for little-endian chips. [DBSWP](#) must be set to 1 after reset to enable little-endian mode.

#### 24.6.14.1 Enhanced receive buffer descriptor

The following table shows the enhanced uDMA receive buffer descriptor. [Table 24-34](#) contains the descriptions for each field.

**Table 24-33. Enhanced uDMA receive buffer descriptor (RxBd)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Offset + 0	Data length															
Offset + 2	E	RO1	W	RO2	L	—	—	M	BC	MC	LG	NO	—	CR	OV	TR
Offset + 4	Rx data buffer pointer – low halfword															
Offset + 6	Rx data buffer pointer – high halfword															

*Table continues on the next page...*

**Table 24-34. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
		The information needed for this field comes from the promiscuous_miss(ff_rx_err_stat[26]) sideband signal.
Offset + 2	7 BC	Set if the DA is broadcast (FFFF_FFFF_FFFF).
Offset + 2	6 MC	Set if the DA is multicast and not BC.
Offset + 2	5 LG	Receive frame length violation. Written by the MAC. A frame length greater than RCR[MAX_FL] was recognized. This field is valid only if the L field is set. The receive data is not altered in any way unless the length exceeds TRUNC_FL bytes.
Offset + 2	4 NO	Receive non-octet aligned frame. Written by the MAC. A frame that contained a number of bits not divisible by 8 was received, and the CRC check that occurred at the preceding byte boundary generated an error or a PHY error occurred. This field is valid only if the L field is set. If this field is set, the CR field is not set.
Offset + 2	3	Reserved, must be cleared.
Offset + 2	2 CR	Receive CRC or frame error. Written by the MAC. This frame contains a PHY or CRC error and is an integral number of octets in length. This field is valid only if the L field is set.
Offset + 2	1 OV	Overflow. Written by the MAC. A receive FIFO overrun occurred during frame reception. If this field is set, the other status fields, M, LG, NO, and CR, lose their normal meaning and are zero. This field is valid only if the L field is set.
Offset + 2	0 TR	Set if the receive frame is truncated (frame length >TRUNC_FL). If the TR field is set, the frame must be discarded and the other error fields must be ignored because they may be incorrect.
Offset + 4	15–0 Data buffer pointer low	Receive data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Receive data buffer pointer, high halfword <sup>1</sup>
Offset + 8	15–13 VPCP	VLAN priority code point. This field is written by the uDMA to indicate the frame priority level. Valid values are from 0 (best effort) to 7 (highest). This value can be used to prioritize different classes of traffic (e.g., voice, video, data). This field is only valid if the L field is set.
Offset + 8	12–6	Reserved, must be cleared.
Offset + 8	5 ICE	IP header checksum error. This is an accelerator option. This field is written by the uDMA. Set when either a non-IP frame is received or the IP header checksum was invalid. An IP frame with less than 3 bytes of payload is considered to be an invalid IP frame. This field is only valid if the L field is set.
Offset + 8	4 PCR	Protocol checksum error. This is an accelerator option. This field is written by the uDMA. Set when the checksum of the protocol is invalid or an unknown protocol is found and checksumming could not be performed. This field is only valid if the L field is set.
Offset + 8	3	Reserved, must be cleared.
Offset + 8	2 VLAN	VLAN. This is an accelerator option. This field is written by the uDMA. It means that the frame has a VLAN tag. This field is valid only if the L field is set.

Table continues on the next page...

**Table 24-34. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
Offset + 8	1 IPV6	IPV6 Frame. This field is written by the uDMA. This field indicates that the frame has an IPv6 frame type. If this field is not set it means that an IPv4 or other protocol frame was received. This field is valid only if the L field is set.
Offset + 8	0 FRAG	IPv4 Fragment. This is an accelerator option. This field is written by the uDMA. It indicates that the frame is an IPv4 fragment frame. This field is only valid when the L field is set.
Offset + A	15 ME	MAC error. This field is written by the uDMA. This field means that the frame stored in the system memory was received with an error (typically, a receive FIFO overflow). This field is only valid when the L field is set.
Offset + A	14–11	Reserved, must be cleared.
Offset + A	10 PE	PHY Error. This field is written by the uDMA. Set to "1" when the frame was received with an Error character on the PHY interface. The frame is invalid. This field is valid only when the L field is set.
Offset + A	9 CE	Collision. This field is written by the uDMA. Set when the frame was received with a collision detected during reception. The frame is invalid and sent to the user application. This field is valid only when the L field is set.
Offset + A	8 UC	Unicast. This field is written by the uDMA, and means that the frame is unicast. This field is valid regardless of whether the L field is set.
Offset + A	7 INT	Generate RXB/RXF interrupt. This field is set by the user to indicate that the uDMA is to generate an interrupt on the <i>dma_int_rxb / dma_int_rxfevent</i> .
Offset + A	6–0	Reserved, must be cleared.
Offset + C	15–0 Payload checksum	Internet payload checksum. This is an accelerator option. It is the one's complement sum of the payload section of the IP frame. The sum is calculated over all data following the IP header until the end of the IP payload. This field is valid only when the L field is set.
Offset + E	15–11 Header length	Header length. This is an accelerator option. This field is written by the uDMA. This field is the sum of 32-bit words found within the IP and its following protocol headers. If an IP datagram with an unknown protocol is found, then the value is the length of the IP header. If no IP frame or an erroneous IP header is found, the value is 0. The following values are minimum values if no header options exist in the respective headers: <ul style="list-style-type: none"> <li>• ICMP/IP: 6 (5 IP header, 1 ICMP header)</li> <li>• UDP/IP: 7 (5 IP header, 2 UDP header)</li> <li>• TCP/IP: 10 (5 IP header, 5 TCP header)</li> </ul> This field is only valid if the L field is set.
Offset + E	10–8	Reserved, must be cleared.
Offset + E	7–0 Protocol type	Protocol type. This is an accelerator option. The 8-bit protocol field found within the IP header of the frame. It is valid only when ICE is cleared. This field is valid only when the L field is set.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0	This value is written by the uDMA. It is only valid if the L field is set.
Offset + 16		

Table continues on the next page...

**Table 24-34. Receive buffer descriptor field definitions (continued)**

Word	Field	Description
	1588 timestamp	
Offset + 18 – Offset + 1E	15–0	Reserved, must be cleared.

- The receive buffer pointer, containing the address of the associated data buffer, must always be evenly divisible by 64. The buffer must reside in memory external to the MAC. The Ethernet controller never modifies this value.

## 24.6.14.2 Enhanced transmit buffer descriptor

**Table 24-35. Enhanced transmit buffer descriptor (TxBD)**

	Byte 1								Byte 0							
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Offset + 16	1588 timestamp – high halfword															
Offset + 18	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Offset + 1A	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Offset + 1C	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Offset + 1E	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

**Table 24-36. Enhanced transmit buffer descriptor field definitions**

Word	Field	Description
Offset + 0	15–0 Data Length	Data length, written by user. Data length is the number of octets the MAC should transmit from this BD's data buffer. It is never modified by the MAC.
Offset + 2	15 R	Ready. Written by the MAC and you.

*Table continues on the next page...*

**Table 24-36. Enhanced transmit buffer descriptor field definitions (continued)**

Word	Field	Description
		0 The data buffer associated with this BD is not ready for transmission. You are free to manipulate this BD or its associated data buffer. The MAC clears this field after the buffer has been transmitted or after an error condition is encountered. 1 The data buffer, prepared for transmission by you, has not been transmitted or currently transmits. You may write no fields of this BD after this field is set.
Offset + 2	14 TO1	Transmit software ownership. This field is reserved for software use. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	13 W	Wrap. Written by user. 0 The next buffer descriptor is found in the consecutive location 1 The next buffer descriptor is found at the location defined in ETDSR.
Offset + 2	12 TO2	Transmit software ownership. This field is reserved for use by software. This read/write field is not modified by hardware and its value does not affect hardware.
Offset + 2	11 L	Last in frame. Written by user. 0 The buffer is not the last in the transmit frame 1 The buffer is the last in the transmit frame
Offset + 2	10 TC	Transmit CRC. Written by user, and valid only when L is set. 0 End transmission immediately after the last data byte 1 Transmit the CRC sequence after the last data byte This field is valid only when the L field is set.
Offset + 2	9 ABC	Append bad CRC. <b>Note:</b> This field is not supported by the uDMA and is ignored.
Offset + 2	8–0	Reserved, must be cleared.
Offset + 4	15–0 Data buffer pointer low	Tx data buffer pointer, low halfword
Offset + 6	15–0 Data buffer pointer high	Tx data buffer pointer, high halfword. The buffer must reside in memory external to the MAC. This value is never modified by the Ethernet controller. <b>NOTE:</b> For optimal performance, make the transmit buffer pointer evenly divisible by 64.
Offset + 8	15 TXE	Transmit error occurred. This field is written by the uDMA. This field indicates that there was a transmit error of some sort reported with the frame. Effectively this field is an OR of the other error fields including UE, EE, FE, LCE, OE, and TSE. This field is valid only when the L field is set.
Offset + 8	14	Reserved, must be cleared.
Offset + 8	13 UE	Underflow error. This field is written by the uDMA. This field indicates that the MAC reported an underflow error on transmit. This field is valid only when the L field is set.
Offset + 8	12 EE	Excess Collision error. This field is written by the uDMA. This field indicates that the MAC reported an excess collision error on transmit. This field is valid only when the L field is set.

*Table continues on the next page...*

**Table 24-36. Enhanced transmit buffer descriptor field definitions (continued)**

Word	Field	Description
Offset + 8	11 FE	Frame with error. This field is written by the uDMA. This field indicates that the MAC reported that the uDMA reported an error when providing the packet. This field is valid only when the L field is set.
Offset + 8	10 LCE	Late collision error. This field is written by the uDMA. This field indicates that the MAC reported that there was a Late Collision on transmit. This field is valid only when the L field is set.
Offset + 8	9 OE	Overflow error. This field is written by the uDMA. This field indicates that the MAC reported that there was a FIFO overflow condition on transmit. This field is only valid when the L field is set.
Offset + 8	8 TSE	Timestamp error. This field is written by the uDMA. This field indicates that the MAC reported a different frame type than a timestamp frame. This field is valid only when the L field is set.
Offset + 8	7–0	Reserved, must be cleared.
Offset + A	15	Reserved, must be cleared.
Offset + A	14 INT	Generate interrupt flags. This field is written by the user. This field is valid regardless of the L field and must be the same for all EBD for a given frame. The uDMA does not update this value.
Offset + A	13 TS	Timestamp. This field is written by the user. This indicates that the uDMA is to generate a timestamp frame to the MAC. This field is valid regardless of the L field and must be the same for all EBD for the given frame. The uDMA does not update this value.
Offset + A	12 PINS	Insert protocol specific checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the protocol checksum and overwrites the corresponding checksum field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	11 IINS	Insert IP header checksum. This field is written by the user. If set, the MAC's IP accelerator calculates the IP header checksum and overwrites the corresponding header field with the calculated value. The checksum field must be cleared by the application generating the frame. The uDMA does not update this value. This field is valid regardless of the L field and must be the same for all EBD for a given frame.
Offset + A	10–0	Reserved, must be cleared.
Offset + C	15–0	Reserved, must be cleared.
Offset + E	15–0	Reserved, must be cleared.
Offset + 10	15–0	Reserved, must be cleared.
Offset + 12	15 BDU	Last buffer descriptor update done. Indicates that the last BD data has been updated by uDMA. This field is written by the user (=0) and uDMA (=1).
Offset + 12	14–0	Reserved, must be cleared.
Offset + 14	15–0	This value is written by the uDMA . It is valid only when the L field is set.
Offset + 16	1588 timestamp	
Offset + 18–Offset + 1E	15–0	Reserved, must be cleared.

## 24.6.15 Client FIFO application interface

The FIFO interface is completely asynchronous from the Ethernet line, and the transmit and receive interface can operate at a different clock rate.

All transfers to/from the user application are handled independently of the core operation, and the core provides a simple interface to user applications based on a two-signal handshake.

### 24.6.15.1 Data structure description

The data structure defined in the following tables for the FIFO interface must be respected to ensure proper data transmission on the Ethernet line. Byte 0 is sent to and received from the line first.

**Table 24-37. FIFO interface data structure**

	63	56 55	48 47	40 39	32 31	24 23	16 15	8 7	0
Word 0	Byte 7	Byte 6	Byte 5	Byte 4	Byte 3	Byte 2	Byte 1	Byte 0	
Word 1	Byte 15	Byte 14	Byte 13	Byte 12	Byte 11	Byte 10	Byte 9	Byte 8	
...	...								

The size of a frame on the FIFO interface may not be a modulo of 64-bit.

The user application may not care about the Ethernet frame formats in full detail. It needs to provide and receive an Ethernet frame with the following structure:

- Ethernet MAC destination address
- Ethernet MAC source address
- Optional 802.1q VLAN tag (VLAN type and info field)
- Ethernet length/type field
- Payload

Frames on the FIFO interface do not contain preamble and SFD fields, which are inserted and discarded by the MAC on transmit and receive, respectively.

- On receive, CRC and frame padding can be stripped or passed through transparently.
- On transmit, padding and CRC can be provided by the user application, or appended automatically by the MAC independently for each frame. No size restrictions apply.

**Note**

On transmit, if ENET $n$ \_TCR[ADDINS] is set, bytes 6–11 of each frame can be set to any value, since the MAC overwrites the bytes with the MAC address programmed in the ENET $n$ \_PAUR and ENET $n$ \_PALR registers.

**Table 24-38. FIFO interface frame format**

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–13	Length/type field
14–N	Payload data

VLAN-tagged frames are supported on both transmit and receive, and implement additional information (VLAN type and info).

**Table 24-39. FIFO interface VLAN frame format**

Byte number	Field
0–5	Destination MAC address
6–11	Source MAC address
12–15	VLAN tag and info
16–17	Length/type field
18–N	Payload data

**Note**

The standard defines that the LSB of the MAC address is sent/received first, while for all the other header fields — in other words, length/type, VLAN tag, VLAN info, and pause quanta — the MSB is sent/received first.

**24.6.15.2 Data structure examples**

## Functional description

**Figure 24-14. Normal Ethernet frame 64-bit mapping example**

**Figure 24-15. VLAN-tagged frame 64-bit mapping example**

If CRC forwarding is enabled (CRCFWD = 0), the last four valid octets of the frame contain the FCS field. The non-significant bytes of the last word can have any value.

### 24.6.15.3 Frame status

A MAC layer status word and an accelerator status word is available in the receive buffer descriptor.

See [Enhanced buffer descriptors](#) for details.

The status is available with each frame with the last data of the frame.

If the frame status contains a MAC layer error (for example, CRC or length error), RxBD[ME] is also set with the last data of the frame.

## 24.6.16 FIFO protection

The following sections describe the FIFO protection mechanisms.

### 24.6.16.1 Transmit FIFO underflow

During a frame transfer, when the transmit FIFO reaches the almost empty threshold with no end-of-frame indication stored in the FIFO, the MAC logic:

- Stops reading data from the FIFO
- Asserts the MII error signal (MII\_TXER) (1 in Figure 24-16) to indicate that the fragment already transferred is not valid
- Deasserts the MII transmit enable signal (MII\_TXEN) to terminate the frame transfer (2)

After an underflow, when the application completes the frame transfer (3), the MAC transmit logic discards any new data available in the FIFO until the end of packet is reached (4) and sets the enhanced TxBD[UE] field.

The MAC starts to transfer data on the MII interface when the application sends a new frame with a start of frame indication (5).

Figure 24-16. Transmit FIFO underflow protection

### 24.6.16.2 Transmit FIFO overflow

On the transmit path, when the FIFO reaches the programmable almost full threshold, the internal MAC ready signal is deasserted. The application should stop sending new data.

However, if the application keeps sending data, the transmit FIFO overflows, corrupting contents that were previously stored. The core logic sets the enhanced TxBD[OE] field for the next frame transmitted to indicate this overflow occurrence.

#### Note

Overflow is a fatal error and must be addressed by resetting the core or clearing ENET $n$ \_ECR[ETHER\_EN], to clear the FIFOs and prepare for normal operation again.

### 24.6.16.3 Receive FIFO overflow

During a frame reception, if the client application is not able to receive data (1), the MAC receive control truncates the incoming frame when the FIFO reaches the programmable almost-full threshold to avoid an overflow.

The frame is subsequently received on the FIFO interface with an error indication (enhanced RxBD[ME] field set together with receive end-of-packet) (2) with the truncation error status field set (3).

Figure 24-17. Receive FIFO overflow protection

## 24.6.17 PHY management interface

The MDIO interface is a two-wire management interface. The MDIO management interface implements a standardized method to access the PHY device management registers.

The core implements a master MDIO interface, which can be connected to up to 32 PHY devices.

### 24.6.17.1 MDIO clause 22 frame format

The core MDIO master controller communicates with the slave (PHY device) using frames that are defined in the following table.

A complete frame has a length of 64 bits made up of an optional 32-bit preamble, 14-bit command, 2-bit bus direction change, and 16-bit data. Each bit is transferred on the rising edge of the MDIO clock (MDC signal). The MDIO data signal is tri-stated between frames.

The core PHY management interface supports the standard MDIO specification (IEEE 802.3 Clause 22).

**Table 24-40. MDIO clause 22 frame structure**

ST	OP	PHYADR	REGADR	TA	DATA
----	----	--------	--------	----	------

**Table 24-41. MDIO frame field descriptions**

Field	Description
ST (2 bits)	Start indication field, programmed with ENET $n$ _MMFR[ST] and equal to 01 for Standard MDIO (Clause 22).
OP (2 bits)	Opcode defines type of operation. Programmed with ENET $n$ _MMFR[OP]. 01 Write operation 10 Read operation
PHYADR (5 bits)	Five-bit PHY device address, programmed with ENET $n$ _MMFR[PA]. Up to 32 devices can be addressed.
REGADR (5 bits)	Five-bit register address, programmed with ENET $n$ _MMFR[RA]. Each PHY can implement up to 32 registers.
TA (2 bits)	Turnaround time, programmed with ENET $n$ _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.
Data	Data, set by ENET $n$ _MMFR[DATA]. Written to or read from the PHY

**Table 24-41. MDIO frame field descriptions**

Field	Description
(16 bits)	

### 24.6.17.2 MDIO clause 45 frame format

The extended MDIO frame structure defined in IEEE 802.3 Clause 45 introduces indirect addressing. First, a write transaction to an address register is done, followed by a write or read transaction which will put the 16-bit data in the register or retrieve the register contents respectively. A preamble of 32 bits of logical ones is sent prior to every transaction. The MDIO data signal is tri-stated between frames.

The extended MDIO defines four transactions, which are determined by the two-bit opcode field.

**Table 24-42. MDIO clause 45 frame structure**

ST	OP	PRTAD	DEVAD	TA	ADDR/DATA
----	----	-------	-------	----	-----------

All bits are transmitted from left to right (Preamble bits first) and all fields have their Most-Significant bit sent first (leftmost in above table). The complete frame has a length of 64 bits (32-bit preamble, 14-bit command, 2-bit bus direction change, 16-bit data). Each bit is transferred with the rising edge of the MDIO clock (MDC).

The fields and transactions are summarized in the following tables.

**Table 24-43. MDIO clause 45 frame field descriptions**

Field	Description
ST	Start indication. Indicates the end of the preamble and start of the frame. This value is 00 for extended MDIO (Clause 45) frames.
OP	Opcode defines if a read or write operation is performed and is programmed with ENET $n$ _MMFR[OP]. See <a href="#">Table 24-44</a> for more information. 00 Address write 01 Write operation 10 Read inc. operation 11 Read operation
PRTAD	The port address specifies a MDIO port. Each Port can have up to 32 devices which each can have a separate set of registers.
DEVAD	Device address. Up to 32 devices can be addressed (within a port).
TA	Turnaround time, programmed with ENET $n$ _MMFR[TA]. Two bit-times are reserved for read operations to switch the data bus from write to read. The PHY device presents its register contents in the data phase and drives the bus from the second bit of the turnaround phase.

*Table continues on the next page...*

**Table 24-43. MDIO clause 45 frame field descriptions (continued)**

Field	Description
ADDR/DATA	16-bit address (for address write) or data, set by ENET $n$ _MMFR[DATA], written to or read from the PHY.

**Table 24-44. MDIO Clause 45 Transactions**

Transaction Type	Description
Address	A write transaction to the internal address register of the device/port. The data section of the frame contains the value to be stored in the device's internal address "pointer" register for further transactions.
Write	Data write to a register. The 16 bit data will be written to the register identified by the device-internal address.
Read	Data is read from the register identified by the device-internal address.
Read inc.	Read with address postincrement. The register identified by the device-internal address is read. After this, the device-internal address is incremented. If the address register is all '1' (0xFFFF) no increment is done (i.e. increment does not wrap around).

### 24.6.17.3 MDIO clock generation

The MDC clock is generated from the internal bus clock (i.e., IPS bus clock) divided by the value programmed in ENET $n$ \_MSCR[MII\_SPEED].

### 24.6.17.4 MDIO operation

To perform an MDIO access, set the MDIO command register (ENETn\_MMFR) according to the description provided in MII Management Frame Register (ENETn\_MMFR).

To check when the programmed access completes, read the ENETn\_EIR[MII] field.

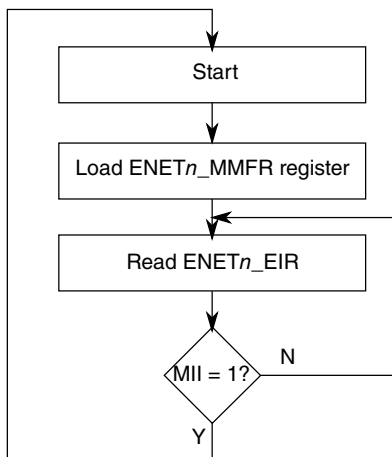

Figure 24-18. MDIO access overview

### 24.6.18 Ethernet interfaces

The following Ethernet interfaces are implemented:

- Fast Ethernet MII (Media Independent Interface)
- RMII 10/100 using interface converters/gaskets

The following table shows how to configure ENET registers to select each interface.

Mode	RCR[RMII_10T]	RCR[RMII_MODE]
MII - 10 Mbit/s	—	0
MII - 100 Mbit/s	—	0
RMII - 10 Mbit/s	1	1
RMII - 100 Mbit/s	0	1

#### 24.6.18.1 RMII interface

In RMII receive mode, for normal reception following assertion of CRS\_DV, RXD[1:0] is 00 until the receiver determines that the receive event has a proper start-of-stream delimiter (SSD).

The preamble appears (RXD[1:0]=01) and the MACs begin capturing data following detection of SFD.

**Figure 24-19. RMII receive operation**

If a false carrier is detected (bad SSD), then RXD[1:0] is 10 until the end of the receive event. This is a unique pattern since a false carrier can only occur at the beginning of a packet where the preamble is decoded (RXD[1:0] = 01).

**Figure 24-20. RMII receive operation with false carrier**

In RMII transmit mode, TXD[1:0] provides valid data for each REF\_CLK period while TXEN is asserted.

**Figure 24-21. RMII transmit operation**

### 24.6.18.2 MII Interface — transmit

On transmit, all data transfers are synchronous to MII\_TXCLK rising edge. The MII data enable signal MII\_TXEN is asserted to indicate the start of a new frame, and remains asserted until the last byte of the frame is present on the MII\_TXD[3:0] bus.

Between frames, MII\_TXEN remains deasserted.

**Figure 24-22. MII transmit operation**

If a frame is received on the FIFO interface with an error (for example, RxBD[ME] set) the frame is subsequently transmitted with the MII\_TXER error signal for one clock cycle at any time during the packet transfer.

**Figure 24-23. MII transmit operation — errored frame**

### 24.6.18.2.1 Transmit with collision — half-duplex

When a collision is detected during a frame transmission (MII\_COL asserted), the MAC stops the current transmission, sends a 32-bit jam pattern, and re-transmits the current frame.

(See [Collision detection in half-duplex mode](#) for details)

Figure 24-24. MII transmit operation — transmission with collision

### 24.6.18.3 MII interface — receive

On receive, all signals are sampled on the MII\_RXCLK rising edge. The MII data enable signal, MII\_RXDV, is asserted by the PHY to indicate the start of a new frame and remains asserted until the last byte of the frame is present on MII\_RXD[3:0] bus.

Between frames, MII\_RXDV remains deasserted.

Figure 24-25. MII receive operation

## Functional description

If the PHY detects an error on the frame received from the line, the PHY asserts the MII error signal, MII\_RXER, for at least one clock cycle at any time during the packet transfer.

**Figure 24-26. MII receive operation — errored frame**

A frame received on the MII interface with a PHY error indication is subsequently transferred on the FIFO interface with RxBD[ME] set.

### 24.6.19 Interrupt coalescence

The purpose of the interrupt coalescing is to reduce the number of interrupts generated by the MAC so as to reduce the CPU loading.

To facilitate this interrupt coalescing, these registers are available with the same control and configuration fields.

- [Transmit Interrupt Coalescing Register \(ENET\\_TXIC\)](#)
- [Receive Interrupt Coalescing Register \(ENET\\_RXIC\)](#)

When coalescing is enabled by asserting the corresponding ICEN field and such interrupt is also enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt when the threshold number of frames is reached (defined by ICFT) or when the threshold timer expires (defined by ICTT).

When coalescing is disabled by de-asserting ICEN, but interrupt is enabled by the corresponding interrupt mask of the EIMR register, the MAC generates an interrupt as they are received without using coalescing. Interrupt coalescing is done for each transmit and receive queue/class independently.

### 24.6.19.1 Interrupt coalescence setup

Interrupt coalescence supports both legacy and enhanced BDs. The following guidelines are recommended when setting up interrupt coalescence.

- When the MAC is configured for enhanced (IEEE 1588) mode, that is, enhanced BDs:
  - Set the INT bit in the enhanced received buffer descriptor to one.
  - Set the INT bit in the enhanced transmit buffer descriptor(s) to one.
- Clear the TXB and RXB fields in the EIMR register.

### 24.6.19.2 Updating the frame count threshold on-the-fly

To update the ICFT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

#### NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new threshold value to the ICFT field.
3. Set ICEN to one.

#### NOTE

The ICFT field can be updated on-the-fly without disabling the ICEN field. The hardware interrupt will continue and there is a possibility that an interrupt will occur depending on the state of the hardware counter and the previous ICFT value.

### 24.6.19.3 Updating the timer threshold on-the-fly

To update the ICTT field in the RXIC and TXIC registers:

1. Disable interrupt coalescence by clearing the appropriate ICEN field. This will allow the internal interrupt coalescence counter to reset to zero.

#### NOTE

When disabling interrupt coalescence, if an interrupt event is pending, that is, the interrupt counter is not zero, then an interrupt will occur.

2. Write the new timer value to the ICTT field.
3. Set ICEN to one.

# Chapter 25

## External Watchdog Monitor (EWM)

### 25.1 Introduction

For safety, a redundant watchdog system, External Watchdog Monitor (EWM), is designed to monitor external circuits, as well as the MCU software flow. This provides a back-up mechanism to the internal watchdog that resets the MCU's CPU and peripherals.

The watchdog is generally used to monitor the flow and execution of embedded software within an MCU. The watchdog consists of a counter that if allowed to overflow, forces an internal reset (asynchronous) to all on-chip peripherals and optionally assert the  $\overline{\text{RESET}}$  pin to reset external devices/circuits. The overflow of the watchdog counter must not occur if the software code works well and services the watchdog to re-start the actual counter.

The EWM differs from the internal watchdog in that it does not reset the MCU's CPU and peripherals. The EWM provides an independent  $\overline{\text{EWM\_out}}$  signal that when asserted resets or places an external circuit into a safe mode. The  $\overline{\text{EWM\_out}}$  signal is asserted upon the EWM counter time-out. An optional external input  $\overline{\text{EWM\_in}}$  is provided to allow additional control of the assertion of  $\overline{\text{EWM\_out}}$  signal.

#### 25.1.1 Features

Features of EWM module include:

- Independent LPO\_CLK clock source
- Programmable time-out period specified in terms of number of EWM LPO\_CLK clock cycles.
- Windowed refresh option
  - Provides robust check that program flow is faster than expected.

- Programmable window.
- Refresh outside window leads to assertion of  $\overline{\text{EWM\_out}}$ .
- Robust refresh mechanism
  - Write values of 0xB4 and 0x2C to EWM Refresh Register within 63 peripheral bus clock cycles.
- One output port,  $\overline{\text{EWM\_out}}$ , when asserted is used to reset or place the external circuit into safe mode.
- One Input port,  $\text{EWM\_in}$ , allows an external circuit to control the assertion of the  $\overline{\text{EWM\_out}}$  signal.

### 25.1.2 Modes of Operation

This section describes the module's operating modes.

#### 25.1.2.1 Stop Mode

When the EWM is in stop mode, the CPU refreshes to the EWM cannot occur. On entry to stop mode, the EWM's counter freezes.

There are two possible ways to exit from Stop mode:

- On exit from stop mode through a reset, the EWM remains disabled.
- On exit from stop mode by an interrupt, the EWM is re-enabled, and the counter continues to be clocked from the same value prior to entry to stop mode.

Note the following if the EWM enters the stop mode during CPU refresh mechanism: At the exit from stop mode by an interrupt, refresh mechanism state machine starts from the previous state which means, if first refresh command is written correctly and EWM enters the stop mode immediately, the next command has to be written within the next 63 peripheral bus clocks after exiting from stop mode. User must mask all interrupts prior to executing EWM refresh instructions.

#### 25.1.2.2 Wait Mode

The EWM module treats the stop and wait modes as the same. EWM functionality remains the same in both of these modes.

### 25.1.2.3 Debug Mode

Entry to debug mode has no effect on the EWM.

- If the EWM is enabled prior to entry of debug mode, it remains enabled.
- If the EWM is disabled prior to entry of debug mode, it remains disabled.

### 25.1.3 Block Diagram

This figure shows the EWM block diagram.

Figure 25-1. EWM Block Diagram

## 25.2 EWM Signal Descriptions

The EWM has two external signals and internal options for the counter clock sources, as shown in the following table.

**Table 25-1. EWM Signal Descriptions**

Signal	Description	I/O
EWM_in	EWM input for safety status of external safety circuits. The polarity of EWM_in is programmable using the EWM_CTRL[ASSIN] bit. The default polarity is active-low.	I
EWM_out	EWM reset out signal	O
lpo_clk[3:0]	Low power clock sources for running counter	I

### NOTE

- lpo\_clk[0] is 32 kHz clock generated by 32 kHz XTAL, which could be automatically switched to 32 kHz RCOSC upon XTAL clock loss;
- lpo\_clk[1] is 1 MHz RCOSC clock generated by ANATOP;
- lpo\_clk[3:2] are not used on this device.

## 25.3 Memory Map/Register Definition

This section contains the module memory map and registers.

### NOTE

EWM only supports 8-bit register access. 16-bit and 32-bit access are not possible.

### 25.3.1 EWM Register Descriptions

#### 25.3.1.1 EWM Memory Map

Base address: 400B\_4000

Offset	Register	Width (In bits)	Access	Reset value
0h	<a href="#">Control (CTRL)</a>	8	RW	00h
1h	<a href="#">Service (SERV)</a>	8	WORZ	00h
2h	<a href="#">Compare Low (CMPL)</a>	8	WONCE	00h
3h	<a href="#">Compare High (CMPH)</a>	8	WONCE	FFh
4h	<a href="#">Clock Control (CLKCTRL)</a>	8	WONCE	00h
5h	<a href="#">Clock Prescaler (CLKPRESCALER)</a>	8	WONCE	00h

## 25.3.1.2 Control (CTRL)

### 25.3.1.2.1 Address

Register	Offset
CTRL	0h

### 25.3.1.2.2 Function

The CTRL register is cleared by any reset.

#### NOTE

INEN, ASSIN and EWMEN bits can be written once after a CPU reset. Modifying these bits more than once, generates a bus transfer error.

### 25.3.1.2.3 Diagram

### 25.3.1.2.4 Fields

Field	Function
7-4	Reserved
—	

Table continues on the next page...

## Memory Map/Register Definition

Field	Function
3 INTEN	Interrupt Enable. This bit when set and $\overline{\text{EWM\_out}}$ is asserted, an interrupt request is generated. To de-assert interrupt request, user should clear this bit by writing 0.
2 INEN	Input Enable. This bit when set, enables the EWM_in port.
1 ASSIN	EWM_in's Assertion State Select. Default assert state of the EWM_in signal is logic zero. Setting the ASSIN bit inverts the assert state of EWM_in signal to a logic one.
0 EWMEN	EWM enable. This bit when set, enables the EWM module. This resets the EWM counter to zero and deasserts the $\overline{\text{EWM\_out}}$ signal. This bit when unset, keeps the EWM module disabled. It cannot be re-enabled until a next reset, due to the write-once nature of this bit.

### 25.3.1.3 Service (SERV)

#### 25.3.1.3.1 Address

Register	Offset
SERV	1h

#### 25.3.1.3.2 Function

The SERV register provides the interface from the CPU to the EWM module. It is write-only and reads of this register return zero.

#### 25.3.1.3.3 Diagram

#### 25.3.1.3.4 Fields

Field	Function
7-0 SERVICE	SERVICE

Field	Function
	<p>The EWM refresh mechanism requires the CPU to write two values to the SERV register: a first data byte of 0xB4, followed by a second data byte of 0x2C. The EWM refresh is invalid if either of the following conditions is true.</p> <ul style="list-style-type: none"> <li>The first or second data byte is not written correctly.</li> <li>The second data byte is not written within a fixed number of peripheral bus cycles of the first data byte. This fixed number of cycles is called <i>EWM_refresh_time</i>.</li> </ul> <p>63 peripheral bus clock cycles are required for <i>EWM_refresh_time</i></p>

### 25.3.1.4 Compare Low (CMPL)

#### 25.3.1.4.1 Address

Register	Offset
CMPL	2h

#### 25.3.1.4.2 Function

The CMPL register is reset to zero after a CPU reset. This provides no minimum time for the CPU to refresh the EWM counter.

#### NOTE

This register can be written only once after a CPU reset. Writing this register more than once generates a bus transfer error.

#### 25.3.1.4.3 Diagram

#### 25.3.1.4.4 Fields

Field	Function
7-0 COMPAREL	COMPAREL

## Memory Map/Register Definition

Field	Function
	To prevent runaway code from changing this field, software should write to this field after a CPU reset even if the (default) minimum refresh time is required.

### 25.3.1.5 Compare High (CMPH)

#### 25.3.1.5.1 Address

Register	Offset
CMPH	3h

#### 25.3.1.5.2 Function

The CMPH register is reset to 0xFF after a CPU reset. This provides a maximum of 256 clocks time, for the CPU to refresh the EWM counter.

#### NOTE

This register can be written only once after a CPU reset. Writing this register more than once generates a bus transfer error.

#### NOTE

The valid values for CMPH are up to 0xFE because the EWM counter never expires when CMPH = 0xFF. The expiration happens only if EWM counter is greater than CMPH.

#### 25.3.1.5.3 Diagram

#### 25.3.1.5.4 Fields

Field	Function
7-0 COMPAREH	COMPAREH

Field	Function
	To prevent runaway code from changing this field, software should write to this field after a CPU reset even if the (default) maximum refresh time is required.

## 25.3.1.6 Clock Control (CLKCTRL)

### 25.3.1.6.1 Address

Register	Offset
CLKCTRL	4h

### 25.3.1.6.2 Function

This CLKCTRL register is reset to 0x00 after a CPU reset.

#### NOTE

This register can be written only once after a CPU reset. Writing this register more than once generates a bus transfer error.

#### NOTE

User should select the required low power clock before enabling the EWM.

### 25.3.1.6.3 Diagram

### 25.3.1.6.4 Fields

Field	Function
7-2	reserved
—	
1-0	CLKSEL

## Memory Map/Register Definition

Field	Function
CLKSEL	<p>EWM has 4 possible low power clock sources for running EWM counter. One of the clock source can be selected by writing into this field.</p> <ul style="list-style-type: none"> <li>• 00 - lpo_clk[0] will be selected for running EWM counter.</li> <li>• 01 - lpo_clk[1] will be selected for running EWM counter.</li> <li>• 10 - lpo_clk[2] will be selected for running EWM counter.</li> <li>• 11 - lpo_clk[3] will be selected for running EWM counter.</li> </ul>

### 25.3.1.7 Clock Prescaler (CLKPRESCALER)

#### 25.3.1.7.1 Address

Register	Offset
CLKPRESCALER	5h

#### 25.3.1.7.2 Function

This CLKPRESCALER register is reset to 0x00 after a CPU reset.

#### NOTE

This register can be written only once after a CPU reset. Writing this register more than once generates a bus transfer error.

#### NOTE

Write the required prescaler value before enabling the EWM.

#### NOTE

The implementation of this register is chip-specific. See the Chip Configuration details.

#### 25.3.1.7.3 Diagram

### 25.3.1.7.4 Fields

Field	Function
7-0 CLK_DIV	CLK_DIV Selected low power clock source for running the EWM counter can be prescaled as below. <ul style="list-style-type: none"> <li>• Prescaled clock frequency = low power clock source frequency / ( 1 + CLK_DIV )</li> </ul>

## 25.4 Functional Description

The following sections describe functional details of the EWM module.

### NOTE

When the BUS\_CLK is lost, then EWM module doesn't generate the  $\overline{\text{EWM\_out}}$  signal and no refresh operation is possible

### 25.4.1 The $\overline{\text{EWM\_out}}$ Signal

The  $\overline{\text{EWM\_out}}$  is a digital output signal used to gate an external circuit (application specific) that controls critical safety functions. For example, the  $\overline{\text{EWM\_out}}$  could be connected to the high voltage transistors circuits that control an AC motor in a large appliance.

The  $\overline{\text{EWM\_out}}$  signal remains deasserted when the EWM is being regularly refreshed by the CPU within the programmable refresh window, indicating that the application code is executed as expected.

The  $\overline{\text{EWM\_out}}$  signal is asserted in any of the following conditions:

- The EWM refresh occurs when the counter value is less than CMPL value.
- The EWM counter value reaches the CMPH value, and no EWM refresh has occurred.
- If functionality of EWM\_in pin is enabled and EWM\_in pin is asserted while refreshing the EWM.
- After any reset (by the virtue of the external pull-down mechanism on the  $\overline{\text{EWM\_out}}$  pin)

## Functional Description

The  $\overline{\text{EWM\_out}}$  is asserted after any reset by the virtue of the external pull-down mechanism on the  $\overline{\text{EWM\_out}}$  signal. Then, to deassert the  $\overline{\text{EWM\_out}}$  signal, set EWMEN bit in the CTRL register to enable the EWM.

If the  $\overline{\text{EWM\_out}}$  signal shares its pad with a digital I/O pin, on reset this actual pad defers to being an input signal. The pad state is controlled by the  $\overline{\text{EWM\_out}}$  signal only after the EWM is enabled by the EWMEN bit in the CTRL register.

### Note

$\overline{\text{EWM\_out}}$  pad must be in pull down state when EWM functionality is used and when EWM is under Reset.

## 25.4.2 $\overline{\text{EWM\_OUT}}$ pin state in low power modes

During Wait, Stop and Power Down modes the  $\overline{\text{EWM\_OUT}}$  pin enters a high-impedance state. A user has the option to control the logic state of the pin using an external pull device or by configuring the internal pull device. When the CPU enters a Run mode from Wait or Stop recovery, the pin resumes its previous state before entering Wait or Stop mode. When the CPU enters Run mode from Power Down, the pin returns to its reset state.

## 25.4.3 The EWM\_in Signal

The EWM\_in is a digital input signal for safety status of external safety circuits, that allows an external circuit to control the assertion of the  $\overline{\text{EWM\_out}}$  signal. For example, in the application, an external circuit monitors a critical safety function, and if there is fault with safety function, the external circuit can then actively initiate the  $\overline{\text{EWM\_out}}$  signal that controls the gating circuit.

The EWM\_in signal is ignored if the EWM is disabled, or if INEN bit of CTRL register is cleared, as after any reset.

On enabling the EWM (setting the CTRL[EWMEN] bit) and enabling EWM\_in functionality (setting the CTRL[INEN] bit), the EWM\_in signal must be in the deasserted state prior to the CPU start refreshing the EWM. This ensures that the  $\overline{\text{EWM\_out}}$  stays in the deasserted state; otherwise, the  $\overline{\text{EWM\_out}}$  output signal is asserted.

### Note

The user must update the CMPH and CMPL registers prior to enabling the EWM. After enabling the EWM, the counter resets to zero, therefore the user shall provide a reasonable time after a power-on reset for the external monitoring circuit to stabilize. The user shall also ensure that the EWM\_in pin is deasserted.

#### 25.4.4 EWM Counter

It is an 8-bit ripple counter fed from a clock source that is independent of the peripheral bus clock source. As the preferred time-out is between 1 ms and 100 ms the actual clock source should be in the kHz range.

The counter is reset to zero after the CPU reset, or when EWM refresh action completes, or at counter overflow. The counter value is not accessible to the CPU.

#### 25.4.5 EWM Compare Registers

The compare registers CMPL and CMPH are write-once after a CPU reset and cannot be modified until another CPU reset occurs.

The EWM compare registers are used to create a refresh window to refresh the EWM module.

It is illegal to program CMPL and CMPH with same value. In this case, as soon as counter reaches (CMPL + 1),  $\overline{\text{EWM\_out}}$  is asserted.

#### 25.4.6 EWM Refresh Mechanism

Other than the initial configuration of the EWM, the CPU can only access the EWM by the EWM Service Register. The CPU must access the EWM service register with correct write of unique data within the windowed time frame as determined by the CMPL and CMPH registers for correct EWM refresh operation. Therefore, three possible conditions can occur:

Table 25-2. EWM Refresh Mechanisms

Condition	Mechanism
An EWM refresh action completes when: $CMPH < Counter < CMPL$ .	The software behaves as expected and the EWM counter is reset to zero. The $\overline{EWM\_out}$ output signal remains in the deasserted state if, during the EWM refresh action, the $\overline{EWM\_in}$ input has been in deasserted state..
An EWM refresh action completes when $Counter < CMPL$	The software refreshes the EWM before the windowed time frame, the counter is reset to zero and the $\overline{EWM\_out}$ output signal is asserted irrespective of the input $\overline{EWM\_in}$ .
Counter value reaches CMPH prior to completion of EWM refresh action.	Software has not refreshed the EWM. The EWM counter is reset to zero and the $\overline{EWM\_out}$ output signal is asserted irrespective of the input $\overline{EWM\_in}$ .

### 25.4.7 EWM Interrupt

When  $\overline{EWM\_out}$  is asserted, an interrupt request is generated to indicate the assertion of the EWM reset out signal. This interrupt is enabled when CTRL[INTEN] is set. Clearing this bit clears the interrupt request but does not affect  $\overline{EWM\_out}$ . The  $\overline{EWM\_out}$  signal can be deasserted only by forcing a system reset.

### 25.4.8 Selecting the EWM counter clock

There are four possible low power clock sources for the EWM counter. Select one of the available clock sources by programming CLKCTRL[CLKSEL].

### 25.4.9 Counter clock prescaler

The EWM counter clock source can be prescaled by a clock divider, by programming CLKPRESCALER[CLK\_DIV]. This divided clock is used to run the EWM counter.

#### NOTE

The divided clock used to run the EWM counter must be no more than half the frequency of the bus clock.

# Chapter 26

## Flexible Controller Area Network (FLEXCAN)

### 26.1 Overview

The Flexible Controller Area Network (FLEXCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification.

The CAN protocol was primarily designed to be used as a vehicle serial data bus meeting the specific requirements of this field: real-time processing, reliable operation in the EMI environment of a vehicle, cost-effectiveness and required bandwidth. The FLEXCAN module is a full implementation of the CAN protocol specification, which supports both standard and extended message frames. 64 Message Buffers are supported by the Flexcan module.

#### 26.1.1 Block Diagram

A general block diagram is shown in the figure below, which describes the main sub-blocks implemented in the FLEXCAN module, including the associated memory for storing Mailboxes, Rx Global Mask Registers, Rx Individual Mask Registers, Rx FIFO and Rx FIFO ID Filters.

Support for 64 Mailboxes and 6-deep Rx FIFO is provided. The functions of the sub-modules are described in subsequent sections.

Figure 26-1. FLEXCAN Block Diagram

## 26.1.2 FLEXCAN Module Features

The FLEXCAN module includes these distinctive legacy features:

- Version 2.0B
  - Standard data and remote frames
  - Extended data and remote frames
  - Zero to eight bytes data length
  - Programmable bit rate up to 1 Mb/sec
  - Content-related addressing
- Flexible Mailboxes of eight bytes data length
- Each Mailbox is configurable as Rx or Tx, all supporting standard and extended messages
- Individual Rx Mask Registers per Mailbox
- Full featured Rx FIFO with storage capacity for 6 frames and internal pointer handling
- Transmission abort capability
- Powerful Rx FIFO ID filtering, capable of matching incoming IDs against either 128 extended, 256 standard or 512 partial (8 bits) IDs, with up to 32 individual masking capability
- 100% backwards compatibility with previous FLEXCAN version
- Unused structures space can be used as general purpose RAM space
- Listen only mode capability
- Programmable loop-back mode supporting self-test operation
- Programmable transmission priority scheme: lowest ID, lowest buffer number or highest priority
- Time Stamp based on 16-bit free-running timer
- Global network time, synchronized by a specific message
- Maskable interrupts independent of the transmission medium (an external transceiver is assumed)
- Short latency time due to an arbitration scheme for high-priority messages
- Low power modes, with programmable wake up on bus activity
- Configurable Glitch filter width to filter the noise on CAN bus when waking up
- Remote request frames may be handled automatically or by software.
- ID filter configuration in Normal Mode
- CAN bit time settings and configuration bits can only be written in Freeze Mode
- Tx mailbox status (Lowest priority buffer or empty buffer)
- SYNC bit status to inform that the module is synchronous with CAN bus
- CRC status for transmitted message
- Selectable priority between Mailboxes and Rx FIFO during matching process

### 26.1.3 Modes of Operation

The FLEXCAN module has four functional modes: Normal Mode (User and Supervisor), Freeze Mode, Listen-Only Mode and Loop-Back Mode. There are also two low power modes: Disable Mode and Stop Mode.

- Normal Mode (User or Supervisor):

In Normal Mode, the module operates receiving and/or transmitting message frames, errors are handled normally and all the CAN Protocol functions are enabled. User and Supervisor Modes differ in the access to some restricted control registers.

- Freeze Mode:

It is enabled when the FRZ bit in the MCR Register is asserted. If enabled, Freeze Mode is entered when the HALT bit in MCR is set or when Debug Mode is requested at MCU level and the FRZ\_ACK bit in the MCR Register is asserted by the FlexCAN. In this mode, no transmission or reception of frames is done and synchronicity to the CAN bus is lost. See [Freeze Mode](#) for more information.

- Listen-Only Mode:

The module enters this mode when the LOM bit in the Control Register is asserted. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.

- Loop-Back Mode:

The module enters this mode when the LPB bit in the Control Register is asserted. In this mode, FLEXCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is internally fed back to the receiver input. The FLEXCAN\_RX input pin is ignored and the FLEXCAN\_TX output goes to the recessive state (logic '1'). FLEXCAN behaves as it normally does when transmitting and treats its own transmitted message as a message received from a remote node. In this mode, FLEXCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field to ensure proper reception of its own message. Both transmit and receive interrupts are generated.

- Module Disable Mode:

This low power mode is entered when the MDIS bit in the MCR Register is asserted and the LPM\_ACK is asserted by the FlexCAN. When disabled, the module requests to disable the clocks to the CAN Protocol Engine and Controller Host Interface sub-modules. Exit from this mode is done by negating the MDIS bit in the MCR Register. See [Module Disable Mode](#) for more information.

- Stop Mode:

This low power mode is entered when Stop Mode is requested at Arm level and the LPM\_ACK bit in the MCR Register is asserted by the FlexCAN. When in Stop Mode, the module puts itself in an inactive state and then informs the Arm that the clocks can be shut down globally. Exit from this mode happens when the Stop Mode request is removed or when activity is detected on the CAN bus and the Self Wake Up mechanism is enabled. See [Stop Mode](#) for more information.

## 26.2 External Signals

The FLEXCAN module has two I/O signals.

## 26.3 Clocks

The table found here describes the clock sources for FLEXCAN.

Please see Clock Controller Module (CCM) for clock setting, configuration and gating information.

**Table 26-1. FLEXCAN Clocks**

Clock name	Clock Root	Description
ipg_clk	ipg_clk_root	Peripheral clock
ipg_clk_chi	ipg_clk_root	CHI clock
ipg_clk_pe	can_clk_root	Protocol Engine clock
ipg_clk_pe_nogate	can_clk_root	Protocol Engine clock (no gating)
ipg_clk_s	ipg_clk_root	Peripheral access clock
mem_ram_CLK	ipg_clk_root	RAM clock

## 26.4 Message Buffer Structure

Message Buffer Address: Base + 0x0080-0x047C.

## Message Buffer Structure

The Message Buffer structure used by the FLEXCAN module is represented in the following table.

Both Extended and Standard Frames (29-bit Identifier and 11-bit Identifier, respectively) used in the CAN specification are represented.

Each individual Message buffer is formed by 16 bytes.

**Table 26-2. Message Buffer Structure**

	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0x0					CODE					S R R	I D E	R T R	DLC				TIME STAMP															
0x4	PRIO		ID Standard								ID Extended																					
0x8	DATA BYTE 0				DATA BYTE 1				DATA BYTE 2				DATA BYTE 3																			
0xC	DATA BYTE 4				DATA BYTE 5				DATA BYTE 6				DATA BYTE 7																			

### CODE - Message Buffer Code

This 4-bit field can be accessed (read or write) by the CPU and by the FLEXCAN module itself, as part of the message buffer matching and arbitration process. The encoding is shown in the following tables. See [Functional Description](#) for additional information.

**Table 26-3. Message Buffer Code for Rx buffers**

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
0b0000: INACTIVE - MB is not active.	INACTIVE	-	-	-	MB does not participate in the matching process.
0b0100: EMPTY - MB is active and empty.	EMPTY	-	FULL	-	When a frame is received successfully (after move-in process. Refer to <a href="#">Move-in</a> for details), the CODE field is automatically updated to FULL.
0b0010: FULL - MB is full.	FULL	Yes	FULL	-	The act of reading the C/S word followed by unlocking the MB (SRV) does not make the code return to EMPTY. It remains FULL. If a new frame is moved to the MB after the MB was serviced, the code still remains FULL. Refer to <a href="#">Matching Process</a> for matching details related to FULL code.

*Table continues on the next page...*

Table 26-3. Message Buffer Code for Rx buffers (continued)

CODE Description	Rx Code BEFORE receive New Frame	SRV <sup>1</sup>	Rx Code AFTER successful reception <sup>2</sup>	RRS <sup>3</sup>	Comment
		No	OVERRUN	-	If the MB is FULL and a new frame is moved to this MB before the CPU services it, the CODE field is automatically updated to OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.
0b0110: OVERRUN - MB is being overwritten into a full buffer.	OVERRUN	Yes	FULL	-	If the CODE field indicates OVERRUN and CPU has serviced the MB, when a new frame is moved to the MB, the code returns to FULL.
		No	OVERRUN	-	If the CODE field already indicates OVERRUN, and another new frame must be moved, the MB will be overwritten again, and the code will remain OVERRUN. Refer to <a href="#">Matching Process</a> for details about overrun behavior.
0b1010: RANSWER <sup>4</sup> - A frame was configured to recognize a Remote Request Frame and transmit a Response Frame in return.	RANSWER	-	TANSWER(0b1110)	0	A Remote Answer was configured to recognize a remote request frame received, after that a MB is set to transmit a response frame. The code is automatically changed to TANSWER (0b1110). Refer to <a href="#">Matching Process</a> for details.  If CTRL2[RRS] is negated, transmit a response frame whenever a remote request frame with the same ID is received.
			-	1	This code is ignored during matching and arbitration process. Refer to <a href="#">Matching Process</a> for details.
CODE[0]=1b1: BUSY - FlexCAN is updating the contents of the MB. The CPU must not access the MB.	BUSY <sup>5</sup>	-	FULL	-	Indicates that the MB is being updated, it will be negated automatically and does not interfere on the next CODE.
			OVERRUN	-	

1. SRV: Serviced MB. MB was read and unlocked by reading TIMER or other MB.
2. A frame is considered successful reception after the frame to be moved to MB (move-in process). Refer to [Move-in](#) for details)
3. Remote Request Stored bit from CTRL2 register. Refer to [CTRL2](#) for details.
4. Code 4'b1010 is not considered as a Tx and a MB with this code should not to be aborted.
5. Note that for Tx MBs, the BUSY bit should be ignored upon read, except when AEN bit is set in the MCR register. If this bit is asserted, the corresponding MB does not participate in the matching process.

**Table 26-4. Message Buffer Code for Tx buffers**

CODE Description	Tx Code BEFORE tx frame	MB RTR	Tx Code AFTER successful transmission	Comment
0b1000: INACTIVE - MB is not active	INACTIVE	-	-	MB does not participate in the arbitration process.
0b1001: ABORT - MB is aborted	ABORT	-	-	MB does not participate in the arbitration process.
0b1100: DATA - MB is a Tx Data Frame (MB RTR must be 0)	DATA	0	INACTIVE	Transmit data frame unconditionally once. After transmission, the MB automatically returns to the INACTIVE state.
0b1100: REMOTE - MB is a Tx Remote Request Frame (MB RTR must be 1)	REMOTE	1	EMPTY	Transmit remote request frame unconditionally once. After transmission, the MB automatically becomes an Rx Empty MB with the same ID.
0b1110: TANSWER - MB is a Tx Response Frame from an incoming Remote Request Frame	TANSWER	-	RANSWER	This is an intermediate code that is automatically written to the MB by the CHI as a result of match to a remote request frame. The remote response frame will be transmitted unconditionally once and then the code will automatically return to RANSWER (0b1010). The CPU can also write this code with the same effect.  The remote response frame can be either a data frame or another remote request frame depending on the RTR bit value. Refer to <a href="#">Matching Process</a> and <a href="#">Arbitration process</a> for details.

### SRR - Substitute Remote Request

Fixed recessive bit, used only in extended format. It must be set to '1' by the user for transmission (Tx Buffers) and will be stored with the value received on the CAN bus for Rx receiving buffers. It can be received as either recessive or dominant. If FLEXCAN receives this bit as dominant, then it is interpreted as arbitration loss.

1= Recessive value is compulsory for transmission in Extended Format frames

0= Dominant is not a valid value for transmission in Extended Format frames

### IDE - ID Extended Bit

This bit identifies whether the frame format is standard or extended. It is also used as part of the reception filter.

1= Frame format is extended

0= Frame format is standard

### RTR - Remote Transmission Request

This bit affects the behavior of Remote Frames and is part of the reception filter. Refer to the tables above and RRS bit in [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for additional details.

If FLEXCAN transmits this bit as '1' (recessive) and receives it as '0' (dominant), it is interpreted as arbitration loss. If this bit is transmitted as '0' (dominant), then if it is received as '1' (recessive), the FLEXCAN module treats it as bit error. If the value received matches the value transmitted, it is considered as a successful bit transmission.

1= Indicates the current MB has a Remote Frame to be transmitted if MB is Tx. If the MB is Rx then incoming Remote Request Frames may be stored.

0= Indicates the current MB has a Data Frame to be transmitted. In Rx MB it may be considered in matching processes.

**DLC - Length of Data in Bytes**

This 4-bit field is the length (in bytes) of the Rx or Tx data, which is located in offset 0x08 through 0x0F of the MB space (see the first table above). In reception, this field is written by the FLEXCAN module, copied from the DLC (Data Length Code) field of the received frame. In transmission, this field is written by the Arm and corresponds to the DLC field value of the frame to be transmitted. When RTR=1, the Frame to be transmitted is a Remote Frame and does not include the data field, regardless of the Length field. The DLC field indicates which DATA BYTEs are valid as shown in the table below.

**TIME STAMP - Free-Running Counter Time Stamp**

This 16-bit field is a copy of the Free-Running Timer, captured for Tx and Rx frames at the time when the beginning of the Identifier field appears on the CAN bus.

**PRI0 - Local priority**

This 3-bit field is only used when MCR[LPRIO\_EN] bit is asserted and it only makes sense for Tx mailboxes. These bits are not transmitted. They are appended to the regular ID to define the transmission priority. See [Arbitration process](#).

**ID - Frame Identifier**

In Standard Frame format, only the 11 most significant bits (28 to 18) are used for frame identification in both receive and transmit cases. The 18 least significant bits are ignored. In Extended Frame format, all bits are used for frame identification in both receive and transmit cases.

**DATA BYTE 0-7 - Data Field**

Up to eight bytes can be used for a data frame.

For Rx frames, the data is stored as it is received from the CAN bus. DATA BYTE ( $n$ ) is valid only if  $n$  is less than DLC as shown in the table below.

For Tx frames, the CPU prepares the data field to be transmitted within the frame.

**Table 26-5. DATA BYTEs validity**

DLC	Valid DATA BYTEs
0	none
1	DATA BYTE 0
2	DATA BYTE 0-1
3	DATA BYTE 0-2
4	DATA BYTE 0-3
5	DATA BYTE 0-4
6	DATA BYTE 0-5
7	DATA BYTE 0-6
8	DATA BYTE 0-7

## 26.5 Rx FIFO Structure

When the MCR[RFEN] bit is set, the memory area from 0x80 to 0xDC (which is normally occupied by MBs 0 to 5) is used by the reception FIFO engine.

The region 0x80-0x8C contains the output of the FIFO which must be read by the CPU as a Message Buffer. This output contains the oldest message received and not read yet. The region 0x90-0xDC is reserved for internal use of the FIFO engine.

An additional memory area, that starts at 0xE0 and may extend up to 0x2DC (normally occupied by MBs 6 up to 37) depending on the CTRL2[RFFN] field setting, contains the ID Filter Table (configurable from 8 to 128 memory positions) that specifies filtering criteria for accepting frames into the FIFO. [Table 26-6](#) shows the Rx FIFO data structure.

Each ID Filter Table Element occupies an entire 32-bit word and can be compounded by one, two or four Identifier Acceptance Filters (IDAF) depending on the MCR[IDAM] field setting. [Table 26-7](#), [Table 26-8](#) and [Table 26-9](#) show the IDAF indexation. [Table 26-10](#) show the three different formats that the IDAF can assume, depending on the MCR[IDAM] field setting. Note that all elements of the table must have the same format. See [Rx FIFO](#) for more information.

Out of reset, the ID Filter Table flexible memory area defaults to 0xE0 and only extends to 0xFC, which corresponds to MBs 6 to 7 for RFFN=0.

### RXIDA - Rx Frame Identifier (Format A)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), only the 11 most significant bits (29 to 19 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all bits are used.

### RXIDB\_0, RXIDB\_1 - Rx Frame Identifier (Format B)

Specifies an ID to be used as acceptance criteria for the FIFO. In the Standard Format (IDAF's or incoming frame's IDE bit is negated), the 11 most significant bits (29 to 19 and 13 to 3 ) are used for frame identification. In the Extended Format (both IDAF's and incoming frame's IDE are asserted), all 14 bits of the field are compared with the 14 most significant bits of the Identifier of the incoming frame. The 15 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

### RXIDC\_0, RXIDC\_1, RXIDC\_2, RXIDC\_3 - Rx Frame Identifier (Format C)

Specifies an ID to be used as acceptance criteria for the FIFO. In both Standard Format and Extended Format, all 8 bits of the field are compared to the 8 most significant bits of the Identifier of the incoming frame. The 3 least significant bits of the Identifier of an incoming Standard Format frame and the 21 least significant bits of the Identifier of an incoming Extended Format frame do not affect the acceptance.

## 26.6 Functional Description

This section provides a complete functional description of the block.

### 26.6.1 Functional Overview

The FLEXCAN module is a CAN protocol engine with a very flexible mailbox system for transmitting and receiving CAN frames. The mailbox system consists of a set of 64 Message Buffers (MB) that store configuration and control data, time stamp, message ID and data (see [Message Buffer Structure](#)). The memory corresponding to the first 38 MBs can be configured to support a FIFO reception scheme with a powerful ID filtering mechanism, capable of checking incoming frames against a table of IDs (up to 128 extended IDs or 256 standard IDs or 512 8-bit ID slices), with individual mask register for up to 32 ID Filter Table elements. Simultaneous reception through FIFO and mailbox is supported. For mailbox reception, a *matching* algorithm makes it possible to store received frames only into MBs that have the same ID. A masking scheme makes it possible to match the ID programmed on the MB with a range of Identifiers on received

CAN frames. For transmission, an *arbitration* algorithm decides the prioritization of MBs to be transmitted based on the message ID (optionally augmented by 3 local priority bits) or the MB ordering.

Before proceeding with the functional description, an important concept must be explained. A Message Buffer is said to be "active" at a given time if it can participate in both the Matching and Arbitration processes. An Rx MB with a 0b0000 code is inactive (refer to [Table 26-3](#)). Similarly, a Tx MB with a 0b1000 or 0b1001 code is also inactive (refer to [Table 26-4](#)).

## 26.6.2 Transmit Process

In order to transmit a CAN frame, the CPU must prepare a Message Buffer for transmission by executing the procedure found here.

1. Check if the respective interruption bit is set and clear it.
2. If the MB is active (transmission pending), write the ABORT code (0b1001) to the CODE field of the Control and Status word to request an abortion of the transmission. Wait for the corresponding IFLAG to be asserted by polling the IFLAG register or by the interrupt request if enabled by the respective IMASK. Then read back the CODE field to check if the transmission was aborted or transmitted (see [Transmission Abort Mechanism](#)). If backwards compatibility is desired (MCR[AEN] bit negated), just write the INACTIVE code (0b1000) to the CODE field to inactivate the MB but then the pending frame may be transmitted without notification (see [Message Buffer Inactivation](#)).
3. Write the ID word.
4. Write the data bytes.
5. Write the DLC, Control and Code fields of the Control and Status word to activate the MB.

Once the MB is activated, it will participate into the arbitration process and eventually be transmitted according to its priority.

At the end of the successful transmission, the value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the MB's Time Stamp field, the CODE field in the Control and Status word is updated, the CRC Register is updated, a status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit. The new CODE field after transmission depends on the code that was used to activate the MB in step four (see [Table 26-3](#) and [Table 26-4](#) in [Message Buffer Structure](#)).

When the Abort feature is enabled (MCR[AEN] bit is asserted), after the Interrupt Flag is asserted for a Mailbox configured as transmit buffer, the Mailbox is blocked, therefore the CPU is not able to update it until it negates the Interrupt Flag. It means that the CPU must clear the corresponding IFLAG before starting to prepare this MB for a new transmission or reception.

### 26.6.3 Arbitration process

The arbitration process scans the Mailboxes searching the Tx one that holds the message to be sent in the next opportunity. This Mailbox is called the *arbitration winner*.

The scan starts from the lowest Mailbox number and runs toward the higher ones.

The arbitration process is triggered in the following events:

- From the CRC field of the CAN frame. The start point depends on the CTRL2[TASD] field value. See [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details.
- During the error delimiter field of the CAN frame
- During the Overload Delimiter field of a CAN frame.
- When the winner is inactivated and the CAN bus has still not reached the first bit of the Intermission field.
- When Arm write to the C/S word of a winner MB and the CAN bus has still not reached the first bit of the Intermission field.
- When CHI is in Idle state and Arm writes to the C/S word of any MB.
- When FlexCAN exits Bus Off state
- Upon leaving Freeze Mode or Low Power Mode

If the arbitration process does not manage to evaluate all Mailboxes before the CAN bus has reached the first bit of the Intermission field the temporary arbitration winner is invalidated and the FlexCAN will not compete for the CAN bus in the next opportunity.

The arbitration process selects the winner among the active Tx Mailboxes at the end of the scan according to both CTRL1[LBUF] and MCR[LPRIO\_EN] bits settings.

#### 26.6.3.1 Lowest Mailbox number first

If CTRL1[LBUF] bit is asserted the first (lowest number) active Tx Mailbox found is the arbitration winner. MCR[LPRIO\_EN] bit has no effect when CTRL1[LBUF] is asserted.

### 26.6.3.2 Highest Mailbox priority first

If CTRL1[LBUF] bit is negated then the arbitration process searches the active Tx Mailbox with the highest priority, and this Mailbox would have a higher probability to win the arbitration on CAN bus.

The sequence of bits considered for this arbitration is called the *arbitration value* of the Mailbox. The highest priority Tx Mailbox is the one that has the least arbitration value among all Tx Mailboxes.

If two or more Mailboxes have equivalent arbitration values the lowest Mailbox number is the arbitration winner.

The composition of the arbitration value depends on MCR[LPRIO\_EN] bit setting.

#### 26.6.3.2.1 Local Priority disabled

If MCR[LPRIO\_EN] bit is negated the arbitration value is built in the exact sequence of bits as they would be transmitted in a CAN frame (see [Table 26-11](#)) in such a way that the Local Priority is disabled.

**Table 26-11. Composition of the arbitration value when Local Priority is disabled**

Format	Mailbox Arbitration Value (32 bits)				
Standard (IDE = 0)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	Extended ID[28:18 ] (11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

#### 26.6.3.2.2 Local Priority enabled

If Local Priority is desired MCR[LPRIO\_EN] must be asserted.

In this case the Mailbox PRIO field is included at the very left of the arbitration value (see the table below).

**Table 26-12. Composition of the arbitration value when Local Priority is enabled**

Format	Mailbox Arbitration Value (35 bits)					
Standard (IDE = 0)	PRIO (3 bits)	Standard ID (11 bits)	RTR (1 bit)	IDE (1 bit)	- (18 bits)	- (1 bit)
Extended (IDE = 1)	PRIO (3 bits)	Extended ID[28:18 ](11 bits)	SRR (1 bit)	IDE (1 bit)	Extended ID[17:0 ] (18 bits)	RTR (1 bit)

As the PRIO field is the most significant part of the arbitration value Mailboxes with low PRIO values have higher priority than Mailboxes with high PRIO values regardless the rest of their arbitration values.

Note that the PRIO field is not part of the frame on the CAN bus. Its purpose is only to affect the internal arbitration process.

Once the arbitration winner is found, its content is copied to a hidden auxiliary MB called Tx Serial Message Buffer (Tx SMB), which has the same structure as a normal MB but is not user accessible. This operation is called "move-out" and after it is done, write access to the corresponding MB is blocked (if the AEN bit in MCR is asserted). The write access is released in the following events:

- After the MB is transmitted
- FlexCAN enters in Freeze Mode or Bus Off
- FlexCAN loses the bus arbitration or there is an error during the transmission

At the first opportunity window on the CAN bus, the message on the Tx SMB is transmitted according to the CAN protocol rules. FlexCAN transmits up to eight data bytes, even if the DLC (Data Length Code) field value is greater than that.

Arbitration process can be triggered in the following situations:

- During Rx and Tx frames from CAN CRC field to end of frame. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally, T ASD value may be changed (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.
- During CAN Bus Off state from TX\_ERR\_CNT=124 to 128. Arbitration start point depends on instantiation parameters NUMBER\_OF\_MB and T ASD. Additionally, T ASD value may be changed(see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)) to optimize the arbitration start point.
- During C/S write by CPU in Bus Idle. First C/S write starts arbitration process and a second C/S write during this same arbitration restarts the process. If other C/S writes are performed, Tx arbitration process is pending. If there is no arbitration winner after arbitration process has finished, then TX arbitration machine begins a new arbitration process.
- Arbitration winner deactivation during a valid arbitration window.
- Upon Leave Freeze Mode. If there is a re-synchronization during WaitForBusIdle arbitration process is restarted.

Arbitration process stops in the following situation:

- All Mailboxes were scanned.
- A Tx active Mailbox is found in case of Lowest Buffer feature enabled.
- Arbitration winner inactivation or abort during any arbitration process.

## Functional Description

- There was not enough time to finish Tx arbitration process. For instance, a deactivation was performed near the end of frame). In this case arbitration process is pending.
- Error or Overload flag in the bus.
- Low Power or Freeze Mode request in Idle state

Arbitration is considered pending as described below:

- It was not possible to finish arbitration process in time.
- C/S write during arbitration if write is performed in a MB which number is lower than the Tx arbitration pointer.
- Any C/S write if there is no Tx Arbitration process in progress.
- Rx Match has just updated a Rx Code to Tx Code.
- Entering Bus off state.

C/S write during arbitration has the following effect:

- If C/S write is performed in the arbitration winner, a new process is restarted immediately.
- C/S write during arbitration if write is performed in a MB which number is higher than the Tx arbitration pointer.

## 26.6.4 Receive Process

To be able to receive CAN frames into a Mailbox, the CPU must prepare it for reception by executing the steps listed here.

1. If the Mailbox is active (either Tx or Rx) inactivate the Mailbox (see [Message Buffer Inactivation](#)), preferably with a *safe inactivation* (see [Transmission Abort Mechanism](#));
2. Write the ID word;
3. Write the EMPTY code (0b0100) to the CODE field of the Control and Status word to activate the Mailbox.

Once the Mailbox is activated in the third step, it will be able to receive frames that match the programmed filter. At the end of a successful reception, the Mailbox is updated by the *move-in process* (see [Move-in](#)) as follows:

1. The received Data field (8 bytes at most) is stored;
2. The received Identifier field is stored;
3. The value of the Free Running Timer at the time of the second bit of frame's Identifier field is written into the Mailbox Time Stamp field;
4. The received SRR, IDE, RTR and DLC fields are stored;

5. The CODE field in the Control and Status word is updated. (see [Table 26-3](#) and [Table 26-4](#) in Section [Message Buffer Structure](#))
6. A status flag is set in the Interrupt Flag Register and an interrupt is generated if allowed by the corresponding Interrupt Mask Register bit.

The recommended way for the CPU servicing (read) the frame received in a Mailbox is using the following procedure:

1. Read the Control and Status word of that Mailbox;
2. Check if the BUSY bit is deasserted, indicating that the Mailbox is locked. Repeat step 1) while it is asserted. See [Message Buffer Lock Mechanism](#);
3. Read the contents of the Mailbox. Once Mailbox is locked now, its contents won't be modified by FlexCAN Move-in processes. See [Move-in](#);
4. Acknowledge the proper flag at IFLAG registers;
5. Read the Free Running Timer. It is optional but recommended to unlock Mailbox as soon as possible and make it available for reception.

The CPU should synchronize to frame reception by the status flag bit for the specific Mailbox in one of the IFLAG Registers and not by the CODE field of that Mailbox. Polling the CODE field does not work because once a frame was received and the CPU services the Mailbox (by reading the C/S word followed by unlocking the Mailbox), the CODE field will not return to EMPTY. It will remain FULL. If the CPU tries to workaround this behavior by writing to the C/S word to force an EMPTY code after reading the Mailbox without a prior *safe inactivation*, a newly received message matching the filter of that Mailbox may be lost.

In summary: never do polling by reading directly the C/S word of the Mailboxes. Instead, read the IFLAG registers.

Note that the received frame's Identifier field is always stored in the matching Mailbox, thus the contents of the ID field in a Mailbox may change if the match was due to masking. Note also that FlexCAN does receive frames transmitted by itself if there exists a matching Rx Mailbox, provided the MCR[SRX\_DIS] bit is not asserted. If MCR[SRX\_DIS] bit is asserted, FlexCAN will not store messages transmitted by itself in any MB, even if it contains a matching MB, and no interrupt flag or interrupt signal will be generated due to the frame reception.

To be able to receive CAN messages through the Rx FIFO, the CPU must enable and configure the Rx FIFO during Freeze Mode(see [Rx FIFO](#)). Upon receiving the Frames Available in Rx FIFO interrupt(see [Interrupt Masks 1 Register \(FLEXCAN\\_IMASK1\)](#), bit IFLAG[BUF5I] - Frames available in Rx FIFO), the CPU should service the received frame using the following procedure:

1. Read the Control and Status word (optional - needed only if a mask was used for IDE and RTR bits);
2. Read the ID field (optional - needed only if a mask was used);
3. Read the Data field;
4. Read the RXFIR register (optional);
5. Clear the Frames Available in Rx FIFO interrupt by writing 1 to IFLAG[BUF5I] bit (mandatory - releases the MB and allows the CPU to read the next Rx FIFO entry)

### 26.6.5 Matching Process

The matching process scans the MB memory looking for Rx MBs programmed with the same ID as the one received from the CAN bus. If the FIFO is enabled, the priority of scanning can be selected between Mailboxes and FIFO filters. In any case, the matching starts from the lowest number Message Buffer toward the higher ones. If no match is found within the first structure then the other is scanned subsequently. In the event that the FIFO is full, the matching algorithm will always look for a matching MB outside the FIFO region.

As the frame is being received, it is stored in a hidden auxiliary MB called Rx Serial Message Buffer (Rx SMB).

The matching process start point depends on the following conditions:

- if the received frame is a remote frame, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field equal to zero, the start point is the CRC field of the frame;
- if the received frame is a data frame with DLC field different than zero, the start point is the DATA field of the frame;

If a matching ID is found in the FIFO table or in one of the Mailboxes, the contents of the SMB will be transferred to the FIFO or to the matched Mailbox by the move-in process. If any CAN protocol error is detected then no match results will be transferred to the FIFO or to the matched Mailbox at the end of reception.

The matching process scans all matching elements of both Rx FIFO (if enabled) and active Rx Mailboxes (CODE is EMPTY, FULL, OVERRUN or RANSWER) in search of a successful comparison with the matching elements of the Rx SMB that is receiving the frame on the CAN bus. The SMB has the same structure of a Mailbox. The reception structures (Rx FIFO or Mailboxes) associated with the matching elements that had a successful comparison are the *matched structures*. The *matching winner* is selected at the end of the scan among those matched structures and depends on conditions described ahead. Refer to the following table for details.

**Table 26-13. Matching architecture**

Structure	SMB[RTR]	CTRL2[RRS]	CTRL2[EACEN]	MB[IDE]	MB[RTR]	MB[ID] <sup>1</sup>	MB[CODE]
Mailbox	0	-	0	cmp <sup>2</sup>	no_cmp <sup>3</sup>	cmp_msk <sup>4</sup>	EMPTY or FULL or OVERRUN
Mailbox	0	-	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	0	-	cmp	no_cmp	cmp	RANSWER
Mailbox	1	1	0	cmp	no_cmp	cmp_msk	EMPTY or FULL or OVERRUN
Mailbox	1	1	1	cmp_msk	cmp_msk	cmp_msk	EMPTY or FULL or OVERRUN
FIFO <sup>5</sup>	-	-	-	cmp_msk	cmp_msk	cmp_msk	-

1. For Mailbox structure, If SMB[IDE] is asserted, the ID is 29 bits (ID Standard + ID Extended). In case of SMB[IDE] to be negated, the ID is only 11 bits (ID Standard). Please, refer to [Message Buffer Structure](#) for ID details. For FIFO structure, the ID depends on IDAM. Please, refer to [Rx FIFO Structure](#) for IDAM details.
2. cmp: Compares the SMB contents with the MB contents regardless the masks.
3. no\_cmp: The SMB contents are not compared with the MB contents.
4. cmp\_msk: Compares the SMB contents with MB contents taking into account the masks.
5. SMB[IDE] and SMB[RTR] are not taken into account when IDAM is type C.

A reception structure is *free-to-receive* when any of the following conditions is satisfied:

- the CODE field of the Mailbox is EMPTY;
- the CODE field of the Mailbox is either FULL or OVERRUN and it has already been serviced (the C/S word was read by the Arm and unlocked as described in [Message Buffer Lock Mechanism](#));
- the CODE field of the Mailbox is either FULL or OVERRUN and an inactivation is performed. (see [Message Buffer Inactivation](#))
- the Rx FIFO is not full.

The scan order for Mailboxes and Rx FIFO is from the matching element with lowest number to the higher ones.

The matching winner search for Mailboxes is affected by the MCR[IRMQ] bit. If it is negated the matching winner is the first matched Mailbox regardless if it is free-to-receive or not . If it is asserted, the matching winner is selected according to the priority below:

1. the first free-to-receive matched Mailbox;
2. the last non free-to-receive matched Mailbox.

It is possible to select the priority of scan between Mailboxes and Rx FIFO by the CTRL2[MRP] bit.

If the selected priority is Rx FIFO first:

- if the Rx FIFO is a matched structure and is free-to-receive then the Rx FIFO is the matching winner regardless of the scan for Mailboxes;
- otherwise (the Rx FIFO is not a matched structure or is not free-to-receive), then the matching winner is searched among Mailboxes as described above.

If the selected priority is Mailboxes first:

- if a free-to-receive matched Mailbox is found, it is the matching winner regardless the scan for Rx FIFO;
- if no matched Mailbox is found, then the matching winner is searched in the scan for the Rx FIFO;
- if both conditions above are not satisfied and a non free-to-receive matched Mailbox is found then the matching winner determination is conditioned by the MCR[IRMQ] bit:
  - if MCR[IRMQ] bit is negated the matching winner is the first matched Mailbox;
  - if MCR[IRMQ] bit is asserted the matching winner is the Rx FIFO if it is a free-to-receive matched structure, otherwise the matching winner is the last non free-to-receive matched Mailbox.

Please, refer to the table below for a summary of matching possibilities.

If a non-safe Mailbox inactivation (see [Message Buffer Inactivation](#)) occurs during matching process and the Mailbox inactivated is the temporary matching winner then the temporary matching winner is invalidated. The matching elements scan is not stopped nor restarted, it continues normally. The consequence is that the current matching process works as if the matching elements compared before the inactivation did not exist, therefore a message may be lost.

Suppose, for example, that the FIFO is disabled, IRMQ is enabled and there are two MBs with the same ID, and FlexCAN starts receiving messages with that ID. Let us say that these MBs are the second and the fifth in the array. When the first message arrives, the matching algorithm will find the first match in MB number 2. The code of this MB is EMPTY, so the message is stored there. When the second message arrives, the matching algorithm will find MB number 2 again, but it is not "free-to-receive", so it will keep looking and find MB number 5 and store the message there. If yet another message with the same ID arrives, the matching algorithm finds out that there are no matching MBs that are "free-to-receive", so it decides to overwrite the last matched MB, which is number 5. In doing so, it sets the CODE field of the MB to indicate OVERRUN.

**Table 26-14. Matching Possibilities and Resulting Reception Structures**

RFEN	IRMQ	MRP	Matched in MB	Matched in FIFO	Reception Structure	Description
No FIFO, only MB, match is always MB first						
0	0	X <sup>1</sup>	None <sup>2</sup>	- <sup>3</sup>	None	Frame lost by no match
0	0	X	Free <sup>4</sup>	-	FirstMB	
0	1	X	None	-	None	Frame lost by no match
0	1	X	Free	-	FirstMB	
0	1	X	NotFree	-	LastMB	Overrun
FIFO enabled, no match in FIFO is as if FIFO does not exist						
1	0	X	None	None <sup>5</sup>	None	Frame lost by no match
1	0	X	Free	None	FirstMB	
1	1	X	None	None	None	Frame lost by no match
1	1	X	Free	None	FirstMB	
1	1	X	NotFree	None	LastMB	Overrun
FIFO enabled, Queue disabled						
1	0	0	X	NotFull <sup>6</sup>	FIFO	
1	0	0	None	Full <sup>7</sup>	None	Frame lost by FIFO full (FIFO Overflow)
1	0	0	Free	Full	FirstMB	
1	0	0	NotFree	Full	FirstMB	
1	0	1	None	NotFull	FIFO	
1	0	1	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	0	1	Free	X	FirstMB	
1	0	1	NotFree	X	FirstMB	Overrun
FIFO enabled, Queue enabled						
1	1	0	X	NotFull	FIFO	
1	1	0	None	Full	None	Frame lost by FIFO full (FIFO Overflow)
1	1	0	Free	Full	FirstMB	
1	1	0	NotFree	Full	LastMB	Overrun
1	1	1	None	NotFull	FIFO	
1	1	1	Free	X	FirstMB	
1	1	1	NotFree	NotFull	FIFO	
1	1	1	NotFree	Full	LastMB	Overrun

1. It is a don't care condition.
2. Matched in MB "None" means that the frame has not matched any MB (free-to-receive or non-free-to-receive).
3. It is a forbidden condition.
4. Matched in MB "Free" means that the frame matched at least one MB free-to-receive regardless it has matched MBs non-free-to-receive.
5. Matched in FIFO "None" means that the frame has not matched any filter in FIFO. It is as if the FIFO didn't exist (CTRL2[RFEN]=0).
6. Matched in FIFO "NotFull" means that the frame has matched a FIFO filter and has empty slots to receive it.
7. Matched in FIFO "Full" means that the frame has matched a FIFO filter but couldn't store it because it has no empty slots to receive it.

The ability to match the same ID in more than one MB can be exploited to implement a reception queue (in addition to the full featured FIFO) to allow more time for Arm to service the MBs. By programming more than one MB with the same ID, received messages will be queued into the MBs. Arm can examine the Time Stamp field of the MBs to determine the order in which the messages arrived.

Matching to a range of IDs is possible by using ID Acceptance Masks. FlexCAN supports individual masking per MB. Please refer to [Rx Mailboxes Global Mask Register \(FLEXCAN\\_RXMGMASK\)](#). During the matching algorithm, if a mask bit is asserted, then the corresponding ID bit is compared. If the mask bit is negated, the corresponding ID bit is "don't care". Please note that the Individual Mask Registers are implemented in RAM, so they are not initialized out of reset. Also, they can only be programmed while the module is in Freeze Mode,, otherwise they are blocked by hardware.

FlexCAN also supports an alternate masking scheme with only four mask registers (RGXMASK, RX14MASK, RX15MASK and RXFGMASK) for backward compatibility. This alternate masking scheme is enabled when the IRMQ bit in the MCR Register is negated.

### 26.6.6 Move Process

There are two types of move process, namely move-in and move-out.

#### 26.6.6.1 Move-in

The move-in process is the copy of a message received by an Rx SMB to a Rx Mailbox or FIFO that has matched it. If the move destination is the Rx FIFO, attributes of the message are also copied to the RXFIR FIFO. Each Rx SMB has its own move-in process, but only one is performed at a given time as described ahead. The move-in starts only when the message held by the Rx SMB has a corresponding matching winner (see [Matching Process](#)) and all of the following conditions are true:

- the CAN bus has reached or let past either:
  - the second bit of Intermission field next to the frame that carried the message that is in the Rx SMB;
  - the first bit of an overload frame next to the frame that carried the message that is in the Rx SMB;
- there is no ongoing matching process;

- the destination Mailbox is not locked by Arm;
- there is no ongoing move-in process from another Rx SMB. If more than one move-in processes are to be started at the same time both are performed and the newest substitutes the oldest.

The term *pending move-in* is used throughout the document and stands for a move-to-be that still does not satisfy all of the aforementioned conditions.

The move-in is cancelled and the Rx SMB is able to receive another message if any of the following conditions is satisfied:

- the destination Mailbox is inactivated after the CAN bus has reached the first bit of Intermission field next to the frame that carried the message and its matching process has finished;
- there is a previous pending move-in to the same destination Mailbox.
- the Rx SMB is receiving a frame transmitted by the FlexCAN itself and the self-reception is disabled;
- any CAN protocol error is detected.

Note that the pending move-in is not cancelled if the module enters in Freeze or Low Power Mode. It only stays on hold waiting for exiting Low Power Mode and to be unlocked. If an MB is unlocked during Freeze Mode, the move-in happens immediately.

The move-in process consists of the following steps:

1. if the message is destined to the Rx FIFO, push IDHIT into the RXFIR FIFO;
2. reads the words DATA0-3 and DATA4-7 from the Rx SMB;
3. writes it in the words DATA0-3 and DATA4-7 of the Rx Mailbox;
4. reads the words Control/Status and ID from the Rx SMB;
5. writes it in the words Control/Status and ID of the Rx Mailbox, updating the CODE field according to [Table 26-3](#).

The move-in process is not atomic, in such a way that it is immediately cancelled by the inactivation of the destination Mailbox (see [Message Buffer Inactivation](#)) and in this case the Mailbox may be left partially updated, thus incoherent. The exception is if the move-in destination is an Rx FIFO Message Buffer, then the process cannot be cancelled.

The BUSY Bit (least significant bit of the CODE field) of the destination Message Buffer is asserted while the move-in is being performed in such a way that Arm beware that the Message Buffer content is temporarily incoherent.

## 26.6.6.2 Move-out

The move-out process is the copy of the content from a Tx Mailbox to the Tx SMB when a message for transmission is available (see [Arbitration process](#)). The move-out occurs in the following conditions:

- the first bit of Intermission field;
- during Bus off field when TX Error Counter is in the 124 to 128 range;
- during BusIdle field;
- during Wait For Bus Idle field.

The move-out process is not atomic. Only Arm has priority to access the memory concurrently out of BusIdle state. In BusIdle, the move-out has the lowest priority to the concurrent memory accesses.

## 26.6.7 Data Coherence

In order to maintain data coherency and FlexCAN proper operation, the Arm must obey the rules described in the [Transmit Process](#) and [Receive Process](#).

Any form of Arm accessing an MB structure within FlexCAN other than those specified may cause FlexCAN to behave in an unpredictable way.

### 26.6.7.1 Transmission Abort Mechanism

The abort mechanism provides a safe way to request the abortion of a pending transmission. A feedback mechanism is provided to inform Arm if the transmission was aborted or if the frame could not be aborted and was transmitted instead.

In order to abort a transmission, Arm must write a specific abort code (0b1001) to the CODE field of the Control and Status word. The active MBs configured as transmission must be aborted first and then they may be updated. If the abort code is written to a Mailbox that is currently being transmitted, or to a Mailbox that was already loaded into the SMB for transmission, the write operation is blocked and the MB is kept active, but the abort request is captured and kept pending until one of the following conditions are satisfied:

- The module loses the bus arbitration
- There is an error during the transmission
- The module is put into Freeze Mode
- The module enters in BusOff state
- There is an overload frame

If none of conditions above are reached, the MB is transmitted correctly, the interrupt flag is set in the IFLAG register and an interrupt to the Arm is generated (if enabled). The abort request is automatically cleared when the interrupt flag is set. In the other hand, if one of the above conditions is reached, the frame is not transmitted, therefore the abort code is written into the CODE field, the interrupt flag is set in the IFLAG and an interrupt is (optionally) generated to Arm.

If Arm writes the ABORT code before the transmission begins internally, then the write operation is not blocked, therefore the MB is updated and the interrupt flag is set. In this way Arm just needs to read the abort code to make sure the active MB was *safely inactivated*. Although the AEN bit is asserted and Arm wrote the abort code, in this case the MB is inactivated and not aborted, because the transmission did not start yet. One Mailbox is only aborted when the abort request is captured and kept pending until one of the previous conditions are satisfied.

The abort procedure can be summarized as follows:

1. Arm checks the corresponding IFLAG and clears it, if asserted.
2. Arm writes 0b1001 into the CODE field of the C/S word.
3. Arm waits for the corresponding IFLAG indicating that the frame was either transmitted or aborted.
4. Arm reads the CODE field to check if the frame was either transmitted (CODE=0b1000) or aborted (CODE=0b1001).
5. It is necessary to clear the corresponding IFLAG in order to allow the MB to be reconfigured.

### 26.6.7.2 Message Buffer Inactivation

Inactivation is a mechanism provided to protect the Mailbox against updates by the FlexCAN internal processes, thus allowing Arm to rely on Mailbox data coherence after having updated it, even in Normal Mode.

If a Mailbox is inactivated it does not participate neither in the arbitration nor in the matching process until it is reactivated. See [Transmit Process](#) and [Receive Process](#) for more detailed instruction on how to inactivate and reactivate a Mailbox.

In order to inactivate a Mailbox Arm must update its CODE field to INACTIVE (either 0b0000 or 0b1000).

As the user is not able to synchronize the CODE field update with the FlexCAN internal processes an inactivation can lead to undesirable results:

## Functional Description

- a frame in the bus that matches the filtering of the inactivated Rx Mailbox may be lost without notice, even if there are other Mailboxes with the same filter;
- a frame containing the message within the inactivated Tx Mailbox may be transmitted without notice.

In order to eliminate such risk and perform a *safe inactivation* Arm must use the following mechanism along with the inactivation itself:

- for Tx Mailboxes, the Transmission Abort (see [Transmission Abort Mechanism](#));

The inactivation automatically unlocks the Mailbox (see [Message Buffer Lock Mechanism](#)).

Message Buffers that are part of the Rx FIFO cannot be inactivated. There is no write protection on FIFO region by FlexCAN. Arm must keep the data coherence into FIFO region when RFEN is asserted.

### 26.6.7.3 Message Buffer Lock Mechanism

Besides MB inactivation, FlexCAN has another data coherence mechanism for the receive process. When Arm reads the Control and Status word of an Rx MB with codes FULL or OVERRUN, FlexCAN assumes that Arm wants to read the whole MB in an atomic operation, and thus it sets an internal lock flag for that MB. The lock is released when Arm reads the Free Running Timer (global unlock operation), or when it reads the Control and Status word of another MB regardless of its code or when Arm writes into C/S word from locked MB. The MB locking is done to prevent a new frame to be written into the MB while Arm is reading it.

The locking mechanism only applies to Rx MBs that are not part of FIFO and have a code different than INACTIVE (0b0000) or EMPTY<sup>1</sup> (0b0100). Also, Tx MBs can not be locked.

Suppose, for example, that the FIFO is disabled and the second and the fifth MBs of the array are programmed with the same ID, and FlexCAN has already received and stored messages into these two MBs. Suppose now that the Arm decides to read MB number 5 and at the same time another message with the same ID is arriving. When Arm reads the Control and Status word of MB number 5, this MB is locked. The new message arrives and the matching algorithm finds out that there are no "free-to-receive" MBs, so it decides to override MB number 5. However, this MB is locked, so the new message can not be written there. It will remain in the SMB waiting for the MB to be unlocked, and only then will be written to the MB. If the MB is not unlocked in time and yet another

---

1. In previous FlexCAN versions, reading the C/S word locks the MB even if it is EMPTY. This behavior is maintained when the IRMQ bit is negated.

new message with the same ID arrives, then the new message overwrites the one on the SMB and there will be no indication of lost messages either in the CODE field of the MB or in the Error and Status Register.

While the message is being moved-in from the SMB to the MB, the BUSY bit on the CODE field is asserted. If Arm reads the Control and Status word and finds out that the BUSY bit is set, it should defer accessing the MB until the BUSY bit is negated.

If the BUSY bit is asserted or if the MB is empty, then reading the Control and Status word does not lock the MB.

Inactivation takes precedence over locking. If Arm inactivates a locked Rx Mailbox, then its lock status is negated and the Mailbox is marked as invalid for the current matching round. Any pending message on the SMB will not be transferred anymore to the Mailbox. An MB is unlocked when Arm reads the Free Running Timer Register (see [Free Running Timer Register \(FLEXCAN\\_TIMER\)](#)), or the C/S word of another MB.

Lock and unlock mechanisms have the same functionality in both Normal and Freeze modes.

An unlock during Normal or Freeze mode results in the move-in of the pending message. However, the move-in is postponed if an unlock occurs during any of the low power modes (see in [Modes of Operation](#) specific information on Module Disable or Stop modes) and it will take place only when the module resumes to Normal or Freeze modes.

### 26.6.8 Rx FIFO

The receive-only FIFO is enabled by asserting the RFEN bit in the MCR.

The reset value of this bit is zero to maintain software backward compatibility with previous versions of the module that did not have the FIFO feature. The FIFO is 6-message deep, therefore when the FIFO is enabled, the memory region occupied by the first 6 Message Buffers is reserved for use of the FIFO engine (see [Rx FIFO Structure](#)). Arm can read the received messages sequentially, in the order they were received, by repeatedly reading a Message Buffer structure at the output of the FIFO.

The IFLAG[BUF5I] (Frames available in Rx FIFO) is asserted when there is at least one frame available to be read from the FIFO. An interrupt is generated if it is enabled by the corresponding mask bit. Upon receiving the interrupt, Arm can read the message (accessing the output of the FIFO as a Message Buffer) and the RXFIR register and then clear the interrupt. If there are more messages in the FIFO the act of clearing the interrupt updates the output of the FIFO with the next message and update the RXFIR with the attributes of that message, reissuing the interrupt to Arm. Otherwise, the flag remains negated. The output of the FIFO is only valid when the IFLAG[BUF5I] is asserted.

The IFLAG[BUF6I] (Rx FIFO Warning) is asserted when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. The flag remains asserted until Arm clears it.

The IFLAG[BUF7I] (Rx FIFO Overflow) is asserted when an incoming message was lost because the Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox. The flag remains asserted until the Arm clears it.

Clearing one of those three flags does not affect the state of the other two.

An interrupt is generated if an IFLAG bit is asserted and the corresponding mask bit is asserted too.

A powerful filtering scheme is provided to accept only frames intended for the target application, thus reducing the interrupt servicing work load. The filtering criteria is specified by programming a table of up to 128 32-bit registers, according to CTRL2[RFFN] setting, that can be configured to one of the following formats (see also [Rx FIFO Structure](#)):

- Format A: 128 IDAFs (extended or standard IDs including IDE and RTR)
- Format B: 256 IDAFs (standard IDs or extended 14-bit ID slices including IDE and RTR)
- Format C: 512 IDAFs (standard or extended 8-bit ID slices)

Every frame available in the FIFO has a corresponding IDHIT (Identifier Acceptance Filter Hit Indicator) that can be read by accessing the RXFIR register. The RXFIR[IDHIT] field refers to the message at the output of the FIFO and is valid whilst the IFLAG[BUF5I] flag is asserted. The RXFIR register must be read only before clearing the flag, which guarantees that the information refers to the correct frame within the FIFO.

Up to thirty two elements of the ID Filter Table are individually affected by the Individual Mask Registers (RXIMR0 - RXIMR31), according to CTRL2[RFFN] setting (refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)), allowing very powerful filtering criteria to be defined. If the MCR[IRMQ] bit is negated (or if the RXIMR are not available for the particular MCU), then the FIFO ID Filter Table is affected by RXFGMASK.

## 26.6.9 CAN Protocol Related Features

### 26.6.9.1 Remote Frames

Remote frame is a special kind of frame. The user can program a mailbox to be a Remote Request Frame by writing the mailbox as Transmit with the RTR bit set to '1'. After the remote request frame is transmitted successfully, the mailbox becomes a Receive Message Buffer, with the same ID as before.

When a remote request frame is received by FlexCAN, it can be treated in three ways, depending on Remote Request Storing (CTRL2[RRS]) and Rx FIFO Enable (MCR[RFEN]) bits:

- If RRS is negated the frame's ID is compared to the IDs of the Transmit Message Buffers with the CODE field 0b1010. If there is a matching ID, then this mailbox frame will be transmitted. Note that if the matching mailbox has the RTR bit set, then FlexCAN will transmit a remote frame as a response. The received remote request frame is not stored in a receive buffer. It is only used to trigger a transmission of a frame in response. The mask registers are not used in remote frame matching, and all ID bits (except RTR) of the incoming received frame should match. In the case that a remote request frame was received and matched a mailbox, this message buffer immediately enters the internal arbitration process, but is considered as normal Tx mailbox, with no higher priority. The data length of this frame is independent of the DLC field in the remote frame that initiated its transmission.
- If RRS is asserted the frame's ID is compared to the IDs of the receive mailboxes with the CODE field 0b0100, 0b0010 or 0b0110. If there is a matching ID, then this mailbox will store the remote frame in the same fashion of a data frame. No automatic remote response frame will be generated. The mask registers are used in the matching process.
- If RFEN is asserted FlexCAN will not generate an automatic response for remote request frames that match the FIFO filtering criteria. If the remote frame matches one of the target IDs, it will be stored in the FIFO and presented to the Arm. Note that for filtering formats A and B, it is possible to select whether remote frames are accepted or not. For format C, remote frames are always accepted (if they match the ID). Remote Request Frames are considered as normal frames, and generate a FIFO overflow when a successful reception occurs and the FIFO is already full.

### 26.6.9.2 Overload Frames

FLEXCAN does transmit overload frames due to detection of following conditions on CAN bus:

- Detection of a dominant bit in the first/second bit of Intermission

- Detection of a dominant bit at the 7th bit (last) of End of Frame field (Rx frames)
- Detection of a dominant bit at the 8th bit (last) of Error Frame Delimiter or Overload Frame Delimiter

### 26.6.9.3 Time Stamp

The value of the Free Running Timer is sampled at the beginning of the Identifier field on the CAN bus, and is stored at the end of "move-in" in the TIME STAMP field, providing network behavior with respect to time.

Note that the Free Running Timer can be reset upon a specific frame reception, enabling network time synchronization. Refer to TSYN description in [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

### 26.6.9.4 Protocol Timing

The FLEXCAN module supports a variety of means to setup bit timing parameters that are required by the CAN protocol. The Control Register has various fields used to control bit timing parameters: PRES DIV, PROPSEG, PSEG1, PSEG2 and RJW. See [Control 1 Register \(FLEXCAN\\_CTRL1\)](#).

The PRES DIV field controls a prescaler that generates the Serial Clock (Sclock), whose period defines the 'time quantum' used to compose the CAN waveform. A time quantum is the atomic unit of time handled by the CAN engine.

$$f_{Tq} = \frac{f_{CANCLK}}{(\text{Prescaler value})}$$

A bit time is subdivided into three segments<sup>2</sup> (reference [Table 26-15](#)):

---

2. For further explanation of the underlying concepts please refer to ISO/DIS 11519-1, Section 10.3. Reference also the Bosch CAN 2.0A/B protocol specification dated September 1991 for bit timing.

- SYNC\_SEG: This segment has a fixed length of one time quantum. Signal edges are expected to happen within this section.
- Time Segment 1: This segment includes the Propagation Segment and the Phase Segment 1 of the CAN standard. It can be programmed by setting the PROPSEG and the PSEG1 fields of the CTRL Register so that their sum (plus 2) is in the range of 4 to 16 time quanta.
- Time Segment 2: This segment represents the Phase Segment 2 of the CAN standard. It can be programmed by setting the PSEG2 field of the CTRL Register (plus 1) to be 2 to 8 time quanta long.

$$\text{Bit Rate} = \frac{f_{Tq}}{\text{(number of Time Quanta)}}$$

**Figure 26-2. Segments within the Bit Time**

Whenever CAN bit is used as a measure of duration (e.g. MCR[FRZ\_ACK] and MCR[LPM\_ACK] in [Module Configuration Register \(FLEXCAN\\_MCR\)](#)), the number of peripheral clocks in one CAN bit can be calculated as:

$$\text{NCCP} = \frac{f_{\text{sys}} \times [1 + (\text{PSEG1} + 1) + (\text{PSEG2} + 1) + (\text{PROPSEG} + 1)] \times (\text{PRES DIV} + 1)}{f_{\text{CANCLK}}}$$

where:

## Functional Description

NCCP is the number of peripheral clocks in one CAN bit;

$f_{\text{CANCLK}}$  is the Protocol Engine (PE) Clock in Hz;

$f_{\text{SYS}}$  is the frequency of operation of the system (CHI) clock, in Hz;

PSEG1 is the value in CTRL1[PSEG1] field;

PSEG2 is the value in CTRL1[PSEG2] field;

PROPSEG is the value in CTRL1[PROPSEG] field;

PRES DIV is the value in CTRL1[PRES DIV] field.

For example, 180 CAN bits = 180 x NCCP peripheral clock periods.

Figure 26-2 gives an overview of the CAN compliant segment settings and the related parameter values.

**Table 26-15. Time Segment Syntax**

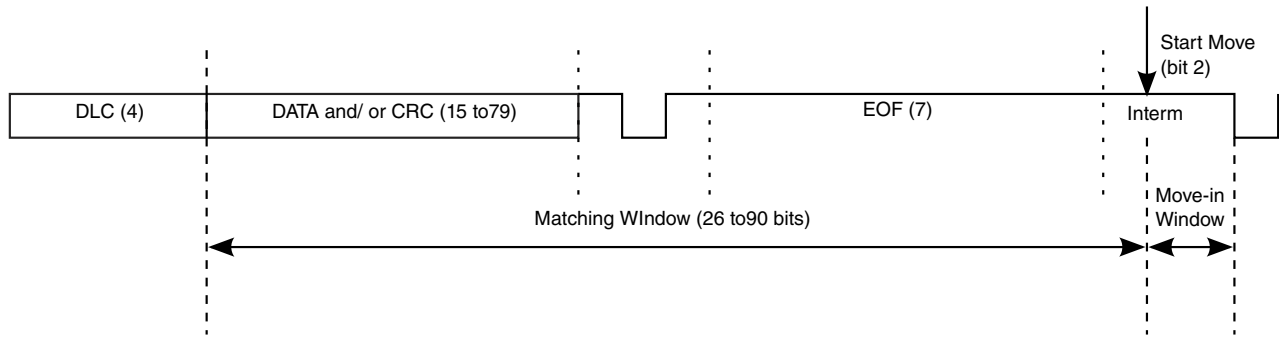

Syntax	Description
SYNC_SEG	System expects transitions to occur on the bus during this period.
Transmit Point	A node in transmit mode transfers a new value to the CAN bus at this point.
Sample Point	A node samples the bus at this point. If the three samples per bit option is selected, then this point marks the position of the third sample.

**Table 26-16. CAN Standard Compliant Bit Time Segment Settings**

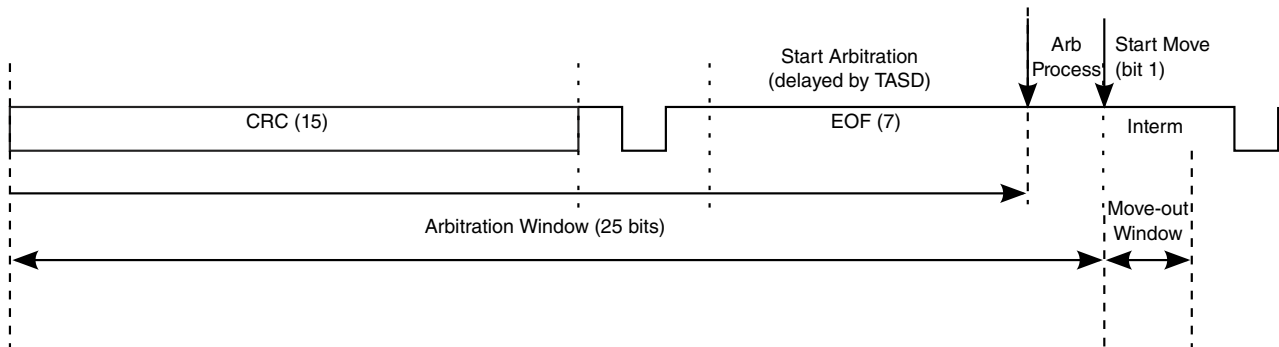

Time Segment 1	Time Segment 2	Re-synchronization Jump Width
5 .. 10	2	1 .. 2
4 .. 11	3	1 .. 3
5 .. 12	4	1 .. 4
6 .. 13	5	1 .. 4
7 .. 14	6	1 .. 4
8 .. 15	7	1 .. 4
9 .. 16	8	1 .. 4

### 26.6.9.5 Arbitration and Matching Timing

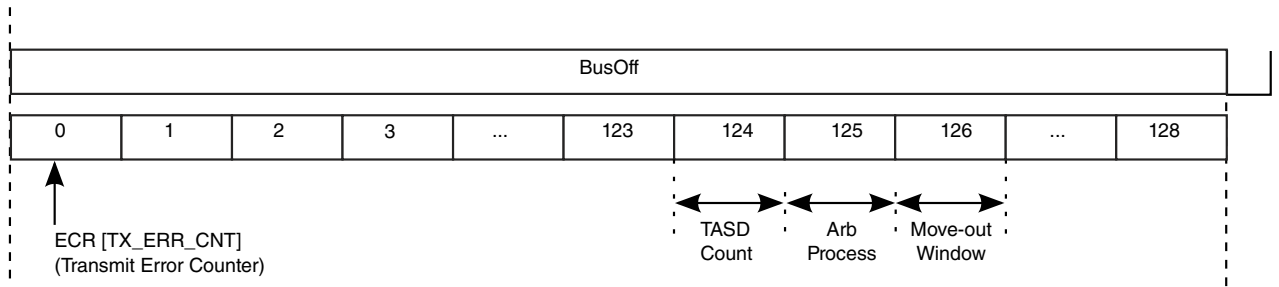

During normal reception and transmission of frames, the matching, arbitration, move-in and move-out processes are executed during certain time windows inside the CAN frame, as shown in the following figures.

**Figure 26-3. Matching and Move-In Time Windows**

**Figure 26-4. Arbitration and Move-Out Time Windows**

**Figure 26-5. Arbitration at the end of Bus Off and Move-Out Time Windows**

When doing matching and arbitration, FlexCAN needs to scan the whole Message Buffer memory during the available time window. In order to have sufficient time to do that, the following requirements must be observed:

- A valid CAN bit timing must be programmed, as indicated in [Table 26-16](#)
- The peripheral clock frequency can not be smaller than the oscillator clock frequency, i.e. the PLL can not be programmed to divide down the oscillator clock
- There must be a minimum ratio between the peripheral clock frequency and the CAN bit rate, as specified in the following table.

**Table 26-17. Minimum Ratio Between Peripheral Clock Frequency and CAN Bit Rate**

Number of Message Buffers	RFEN	Minimum Number of Peripheral Clocks per CAN bit
16 and 32	0	16
64	0	25
16	1	16
32	1	17
64	1	30

A direct consequence of the first requirement is that the minimum number of time quanta per CAN bit must be 8, so the oscillator clock frequency should be at least 8 times the CAN bit rate. The minimum frequency ratio specified in [Table 26-17](#) can be achieved by choosing a high enough peripheral clock frequency when compared to the oscillator clock frequency, or by adjusting one or more of the bit timing parameters (PRES DIV, PROPSEG, PSEG1, PSEG2). As an example, taking the case of 64 MBs, if the oscillator and peripheral clock frequencies are equal and the CAN bit timing is programmed to have 8 time quanta per bit, then the prescaler factor (PRES DIV + 1) should be at least 2. For prescaler factor equal to one and CAN bit timing with 8 time quanta per bit, the ratio between peripheral and oscillator clock frequencies should be at least 2.

## 26.6.10 Modes of Operation Details

The FlexCAN module has four functional modes (Normal Mode, Freeze Mode, Listen-Only Mode and Loop-Back Mode) and two low power modes (Disable Mode and Stop Mode). See in [Modes of Operation](#) an introductory description of all these modes of operation. The following sub-sections bring functional details on Freeze mode and the low power modes.

### 26.6.10.1 Freeze Mode

This mode is requested by Arm through the assertion of the HALT bit in the MCR Register or when the MCU is put into Debug Mode. In both cases it is also necessary that the FRZ bit is asserted in the MCR Register and the module is not in any of the low power modes (Disable, Stop). The acknowledgement is obtained through the assertion by the FlexCAN of FRZ\_ACK bit in the same register. The Arm must only consider the FlexCAN in Freeze Mode when both request and acknowledgement conditions are satisfied.

When Freeze Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Intermission, Passive Error, Bus Off or Idle state
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores the FLEXCAN\_RX input pin and drives the FLEXCAN\_TX pin as recessive
- Stops the prescaler, thus halting all CAN protocol activities
- Grants write access to the Error Counters Register, which is read-only in other modes
- Sets the NOT\_RDY and FRZ\_ACK bits in MCR

After requesting Freeze Mode, the user must wait for the FRZ\_ACK bit to be asserted in MCR before executing any other action, otherwise FlexCAN may operate in an unpredictable way. In Freeze mode, all memory mapped registers are accessible, except for CTRL1[CLK\_SRC] bit that can be read but cannot be written.

Exiting Freeze Mode is done in one of the following ways:

- Arm negates the FRZ bit in the MCR Register
- The Arm is removed from Debug Mode and the HALT bit is negated

The FRZ\_ACK bit is negated after protocol engine recognizes the negation of freeze request. Once out of Freeze Mode, FlexCAN tries to re-synchronize to the CAN bus by waiting for 11 consecutive recessive bits.

### 26.6.10.2 Module Disable Mode

This low power mode is normally used to temporarily disable a complete FlexCAN block, with no power consumption. It is requested by the Arm through the assertion of the MDIS bit in the MCR Register and the acknowledgement is obtained through the assertion by the FlexCAN of the LPM\_ACK bit in the same register. The Arm must only consider the FlexCAN in Disable Mode when both request and acknowledgement conditions are satisfied.

If the module is disabled during Freeze Mode, it requests to disable the clocks to the PE and CHI sub-modules, sets the LPM\_ACK bit and negates the FRZ\_ACK bit. The ability to shut down the clocks depends on how FlexCAN is integrated into the MCU. If the module is disabled during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and then checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive

- May shut down the clocks to the PE and CHI sub-modules, depending on how FlexCAN is integrated into the MCU
- Sets the NOT\_RDY and LPM\_ACK bits in MCR

The Bus Interface Unit continues to operate, enabling the Arm to access memory mapped registers, except the Rx Mailboxes Global Mask Registers, the Rx Buffer 14 Mask Register, the Rx Buffer 15 Mask Register, the Rx FIFO Global Mask Register. The Rx FIFO Information Register, the Message Buffers, the Rx Individual Mask Registers, and the reserved words within RAM may not be accessed when the module is in Disable Mode depending on how FlexCAN RAM is integrated into the Arm. Exiting from this mode is done by negating the MDIS bit by Arm, which make FlexCAN requests to resume the clocks and negates the LPM\_ACK bit after CAN protocol engine recognizes the negation of disable mode requested by Arm.

### 26.6.10.3 Stop Mode

This is a system low power mode in which system clocks can be stopped for maximum power savings. To enter stop mode, the CPU should manually assert a global Stop Mode request (see the CAN1\_STOP\_REQ and CAN2\_STOP\_REQ bit in the register IOMUXC\_GPR4) and check the acknowledgement asserted by the FlexCAN (see the CAN1\_STOP\_ACK and CAN2\_STOP\_ACK in the register IOMUXC\_GPR4). The CPU must only consider the FlexCAN in Stop Mode when both request and acknowledgement conditions are satisfied.

If FlexCAN receives the global Stop Mode request during Freeze Mode, it sets the LPM\_ACK bit, negates the FRZ\_ACK bit and then sends the Stop Acknowledge signal to the CPU, in order to shut down the clocks globally. If Stop Mode is requested during transmission or reception, FlexCAN does the following:

- Waits to be in either Idle or Bus Off state, or else waits for the third bit of Intermission and checks it to be recessive
- Waits for all internal activities like arbitration, matching, move-in and move-out to finish. Pending move-in is not taken in account
- Ignores its FLEXCAN\_RX input pin and drives its FLEXCAN\_TX pin as recessive
- Sets the NOT\_RDY and LPM\_ACK bits in MCR
- Sends a Stop Acknowledge signal to the CPU, so that it can shut down the clocks globally

Exiting Stop Mode is done in one of the following ways:

- Arm resuming the clocks and removing the Stop Mode request
- Arm resuming the clocks and Stop Mode request as a result of the Self Wake mechanism

In the Self Wake mechanism, if the SLF\_WAK bit in MCR Register was set at the time FlexCAN entered Stop Mode, then upon detection of a recessive to dominant transition on the CAN bus, FlexCAN sets the WAK\_INT bit in the ESR Register and, if enabled by the WAK\_MSK bit in MCR, generates a Wake Up interrupt to the Arm. Upon receiving the interrupt, the Arm should resume the clocks and remove the Stop Mode request manually. FlexCAN will then wait for 11 consecutive recessive bits to synchronize to the CAN bus. As a consequence, it will not receive the frame that woke it up .

The sensitivity to CAN bus activity can be modified by applying a low-pass filter function to the FLEXCAN\_RX input line while in Stop Mode. See the WAK\_SRC bit in [Module Configuration Register \(FLEXCAN\\_MCR\)](#) . This feature can be used to protect FlexCAN from waking up due to short glitches on the CAN bus lines. Such glitches can result from electromagnetic interference within noisy environments, the glitch filter width can be set in [Glitch Filter Width Register \(FLEXCAN\\_GFWR\)](#).

### 26.6.11 Interrupts

The module can generate up to 70 interrupt sources (64 interrupts due to message buffers and 6 interrupts due to Ored interrupts from MBs, Bus Off, Error, Tx Warning, Rx Warning and Wake Up)).

The number of actual sources depends on the configured number of message buffers.

Each one of the message buffers can be an interrupt source, if its corresponding IMASK bit is set. There is no distinction between Tx and Rx interrupts for a particular buffer, under the assumption that the buffer is initialized for either transmission or reception. Each of the buffers has assigned a flag bit in the IFLAG Registers. The bit is set when the corresponding buffer completes a successful transmission/reception and is cleared when the Arm writes it to '1' (unless another interrupt is generated at the same time).

If the Rx FIFO is enabled (bit RFEN on MCR set), the interrupts corresponding to MBs 0 to 7 have a different behavior. Bit 7 of the IFLAG1 becomes the "FIFO Overflow" flag; bit 6 becomes the FIFO Warning flag, bit 5 becomes the "Frames Available in FIFO flag" and bits 4-0 are unused. See [Interrupt Flags 1 Register \(FLEXCAN\\_IFLAG1\)](#) for more information.

A combined interrupt for all MBs is also generated by an Or of all the interrupt sources from MBs. This interrupt gets generated when any of the Mailboxes or FIFO generates an interrupt. The Arm must read the IFLAG Registers to determine which MB or FIFO caused the interrupt.

The other 5 interrupt sources (Bus Off, Error, Tx Warning, Rx Warning and Wake Up) generate interrupts like the MB ones, and can be read from both the Error and Status Register 1 and 2. The Bus Off, Error, Tx Warning and Rx Warning interrupt mask bits are located in the Control 1 Register and the Wake-Up interrupt mask bit is located in the MCR.

## 26.7 Initialization/Application Information

This section provides instructions for initializing the FLEXCAN module.

### 26.7.1 FLEXCAN Initialization Sequence

The FLEXCAN module may be reset in two ways:

- SOC level hard reset which resets all memory mapped registers asynchronously
- SOFT\_RST bit in MCR, which resets some of the memory mapped registers synchronously

Soft reset is synchronous and has to follow an internal request/acknowledge procedure across clock domains. Therefore, it may take some time to fully propagate its effects. The SOFT\_RST bit remains asserted while soft reset is pending, so software can poll this bit to know when the reset has completed. Also, soft reset can not be applied while clocks are shut down in any of the low power modes. The low power mode should be exited and the clocks resumed before applying soft reset.

After the module is enabled (MDIS bit negated), FLEXCAN automatically goes to Freeze Mode. In Freeze Mode, FLEXCAN is un-synchronized to the CAN bus, the HALT and FRZ bits in MCR Register are set, the internal state machines are disabled and the FRZ\_ACK and NOT\_RDY bits in the MCR Register are set. The FLEXCAN\_TX pin is in recessive state and FLEXCAN does not initiate any transmission or reception of CAN frames. Note that the Message Buffers and the Rx Individual Mask Registers are not affected by reset, so they are not automatically initialized.

For any configuration change/initialization it is required that FLEXCAN is put into Freeze Mode. The following is a generic initialization sequence applicable to the FLEXCAN module:

- Initialize the Module Configuration Register
  - Enable the individual filtering per MB and reception queue features by setting the IRMQ bit
  - Enable the warning interrupts by setting the WRN\_EN bit

- If required, disable frame self reception by setting the SRX\_DIS bit
- Enable the FIFO by setting the RFEN bit
- Enable the abort mechanism by setting the AEN bit
- Enable the local priority feature by setting the LPRIO\_EN bit
- Initialize the Control Register
  - Determine the bit timing parameters: PROPSEG, PSEG1, PSEG2, RJW
  - Determine the bit rate by programming the PRESDIV field
  - Determine the internal arbitration mode (LBUF bit)
- Initialize the Message Buffers
  - The Control and Status word of all Message Buffers must be initialized
  - If FIFO was enabled, the 8-entry ID table must be initialized
  - Other entries in each Message Buffer should be initialized as required
- Initialize the Rx Individual Mask Registers
- Set required interrupt mask bits in the IMASK Registers (for all MB interrupts), in CTRL Register (for Bus Off and Error interrupts) and in MCR Register for Wake-Up interrupt
- Negate the HALT bit in MCR

Starting with the last event, FLEXCAN attempts to synchronize to the CAN bus.

## 26.8 FLEXCAN Memory Map/Register Definition

The complete memory map for a FLEXCAN module with 64 MBs capability is shown in the following table. Each individual register is identified by its complete name and the corresponding mnemonic. The access type can be Supervisor (S) or Unrestricted (U). Most of the registers can be configured to have either Supervisor or Unrestricted access by programming the SUPV bit in the MCR Register. The MCR register allows only Supervisor access regardless the SUPV bit state.

The FLEXCAN module stores CAN messages for transmission and reception using a Mailboxes and Rx FIFO structure.

## 26.8.1 Module Configuration Register (FLEXCANx\_MCR)

This register defines global system configurations, such as the module operation mode (e.g., low power) and maximum message buffer configuration.

Address: Base address + 0h offset

## FLEXCAN Memory Map/Register Definition

### FLEXCANx\_MCR field descriptions

Field	Description
31 MDIS	<p>This bit controls whether FLEXCAN is enabled or not. When disabled, FLEXCAN shuts down the clocks to the CAN Protocol Interface and Message Buffer Management sub-modules. This is the only bit in MCR not affected by soft reset. See <a href="#">Module Disable Mode</a> for more information.</p> <p>1 Disable the FLEXCAN module 0 Enable the FLEXCAN module</p>
30 FRZ	<p>The FRZ bit specifies the FLEXCAN behavior when the HALT bit in the MCR Register is set or when Debug Mode is requested at Arm level. When FRZ is asserted, FLEXCAN is enabled to enter Freeze Mode. Negation of this bit field causes FLEXCAN to exit from Freeze Mode.</p> <p>1 Enabled to enter Freeze Mode 0 Not enabled to enter Freeze Mode</p>
29 RFEN	<p>This bit controls whether the Rx FIFO feature is enabled or not. When RFEN is set, MBs 0 to 5 cannot be used for normal reception and transmission because the corresponding memory region (0x80-0xDC) is used by the FIFO engine as well as additional MBs (up to 32, depending on CTRL2[RFFN] setting) which are used as Rx FIFO ID Filter Table elements. RFEN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 26-17</a> (see <a href="#">Arbitration and Matching Timing</a>). This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FIFO enabled 0 FIFO not enabled</p>
28 HALT	<p>Assertion of this bit puts the FLEXCAN module into Freeze Mode. The Arm should clear it after initializing the Message Buffers and Control Register. No reception or transmission is performed by FLEXCAN before this bit is cleared. Freeze Mode can not be entered while FLEXCAN is in any of the low power modes. See <a href="#">Freeze Mode</a> for more information</p> <p>1 Enters Freeze Mode if the FRZ bit is asserted. 0 No Freeze Mode request.</p>

Table continues on the next page...

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
27 NOT_RDY	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode, Stop Mode or Freeze Mode. It is negated once FLEXCAN has exited these modes.</p> <p>1 FLEXCAN module is either in Disable Mode, Stop Mode or Freeze Mode 0 FLEXCAN module is either in Normal Mode, Listen-Only Mode or Loop-Back Mode</p>
26 WAK_MSK	<p>This bit enables the Wake Up Interrupt generation.</p> <p>1 Wake Up Interrupt is enabled 0 Wake Up Interrupt is disabled</p>
25 SOFT_RST	<p>When this bit is asserted, FlexCAN resets its internal state machines and some of the memory mapped registers. The following registers are reset: MCR (except the MDIS bit), TIMER, ECR, ESR1, ESR2, IMASK1, IMASK2, IFLAG1, IFLAG2 and CRCR. Configuration registers that control the interface to the CAN bus are not affected by soft reset. The following registers are unaffected: CTRL1, CTRL2, RXIMR0_RXIMR63, RXGMASK, RX14MASK, RX15MASK, RXFGMASK, RXFIR and all Message Buffers</p> <p>The SOFT_RST bit can be asserted directly by the Arm when it writes to the MCR Register. It may take some time to fully propagate its effect. The SOFT_RST bit remains asserted while reset is pending, and is automatically negated when reset completes. Therefore, software can poll this bit to know when the soft reset has completed.</p> <p>Soft reset cannot be applied while clocks are shut down in any of the low power modes. The module should be first removed from low power mode, and then soft reset can be applied.</p> <p>1 Reset the registers 0 No reset request</p>
24 FRZ_ACK	<p>This read-only bit indicates that FLEXCAN is in Freeze Mode and its prescaler is stopped. The Freeze Mode request cannot be granted until current transmission or reception processes have finished. Therefore the software can poll the FRZ_ACK bit to know when FLEXCAN has actually entered Freeze Mode. If Freeze Mode request is negated, then this bit is negated once the FLEXCAN prescaler is running again. If Freeze Mode is requested while FLEXCAN is in any of the low power modes, then the FRZ_ACK bit will only be set when the low power mode is exited. See <a href="#">Freeze Mode</a> for more information</p> <p>1 FLEXCAN in Freeze Mode, prescaler stopped 0 FLEXCAN not in Freeze Mode, prescaler running</p>
23 SUPV	<p>This bit configures some of the FLEXCAN registers to be either in Supervisor or User Mode. Reset value of this bit is '1', so the affected registers start with Supervisor access allowance only. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FlexCAN is in Supervisor Mode. Affected registers allow only Supervisor access. Unrestricted access behaves as though the access was done to an unimplemented register location 0 FlexCAN is in User Mode. Affected registers allow both Supervisor and Unrestricted accesses</p>
22 SLF_WAK	<p>This bit enables the Self Wake Up feature when FLEXCAN is in Stop Mode. If this bit had been asserted by the time FLEXCAN entered Stop Mode, then FLEXCAN will look for a recessive to dominant transition on the bus during these modes. If a transition from recessive to dominant is detected during Stop Mode, then FLEXCAN generates, if enabled to do so, a Wake Up interrupt to the Arm so that it can resume the clocks globally and FlexCAN can request to resume the clocks. This bit can not be written while the module is in Stop Mode.</p> <p>1 FLEXCAN Self Wake Up feature is enabled 0 FLEXCAN Self Wake Up feature is disabled</p>
21 WRN_EN	<p>When asserted, this bit enables the generation of the TWRN_INT and RWRN_INT flags in the Error and Status Register. If WRN_EN is negated, the TWRN_INT and RWRN_INT flags will always be zero,</p>

Table continues on the next page...

**FLEXCANx\_MCR field descriptions (continued)**

Field	Description
	<p>independent of the values of the error counters, and no warning interrupt will ever be generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 TWRN_INT and RWRN_INT bits are set when the respective error counter transition from <math>&lt;96</math> to <math>\geq 96</math>.                      0 TWRN_INT and RWRN_INT bits are zero, independent of the values in the error counters.</p>
20 LPM_ACK	<p>This read-only bit indicates that FLEXCAN is either in Disable Mode or Stop Mode. Either of these low power modes can not be entered until all current transmission or reception processes have finished, so the Arm can poll the LPM_ACK bit to know when FLEXCAN has actually entered low power mode. See <a href="#">Module Disable Mode</a>, and <a href="#">Stop Mode</a> for more information</p> <p>1 FLEXCAN is either in Disable Mode, or Stop mode                      0 FLEXCAN not in any of the low power modes</p>
19 WAK_SRC	<p>This bit defines whether the integrated low-pass filter is applied to protect the FLEXCAN_RX input from spurious wake up. See <a href="#">Stop Mode</a> for more information. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN uses the filtered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus                      0 FLEXCAN uses the unfiltered FLEXCAN_RX input to detect recessive to dominant edges on the CAN bus.</p>
18 -	<p>This field is reserved.                      Reserved</p>
17 SRX_DIS	<p>This bit defines whether FlexCAN is allowed to receive frames transmitted by itself. If this bit is asserted, frames transmitted by the module will not be stored in any MB, regardless if the MB is programmed with an ID that matches the transmitted frame, and no interrupt flag or interrupt signal will be generated due to the frame reception. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Self reception disabled                      0 Self reception enabled</p>
16 IRMQ	<p>This bit indicates whether Rx matching process will be based either on individual masking and queue or on masking scheme with RXMGMASK, RX14MASK and RX15MASK, RXFGMASK. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Individual Rx masking and queue feature are enabled.                      0 Individual Rx masking and queue feature are disabled. For backward compatibility, the reading of C/S word locks the MB even if it is EMPTY.</p>
15–14 -	<p>This field is reserved.                      Reserved</p>
13 LPRIO_EN	<p>This bit is provided for backwards compatibility reasons. It controls whether the local priority feature is enabled or not. It is used to extend the ID used during the arbitration process. With this extended ID concept, the arbitration process is done based on the full 32-bit word, but the actual transmitted ID still has 11-bit for standard frames and 29-bit for extended frames. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Local Priority enabled                      0 Local Priority disabled</p>
12 AEN	<p>This bit is supplied for backwards compatibility reasons. When asserted, it enables the Tx abort feature. This feature guarantees a safe procedure for aborting a pending transmission, so that no frame is sent in the CAN bus without notification. This bit can only be written in Freeze mode as it is blocked by hardware</p>

*Table continues on the next page...*

## FLEXCANx\_MCR field descriptions (continued)

Field	Description
	<p>in other modes. Write Abort code into Rx Mailboxes can cause unpredictable results when the MCR[AEN] is asserted.</p> <p>1 Abort enabled 0 Abort disabled</p>
11–10 -	<p>This field is reserved. Reserved</p>
9–8 IDAM	<p>This 2-bit field identifies the format of the elements of the Rx FIFO filter table, as shown below. Note that all elements of the table are configured at the same time by this field (they are all the same format). See <a href="#">Rx FIFO Structure</a>. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>00 Format A One full ID (standard or extended) per ID filter Table element. 01 Format B Two full standard IDs or two partial 14-bit extended IDs per ID filter Table element. 10 Format C Four partial 8-bit IDs (standard or extended) per ID filter Table element. 11 Format D All frames rejected.</p>
7 -	<p>This field is reserved. Reserved</p>
MAXMB	<p>This 7-bit field defines the number of the last Message Buffers that will take part in the matching and arbitration processes. The reset value (0x0F) is equivalent to 16 MB configuration. This field can only be written in Freeze Mode as it is blocked by hardware in other modes</p> <p>Number of the last MB = MAXMB.</p> <p><b>NOTE:</b> Additionally, the value of MAXMB must encompass the FIFO size defined by CTRL2[RFFN]</p> <p>MAXMB also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 26-17</a> (see <a href="#">Arbitration and Matching Timing</a>).</p>

## 26.8.2 Control 1 Register (FLEXCANx\_CTRL1)

This register is defined for specific FLEXCAN control features related to the CAN bus, such as bit-rate, programmable sampling point within an Rx bit, Loop Back Mode, Listen Only Mode, Bus Off recovery behavior and interrupt enabling (Bus-Off, Error, Warning). It also determines the Division Factor for the clock prescaler.

Address: Base address + 4h offset

### FLEXCANx\_CTRL1 field descriptions

Field	Description
31–24 PRESDIV	This 8-bit field defines the ratio between the PE clock frequency and the Serial Clock (Sclock) frequency. The Sclock period defines the time quantum of the CAN protocol. For the reset value, the Sclock frequency is equal to the PE clock frequency. The Maximum value of this register is 0xFF, that gives a minimum Sclock frequency equal to the PE clock frequency divided by 256. For more information refer to <a href="#">Protocol Timing</a> . This field can only be written in Freeze mode as it is blocked by hardware in other modes.  Sclock frequency = CPI clock frequency / (PRESDIV+1)
23–22 RJW	This 2-bit field defines the maximum number of time quanta <sup>1</sup> that a bit time can be changed by one re-synchronization. The valid programmable values are 0-3. This field can only be written in Freeze mode as it is blocked by hardware in other modes  Resync Jump Width = RJW + 1.

Table continues on the next page...

**FLEXCANx\_CTRL1 field descriptions (continued)**

Field	Description
21–19 PSEG1	This 3-bit field defines the length of Phase Buffer Segment 1 in the bit time . The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 1 = (PSEG1 + 1) x Time-Quanta.
18–16 PSEG2	This 3-bit field defines the length of Phase Buffer Segment 2 in the bit time . The valid programmable values are 1-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes Phase Buffer Segment 2 = (PSEG2 + 1) x Time-Quanta.
15 BOFF_MSK	This bit provides a mask for the Bus Off Interrupt. 1 Bus Off interrupt enabled 0 Bus Off interrupt disabled
14 ERR_MSK	This bit provides a mask for the Error Interrupt. 1 Error interrupt enabled 0 Error interrupt disabled
13 -	This field is reserved. Reserved
12 LPB	This bit configures FlexCAN to operate in Loop-Back Mode. In this mode, FlexCAN performs an internal loop back that can be used for self test operation. The bit stream output of the transmitter is fed back internally to the receiver input. The FLEXCAN_RX input pin is ignored and the FLEXCAN_TX output goes to the recessive state (logic '1'). FlexCAN behaves as it normally does when transmitting, and treats its own transmitted message as a message received from a remote node. In this mode, FlexCAN ignores the bit sent during the ACK slot in the CAN frame acknowledge field, generating an internal acknowledge bit to ensure proper reception of its own message. Both transmit and receive interrupts are generated. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Loop Back enabled 0 Loop Back disabled
11 TWRN_MSK	This bit provides a mask for the Tx Warning Interrupt associated with the TWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Tx Warning Interrupt enabled 0 Tx Warning Interrupt disabled
10 RWRN_MSK	This bit provides a mask for the Rx Warning Interrupt associated with the RWRN_INT flag in the Error and Status Register. This bit is read as zero when MCR[WRN_EN] bit is negated. This bit can only be written if MCR[WRN_EN] bit is asserted. 1 Rx Warning Interrupt enabled 0 Rx Warning Interrupt disabled
9–8 -	This field is reserved. Reserved
7 SMP	This bit defines the sampling mode of CAN bits at the FLEXCAN_RX. This bit can only be written in Freeze mode as it is blocked by hardware in other modes. 1 Three samples are used to determine the value of the received bit: the regular one (sample point) and 2 preceding samples, a majority rule is used 0 Just one sample is used to determine the bit value
6 BOFF_REC	This bit defines how FLEXCAN recovers from Bus Off state. If this bit is negated, automatic recovering from Bus Off state occurs according to the CAN Specification 2.0B. If the bit is asserted, automatic recovering from Bus Off is disabled and the module remains in Bus Off state until the bit is negated by the

*Table continues on the next page...*

**FLEXCANx\_CTRL1 field descriptions (continued)**

Field	Description
	<p>user. If the negation occurs before 128 sequences of 11 recessive bits are detected on the CAN bus, then Bus Off recovery happens as if the BOFF_REC bit had never been asserted. If the negation occurs after 128 sequences of 11 recessive bits occurred, then FLEXCAN will re-synchronize to the bus by waiting for 11 recessive bits before joining the bus. After negation, the BOFF_REC bit can be re-asserted again during Bus Off, but it will only be effective the next time the module enters Bus Off. If BOFF_REC was negated when the module entered Bus Off, asserting it during Bus Off will not be effective for the current Bus Off recovery.</p> <p>1 Automatic recovering from Bus Off state disabled                      0 Automatic recovering from Bus Off state enabled, according to CAN Spec 2.0 part B</p>
5 TSYN	<p>This bit enables a mechanism that resets the free-running timer each time a message is received in Message Buffer 0. This feature provides means to synchronize multiple FLEXCAN stations with a special "SYNC" message (i.e., global network time). If the RFEN bit in MCR is set (FIFO enabled), the first available Mailbox, according to CTRL2[RFFN] setting, is used for timer synchronization instead of MB0. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Timer Sync feature enabled                      0 Timer Sync feature disabled</p>
4 LBUF	<p>This bit defines the ordering mechanism for Message Buffer transmission. When asserted, the LPRIO_EN bit does not affect the priority arbitration. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Lowest number buffer is transmitted first                      0 Buffer with highest priority is transmitted first</p>
3 LOM	<p>This bit configures FLEXCAN to operate in Listen Only Mode. In this mode, transmission is disabled, all error counters are frozen and the module operates in a CAN Error Passive mode. Only messages acknowledged by another CAN station will be received. If FLEXCAN detects a message that has not been acknowledged, it will flag a BIT0 error (without changing the REC), as if it was trying to acknowledge the message.</p> <p>Listen-Only Mode acknowledgement can be obtained by the state of ESR1[FLT_CONF] field which is Passive Error when Listen-Only Mode is entered. There can be some delay between the Listen-Only Mode request and acknowledge.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 FLEXCAN module operates in Listen Only Mode                      0 Listen Only Mode is deactivated</p>
PROP_SEG	<p>This 3-bit field defines the length of the Propagation Segment in the bit time. The valid programmable values are 0-7. This field can only be written in Freeze mode as it is blocked by hardware in other modes</p> <p>Propagation Segment Time = (PROPSEG + 1) * Time-Quanta.                      Time-Quantum = one Sclock period.</p>

1. One time quantum is equal to the Sclock period.

**26.8.3 Free Running Timer Register (FLEXCANx\_TIMER)**

This register represents a 16-bit free running counter that can be read and written by the Arm. The timer starts from \$0000 after Reset, counts linearly to \$FFFF, and wraps around.

The timer is clocked by the FLEXCAN bit-clock (which defines the baud rate on the CAN bus). During a message transmission/reception, it increments by one for each bit that is received or transmitted. When there is no message on the bus, it counts using the previously programmed baud rate. During Freeze Mode, disable, and stop mode, the timer is not incremented.

The timer value is captured at the beginning of the identifier field of any frame on the CAN bus. This captured value is written into the Time Stamp entry in a message buffer after a successful reception or transmission of a message.

If bit CTRL1[TSYN] is asserted the Timer is reset whenever a message is received in the first available Mailbox, according to CTRL2[RFFN] setting.

Arm can write to this register anytime. However, if the write occurs at the same time that the Timer is being reset by a reception in the first Mailbox, then the write value is discarded.

Reading this register affects the Mailbox Unlocking procedure. For additional details, refer to [Message Buffer Lock Mechanism](#).

### 26.8.4 Rx Mailboxes Global Mask Register (FLEXCANx\_RXMGMASK)

RXMGMASK is provided for legacy support. Asserting the MCR[IRMQ] bit causes the RXMGMASK Register to have no effect on the module operation.

RXMGMASK is used to mask the filter fields of all Rx MBs, excluding MBs 14-15, which have individual mask registers.

This register can only be written in Freeze mode as it is blocked by hardware in other modes.

**Table 26-18. Rx Mailboxes Global Mask usage**

SMB[RTR] <sup>1</sup>	CTRL2[RRS]	CTRL2[EACEN]	Mailbox filter fields			
			MB[RTR]	MB[IDE]	MB[ID]	reserved
0	-	0	- Note <sup>2</sup>	- Note <sup>3</sup>	MG[28:0]	MG[31:29]
0	-	1	MG[31]	MG[30]	MG[28:0]	MG[29]
1	0	-	-	-	-	MG[31:0]
1	1	0	-	-	MG[28:0]	MG[31:29]
1	1	1	MG[31]	MG[30]	MG[28:0]	MG[29]

1. RTR bit of the Incoming Frame. It is saved into an auxiliary MB called Rx Serial Message Buffer (Rx SMB).
2. If CTRL2[EACEN] bit is negated the RTR bit of Mailbox is never compared with the RTR bit of the Incoming Frame (Rx SMB[RTR]).
3. If CTRL2[EACEN] bit is negated the IDE bit of Mailbox is always compared with the IDE bit of the Incoming Frame (Rx SMB[IDE]).

Address: Base address + 10h offset

**FLEXCANx\_RXMGMASK field descriptions**

Field	Description
MG31_MG0	<p>These bits mask the Mailbox filter bits as shown in the figure above. Note that the alignment with the ID word of the Mailbox is not perfect as the two most significant MG bits affect the fields RTR and IDE which are located in the Control and Status word of the Mailbox. <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a> shows in detail which MG bits mask each Mailbox filter field.</p> <p>1 The corresponding bit in the filter is checked against the one received  0 the corresponding bit in the filter is "don't care"</p>

**26.8.5 Rx Buffer 14 Mask Register (FLEXCANx\_RX14MASK)**

RX14MASK is provided for legacy support, asserting the MCR[IRMQ] bit causes the RX14MASK to have no effect on the module operation.

RX14MASK is used to mask the filter fields of Message Buffer 14.

This register can only be programmed while the module is in Freeze Mode as it is blocked by hardware in other modes.

Address: Base address + 14h offset

FLEXCAN responds to any bus state as described in the protocol, e.g. transmit 'Error Active' or 'Error Passive' flag, delay its transmission start time ('Error Passive') and avoid any influence on the bus when in 'Bus Off' state. The following are the basic rules for FLEXCAN bus state transitions.

- If the value of Tx\_Err\_Counter or Rx\_Err\_Counter increases to be greater than or equal to 128, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Passive' state.
- If the FLEXCAN state is 'Error Passive', and either Tx\_Err\_Counter or Rx\_Err\_Counter decrements to a value less than or equal to 127 while the other already satisfies this condition, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Error Active' state.
- If the value of Tx\_Err\_Counter increases to be greater than 255, the FLT\_CONF field in the Error and Status Register is updated to reflect 'Bus Off' state, and an interrupt may be issued. The value of Tx\_Err\_Counter is then reset to zero.
- If FLEXCAN is in 'Bus Off' state, then Tx\_Err\_Counter is cascaded together with another internal counter to count the 128th occurrences of 11 consecutive recessive bits on the bus. Hence, Tx\_Err\_Counter is reset to zero and counts in a manner where the internal counter counts 11 such bits and then wraps around while incrementing the Tx\_Err\_Counter. When Tx\_Err\_Counter reaches the value of 128, the FLT\_CONF field in the Error and Status Register is updated to be 'Error Active' and both error counters are reset to zero. At any instance of dominant bit following a stream of less than 11 consecutive recessive bits, the internal counter resets itself to zero without affecting the Tx\_Err\_Counter value.
- If during system start-up, only one node is operating, then its Tx\_Err\_Counter increases in each message it is trying to transmit, as a result of acknowledge errors (indicated by the ACK\_ERR bit in the Error and Status Register). After the transition to 'Error Passive' state, the Tx\_Err\_Counter does not increment anymore by acknowledge errors. Therefore the device never goes to the 'Bus Off' state.
- If the Rx\_Err\_Counter increases to a value greater than 127, it is not incremented further, even if more errors are detected while being a receiver. At the next successful message reception, the counter is set to a value between 119 and 127 to resume to 'Error Active' state.

**26.8.8 Error and Status 1 Register (FLEXCANx\_ESR1)**

This register reflects various error conditions, some general status of the device and it is the source of four interrupts to the Arm.

The Arm read action clears bits 15-10, therefore the reported *error conditions*(bits 15-10) are those that occurred since the last time the Arm read this register. Bits 9-3 are status bits .

Some bits in this register are read-only and some are not .

### FLEXCANx\_ESR1 field descriptions

Field	Description
31-19 -	This field is reserved. Reserved
18 SYNCH	This read-only flag indicates whether the FlexCAN is synchronized to the CAN bus and able to participate in the communication process. It is set and cleared by the FlexCAN. Refer to <a href="#">Table 26-19</a>  1 FlexCAN is synchronized to the CAN bus 0 FlexCAN is not synchronized to the CAN bus
17 TWRN_INT	If the WRN_EN bit in MCR is asserted, the TWRN_INT bit is set when the TX_WRN flag transition from '0' to '1', meaning that the Tx error counter reached 96. If the corresponding mask bit in the Control Register (TWRN_MSK) is set, an interrupt is generated to the Arm. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. Arm must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This flag is not generated during "Bus Off" state. This bit is not updated during Freeze mode.  1 The Tx error counter transition from < 96 to >= 96 0 No such occurrence
16 RWRN_INT	If the WRN_EN bit in MCR is asserted, the RWRN_INT bit is set when the RX_WRN flag transition from '0' to '1', meaning that the Rx error counters reached 96. If the corresponding mask bit in the Control Register (RWRN_MSK) is set, an interrupt is generated to the Arm. This bit is cleared by writing it to '1'. When WRN_EN is negated, this flag is masked. Arm must clear this flag before disabling the bit. Otherwise it will be set when the WRN_EN is set again. Writing '0' has no effect. This bit is not updated during Freeze mode.  1 The Rx error counter transition from < 96 to >= 96 0 No such occurrence
15 BIT1_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.  This bit is not set by a transmitter in case of arbitration field or ACK slot, or in case of a node sending a passive error flag that detects dominant bits.  1 At least one bit sent as recessive is received as dominant 0 No such occurrence

Table continues on the next page...

## FLEXCANx\_ESR1 field descriptions (continued)

Field	Description
14 BIT0_ERR	This bit indicates when an inconsistency occurs between the transmitted and the received bit in a message.  1 At least one bit sent as dominant is received as recessive 0 No such occurrence
13 ACK_ERR	This bit indicates that an Acknowledge Error has been detected by the transmitter node, i.e., a dominant bit has not been detected during the ACK SLOT.  1 An ACK error occurred since last read of this register 0 No such occurrence
12 CRC_ERR	This bit indicates that a CRC Error has been detected by the receiver node, i.e., the calculated CRC is different from the received.  1 A CRC error occurred since last read of this register. 0 No such occurrence
11 FRM_ERR	This bit indicates that a Form Error has been detected by the receiver node, i.e., a fixed-form bit field contains at least one illegal bit.  1 A Form Error occurred since last read of this register 0 No such occurrence
10 STF_ERR	This bit indicates that a Stuffing Error has been detected.  1 A Stuffing Error occurred since last read of this register. 0 No such occurrence.
9 TX_WRN	This bit indicates when repetitive errors are occurring during message transmission.  1 TX_Err_Counter $\geq$ 96 0 No such occurrence
8 RX_WRN	This bit indicates when repetitive errors are occurring during message reception.  1 Rx_Err_Counter $\geq$ 96 0 No such occurrence
7 IDLE	This bit indicates when CAN bus is in IDLE state. Refer to <a href="#">Table 26-19</a> .  1 CAN bus is now IDLE 0 No such occurrence
6 TX	This bit indicates if FLEXCAN is transmitting a message. Refer to <a href="#">Table 26-19</a> .  1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
5-4 FLT_CONF	If the LOM bit in the Control Register is asserted, after some delay that depends on the CAN bit timing the FLT_CONF field will indicate "Error Passive". The very same delay affects the way how FLT_CONF reflects an update to ECR register by the Arm. It may be necessary up to one CAN bit time to get them coherent again.  Since the Control Register is not affected by soft reset, the FLT_CONF field will not be affected by soft reset if the LOM bit is asserted.  This 2-bit field indicates the Confinement State of the FLEXCAN module, as shown in below:  00 Error Active

Table continues on the next page...

**FLEXCANx\_ESR1 field descriptions (continued)**

Field	Description
	01 Error Passive 1x Bus off
3 RX	This bit indicates if FlexCAN is receiving a message. Refer to <a href="#">Table 26-19</a> .  1 FLEXCAN is transmitting a message 0 FLEXCAN is receiving a message
2 BOFF_INT	This bit is set when FLEXCAN enters 'Bus Off' state. If the corresponding mask bit in the Control Register (BOFF_MSK) is set, an interrupt is generated to the Arm. This bit is cleared by writing it to '1'. Writing '0' has no effect.  1 FLEXCAN module entered 'Bus Off' state 0 No such occurrence
1 ERR_INT	This bit indicates that at least one of the Error Bits (bits 15-10) is set. If the corresponding mask bit in the Control Register (ERR_MSK) is set, an interrupt is generated to the Arm. This bit is cleared by writing it to '1'. Writing '0' has no effect.  1 Indicates setting of any Error Bit in the Error and Status Register 0 No such occurrence
0 WAK_INT	When FLEXCAN is Stop Mode and a recessive to dominant transition is detected on the CAN bus and if the WAK_MSK bit in the MCR Register is set, an interrupt is generated to the Arm. This bit is cleared by writing it to '1'. When SLF_WAK is negated, this flag is masked. Arm must clear this flag before disabling the bit. Otherwise it will be set when the SLF_WAK is set again. Writing '0' has no effect  1 Indicates a recessive to dominant transition received on the CAN bus when the FLEXCAN module is in Stop Mode 0 No such occurrence

**26.8.9 Interrupt Masks 2 Register (FLEXCANx\_IMASK2)**

This register allows any number of a range of 32 Message Buffer Interrupts to be enabled or disabled. It contains one interrupt mask bit per buffer, enabling the Arm to determine which buffer generates an interrupt after a successful transmission or reception (i.e. when the corresponding IFLAG2 bit is set).

Address: Base address + 24h offset

**FLEXCANx\_IMASK2 field descriptions**

Field	Description
BUF63M_BUF32M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB32 to MB63) Interrupt.

**FLEXCANx\_IMASK2 field descriptions (continued)**

Field	Description
	Setting or clearing a bit in the IMASK2 Register can assert or negate an interrupt request, if the corresponding IFLAG2 bit is set.
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

**26.8.10 Interrupt Masks 1 Register (FLEXCANx\_IMASK1)**

This register allows to enable or disable any number of a range of 32 Message Buffer Interrupts. It contains one interrupt mask bit per buffer, enabling the Arm to determine which buffer generates an interrupt after a successful transmission or reception (i.e., when the corresponding IFLAG1 bit is set).

Address: Base address + 28h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

**FLEXCANx\_IMASK1 field descriptions**

Field	Description
BUF31M_BUF0M	Each bit enables or disables the respective FLEXCAN Message Buffer (MB0 to MB31) Interrupt. Setting or clearing a bit in the IMASK1 Register can assert or negate an interrupt request, if the corresponding IFLAG1 bit is set
1	The corresponding buffer Interrupt is enabled
0	The corresponding buffer Interrupt is disabled

RFFN value is selected extending Rx FIFO filters beyond MB7 (see [Control 2 Register \(FLEXCAN\\_CTRL2\)](#)). For example, when RFFN is 0x8, the MB0-23 range is occupied by Rx FIFO filters and related IFLAGS must be cleared.

Before updating MCR[MAXMB] field, Arm must service the IFLAG1 which MB value is greater than the MCR[MAXMB] to be updated, otherwise they will keep set and be inconsistent with the amount of MBs available.

Address: Base address + 30h offset

### FLEXCANx\_IFLAG1 field descriptions

Field	Description
31–8 BUF31I_BUF8I	Each bit flags the respective FLEXCAN Message Buffer (MB8 to MB31) interrupt.  1 The corresponding MB has successfully completed transmission or reception 0 No such occurrence
7 BUF7I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB7.  If the MCR[RFEN] bit is asserted, this flag indicates that a message was lost because Rx FIFO is full. Note that the flag will not be asserted when the Rx FIFO is full and the message was captured by a Mailbox.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by Arm writes.  1 MB7 completed transmission/reception or FIFO overflow 0 No such occurrence
6 BUF6I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB6.  If the MCR[RFEN] bit is asserted, this flag indicates when the number of unread messages within the Rx FIFO is increased to 5 from 4 due to the reception of a new one, meaning that the Rx FIFO is almost full. Note that if the flag is cleared while the number of unread messages is greater than 4 it will not assert again until the number of unread messages within the Rx FIFO is decreased to equal or less than 4.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by Arm writes.  1 MB6 completed transmission/reception or FIFO almost full 0 No such occurrence
5 BUF5I	If the Rx FIFO is not enabled, this bit flags the interrupt for MB5. If the Rx FIFO is enabled, this flag indicates that at least one frame is available to be read from the Rx FIFO.  This flag is cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by Arm writes.

*Table continues on the next page...*

**FLEXCANx\_IFLAG1 field descriptions (continued)**

Field	Description
	1 MB5 completed transmission/reception or frames available in the FIFO 0 No such occurrence
BUF4I_BUF0I	If the Rx FIFO is not enabled, these bits flag the interrupts for MB0 to MB4 . If the Rx FIFO is enabled, these flags are not used and must be considered as reserved locations.  These flags are cleared by the FlexCAN whenever the bit MCR[RFEN] is changed by Arm writes.  1 Corresponding MB completed transmission/reception 0 No such occurrence

**26.8.13 Control 2 Register (FLEXCANx\_CTRL2)**

This register contains control bits for CAN errors, FIFO features and mode selection.

**Table 26-20. Rx FIFO Filters**

RFFN[3:0]	Number of Rx FIFO filters	Message Buffers occupied by Rx FIFO and ID Filter Table	Remaining Available Mailboxes <sup>1</sup>	Rx FIFO ID Filter Table Elements Affected by Rx Individual Masks <sup>2</sup>	Rx FIFO ID Filter Table Elements Affected by Rx FIFO Global Mask <sup>2</sup>

1. The number of the last remaining available mailboxes is defined by the MCR[MAXMB] field.
2. If Rx Individual Mask Registers are not enabled then all Rx FIFO filters are affected by the Rx FIFO Global Mask.

Each group of eight filters occupies a memory space equivalent to two Message Buffers which means that the more filters are implemented the less Mailboxes will be available.

Considering that the Rx FIFO occupies the memory space originally reserved for MB0-5, RFFN should be programmed with a value corresponding to a number of filters not greater than the number of available memory words which can be calculated as follows:

$$(\text{SETUP\_MB} - 6) \times 4$$

where SETUP\_MB is MAXMB.

The number of remaining Mailboxes available will be:

$$\text{SETUP\_MB} - 8 - (\text{RFFN} \times 2)$$

If the Number of Rx FIFO Filters programmed through RFFN exceeds the SETUP\_MB value, the exceeding ones will not be functional. Unshaded regions in [Table 26-21](#) indicate the valid combinations of MAXMB, RFEN and RFFN, shaded regions are not functional.

**Table 26-21. Valid Combinations of MAXMB, RFEN and RFFN**

31 -	must be written as 0
30-29 -	This field is reserved. Reserved
28 WRMFRZ	Enable unrestricted write access to FlexCAN memory in Freeze mode. This bit can only be written in Freeze mode and has no effect out of Freeze mode.  1 Enable unrestricted write access to FlexCAN memory 0 Keep the write access restricted in some regions of FlexCAN memory

Table continues on the next page...

## FLEXCANx\_CTRL2 field descriptions (continued)

Field	Description
27–24 RFFN	<p>This 4-bit field defines the number of Rx FIFO filters according to <a href="#">Table 26-20</a>. The maximum selectable number of filters is determined by the Arm. This field can only be written in Freeze mode as it is blocked by hardware in other modes. RFFN defines a number of Message Buffers occupied by Rx FIFO and ID Filter (see <a href="#">Table 26-20</a>) that <b>may not exceed</b> the number of available Mailboxes present in module, defined by MCR[MAXMB]. Default RFFN value is 0x0, which leads to a total of 8 Rx FIFO filters, occupies the first 8 Message Buffers (MB 0-7) and makes available the next Message Buffers (MB 8-63) for Mailboxes. As a second example, when RFFN is set to 0xD, there will be 112 Rx FIFO filters, located in MB 0-33, and MB 34-63 are available for Mailboxes. Notice that, in this case, individual masks (RXIMR) will just cover Rx FIFO filters in 0-31 range, and filters 32-111 will use RXFGMASK. In case of reducing the number of last Message Buffers, MCR[MAXMB] (see <a href="#">Module Configuration Register (FLEXCAN_MCR)</a>) can be adjusted by the application to minimum of 33, in order to give room to the Rx FIFO and its ID Filter Table defined by RFFN. On the contrary, if the application sets MCR[MAXMB] to 16, for instance, the maximum RFFN is limited to 0x4. RFFN also impacts the definition of the minimum number of peripheral clocks per CAN bit as described in <a href="#">Table 26-17</a> (see <a href="#">Arbitration and Matching Timing</a>).</p>
23–19 TASD	<p>This 5-bit field indicates how many CAN bits the Tx arbitration process start point can be delayed from the first bit of CRC field on CAN bus. This field can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>This field is useful to optimize the transmit performance based on factors such as: peripheral/serial clock ratio, CAN bit timing and number of MBs. The duration of an arbitration process, in terms of CAN bits, is directly proportional to the number of available MBs and CAN baud rate and inversely proportional to the peripheral clock frequency.</p> <p>The optimal arbitration timing is that in which the last MB is scanned right before the first bit of the Intermission field of a CAN frame. Therefore, if there are few MBs and the system/serial clock ratio is high and the CAN baud rate is low then the arbitration can be delayed and vice-versa.</p> <p>If TASD is 0 then the arbitration start is not delayed, thus Arm has less time to configure a Tx MB for the next arbitration, but more time is reserved for arbitration. In the other hand, if TASD is 24 then Arm can configure a Tx MB later and less time is reserved for arbitration.</p> <p>If too little time is reserved for arbitration the FlexCAN may be not able to find winner MBs in time to compete with other nodes for the CAN bus. If the arbitration ends too much time before the first bit of Intermission field then there is a chance that Arm reconfigure some Tx MBs and the winner MB is not the best to be transmitted.</p> <p>The reset value is different on various platforms, according to their peripheral clock frequency, number of MBs and target CAN baud rate.</p> <p>The optimal configuration for TASD can be calculated as:</p> $TASD = 25 - \left\{ \frac{f_{CANCLK} \times [MAXMB + 3 - (RFEN \times 8) - (RFEN \times RFFN \times 2)] \times 2}{f_{sys} \times [1 + (PSEG1 + 1) + (PSEG2 + 1) + (PROPSEG + 1)] \times (PRES DIV + 1)} \right\}$ <p>where:</p> <p><math>f_{CANCLK}</math> is the Protocol Engine (PE) Clock in Hz; PE clock is derived from CAN_CLK_ROOT in CCM. See the Clock controller module.</p>

Table continues on the next page...

## FLEXCANx\_CTRL2 field descriptions (continued)

Field	Description
	<p><math>f_{SYS}</math> is the peripheral clock in Hz;</p> <p>MAXMB is the value in CTRL1[MAXMB] field;</p> <p>RFEN is the value in CTRL1[RFEN] bit;</p> <p>RFFN is the value in CTRL2[RFFN] field;</p> <p>PSEG1 is the value in CTRL1[PSEG1] field;</p> <p>PSEG2 is the value in CTRL1[PSEG2] field;</p> <p>PROPSEG is the value in CTRL1[PROPSEG] field;</p> <p>PRES DIV is the value in CTRL1[PRES DIV] field.</p> <p>Please refer to <a href="#">Arbitration process</a> and <a href="#">Protocol Timing</a> for more details.</p>
18 MRP	<p>If this bit is set the matching process starts from the Mailboxes and if no match occurs the matching continues on the Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Matching starts from Mailboxes and continues on Rx FIFO 0 Matching starts from Rx FIFO and continues on Mailboxes</p>
17 RRS	<p>If this bit is asserted Remote Request Frame is submitted to a matching process and stored in the corresponding Message Buffer in the same fashion of a Data Frame. No automatic Remote Response Frame will be generated.</p> <p>If this bit is negated the Remote Request Frame is submitted to a matching process and an automatic Remote Response Frame is generated if a Message Buffer with CODE=0b1010 is found with the same ID.</p> <p>This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Remote Request Frame is stored 0 Remote Response Frame is generated</p>
16 EACEN	<p>This bit controls the comparison of IDE and RTR bits within Rx Mailboxes filters with their corresponding bits in the incoming frame by the matching process. This bit does not affect matching for Rx FIFO. This bit can only be written in Freeze mode as it is blocked by hardware in other modes.</p> <p>1 Enables the comparison of both Rx Mailbox filter's IDE and RTR bit with their corresponding bits within the incoming frame. Mask bits do apply. 0 Rx Mailbox filter's IDE bit is always compared and RTR is never compared despite mask bits.</p>
-	<p>This field is reserved. Reserved</p>

## 26.8.14 Error and Status 2 Register (FLEXCANx\_ESR2)

This register reflects various interrupt flags and some general status.

Address: Base address + 38h offset

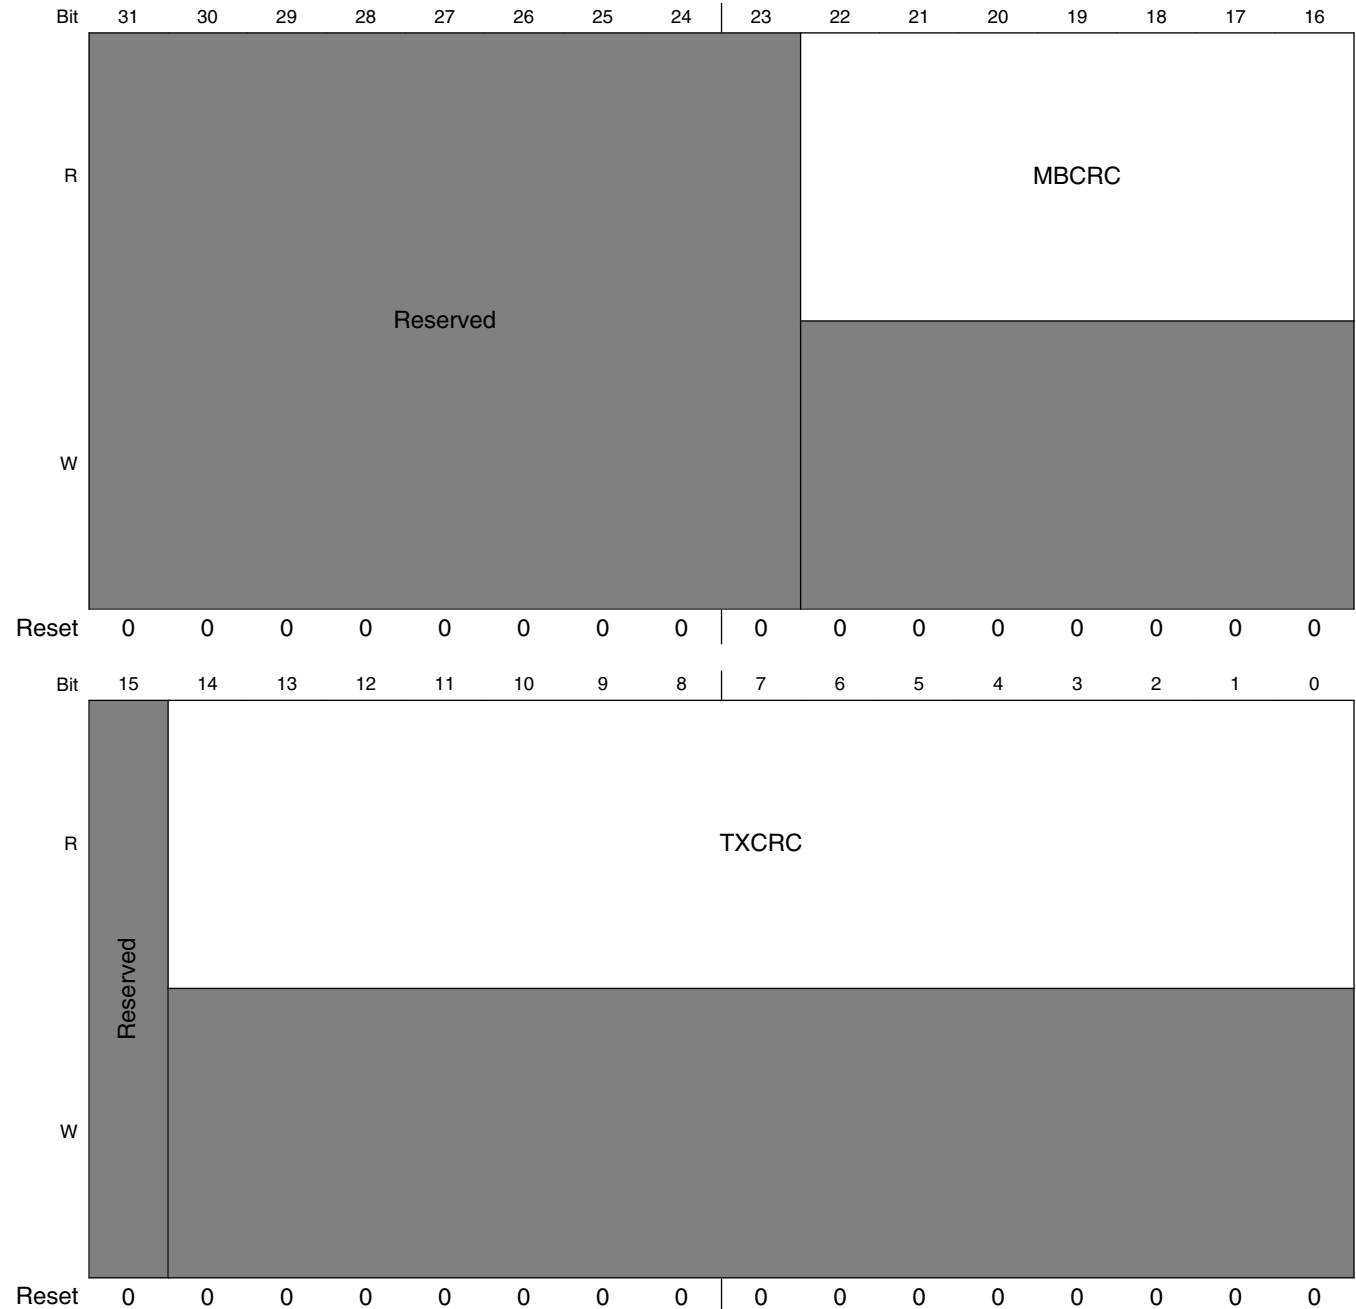

## FLEXCANx\_ESR2 field descriptions

Field	Description
31–23 -	This field is reserved. Reserved
22–16 LPTM	If ESR2[VPS] is asserted, his 7-bit field indicates the lowest number inactive Mailbox (refer to IMB bit description). If there is no inactive Mailbox then the Mailbox indicated depends on CTRL1[LBUF] bit value . If CTRL1[LBUF] bit is negated then the Mailbox indicated is the one which has the greatest arbitration value (see <a href="#">Highest Mailbox priority first</a> ). If CTRL1[LBUF] bit is asserted then the Mailbox indicated is the highest number active Tx Mailbox. If a Tx Mailbox is being transmitted it is not considered in LPTM calculation. If ESR2[IMB] is not asserted and a frame is transmitted successfully, LPTM is updated with its Mailbox number.
15 -	This field is reserved. Reserved
14 VPS	This bit indicates whether IMB and LPTM contents are currently valid or not. VPS is asserted upon every complete Tx arbitration process unless the Arm writes to Control and Status word of a Mailbox that has already been scanned (i.e. it is behind Tx Arbitration Pointer) during the Tx arbitration process . If there is no inactive Mailbox and only one Tx Mailbox which is being transmitted then VPS is not asserted. VPS is negated upon the start of every Tx arbitration process or upon a write to Control and Status word of any Mailbox.ESR2[VPS] is not affected by any Arm write into Control Status (C/S) of a MB which is blocked by abort mechanism. When MCR[AEN] is asserted, the abort code write in C/S of a MB that is been transmitted (pending abort), or any write attempt into a Tx MB with IFLAG set is blocked.  1 Contents of IMB and LPTM are valid 0 Contents of IMB and LPTM are invalid
13 IMB	If ESR2[VPS] is asserted, this bit indicates whether there is any inactive Mailbox (CODE field is either 0b1000 or 0b0000).  This bit is asserted in the following cases: (1) During arbitration, if a LPTM is found and it is inactive. (2) If IMB is not asserted and a frame is transmitted successfully. (3) This bit is cleared in all start of arbitration (see <a href="#">Arbitration process</a> ).  LPTM mechanism have the following behavior: if a MB is successfully transmitted and ESR2[IMB]=0 (no inactive Mailbox), then ESR2[VPS] and ESR2[IMB] are asserted and the index related to the MB just transmitted is loaded into ESR2[LPTM].  1 If ESR2[VPS] is asserted, there is at least one inactive Mailbox. LPTM content is the number of the first one. 0 If ESR2[VPS] is asserted, the ESR2[LPTM] is not an inactive Mailbox.
-	This field is reserved. Reserved

### 26.8.15 CRC Register (FLEXCANx\_CRCR)

This register provides information about the CRC of transmitted messages

Address: Base address + 44h offset

**FLEXCANx\_CRCR field descriptions**

Field	Description
31–23 -	This field is reserved. Reserved
22–16 MBCRC	This field indicates the number of the Mailbox corresponding to the value in TXCRC field.
15 -	This field is reserved. Reserved
TXCRC	This field indicates the CRC value of the last message transmitted. This field is updated at the same time the Tx Interrupt Flag is asserted.

**26.8.16 Rx FIFO Global Mask Register (FLEXCANx\_RXFGMASK)**

If Rx FIFO is enabled RXFGMASK is used to mask the Rx FIFO ID Filter Table elements that do not have a corresponding RXIMR according to CTRL2[RFFN] field setting.

This register can only be written in Freeze Mode as it is blocked by hardware in other modes.

**Table 26-22. Rx FIFO Global Mask usage**

Rx FIFO ID Filter Table Elements Format (MCR[IDAM])	Identifier Acceptance Filter fields					
	RTR	IDE	RXIDA	RXIDB	RXIDC	reserved
A	FGM[31]	FGM[30]	FGM[29:1]	-	-	FGM[0]
B	FGM[31] FGM[15]	FGM[30] FGM[14]	-	FGM[29:16] FGM[13:0] 1	-	-
C	-	-	-	-	FGM[31:24] FGM[23:16] FGM[15:8] FGM[7:0] 2	-

1. If MCR[IDAM] field is equivalent to the format B only the fourteen most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.
2. If MCR[IDAM] field is equivalent to the format C only the eight most significant bits of the Identifier of the incoming frame are compared with the Rx FIFO filter.

Address: Base address + 48h offset

**FLEXCANx\_RXFGMASK field descriptions**

Field	Description
FGM31_FGM0	<p>These bits mask the ID Filter Table elements bits in a perfect alignment. <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a> shows in detail which FGM bits mask each IDAF field. Clear this register has the effect of disabling the ID Filter.</p> <p>1 The corresponding bit in the filter is checked                      0 The corresponding bit in the filter is "don't care"</p>

**26.8.17 Rx FIFO Information Register (FLEXCANx\_RXFIR)**

RXFIR provides information on Rx FIFO.

This register is the port through which Arm accesses the output of the RXFIR FIFO located in RAM. The RXFIR FIFO is written by the FlexCAN whenever a new message is moved into the Rx FIFO as well as its output is updated whenever the output of the Rx FIFO is updated with the next message. Refer to [Rx FIFO](#) to find instructions on reading this register.

Address: Base address + 4Ch offset

**FLEXCANx\_RXFIR field descriptions**

Field	Description
31–9 -	This field is reserved. Reserved
IDHIT	This 9-bit field indicates which Identifier Acceptance Filter (see <a href="#">Rx FIFO Structure</a> ) was hit by the received message that is in the output of the Rx FIFO . (refer to <a href="#">Rx FIFO</a> for details) If multiple filters match the incoming message ID then the first matching IDAF found (lowest number) by the matching process is indicated. This field is valid only while the IFLAG[BUF5I] is asserted.

### 26.8.18 Rx Individual Mask Registers (FLEXCANx\_RXIMRn)

RXIMR are used as acceptance masks for ID filtering in Rx MBs and the Rx FIFO . If the Rx FIFO is not enabled, one mask register is provided for each available Mailbox, providing ID masking capability on a per Mailbox basis.

When the Rx FIFO is enabled (MCR[RFEN] bit is asserted), up to 32 Rx Individual Mask Registers can apply to the Rx FIFO ID Filter Table elements on a one-to-one correspondence depending on CTRL2[RFFN] setting. Refer to [Control 2 Register \(FLEXCAN\\_CTRL2\)](#) for details .

RXIMR can only be written by the Arm while the module is in Freeze Mode, otherwise they are blocked by hardware .

The Individual Rx Mask Registers are not affected by reset and must be explicitly initialized prior to any reception.

Address: Base address + 880h offset + (4d × i), where i=0d to 63d

#### FLEXCANx\_RXIMRn field descriptions

Field	Description
MI31_MIO	<p>These bits mask both Mailbox filter and Rx FIFO ID Filter Table element in distinct ways.</p> <p>For Mailbox filter refer to <a href="#">Rx Mailboxes Global Mask Register (FLEXCAN_RXMGMASK)</a>.</p> <p>For Rx FIFO ID Filter Table element refer to <a href="#">Rx FIFO Global Mask Register (FLEXCAN_RXFGMASK)</a>.</p> <p>1 The corresponding bit in the filter is checked                      0 the corresponding bit in the filter is "don't care"</p>

### 26.8.19 Glitch Filter Width Registers (FLEXCANx\_GFWR)

The Glitch Filter just takes effects when FLEXCAN enters the STOP mode.

Address: Base address + 9E0h offset

**FLEXCANx\_GFWR field descriptions**

<b>Field</b>	<b>Description</b>
31–8 Reserved	This read-only field is reserved and always has the value 0.
GFWR	<p>It determines the Glitch Filter Width. The width will be divided from Oscillator clock by GFWR values. By default, it is 5.33 <math>\mu</math>s when the oscillator is 24 MHz.</p> <p>Filter Pulse Width = [(GFWR FIELD + 1) x (1 / Osc. Frequency)]</p>

# Chapter 27

## Flexible I/O (FlexIO)

### 27.1 Chip-specific FlexIO information

#### NOTE

On this device, FLEXIO1 and FLEXIO2 parameters are not exactly the same. FLEXIO1 has 16 pins, while FLEXIO2 has 32 pins.

### 27.2 Introduction

#### 27.2.1 Overview

The FlexIO is a highly configurable module providing a wide range of functionality including:

- Emulation of a variety of serial/parallel communication protocols
- Flexible 16-bit timers with support for a variety of trigger, reset, enable and disable conditions
- Programmable logic blocks allowing the implementation of digital logic functions on-chip and configurable interaction of internal and external modules
- Programmable state machine for offloading basic system control functions from CPU

#### 27.2.2 Features

The FlexIO module is capable of supporting a wide range of protocols including, but not limited to:

- UART
- I2C

## Introduction

- SPI
- I2S
- Camera IF
- Motorola 68K/Intel 8080 bus
- PWM/Waveform generation

The following key features are provided:

- Array of 32-bit shift registers with transmit, receive and data match modes
- Double buffered shifter operation for continuous data transfer
- Shifter concatenation to support large transfer sizes
- Automatic start/stop bit generation
- 1, 2, 4, 8, 16 or 32 multi-bit shift widths for parallel interface support
- Interrupt, DMA or polled transmit/receive operation
- Programmable baud rates independent of bus clock frequency, with support for asynchronous operation during stop modes
- Highly flexible 16-bit timers with support for a variety of internal or external trigger, reset, enable and disable conditions
- Programmable logic mode for integrating external digital logic functions on-chip or combining pin/shifter/timer functions to generate complex outputs
- Programmable state machine for offloading basic system control functions from CPU with support for up to 8 states, 8 outputs and 3 selectable inputs per state

### 27.2.3 Block Diagram

The following diagram gives a high-level overview of the configuration of FlexIO timers and shifters.

Figure 27-1. FlexIO block diagram

## 27.2.4 Modes of operation

The FlexIO module supports the chip modes described in the following table.

**Table 27-1. Chip modes supported by the FlexIO module**

Chip mode	FlexIO Operation
Run	Normal operation
Stop/Wait	Can continue operating provided the Doze Enable bit (CTRL[DOZEN]) is clear and the FlexIO is using an external or internal clock source which remains operating during stop/wait modes.
Low Leakage Stop	The Doze Enable (CTRL[DOZEN]) bit is ignored and the FlexIO will wait for all Timers to complete any pending operation before acknowledging low leakage mode entry.
Debug	Can continue operating provided the Debug Enable bit (CTRL[DBGGE]) is set.

## 27.2.5 FlexIO Signal Descriptions

Signal	Description	I/O
FXIO_Dn (n=0...31)	Bidirectional FlexIO Shifter and Timer pin inputs/outputs	I/O

## 27.3 Memory Map and Registers

### 27.3.1 FLEXIO Register Descriptions

#### 27.3.1.1 FLEXIO Memory Map

Base address: 401A\_C000 for FlexIO1, 401B\_0000 for FlexIO2.

#### NOTE

Number of Pin IO is  $2^4$  for FlexIO1,  $2^5$  for FlexIO2.

### 27.3.1.2.3 Fields

Field	Function
31-24 MAJOR	Major Version Number This read only field returns the major version number for the module specification.

*Table continues on the next page...*

## Memory Map and Registers

Field	Function
23-16 MINOR	Minor Version Number This read only field returns the minor version number for the module specification.
15-0 FEATURE	Feature Specification Number This read only field returns the feature set number. 0000000000000000b - Standard features implemented. 0000000000000001b - Supports state, logic and parallel modes.

### 27.3.1.3 Parameter (PARAM)

#### 27.3.1.3.1 Address

Register	Offset
PARAM	4h

#### 27.3.1.3.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	TRIGGER								PIN							
W	[Greyed out]															
Reset	0	0	0	0	0	0	1	0	0	0	1	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	TIMER								SHIFTER							
W	[Greyed out]															
Reset	0	0	0	0	0	1	0	0	0	0	0	0	0	1	0	0

#### 27.3.1.3.3 Fields

Field	Function
31-24 TRIGGER	Trigger Number Number of external triggers implemented.
23-16 PIN	Pin Number Number of Pins implemented.
15-8 TIMER	Timer Number Number of Timers implemented.
7-0	Shifter Number

Field	Function
SHIFTER	Number of Shifters implemented.

## 27.3.1.4 FlexIO Control (CTRL)

### 27.3.1.4.1 Address

Register	Offset
CTRL	8h

### 27.3.1.4.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	DOZE	DBG	0													
W	N	E														
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0													FAST	SWR	FLEX
W														ACC	ST	EN
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 27.3.1.4.3 Fields

Field	Function
31 DOZEN	Doze Enable Disables FlexIO operation in Doze modes. 0b - FlexIO enabled in Doze modes. 1b - FlexIO disabled in Doze modes.
30 DBGE	Debug Enable Enables FlexIO operation in Debug mode. 0b - FlexIO is disabled in debug modes. 1b - FlexIO is enabled in debug modes
29-3 —	
2 FASTACC	Fast Access Enables fast register accesses to FlexIO registers, but requires the FlexIO functional clock to be at least twice the frequency of the bus clock.

Table continues on the next page...

## Memory Map and Registers

Field	Function
	0b - Configures for normal register accesses to FlexIO 1b - Configures for fast register accesses to FlexIO
1 SWRST	Software Reset The FlexIO Control Register is not affected by the software reset, all other logic in the FlexIO is affected by the software reset and register accesses are ignored until this bit is cleared. This register bit will remain set until cleared by software, and the reset has cleared in the FlexIO clock domain. 0b - Software reset is disabled 1b - Software reset is enabled, all FlexIO registers except the Control Register are reset.
0 FLEXEN	FlexIO Enable 0b - FlexIO module is disabled. 1b - FlexIO module is enabled.

### 27.3.1.5 Pin State (PIN)

#### 27.3.1.5.1 Address

Register	Offset
PIN	Ch

#### 27.3.1.5.2 Diagram

#### 27.3.1.5.3 Fields

Field	Function
31-0 PDI	Pin Data Input Returns the input data on each of the FlexIO pins.

## 27.3.1.6 Shifter Status (SHIFTSTAT)

### 27.3.1.6.1 Address

Register	Offset
SHIFTSTAT	10h

### 27.3.1.6.2 Diagram

### 27.3.1.6.3 Fields

Field	Function
31-4 —	
3-0 SSF	<p>Shifter Status Flag</p> <p>The shifter status flag is updated when one of the following events occurs:</p> <p>For SMOD=Receive, the status flag is set when SHIFTBUF has been loaded with data from Shifter (SHIFTBUF is full), and the status flag is cleared when SHIFTBUF register is read.</p> <p>For SMOD=Transmit, the status flag is set when SHIFTBUF data has been transferred to the Shifter (SHIFTBUF is empty) or when initially configured for SMOD=Transmit, and the status flag is cleared when the SHIFTBUF register is written.</p> <p>For SMOD=Match Store, the status flag is set when a match has occurred between SHIFTBUF and Shifter, and the status flag is cleared when the SHIFTBUF register is read.</p> <p>For SMOD=Match Continuous, returns the current match result between the SHIFTBUF and Shifter.</p> <p>For SMOD=State, the status flag for a shifter will set when it is selected by the current state pointer.</p> <p>For SMOD=Logic, returns the current value of the programmable logic block output.</p> <p>The status flag can also be cleared by writing a logic one to the flag for all modes except Match Continuous/State/Logic.</p>

## Memory Map and Registers

Field	Function
	0b - Status flag is clear. 1b - Status flag is set.

### 27.3.1.7 Shifter Error (SHIFTErr)

#### 27.3.1.7.1 Address

Register	Offset
SHIFTErr	14h

#### 27.3.1.7.2 Diagram

Bits	31	30	29	28	27	26	25	24		23	22	21	20	19	18	17	16
R	0																
W	[Shaded]																
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8		7	6	5	4	3	2	1	0
R	0											SEF					
W	[Shaded]											w1c					
Reset	0	0	0	0	0	0	0	0		0	0	0	0	0	0	0	0

#### 27.3.1.7.3 Fields

Field	Function
31-4 —	
3-0 SEF	<p>Shifter Error Flags</p> <p>The shifter error flag is set when one of the following events occurs:</p> <p>For SMOD=Receive, indicates Shifter was ready to store new data into SHIFTBUF before the previous data was read from SHIFTBUF (SHIFTBUF Overrun), or indicates that the received start or stop bit does not match the expected value.</p> <p>For SMOD=Transmit, indicates Shifter was ready to load new data from SHIFTBUF before new data had been written into SHIFTBUF (SHIFTBUF Underrun).</p> <p>For SMOD=Match Store, indicates a match event occurred before the previous match data was read from SHIFTBUF (SHIFTBUF Overrun).</p>

Field	Function
	<p>For SMOD=Match Continuous, the error flag is set when a match has occurred between SHIFTBUF and Shifter.</p> <p>For SMOD=Logic, the error flag is set when the output of the programmable logic block has asserted.</p> <p>Can be cleared by writing logic one to the flag. For SMOD=Match Continuous, can also be cleared when the SHIFTBUF register is read.</p> <p>0b - Shifter Error Flag is clear. 1b - Shifter Error Flag is set.</p>

## 27.3.1.8 Timer Status (TIMSTAT)

### 27.3.1.8.1 Address

Register	Offset
TIMSTAT	18h

### 27.3.1.8.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W	[Shaded]															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0												TSF			
W	[Shaded]												w1c			
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

### 27.3.1.8.3 Fields

Field	Function
31-4 —	
3-0 TSF	<p>Timer Status Flags</p> <p>The timer status flag sets depending on the timer mode, and can be cleared by writing logic one to the flag.</p>

## Memory Map and Registers

Field	Function
	<p>In 8-bit counter mode, the timer status flag is set when the upper 8-bit counter equals zero and decrements, this also causes the counter to reload with the value in the compare register.</p> <p>In 8-bit PWM mode, the timer status flag is set when the upper 8-bit counter equals zero and decrements, this also causes the counter to reload with the value in the compare register..</p> <p>In 16-bit counter mode, the timer status flag is set when the 16-bit counter equals zero and decrements, this also causes the counter to reload with the value in the compare register..</p> <p>0b - Timer Status Flag is clear. 1b - Timer Status Flag is set.</p>

### 27.3.1.9 Shifter Status Interrupt Enable (SHIFTSIEN)

#### 27.3.1.9.1 Address

Register	Offset
SHIFTSIEN	20h

#### 27.3.1.9.2 Diagram

#### 27.3.1.9.3 Fields

Field	Function
31-4 —	
3-0 SSIE	<p>Shifter Status Interrupt Enable</p> <p>Enables interrupt generation when corresponding SSF is set.</p> <p>0b - Shifter Status Flag interrupt disabled. 1b - Shifter Status Flag interrupt enabled.</p>

## 27.3.1.10 Shifter Error Interrupt Enable (SHIFTEIEN)

### 27.3.1.10.1 Address

Register	Offset
SHIFTEIEN	24h

### 27.3.1.10.2 Diagram

### 27.3.1.10.3 Fields

Field	Function
31-4 —	
3-0 SEIE	Shifter Error Interrupt Enable Enables interrupt generation when corresponding SEF is set. 0b - Shifter Error Flag interrupt disabled. 1b - Shifter Error Flag interrupt enabled.

## 27.3.1.11 Timer Interrupt Enable (TIMIEN)

### 27.3.1.11.1 Address

Register	Offset
TIMIEN	28h

### 27.3.1.11.2 Diagram

### 27.3.1.11.3 Fields

Field	Function
31-4 —	
3-0 TEIE	Timer Status Interrupt Enable Enables interrupt generation when corresponding TSF is set. 0b - Timer Status Flag interrupt is disabled. 1b - Timer Status Flag interrupt is enabled.

### 27.3.1.12 Shifter Status DMA Enable (SHIFTSDEN)

#### 27.3.1.12.1 Address

Register	Offset
SHIFTSDEN	30h

### 27.3.1.12.2 Diagram

### 27.3.1.12.3 Fields

Field	Function
31-4 —	
3-0 SSDE	Shifter Status DMA Enable Enables DMA request generation when corresponding SSF is set. 0b - Shifter Status Flag DMA request is disabled. 1b - Shifter Status Flag DMA request is enabled.

## 27.3.1.13 Shifter State (SHIFTSTATE)

### 27.3.1.13.1 Address

Register	Offset
SHIFTSTATE	40h

### 27.3.1.13.2 Diagram

### 27.3.1.13.3 Fields

Field	Function
31-3 —	
2-0 STATE	Current State Pointer The current state field maintains a pointer to keep track of the current Shifter (configured for State mode) enabled to drive outputs and compute the next state. Reading this register when the state pointer is updating can result in the incorrect state returned.

## 27.3.1.14 Shifter Control N (SHIFTCTLn)

### 27.3.1.14.1 Address

Register	Offset
SHIFTCTL0	80h
SHIFTCTL1	84h
SHIFTCTL2	88h
SHIFTCTL3	8Ch

### 27.3.1.14.2 Diagram

### 27.3.1.14.3 Fields

Field	Function
31-26 —	
25-24 TIMSEL	Timer Select Selects which Timer is used for controlling the logic/shift register and generating the Shift clock. TIMSEL=i will select TIMERi.
23 TIMPOL	Timer Polarity 0b - Shift on posedge of Shift clock 1b - Shift on negedge of Shift clock
22-18 —	
17-16 PINCFG	Shifter Pin Configuration 00b - Shifter pin output disabled 01b - Shifter pin open drain or bidirectional output enable 10b - Shifter pin bidirectional output data 11b - Shifter pin output
15-13 —	
12-8 PINSEL	Shifter Pin Select Selects which pin is used by the Shifter input or output. PINSEL=i will select the FXIO_Di pin.
7 PINPOL	Shifter Pin Polarity 0b - Pin is active high 1b - Pin is active low
6-3 —	
2-0 SMOD	Shifter Mode Configures the mode of the Shifter. 000b - Disabled.

## Memory Map and Registers

Field	Function
	001b - Receive mode. Captures the current Shifter content into the SHIFTBUF on expiration of the Timer. 010b - Transmit mode. Load SHIFTBUF contents into the Shifter on expiration of the Timer. 011b - Reserved. 100b - Match Store mode. Shifter data is compared to SHIFTBUF content on expiration of the Timer. 101b - Match Continuous mode. Shifter data is continuously compared to SHIFTBUF contents. 110b - State mode. SHIFTBUF contents are used for storing programmable state attributes. 111b - Logic mode. SHIFTBUF contents are used for implementing programmable logic look up table.

### 27.3.1.15 Shifter Configuration N (SHIFTCFGa)

#### 27.3.1.15.1 Address

Register	Offset
SHIFTCFG0	100h
SHIFTCFG1	104h
SHIFTCFG2	108h
SHIFTCFG3	10Ch

#### 27.3.1.15.2 Diagram

#### 27.3.1.15.3 Fields

Field	Function
31-21	
—	

Table continues on the next page...

Field	Function
20-16 PWIDTH	<p>Parallel Width</p> <p>For all Shifters, this register field configures the number of bits to be shifted on each Shift clock as follows:</p> <p>1-bit shift for PWIDTH=0 4-bit shift for PWIDTH=1...3 8-bit shift for PWIDTH=4...7 16-bit shift for PWIDTH=8...15 32-bit shift for PWIDTH=16...31</p> <p>For Shifters which support parallel transmit (SHIFTER0, SHIFTER4) or parallel receive (SHIFTER3, SHIFTER7), this register field, together with SHIFTCTL[PINSEL], also selects the pins to be driven or sampled on each Shift clock as follows:</p> <p>FXIO_D[PINSEL+PWIDTH]:FXIO_D[PINSEL]</p> <p>For SMOD=State, this field is used to disable state outputs. See 'State Mode' section for more detail.</p>
15-10 —	
9 —	
8 INSRC	<p>Input Source</p> <p>Selects the input source for the shifter.</p> <p>0b - Pin 1b - Shifter N+1 Output</p>
7 —	
6 —	
5-4 SSTOP	<p>Shifter Stop bit</p> <p>For SMOD=Transmit, this field allows automatic stop bit insertion if the selected timer has also enabled a stop bit.</p> <p>For SMOD=Receive or Match Store, this field allows automatic stop bit checking if the selected timer has also enabled a stop bit.</p> <p>For SMOD=State, this field is used to disable state outputs. See 'State Mode' section for more detail.</p> <p>For SMOD=Logic, this field is used to mask logic pin inputs. See 'Logic Mode' section for more detail.</p> <p>00b - Stop bit disabled for transmitter/receiver/match store 01b - Reserved for transmitter/receiver/match store 10b - Transmitter outputs stop bit value 0 on store, receiver/match store sets error flag if stop bit is not 0 11b - Transmitter outputs stop bit value 1 on store, receiver/match store sets error flag if stop bit is not 1</p>
3-2 —	
1-0 SSTART	<p>Shifter Start bit</p> <p>For SMOD=Transmit, this field allows automatic start bit insertion if the selected timer has also enabled a start bit.</p>

## Memory Map and Registers

Field	Function
	<p>For SMOD=Receive or Match Store, this field allows automatic start bit checking if the selected timer has also enabled a start bit.</p> <p>For SMOD=State, this field is used to disable state outputs. See 'State Mode' section for more detail.</p> <p>For SMOD=Logic, this field is used to mask logic pin inputs. See 'Logic Mode' section for more detail.</p> <p>00b - Start bit disabled for transmitter/receiver/match store, transmitter loads data on enable            01b - Start bit disabled for transmitter/receiver/match store, transmitter loads data on first shift            10b - Transmitter outputs start bit value 0 before loading data on first shift, receiver/match store sets error flag if start bit is not 0            11b - Transmitter outputs start bit value 1 before loading data on first shift, receiver/match store sets error flag if start bit is not 1</p>

### 27.3.1.16 Shifter Buffer N (SHIFTBUFa)

#### 27.3.1.16.1 Address

Register	Offset
SHIFTBUF0	200h
SHIFTBUF1	204h
SHIFTBUF2	208h
SHIFTBUF3	20Ch

#### 27.3.1.16.2 Diagram

#### 27.3.1.16.3 Fields

Field	Function
31-0	Shift Buffer
SHIFTBUF	Shift buffer data is used for a variety of functions depending on the SMOD setting:

Field	Function
	<p>For SMOD=Receive, Shifter data is transferred into SHIFTBUF at the expiration of Timer. The SHIFTBUF register should only be read when the corresponding shifter status flag is set, indicating new Shifter data is available.</p> <p>For SMOD=Transmit, SHIFTBUF data is transferred into the Shifter before the Timer begins.</p> <p>For SMOD=Match Store, SHIFTBUF[31:16] contains the data to be matched with the Shifter contents and SHIFTBUF[15:0] can be used to mask the match result (1=mask, 0=no mask). The Match is checked when the Timer expires and Shifter data [31:16] is written to SHIFTBUF[31:16] whenever a match event occurs. The SHIFTBUF register should only be read when the corresponding shifter status flag is set, indicating new Shifter data is available.</p> <p>For SMOD=Match Continuous, SHIFTBUF[31:16] contains the data to be matched with the Shifter contents and SHIFTBUF[15:0] can be used to mask the match result (1=mask, 0=no mask).</p> <p>For SMOD=Logic, SHIFTBUF[31:0] is used to implement a 5-input, 32-bit programmable logic look-up table. See 'Logic Mode' section for more detail.</p> <p>For SMOD=State, SHIFTBUF[31:24] is used to drive the output value when this shifter is selected by the current state pointer and SHIFTBUF[23:0] is used to configure the value of the next state transition. See 'State Mode' section for more detail.</p>

### 27.3.1.17 Shifter Buffer N Bit Swapped (SHIFTBUFBISa)

#### 27.3.1.17.1 Address

Register	Offset
SHIFTBUFBIS0	280h
SHIFTBUFBIS1	284h
SHIFTBUFBIS2	288h
SHIFTBUFBIS3	28Ch

#### 27.3.1.17.2 Diagram

### 27.3.1.17.3 Fields

Field	Function
31-0	Shift Buffer
SHIFTBUFBIS	Alias to SHIFTBUF register, except reads/writes to this register are bit swapped. Reads return SHIFTBUF[0:31].

### 27.3.1.18 Shifter Buffer N Byte Swapped (SHIFTBUFBYSa)

#### 27.3.1.18.1 Address

Register	Offset
SHIFTBUFBYS0	300h
SHIFTBUFBYS1	304h
SHIFTBUFBYS2	308h
SHIFTBUFBYS3	30Ch

#### 27.3.1.18.2 Diagram

### 27.3.1.18.3 Fields

Field	Function
31-0	Shift Buffer
SHIFTBUFBYS	Alias to SHIFTBUF register, except reads/writes to this register are byte swapped. Reads return { SHIFTBUF[7:0], SHIFTBUF[15:8], SHIFTBUF[23:16], SHIFTBUF[31:24] }.

## 27.3.1.19 Shifter Buffer N Bit Byte Swapped (SHIFTBUFBSa)

### 27.3.1.19.1 Address

Register	Offset
SHIFTBUFBS0	380h
SHIFTBUFBS1	384h
SHIFTBUFBS2	388h
SHIFTBUFBS3	38Ch

### 27.3.1.19.2 Diagram

### 27.3.1.19.3 Fields

Field	Function
31-0	Shift Buffer
SHIFTBUFBS	Alias to SHIFTBUF register, except reads/writes to this register are bit swapped within each byte. Reads return { SHIFTBUF[24:31], SHIFTBUF[16:23], SHIFTBUF[8:15], SHIFTBUF[0:7] }.

## 27.3.1.20 Timer Control N (TIMCTLa)

### 27.3.1.20.1 Address

Register	Offset
TIMCTL0	400h
TIMCTL1	404h
TIMCTL2	408h
TIMCTL3	40Ch

### 27.3.1.20.2 Diagram

### 27.3.1.20.3 Fields

Field	Function
31-30 —	
29-24 TRGSEL	<p>Trigger Select</p> <p>The valid values for TRGSEL will depend on the FLEXIO_PARAM register.</p> <ul style="list-style-type: none"> <li>When TRGSRC = 1, the valid values for N will depend on PIN, TIMER, SHIFTER fields in the FLEXIO_PARAM register.</li> <li>When TRGSRC = 0, the valid values for N will depend on TRIGGER field in FLEXIO_PARAM register.</li> </ul> <p>Refer to the chip configuration section for external trigger selection.</p> <p><b>NOTE:</b> For a pin, N=0 to 31. For a Shifter/Timer, N=0 to 3.</p> <p>The internal trigger selection is configured as follows:</p> <ul style="list-style-type: none"> <li>4*N - Pin 2*N input</li> <li>4*N+1 - Shifter N status flag</li> <li>4*N+2 - Pin 2*N+1 input</li> <li>4*N+3 - Timer N trigger output</li> </ul>
23 TRGPOL	<p>Trigger Polarity</p> <p>0b - Trigger active high 1b - Trigger active low</p>
22	Trigger Source

Table continues on the next page...

Field	Function
TRGSRC	0b - External trigger selected 1b - Internal trigger selected
21-18 —	
17-16 PINCFG	Timer Pin Configuration 00b - Timer pin output disabled 01b - Timer pin open drain or bidirectional output enable 10b - Timer pin bidirectional output data 11b - Timer pin output
15-13 —	
12-8 PINSEL	Timer Pin Select Selects which pin is used by the Timer input or output. PINSEL=i will select the FXIO_Di pin.
7 PINPOL	Timer Pin Polarity 0b - Pin is active high 1b - Pin is active low
6-2 —	
1-0 TIMOD	Timer Mode In 8-bit baud counter mode, the lower 8-bits of the counter and compare register are used to configure the baud rate of the timer shift clock, and the upper 8-bits are used to configure the shifter bit count. In 8-bit PWM high mode, the lower 8-bits of the counter and compare register are used to configure the high period of the timer shift clock, and the upper 8-bits are used to configure the low period of the timer shift clock. The shifter bit count is configured using another timer or external signal. In 16-bit counter mode, the full 16-bits of the counter and compare register are used to configure either the baud rate of the shift clock or the shifter bit count. 00b - Timer Disabled. 01b - Dual 8-bit counters baud mode. 10b - Dual 8-bit counters PWM high mode. 11b - Single 16-bit counter mode.

### 27.3.1.21 Timer Configuration N (TIMCFGa)

#### 27.3.1.21.1 Address

Register	Offset
TIMCFG0	480h
TIMCFG1	484h
TIMCFG2	488h
TIMCFG3	48Ch

### 27.3.1.21.2 Function

The options to enable or disable the timer using the Timer N-1 enable or disable are reserved when N is evenly divisible by 4 (eg: Timer 0).

#### NOTE

The pin and trigger level/edges specified below refer to the signal state after being modified by the PINPOL or TRGPOL setting in the TIMCTL register. For example, "Trigger low" means a trigger is actually at logic level 1 if the TRGPOL is set to 1 (active low).

### 27.3.1.21.3 Diagram

### 27.3.1.21.4 Fields

Field	Function
31-26 —	
25-24 TIMOUT	Timer Output Configures the initial state of the Timer Output and whether it is affected by the Timer reset. 00b - Timer output is logic one when enabled and is not affected by timer reset 01b - Timer output is logic zero when enabled and is not affected by timer reset 10b - Timer output is logic one when enabled and on timer reset 11b - Timer output is logic zero when enabled and on timer reset
23-22 —	
21-20 TIMDEC	Timer Decrement Configures the source of the Timer decrement and the source of the Shift clock. 00b - Decrement counter on FlexIO clock, Shift clock equals Timer output. 01b - Decrement counter on Trigger input (both edges), Shift clock equals Timer output. 10b - Decrement counter on Pin input (both edges), Shift clock equals Pin input.

Table continues on the next page...

Field	Function
	11b - Decrement counter on Trigger input (both edges), Shift clock equals Trigger input.
19 —	
18-16 TIMRST	<p>Timer Reset</p> <p>Configures the condition that causes the timer counter (and optionally the timer output) to be reset. In 8-bit counter mode, the timer reset will only reset the lower 8-bits that configure the baud rate. In all other modes, the timer reset will reset the full 16-bits of the counter.</p> <ul style="list-style-type: none"> <li>000b - Timer never reset</li> <li>001b - Reserved</li> <li>010b - Timer reset on Timer Pin equal to Timer Output</li> <li>011b - Timer reset on Timer Trigger equal to Timer Output</li> <li>100b - Timer reset on Timer Pin rising edge</li> <li>101b - Reserved</li> <li>110b - Timer reset on Trigger rising edge</li> <li>111b - Timer reset on Trigger rising or falling edge</li> </ul>
15 —	
14-12 TIMDIS	<p>Timer Disable</p> <p>Configures the condition that causes the Timer to be disabled and stop decrementing.</p> <ul style="list-style-type: none"> <li>000b - Timer never disabled</li> <li>001b - Timer disabled on Timer N-1 disable</li> <li>010b - Timer disabled on Timer compare</li> <li>011b - Timer disabled on Timer compare and Trigger Low</li> <li>100b - Timer disabled on Pin rising or falling edge</li> <li>101b - Timer disabled on Pin rising or falling edge provided Trigger is high</li> <li>110b - Timer disabled on Trigger falling edge</li> <li>111b - Reserved</li> </ul>
11 —

## 27.4 Functional description

### 27.4.1 Clocking and Resets

### 27.4.1.1 Functional clock

The FlexIO functional clock is asynchronous to the bus clock and can remain enabled in low power modes. The FlexIO functional clock must be enabled before accessing any FlexIO registers.

### 27.4.1.2 Bus clock

The bus clock is only used for bus accesses to the control and configuration registers.

### 27.4.1.3 Chip reset

The logic and registers for the FlexIO are reset to their default state on a chip reset.

### 27.4.1.4 Software reset

The FlexIO implements a software reset bit in its Control Register. The CTRL[RST] will reset all logic and registers to their default state, except for the CTRL itself.

## 27.4.2 Shifter operation

Shifters are responsible for buffering and shifting data into or out of the FlexIO. The timing of shift, load and store events are controlled by the Timer assigned to the Shifter via the SHIFTCTL[TIMSEL] register. The Shifters are designed to support either DMA, interrupt or polled operation. The following block diagram provides a detailed view of the Shifter microarchitecture.

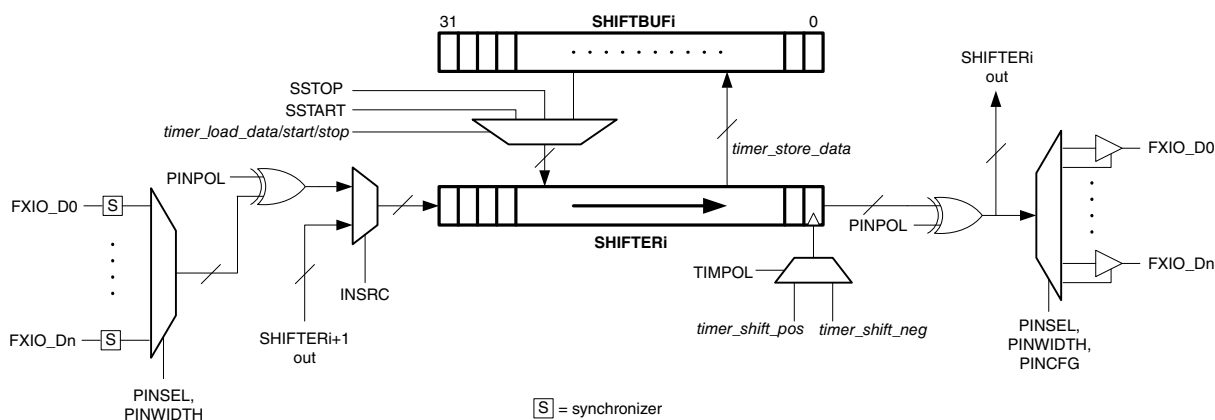

Figure 27-2. Shifter Microarchitecture

### 27.4.2.1 Transmit Mode

When configured for Transmit mode (SHIFTCTL[SMOD]=Transmit), the shifter will load data from the SHIFTBUF register and shift data out when a load event is signalled by the assigned Timer. An optional start/stop bit can also be automatically loaded before/after SHIFTBUF data by configuring the SHIFTCFG[SSTART], TIMCFG[TSTART] or SHIFTCFG[SSTOP], TIMCFG[TSTOP] registers in the Shifter and Timer. Note that the shifter will immediately load a stop bit when the Shifter is initially configured for Transmit mode if a stop bit is enabled.

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set when data has been loaded from the SHIFTBUF register into the Shifter or when the Shifter is initially configured into Transmit mode. The flag will clear when new data has been written into the SHIFTBUF register.

The Shifter Error Flag (SHIFTErr[SEF]) and any enabled interrupts will set when an attempt to load data from an empty SHIFTBUF register occurs (buffer underrun). The flag can be cleared by writing it with logic 1.

### 27.4.2.2 Receive Mode

When configured for Receive mode (SHIFTCTL[SMOD]=Receive), the shifter will shift data in and store data into the SHIFTBUF register when a store event is signalled by the assigned Timer. Checking for a start/stop bit can be enabled before/after shifter data is sampled by configuring the SHIFTCFG[SSTART], TIMCFG[TSTART] or SHIFTCFG[SSTOP], TIMCFG[TSTOP] registers in the Shifter and Timer.

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set when data has been stored into the SHIFTBUF register from the Shifter. The flag will clear when the data has been read from the SHIFTBUF register.

The Shifter Error Flag (SHIFTErr[SEF]) and any enabled interrupts will set when an attempt to store data into a full SHIFTBUF register occurs (buffer overrun) or when a mismatch occurs on a start/stop bit check. The flag can be cleared by writing it with logic 1.

### 27.4.2.3 Match Store Mode

When configured for Match Store mode (SHIFTCTL[SMOD]=Match Store), the shifter will shift data in, check for a match result and store matched data into the SHIFTBUF register when a store event is signalled by the assigned Timer. Checking for a start/stop bit can be enabled before/after shifter data is sampled by configuring the SHIFTCFG[SSTART], TIMCFG[TSTART] or SHIFTCFG[SSTOP], TIMCFG[TSTOP] registers in the Shifter and Timer. Up to 16-bits of data can be compared using SHIFTBUF[31:16] to configure the data to be matched and SHIFTBUF[15:0] to mask the match result.

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set when a match occurs and matched data has been stored into the SHIFTBUF register from the Shifter. The flag will clear when the matched data has been read from the SHIFTBUF register.

The Shifter Error Flag (SHIFTErr[SEF]) and any enabled interrupts will set when an attempt to store matched data into a full SHIFTBUF register occurs (buffer overrun) or when a mismatch occurs on a start/stop bit check. The flag can be cleared by writing it with logic 1.

### 27.4.2.4 Match Continuous Mode

When configured for Match Continuous mode (SHIFTCTL[SMOD]=Match Continuous), the shifter will shift data in and continuously check for a match result whenever a shift event is signalled by the assigned Timer. Up to 16-bits of data can be compared using SHIFTBUF[31:16] to configure the data to be matched and SHIFTBUF[15:0] to mask the match result.

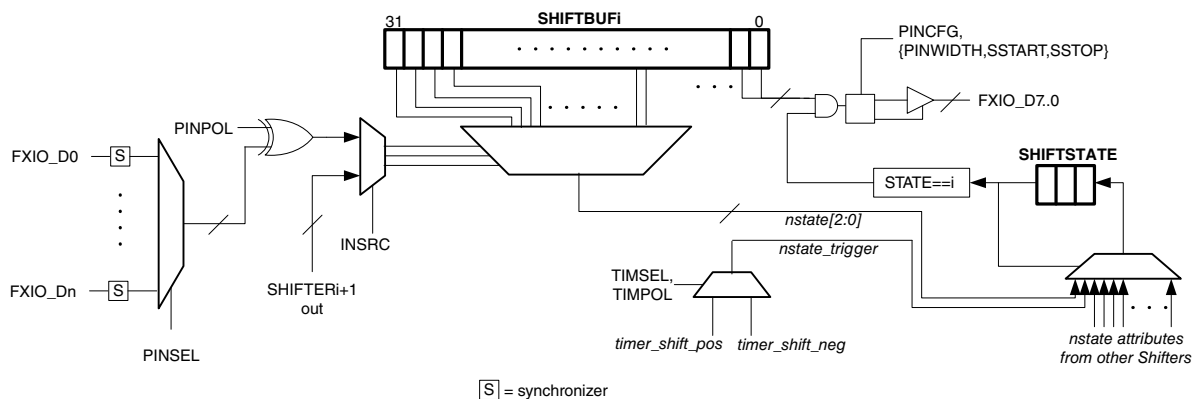

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set when a match occurs. The flag will clear automatically as soon as there is no longer a match between Shifter data and SHIFTBUF register.

The Shifter Error Flag (SHIFTErr[SEF]) and any enabled interrupts will set when a match occurs. The flag will clear when there is a read from the SHIFTBUF register or it written with logic 1.

### 27.4.2.5 State Mode

Using State mode enables the user to implement any state machine with up to 8 states, 8 outputs and 3 selectable inputs per state. This feature allows basic control functions to be offloaded from the CPU, which could potentially remain in a STOP/VLPS low power mode.

When configured for State mode ( $\text{SHIFTCTL}[\text{SMOD}] = \text{State}$ ), the  $\text{SHIFTBUF}$  register is used to drive the output and compute next state values when the Shifter has been selected by the current state pointer ( $\text{SHIFTSTATE}[\text{STATE}]$ ). The following diagram provides a detailed view of Shifter microarchitecture when configured for State mode.

**Figure 27-3. State Microarchitecture**

When Shifter  $i$  has been selected by the current state pointer, output pins  $\text{FXIO\_D}[7:0]$  will be driven by  $\text{SHIFTBUF}_i[31:24]$  using the configuration set by  $\text{SHIFTCTL}_i[\text{PINCFG}]$ . When set,  $\text{SHIFTCFG}_i\{\text{PWIDTH}[3:0], \text{SSTOP}[1:0], \text{SSTART}[1:0]\}$  are respectively used to disable the output drive on pins  $\text{FXIO\_D}[7:0]$  for state machine applications which require less than 8 output pins.

The next state value is computed using the 3 input pins selected by  $\text{SHIFTCTL}_i[\text{PINSEL}]$  together with  $\text{SHIFTBUF}_i[23:0]$ . Note that each state could potentially use a different set of 3 input pins. The following table details how the next state value is computed when the current state pointer is pointing to Shifter  $i$ .

**Table 27-2. Next State computation for  $\text{SHIFTSTATE}[\text{STATE}] = i$**

$\text{FXIO\_D}[\text{PINSEL}+2]$	$\text{FXIO\_D}[\text{PINSEL}+1]$	$\text{FXIO\_D}[\text{PINSEL}]$	Next State Value
0	0	0	$\text{SHIFTBUF}_i[2:0]$
0	0	1	$\text{SHIFTBUF}_i[5:3]$
0	1	0	$\text{SHIFTBUF}_i[8:6]$
0	1	1	$\text{SHIFTBUF}_i[11:9]$

Table continues on the next page...

**Table 27-2. Next State computation for SHIFTSTATE[STATE]=i (continued)**

...	...	...	...
1	1	1	SHIFTBUFi[23:21]

Note that other shifters/timers could potentially be configured to drive the input pins of a given state, allowing the user to create complex combinations of shifters/timers as desired e.g. the output of a Shifter configured for logic mode could potentially be used to drive a state machine input.

The next state transition is triggered using the Timer output selected by SHIFTCTLi[TIMSEL] with polarity controlled by SHIFTCTLi[TIMPOL]. Note that each state could potentially use a different Timer to trigger each next state transition, allowing a variety of internal/external trigger sources and clocking configurations to be used (see Timer section for more detail).

The current state pointer defaults to Shifter 0 at reset, however it can be written by the user to select a different Shifter for the initial state. If the current state pointer selects a Shifter which is not configured for State mode, then outputs will not be driven and a next state transition is never triggered.

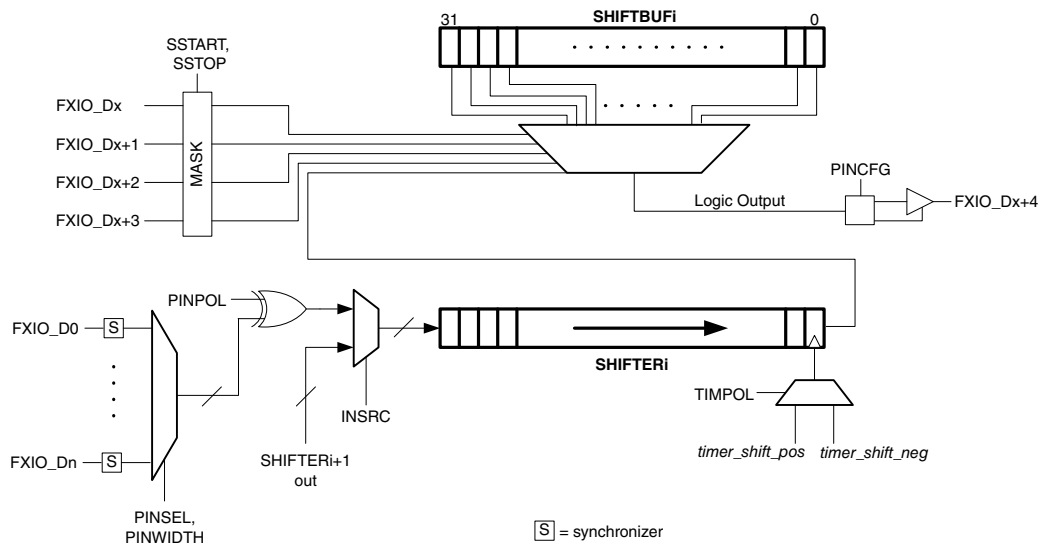

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set whenever the Shifter has been selected by the current state pointer. The flag will clear when the current state pointer is updated to a different Shifter.

### 27.4.2.6 Logic Mode

Using logic mode enables the user to implement a small amount of programmable digital logic within a FlexIO Shifter. This feature allows board-level glue logic to be integrated on-chip using FlexIO hardware.

When configured for Logic mode (SHIFTCTL[SMOD]=Logic), the SHIFTBUF register is used to implement a 5-input, 32-bit programmable logic look-up table. The following diagram provides a detailed view of Shifter microarchitecture when configured for Logic mode.

**Figure 27-4. Logic Microarchitecture**

The look-up table is driven using 4 pin inputs (maskable using SHIFTCFG[SSTOP] and SHFITCFG[SSTART]) plus 1 input from the internal shifter and can be configured to drive an output pin using the SHIFTCFG[PINCFG] field. Pin inputs and outputs are fixed for each logic look-up table and are not selectable. The following table lists the logic output value selected by the look-up table for Shifter 'i'.

**Table 27-3. Logic Look-up table for Shifter 'i'**

SHIFTERi[0]	FXIO_D[x+3] <sup>1</sup>	FXIO_D[x+2]	FXIO_D[x+1]	FXIO_D[x]	Logic Output to FXIO_D[x+4]
0	0	0	0	0	SHIFTBUFi[0]
0	0	0	0	1	SHIFTBUFi[1]
0	0	0	1	0	SHIFTBUFi[2]
0	0	0	1	1	SHIFTBUFi[3]
...	...	...	...	...	...
1	1	1	1	1	SHIFTBUFi[31]

- for Shifter i=0...3, x=i  
for Shifter i=4...7, x=i+4

To minimize output glitches, SHIFTCFG[SSTOP] and SHIFTCFG[SSTART] can be used to mask unused input pins. When set, {SSTOP[1:0], SSTART[1:0]} will mask FXIO\_D[x+3]...FXIO\_D[x] inputs respectively, so that any transitions on these pins will not cause the logic output to glitch.

Note that other shifters/timers could potentially be configured to drive the input pins of a given look-up table (without synchronization), allowing the user to concatenate look-up tables or create complex combinations of shifters/timers as desired.

SHIFTCFG[PWIDTH] will control the number of delay stages introduced by the internal shifter input (SHIFTERi[0]). For example, when configured for 1-bit shift (PWIDTH=0), the internal shifter will introduce a 32 Shift clock delay before passing its input (selected by SHIFTCTL[PINSEL]) to the look-up table. When configured for 32-bit shift (PWIDTH=16...31), the internal shifter will introduce a 1 Shift clock delay to its input.

The Shifter Status Flag (SHIFTSTAT[SSF]) and any enabled interrupts or DMA requests will set whenever the output pin allocated to the logic look-up table has a value of 1 (after being synchronized to the FlexIO clock). The flag will clear when the output pin has a value of 0. This also allows the SSF flag to be used as a trigger to a Timer if desired.

The Shifter Error Flag (SHIFTErr[SEF]) and any enabled interrupts will set when the output pin allocated to the logic look-up table has a value of 1. The flag can be cleared by writing it with logic 1.

### **27.4.3 Timer Operation**

The FlexIO 16-bit timers control the loading, shifting and storing of the shift registers, the counters load the contents of the compare register and decrement down to zero on the FlexIO clock. They can perform generic timer functions such as generating a clock or select output or a PWM waveform. Timers can be configured to enable in response to a trigger, pin or shifter condition; decrement always or only on a trigger or pin edge; reset in response to a trigger or pin condition; and disable on a trigger or pin condition or on a timer compare. Timers can optionally include a start condition and/or stop condition.

Each timer operates independently, although a timer can be configured to enable or disable at the same time as the previous timer (eg: timer1 can enable or disable at the same time as timer 0) and a timer output can be used to trigger any other timer. The trigger used by each timer is configured independently and can be configured to be a timer output, shifter status flag, pin input or an external trigger input (refer to the chip configuration section for details on the external trigger connections). The trigger configuration is separate from the pin configuration, which can be configured for input, output data or output enable.

The Timer Configuration Register (TIMCFGn) should be configured before setting the Timer Mode (TIMOD).

#### **27.4.3.1 Timer 8-bit Baud Counter Mode**

In 8-bit Baud Counter Mode, the 16-bit counter is divided into two 8-bit counters. The lower 8-bits are used to configure the baud rate of the shift clock and the upper 8-bits are used to configure the number number of shift clock edges in the transfer. When the lower

8-bits decrement to zero, the timer output is toggled and the lower 8-bits reload from the compare register. The upper 8-bits only decrement when the lower 8-bits equal zero and decrement.

A timer compare event occurs when the upper 8-bits equal zero and decrements. The timer status flag is set on a timer compare event.

### 27.4.3.2 Timer 8-bit High PWM Mode

In 8-bit High PWM Mode, the 16-bit counter is divided into two 8-bit counters. The lower 8-bits are used to configure the timer output high period and the upper 8-bits are used to configure the timer output low period. The lower 8-bits decrement when the output is high. When the lower 8-bits equal zero and decrement, the timer output is cleared and the lower 8-bits are reloaded from the compare register. The upper 8-bits decrement when the output is low. When the upper 8-bits equal zero and decrement, the timer output is set and the upper 8-bits are reloaded from the compare register.

A timer compare event occurs when the upper 8-bits equal zero and decrements. The timer status flag is set on a timer compare event.

### 27.4.3.3 Timer 16-bit Counter Mode

In 16-bit Counter Mode, the 16-bit counter can be used to configure either the baud rate of the shift clock (eg: TIMDEC[1:0] != 10 or 11) or the number of shift clock edges in the transfer (eg: TIMDEC[1:0] = 10 or 11). When the 16-bit counter equals zero and decrements, the timer output toggles and the counter reloads from the compare register.

A timer compare event occurs when the 16-bit counter equals zero and decrements. The timer status flag is set on a timer compare event.

### 27.4.3.4 Timer Enable and Start Bit

When the TIMOD is configured for the desired mode, and the condition configured by timer enable (TIMENA) is detected then the following events occur.

- Timer counter will load the current value of the compare Register and start decrementing as configured by TIMDEC.
- Timer output will set depending on the TIMOUT configuration.
- Transmit shifters controlled by this timer will either output their start bit value, or load the shift register from the shift buffer and output the first bit, as configured by SSTART.

If the Timer start bit is enabled, the timer counter will reload with the compare register on the first rising edge of the shift clock after the timer starts decrementing. If there is no falling edge on the shift clock before the first rising edge (for example, when  $TIMOUT=1$ ), a shifter that is configured to shift on falling edge and load on the first shift will not load correctly.

### **27.4.3.5 Timer Decrement and Reset**

The Timer will then generate the timer output and timer shift clock depending on the  $TIMOD$  and  $TIMDEC$  fields. The shifter clock is either equal to the timer output (when  $TIMDEC \neq 10$  or  $11$ ) or equal to the decrement clock (when  $TIMDEC = 10$  or  $11$ ). When  $TIMDEC$  is configured to decrement from a pin or trigger, the timer will decrement on both rising and falling edges.

When the Timer is configured to reset as configured in the  $TIMRST$  field then the Timer counter will load the current value of the compare register again, the timer output may also be affected by the reset as configured in  $TIMOUT$ .

In general, when the timer counter decrements to zero a timer compare event is triggered. The timer compare event will cause the timer counter to load the contents of the timer compare register, the timer output to toggle, any configured transmit shift registers to load, and any configured receive shift registers to store. Depending on the mode, the timer status flag may also be set,

### **27.4.3.6 Timer Disable and Stop Bit**

When the is Timer is configured to add a stop bit on each compare, the following additional events will occur.

- Transmit shifters controlled by this timer will output their stop bit value (if configured by  $SSTOP$ ).
- Receive shifters controlled by this timer will store the contents of the shift register in their shift buffer, as configured by  $SSTOP$ .
- On the first rising edge of the shifter clock after the compare, the timer counter will reload the current value of the Compare Register.

Transmit shifters must be configured to load on the first shift when the timer is configured to insert a stop bit on each compare.

When the condition configured by timer disable ( $TIMDIS$ ) is detected, the following events occur.

- Timer counter will reload the current value of the Compare Register and start decrementing as configured by TIMDEC.
- Timer output will clear.
- Transmit shifters controlled by this timer will output their stop bit value (if configured by SSTOP).
- Receive shifters controlled by this timer will store the contents of the shift register in their shift buffer, as configured by SSTOP.

If the timer stop bit is enabled, the timer counter will continue decrementing until the next rising edge of the shift clock is detected, at which point it will finish.

A timer enable condition can be detected in the same cycle as a timer disable condition (if timer stop bit is disabled), or on the first rising edge of the shift clock after the disable condition (if stop bit is enabled). Receive shift registers with stop bit enabled will store the contents of the shift register into the shift buffer and verify the state of the input data on the configured shift edge while the timer is in the stop state condition. If there is no configured edge between the timer disable and the next rising edge of the shift clock then the final store and verify do not occur.

## 27.4.4 Pin operation

The pin configuration for each timer and shifter can be configured to use any FlexIO pin with either polarity. Each timer and shifter can be configured as an input, output data, output enable or bidirectional output. A pin configured for output enable can be used as an open drain (with inverted polarity, since the output enable assertion would cause logic zero to be output on the pin) or to control the enable on the bidirectional output. Any timer or shifter could be configured to control the output enable for a pin where the bidirectional output data is driven by another timer or shifter.

### 27.4.4.1 Parallel Interface

Shifters can be configured to use multiple FlexIO pins in parallel using the SHIFTCFG[PWIDTH] field. PWIDTH is used to configure the following settings of a shifter:

1. Number of bits shifted per Shift clock.
2. Number of pins driven by the shifter per Shift clock (only on shifters supporting parallel transmit i.e. SHIFTER0, SHIFTER4).
3. Number of pins sampled by the shifter per Shift clock (only on Shifter supporting parallel receive i.e. SHIFTER3, SHIFTER7).

When configured for parallel shift, either 4, 8, 16 or 32-bits can be shifted on every Shift clock. If an adjacent shifter is selected as the input source (SHIFTCFG[INSRC]=1), the least significant 4, 8, 16 or 32-bits from the adjacent shifter will be sampled on each Shift clock.

For shifters supporting parallel receive (SHIFTER3, SHIFTER7), the shifter can be configured to sample multiple pins (SHIFTCFG[INSRC]=0), with PWIDTH and PINSEL selecting the pins as follows: FXIO\_D[PINSEL+PWIDTH]:FXIO\_D[PINSEL]. Note that if PWIDTH is less than the number of bits being shifted on each Shift clock, then the most significant bits will be masked with 0 e.g. if PINSEL=7 and PWIDTH=6, then SHIFTER[31:24] will sample {0,0,FXIO\_D[12:7]} on each Shift clock.

For shifters supporting parallel transmit (SHIFTER0, SHIFTER4), the shifter can be configured to drive multiple pins using SHIFTCTL[PINCFG], with PWIDTH and PINSEL selecting the pins as follows: FXIO\_D[PINSEL+PWIDTH]:FXIO\_D[PINSEL]. Note that if PWIDTH is less than the number of bits being shifted on each Shift clock, then the most significant pins will not be driven e.g. if PINSEL=7 and PWIDTH=6, then SHIFTER[5:0] will drive only FXIO\_D[12:7] on each Shift clock.

### **27.4.4.2 Pin Synchronization**

When configuring a pin as an input (this includes a timer trigger configured as a pin input), the input signal is first synchronized to the FlexIO clock before the signal is used by a timer or shifter. This introduces a small latency of between 0.5 to 1.5 FlexIO clock cycles when using an external pin input to generate an output or control a shifter. This sets the maximum setup time at 1.5 FlexIO clock cycles.

If an input is used by more than one timer or shifter then the synchronization occurs once to ensure any edge is seen on the same cycle by all timers and shifters using that input.

Note that FlexIO pins are also connected internally, configuring a FlexIO shifter or timer to output data on an unused pin will make an internal connection that allows other shifters and timer to use this pin as an input. This allows a shifter output to be used to trigger a timer or a timer output to be shifted into a shifter. This path is also synchronized to the FlexIO clock and therefore incurs a 1 cycle latency.

So when using a Pin input as a Timer Trigger, Timer Clock or Shifter Data Input, the following synchronization delays occur:

1. 0.5 – 1.5 FlexIO clock cycles for external pin
2. 1 FlexIO clock cycle for an internally driven pin

For timing considerations such as output valid time and input setup time for specific applications (SPI Master, SPI Slave, I2C Master, I2S Master, I2S Slave) please refer to the FlexIO Application Information Section.

## 27.4.5 Interrupts and DMA Requests

The following table illustrates the status flags that can generate the FlexIO interrupt and DMA requests.

**Table 27-4. FlexIO Interrupts and DMA Requests**

Flag	Description	Interrupt	DMA Request	Low Power Wakeup
SSF	Shifter Status Flag.	Y	Y	Y
SEF	Shifter Error Flag.	Y	N	Y
TSF	Timer Status Flag.	Y	N	Y

## 27.4.6 Peripheral Triggers

The connection of the FlexIO peripheral triggers with other peripherals are device specific.

### 27.4.6.1 Output Triggers

Each FlexIO Timer generates an output trigger equal to the timer output. The output trigger is not affected by the timer pin polarity configuration.

### 27.4.6.2 Input Trigger

FlexIO supports multiple external trigger inputs that can be used to trigger one or more FlexIO timers. The external triggers are synchronized to the FlexIO functional clock and must assert for at least two cycles of the FlexIO functional clock to be sampled correctly.

## 27.5 Application Information

This section provides examples for a variety of FlexIO module applications.

## 27.5.1 UART Transmit

UART transmit can be supported using one Timer, one Shifter and one Pin (two Pins if supporting CTS). The start and stop bit insertion is handled automatically and multiple transfers can be supported using DMA controller. The timer status flag can be used to indicate when the stop bit of each word is transmitted.

Break and idle characters require software intervention, before transmitting a break or idle character the SSTART and SSTOP fields should be altered to transmit the required state and the data to transmit must equal 0xFF or 0x00. Supporting a second stop bit requires the stop bit to be inserted into the data stream using software (and increasing the number of bits to transmit). Note that when performing byte writes to SHIFTBUF<sub>n</sub> (or SHIFTBUFBIS for transmitting MSB first), the rest of the register remains unaltered allowing an address mark bit or additional stop bit to remain undisturbed.

FlexIO does not support automatic insertion of parity bits.

**Table 27-5. UART Transmit Configuration**

Register	Value	Comments
SHIFTCFG <sub>n</sub>	0x0000_0032	Configure start bit of 0 and stop bit of 1.
SHIFTCTL <sub>n</sub>	0x0003_0002	Configure transmit using Timer 0 on posedge of clock with output data on Pin 0. Can invert output data by setting PINPOL, or can support open drain by setting PINPOL=0x1 and PINCFG=0x1.
TIMCMP <sub>n</sub>	0x0000_0F01	Configure 8-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set TIMCMP[15:8] = (number of bits x 2) - 1. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFG <sub>n</sub>	0x0000_2222	Configure start bit, stop bit, enable on trigger asserted and disable on compare. Can support CTS by configuring TIMEN=0x3.
TIMCTL <sub>n</sub>	0x01C0_0001	Configure dual 8-bit counter using Shifter 0 status flag as inverted internal trigger source. Can support CTS by configuring PINSEL=0x1 (for Pin 1) and PINPOL=0x1.
SHIFTBUF <sub>n</sub>	Data to transmit	Transmit data can be written to SHIFTBUF[7:0] to initiate an 8-bit transfer, use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request. Can support MSB first transfer by writing to SHIFTBUFBBS[7:0] register instead.

## 27.5.2 UART Receive

UART receive can be supported using one Timer, one Shifter and one Pin (two Timers and two Pins if supporting RTS). The start and stop bit verification is handled automatically and multiple transfers can be supported using the DMA controller. The timer status flag can be used to indicate when the stop bit of each word is received.

Triple voting of the received data is not supported by FlexIO, data is sampled only once in the middle of each bit. Another timer can be used to implement a glitch filter on the incoming data, another Timer can also be used to detect an idle line of programmable length. Break characters will cause the error flag to set and the shifter buffer register will return 0x00.

FlexIO does not support automatic verification of parity bits.

**Table 27-6. UART Receiver Configuration**

Register	Value	Comments
SHIFTCFGn	0x0000_0032	Configure start bit of 0 and stop bit of 1.
SHIFTCTLn	0x0080_0001	Configure receive using Timer 0 on negeedge of clock with input data on Pin 0. Can invert input data by setting PINPOL.
TIMCMPn	0x0000_0F01	Configure 8-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set $TIMCMP[15:8] = (\text{number of bits} \times 2) - 1$ . Set $TIMCMP[7:0] = (\text{baud rate divider} / 2) - 1$ .
TIMCFGn	0x0204_2422	Configure start bit, stop bit, enable on pin posedge and disable on compare. Enable resynchronization to received data with $TIMOUT=0x2$ and $TIMRST=0x4$ .
TIMCTLn	0x0000_0081	Configure dual 8-bit counter using inverted Pin 0 input.
SHIFTBUFn	Data to receive	Received data can be read from $SHIFTBUFBYS[7:0]$ , use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support MSB first transfer by reading from $SHIFTBUFBIS[7:0]$ register instead.

The UART Receiver with RTS configuration uses a 2nd Timer to generate the RTS output. The RTS will assert when the start bit is detected and negate when the data is read from the shifter buffer register. No start bit will be detected while the RTS is asserted, the received data is simply ignored.

**Table 27-7. UART Receiver with RTS Configuration**

Register	Value	Comments
SHIFTCFGn	0x0000_0032	Configure start bit of 0 and stop bit of 1.
SHIFCTLn	0x0080_0001	Configure receive using Timer 0 on negege of clock with input data on Pin 0. Can invert input data by setting PINPOL.
TIMCMPn	0x0000_0F01	Configure 8-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set TIMCMP[15:8] = (number of bits x 2) - 1. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFGn	0x0204_2522	Configure start bit, stop bit, enable on pin posedge with trigger asserted and disable on compare. Enable resynchronization to received data with TIMOUT=0x2 and TIMRST=0x4.
TIMCTLn	0x03C0_0081	Configure dual 8-bit counter using inverted Pin 0 input. Trigger is internal using inverted Pin 1 input.
TIMCMP(n+1)	0x0000_FFFF	Never compare.
TIMCFG(n+1)	0x0030_6100	Enable on Timer N enable and disable on trigger falling edge. Decrement on trigger to ensure no compare.
TIMCTL(n+1)	0x0143_0083	Configure 16-bit counter and output on Pin 1. Trigger is internal using Shifter 0 flag.
SHIFTBUFn	Data to receive	Received data can be read from SHIFTBUFBYS[7:0], use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support MSB first transfer by reading from SHIFTBUFBIS[7:0] register instead.

### 27.5.3 SPI Master

SPI master mode can be supported using two Timers, two Shifters and four Pins. Either CPHA=0 or CPHA=1 can be supported and transfers can be supported using the DMA controller. For CPHA=1, the select can remain asserted for multiple transfers and the timer status flag can be used to indicate the end of the transfer.

The stop bit is used to guarantee a minimum of 1 clock cycle between the slave select negating and before the next transfer. Writing to the transmit buffer by either core or DMA is used to initiate each transfer.

Due to synchronization delays, the setup time for the serial input data is 1.5 FlexIO clock cycles, so the maximum baud rate is divide by 4 of the FlexIO clock frequency.

**Table 27-8. SPI Master (CPHA=0) Configuration**

Register	Value	Comments
SHIFTCFGn	0x0000_0000	Start and stop bit disabled.
SHIFCTLn	0x0083_0002	Configure transmit using Timer 0 on negege of clock with output data on Pin 0.
SHIFTCFG(n+1)	0x0000_0000	Start and stop bit disabled.
SHIFCTL(n+1)	0x0000_0101	Configure receive using Timer 0 on posedge of clock with input data on Pin 1.
TIMCMPn	0x0000_3F01	Configure 32-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set TIMCMP[15:8] = (number of bits x 2) - 1. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFGn	0x0100_2222	Configure start bit, stop bit, enable on trigger high and disable on compare, initial clock state is logic 0.
TIMCTLn	0x01C3_0201	Configure dual 8-bit counter using Pin 2 output (shift clock), with Shifter 0 flag as the inverted trigger. Set PINPOL to invert the output shift clock.
TIMCMP(n+1)	0x0000_FFFF	Never compare.
TIMCFG(n+1)	0x0000_1100	Enable when Timer 0 is enabled and disable when Timer 0 is disabled.
TIMCTL(n+1)	0x0003_0383	Configure 16-bit counter (never compare) using inverted Pin 3 output (as slave select).
SHIFTBUFn	Data to transmit	Transmit data can be written to SHIFTBUF, use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request. Can support MSB first transfer by writing to SHIFTBUFBBS register instead.
SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUFBYS, use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support MSB first transfer by reading from SHIFTBUFBIS register instead.

SHIFTCTL(n+1)	0x0080_0101	Configure receive using Timer 0 on negedge of clock with input data on Pin 1.
TIMCMPn	0x0000_3F01	Configure 32-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set TIMCMP[15:8] = (number of bits x 2) - 1. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFGn	0x0100_2222	Configure start bit, stop bit, enable on trigger high and disable on compare, initial clock state is logic 0.
TIMCTLn	0x01C3_0201	Configure dual 8-bit counter using Pin 2 output (shift clock), with Shifter 0 flag as the inverted trigger. Set PINPOL to invert the output shift clock. Set TIMDIS=3 to keep slave select asserted for as long as there is data in the transmit buffer.
TIMCMP(n+1)	0x0000_FFFF	Never compare.
TIMCFG(n+1)	0x0000_1100	Enable when Timer 0 is enabled and disable when Timer 0 is disabled.
TIMCTL(n+1)	0x0003_0383	Configure 16-bit counter (never compare) using inverted Pin 3 output (as slave select).
SHIFTBUFn	Data to transmit	Transmit data can be written to SHIFTBUF, use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request. Can support MSB first transfer by writing to SHIFTBUFBBS register instead.
SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUFBYS, use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support MSB first transfer by reading from SHIFTBUFBIS register instead.

## 27.5.4 SPI Slave

SPI slave mode can be supported using one Timer, two Shifters and four Pins. Either CPHA=0 or CPHA=1 can be supported and transfers can be supported using the DMA controller. For CPHA=1, the select can remain asserted for multiple transfers and the timer status flag can be used to indicate the end of the transfer.

The transmit data must be written to the transmit buffer register before the external slave select asserts, otherwise the shifter error flag will be set.

Due to synchronization delays, the output valid time for the serial output data is 2.5 FlexIO clock cycles, so the maximum baud rate is divide by 6 of the FlexIO clock frequency.

**Table 27-10. SPI Slave (CPHA=0) Configuration**

SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUFBYS, use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support MSB first transfer by reading from SHIFTBUFBIS register instead.

### 27.5.5 I2C Master

I2C master mode can be supported using two Timers, two Shifters and two Pins. One timer is used to generate the SCL output and one timer is used to control the shifters. The two shifters are used to transmit and receive for every word, when receiving the transmitter must transmit 0xFF to tristate the output. FlexIO inserts a stop bit after every word to generate/verify the ACK/NACK. FlexIO waits for the first write to the transmit data buffer before enabling SCL generation. Data transfers can be supported using the DMA controller and the shifter error flag will set on transmit underrun or receive overflow.

The first timer generates the bit clock for the entire packet (START to Repeated START/STOP), so the compare register needs to be programmed with the total number of clock edges in the packet (minus one). The timer supports clock stretching using the reset counter when pin equal to output (although this increases both the clock high and clock low periods by at least 1 FlexIO clock cycle each). The second timer uses the SCL input pin to control the transmit/receive shift registers, this enforces an SDA data hold time by an extra 2 FlexIO clock cycles.

Both the transmit and receive shifters need to be serviced for each word in the transfer, the transmit shifter must transmit 0xFF when receiving and the receive shifter returns the data actually present on the SDA pin. The transmit shifter will load 1 additional word on the last falling edge of SCL pin, this word should be 0x00 if generating a STOP condition or 0xFF if generating a repeated START condition. During the last word of a master-receiver transfer, the transmit SSTOP bit should be set by software to generate a NACK.

The receive shift register will assert an error interrupt if a NACK is detected, but software is responsible for generating the STOP or repeated START condition. If a NACK is detected during master-transmit, the interrupt routine should immediately write the transmit shifter register with 0x00 (if generating STOP) or 0xFF (if generating repeated START). Software should then wait for the next rising edge on SCL and then disable both timers. The transmit shifter should then be disabled after waiting the setup delay for a repeated START or STOP condition.

Due to synchronization delays, the data valid time for the transmit output is 2 FlexIO clock cycles, so the maximum baud rate is divide by 6 of the FlexIO clock frequency.

The I2C master data valid is delayed 2 cycles because the clock output is passed through a synchronizer before clocking the transmit/receive shifter (to guarantee some SDA hold time). Since the SCL output is synchronous with FlexIO clock, the synchronization delay is 1 cycle and then 1 cycle to generate the output.

**Table 27-12. I2C Master Configuration**

TIMCFGn	0x0102_2222	Configure start bit, stop bit, enable on trigger high, disable on compare, reset if output equals pin. Initial clock state is logic 0 and is not affected by reset.
TIMCTLn	0x01C1_0101	Configure dual 8-bit counter using Pin 1 output enable (SCL open drain), with Shifter 0 flag as the inverted trigger.
TIMCMP(n+1)	0x0000_000F	Configure 8-bit transfer. Set TIMCMP[15:0] = (number of bits x 2) - 1.
TIMCFG(n+1)	0x0020_1112	Enable when Timer 0 is enabled, disable when Timer 0 is disabled, enable start bit and stop bit at end of each word, decrement on pin input.
TIMCTL(n+1)	0x01C0_0183	Configure 16-bit counter using inverted Pin 1 input (SCL).
SHIFTBUFn	Data to transmit	Transmit data can be written to SHIFTBUFBBS[7:0], use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request.
SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUFBIS[7:0], use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request.

## 27.5.6 I2S Master

I2S master mode can be supported using two Timers, two Shifters and four Pins. One timer is used to generate the bit clock and control the shifters and one timer is used to generate the frame sync. FlexIO waits for the first write to the transmit data buffer before enabling bit clock and frame sync generation. Data transfers can be supported using the DMA controller and the shifter error flag will set on transmit underrun or receive overflow.

The bit clock frequency is an even integer divide of the FlexIO clock frequency, and the initial frame sync assertion occurs at the same time as the first bit clock edge. The timer uses the start bit to ensure the frame sync is generated one clock cycle before the first output data.

Due to synchronization delays, the setup time for the receiver input is 1.5 FlexIO clock cycles, so the maximum baud rate is divide by 4 of the FlexIO clock frequency.

Table 27-13. I2S Master Configuration

Register	Value	Comments
SHIFTCFGn	0x0000_0001	Load transmit data on first shift and stop bit disabled.
SHIFTCTLn	0x0003_0002	Configure transmit using Timer 0 on rising edge of clock with output data on Pin 0.
SHIFTCFG(n+1)	0x0000_0000	Start and stop bit disabled.
SHIFTCTL(n+1)	0x0080_0101	Configure receive using Timer 0 on falling edge of clock with input data on Pin 1.
TIMCMPn	0x0000_3F01	Configure 32-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set $TIMCMP[15:8] = (\text{number of bits} \times 2) - 1$ . Set $TIMCMP[7:0] = (\text{baud rate divider} / 2) - 1$ .
TIMCFGn	0x0000_0202	Configure start bit, enable on trigger high and never disable. Initial clock state is logic 1.
TIMCTLn	0x01C3_0201	Configure dual 8-bit counter using Pin 2 output (bit clock), with Shifter 0 flag as the inverted trigger. Set PINPOL to invert the output shift clock.
TIMCMP(n+1)	0x0000_007F	Configure 32-bit transfer with baud rate of divide by 4 of the FlexIO clock. Set $TIMCMP[15:0] = (\text{number of bits} \times \text{baud rate divider}) - 1$ .
TIMCFG(n+1)	0x0000_0100	Enable when Timer 0 is enabled and never disable.
TIMCTL(n+1)	0x0003_0383	Configure 16-bit counter using inverted Pin 3 output (as frame sync).
SHIFTBUFn	Data to transmit	Transmit data can be written to SHIFTBUFBIS, use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request. Can support LSB first transfer by writing to SHIFTBUF register instead.
SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUFBIS, use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support LSB first transfer by reading from SHIFTBUF register instead.

## 27.5.7 I2S Slave

I2S slave mode can be supported using three Timers, two Shifters and four Pins (for single transmit and single receive, other combinations of transmit and receive are possible).

The transmit data must be written to the transmit buffer register before the external frame sync asserts, otherwise the shifter error flag will be set.

Due to synchronization delays, the output valid time for the serial output data is 2.5 FlexIO clock cycles, so the maximum baud rate is divide by 6 of the FlexIO clock frequency.

The output valid time of I2S slave is max 2.5 cycles because there is a maximum 1.5 cycle delay on the clock synchronization plus 1 cycle to output the data

Timer 2 detects the falling edge of frame sync (start of new frame) and asserts output until falling edge of bit clock (when frame sync is normally sampled). Timer 0 detects falling edge of bit clock with Timer 2 output asserted and asserts output for length of frame. Timer 1 detects rising edge of bit clock with Timer 0 output asserted and controls shift registers for 32-bit transfers.

**Table 27-14. I2S Slave Configuration**

Register	Value	Comments
SHIFTCFGn	0x0000_0000	Start and stop bit disabled.
SHIFTCTLn	0x0103_0002	Configure transmit using Timer 1 on rising edge of shift clock with output data on Pin 0.
SHIFTCFG(n+1)	0x0000_0000	Start and stop bit disabled.
SHIFTCTL(n+1)	0x0180_0101	Configure receive using Timer 1 on falling edge of shift clock with input data on Pin 1.
TIMCMPn	0x0000_007F	Configure two 32-bit transfers per frame. Set TIMCMP[15:0] = (number of bits x 4) - 1.
TIMCFGn	0x0020_2500	Configure enable on pin rising edge (inverted bit clock) with trigger high (Timer 2) and disable on compare, initial clock state is logic 1 and decrement on pin input (bit clock).
TIMCTLn	0x0B40_0283	Configure 16-bit counter using inverted Pin 2 input (bit clock), with Timer 2 output as the trigger.
TIMCMP(n+1)	0x0000_003F	Configure 32-bit transfers. Set TIMCMP[15:0] = (number of bits x 2) - 1.
TIMCFG(n+1)	0x0020_2500	Configure enable on pin (bit clock) rising edge with trigger (Timer 0) high and disable on compare, initial clock state is

TIMCFG(n+2)	0x0020_6400	Configure enable on inverted pin (frame sync) rising edge and disable on trigger falling edge (bit clock), initial clock state is logic 1 and decrement on inverted pin input (frame sync).
TIMCTL(n+2)	0x0440_0383	Configure 16-bit counter using inverted Pin 3 input (frame sync), with Pin 2 input (bit clock) as the trigger.
SHIFTBUFn	Data to transmit	Transmit data can be written to SHIFTBUF <sub>BIS</sub> , use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request. Can support LSB first transfer by writing to SHIFTBUF register instead.
SHIFTBUF(n+1)	Data to receive	Received data can be read from SHIFTBUF <sub>BIS</sub> , use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request. Can support LSB first transfer by reading from SHIFTBUF register instead.

## 27.5.8 Camera Interface

Camera Interface can be supported using one Timer, one or more Shifters and multiple Pins. Multiple transfers can be supported using DMA controller.

The example below describes FlexIO configuration for interfacing to an 8-bit CMOS sensor with PCLK, VSYNC, HREF and D[7:0] outputs. The example uses a 128-bit buffer to capture 16-pixels of image data before interrupt or DMA transfer, however a bigger or smaller buffer may be used depending on system DMA performance and FlexIO resource usage by other applications. Note that additional timers may be used to track number of pixels per row and number of rows per frame or HREF/VSYNC may be assigned as GPIO interrupts for software tracking.

**Table 27-15. Camera Interface Configuration for 8-bit CMOS sensor**

## 27.5.9 Motorola 68K/Intel 8080 Bus Interface

The Motorola 68K and Intel 8080 bus are two parallel interfaces commonly used by Smart/Asynchronous LCD controllers. In conjunction with GPIO, FlexIO is able to drive these interfaces using one Timer and one Shifter, although additional Shifters could be used to support large transfers via the DMA controller.

The configuration below provides an example of how to drive a 16-bit 68K or 8080 bus. For a 8080 bus, two GPIO are used to drive the nCS and RS pins. For a 68K bus, an additional GPIO is required to drive the RDWR pin.

TIMCFG0	0x0000_2200	Configure enable on trigger high and disable on compare. Timer output high on enable.
TIMCTL0	0x01C3_1001 (Motorola 68K, 1-beat) 0x1DC3_1001 (Motorola 68K, 16-beats) 0x01C3_1081 (Intel 8080, 1-beat) 0x1DC3_1081 (Intel 8080, 16-beats)	Configure dual 8-bit counter using FXIO_D[16] output (EN pin for 68K, nWR pin for 8080), with Shifter 0 (1-beat) or Shifter 7 (16-beats) flag as the inverted trigger.
SHIFTBUF0...7	Data to transmit	Transmit data can be written to SHIFTBUF0 (1-beat) or SHIFTBUF0...7 (16-beats) to initiate a transfer, use the Shifter Status Flag to indicate when data can be written using interrupt or DMA request.

Table 27-17. Motorola 68K/Intel 8080 Read Configuration

Register	Value	Comments
SHIFTCFG0...6	0x000F_0100	Configure 16-bit parallel shift in from adjacent shifter.
SHIFTCFG7	0x000F_0000	Configure 16-bit parallel shift in from pin.
SHIFCTL0...7	0x0080_0001	Configure receive using Timer 0 on negedge of clock with data input from FXIO_D[15:0].
TIMCMP0	0x0000_0101 (1-beat) 0x0000_1F01 (16-beats)	Configure 1 or 16-beat transfer with baud rate of divide by 4 of the FlexIO clock. Set TIMCMP[15:8] = (number of beats x 2) - 1. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFG0	0x0000_2220	Configure stop_bit, enable on trigger high and disable on compare. Timer output high on enable.
TIMCTL0	0x1DC3_1001 (Motorola 68K, 1 beat) 0x01C3_1001 (Motorola 68K, 16 beats) 0x1DC3_1181 (Intel 8080, 1 beat) 0x01C3_1181 (Intel 8080, 16 beats)	Configure dual 8-bit counter using either FXIO_D[16] output (EN pin for 68K) or FXIO_D[17] output (nRD pin for 8080), with Shifter 7 flag (1-beat) or Shifter 0 flag (16-beats) as the inverted trigger.
SHIFTBUF0...7	Data received	Received data can be read from SHIFTBUF0 (1-beat) or SHIFTBUF0...7 (16-beats), use the Shifter Status Flag to indicate when data can be read using interrupt or DMA request.

In general, any operation to a 68K/8080 bus slave will begin with a register write cycle followed by one or more data read or write cycles. To accomplish this, the following program flow should be used:

1. Configure FlexIO with 1-beat write configuration
2. Configure GPIO to assert nCS, RS pins (and deassert RDWR pin for 68K)
3. Write register index data to SHIFTBUF0[15:0]
4. Configure GPIO to deassert RS pin (and assert RDWR pin for 68K data read)
5. Configure FlexIO with desired read or write configuration (e.g. 1 or 16-beats)
6. Use the Shifter Status Flag to trigger interrupt or DMA driven data transfers to/from SHIFTBUF registers
7. Configure GPIO to deassert nCS pin

### **27.5.10 Low Power State Machine**

The configuration below details a hypothetical state machine example to illustrate the flexibility allowed when using Shifter state mode.

In this example, FlexIO waits for the FXIO\_D[2] pin to assert and then drives a complementary square wave output at a frequency of FLEXIO\_CLK/131072 on the FXIO\_D[1:0] pins while the comparator output is asserted (assumes comparator is connected to external trigger 15, see Chip Configuration chapter for actual FlexIO trigger mappings). Throughout this operation, the CPU can be kept in a STOP/VLPS mode, by clearing the CTRL[DOZEN] bit and ensuring the FLEXIO\_CLK is enabled. The state diagram below shows the states and transitions implemented by this example.

Figure 27-5. State Diagram

Table 27-18. State Machine Configuration

Register	Value	Comments
SHIFTCFG0...2	0x0000_0003	Enable FXIO_D[1:0] as outputs.
SHIFTCTL0	0x0080_0206	Configure for State mode using FXIO_D[4:2] as inputs to select next state and Timer0 output low to trigger next state.
SHIFTBUF0	0x0020_8208	State0: Drive FXIO_D[1:0]=00, transition to State0 if FXIO_D[2]=0, State1 if FXIO_D[2]=1.
SHIFTCTL1	0x0000_0206	Configure for State mode using FXIO_D[4:2] as inputs to select next state and Timer0 output high to trigger next state.
SHIFTBUF1	0x0140_8408	State1: Drive FXIO_D[1:0]=01, transition to State0 if FXIO_D[2]=0, State1 if CMP=0, State2 if CMP=1 (FXIO_D[3]=1)
SHIFTCTL2	0x0080_0206	Configure for State mode using FXIO_D[4:2] as inputs to select next state and Timer0 output low to trigger next state.
SHIFTBUF2	0x0224_9249	State2: Drive FXIO_D[1:0]=10, transition to State1 when Timer0 output low

Table continues on the next page...

**Table 27-18. State Machine Configuration (continued)**

Register	Value	Comments
TIMCMP0	0x0000_FFFF	Configure baud rate of divide by 131072 of the FlexIO clock. Set TIMCMP[7:0] = (baud rate divider / 2) - 1.
TIMCFG0	0x0000_0000	Configure timer always enabled.
TIMCTL0	0x0000_0003	Configure single 16-bit counter.
TIMCFG1	0x0010_7600	Configure timer enabled on trigger rising edge, disabled on trigger falling edge, decrement on trigger edge.
TIMCTL1	0x0F03_0303	Configure timer output enabled on FXIO_D[3], external trigger 15 (comparator output) selected.

# Chapter 28

## Enhanced Flex Pulse Width Modulator (eFlexPWM)

### 28.1 Chip-specific FlexPWM information

#### NOTE

On this device, PWM<sub>x</sub>\_EXTB are not applicable. Also, this device does not have the specific pin of external ADC input.

### 28.2 Introduction

The pulse width modulator (PWM) module contains PWM submodules, each of which is set up to control a single half-bridge power stage. Fault channel support is provided.

This PWM module can generate various switching patterns, including highly sophisticated waveforms. It can be used to control all known motor types and is ideal for controlling different Switched Mode Power Supplies (SMPS) topologies as well.

#### 28.2.1 Features

- 16 bits of resolution for center, edge-aligned, and asymmetrical PWMs
- Fractional PWM clock generation for enhanced resolution of the PWM period and duty cycle
- Dithering to simulate enhanced resolution when fine edge placement is not available
- PWM outputs that can operate as complementary pairs or independent channels
- Ability to accept signed numbers for PWM generation
- Independent control of both edges of each PWM output
- Support for synchronization to external hardware or other PWM
- Double buffered PWM registers
  - Integral reload rates from 1 to 16
  - Half cycle reload capability
- Multiple output trigger events can be generated per PWM cycle via hardware

- Support for double switching PWM outputs
- Fault inputs can be assigned to control multiple PWM outputs
- Programmable filters for fault inputs
- Independently programmable PWM output polarity
- Independent top and bottom deadtime insertion
- Each complementary pair can operate with its own PWM frequency and deadtime values
- Individual software control for each PWM output
- All outputs can be programmed to change simultaneously via a FORCE\_OUT event
- PWM\_X pin can optionally output a third PWM signal from each submodule
- Channels not used for PWM generation can be used for buffered output compare functions
- Channels not used for PWM generation can be used for input capture functions
- Enhanced dual edge capture functionality
- The option to supply the source for each complementary PWM signal pair from any of the following:
  - Crossbar module outputs
  - External ADC input, taking into account values set in ADC high and low limit registers

## 28.2.2 Modes of Operation

Be careful when using this module in stop, wait and debug operating modes.

### CAUTION

Some applications (such as three-phase AC motors) require regular software updates for proper operation. Failure to provide regular software updates could result in destroying the hardware setup.

To accommodate this situation, PWM outputs are placed in their inactive states in stop mode, and they can optionally be placed in inactive states in wait and debug (EOnCE) modes. PWM outputs are reactivated (assuming they were active beforehand) when these modes are exited.

**Table 28-1. Modes when PWM Operation is Restricted**

Mode	Description
Stop	PWM outputs are inactive.
Wait	PWM outputs are driven or inactive as a function of CTRL2[WAITEN].
Debug	CPU and peripheral clocks continue to run, but the CPU may stall for periods of time. PWM outputs are driven or inactive as a function of CTRL2[DBGEN].

## 28.2.3 Block Diagram

The following figure is a block diagram of the PWM.

### 28.2.3.1 PWM Submodule

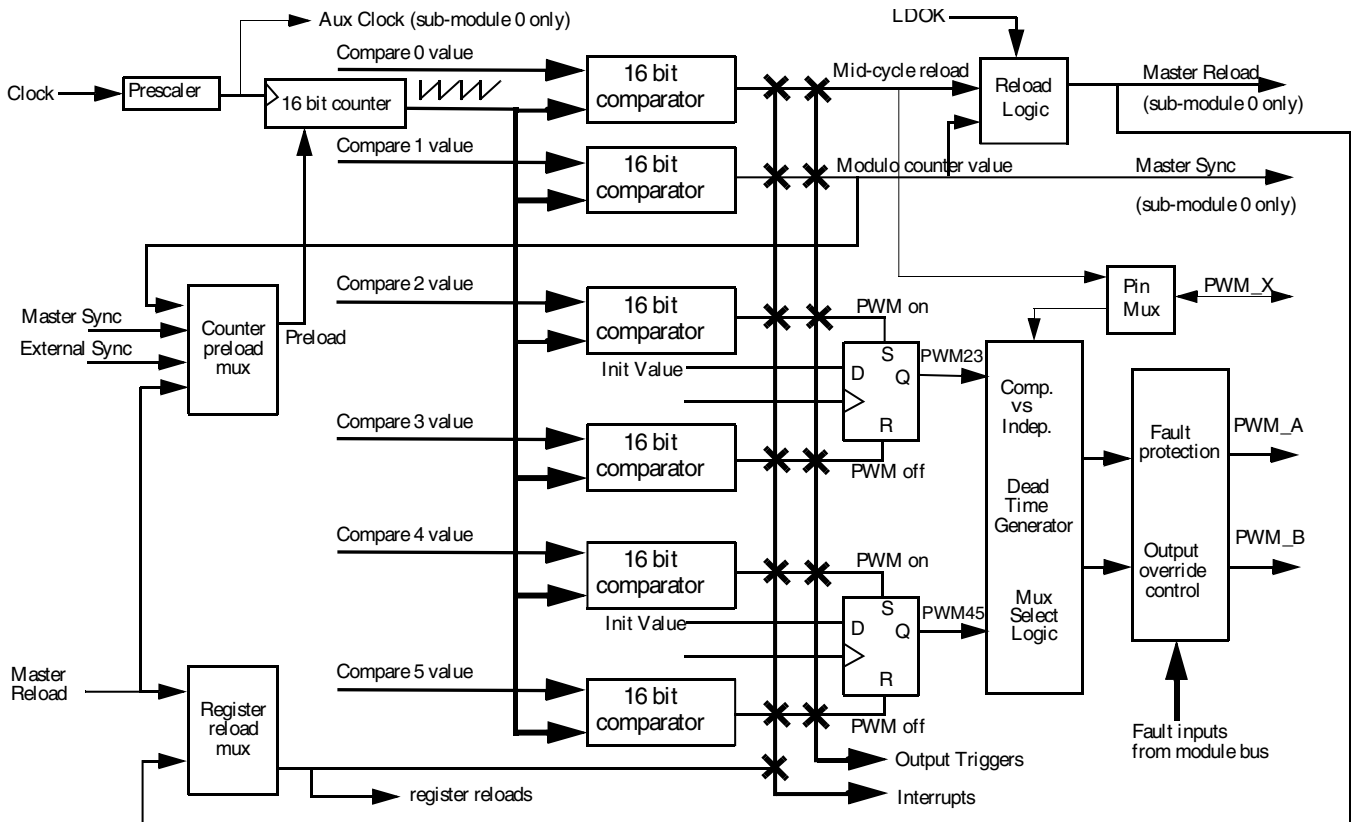

Figure 28-1. PWM Submodule Block Diagram

## 28.3 Signal Descriptions

The PWM has pins named PWM[n]\_A, PWM[n]\_B, PWM[n]\_X, FAULT[n], PWM[n]\_EXT\_SYNC, EXT\_FORCE, PWM[n]\_EXTA, and PWM[n]\_EXTB. The PWM also has an on-chip input called EXT\_CLK and output signals called PWM[n]\_OUT\_TRIGx.

### **28.3.1 PWM[n]\_A and PWM[n]\_B - External PWM Output Pair**

These pins are the output pins of the PWM channels. These pins can be independent PWM signals or a complementary pair. When not needed as an output, they can be used as inputs to the input capture circuitry.

### **28.3.2 PWM[n]\_X - Auxiliary PWM Output signal**

These pins are the auxiliary output pins of the PWM channels. They can be independent PWM signals. When not needed as an output, they can be used as inputs to the input capture circuitry or used to detect the polarity of the current flowing through the complementary circuit at deadtime correction.

### **28.3.3 FAULT[n] - Fault Inputs**

These are input pins for disabling selected PWM outputs.

### **28.3.4 PWM[n]\_EXT\_SYNC - External Synchronization Signal**

These input signals allow a source external to the PWM to initialize the PWM counter. In this manner, the PWM can be synchronized to external circuitry.

### **28.3.5 EXT\_FORCE - External Output Force Signal**

This input signal allows a source external to the PWM to force an update of the PWM outputs. In this manner, the PWM can be synchronized to external circuitry.

### **28.3.6 PWM[n]\_EXTA and PWM[n]\_EXTB - Alternate PWM Control Signals**

These pins allow an alternate source to control the PWM\_A and PWM\_B outputs. Typically, either the PWM\_EXT\_A or PWM\_EXT\_B input (depending on the state of MCTRL[IPOL]) is used for the generation of a complementary pair. Typical control signals include ADC conversion high/low limits, TMR outputs, GPIO inputs, and comparator outputs.

### 28.3.7 PWM[n]\_OUT\_TRIG0 and PWM[n]\_OUT\_TRIG1 - Output Triggers

These outputs allow the PWM submodules to control timing of ADC conversions. See the description of the Output Trigger Control Register for information about how to enable these outputs and how the compare registers match up to the output triggers.

### 28.3.8 EXT\_CLK - External Clock Signal

This signal allows a source external to the PWM (typically a timer or an off-chip source) to control the PWM clocking. In this manner, the PWM can be synchronized to the timer, or multiple chips can be synchronized to each other.

## 28.4 PWM register descriptions

The address of a register is the sum of a base address and an address offset. The base address is defined at the core level, and the address offset is defined at the module level. The PWM module has a set of registers for each PWM submodule, for the configuration logic, and for each fault channel. While the registers are 16-bit wide, they can be accessed in pairs as 32-bit registers.

Submodule registers are repeated for each PWM submodule. To designate which submodule they are in, register names are prefixed with SM0, SM1, SM2, and SM3. The base address of submodule 0 is the same as the base address for the PWM module as a whole. The base address of submodule 1 is offset \$60 from the base address for the PWM module as a whole. This \$60 offset is based on the number of registers in a submodule. The base address of submodule 2 is equal to the base address of submodule 1 plus this same \$60 offset. The pattern repeats for the base address of submodule 3.

The base address of the configuration registers is equal to the base address of the PWM module as a whole plus an offset of \$180.

Fault channel registers are repeated for each fault channel. To designate which fault channel they are in, register names are prefixed with F0 and F1. The base address of fault channel 0 is equal to the base address of the PWM module as a whole plus an offset of \$18C. The base address of fault channel 1 is the base address of fault channel 0 + \$4. This \$4 offset is based on the number of registers in a fault channel. Each of the four fields in the fault channel registers corresponds to fault inputs 3-0.

## 28.4.1 PWM Memory map

Base address: 403D\_C000 for FlexPWM1; 403E\_0000 for FlexPWM2; 403E\_4000 for FlexPWM3; 403E\_8000 for FlexPWM4.

### NOTE

PWM\_X only applicable to FlexPWM1, while FlexPWM2/3/4 do not have the PWMX outputs or inputs.

## 28.4.2 Counter Register (SM0CNT - SM3CNT)

### 28.4.2.1 Offset

For a = 0 to 3:

Register	Offset
SMaCNT	0h + (a × 60h)

### 28.4.2.2 Function

This read-only register displays the state of the signed 16-bit submodule counter. This register is not byte accessible.

### 28.4.2.3 Diagram

### 28.4.2.4 Fields

Field	Function
15-0	Counter Register Bits
CNT	

## 28.4.3 Initial Count Register (SM0INIT - SM3INIT)

### 28.4.3.1 Offset

For a = 0 to 3:

Register	Offset
SMaINIT	2h + (a × 60h)

### 28.4.3.2 Function

The 16-bit signed value in this buffered, read/write register defines the initial count value for the PWM in PWM clock periods. This is the value loaded into the submodule counter when local sync, master sync, or master reload is asserted (based on the value of CTRL2[INIT\_SEL]) or when CTRL2[FORCE] is asserted and force init is enabled. For PWM operation, the buffered contents of this register are loaded into the counter at the start of every PWM cycle. This register is not byte accessible.

#### NOTE

The INIT register is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. This register cannot be written when MCTRL[LDOK] is set. Reading INIT reads the value in a buffer and not necessarily the value the PWM generator is currently using.

15-0	Initial Count Register Bits
INIT	

## 28.4.4 Control 2 Register (SM0CTRL2 - SM3CTRL2)

### 28.4.4.1 Offset

For a = 0 to 3:

Register	Offset
SMACTRL2	4h + (a × 60h)

### 28.4.4.2 Diagram

### 28.4.4.3 Fields

Field	Function
15 DBGEN	<p>Debug Enable</p> <p>When set to one, the PWM will continue to run while the chip is in debug mode. If the device enters debug mode and this bit is zero, then the PWM outputs will be disabled until debug mode is exited. At that point the PWM pins will resume operation as programmed in the PWM registers.</p> <p>For certain types of motors (such as 3-phase AC), it is imperative that this bit be left in its default state (in which the PWM is disabled in debug mode). Failure to do so could result in damage to the motor or inverter. For other types of motors (example: DC motors), this bit might safely be set to one, enabling the PWM in debug mode. The key point is PWM parameter updates will not occur in debug mode. Any motors requiring such updates should be disabled during debug mode. If in doubt, leave this bit set to zero.</p>
14 WAITEN	<p>WAIT Enable</p> <p>When set to one, the PWM will continue to run while the chip is in WAIT mode. In this mode, the peripheral clock continues to run but the CPU clock does not. If the device enters WAIT mode and this bit is zero, then the PWM outputs will be disabled until WAIT mode is exited. At that point the PWM pins will resume operation as programmed in the PWM registers.</p> <p>For certain types of motors (such as 3-phase AC), it is imperative that this bit be left in its default state (in which the PWM is disabled in WAIT mode). Failure to do so could result in damage to the motor or inverter. For other types of motors (example: DC motors), this bit might safely be set to one, enabling the PWM in WAIT mode. The key point is PWM parameter updates will not occur in this mode. Any motors requiring such updates should be disabled during WAIT mode. If in doubt, leave this bit set to zero.</p>
13 INDEP	Independent or Complementary Pair Operation

Table continues on the next page...

## PWM register descriptions

Field	Function
	This bit determines if the PWM_A and PWM_B channels will be independent PWMs or a complementary PWM pair. 0b - PWM_A and PWM_B form a complementary PWM pair. 1b - PWM_A and PWM_B outputs are independent PWMs.
12 PWM23_INIT	PWM23 Initial Value This read/write bit determines the initial value for PWM23 and the value to which it is forced when FORCE_INIT is asserted.
11 PWM45_INIT	PWM45 Initial Value This read/write bit determines the initial value for PWM45 and the value to which it is forced when FORCE_INIT is asserted.
10 PWMX_INIT	PWM_X Initial Value This read/write bit determines the initial value for PWM_X and the value to which it is forced when FORCE_INIT is asserted.
9-8 INIT_SEL	Initialization Control Select These read/write bits control the source of the INIT signal which goes to the counter. 00b - Local sync (PWM_X) causes initialization. 01b - Master reload from submodule 0 causes initialization. This setting should not be used in submodule 0 as it will force the INIT signal to logic 0. The submodule counter will only reinitialize when a master reload occurs. 10b - Master sync from submodule 0 causes initialization. This setting should not be used in submodule 0 as it will force the INIT signal to logic 0. 11b - EXT_SYNC causes initialization.
7 FRCEN	FRCEN This bit allows the CTRL2[FORCE] signal to initialize the counter without regard to the signal selected by CTRL2[INIT_SEL]. This is a software controlled initialization. A forced initialization will also assert the local reload if MCTRL[LDOK] is set. 0b - Initialization from a FORCE_OUT is disabled. 1b - Initialization from a FORCE_OUT is enabled.
6 FORCE	Force Initialization If CTRL2[FORCE_SEL] is set to 000, writing a 1 to this bit results in a FORCE_OUT event. This causes the following actions to be taken: <ul style="list-style-type: none"> <li>The PWM_A and PWM_B output pins will assume values based on DTSRCSEL[SMxSEL23] and DTSRCSEL[SMxSEL45].</li> <li>If CTRL2[FRCEN] is set, the counter value will be initialized with the INIT register value.</li> </ul>
5-3 FORCE_SEL	This read/write bit determines the source of the FORCE OUTPUT signal for this submodule. 000b - The local force signal, CTRL2[FORCE], from this submodule is used to force updates. 001b - The master force signal from submodule 0 is used to force updates. This setting should not be used in submodule 0 as it will hold the FORCE OUTPUT signal to logic 0. 010b - The local reload signal from this submodule is used to force updates without regard to the state of LDOK. 011b - The master reload signal from submodule0 is used to force updates if LDOK is set. This setting should not be used in submodule0 as it will hold the FORCE OUTPUT signal to logic 0. 100b - The local sync signal from this submodule is used to force updates. 101b - The master sync signal from submodule0 is used to force updates. This setting should not be used in submodule0 as it will hold the FORCE OUTPUT signal to logic 0. 110b - The external force signal, EXT_FORCE, from outside the PWM module causes updates. 111b - The external sync signal, EXT_SYNC, from outside the PWM module causes updates.
2 RELOAD_SEL	Reload Source Select This read/write bit determines the source of the RELOAD signal for this submodule. When this bit is set, MCTRL[LDOK[0]] for submodule 0 should be used since the local MCTRL[LDOK] will be ignored.

*Table continues on the next page...*

Field	Function
	0b - The local RELOAD signal is used to reload registers. 1b - The master RELOAD signal (from submodule 0) is used to reload registers. This setting should not be used in submodule 0 as it will force the RELOAD signal to logic 0.
1-0 CLK_SEL	Clock Source Select These read/write bits determine the source of the clock signal for this submodule. 00b - The IPBus clock is used as the clock for the local prescaler and counter. 01b - EXT_CLK is used as the clock for the local prescaler and counter. 10b - Submodule 0's clock (AUX_CLK) is used as the source clock for the local prescaler and counter. This setting should not be used in submodule 0 as it will force the clock to logic 0. 11b - reserved

## 28.4.5 Control Register (SM0CTRL - SM3CTRL)

### 28.4.5.1 Offset

For a = 0 to 3:

Register	Offset
SMaCTRL	6h + (a × 60h)

### 28.4.5.2 Diagram

### 28.4.5.3 Fields

Field	Function
15-12 LDFQ	Load Frequency These buffered read/write bits select the PWM load frequency. Reset clears LDFQ, selecting loading every PWM opportunity. A PWM opportunity is determined by HALF and FULL.

Table continues on the next page...

## PWM register descriptions

Field	Function
	<p><b>NOTE:</b> LDFQ takes effect when the current load cycle is complete, regardless of the state of MCTRL[LDOK]. Reading LDFQ reads the buffered values and not necessarily the values currently in effect.</p> <p>0000b - Every PWM opportunity            0001b - Every 2 PWM opportunities            0010b - Every 3 PWM opportunities            0011b - Every 4 PWM opportunities            0100b - Every 5 PWM opportunities            0101b - Every 6 PWM opportunities            0110b - Every 7 PWM opportunities            0111b - Every 8 PWM opportunities            1000b - Every 9 PWM opportunities            1001b - Every 10 PWM opportunities            1010b - Every 11 PWM opportunities            1011b - Every 12 PWM opportunities            1100b - Every 13 PWM opportunities            1101b - Every 14 PWM opportunities            1110b - Every 15 PWM opportunities            1111b - Every 16 PWM opportunities</p>
11 HALF	<p>Half Cycle Reload</p> <p>This read/write bit enables half-cycle reloads. A half cycle is defined by when the submodule counter matches the VAL0 register and does not have to be half way through the PWM cycle.</p> <p>0b - Half-cycle reloads disabled.            1b - Half-cycle reloads enabled.</p>
10 FULL	<p>Full Cycle Reload</p> <p>This read/write bit enables full-cycle reloads. A full cycle is defined by when the submodule counter matches the VAL1 register. Either CTRL[HALF] or CTRL[FULL] must be set in order to move the buffered data into the registers used by the PWM generators or CTRL[LDMOD] must be set. If both CTRL[HALF] and CTRL[FULL] are set, then reloads can occur twice per cycle.</p> <p>0b - Full-cycle reloads disabled.            1b - Full-cycle reloads enabled.</p>
9-8 DT	<p>Deadtime</p> <p>These read only bits reflect the sampled values of the PWM_X input at the end of each deadtime. Sampling occurs at the end of deadtime 0 for DT[0] and the end of deadtime 1 for DT[1]. Reset clears these bits.</p>
7 COMPMODE	<p>Compare Mode</p> <p>This bit controls how comparisons are made between the VAL* registers and the PWM submodule counter. This bit can only be written one time after which it requires a reset to release the bit for writing again.</p> <p>0b - The VAL* registers and the PWM counter are compared using an "equal to" method. This means that PWM edges are only produced when the counter is equal to one of the VAL* register values. This implies that a PWMA output that is high at the end of a period will maintain this state until a match with VAL3 clears the output in the following period.            1b - The VAL* registers and the PWM counter are compared using an "equal to or greater than" method. This means that PWM edges are produced when the counter is equal to or greater than one of the VAL* register values. This implies that a PWMA output that is high at the end of a period could go low at the start of the next period if the starting counter value is greater than (but not necessarily equal to) the new VAL3 value.</p>
6-4 PRSC	<p>Prescaler</p> <p>These buffered read/write bits select the divide ratio of the PWM clock frequency selected by CTRL2[CLK_SEL].</p>

*Table continues on the next page...*

Field	Function
	<p><b>NOTE:</b> Reading CTRL[PRSC] reads the buffered values and not necessarily the values currently in effect. CTRL[PRSC] takes effect at the beginning of the next PWM cycle and only when the load okay bit, MCTRL[LDOK], is set or CTRL[LDMOD] is set. This field cannot be written when MCTRL[LDOK] is set.</p> <p>000b - PWM clock frequency = <math>f_{clk}</math>  001b - PWM clock frequency = <math>f_{clk}/2</math>  010b - PWM clock frequency = <math>f_{clk}/4</math>  011b - PWM clock frequency = <math>f_{clk}/8</math>  100b - PWM clock frequency = <math>f_{clk}/16</math>  101b - PWM clock frequency = <math>f_{clk}/32</math>  110b - PWM clock frequency = <math>f_{clk}/64</math>  111b - PWM clock frequency = <math>f_{clk}/128</math></p>
3 SPLIT	<p>Split the DBLPWM signal to PWMA and PWMB</p> <p>This read/write bit is only used when DBLEN is set. This bit allows the two PWM pulses generated by DBLEN to be split with one pulse on PWMA and one on PWMB. The two pulses within the same PWM period are created by an XOR function of the PWMA and PWMB sources. The splitting function causes PWMA to output the pulse that occurs when the PWMA source is 1 and the PWMB source is 0. The PWMB output occurs when the PWMB source is 1 and the PWMA source is 0. (See <a href="#">Double Switching PWMs</a>.)</p> <p>0b - DBLPWM is not split. PWMA and PWMB each have double pulses.  1b - DBLPWM is split to PWMA and PWMB.</p>
2 LDMOD	<p>Load Mode Select</p> <p>This read/write bit selects the timing of loading the buffered registers for this submodule.</p> <p>0b - Buffered registers of this submodule are loaded and take effect at the next PWM reload if MCTRL[LDOK] is set.  1b - Buffered registers of this submodule are loaded and take effect immediately upon MCTRL[LDOK] being set. In this case it is not necessary to set CTRL[FULL] or CTRL[HALF].</p>
1 DBLX	<p>PWMX Double Switching Enable</p> <p>This read/write bit enables the double switching behavior on PWMX. When this bit is set, the PWMX output shall be the exclusive OR combination of PWMA and PWMB prior to polarity and masking considerations.</p> <p>0b - PWMX double pulse disabled.  1b - PWMX double pulse enabled.</p>
0 DBLEN	<p>Double Switching Enable</p> <p>This read/write bit enables the double switching PWM behavior(See <a href="#">Double Switching PWMs</a>). Double switching is not compatible with fractional PWM clock generation. Make sure this bit is clear when setting FRCTRL[FRAC23_EN], FRCTRL[FRAC45_EN], or FRCTRL[FRAC1_EN].</p> <p>0b - Double switching disabled.  1b - Double switching enabled.</p>

## 28.4.6 Value Register 0 (SM0VAL0 - SM3VAL0)

### 28.4.6.1 Offset

For a = 0 to 3:

## PWM register descriptions

Register	Offset
SMaVAL0	Ah + (a × 60h)

### 28.4.6.2 Diagram

### 28.4.6.3 Fields

Field	Function
15-0 VAL0	<p>Value Register 0</p> <p>The 16-bit signed value in this buffered, read/write register defines the mid-cycle reload point for the PWM in PWM clock periods. This value also defines when the PWM_X signal is set and the local sync signal is reset. This register is not byte accessible.</p> <p><b>NOTE:</b> The VAL0 register is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. VAL0 cannot be written when MCTRL[LDOK] is set. Reading VAL0 reads the value in a buffer. It is not necessarily the value the PWM generator is currently using.</p>

## 28.4.7 Fractional Value Register 1 (SM0FRACVAL1 - SM3FRACVAL1)

### 28.4.7.1 Offset

For a = 0 to 3:

Register	Offset
SMaFRACVAL1	Ch + (a × 60h)

## 28.4.7.2 Diagram

## 28.4.7.3 Fields

Field	Function
15-11 FRACVAL1	<p>Fractional Value 1 Register</p> <p>These bits act as a fractional addition to the value in the VAL1 register which controls the PWM period width. The PWM period is computed in terms of IPBus clock cycles. This fractional portion is accumulated at the end of every cycle until an additional whole IPBus cycle is reached. At this time the value being used for VAL1 is temporarily incremented and the PWM cycle is extended by one clock period to compensate for the accumulated fractional values.</p> <p><b>NOTE:</b> The FRACVAL1 register is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. FRACVAL1 cannot be written when MCTRL[LDOK] is set. Reading FRACVAL1 reads the value in a buffer and not necessarily the value the PWM generator is currently using.</p>
10-0 —	RESERVED

## 28.4.8 Value Register 1 (SM0VAL1 - SM3VAL1)

### 28.4.8.1 Offset

For a = 0 to 3:

Register	Offset
SMaVAL1	Eh + (a × 60h)

### 28.4.8.2 Diagram

### 28.4.8.3 Fields

Field	Function
15-0 VAL1	<p>Value Register 1</p> <p>The 16-bit signed value written to this buffered, read/write register defines the modulo count value (maximum count) for the submodule counter. Upon reaching this count value, the counter reloads itself with the contents of the INIT register and asserts the local sync signal while resetting PWM_X. This register is not byte accessible.</p> <p><b>NOTE:</b> The VAL1 register is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. VAL1 cannot be written when MCTRL[LDOK] is set. Reading VAL1 reads the value in a buffer. It is not necessarily the value the PWM generator is currently using.</p> <p><b>NOTE:</b> When using FRACVAL1, limit the maximum value of VAL1 to 0xFFFE for unsigned applications or to 0x7FFE for signed applications, to avoid counter rollovers caused by accumulating the fractional period defined by FRACVAL1.</p> <p><b>NOTE:</b> If the VAL1 register defines the timer period (Local Sync is selected as the counter initialization signal), a 100% duty cycle cannot be achieved on the PWMX output. After the count reaches VAL1, the PWMX output is low for a minimum of one count every cycle. When the Master Sync signal (only originated by the Local Sync from sub-module 0) is used to control the timer period, the VAL1 register can be free for other functions such as PWM generation without the duty cycle limitation.</p>

## 28.4.9 Fractional Value Register 2 (SM0FRACVAL2 - SM3FRACVAL2)

### 28.4.9.1 Offset

For a = 0 to 3:

Register	Offset

For a = 0 to 3:

Register	Offset
SMaVAL5	1Eh + (a × 60h)

### 28.4.16.2 Diagram

### 28.4.16.3 Fields

Field	Function
15-0 VAL5	<p>Value Register 5</p> <p>The 16-bit signed value in this buffered, read/write register defines the count value to set PWM45 low. This register is not byte accessible.</p> <p><b>NOTE:</b> The VAL5 register is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. VAL5 cannot be written when MCTRL[LDOK] is set. Reading VAL5 reads the value in a buffer and not necessarily the value the PWM generator is currently using.</p>

## 28.4.17 Fractional Control Register (SM0FRCTRL - SM3FRCTRL)

### 28.4.17.1 Offset

For a = 0 to 3:

Register	Offset
SMaFRCTRL	20h + (a × 60h)

### 28.4.17.2 Diagram

### 28.4.17.3 Fields

Field	Function
15 TEST	Test Status Bit This is a read only test bit for factory use. This bit will reset to 0 but may be either 0 or 1 during PWM operation.
14-9 —	RESERVED
8 FRAC_PU	Fractional Delay Circuit Power Up This bit is used to power up the fractional delay analog block. The fractional delay block takes 25 us to power up after the first FRAC_PU bit in any submodule is set. The fractional delay block only powers down when the FRAC_PU bits in all submodules are 0. The fractional delay logic can only be used when the IPBus clock is running at 100 MHz. When turned off, fractional placement is disabled.  After setting this bit and waiting the 25usec, load the PWM VAL* registers with values to create a PWM output with greater than 0% duty cycle and run for at least one PWM period. This can be done without the outputs enabled and is used to clear the state of the analog block that produces the fractional delays.  0b - Turn off fractional delay logic. 1b - Power up fractional delay logic.
7-5 —	RESERVED
4 FRAC45_EN	Fractional Cycle Placement Enable for PWM_B This bit is used to enable the fractional cycle edge placement of PWM_B using the FRACVAL4 and FRACVAL5 registers. When disabled, the fractional cycle edge placement of PWM_B is bypassed.  <b>NOTE:</b> The FRAC45_EN bit is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. FRAC45_EN cannot be written when MCTRL[LDOK] is set. Reading FRAC45_EN reads the value in a buffer and not necessarily the value the PWM generator is currently using.  0b - Disable fractional cycle placement for PWM_B. 1b - Enable fractional cycle placement for PWM_B.
3 —	RESERVED
2	Fractional Cycle Placement Enable for PWM_A

Table continues on the next page...

Field	Function
FRAC23_EN	This bit is used to enable the fractional cycle edge placement of PWM_A using the FRACVAL2 and FRACVAL3 registers. When disabled, the fractional cycle edge placement of PWM_A is bypassed.  <b>NOTE:</b> The FRAC23_EN bit is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. FRAC23_EN cannot be written when MCTRL[LDOK] is set. Reading FRAC23_EN reads the value in a buffer and not necessarily the value the PWM generator is currently using. 0b - Disable fractional cycle placement for PWM_A. 1b - Enable fractional cycle placement for PWM_A.
1 FRAC1_EN	Fractional Cycle PWM Period Enable  This bit is used to enable the fractional cycle length of the PWM period using the FRACVAL1 register. When disabled, the fractional cycle length of the PWM period is bypassed.  <b>NOTE:</b> The FRAC1_EN bit is buffered. The value written does not take effect until MCTRL[LDOK] is set and the next PWM load cycle begins or CTRL[LDMOD] is set. FRAC1_EN cannot be written when MCTRL[LDOK] is set. Reading FRAC1_EN reads the value in a buffer and not necessarily the value the PWM generator is currently using. 0b - Disable fractional cycle length for the PWM period. 1b - Enable fractional cycle length for the PWM period.
0 —	RESERVED

## 28.4.18 Output Control Register (SM0OCTRL - SM3OCTRL)

### 28.4.18.1 Offset

For a = 0 to 3:

Register	Offset
SMaOCTRL	22h + (a × 60h)

### 28.4.18.2 Diagram

### 28.4.18.3 Fields

Field	Function
15 PWMA_IN	PWM_A Input This read only bit shows the logic value currently being driven into the PWM_A input. The bit's reset state is undefined.
14 PWMB_IN	PWM_B Input This read only bit shows the logic value currently being driven into the PWM_B input. The bit's reset state is undefined.
13 PWMX_IN	PWM_X Input This read only bit shows the logic value currently being driven into the PWM_X input. The bit's reset state is undefined.
12-11 —	RESERVED
10 POLA	PWM_A Output Polarity This bit inverts the PWM_A output polarity.  0b - PWM_A output not inverted. A high level on the PWM_A pin represents the "on" or "active" state. 1b - PWM_A output inverted. A low level on the PWM_A pin represents the "on" or "active" state.
9 POLB	PWM_B Output Polarity This bit inverts the PWM_B output polarity.  0b - PWM_B output not inverted. A high level on the PWM_B pin represents the "on" or "active" state. 1b - PWM_B output inverted. A low level on the PWM_B pin represents the "on" or "active" state.
8 POLX	PWM_X Output Polarity This bit inverts the PWM_X output polarity.  0b - PWM_X output not inverted. A high level on the PWM_X pin represents the "on" or "active" state. 1b - PWM_X output inverted. A low level on the PWM_X pin represents the "on" or "active" state.
7-6 —	RESERVED
5-4 PWMAFS	PWM_A Fault State These bits determine the fault state for the PWM_A output during fault conditions and STOP mode. It may also define the output state during WAIT and DEBUG modes depending on the settings of CTRL2[WAITEN] and CTRL2[DBGEN].  00b - Output is forced to logic 0 state prior to consideration of output polarity control. 01b - Output is forced to logic 1 state prior to consideration of output polarity control. 10b - Output is tristated. 11b - Output is tristated.
3-2 PWMBFS	PWM_B Fault State These bits determine the fault state for the PWM_B output during fault conditions and STOP mode. It may also define the output state during WAIT and DEBUG modes depending on the settings of CTRL2[WAITEN] and CTRL2[DBGEN].  00b - Output is forced to logic 0 state prior to consideration of output polarity control. 01b - Output is forced to logic 1 state prior to consideration of output polarity control.

14	Registers Updated Flag

Table continues on the next page...

## PWM register descriptions

Field	Function
RUF	This read-only flag is set when one of the INIT, VALx, FRACVALx, or CTRL[PRSC] registers has been written, which indicates potentially non-coherent data in the set of double buffered registers. Clear this bit by a proper reload sequence consisting of a reload signal while MCTRL[LDOK] = 1. Reset clears this bit.  0b - No register update has occurred since last reload. 1b - At least one of the double buffered registers has been updated since the last reload.
13 REF	Reload Error Flag This read/write flag is set when a reload cycle occurs while MCTRL[LDOK] is 0 and the double buffered registers are in a non-coherent state (STS[RUF] = 1). Clear this bit by writing a logic one to this location. Reset clears this bit.  0b - No reload error occurred. 1b - Reload signal occurred with non-coherent data and MCTRL[LDOK] = 0.
12 RF	Reload Flag This read/write flag is set at the beginning of every reload cycle regardless of the state of MCTRL[LDOK]. Clear this bit by writing a logic one to this location when DMAEN[VALDE] is clear (non-DMA mode). This flag can also be cleared by the DMA done signal when DMAEN[VALDE] is set (DMA mode). Reset clears this bit.  0b - No new reload cycle since last STS[RF] clearing 1b - New reload cycle since last STS[RF] clearing
11 CFA1	Capture Flag A1 This bit is set when a capture event occurs on the Capture A1 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CA1DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CA1DE] is set (DMA mode). Reset clears this bit.
10 CFA0	Capture Flag A0 This bit is set when a capture event occurs on the Capture A0 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CA0DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CA0DE] is set (DMA mode). Reset clears this bit.
9 CFB1	Capture Flag B1 This bit is set when a capture event occurs on the Capture B1 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CB1DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CB1DE] is set (DMA mode). Reset clears this bit.
8 CFB0	Capture Flag B0 This bit is set when a capture event occurs on the Capture B0 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CB0DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CB0DE] is set (DMA mode). Reset clears this bit.
7 CFX1	Capture Flag X1 This bit is set when a capture event occurs on the Capture X1 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CX1DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CX1DE] is set (DMA mode). Reset clears this bit.
6 CFX0	Capture Flag X0 This bit is set when a capture event occurs on the Capture X0 circuit. This bit is cleared by writing a one to this bit position if DMAEN[CX0DE] is clear (non-DMA mode) or by the DMA done signal if DMAEN[CX0DE] is set (DMA mode). Reset clears this bit.
5-0 CMPF	Compare Flags These bits are set when the submodule counter value matches the value of one of the VALx registers. Clear these bits by writing a 1 to a bit position.  000000b - No compare event has occurred for a particular VALx value. 000001b - A compare event has occurred for a particular VALx value.

## 28.4.20 Interrupt Enable Register (SM0INTEN - SM3INTEN)

### 28.4.20.1 Offset

For a = 0 to 3:

Register	Offset

13 REIE	Reload Error Interrupt Enable This read/write bit enables the reload error flag, STS[REF], to generate CPU interrupt requests. Reset clears this bit. 0b - STS[REF] CPU interrupt requests disabled 1b - STS[REF] CPU interrupt requests enabled
12 RIE	Reload Interrupt Enable This read/write bit enables the reload flag, STS[RF], to generate CPU interrupt requests. Reset clears this bit. 0b - STS[RF] CPU interrupt requests disabled 1b - STS[RF] CPU interrupt requests enabled
11 CA1IE	Capture A 1 Interrupt Enable This bit allows the STS[CFA1] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CA1DE]. 0b - Interrupt request disabled for STS[CFA1]. 1b - Interrupt request enabled for STS[CFA1].

Table continues on the next page...

## PWM register descriptions

Field	Function
10 CA0IE	<p>Capture A 0 Interrupt Enable</p> <p>This bit allows the STS[CFA0] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CA0DE].</p> <p>0b - Interrupt request disabled for STS[CFA0]. 1b - Interrupt request enabled for STS[CFA0].</p>
9 CB1IE	<p>Capture B 1 Interrupt Enable</p> <p>This bit allows the STS[CFB1] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CB1DE].</p> <p>0b - Interrupt request disabled for STS[CFB1]. 1b - Interrupt request enabled for STS[CFB1].</p>
8 CB0IE	<p>Capture B 0 Interrupt Enable</p> <p>This bit allows the STS[CFB0] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CB0DE].</p> <p>0b - Interrupt request disabled for STS[CFB0]. 1b - Interrupt request enabled for STS[CFB0].</p>
7 CX1IE	<p>Capture X 1 Interrupt Enable</p> <p>This bit allows the STS[CFX1] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CX1DE].</p> <p>0b - Interrupt request disabled for STS[CFX1]. 1b - Interrupt request enabled for STS[CFX1].</p>
6 CX0IE	<p>Capture X 0 Interrupt Enable</p> <p>This bit allows the STS[CFX0] flag to create an interrupt request to the CPU. Do not set both this bit and DMAEN[CX0DE].</p> <p>0b - Interrupt request disabled for STS[CFX0]. 1b - Interrupt request enabled for STS[CFX0].</p>
5-0 CMPIE	<p>Compare Interrupt Enables</p> <p>These bits enable the STS[CMPI] flags to cause a compare interrupt request to the CPU.</p> <p>000000b - The corresponding STS[CMPI] bit will not cause an interrupt request. 000001b - The corresponding STS[CMPI] bit will cause an interrupt request.</p>

## 28.4.21 DMA Enable Register (SM0DMAEN - SM3DMAEN)

### 28.4.21.1 Offset

For a = 0 to 3:

Register	Offset
SMaDMAEN	28h + (a × 60h)

## 28.4.21.2 Diagram

## 28.4.21.3 Fields

Field	Function
15-10 —	RESERVED
9 VALDE	Value Registers DMA Enable This read/write bit enables DMA write requests for the VALx and FRACVALx registers when STS[RF] is set. Reset clears this bit. 0b - DMA write requests disabled 1b - DMA write requests for the VALx and FRACVALx registers enabled
8 FAND	FIFO Watermark AND Control This read/write bit works in conjunction with the DMAEN[CAPTDE] field when it is set to watermark mode (DMAEN[CAPTDE] = 01). While DMAEN[CAxDE], DMAEN[CBxDE], and DMAEN[CXxDE] determine which FIFO watermarks the DMA read request is sensitive to, this bit determines if the selected watermarks are AND'ed together or OR'ed together in order to create the request. 0b - Selected FIFO watermarks are OR'ed together. 1b - Selected FIFO watermarks are AND'ed together.
7-6 CAPTDE	Capture DMA Enable Source Select These read/write bits select the source of enabling the DMA read requests for the capture FIFOs. Reset clears these bits. 00b - Read DMA requests disabled. 01b - Exceeding a FIFO watermark sets the DMA read request. This requires at least one of DMAEN[CA1DE], DMAEN[CA0DE], DMAEN[CB1DE], DMAEN[CB0DE], DMAEN[CX1DE], or DMAEN[CX0DE] to also be set in order to determine to which watermark(s) the DMA request is sensitive. 10b - A local sync (VAL1 matches counter) sets the read DMA request. 11b - A local reload (STS[RF] being set) sets the read DMA request.
5 CA1DE	Capture A1 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture A1 FIFO data when STS[CFA1] is set. Reset clears this bit. Do not set both this bit and INTEN[CA1IE].
4 CA0DE	Capture A0 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture A0 FIFO data when STS[CFA0] is set. Reset clears this bit. Do not set both this bit and INTEN[CA0IE].
3 CB1DE	Capture B1 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture B1 FIFO data when STS[CFB1] is set. Reset clears this bit. Do not set both this bit and INTEN[CB1IE].

Table continues on the next page...

## PWM register descriptions

Field	Function
2 CB0DE	Capture B0 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture B0 FIFO data when STS[CFB0] is set. Reset clears this bit. Do not set both this bit and INTEN[CB0IE].
1 CX1DE	Capture X1 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture X1 FIFO data when STS[CFX1] is set. Reset clears this bit. Do not set both this bit and INTEN[CX1IE].
0 CX0DE	Capture X0 FIFO DMA Enable This read/write bit enables DMA read requests for the Capture X0 FIFO data when STS[CFX0] is set. Reset clears this bit. Do not set both this bit and INTEN[CX0IE].

## 28.4.22 Output Trigger Control Register (SM0TCTRL - SM3TCTRL)

### 28.4.22.1 Offset

For a = 0 to 3:

Register	Offset
SMaTCTRL	2Ah + (a × 60h)

### 28.4.22.2 Diagram

### 28.4.22.3 Fields

Field	Function
15	Output Trigger 0 Source Select

Table continues on the next page...

Field	Function
PWAOT0	This bit selects which signal to bring out on the PWM's PWM_OUT_TRIG0 port. The output trigger port is often connected to routing logic on the chip. This control bit allows the PWMA output signal to be driven onto the output trigger port so it can be sent to the chip routing logic.  0b - Route the PWM_OUT_TRIG0 signal to PWM_OUT_TRIG0 port. 1b - Route the PWMA output to the PWM_OUT_TRIG0 port.
14 PWBOT1	Output Trigger 1 Source Select  This bit selects which signal to bring out on the PWM's PWM_OUT_TRIG1 port. The output trigger port is often connected to routing logic on the chip. This control bit allows the PWMB output signal to be driven onto the output trigger port so it can be sent to the chip routing logic.  0b - Route the PWM_OUT_TRIG1 signal to PWM_OUT_TRIG1 port. 1b - Route the PWMB output to the PWM_OUT_TRIG1 port.
13 —	RESERVED
12 TRGFRQ	Trigger frequency  This read/write bit allows control over the frequency of the trigger outputs when using non-zero values of CTRL[LDFQ].  0b - Trigger outputs are generated during every PWM period even if the PWM is not reloaded every period due to CTRL[LDFQ] being non-zero. 1b - Trigger outputs are generated only during the final PWM period prior to a reload opportunity when the PWM is not reloaded every period due to CTRL[LDFQ] being non-zero.
11-6 —	RESERVED
5-0 OUT_TRIG_EN	Output Trigger Enables  These bits enable the generation of PWM_OUT_TRIG0 and PWM_OUT_TRIG1 outputs based on the counter value matching the value in one or more of the VAL0-5 registers. VAL0, VAL2, and VAL4 are used to generate PWM_OUT_TRIG0, and VAL1, VAL3, and VAL5 are used to generate PWM_OUT_TRIG1. The PWM_OUT_TRIGx signals are only asserted as long as the counter value matches the VALx value; therefore, up to six triggers can be generated (three each on PWM_OUT_TRIG0 and PWM_OUT_TRIG1) per PWM cycle per submodule.  <b>NOTE:</b> Due to delays in creating the PWM outputs, the output trigger signals will lead the PWM output edges by 2-3 clock cycles depending on the fractional cycle value being used. 000000b - PWM_OUT_TRIGx will not set when the counter value matches the VALx value. 000001b - PWM_OUT_TRIGx will set when the counter value matches the VALx value.

## 28.4.23 Fault Disable Mapping Register 0 (SM0DISMAP0 - SM3DISMAP0)

### 28.4.23.1 Offset

For a = 0 to 3:

Register	Offset
SMaDISMAP0	2Ch + (a × 60h)

### 28.4.23.2 Function

This register determines which PWM pins are disabled by the fault protection inputs. Reset sets all of the bits in the fault disable mapping register.

### 28.4.23.3 Diagram

### 28.4.23.4 Fields

Field	Function
15-12 —	RESERVED
11-8 DIS0X	PWM_X Fault Disable Mask 0 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 0. The PWM_X output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.
7-4 DIS0B	PWM_B Fault Disable Mask 0 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 0. The PWM_B output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.
3-0 DIS0A	PWM_A Fault Disable Mask 0 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 0. The PWM_A output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.

### 28.4.24 Fault Disable Mapping Register 1 (SM0DISMAP1 - SM3DISMAP1)

### 28.4.24.1 Offset

For a = 0 to 3:

Register	Offset
SMaDISMAP1	2Eh + (a × 60h)

### 28.4.24.2 Function

This register determines which PWM pins are disabled by the fault protection inputs. Reset sets all of the bits in the fault disable mapping register.

### 28.4.24.3 Diagram

### 28.4.24.4 Fields

Field	Function
15-12 —	RESERVED
11-8 DIS1X	PWM_X Fault Disable Mask 1 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 1. The PWM_X output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.
7-4 DIS1B	PWM_B Fault Disable Mask 1 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 1. The PWM_B output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.
3-0 DIS1A	PWM_A Fault Disable Mask 1 Each of the four bits of this read/write field is one-to-one associated with the four FAULTx inputs of fault channel 1. The PWM_A output is turned off if there is a logic 1 on a FAULTx input and a 1 in the corresponding bit of this field. A reset sets all bits in this field.

## 28.4.25 Deadtime Count Register 0 (SM0DTCNT0 - SM3DTCNT0)

### 28.4.25.1 Offset

For a = 0 to 3:

Register	Offset
SMaDTCNT0	30h + (a × 60h)

### 28.4.25.2 Function

Deadtime operation applies only to complementary channel operation. The values written to the DTCNTx registers are in terms of IPBus clock cycles regardless of the setting of CTRL[PRSC] and/or CTRL2[CLK\_SEL]. Reset sets the deadtime count registers to a default value of 0x07FF, selecting a deadtime of 2047 IPBus clock cycles. The DTCNTx registers are not byte accessible.

### 28.4.25.3 Diagram

### 28.4.25.4 Fields

Field	Function
15-0 DTCNT0	DTCNT0 The DTCNT0 field is interpreted differently depending on whether or not the fractional delays are being used (FRCNTRL[FRAC23_EN] is set). If the fractional delays are off, then the upper 5 bits of DTCNT0 are ignored and the remaining 11 bits are used to specify the number of cycles of deadtime. In this case the maximum value is 0x07FF which indicates 2047 cycles of deadtime. If the fractional delays are being used, then the upper 11 bits of DTCNT0 represent the number of whole cycles of deadtime and the lower 5 bits of each register represent the fractional cycle added to the whole number. In this case the maximum value is 0xFFFF which represents 2047 31/32 cycles of deadtime.

Field	Function
	The DTCNT0 field is used to control the deadtime during 0 to 1 transitions of the PWM_A output (assuming normal polarity).

## 28.4.26 Deadtime Count Register 1 (SM0DTCNT1 - SM3DTCNT1)

### 28.4.26.1 Offset

For a = 0 to 3:

Register	Offset
SMaDTCNT1	32h + (a × 60h)

### 28.4.26.2 Function

Deadtime operation applies only to complementary channel operation. The values written to the DTCNTx registers are in terms of IPBus clock cycles regardless of the setting of CTRL[PRSC] and/or CTRL2[CLK\_SEL]. Reset sets the deadtime count registers to a default value of 0x07FF, selecting a deadtime of 2047 IPBus clock cycles. The DTCNTx registers are not byte accessible.

### 28.4.26.3 Diagram

### 28.4.26.4 Fields

Field	Function
15-0 DTCNT1	DTCNT1

## PWM register descriptions

Field	Function
	<p>The DTCNT1 field is interpreted differently depending on whether or not the fractional delays are being used (FRCNTRL[FRAC45_EN] is set). If the fractional delays are off, then the upper 5 bits of DTCNT1 are ignored and the remaining 11 bits are used to specify the number of cycles of deadtime. In this case the maximum value is 0x07FF which indicates 2047 cycles of deadtime. If the fractional delays are being used, then the upper 11 bits of DTCNT1 represent the number of whole cycles of deadtime and the lower 5 bits of each register represent the fractional cycle added to the whole number. In this case the maximum value is 0xFFFF which represents 2047 31/32 cycles of deadtime.</p> <p>The DTCNT1 field is used to control the deadtime during 0 to 1 transitions of the PWM_B output (assuming normal polarity).</p>

## 28.4.27 Capture Control A Register (SM0CAPTCTRLA - SM3CAPTCTRLA)

### 28.4.27.1 Offset

For a = 0 to 3:

Register	Offset
SMaCAPTCTRLA	34h + (a × 60h)

### 28.4.27.2 Diagram

### 28.4.27.3 Fields

Field	Function
15-13 CA1CNT	<p>Capture A1 FIFO Word Count</p> <p>This field reflects the number of words in the Capture A1 FIFO.</p>

Table continues on the next page...

Field	Function
12-10 CA0CNT	<p>Capture A0 FIFO Word Count</p> <p>This field reflects the number of words in the Capture A0 FIFO.</p>
9-8 CFAWM	<p>Capture A FIFOs Water Mark</p> <p>This field represents the water mark level for capture A FIFOs. The capture flags, STS[CFA1] and STS[CFA0], are not set until the word count of the corresponding FIFO is greater than this water mark level.</p>
7 EDGCNTA_EN	<p>Edge Counter A Enable</p> <p>This bit enables the edge counter which counts rising and falling edges on the PWM_A input signal.</p> <p>0b - Edge counter disabled and held in reset 1b - Edge counter enabled</p>
6 INP_SELA	<p>Input Select A</p> <p>This bit selects between the raw PWM_A input signal and the output of the edge counter/compare circuitry as the source for the input capture circuit.</p> <p>0b - Raw PWM_A input signal selected as source. 1b - Output of edge counter/compare selected as source. Note that when this bitfield is set to 1, the internal edge counter is enabled and the rising and/or falling edges specified by the CAPCTRLA[EDGA0] and CAPCTRLA[EDGA1] fields are ignored. The software must still place a value other than 00 in either or both of the CAPCTRLA[EDGA0] and/or CAPCTRLA[EDGA1] fields in order to enable one or both of the capture registers.</p>
5-4 EDGA1	<p>Edge A 1</p> <p>These bits control the input capture 1 circuitry by determining which input edges cause a capture event.</p> <p>00b - Disabled 01b - Capture falling edges 10b - Capture rising edges 11b - Capture any edge</p>
3-2 EDGA0	<p>Edge A 0</p> <p>These bits control the input capture 0 circuitry by determining which input edges cause a capture event.</p> <p>00b - Disabled 01b - Capture falling edges 10b - Capture rising edges 11b - Capture any edge</p>
1 ONESHOTA	<p>One Shot Mode A</p> <p>This bit selects between free running and one shot mode for the input capture circuitry.</p> <p>0b - Free running mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after CAPCTRLA[ARMA] is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and capture circuit 0 is re-armed. The process continues indefinitely. If only one of the capture circuits is enabled, then captures continue indefinitely on the enabled capture circuit. 1b - One shot mode is selected. If both capture circuits are enabled, then capture circuit 0 is armed first after CAPCTRLA[ARMA] is set. Once a capture occurs, capture circuit 0 is disarmed and capture circuit 1 is armed. After capture circuit 1 performs a capture, it is disarmed and CAPCTRLA[ARMA] is cleared. No further captures will be performed until CAPCTRLA[ARMA] is set again. If only one of the capture circuits is enabled, then a single capture will occur on the enabled capture circuit and CAPCTRLA[ARMA] is then cleared.</p>
0 ARMA	<p>Arm A</p> <p>Setting this bit high starts the input capture process. This bit can be cleared at any time to disable input capture operation. This bit is self-cleared when in one shot mode and one or more of the enabled capture circuits has had a capture event.</p>

## PWM register descriptions
