29 LOWFREQF	Low Frequency Flag This bit indicates that the CLKDIV bitfield value is not high enough to filter all enabled channels, and the FIR or Half Band filters didn't finish their operations before the next sample arrived. For more information see Minimum Required CLKDIV bitfield value. Write a logic 1 to this field to clear this flag. **NOTE:** The filtering results in this condition are unpredictable. 0b - CLKDIV value is OK. 1b - CLKDIV value is too low.
28-16 —	Reserved
15-8 —	Reserved
7	Channel 7 Output Data Flag

Table continues on the next page...

Field	Function
CH7F	The CH7F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH7 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH7F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH7F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
6 CH6F	Channel 6 Output Data Flag The CH6F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH6 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH6F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH6F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
5 CH5F	Channel 5 Output Data Flag The CH5F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH5 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH5F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH5F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
4 CH4F	Channel 4 Output Data Flag The CH4F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH4 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH4F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH4F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
3 CH3F	Channel 3 Output Data Flag The CH3F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH3 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH3F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH3F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
2	Channel 2 Output Data Flag

Table continues on the next page...

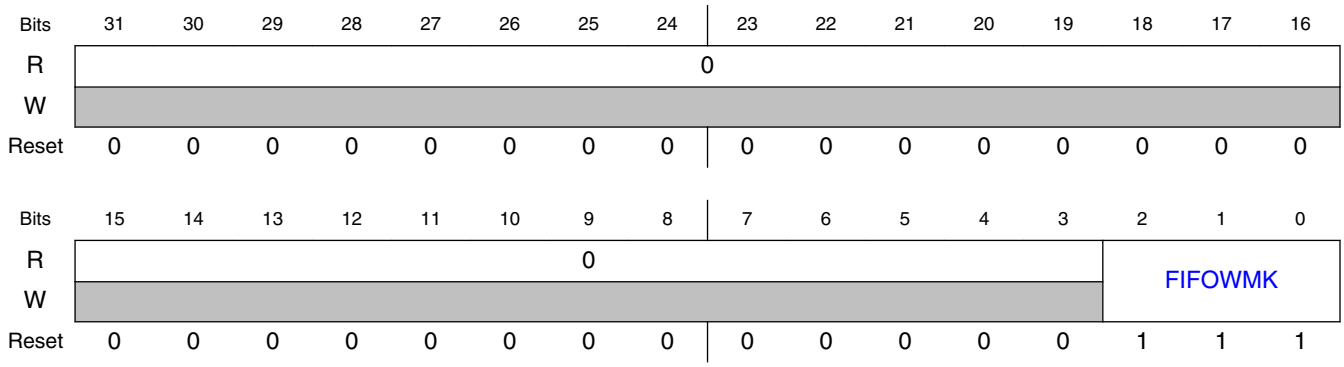
Field	Function
CH2F	The CH2F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH2 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH2F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH2F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
1 CH1F	Channel 1 Output Data Flag The CH1F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH1 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH1F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH1F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Channel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.
0 CH0F	Channel 0 Output Data Flag The CH0F bit flag indicates that the FIFO from this channel has surpassed its watermark value and the data is available at the DATACH0 register. This flag contributes to generate an Interrupt or DMA request if enabled by DISEL in the CTRL_1. Write a logic 1 to this field to clear this flag. If DMA request is set (DISEL = 01) the CH0F flag will be set according to watermark level and will be cleared , in the other cases (IRQ included) the CH0F flag will be set according to the watermark level and will be cleared with the w1c functionality of the bit. **NOTE:** If DMA is enabled, this flag is self-cleared when the DMA transaction is finished. 0b - Chanel's FIFO did not reach the number of elements configured in watermark bit-field. 1b - Channel's FIFO reached the number of elements configured in watermark bit-field.

13.8.4.5 MICFIL FIFO Control register (FIFO_CTRL)

13.8.4.5.1 Offset

Register	Offset
FIFO_CTRL	10h

13.8.4.5.2 Diagram



13.8.4.5.3 Fields

Field	Function
31-3 —	Reserved
2-0 FIFOWMK	FIFO Watermark Control The FIFOWMK controls the watermark of the FIFO used to set CHnF. When the number of results in the FIFO is greater than FIFOWMK value then the CHnF flag is set. A DMA request or interrupt can be also generated according to DISEL bit-field. **NOTE:** This mustn't change when BSY_FIL is asserted. Before changing the watermark value service all filtered data and clear channel flags.

13.8.4.6 MICFIL FIFO Status register (FIFO_STAT)

13.8.4.6.1 Offset

Register	Offset
FIFO_STAT	14h

13.8.4.6.3 Fields

Field	Function
31-16 —	Reserved
15 FIFOUND7	FIFO Underflow Exception flag for channel 7 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
14 FIFOUND6	FIFO Underflow Exception flag for channel 6 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
13 FIFOUND5	FIFO Underflow Exception flag for channel 5 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
12 FIFOUND4	FIFO Underflow Exception flag for channel 4 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
11 FIFOUND3	FIFO Underflow Exception flag for channel 3 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow

Table continues on the next page...

Field	Function
10 FIFOUND2	FIFO Underflow Exception flag for channel 2 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
9 FIFOUND1	FIFO Underflow Exception flag for channel 1 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
8 FIFOUND0	FIFO Underflow Exception flag for channel 0 The FIFOUND bit indicates an exceptional underflow condition in the FIFO. If the FIFO is empty and a read operation is requested then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO Underflow 1b - Exception by FIFO underflow
7 FIFOOVF7	FIFO Overflow Exception flag for channel 7 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
6 FIFOOVF6	FIFO Overflow Exception flag for channel 6 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
5 FIFOOVF5	FIFO Overflow Exception flag for channel 5 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
4 FIFOOVF4	FIFO Overflow Exception flag for channel 4 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
3 FIFOOVF3	FIFO Overflow Exception flag for channel 3 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
2 FIFOOVF2	FIFO Overflow Exception flag for channel 2 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
1 FIFOOVF1	FIFO Overflow Exception flag for channel 1 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag.

Table continues on the next page...

Field	Function
	0b - No exception by FIFO overflow 1b - Exception by FIFO overflow
0 FIFOOVF0	FIFO Overflow Exception flag for channel 0 The FIFOOVF bit indicates an exceptional overflow condition in the FIFO. If the FIFO is full and an additional result is received to be written then this flag is set. Write a logic 1 to this field to clear this flag. 0b - No exception by FIFO overflow 1b - Exception by FIFO overflow

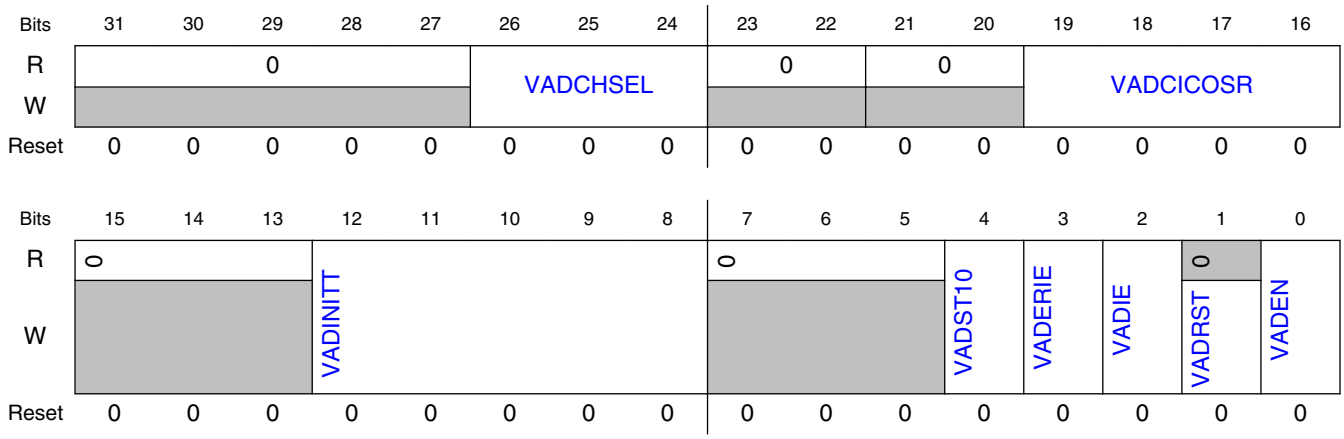
13.8.4.11 Voice Activity Detector 0 Control register (VAD0_CTRL_1)

13.8.4.11.1 Offset

Register	Offset
VAD0_CTRL_1	90h

13.8.4.11.2 Diagram



13.8.4.11.3 Fields

Field	Function
31-27 —	Reserved
26-24 VADCHSEL	Voice Activity Detector Channel Selector Selects the number of channel which the hardware voice activity detector will work. **NOTE:** This bitfield mustn't change when BSY_FIL is asserted.
23-22 —	Reserved
21-20 —	Reserved
19-16 VADCICOSR	Voice Activity Detector CIC Oversampling Rate This bitfield defines the oversampling rate of the CIC filter. The oversampling rate is (16-CICOSR). **NOTE:** This bitfield mustn't change when BSY_FIL is asserted.
15-13 —	Reserved
12-8 VADINITT	Voice Activity Detector Initialization Time Selects the number of frames to be used to initialize the voice detection. During this period the output of the voice activity detector is forced to inactive. For more information see Initialization Time. **NOTE:** The initialization time will be the time taken by [VADINITT+1] frames. **NOTE:** This bitfield mustn't change when BSY_FIL is asserted.
7-5 —	Reserved
4 VADST10	Voice Activity Detector Internal Filters Initialization Initializes the signal and noise filter with pre-filter value.

Table continues on the next page...

Field	Function
	NOTE: If the use of this bit is required, it should be stay pulsed by more than 2 cycles of system clock. **NOTE:** There is not voice activity detection when VADST10 is asserted. 0b - Normal operation. 1b - Filters are initialized.
3 VADERIE	Voice Activity Detector Error Interruption Enable The VADERIE bit enables Error Interrupts in the PDM Interface. This error could be caused by an overflow in the input of the HWVAD and it is signalized by the VADINSATF flag. 0b - HWVAD Error Interrupts disabled 1b - HWVAD Error Interrupts enabled
2 VADIE	Voice Activity Detector Interruption Enable This bit enables interrupts in the PDM Interface when voice activity event has been detected by the Hardware Voice Activity Detector (HWVAD). See the VADIF for more information. 0b - HWVAD Interrupts disabled 1b - HWVAD Interrupts enabled
1 VADRST	Voice Activity Detector Reset The VADRST is a self-negated bit which provides the CPU with the capability to initialize the VAD through the slave-bus interface. This bit always reads as zero. Refer to VAD Soft-reset.
0 VADEN	Voice Activity Detector Enable Enables the use of the Hardware Voice Activity Detector. **NOTE:** This bitfield mustn't change when BSY_FIL is asserted. 0b - The HWVAD is disabled. 1b - The HWVAD is enabled.

13.8.4.12 Voice Activity Detector 0 Control register (VAD0_CTRL_2)

13.8.4.12.1 Offset

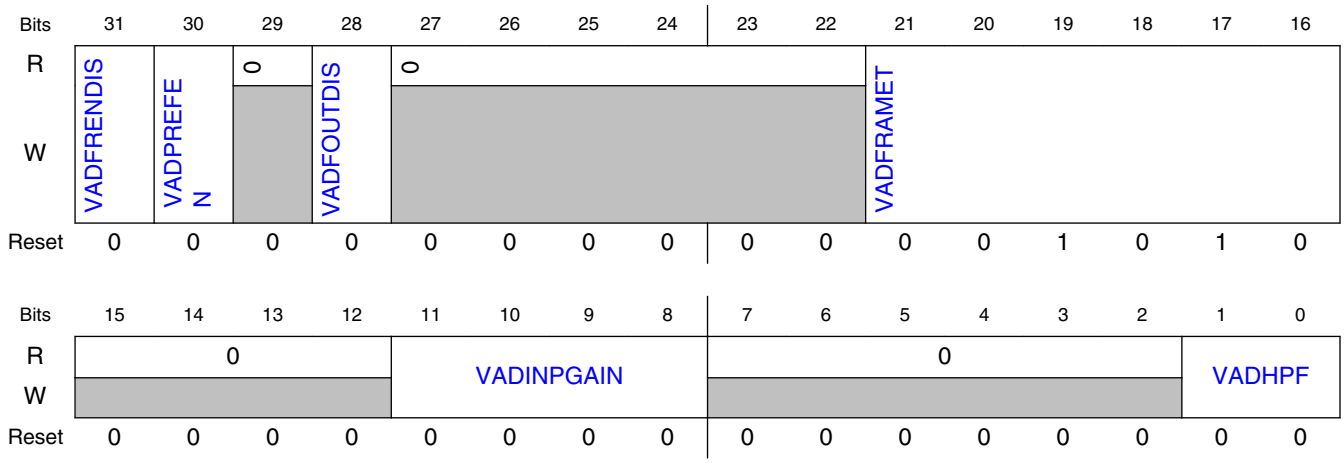
Register	Offset
VAD0_CTRL_2	94h

13.8.4.12.2 Function

NOTE

This register mustn't change when BSY_FIL is asserted.

13.8.4.12.3 Diagram



13.8.4.12.4 Fields

Field	Function
31 VADFRENDIS	Voice Activity Detector Frame Energy Disable Disables the calculus of energy in a frame. For more information see Noise Filter. 0b - Frame energy calculus enabled. 1b - Frame energy calculus disabled.
30 VADPREFEN	Voice Activity Detector Pre Filter Enable Enabled a pre-filter in the input of Noise and Signal filters. For more information see Pre-Filter. 0b - Pre-filter is bypassed. 1b - Pre-filter is enabled.
29 —	Reserved
28 VADFOUTDIS	Voice Activity Detector Force Output Disable Disables the output of the Energy/Envelope-based Detector. 0b - Output is enabled. 1b - Output is disabled.
27-22 —	Reserved
21-16 VADFRAMET	Voice Activity Detector Frame Time Selects the scale value to control the frame time duration as is described in Frame Time Setting. **NOTE:** VADFRAMET=0 is not allowed.
15-12 —	Reserved
11-8 VADINPGAIN	Voice Activity Detector Input Gain This bitfield is the gain value in the HWVAD input as a positive or negative (two's complement) number of bits to shift.
7-2	Reserved

2 VADZCDAUTO	Zero-Crossing Detector Automatic Threshold Enables the automatic estimation of the ZCD threshold. 0b - The ZCD threshold is not estimated automatically, 1b - The ZCD threshold is estimated automatically.
1 —	Reserved
0 VADZCDEN	Zero-Crossing Detector Enable Enables the Zero-Crossing Detector (ZCD) in the Hardware Voice Activity Detector (HWVAD). 0b - The ZCD is disabled. 1b - The ZCD is enabled.

13.8.5 Functional Description

13.8.5.1 Overview

Figure 13-92 shows the block diagram of the PDM Microphone Interface (MICFIL) block. Basically this module is composed by a Decimation Filter and a FIFO by channel, an Input Interface for each pair of microphones, a shared Time Generator unit, a shared bus interface, a shared DMA interface and a shared interrupt interface.

The Decimation Filter implements a low-pass filter in the audio band (20Hz-22.5KHz @48KHz output sampling rate by default) with a configurable decimation rate. It is implemented using an arrange of a CIC, a Half Band, a FIR and a DC remover filter.

The Time Generator unit generates the PDM clock to the microphones. This clock is the same for all the PDM microphones and it is active for all the microphones, i.e. there is not possiblity to turn off the PDM clock for one microphone only.

Finally, the output of each Decimation Filter is stored in a FIFO buffer. Each FIFO is mapped in the DATACHn registers. It is possible to generate either an interrupt or a DMA request when, in each FIFO of all enabled channels, the number of data stored surpasses a configured watermark.

13.8.5.2 Time Generator

The Time Generator is the responsible to generate the PDM clock to the external PDM microphones.

The PDM Clock rate depends on the desired output rate (fout), the quality mode (defined by QSEL bitfield) and the CIC's OSR (defined by CICOSR bitfield) as is shown in Table 13-57.

To the MICFIL work properly, the CLKDIV bitfield must be configured depending on the desired Output rate, the internal MICFIL clock frequency and the OSR value (see CIC Filter) as shown in Equation 1 on page 4237. Once calculated the CLKDIV value, the generated PDM clock rate can be estimated as shown in Equation 2 on page 4237, where the K factor value depends on the quality mode (see Table 13-59).

$$CLKDIV = \frac{\text{MICFIL Clock rate}}{8(\text{OSR})(\text{Output Rate})}$$

Equation 1. CLKDIV bitfield value

$$\text{PDM clock rate} = \frac{\text{MICFIL Clock rate}}{2 \cdot \text{floor}(K \cdot CLKDIV)}$$

Equation 2. PDM clock rate

NOTE

The Time Generator is affected by soft-reset. The PDM Clock starts with a rising edge after a soft reset is issued.

13.8.5.2.1 Busy Flag

If a least one Decimation Filter channel is running and HWVAD is stopped (in Normal mode, Debug mode when DBGE is 1 or Low Power mode) and then all channels are stopped (by clearing PDMIEN bit, changing to Debug when DBGE=0 or changing to Disable/Low Leakage modes), the MICFIL waits for filter completion, then BSY_FIL is cleared.

If only HWVAD are running and then are stopped, BSY_FIL is cleared immediately.

This bit can also be used as a confirmation that all Decimation Filters are stopped in a transition to Debug (when DBGE=0) or Disable/Low Leakage modes.

13.8.5.3 Input Interface

The Input Interface block splits up the 1-bit bitstream incoming from the PDM microphone in two signals, one by channel, as is shown in Figure 13-92. The left microphone (L) will be directed to the lower channel and the right microphone (R) will be directed to the upper channel.

13.8.5.3.1 Input Interface Signals

The timing diagram of the input interface signals is shown in Figure 13-93. The data generated in the first half (Right microphone) of the PDM clock is directed to the Channel 1 and the data generated during the last half (Left microphone) is directed to the Channel 0.

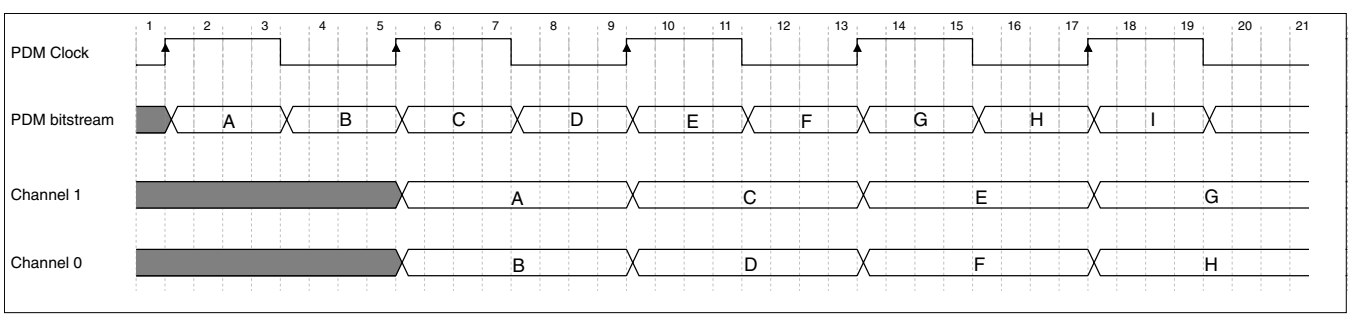

Figure 13-93. Input Interface signals

13.8.5.3.2 Input/Output Timing Requirements

The PDM microphones must meet the setup and hold timing requirements shown in Table 13-58 and Figure 13-94. The "k" factor value in Table 13-58 depends on the selected quality mode as shown in Table 13-59.

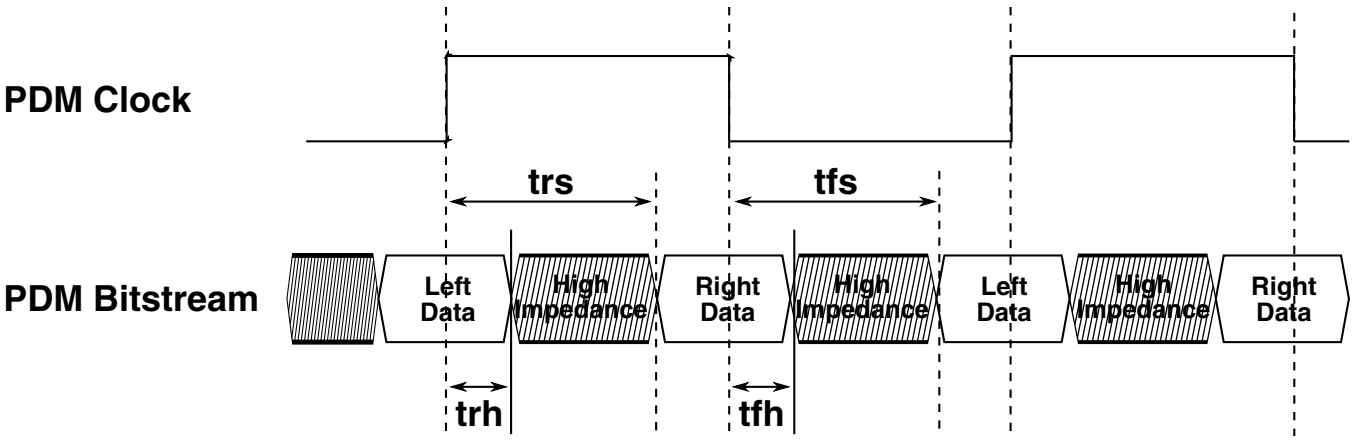

Figure 13-94. Input/Output TIming Requirements

Table 13-58. Timing parameters

Parameter	Value
trs, tfs	$<= \frac{\text{floor}(K \times CLKDIV) - 1}{\text{MICFIL Clock rate}}$ [1]
trh. tfh	>=0

1. Depending on K value, the user must make sure floor(K x CLKDIV) > 1 to avoid timing problems.

Table 13-59. K factor value

Quality mode	K factor
High Quality	1/2
Medium Quality, Very Low Quality 0	1
Low Quality, Very Low Quality 1	2
Very Low Quality 2	4

13.8.5.4 Decimation Filter

Figure 13-95 shows the block diagram of the Decimation Filter. This block is composed by a CIC filter, a DC remover, a FIR filter and a Half Band filter for each channel.

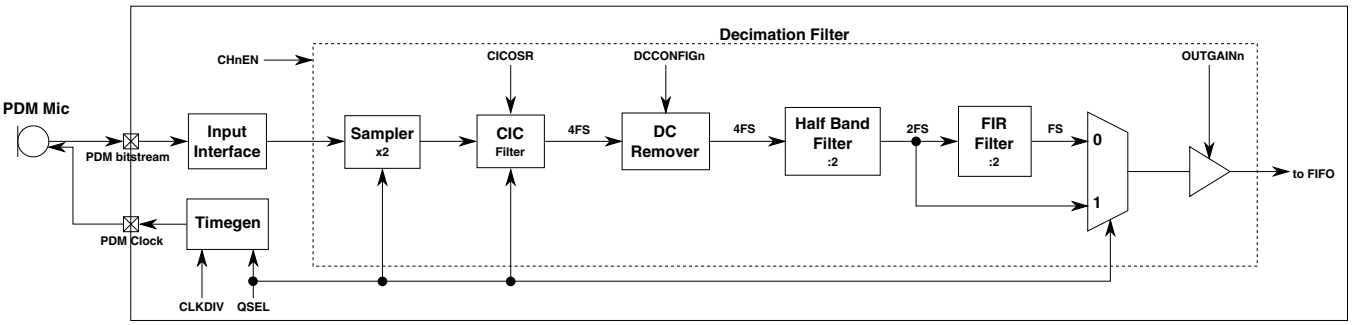

Figure 13-95. Decimation Filter Block Diagram

The Sampler block is activated depending on the quality mode selected (QSEL bitfield). This one samples twice the PDM data incoming from the Input Interface.

The CIC filter (Cascaded Integrator Comb filter) is a low pass filter commonly used to filter the sigma-delta modulator output signal. Its implementation is very simple without multipliers. It is composed by 5 cascadable unit sections of Integrator plus Differentiator units. Each section implements a low pass Sinc filter to improve the attenuation in the high frequencies range. It has a configurable decimation rate. This filter does not introduce phase distortions to the input signal, however the frequency amplitude response is not flat.

The DC remover is a high pass filter used to remove the DC component of the processed signal. It is a first order IIR filter of Chevichev type-I and it's implemented in the Direct Form-II. Its cut-off frequency is configurable.

The Half Band filter block implements a 19-tap low pass digital FIR filter with decimation by 2. It's used to compensate the high CIC drop in passband and helps the FIR filter block to flat the overall passband response.

The FIR filter block implements a 125-tap low pass digital FIR filter with decimation by 2 designed to achieve an overall filter passband ripple less than 0.2dB and a stopband attenuation more than 80dB. Such as the Half Band filter, it is also used to compensate the high CIC drop and to achieve a little passband ripple.

The Decimation Filter output depends on the quality mode selected by the QSEL bitfield, so it can come from the Half Band filter output directly or the FIR filter output.

Each Decimation Filter output can be adjusted by shifting right or left the filtered result. In case the adjusted output overflows or underflows the signed 16-bits, an error interrupt can be generated and the value is saturated to the maximum or minimum value respectively. Finally, each Decimation Filter result is sent to a FIFO.

13.8.5.4.1 CIC Filter

The CIC filter itself is an optimized implementation of the low pass Sinc filter with multiple stages. It is widely used because it requires just adders and subtractors to be implemented. The CIC filter is composed by sub-blocks called: integrator and comb. The architecture of the CIC filter is presented in Figure 13-96 and it consists of 5 integrator sections, and then followed by 5 comb sections downsampled.

The decimation rate of the CIC filters is defined by the CICOSR bitfield and by the quality selected (see Quality Modes). When the MICFIL is running in High and Very Low Quality 0 modes the decimation rate is 2OSR (where OSR = 16-CICOSR), otherwise the decimation rate is OSR only.

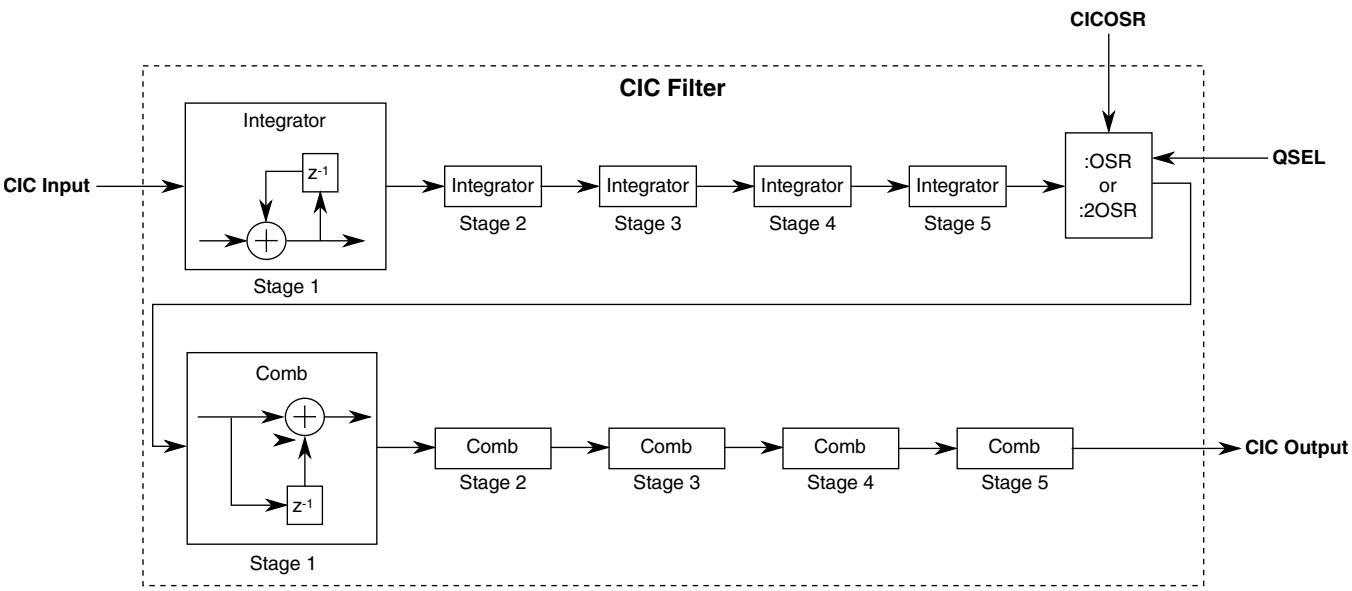

Figure 13-96. CIC Filter Block Diagram

13.8.5.4.2 DC Remover

The purpose of the DC Remover block is to remove the DC level component of the signal using a high-pass filter with a very low cut-off frequency selected by the DCCONFIGn bitfield. This filter can be bypassed when DCCONFIGn=11.

13.8.5.4.3 Half Band Filter

The use of half band filters is very attractive because it divides the base-band of the signal into two equal subbands and the half of the coefficients are zero-valued. The calculated filter has 19 coefficients (8 zero-valued) and its structure is shown in Figure 13-97.

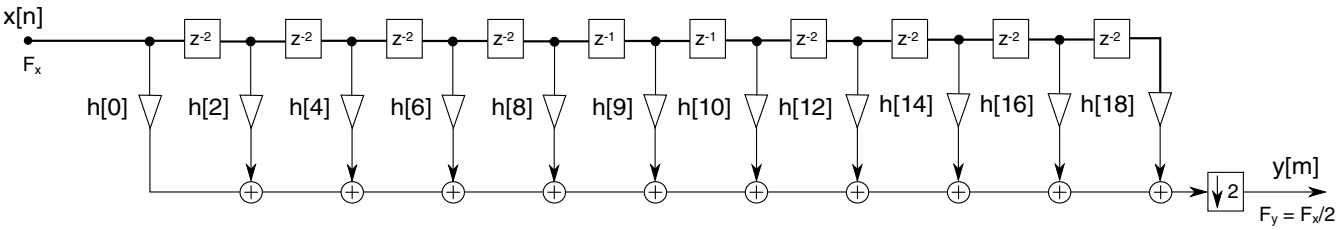

Figure 13-97. Half band filter structure

13.8.5.4.4 FIR Filter

The FIR block implements a fixed low-pass digital FIR filter. The calculated filter has 125 coefficients and its classical structure is shown in Figure 13-98.

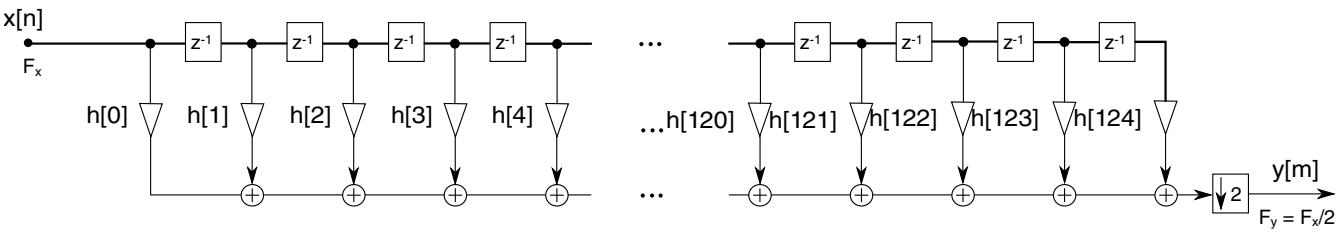

Figure 13-98. FIR filter structure

13.8.5.4.5 Decimated Output

The Decimation Filter's output depends on the quality mode selected by QSEL bitfield. It can be selected between the incoming signal from whether the Half Band filter or the FIR filter.

At the end, the selected output can be adjusted by a gain determined by the OUTGAINn bitfield for each channel (Figure 13-99), then the adjusted output is sent to its respective FIFO. The adjusted output is satured when it is greater than the maximum 16-bits signed positive value or lower than the 16-bits signed negative value. In both cases overflow (OUTOVFn) or underflow (OUTUNFn) flags are set respectively and an error interrupt is generated if ERREN bitfield value was previously enabled.

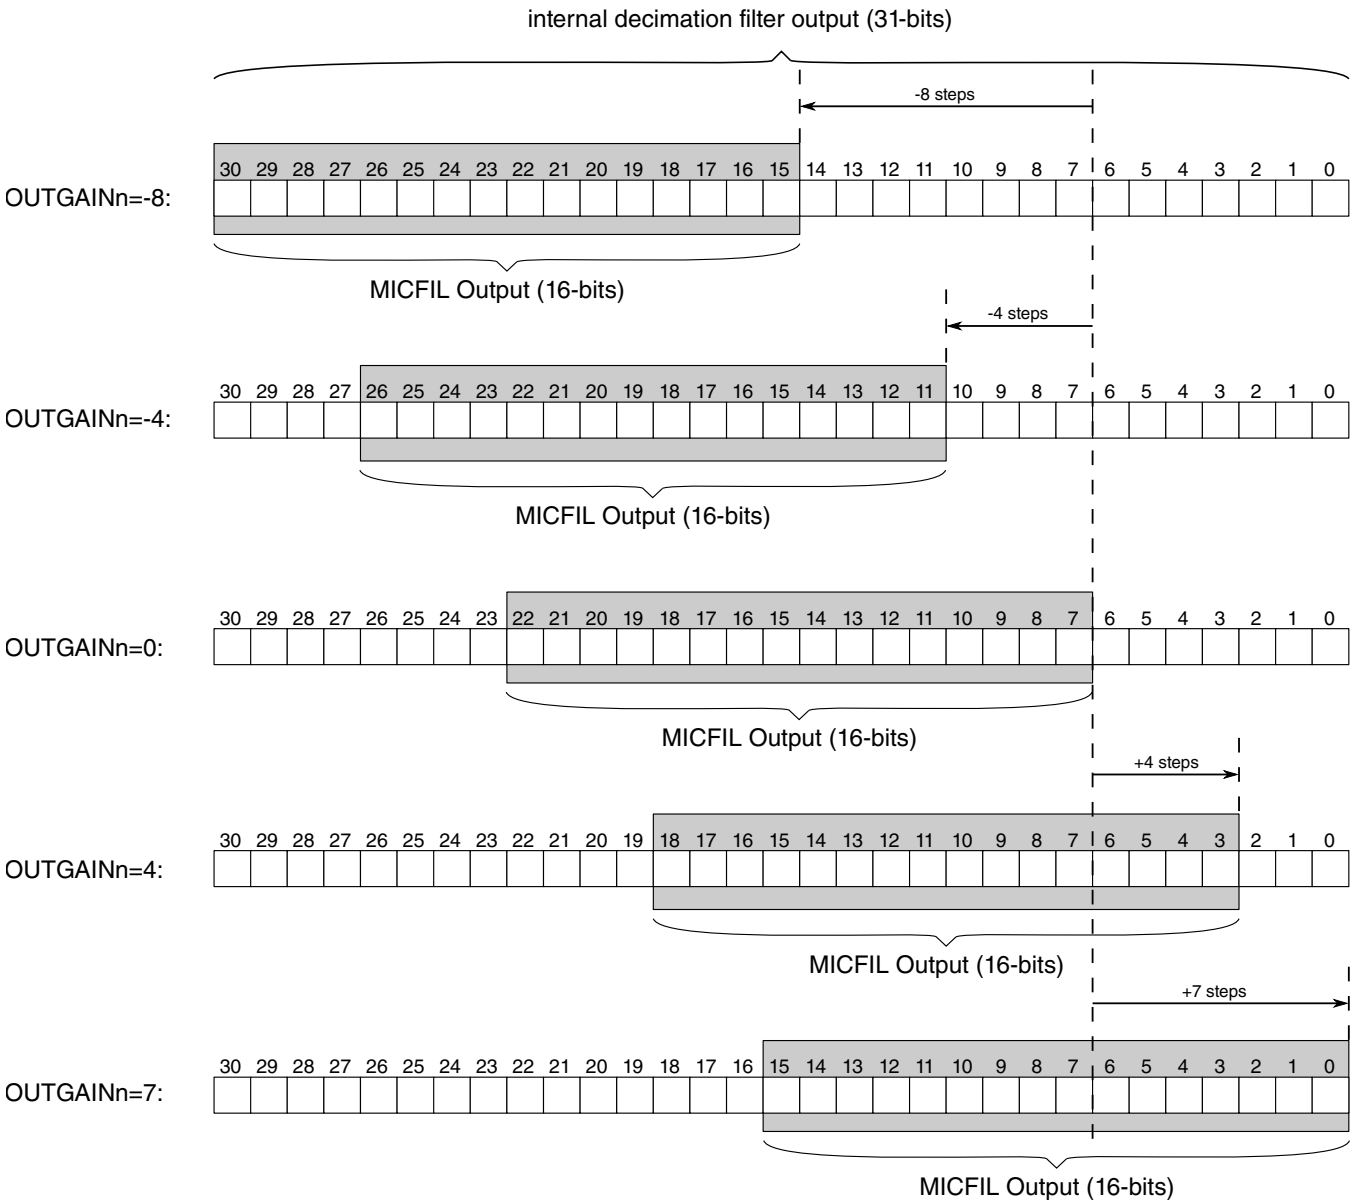

Figure 13-99. Output Gain

13.8.5.4.6 Minimum Required CLKDIV bitfield value

To work properly the CLKDIV bitfield value must have a minimum value according to the quality mode configured (see Quality Modes), the number of enabled channels (EC), OSR value (see CIC Filter) and K factor (see Input/Output Timing Requirements). When this condition is not met the LOWFREQF bit is asserted and an error interrupt can be issued (in case ERREN=1).

The equation to estimate the minimum required CLKDIV bitfield value in Medium, High and Low Quality modes is shown in Equation 3 on page 4243.

$$\text{floor}(K \times CLKDIV) >= K \times \frac{10 + 125EC}{8 \times OSR}$$

Equation 3. Minimum required CLKDIV value in Medium, High and Low Quality modes

The equation to estimate the minimum required CLKDIV bitfield value in Very Low Quality modes is shown in Equation 4 on page 4244.

$$\text{floor}(K \times CLKDIV) >= K \times \frac{10 + 19EC}{8 \times OSR}$$

Equation 4. Minimum required CLKDIV value in Very Low Quality modes

13.8.5.4.7 Overall Bandpass

The bandpass of the Decimation Filter depends on the quality mode and the output rate. For instance, the overall filter passband for different output data rates when the MICFIL is in High, Medium and Low Quality modes is shown in Table 13-60. The passband is about the half of the output rate because the FIR filter is enabled.

Table 13-60. Filter Passband in High, Medlum and Low Quality modes (DCCONFIGn=00)

Output Data Rate (KHz)	Overall Filter Passband
16	7Hz- 7.5KHz
24	10.5Hz - 11.25KHz
32	14Hz - 15KHz
48	21Hz - 22.5KHz

The overall filter passband for different output data rates when the MICFIL is in Very Low Quality modes is shown in Table 13-61.

Table 13-61. Filter Passband in Very Low Quality modes (DCCONFIGn=00)

Output Data Rate (KHz)	Overall Filter Passband
16	3.5Hz- 3.75KHz
24	5.25Hz - 5.63KHz
32	7Hz - 7.5KHz
48	10.5Hz - 11.25KHz
96	21Hz - 22.5KHz

13.8.5.5 Hardware Voice Activity Detector

The Hardware Voice Activity Detector (HWVAD) is a block responsible for detect voice activity in a channel selected by the user as shown in the Figure 13-100 and Figure 13-101. It can be configured in Envelope-based or Energy-based mode and it should be configured as described in Procedures.

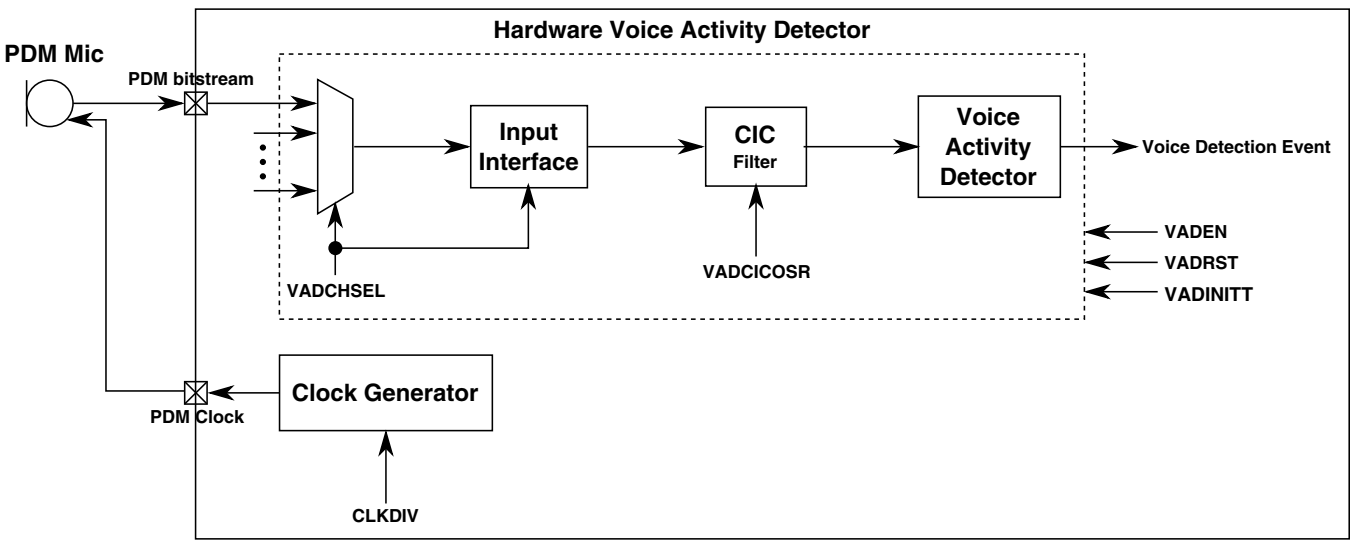

Figure 13-100. HWVAD Block Diagram

The HWVAD can divide the incoming PCM signal from its internal CIC in frames, the frame energy is used to estimate the background noise. Both frame energy and noise energy are examinated, a voice activity is detected when a specific delta between them is detected, then a interrupt will be issued. Optionally a Zero-Crossing Detection block (ZCD) could be enabled to avoid low energy voiced speech be missed, improving the voice detection performance.

The HWVAD detector can be enabled by the VADEN bit (VAD_CTRL_1 register) and could be reset by software through the VADRST bit (VAD_CTRL_1 register) . It is important to remark that the HWVAD detector could be enabled and/or reset only when the MICFIL isn't running i.e. when the BSY_FIL bit in STAT register is cleared.

To perform voice detection a Noise Filter and Signal Filter are used as shown Figure 13-101. In addition, a minimum block in the output of the Noise Filter and a maximum block in the ouput of the Signal Filter can be used. The result of both blocks can be scaled by gain blocks. Finally, the signal and noise estimated are compared, voice is detected when signal is greater than noise.

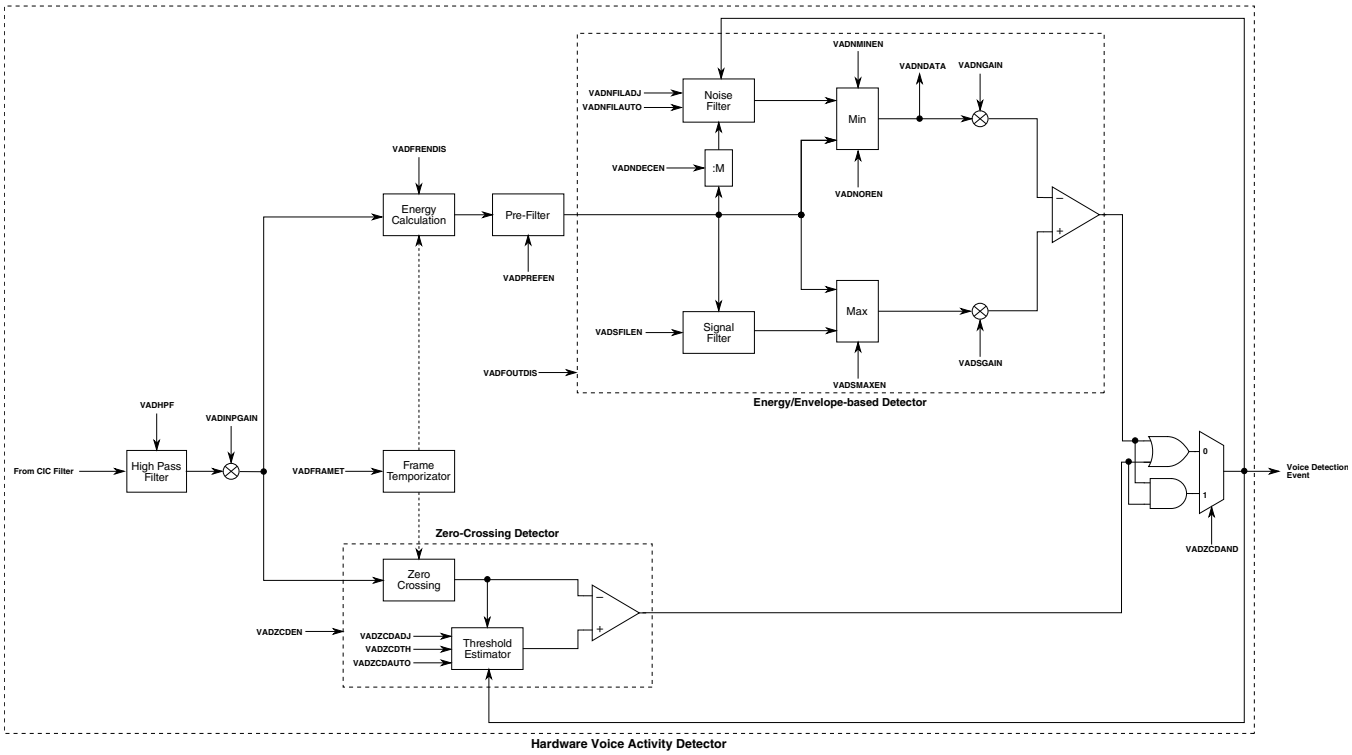

Figure 13-101. HWVAD Block Diagram (cont.)

13.8.5.5.1 High-Pass Filter

The purpose of the High-Pass Filter is to remove the low frequency components. The cut-off frequency is selected by the VADHPF bitfield. This filter is bypassed when VADHPF=00.

13.8.5.5.2 Input Setting

The HWVAD input has internally a user configurable High-Pass filter (see VADHPF bit description) and a user configurable gain (see VADINPGAIN). Both controls could be used to configure the module based on external noise conditions.

13.8.5.5.3 Frame Time Setting

In order to perform voice detection the signal frames incoming from the CIC filter can be divided in frames whose duration can be configured. The frame time will depend on the CIC output rate, the value of the VADFRAMET bitfield and a constant as is defined in Equation 5 on page 4246.

$$frame\ \ time = \frac{VADFRAMET \times 192}{CIC\ \ output\ \ rate}$$

Equation 5. Frame Time

For instance, in the typical case of the CIC filter output rate would be 192KHz, the frame time would be 10ms when VADFRAMET is 10.

13.8.5.5.4 Initialization Time

An initialization time can be configured by the VADINITT bitfield. During this initialization time no voice detection event is issued, Zero-Crossing and Energy/ Envelope-based detectors are kept disabled.

$$initialization\ \ time = (\text{VADINITT}+1) \times frame\ \ time$$

Equation 6. Initialization Time

13.8.5.5.5 Energy Calculation

In case VADFRENDIS = 0, the sum of the absolute values of all the samples of each frame are used to detect voice. Otherwise, if VADFRENDIS=1, the absolute value of the samples are used to detect voice i.e. the data incoming from CIC is not divided in frames.

13.8.5.5.6 Pre-Filter

The Pre-FIlter block is a low-pass filter which can be enabled when VADPREFEN=1.

13.8.5.5.7 Energy/Envelope-based Detector

To perform voice detection a Noise Filter and Signal Filter are used as shown in the HWVAD Block Diagram in the HWVAD Overview. In addition, a minimum block in the output of the Noise Filter and a maximum block in the output of the Signal Filter can be used. The result of both blocks can be scaled by gain blocks. Finally, the signal and noise estimated are compared, voice is detected when signal is greater than noise.

13.8.5.5.8 Noise Filter

The Noise Filter is a low-pass filter . This filter could be adjusted by the VADNFILADJ bitfield . In case VADNFILAUTO=1 the noise filter is enabled only when voice is not detected, when voice is detected the filter output does not change. In case VADNFILAUTO=0 the filter is always enabled.

A decimation stage in the input of the Noise Filter can be enabled by the VADNDECEN bitfield.

13.8.5.5.9 Minimum Noise

In order to estimate the noise, a block which calculates the minimum value between the input and output of the noise filter can be used. This block can be enabled by VADNMINEN, otherwise the output of the noise filter is passed directly.

The estimated noise of the output of this block is stored in the VADNDATA register for post-processing via software.

13.8.5.5.10 Signal Filter

The Signal Filter is a low-pass filter . This filter will be enabled when VADSFILEN=1, otherwise the filter will be bypassed.

13.8.5.5.11 Maximum Signal

In order to estimate the signal, a block which calculates the maximum value between the input and output of the signal filter can be used. This block can be enabled by VADSMAXEN, otherwise the output of the signal filter is passed directly.

13.8.5.5.12 Filter Result Gain Setting

There are two gain adjustment controls, one for the estimated noise (VADNGAIN) and another for signal estimated (VADSGAIN). Both gain adjustments outputs are compared, the comparison result determines whether or not there is voice in the channel.

13.8.5.5.13 Zero-Crossing Detector

Optionally, the HWVAD performance can be increased by the use of a Zero-Crossing Detection (ZCD) circuit. It is enabled by a VADZCDEN bit.

The threshold of the ZCD could be static or calculated dynamically depending on the VADZCDAUTO bit. When it is dynamically determined (VADZCDAUTO = 1) the threshold is calculated automatically taking the VADZCDTH bit-field as initial value, otherwise (VADZCDAUTO=0) the threshold is static in the VADZCDTH user configurable value.

The ZCD result can be AND'ed or OR'ed with the energy-based or envelope-based detection, it is selected by the VADZCDAND bit.The filter coefficient is equal to (VADZCDADJ+1)*2^(-4).

13.8.5.5.14 Interrupt

The HWVAD issues an interrupt when voice activity is detected and the VADIE bit in the VAD_CTRL_1 register is enabled. The voice activity event also will set the VADIF flag in the VAD_STAT register, this bit will be cleared when it is written 1.

13.8.5.5.15 Extended Operation

The VADIF bit could be used for a HWVAD extended operation i.e. using the VADNDATA bitfield value to determine a more accurate voice detection event by software. The procedure to follow will be:

1. An interrupt is issued by the HWVAD, the VADIF is set.
2. Leave the VADIF asserted while sofware is processing the VADNDATA bitfield content.
3. When software finishes to process the VADNDATA and detects voice activity:
   - If Envelope-based Detection is used, pulse VADST10 by more than 2-cycles and clear VADIF flag.
   - If Energy-based Detection is used, clear VADIF flag.

13.8.5.5.16 VAD Soft-reset

The VAD soft-reset is requested by writing 1 to the VADRST bit. It resets the following blocks and/or registers:

- VADIF, VADINSATF bitfields.
- All internal VAD buffers.

13.8.5.6 Bus Interface

The Bus Interface manages the Direct Memory Access (DMA) transactions, the interrupt requests and the user register interface with the SoC.

13.8.5.6.1 FIFO

The FIFO is a First-In, First-Out buffer that saves the overall filtering results. Each FIFO is 8 entries length. There is one FIFO for each channel. A push writes data into the FIFO, and a read pops data from FIFO. The push and pop operations from FIFO are in different clock domains, the push operation is made using the MICFIL clock while the pop operation uses the CPU clock . The FIFO has a configurable watermark FIFOWMK in the FIFO_CTRL register. When the amount of data in all the FIFOs of the enabled channels is greater than the watermark value (FIFO_CTRL[FIFOWMK]) a DMA/IRQ is requested depending on the DISEL field in the CTRL_1 register. After the filters are enabled by PDMIEN, the initial FIR results are discarded and not written into the FIFOs.

About 68 initial FIR results are not stored on FIFOs (FIR_RDY=0). After the STAT[FIR_RDY] register is set the data generated by the filter is valid and starts to push the results in FIFO.

A new filtered result is discarded (not stored) when the FIFO is full and overflow flag FIFOOVFn rises. Similarly, when trying a pop and FIFO is empty no valid data is read and underflow flag rises. In both cases, when overflow or underflow occurs they are flagged in the FIFO_STAT register to the respective channel, and an error interrupt is generated if the ERREN in the CTRL_1 register is asserted.

When the FIFO is reset by asserting the SRES soft-reset bit, zero values fills all FIFO positions, as well as push and pop pointers are set to initial position.

13.8.5.6.2 DMA

If DISEL=01 the FIFO stored samples will be read through DMA transactions. Then if there is at least one enabled channel and all FIFOs of all enabled channels reach their watermark the output interface makes a request for DMA transaction. When the PDMIEN is set and the filters start to operate, there is a period to wait the filter results to stabilize and no filter results are stored on the FIFOs. Therefore the first DMA request takes longer to occur than the following ones.

The CHnF flags in the STAT register are cleared when a DMA transaction is finished.

When the MICFIL is in Low Power mode and the watermark level is surpassed an asynchronous DMA request is delivered to the system, then the system wakes up the CPU clock, returning to Normal mode, to read FIFOs data.

13.8.5.6.3 Interrupt Requests

If DISEL=10 then an interrupt request is used to indicate that filtering results are stored in the FIFOs to be read by CPU. Also in this case the data can be read in the DATACHn registers and the flag CHnF of the STAT register are asserted for the enabled channels when the CHn FIFO surpasses the watermark level.

When the module is in Low Power mode the CPU clock is disabled, but the MICFIL clock remains enabled. In this case, an asynchronous interrupt is delivered to the system, it wakes up the CPU clock, returning to Normal mode. The system could read the FIFOs data and after should clear the CHnF flags to get a new interrupt request.

An error interrupt request can be generated also when an exceptional condition happens, such as a overflow or underflow in any channel output, an overflow or underflow of any FIFO, or the MICFIL clock rate is not the minimum value required to the MICFIL working (see Minimum Required CLKDIV bitfield value). This one is enabled by the

ERREN bit and the type of error is signalized by its respective status flag: OUTOVFn and OUTUNFn for channel outputs errors, FIFOOVF and FIFOUND flags for FIFO errors, and LOWFREQF for MICFIL clock rate.

13.8.5.7 Low Power Mode

In Low Power mode the MICFIL is able to filter the PDM microphone data and perform voice detection such as in Normal mode and can generate a wake up event through asynchronous DMA/IRQ requests depending on CHENn, VADEN and PDMIEN values.

In case the CPU is on a STOP/VLPS entry , PDMIEN is asserted and either CHENn or VADEN are asserted, then the CPU clock is gated.

In case the CPU is on a VLLS/LLS entry , VADEN is asserted and PDMIEN is asserted, then the CPU clock is gated.

In case the CPU is on a VLLS/LLS entry and either PDMIEN or VADEN are cleared, then the mode will be acknowledged when the last sample is processed.

The DMA and IRQ requests can be generated asynchronously to wake up the CPU. Then the system wakes up the CPU clock, and get back the MICFIL to Normal mode to read FIFOs data if required.

NOTE

The asynchronous DMA or interrupt requests are generated only in this mode.

13.8.5.8 Debug Mode

In case DBGE=0, if a debug request is received or DBG is asserted while the MICFIL is running with at least a channel enabled, the PDM generated clock and the MICFIL will be stopped after finish to process remaining data. Otherwise, in case DBGE=1, the module will continue processing, it will not stop.

The PDM Interface cannot enter Debug mode once in Disable/Low Leakage or Low Power mode.

The Debug mode request affects all channels in the MICFIL. Access to output buffers remain operational, as well as their related flags.

NOTE

Once a debug request is issued, it can not be aborted.

13.8.5.9 Disable/Low Leakage mode

When Disable/Low Leakage (DLL) mode is requested while the MICFIL is running with at least a channel enabled, the PDM generated clock and the MICFIL will be stopped after finish to process remaining data, then CPU clock and MICFIL clock are gated. In case this mode is requested via SoC Doze when DOZEN=1 the MICFIL clock is gated but the CPU clock remains running.

After the MICFIL clock is stopped, the BSY_FIL bit is self-cleared and the mode is acknowledged .

Writes only to CTRL_1 and CTRL_2 registers are allowed with the exception of writes to the DBG and SRES bits, which are ignored, but read is still available for these bits.

NOTE

It can take up to 1020 MICFIL clock cycles from the request to the stop of the processing.

13.8.5.10 Soft-reset

The soft-reset is used to clear all the data in the filters. It is requested by writing 1 to the SRES bit. It reset the following blocks and/or registers:

- All internal buffers in Decimation Filters and Voice Activity Detectors.
- All FIFOs.
- All CHnF flags and LOWFREQF flag on the STAT register, and the FIFO_STAT register.
- Time Generator.

13.8.6 Procedures

Following are some simple initialization steps to be done before using the MICFIL block.

13.8.6.1 Initialization Procedure without HWVAD

The sequence of steps for the block initialization without enabling voice activity detector, i.e. using decimation filters only, is as follows:

1. Program the bit-fields as desired for your application (CLKDIV, CHnEN, FIFOWMK, DISEL, ERREN etc.). For more details see Application Clock and CLKDIV calculation example.
2. Start the overall module asserting the PDMIEN bit.
3. The module is ready to receive data from the input ports of the enabled channels.

13.8.6.2 Initialization Procedure with HWVAD

In this section is described the initialization procedures to initialize MICFIL with the voice activity detector.

The voice activity detector can work in two modes: Energy-based mode or Envelope-based mode. Optionally, a Zero-Crossing Detector can be enabled to improve the voice detection.

13.8.6.2.1 HWVAD in Energy-based mode

The sequence of steps to initialize the voice activity detector in Energy-based mode is as follows:

1. Program the control bitfields as desired for your application (CLKDIV, CHnEN, FIFOWMK, DISEL, ERREN etc.). For more details see Application Clock and CLKDIV calculation example.
2. Configure general HWVAD parameters:
   a. CIC oversampling rate (VADCICOSR bitfield).
   b. Configure the voice source channel (VADCHSEL bitfield).
   c. Configure the internal initialization timer (VADINITT bitfield) if required. More details in Initialization Time.
   d. Assert VADEN bitfield.
3. Configure input, noise and signal gains according to the environmental noise conditions:
   a. Configure the input gain (VADINPGAIN bitfield).
   b. Configure the signal gain (VADSGAIN bitfield).
   c. Configure the noise gain (VADNGAIN bitfield).
4. Enable the high-pass filter if required (VADHPF bitfield).
5. Configure the VADNFILADJ bitfield according to environmental noise conditions (VADNFILADJ = 16 is recommended).
6. Put HWVAD in energy-based mode (default values):
   a. Keep the VADFRENDIS bitfield cleared.
   b. Keep the VADPREFEN bitfield cleared.
   c. Keep the VADSFILEN bitfield cleared.

d. Keep the VADSMAXEN bitfield cleared.
e. Keep the VADNFILAUTO bitfield asserted.
f. Keep the VADNMINEN bitfield cleared.
g. Keep the VADNDECEN bitfield cleared.
h. Keep the VADNOREN bitfield cleared.

7. Initialize the Zero-Crossing Detector (Zero-Crossing Detector Initialization) if required.
8. Enable interrupts if required (VADIE and VADERIE bitfields).
9. Start the overall module asserting the PDMIEN bit.
10. The module is ready to receive data from the input ports of the enabled channels and to trigger interrupts when voice is detected.

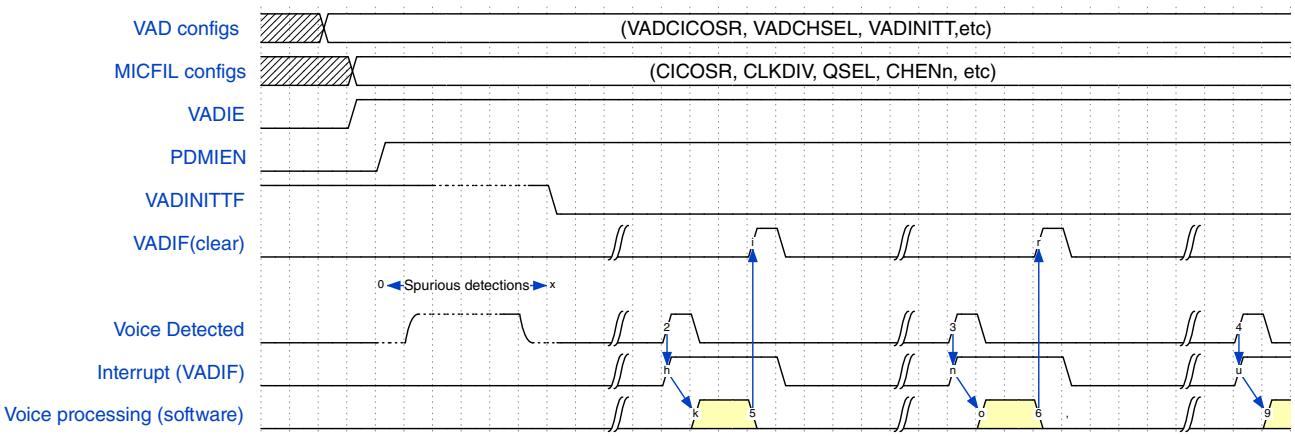

Figure 13-102. Energy-based initialization sequence

13.8.6.2.2 HWVAD in Envelope-based mode

The sequence of steps to initialize MICIL with the voice activity detector in Envelope-based mode is as follows:

1. Program the control bitfields as desired for your application (CLKDIV, CHnEN, FIFOWMK, DISEL, ERREN etc.). For more details see Application Clock and CLKDIV calculation example.
2. Configure general HWVAD parameters:
   a. CIC oversampling rate (VADCICOSR bitfield).
   b. Configure the voice source channel (VADCHSEL bitfield).
   c. Configure the internal initialization timer (VADINITT bitfield) if required. More details in Initialization Time.
   d. Assert VADEN bitfield.
3. Configure input, noise and signal gains according the environment noise conditions:
   a. Configure the input gain (VADINPGAIN bitfield).
   b. Configure the signal gain (VADSGAIN bitfield).
   c. Configure the noise gain (VADNGAIN bitfield).

4. Enable the high-pass filter if required (VADHPF bitfield).
5. Put HWVAD in envelope-based mode:
   a. Keep VADNFILADJ bitfield cleared.
   b. Assert the VADFRENDIS bitfield.
   c. Assert the VADPREFEN bitfield.
   d. Assert the VADSFILEN bitfield.
   e. Assert the VADSMAXEN bitfield.
   f. Clear the VADNFILAUTO bitfield.
   g. Assert the VADNMINEN bitfield.
   h. Assert the VADNDECEN bitfield.
   i. Assert the VADNOREN bitfield.
6. Initialize the Zero-Crossing Detector (Zero-Crossing Detector Initialization) if required.
7. Start the overall module asserting the PDMIEN bit.
8. Wait for VADINITF to be cleared.
9. Write VADST10 bitfield three times.
10. Enable interrupts if required (VADIE and VADERIE bitfields).
11. The module is ready to receive data from the input ports of the enabled channels and to trigger interrupts when voice is detected.

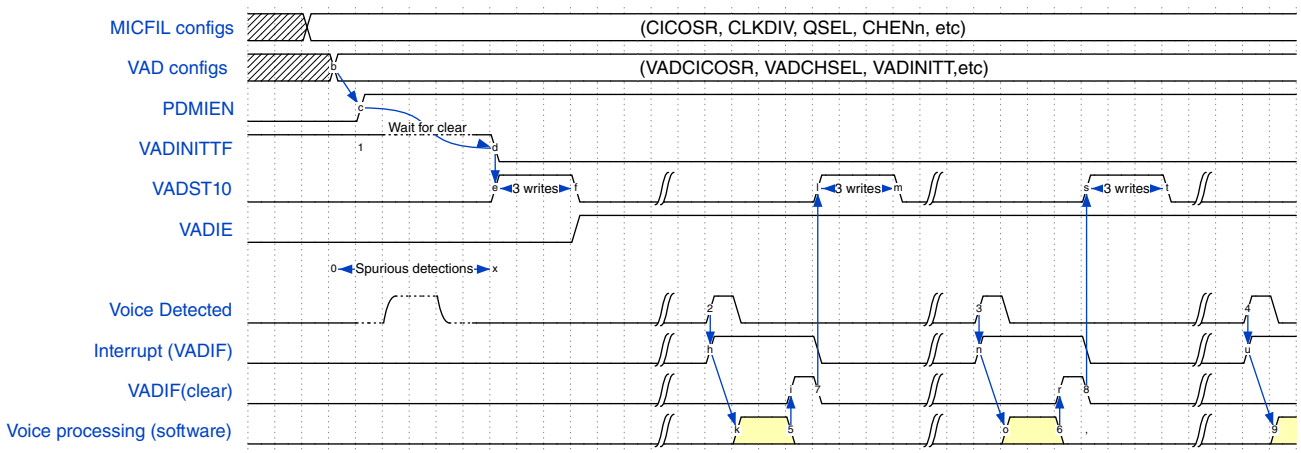

Figure 13-103. Envelope-based initialization sequence

13.8.6.2.3 Zero-Crossing Detector Initialization

The sequence of steps to initialize the Zero-Crossing Detector in Automatic mode is as follows:

1. Configure VADZCDADJ bitfield.
2. Configure an initial threshold in VADZCDTH according to the environmental noise conditions if required.
3. Configure VADZCDAND bitfield.

4. Keep VADZCDAUTO bitfield asserted.
5. Assert VADZCDEN.

The sequence of steps to initialize the Zero-Crossing Detector in Manual mode is as follows:

1. Configure a threshold in VADZCDTH according to the environmental noise conditions if required.
2. Configure VADZCDAND bitfield.
3. Clear VADZCDAUTO bitfield.
4. Assert VADZCDEN.

13.8.6.3 Reconfiguration Procedure

The sequence of steps for the block reconfiguration is as follows:

1. Deassert PDMIEN bit.
2. Wait to BSY_FIL to be cleared.
3. Run a soft-reset cycle.
4. Run a initilialization procedure as described in Initialization Procedure without HWVAD or Initialization Procedure with HWVAD.

13.8.6.4 Application Clock and CLKDIV calculation example

Assume that it is required to work at High Quality mode, CIC decimation by 16 (OSR = 16), 4 channels enabled (EC=4) and an output rate equal to 48KHz:

1. Check the PDM rate for High Quality mode in Table 13-57. PDM rate = 48KHz x 8 x 16 = 6.144MHz. (It is assumed that the PDM microphone part can work at this frequency; if not, quality mode need to be changed or CIC decimation need to be decreased.)
2. Check the K factor value for High Quality mode in Table 13-59. K factor is 1/2.
3. Calculate minimum CLKDIV value (see Equation 3 on page 4243): floor(K x CLKDIV) >= K x (10 + 125EC)/(8 x OSR) then floor(K x CLKDIV) >= 1.9922, Finally, CLKDIV >= 4.
4. Calculate minimum MICFIL application clock (see Equation 1 on page 4237). MICFIL clock rate = 8 x OSR x CLKDIV x (Output rate). From step 3: MICFIL clock rate >= 8 x16 x 4 x 48KHz. Finally, MICFIL clock rate >= 24.58MHz.

13.9 Synchronous Audio Interface (SAI)

13.9.1 Introduction

The I^2S (or I2S) module provides a synchronous audio interface (SAI) that supports full-duplex serial interfaces with frame synchronization such as I^2S, AC97, TDM, and codec/DSP interfaces.

13.9.1.1 Features

Note that some of the features are not supported across all SAI instances; see the chip-specific information in the first section of this chapter.

- Transmitter with independent bit clock and frame sync supporting 2 data lines
- Receiver with independent bit clock and frame sync supporting 2 data lines
- Each data line can support a maximum Frame size of 32 words
- Word size of between 8-bits and 32-bits
- Word size configured separately for first word and remaining words in frame
- Asynchronous 128 x 32-bit FIFO for each transmit and receive data line
- Supports graceful restart after FIFO error
- Supports automatic restart after FIFO error without software intervention
- Supports packing of 8-bit and 16-bit data into each 32-bit FIFO word
- Supports combining multiple data line FIFOs into single data line FIFO
- Independent 32-bit timestamp counters and bit counters for monitoring transmit and receive progress

13.9.1.2 Block diagram

The following block diagram also shows the module clocks.

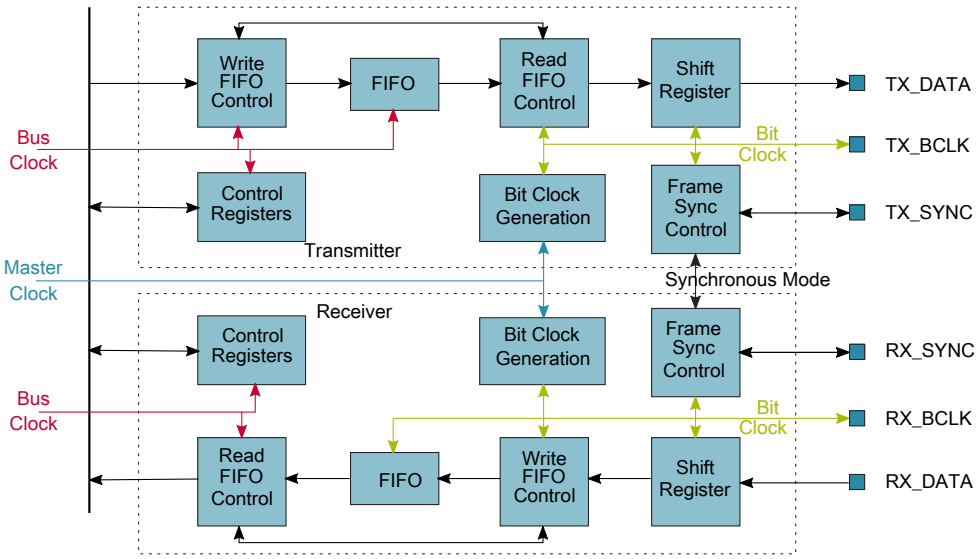

Figure 13-104. I²S/SAI block diagram

13.9.1.3 Modes of operation

Module power modes include Run mode, and Debug mode.

13.9.1.3.1 Run mode

In Run mode, the SAI transmitter and receiver operate normally.

13.9.1.3.2 Debug mode

In Debug mode, the SAI transmitter and/or receiver can continue operating provided the Debug Enable bit is set. When TCSR[DBGE] or RCSR[DBGE] bit is clear and Debug mode is entered, the SAI is disabled after completing the current transmit or receive frame. The transmitter and receiver bit clocks are not affected by Debug mode.

13.9.2 External signals

Name	Function	I/O
TX_BCLK	Transmit Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	I/O

Table continues on the next page...

Name	Function	I/O
TX_SYNC	Transmit Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	I/O
TX_DATA[1:0]	Transmit Data. The transmit data is generated synchronously by the bit clock and is tristated whenever not transmitting a word.	O
RX_BCLK	Receive Bit Clock. The bit clock is an input when externally generated and an output when internally generated.	I/O
RX_SYNC	Receive Frame Sync. The frame sync is an input sampled synchronously by the bit clock when externally generated and an output generated synchronously by the bit clock when internally generated.	I/O
RX_DATA[1:0]	Receive Data. The receive data is sampled synchronously by the bit clock.	I
MCLK	Audio Master Clock. The audio master clock is an input when externally generated and an output when internally generated.	I/O

13.9.3 Functional description

This section provides a complete functional description of the block.

13.9.3.1 SAI clocking

The SAI clocks include:

- The audio master clock
- The bit clock
- The bus clock

13.9.3.1.1 Audio master clock

The audio master clock is used to generate the bit clock when the receiver or transmitter is configured for an internally generated bit clock. The transmitter and receiver can independently select between the bus clock and up to three audio master clocks to generate the bit clock.

The SAI peripheral controls the pin direction and post-divider of an audio master clock. The post-divide can be used to divide down the clock output on the MCLK signal pin, without affecting the audio master clock used by the transmitter and receiver.

The audio master clock generation and selection is chip-specific. Refer to chip-specific clocking information about how the audio master clocks are generated.

13.9.3.1.2 Bit clock

The SAI transmitter and receiver support asynchronous free-running bit clocks that can be generated internally from an audio master clock or supplied externally. There is also the option for synchronous bit clock and frame sync operation between the receiver and transmitter or between multiple SAI peripherals.

- If both transmitter and receiver are configured for asynchronous operation, then the transmitter and receiver will each use *their own* bit clock and frame sync.
- If the *transmitter* is configured for asynchronous mode and the receiver is configured for synchronous mode, then both transmitter and receiver will use the *transmitter* bit clock and frame sync.
- If the *receiver* is configured for asynchronous mode and the transmitter is configured for synchronous mode, then both transmitter and receiver will use the *receiver* bit clock and frame sync.

Note that the software configures synchronous or asynchronous mode, and that choice selects the bit clock/frame sync used.

Externally generated bit clocks must be:

- Enabled before the SAI transmitter or receiver is enabled
- Disabled after the SAI transmitter or receiver is disabled and completes its current frames

If the SAI transmitter or receiver is using an externally generated bit clock in asynchronous mode and that bit clock is generated by an SAI that is disabled in stop mode, then the transmitter or receiver should be disabled by software before entering stop mode. This issue does not apply when the transmitter or receiver is in a synchronous mode because all synchronous SAIs are enabled and disabled simultaneously.

13.9.3.1.3 Bus clock

The bus clock is used by the control and configuration registers and to generate synchronous interrupts and DMA requests.

NOTE

Although there is no specific minimum bus clock frequency specified, the bus clock frequency must be fast enough (relative

to the bit clock frequency) to ensure that the FIFOs can be serviced, without generating either a transmitter FIFO underrun or receiver FIFO overflow condition.

13.9.3.2 SAI resets

The SAI is asynchronously reset on system reset. The SAI has a software reset and a FIFO reset.

13.9.3.2.1 Software reset

The SAI transmitter includes a software reset that resets all transmitter internal logic, including the bit clock generation, status flags, and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

The SAI receiver includes a software reset that resets all receiver internal logic, including the bit clock generation, status flags and FIFO pointers. It does not reset the configuration registers. The software reset remains asserted until cleared by software.

13.9.3.2.2 FIFO reset

The SAI transmitter includes a FIFO reset that synchronizes the FIFO write pointer to the same value as the FIFO read pointer. This empties the FIFO contents and is to be used after TCSR[FEF] is set, and before the FIFO is re-initialized and TCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI transmitter can also reset the FIFO of individual data channels by setting the appropriate TCR3[CFR] bit. This should only be done when the corresponding TCR3[TCE] bit is clear.

The SAI receiver includes a FIFO reset that synchronizes the FIFO read pointer to the same value as the FIFO write pointer. This empties the FIFO contents and is to be used after the RCSR[FEF] is set and any remaining data has been read from the FIFO, and before the RCSR[FEF] is cleared. The FIFO reset is asserted for one cycle only.

The SAI receiver can also reset the FIFO of individual data channels by setting the appropriate RCR3[CFR] bit. This should only be done when the corresponding RCR3[RCE] bit is clear.

13.9.3.3 Synchronous modes

The SAI transmitter and receiver can operate synchronously to each other.

13.9.3.3.1 Synchronous mode

The SAI transmitter and receiver can be configured to operate with synchronous bit clock and frame sync.

If the transmitter bit clock and frame sync are to be used by both the transmitter and receiver:

- The transmitter must be configured for asynchronous operation and the receiver for synchronous operation.
- In synchronous mode, the receiver is enabled only when both the transmitter and receiver are enabled.
- It is recommended that the transmitter is the last enabled and the first disabled.

If the receiver bit clock and frame sync are to be used by both the transmitter and receiver:

- The receiver must be configured for asynchronous operation and the transmitter for synchronous operation.
- In synchronous mode, the transmitter is enabled only when both the receiver and transmitter are both enabled.
- It is recommended that the receiver is the last enabled and the first disabled.

When operating in synchronous mode, only the bit clock, frame sync, and transmitter/receiver enable are shared. The transmitter and receiver otherwise operate independently, although configuration registers must be configured consistently across both the transmitter and receiver.

13.9.3.4 Frame sync configuration

When enabled, the SAI continuously transmits and/or receives frames of data. Each frame consists of a fixed number of words and each word consists of a fixed number of bits. Within each frame, any given word can be masked causing the receiver to ignore that word and the transmitter to tri-state for the duration of that word.

The frame sync signal is used to indicate the start of each frame. A valid frame sync requires a rising edge (if active high) or falling edge (if active low) to be detected and the transmitter or receiver cannot be busy with a previous frame. A valid frame sync is also ignored (slave mode) or not generated (master mode) for the first four bit clock cycles after enabling the transmitter or receiver.

The transmitter and receiver frame sync can be configured independently with any of the following options:

- Externally generated or internally generated
- Active high or active low
- Assert with the first bit in frame or asserts one bit early
- Assert for a duration between 1 bit clock and the first word length
- Frame length from 1 to 32 words per frame
- Word length to support 8 to 32 bits per word
    - First word length and remaining word lengths can be configured separately
- Words can be configured to transmit/receive MSB first or LSB first

These configuration options cannot be changed after the SAI transmitter or receiver is enabled.

13.9.3.5 Data FIFO

Each transmit and receive channel includes a FIFO of size 128 x 32-bit. The FIFO data is accessed using the SAI Transmit/Receive Data Registers.

13.9.3.5.1 Data alignment

Data in the FIFO can be aligned anywhere within the 32-bit wide register through the use of the First Bit Shifted configuration field, which selects the bit index (between 31 and 0) of the first bit shifted.

Examples of supported data alignment and the required First Bit Shifted configuration are illustrated in Figure 13-105 for LSB First configurations and Figure 13-106 for MSB First configurations.

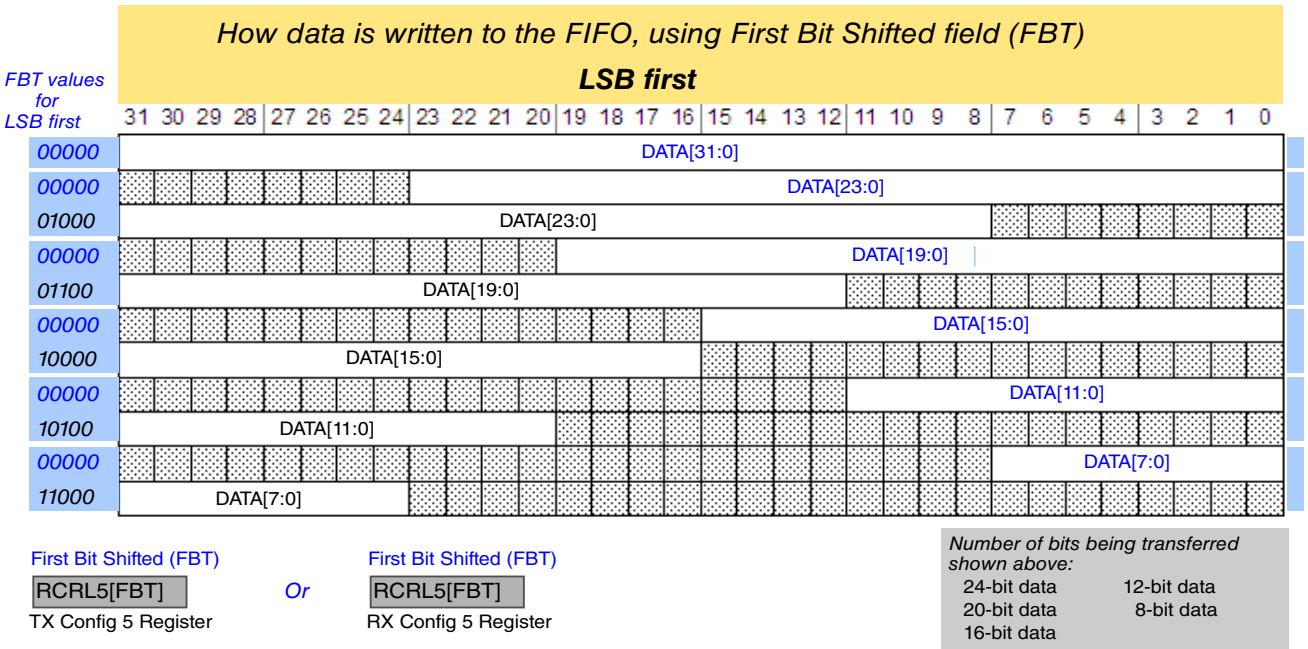

Figure 13-105. SAI first bit shifted, LSB first

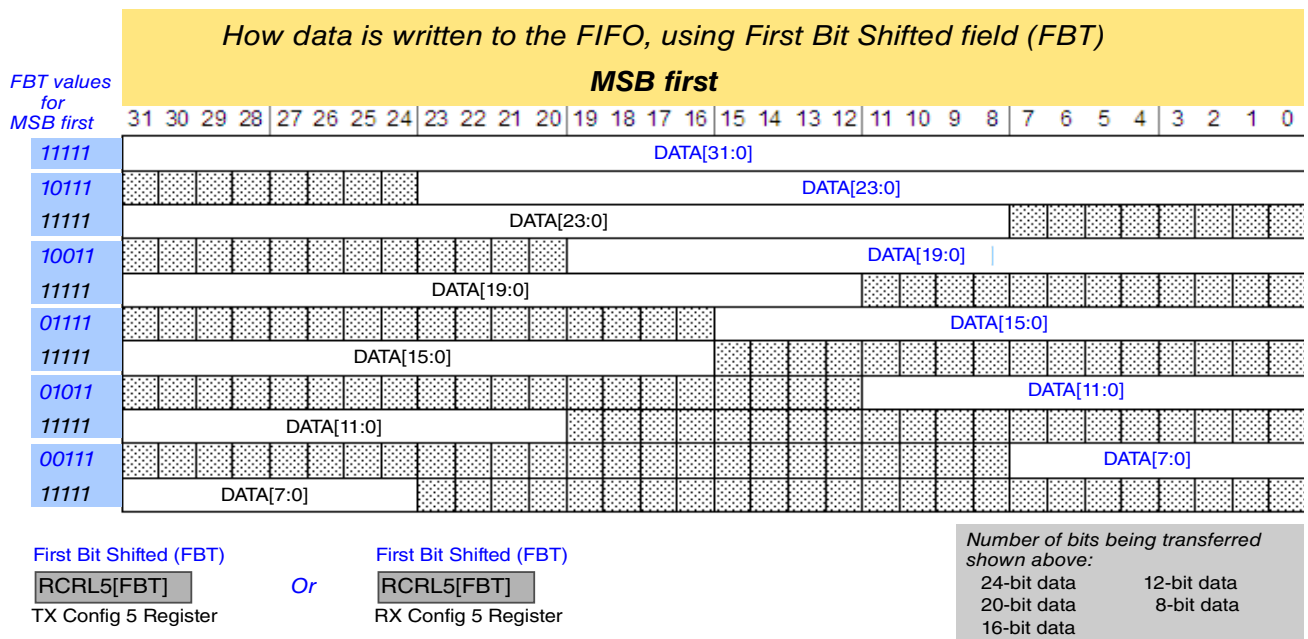

Figure 13-106. SAI first bit shifted, MSB first

13.9.3.5.2 FIFO pointers

When writing to a Transmit Data Register (TDR*n*), the Write FIFO Pointer (WFP) of the corresponding Transmit FIFO Register (TFR*n*) increments after each valid write. The SAI supports 8-bit, 16-bit and 32-bit writes to the Transmit Data Register and the FIFO pointer will increment after each individual write. Note that 8-bit writes should only be used when transmitting up to 8-bit data; 16-bit writes should only be used when transmitting up to 16-bit data.

- If the Transmit FIFO is full, then writes to a Transmit Data Register are ignored.
- If the Transmit FIFO is empty, then to avoid a FIFO underrun, the Transmit Data Register must be written at least 3 bit clocks before the start of the next unmasked word. Before enabling the transmitter, the Transmit FIFO should be initialized with data (since after the transmitter is enabled, the transmitter will start a new frame, and if no data is in the FIFO, then the transmitter will immediately give an error).

When reading a Receive Data Register (RDR*n*), the Read FIFO Pointer (RFP) of the corresponding Receive FIFO Register (RFR*n*) increments after each valid read. The SAI supports 8-bit, 16-bit and 32-bit reads from the RDR and the FIFO pointer will increment after each individual read. Note that 8-bit reads should only be used when receiving up to 8-bit data; 16-bit reads should only be used when receiving up to 16-bit data.

- If the Receive FIFO is empty, then reads from a Receive Data Register are ignored.
- If the Receive FIFO is full, then to avoid a FIFO overrun, the Receive Data Register must be read at least 3 bit clocks before the end of an unmasked word.

13.9.3.5.3 FIFO packing

FIFO packing supports storing multiple 8-bit or 16-bit data words in one 32-bit FIFO word for the transmitter and/or receiver. While this can be emulated by adjusting the number of bits per word and number of words per frame (for example, one 32-bit word per frame versus two 16-bit words per frame), FIFO packing does not require even multiples of words per frame and fully supports word masking. When FIFO packing is enabled, the FIFO pointers only increment when the full 32-bit FIFO word has been written (transmit) or read (receive) by software, supporting scenarios where different words within each frame are loaded/stored in different areas of memory.

When 16-bit FIFO packing is enabled for transmit, the transmit shift register is loaded at the start of each frame and after every second unmasked transmit word. The first word transmitted is taken from 16-bit word at byte offset $0 (first bit is selected by TCFG5[FBT] must be configured within this 16-bit word) and the second word transmitted is taken from the 16-bit word at byte offset $2 (first bit is selected by TCSR5[FBT][3:0]). The transmitter will transmit logic zero until the start of the next word once the 16-bit word has been transmitted.

When 16-bit FIFO packing is enabled for receive, the receive shift register is stored after every second unmasked received word, and at the end of each frame if there is an odd number of unmasked received words in each frame. The first word received is stored in the 16-bit word at byte offset $0 (first bit is selected by RCFG5[FBT] and must be configured within this 16-bit word) and the second word received is stored in the 16-bit word at byte offset $2 (first bit is selected by RCSR5[FBT][3:0]). The receiver will ignore received data until the start of the next word once the 16-bit word has been received.

The 8-bit FIFO packing is similar to 16-bit packing except four words are loaded or stored into each 32-bit FIFO word. The first word is loaded/stored in byte offset $0, second word in byte offset $1, third word in byte offset $2 and fourth word in byte offset $3. The TCFG5[FBT] and/or RCFG5[FBT] must be configured within byte offset $0.

13.9.3.5.4 FIFO Combine

FIFO combining mode allows the separate FIFOs for multiple data channels to be used as a single FIFO for either software accesses or a single data channel or both. Note that the enabled data channels must be contiguous and data channel 0 must be enabled when FIFO Combine mode is enabled.

Combining FIFOs for software access (writing transmit FIFO registers, reading receive FIFO registers) allows a DMA controller or software to read or write multiple FIFOs without incrementing the address that is accessed. Once enabled, the first software access to a FIFO register will access the first enabled channel FIFO, while the second access to a FIFO register will access the second enabled channel FIFO. This continues until software accesses the last enabled channel FIFO and the pointer resets back to the first enabled channel FIFO. To reset the pointer manually, software can reset the FIFOs or disable the FIFO combining on software accesses.

Combining FIFOs for transmit data channels allows one data channel to use the FIFOs of all enabled channel FIFOs, with identical data output on each enabled data channel. The transmit shift registers for all enabled data channels are loaded at the start of each frame and every N unmasked words (where N is the number of enabled data channels). The first word transmitted is loaded from the first enabled channel FIFO, while the second word transmitted is loaded from the second enabled channel FIFO, and so on until the end of the frame. Since the first word in each frame is always loaded from the first enabled data channel, it is recommended that the number of unmasked words in each frame is evenly divisible by the number of enabled data channels.

Combining FIFOs for receive data channels allows one data channel to use the FIFOs of all enabled channel FIFOs, with received data from channel 0 stored into each enabled data channel. The receive shift register for all enabled data channels are stored after every

N unmasked words (where N is the number of enabled data channels). The first word received is stored to the first enabled channel FIFO, while the second word received is stored to the second enabled channel FIFO, and so on until the end of the frame. Since the first word in each frame is always stored the first enabled data channel, it is recommended that the number of unmasked words in each frame is evenly divisible by the number of enabled data channels.

Note that combining FIFOs for data channels will load or store each channel FIFO at the same time. This means that FIFO error conditions are only checked every N words (where N is the number of enabled data channels) and that the FIFO warning and request flags will assert if any of the enabled data channel meets the warning flag or request flag conditions.

13.9.3.6 Word mask register

The SAI transmitter and receiver each contain a word mask register, namely TMR and RMR, that can be used to mask any word in the frame. Because the word mask register is double buffered, software can update it before the end of each frame to mask a particular word in the next frame.

The TMR causes the Transmit Data pin to be tri-stated for the length of each selected word and the transmit FIFO is not read for masked words.

The RMR causes the received data for each selected word to be discarded and not written to the receive FIFO.

13.9.3.7 Timestamp Counter

The transmitter and receiver implement separate timestamp counters and bit counters. The bit counter increments at the end of each bit in a frame whenever the transmitter or receiver is enabled. The bit counter continues to increment if a word is masked or a FIFO underrun or overrun condition occurs, but does not increment if an external frame sync is configured and no frame sync is detected. The bit counter can be reset by software, due to synchronization delays it can take up to 3 bit clock cycles for the bit clock counter to continue incrementing after a bit counter reset.

The timestamp counter increments on the bus interface clock whenever it is enabled, but can be configured to synchronize to the bit counter by waiting for the bit counter to increment first (if configured, this synchronization is performed whenever the time counter is reset). The current value of the timestamp counter is latched whenever the bit counter increments. Reading the bit counter register will cause the latched timestamp

value to be saved in the bit counter timestamp register. The timestamp counter can be reset by software, this also resets the latched timestamp value and the bit counter timestamp register.

The timestamp counter and bit counter can be used by software to track the progress of the transmitter and receiver. It can also be used to calculate the relative frequency of the bit clock against the bus interface clock.

13.9.3.8 Interrupts and DMA requests

The SAI transmitter and receiver generate separate interrupts and separate DMA requests, but support the same status flags.

13.9.3.8.1 FIFO request flag

The FIFO request flag is set based on the number of entries in the FIFO and the FIFO watermark configuration.

The transmit FIFO request flag is set when the number of entries in any of the enabled transmit FIFOs is less than or equal to the transmit FIFO watermark configuration and is cleared when the number of entries in each enabled transmit FIFO is greater than the transmit FIFO watermark configuration.

The receive FIFO request flag is set when the number of entries in any of the enabled receive FIFOs is greater than the receive FIFO watermark configuration and is cleared when the number of entries in each enabled receive FIFO is less than or equal to the receive FIFO watermark configuration.

The FIFO request flag can generate an interrupt or a DMA request.

13.9.3.8.2 FIFO warning flag

The FIFO warning flag is set based on the number of entries in the FIFO.

The transmit warning flag is set when the number of entries in any of the enabled transmit FIFOs is empty and is cleared when the number of entries in each enabled transmit FIFO is not empty.

The receive warning flag is set when the number of entries in any of the enabled receive FIFOs is full and is cleared when the number of entries in each enabled receive FIFO is not full.

The FIFO warning flag can generate an Interrupt or a DMA request.

13.9.3.8.3 FIFO error flag

The transmit FIFO error flag is set when the any of the enabled transmit FIFOs underflow. After it is set, all enabled transmit channels will transmit zero data before TCSR[FEF] is cleared.

When TCR4[FCONT] is set, the FIFO will continue transmitting data following an underflow without software intervention. To ensure that data is transmitted in the correct order, the transmitter will continue from the same word number in the frame that caused the FIFO to underflow, but only after new data has been written to the transmit FIFO. Software should still clear the TCSR[FEF] flag, but without reinitializing the transmit FIFOs.

RCSR[FEF] is set when the any of the enabled receive FIFOs overflow. After it is set, all enabled receive channels discard received data until RCSR[FEF] is cleared and the next next receive frame starts. All enabled receive FIFOs should be emptied before RCSR[FEF] is cleared.

When RCR4[FCONT] is set, the FIFO will continue receiving data following an overflow without software intervention. To ensure that data is received in the correct order, the receiver will continue from the same word number in the frame that caused the FIFO to overflow, but only after data has been read from the receive FIFO. Software should still clear the RCSR[FEF] flag, but without emptying the receive FIFOs.

The FIFO error flag can generate only an interrupt.

13.9.3.8.4 Sync error flag

The sync error flag, TCSR[SEF] or RCSR[SEF], is set when configured for an externally generated frame sync and the external frame sync asserts when the transmitter or receiver is busy with the previous frame. The external frame sync assertion is ignored and the sync error flag is set. When the sync error flag is set, the transmitter or receiver continues checking for frame sync assertion when idle or at the end of each frame.

The sync error flag can generate an interrupt only.

13.9.3.8.5 Word start flag

The word start flag is set at the start of the second bit clock for the selected word, as configured by the Word Flag register field.

The word start flag can generate an interrupt only.

13.9.4 Memory map and register definition

A read or write access to an address from offset 0x108 and above will result in a bus error.

13.9.4.1 I2S register descriptions

13.9.4.1.1 I2S memory map

Field	Function
31-20	Reserved

Table continues on the next page...

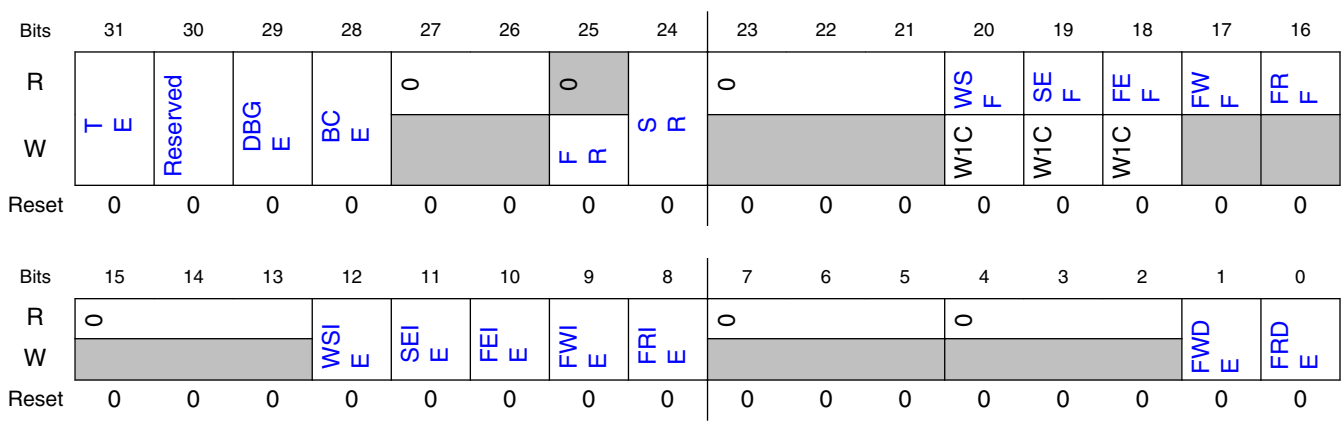
Field	Function
—	
19-16 FRAME	Frame Size The maximum number of slots per frame is 2^FRAME.
15-12 —	Reserved
11-8 FIFO	FIFO Size The number of words in each FIFO is 2^FIFO.
7-4 —	Reserved
3-0 DATALINE	Number of Datalines The number of datalines implemented.

13.9.4.1.4 SAI Transmit Control Register (TCSR)

13.9.4.1.4.1 Offset

Register	Offset
TCSR	8h

13.9.4.1.4.2 Diagram



13.9.4.1.4.3 Fields

Field	Function
31 TE	Transmitter Enable

Table continues on the next page...

Field	Function
	Enables/disables the transmitter. When software clears this field, the transmitter remains enabled, and this bit remains set, until the end of the current frame. 0b - Transmitter is disabled. 1b - Transmitter is enabled, or transmitter has been disabled and has not yet reached end of frame.
30 —	Reserved Software should only write zero to this reserved bit.
29 DBGE	Debug Enable Enables/disables transmitter operation in Debug mode. The transmit bit clock is not affected by debug mode. 0b - Transmitter is disabled in Debug mode, after completing the current frame. 1b - Transmitter is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the transmit bit clock, separately from the TE. This field is automatically set whenever TE is set. When software clears this field, the transmit bit clock remains enabled, and this bit remains set, until the end of the current frame. 0b - Transmit bit clock is disabled. 1b - Transmit bit clock is enabled.
27-26 —	Reserved
25 FR	FIFO Reset Empties the FIFO, and sets the FIFO read and write pointers to the same value, which may or may not be zero. Reading this field will always return zero. FIFO pointers should only be reset when the transmitter is disabled or the FIFO error flag is set. 0b - No effect. 1b - FIFO reset.
24 SR	Software Reset When set, resets the internal transmitter logic including the FIFO read and write pointers. Software-visible registers are not affected, except for the status registers. 0b - No effect. 1b - Software reset.
23-21 —	Reserved
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag. 0b - Start of word not detected. 1b - Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0b - Sync error not detected. 1b - Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled transmit FIFO has underrun. Write a logic 1 to this field to clear this flag. 0b - Transmit underrun not detected. 1b - Transmit underrun detected.
17	FIFO Warning Flag

Table continues on the next page...

Field	Function
FWF	Indicates that an enabled transmit FIFO is empty. 0b - No enabled transmit FIFO is empty. 1b - Enabled transmit FIFO is empty.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled transmit channel FIFO is less than or equal to the transmit FIFO watermark. 0b - Transmit FIFO watermark has not been reached. 1b - Transmit FIFO watermark has been reached.
15-13 —	Reserved
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
7-5 —	Reserved
4-2 —	Reserved
1 FWDE	FIFO Warning DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.

13.9.4.1.5.3 Fields

Field	Function
31-7 —	Reserved
6-0 TFW	Transmit FIFO Watermark Configures the watermark level for all enabled transmit channels.

13.9.4.1.6 SAI Transmit Configuration 2 Register (TCR2)

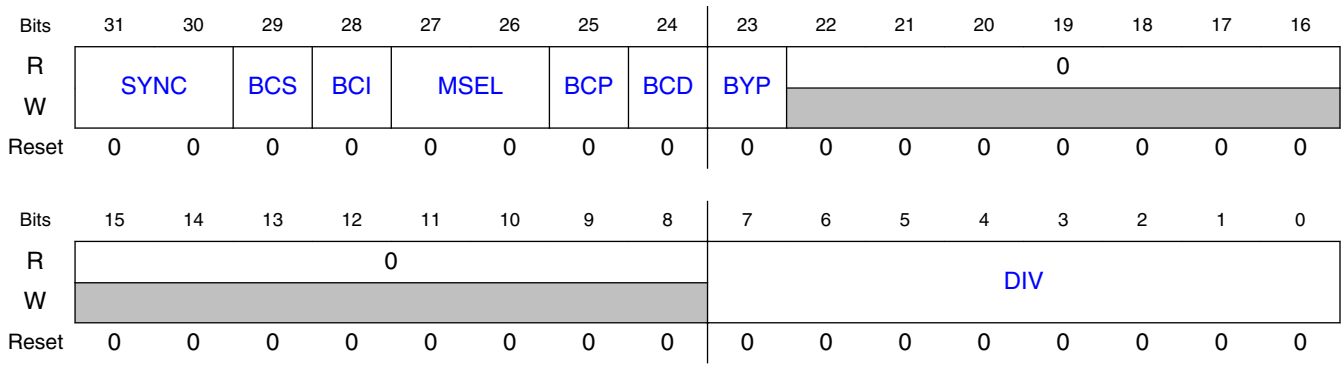
13.9.4.1.6.1 Offset

Register	Offset
TCR2	10h

13.9.4.1.6.2 Function

This register must not be altered when TCSR[TE] is set.

13.9.4.1.6.3 Diagram



13.9.4.1.6.4 Fields

Field	Function
31-30 SYNC	Synchronous Mode Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the receiver must be configured for asynchronous operation. 00b - Asynchronous mode. 01b - Synchronous with receiver. 10b - Reserved. 11b - Reserved.
29 BCS	Bit Clock Swap This field swaps the bit clock used by the transmitter. When the transmitter is configured in asynchronous mode and this bit is set, the transmitter is clocked by the receiver bit clock (RX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the transmitter continues to use the transmit frame sync (TX_SYNC). When the transmitter is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the transmitter bit clock (TX_BCLK) but use the receiver frame sync (RX_SYNC). 0b - Use the normal bit clock source. 1b - Swap the bit clock source.
28 BCI	Bit Clock Input When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the transmitter is delayed by the pad output delay (the transmitter is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time. The slave mode timing from the datasheet should be used for the transmitter when this bit is set. In synchronous mode, this bit allows the transmitter to use the slave mode timing from the datasheet, while the receiver uses the master mode timing. This field has no effect when configured for an externally generated bit clock . 0b - No effect. 1b - Internal logic is clocked as if bit clock was externally generated.
27-26 MSEL	MCLK Select

Table continues on the next page...

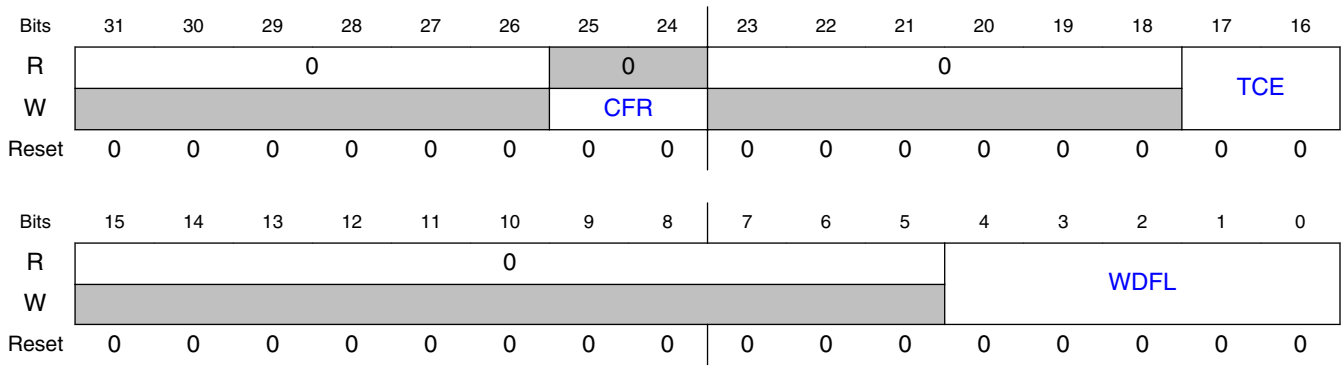
Field	Function
	Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock. **NOTE:** Depending on the device, some Master Clock options might not be available. See the chip-specific information for the meaning of each option. 00b - Bus Clock selected. 01b - Master Clock (MCLK) 1 option selected. 10b - Master Clock (MCLK) 2 option selected. 11b - Master Clock (MCLK) 3 option selected.
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. 0b - Bit clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1b - Bit clock is active low with drive outputs on falling edge and sample inputs on rising edge.
24 BCD	Bit Clock Direction Configures the direction of the bit clock. 0b - Bit clock is generated externally in Slave mode. 1b - Bit clock is generated internally in Master mode.
23 BYP	Bit Clock Bypass Bypasses the bit clock divider, internal bit clock is divide by 1 of the audio master clock. 0b - Internal bit clock is generated from bit clock divider. 1b - Internal bit clock is divide by one of the audio master clock.
22-8 —	Reserved
7-0 DIV	Bit Clock Divide Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is (DIV + 1) * 2.

13.9.4.1.7 SAI Transmit Configuration 3 Register (TCR3)

13.9.4.1.7.1 Offset

Register	Offset
TCR3	14h

13.9.4.1.7.2 Diagram



13.9.4.1.7.3 Fields

Field	Function
31-26 —	Reserved
25-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field will always return zero. FIFO pointers should only be reset when a channel is disabled or the FIFO error flag is set. The width of CFR field = the number of transmit channels (call it N). For example, if CFR is 2 bits wide, then bit position 24 refers to transmit channel 1 FIFO pointer and bit position 25 refers to transmit channel 2 FIFO pointer. Setting bit 24 resets transmit channel 1 FIFO pointer, and setting bit 25 enables transmit channel 2 FIFO pointer. Setting bit N will reset transmit channel N FIFO pointer. 0b - No effect. 1b - Transmit data channel N FIFO is reset.
23-18 —	Reserved
17-16 TCE	Transmit Channel Enable Enables the corresponding data channel for transmit operation. Changing TCE field will take effect immediately for generating the FIFO request and warning flags, but at the end of each frame for transmit operation. The width of TCE field = the number of transmit channels (call it N). For example, if TCE field is 2 bits wide, then bit position 16 refers to transmit channel 1 and bit position 17 refers to transmit channel 2. Setting bit 16 enables transmit channel 1, and setting bit 17 enables transmit channel 2. Setting bit N will enable transmit channel N. 0b - Transmit data channel N is disabled. 1b - Transmit data channel N is enabled.
15-5 —	Reserved
4-0 WDFL	Word Flag Configuration Configures which word sets the start of word flag. The value written must be one less than the word number. For example, writing 0 configures the first word in the frame. When configured to a value greater than TCR4[FRSZ], then the start of word flag is never set.

13.9.4.1.8 SAI Transmit Configuration 4 Register (TCR4)

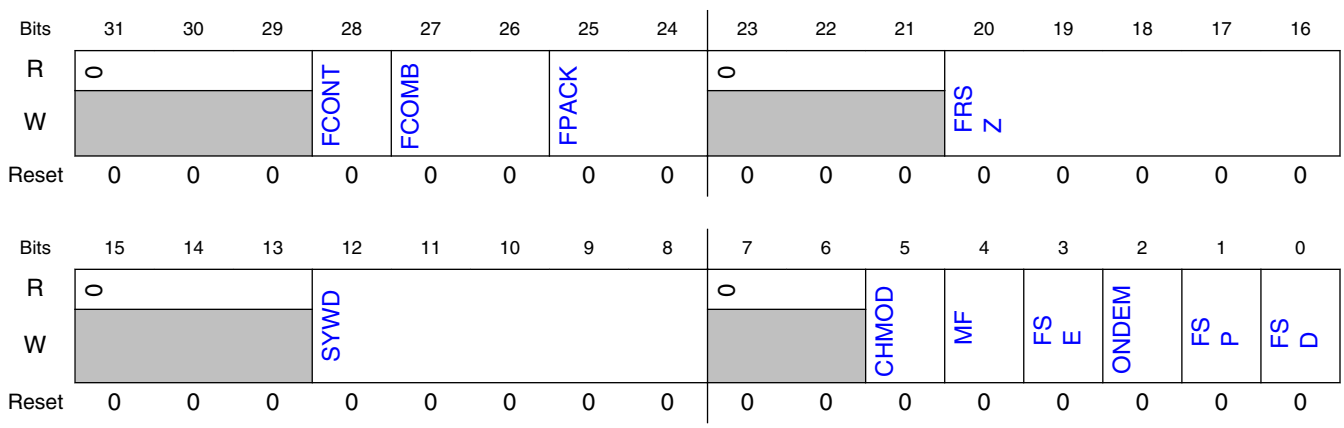
13.9.4.1.8.1 Offset

Register	Offset
TCR4	18h

13.9.4.1.8.2 Function

This register must not be altered when TCSR[TE] is set.

13.9.4.1.8.3 Diagram



13.9.4.1.8.4 Fields

Field	Function
31-29 —	Reserved
28 FCONT	FIFO Continue on Error Configures when the SAI will continue transmitting after a FIFO error has been detected. 0b - On FIFO error, the SAI will continue from the start of the next frame after the FIFO error flag has been cleared. 1b - On FIFO error, the SAI will continue from the same word that caused the FIFO error to set after the FIFO warning flag has been cleared.
27-26 FCOMB	FIFO Combine Mode

Table continues on the next page...

Field	Function
	When FIFO combine mode is enabled for FIFO writes, software writing to any FIFO data register will alternate the write among the enabled data channel FIFOs. For example, if two data channels are enabled then the first write will be performed to the first enabled data channel FIFO and the second write will be performed to the second enabled data channel FIFO. Reseting the FIFO or disabling FIFO combine mode for FIFO writes will reset the pointer back to the first enabled data channel. When FIFO combine mode is enabled for FIFO reads from the transmit shift registers, the transmit data channel output will alternate between the enabled data channel FIFOs. For example, if two data channels are enabled then the first unmasked word will be transmitted from the first enabled data channel FIFO and the second unmasked word will be transmitted from the second enabled data channel FIFO. Since the first word of the frame is always transmitted from the first enabled data channel FIFO, it is recommended that the number of unmasked words per frame is evenly divisible by the number of enabled data channels. 00b - FIFO combine mode disabled. 01b - FIFO combine mode enabled on FIFO reads (from transmit shift registers). 10b - FIFO combine mode enabled on FIFO writes (by software). 11b - FIFO combine mode enabled on FIFO reads (from transmit shift registers) and writes (by software).
25-24 FPACK	FIFO Packing Mode Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8-bit or 16-bit then only the first 8-bit or 16-bits are loaded from the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO write pointer will only increment when the full 32-bit FIFO word has been written by software. 00b - FIFO packing is disabled 01b - Reserved 10b - 8-bit FIFO packing is enabled 11b - 16-bit FIFO packing is enabled
23-21 —	Reserved
20-16 FRSZ	Frame size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15-13 —	Reserved
12-8 SYWD	Sync Width Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7-6 —	Reserved
5 CHMOD	Channel Mode Configures if transmit data pins are configured for TDM mode or Output mode. 0b - TDM mode, transmit data pins are tri-stated when slots are masked or channels are disabled. 1b - Output mode, transmit data pins are never tri-stated and will output zero when slots are masked or channels are disabled.
4 MF	MSB First Configures whether the LSB or the MSB is transmitted first. 0b - LSB is transmitted first.

Table continues on the next page...

Field	Function
	1b - MSB is transmitted first.
3 FSE	Frame Sync Early 0b - Frame sync asserts with the first bit of the frame. 1b - Frame sync asserts one bit before the first bit of the frame.
2 ONDEM	On Demand Mode When set, and the frame sync is generated internally, a frame sync is only generated when the FIFO warning flag is clear. 0b - Internal frame sync is generated continuously. 1b - Internal frame sync is generated when the FIFO warning flag is clear.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0b - Frame sync is active high. 1b - Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0b - Frame sync is generated externally in Slave mode. 1b - Frame sync is generated internally in Master mode.

13.9.4.1.9 SAI Transmit Configuration 5 Register (TCR5)

13.9.4.1.9.1 Offset

Register	Offset
TCR5	1Ch

13.9.4.1.9.2 Function

This register must not be altered when TCSR[TE] is set.

13.9.4.1.9.3 Diagram

13.9.4.1.9.4 Fields

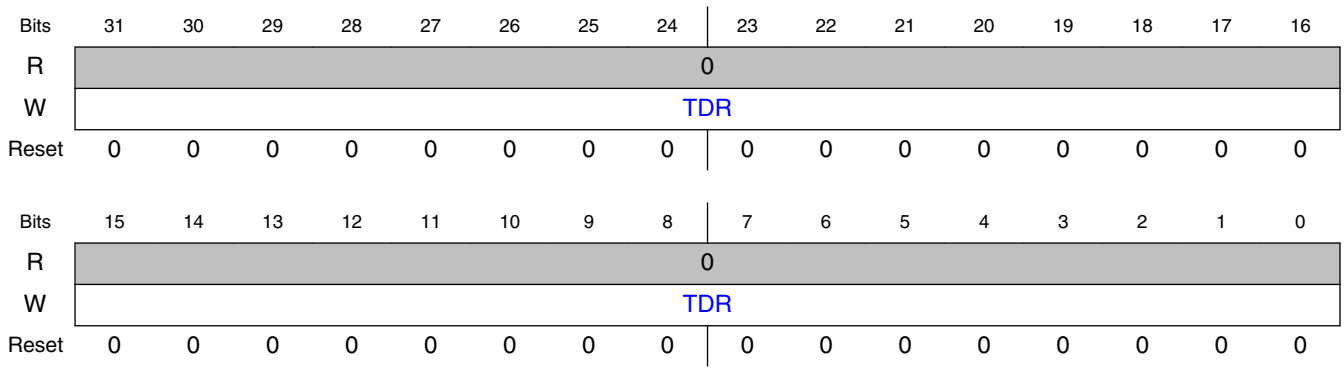
Field	Function
31-29 —	Reserved
28-24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23-21 —	Reserved
20-16 W0W	Word 0 Width Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15-13 —	Reserved
12-8 FBT	First Bit Shifted Configures the bit index for the first bit transmitted for each word in the frame. If configured for MSB First, the index of the next bit transmitted is one less than the current bit transmitted. If configured for LSB First, the index of the next bit transmitted is one more than the current bit transmitted. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
7-0 —	Reserved

13.9.4.1.10 SAI Transmit Data Register (TDR0 - TDR1)

13.9.4.1.10.1 Offset

Register	Offset
TDR0	20h
TDR1	24h

13.9.4.1.10.2 Diagram



13.9.4.1.10.3 Fields

Field	Function
31-0 TDR	Transmit Data Register Writes to this register when the transmit FIFO is not full will push the data written into the transmit data FIFO. Writes to this register when the transmit FIFO is full are ignored.

13.9.4.1.11 SAI Transmit FIFO Register (TFR0 - TFR1)

13.9.4.1.11.1 Offset

Register	Offset
TFR0	40h
TFR1	44h

13.9.4.1.11.2 Function

The MSB of the read and write pointers is used to distinguish between FIFO full and empty conditions. If the read and write pointers are identical, then the FIFO is empty. If the read and write pointers are identical except for the MSB, then the FIFO is full.

13.9.4.1.11.3 Diagram

13.9.4.1.11.4 Fields

Field	Function
31 WCP	Write Channel Pointer When FIFO Combine mode is enabled for writes, indicates that this data channel is the next FIFO to be written. 0b - No effect. 1b - FIFO combine is enabled for FIFO writes and this FIFO will be written on the next FIFO write.
30-24 —	Reserved
23-16 WFP	Write FIFO Pointer FIFO write pointer for transmit data channel.
15-8 —	Reserved
7-0 RFP	Read FIFO Pointer FIFO read pointer for transmit data channel.

13.9.4.1.12 SAI Transmit Mask Register (TMR)

13.9.4.1.12.1 Offset

Register	Offset
TMR	60h

13.9.4.1.12.2 Function

This register is double-buffered and updates:

1. When TCSR[TE] is first set
2. At the end of each frame.

This allows the masked words in each frame to change from frame to frame.

13.9.4.1.12.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	TWM															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R W	TWM															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.9.4.1.12.4 Fields

Field	Function
31-0 TWM	Transmit Word Mask Configures whether the transmit word is masked (transmit data pins are tri-stated or drive zero and transmit data not read from FIFO) for the corresponding word in the frame. 00000000000000000000000000000000b - Word N is enabled. 00000000000000000000000000000001b - Word N is masked. The transmit data pins are tri-stated or drive zero when masked.

13.9.4.1.13 SAI Transmit Timestamp Control Register (TTCR)

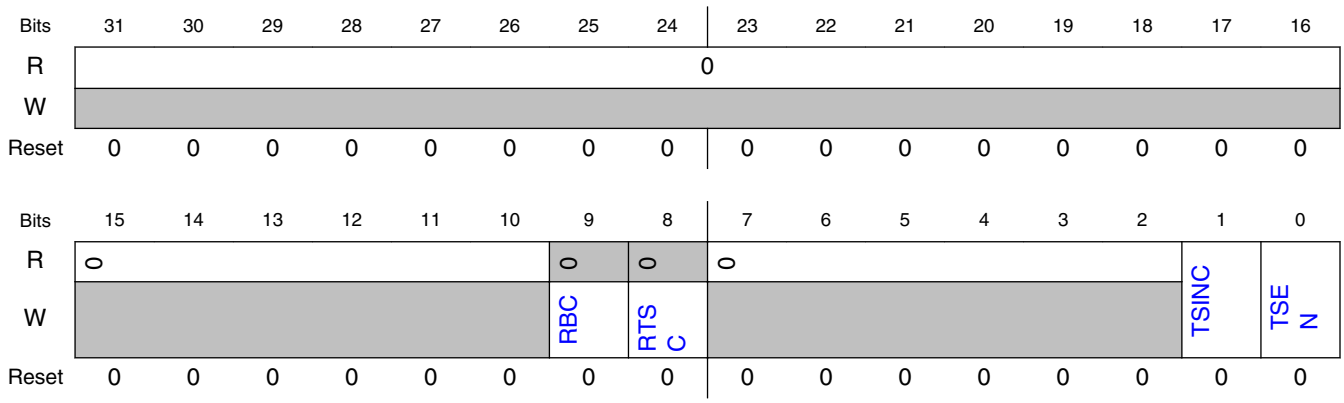
13.9.4.1.13.1 Offset

Register	Offset
TTCR	70h

13.9.4.1.13.2 Function

This register controls the transmit timestamp counter and bit clock counter.

13.9.4.1.13.3 Diagram



13.9.4.1.13.4 Fields

Field	Function
31-10 —	Reserved
9 RBC	Reset Bit Counter Reset the bit counter. 0b - Bit counter is not reset. 1b - Bit counter is reset.
8 RTSC	Reset Timestamp Counter Reset the timestamp counter. 0b - Timestamp counter is not reset. 1b - Timestamp counter is reset.
7-2 —	Reserved
1 TSINC	Timestamp Increment Configures when the timestamp counter starts to increment. 0b - Timestamp counter starts to increment when enabled and the bit counter has incremented. 1b - Timestamp counter starts to increment when enabled.
0 TSEN	Timestamp Enable Enables the timestamp counter to increment on the bus interface clock. 0b - Timestamp counter is disabled. 1b - Timestamp counter is enabled.

13.9.4.1.14 SAI Transmit Timestamp Register (TTSR)

13.9.4.1.14.1 Offset

Register	Offset
TTSR	74h

13.9.4.1.14.2 Function

This register returns the current value of the transmit timestamp counter.

13.9.4.1.14.3 Diagram

Field	Function
31-0 TSC	Timestamp Counter Current value of the timestamp counter.

13.9.4.1.15 SAI Transmit Bit Count Register (TBCR)

13.9.4.1.15.1 Offset

Register	Offset
TBCR	78h

13.9.4.1.15.2 Function

This register returns the current value of the transmit bit counter. The bit counter increments for each bit in a frame when the SAI transmitter is enabled. Reading this

register causes the Bit Count Timestamp Regsiter to update with the value of the timestamp counter that correponds to the bit count register value.

13.9.4.1.17.3 Fields

Field	Function
31 RE	Receiver Enable Enables/disables the receiver. When software clears this field, the receiver remains enabled, and this bit remains set, until the end of the current frame. 0b - Receiver is disabled. 1b - Receiver is enabled, or receiver has been disabled and has not yet reached end of frame.
30 —	Reserved Software should only write zero to this reserved bit.
29 DBGE	Debug Enable Enables/disables receiver operation in Debug mode. The receive bit clock is not affected by Debug mode. 0b - Receiver is disabled in Debug mode, after completing the current frame. 1b - Receiver is enabled in Debug mode.
28 BCE	Bit Clock Enable Enables the receive bit clock, separately from RE. This field is automatically set whenever RE is set. When software clears this field, the receive bit clock remains enabled, and this field remains set, until the end of the current frame. 0b - Receive bit clock is disabled. 1b - Receive bit clock is enabled.
27-26 —	Reserved
25 FR	FIFO Reset Empties the FIFO, and sets the FIFO read and write pointers to the same value, which may or may not be zero. Reading this field will always return zero. FIFO pointers should only be reset when the receiver is disabled or the FIFO error flag is set. 0b - No effect. 1b - FIFO reset.
24 SR	Software Reset Resets the internal receiver logic including the FIFO pointers. Software-visible registers are not affected, except for the status registers. 0b - No effect. 1b - Software reset.
23-21 —	Reserved
20 WSF	Word Start Flag Indicates that the start of the configured word has been detected. Write a logic 1 to this field to clear this flag. 0b - Start of word not detected. 1b - Start of word detected.
19 SEF	Sync Error Flag Indicates that an error in the externally-generated frame sync has been detected. Write a logic 1 to this field to clear this flag. 0b - Sync error not detected. 1b - Frame sync error detected.
18 FEF	FIFO Error Flag Indicates that an enabled receive FIFO has overflowed. Write a logic 1 to this field to clear this flag.

Table continues on the next page...

Field	Function
	0b - Receive overflow not detected. 1b - Receive overflow detected.
17 FWF	FIFO Warning Flag Indicates that an enabled receive FIFO is full. 0b - No enabled receive FIFO is full. 1b - Enabled receive FIFO is full.
16 FRF	FIFO Request Flag Indicates that the number of words in an enabled receive channel FIFO is greater than the receive FIFO watermark. 0b - Receive FIFO watermark not reached. 1b - Receive FIFO watermark has been reached.
15-13 —	Reserved
12 WSIE	Word Start Interrupt Enable Enables/disables word start interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
11 SEIE	Sync Error Interrupt Enable Enables/disables sync error interrupts. 0b - Disables interrupt. 1b - Enables interrupt.
10 FEIE	FIFO Error Interrupt Enable Enables/disables FIFO error interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
9 FWIE	FIFO Warning Interrupt Enable Enables/disables FIFO warning interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
8 FRIE	FIFO Request Interrupt Enable Enables/disables FIFO request interrupts. 0b - Disables the interrupt. 1b - Enables the interrupt.
7-5 —	Reserved
4-2 —	Reserved
1 FWDE	FIFO Warning DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.
0 FRDE	FIFO Request DMA Enable Enables/disables DMA requests. 0b - Disables the DMA request. 1b - Enables the DMA request.

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

13.9.4.1.19.4 Fields

Field	Function
31-30 SYNC	Synchronous Mode Configures between asynchronous and synchronous modes of operation. When configured for a synchronous mode of operation, the transmitter must be configured for asynchronous operation. 00b - Asynchronous mode. 01b - Synchronous with transmitter. 10b - Reserved. 11b - Reserved.
29 BCS	Bit Clock Swap This field swaps the bit clock used by the receiver. When the receiver is configured in asynchronous mode and this bit is set, the receiver is clocked by the transmitter bit clock (TX_BCLK). This allows the transmitter and receiver to share the same bit clock, but the receiver continues to use the receiver frame sync (RX_SYNC). When the receiver is configured in synchronous mode, the transmitter BCS field and receiver BCS field must be set to the same value. When both are set, the transmitter and receiver are both clocked by the receiver bit clock (RX_BCLK) but use the transmitter frame sync (TX_SYNC). 0b - Use the normal bit clock source. 1b - Swap the bit clock source.
28 BCI	Bit Clock Input When this field is set and using an internally generated bit clock in either synchronous or asynchronous mode, the bit clock actually used by the receiver is delayed by the pad output delay (the receiver is clocked by the pad input as if the clock was externally generated). This has the effect of decreasing the data input setup time, but increasing the data output valid time. The slave mode timing from the datasheet should be used for the receiver when this bit is set. In synchronous mode, this bit allows the receiver to use the slave mode timing from the datasheet, while the transmitter uses the master mode timing. This field has no effect when configured for an externally generated bit clock . 0b - No effect.

Table continues on the next page...

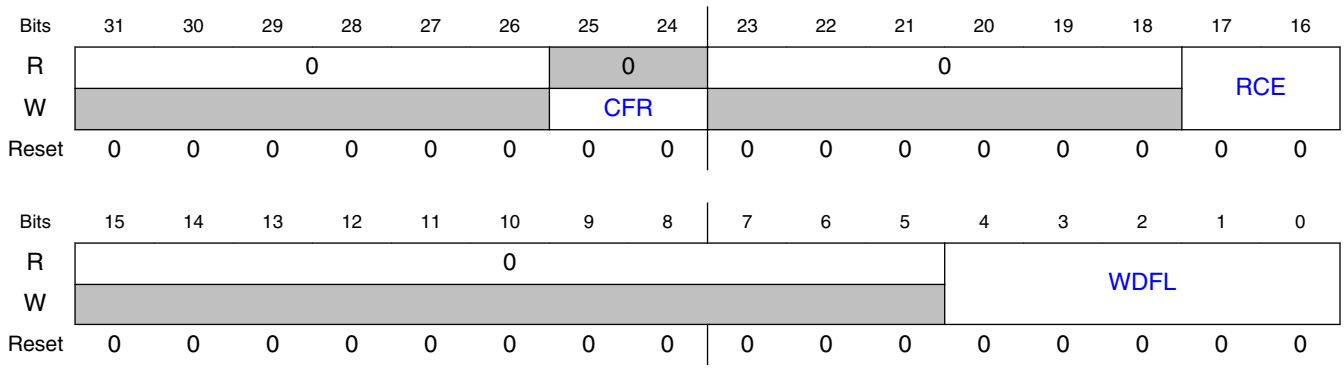
Field	Function
	1b - Internal logic is clocked as if bit clock was externally generated.
27-26 MSEL	MCLK Select Selects the audio Master Clock option used to generate an internally generated bit clock. This field has no effect when configured for an externally generated bit clock. **NOTE:** Depending on the device, some Master Clock options might not be available. See the chip-specific information for the availability and chip-specific meaning of each option. 00b - Bus Clock selected. 01b - Master Clock (MCLK) 1 option selected. 10b - Master Clock (MCLK) 2 option selected. 11b - Master Clock (MCLK) 3 option selected.
25 BCP	Bit Clock Polarity Configures the polarity of the bit clock. 0b - Bit Clock is active high with drive outputs on rising edge and sample inputs on falling edge. 1b - Bit Clock is active low with drive outputs on falling edge and sample inputs on rising edge.
24 BCD	Bit Clock Direction Configures the direction of the bit clock. 0b - Bit clock is generated externally in Slave mode. 1b - Bit clock is generated internally in Master mode.
23 BYP	Bit Clock Bypass Bypasses the bit clock divider, internal bit clock is divide by 1 of the audio master clock. 0b - Internal bit clock is generated from bit clock divider. 1b - Internal bit clock is divide by one of the audio master clock.
22-8 —	Reserved
7-0 DIV	Bit Clock Divide Divides down the audio master clock to generate the bit clock when configured for an internal bit clock. The division value is (DIV + 1) * 2.

13.9.4.1.20 SAI Receive Configuration 3 Register (RCR3)

13.9.4.1.20.1 Offset

Register	Offset
RCR3	94h

13.9.4.1.20.2 Diagram



13.9.4.1.20.3 Fields

Field	Function
31-26 —	Reserved
25-24 CFR	Channel FIFO Reset Resets the FIFO pointers for a specific channel. Reading this field will always return zero. FIFO pointers should only be reset when a channel is disabled or the FIFO error flag is set. The width of CFR field = the number of receive channels (call it N). For example, if CFR is 2 bits wide, then bit position 24 refers to receive channel 1 FIFO pointer and bit position 25 refers to receive channel 2 FIFO pointer. Setting bit 24 resets receive channel 1 FIFO pointer, and setting bit 25 enables receive channel 2 FIFO pointer. Setting bit N will reset receive channel N FIFO pointer. 0b - No effect. 1b - Receive data channel N FIFO is reset.
23-18 —	Reserved
17-16 RCE	Receive Channel Enable Enables the corresponding data channel for receive operation. Changing this field will take effect immediately for generating the FIFO request and warning flags, but at the end of each frame for receive operation. The width of RCE field = the number of receive channels (call it N). For example, if RCE field is 2 bits wide, then bit position 16 refers to receive channel 1 and bit position 17 refers to receive channel 2. Setting bit 16 enables receive channel 1, and setting bit 17 enables receive channel 2. Setting bit N will enable receive channel N. 0b - Receive data channel N is disabled. 1b - Receive data channel N is enabled.
15-5 —	Reserved
4-0 WDFL	Word Flag Configuration Configures which word the start of word flag is set. The value written should be one less than the word number (for example, write zero to configure for the first word in the frame). When configured to a value greater than the Frame Size field, then the start of word flag is never set.

13.9.4.1.21 SAI Receive Configuration 4 Register (RCR4)

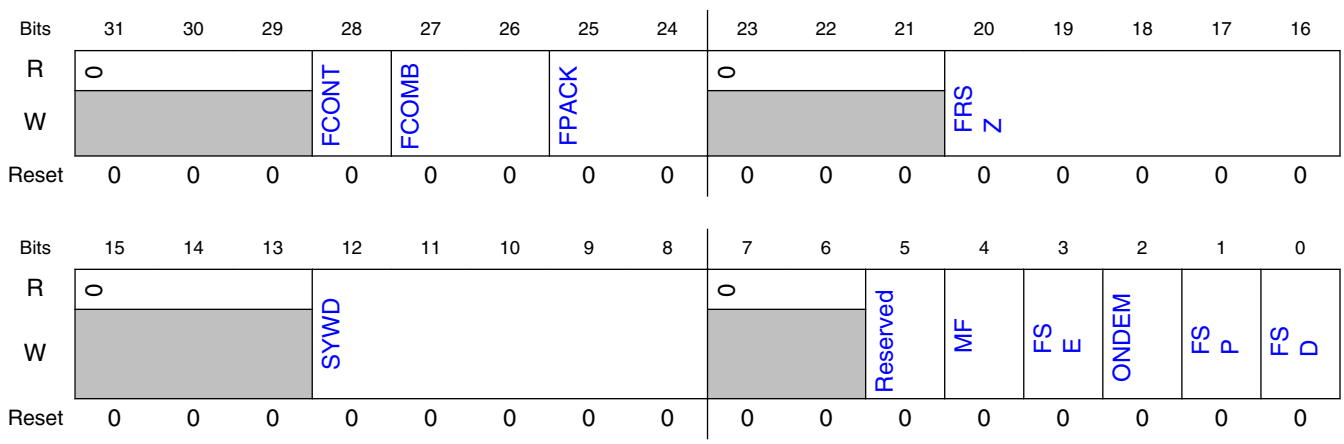
13.9.4.1.21.1 Offset

Register	Offset
RCR4	98h

13.9.4.1.21.2 Function

This register must not be altered when RCSR[RE] is set.

13.9.4.1.21.3 Diagram



13.9.4.1.21.4 Fields

Field	Function
31-29 —	Reserved
28 FCONT	FIFO Continue on Error Configures when the SAI will continue receiving after a FIFO error has been detected. 0b - On FIFO error, the SAI will continue from the start of the next frame after the FIFO error flag has been cleared. 1b - On FIFO error, the SAI will continue from the same word that caused the FIFO error to set after the FIFO warning flag has been cleared.
27-26 FCOMB	FIFO Combine Mode

Table continues on the next page...

Field	Function
	When FIFO combine mode is enabled for FIFO reads, software reading any FIFO data register will alternate the read among the enabled data channel FIFOs. For example, if two data channels are enabled then the first read will be performed to the first enabled data channel FIFO and the second read will be performed to the second enabled data channel FIFO. Reseting the FIFO or disabling FIFO combine mode for FIFO reads will reset the pointer back to the first enabled data channel. When FIFO combine mode is enabled for FIFO writes from the receive shift registers, the first enabled data channel input will alternate between the enabled data channel FIFOs. For example, if two data channels are enabled then the first unmasked received word will be stored in the first enabled data channel FIFO and the second unmasked received word will be stored in the second enabled data channel FIFO. Since the first word of the frame is always stored in the first enabled data channel FIFO, it is recommended that the number of unmasked words per frame is evenly divisible by the number of enabled data channels. 00b - FIFO combine mode disabled. 01b - FIFO combine mode enabled on FIFO writes (from receive shift registers). 10b - FIFO combine mode enabled on FIFO reads (by software). 11b - FIFO combine mode enabled on FIFO writes (from receive shift registers) and reads (by software).
25-24 FPACK	FIFO Packing Mode Enables packing of 8-bit data or 16-bit data into each 32-bit FIFO word. If the word size is greater than 8-bit or 16-bit then only the first 8-bit or 16-bits are stored to the FIFO. The first word in each frame always starts with a new 32-bit FIFO word and the first bit shifted must be configured within the first packed word. When FIFO packing is enabled, the FIFO read pointer will only increment when the full 32-bit FIFO word has been read by software. 00b - FIFO packing is disabled 01b - Reserved. 10b - 8-bit FIFO packing is enabled 11b - 16-bit FIFO packing is enabled
23-21 —	Reserved
20-16 FRSZ	Frame Size Configures the number of words in each frame. The value written must be one less than the number of words in the frame. For example, write 0 for one word per frame. The maximum supported frame size is 32 words.
15-13 —	Reserved
12-8 SYWD	Sync Width Configures the length of the frame sync in number of bit clocks. The value written must be one less than the number of bit clocks. For example, write 0 for the frame sync to assert for one bit clock only. The sync width cannot be configured longer than the first word of the frame.
7-6 —	Reserved
5 —	Reserved Software should only write zero to this bit.
4 MF	MSB First Configures whether the LSB or the MSB is received first. 0b - LSB is received first. 1b - MSB is received first.
3	Frame Sync Early

Table continues on the next page...

Field	Function
FSE	0b - Frame sync asserts with the first bit of the frame. 1b - Frame sync asserts one bit before the first bit of the frame.
2 ONDEM	On Demand Mode When set, and the frame sync is generated internally, a frame sync is only generated when the FIFO warning flag is clear. 0b - Internal frame sync is generated continuously. 1b - Internal frame sync is generated when the FIFO warning flag is clear.
1 FSP	Frame Sync Polarity Configures the polarity of the frame sync. 0b - Frame sync is active high. 1b - Frame sync is active low.
0 FSD	Frame Sync Direction Configures the direction of the frame sync. 0b - Frame Sync is generated externally in Slave mode. 1b - Frame Sync is generated internally in Master mode.

13.9.4.1.22 SAI Receive Configuration 5 Register (RCR5)

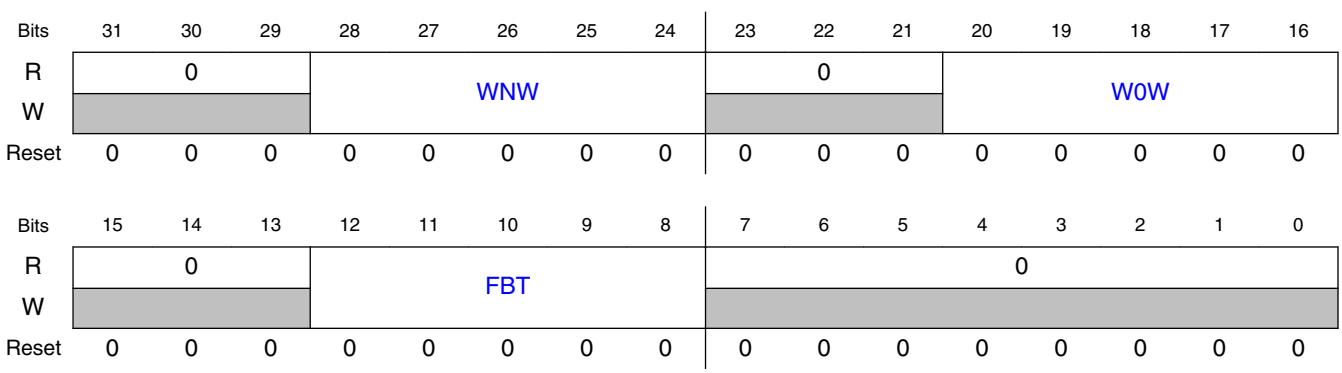
13.9.4.1.22.1 Offset

Register	Offset
RCR5	9Ch

13.9.4.1.22.2 Function

This register must not be altered when RCSR[RE] is set.

13.9.4.1.22.3 Diagram



13.9.4.1.22.4 Fields

Field	Function
31-29 —	Reserved
28-24 WNW	Word N Width Configures the number of bits in each word, for each word except the first in the frame. The value written must be one less than the number of bits per word. Word width of less than 8 bits is not supported.
23-21 —	Reserved
20-16 W0W	Word 0 Width Configures the number of bits in the first word in each frame. The value written must be one less than the number of bits in the first word. Word width of less than 8 bits is not supported if there is only one word per frame.
15-13 —	Reserved
12-8 FBT	First Bit Shifted Configures the bit index for the first bit received for each word in the frame. If configured for MSB First, the index of the next bit received is one less than the current bit received. If configured for LSB First, the index of the next bit received is one more than the current bit received. The value written must be greater than or equal to the word width when configured for MSB First. The value written must be less than or equal to 31-word width when configured for LSB First.
7-0 —	Reserved

13.9.4.1.23 SAI Receive Data Register (RDR0 - RDR1)

13.9.4.1.23.1 Offset

Register	Offset
RDR0	A0h
RDR1	A4h

13.9.4.1.23.2 Function

Reading this register introduces one additional peripheral clock wait state on each read.

13.9.4.1.23.3 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

13.9.4.1.30.4 Fields

Field	Function
31 —	Reserved
30 MOE	MCLK Output Enable Configures MCLK signal pin as an input or an output. 0b - MCLK signal pin is an input. 1b - MCLK signal pin is an output.
29-26 —	Reserved
25-24 —	Reserved
23 DIVEN	MCLK Post Divide Enable Enables the post-divider that is output on the MCLK signal pin, the output divider does not impact the audio master clock used by the transmitter or receiver. 0b - Output on MCLK signal pin is the audio master clock. 1b - Output on MCLK signal pin is a post-divided version of audio master clock.
22-8 —	Reserved
7-0 DIV	MCLK Post Divide Post-divide for the audio master clock that only divides the output to the MCLK signal pin. The division value is (DIV + 1) * 2.

Chapter 14
Graphics Processing Unit (GPU)

14.1 GPU Overview

14.1.1 Overview

This section provides a high-level overview pf the Graphics Processing Unit (GPU) Subsystem in the chip. This chip uses two GPU cores, one for 3D processing and the other to provide 2D/3D acceleration.

14.1.1.1 Block Diagram

The high level block diagram is shown as below:

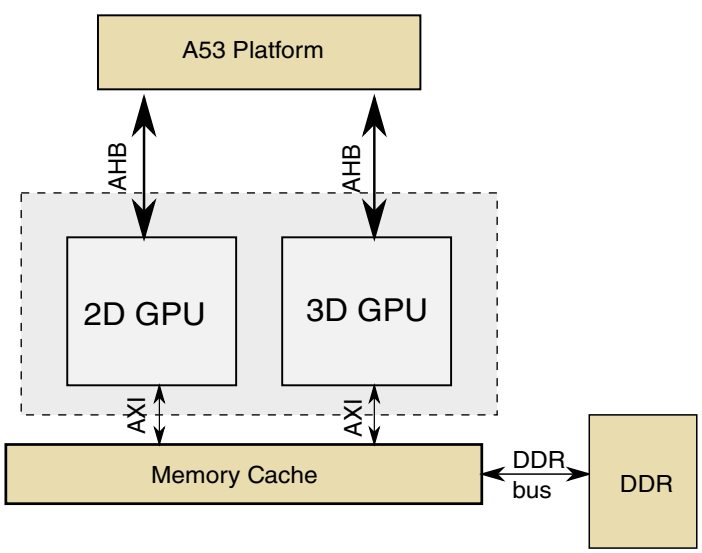

Figure 14-1. High Level Diagram

The 3D GPU and 2D GPU are designed in such a away that if only one core is required, the other can be gated off.

14.1.2 Features

The key features of the GPUs are described below:

- 3D GPU Core:
  - Support OpenGL ES 1.1, 2.0
  - Support OpenVG 1.1
  - TrustZone support using a local MMU to manage secure regions
- 2D GPU Core:
  - Support multi-source composition
  - Support one-pass filter

14.2 2D Graphics Processing Unit (GPU2D)

14.2.1 Overview

This Graphics Processing Unit defines a high-performance, multi-pipe 2D raster graphics core that accelerates the 2D graphics display on a variety of consumer devices and provides advanced compression capabilities.

It supports the following graphic APIs:

- DirectFB (on Linux / Linux Embedded)
- GDI/DirectDraw (on Windows Embedded Compact 7 / Embedded CE 6)
- Android

14.2.1.1 Block Diagram

The block diagram and a description of the functional blocks of the complete graphics pipeline is given below.

- Host Interface - Allows the core to communicate with external memory and the CPU through the AXI or the AHB bus. In this block, data crosses clock domain boundaries.
- Memory Controller - Internal memory management unit that controls the block-to-host memory requests.
- Graphics Pipeline Front End - Inserts high level primitives and commands into the graphics pipeline.

- 2D Drawing and Scaling Engine - Draws 2D graphics primitives and rasterizes 2D images.
- Pixel Engine - Pixel manipulation and filtering on rendered images. The GPU has four pixel pipes.

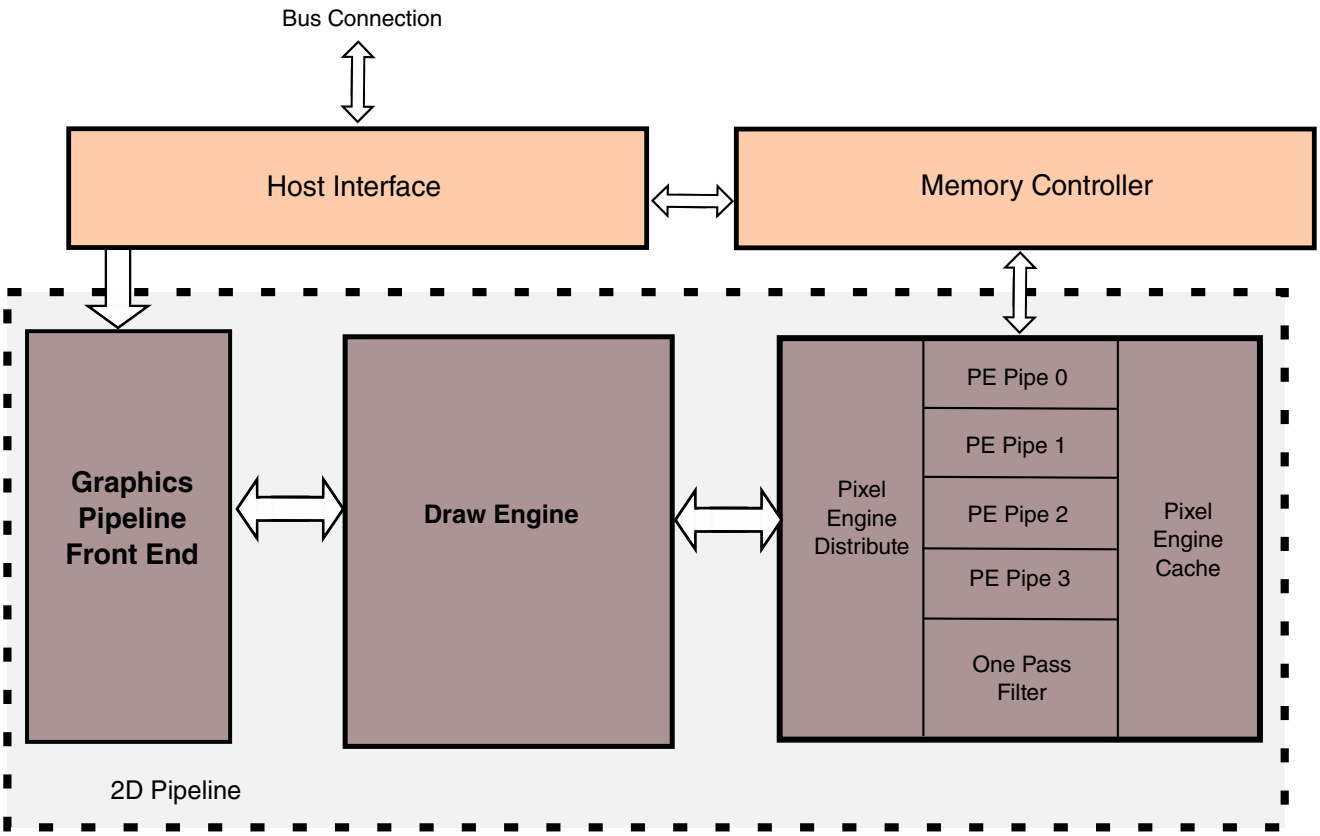

Figure 14-2. GPU Block Diagram

14.2.2 GPU Features

The features of the GPU include:

- 2D GPU Unit:
  - Bit Blit
  - Stretch Blit
  - Rectangle fill and clear
  - Line drawing
  - Filter Blit
  - Mono expansion for text rendering
  - ROP2, ROP3 and ROP4
  - Alpha blending, including Java 2 Porter-Duff compositing blending rules
  - 32K x 32K coordinate system
  - 90 / 180 / 270 degree rotation

    - Transparency by monochrome mask, chroma key, or pattern mask
    - Support 2x2 in 4x4 tile format
    - A8 output with rotation in filter Blit and bit Blit
    - Src/Dest color key full bypass support
- Multi Source Blending:
    - Full support for Multi source blending with variable block size to improve BW and reduce SW overhead
    - Up to 8 sources are supported
    - Programmable block size guarantees cache efficiency so each source is read once and each destination is written once
    - Supports 90, 180, 270 degree rotation with different block size for higher cache efficiency
- YUV Support:
    - Full Multi destination support for converting non-planar YUV formats to planar YUV. It is used in extracting various components from input color into different destination planes
    - YUV422 output with alpha blending supported
- Clock disabling:
    - The core clock enters the frequency scaling block, and a clock with missing pulses is output, buffered, and sent to clock gating logic. The clock gate output will be used by the 2D GPU blocks. The core clock can be shut down through software by setting the proper register bits
- AXI Bus:
    - AXI 4-bit ID, such that all Read and Write transactions have a unique AXI ID
    - AXI out of order read return supported
- Additional Enhancements:
    - Full functional MMU with variable page size support
- Rotation:
    - 90° / 180° / 270° / Mirror rotation is supported for all primitives
    - Independent source rotation
- Transparency Mode:
    - For Monochrome Expansion:
        - Opaque
        - Conditional transparency - Transparent if the current pixel matches the specified value
    - For blits:
        - Opaque
        - Masked transparency - Transparent if the mask for the current pixel or pattern is zero

    - Source Conditional transparency - Transparent if the source pixel is within the specified value range
    - Destination Conditional transparency - Transparent if the destination pixel is not within the specified value range
- Clipping:
    - One clipping rectangle is supported for all bit blit primitives

14.2.2.1 GPU Host and Memory Interface Features

Table 14-1. Host and memory interface features

Feature	GPU Support
AHB interface	32-bit
Interface for External memory access	one 128-bit AXI
Virtual memory support	Yes
Out of order return support	Yes, supports out of order return for different clients
Code and data memory location restrictions	Unrestricted; arbitrary memory reads and writes
System address space	256 Kbytes (64K 32-bit words); however, the range of addresses used is only 4 Kbytes
Physical address	32 bits
Resource locks with CPU	Semaphore lock
Read write request size support	Memory controller supports 16, 32, 64, 128 byte read and write requests
MMU with variable page size support	MMU supports variable page sizes (4KB, 64KB, 1MB, 16MB)
GPU Cache Flush	Auto-flush at programmable intervals

14.2.2.2 GPU Power Management Features

Table 14-2. Power management features

Feature	Support
Low power CMOS technology compatible	Yes
Dynamic clock scaling	Yes
Automatic clock gating of flip flops and rams	Yes
Global clock gating of unused macro blocks	Yes
Active(ON), Idle, Standby and Sleep(OFF) Programmable Power Modes	Yes

14.2.2.3 Composition and 2D Hardware Features

This topic highlights the hardware features of the dedicated 2D GPU.

Table 14-3. Composition and 2D Hardware Features

Feature	Support
Programmable OPs	ROP2, ROP3, ROP4 full alpha blending and transparency
Fixed function	Line draw,Rectangle fill, Rectangle Clear, Bit blit, Stretch blit, Filter blit
Blit support	Copy (Bit), Filter, Monochrome Mask, Stretch/Shrink
Source and Destination formats	The graphics engine supports the following source and destination formats for data, bit blits and filter blits. In addition to these source and destination RGB formats, their swizzle formats (ARGB, RGBA, ABGR, BGRA) are also supported. For YUV formats, the GPU supports their U/V swap formats.

Format	Bit Blit Input	Bit Blit Dest	Stretch Blit Input	Stretch Blit Dest	Filter Blit Input	Filter Blit Dest	OPF Input	OPF Dest	Multi-Source Input	Multi-Source Dest
A1R5G5B5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
A4R4G4B4	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
A8R8G8B8	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
X1R5G5B5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
X4R4G4B4	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
X8R8G8B8	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
R5G6B5	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
A8	Y	Y	Y	Y	Y	Y	Y	Y	Y	Y
YUY2 (packed	Y	Y	Y	N	Y	Yv	Y	Yv	Y	Y

Table continues on the next page...

Table 14-3. Composition and 2D Hardware Features

Feature	Support										
	Format	Bit Blit Input	Bit Blit Dest	Stretch Blit Input	Stretch Blit Dest	Filter Blit Input	Filter Blit Dest	OPF Input	OPF Dest	Multi-Source Input	Multi-Source Dest
	YUV422)										
	UYVY (packed YUV422)	Y	Y	Y	N	Y	N	Y	Y	Y	Y
	YV12 (planar YUV420)	Y	MD	Y	N	Y	N	Y	N	Y	N
	NV12 (semi-planar YUV420)	Y	MD	Y	N	Y	N	Y	N	Y	N
	NV16 (semi-planar YUV422)	Y	MD	Y	N	Y	N	Y	N	Y	N
	8-bit color index	N	N	Y	N	Y	N	N	N	Y	N
	1-bit monochrome	Y	N	N	N	N	N	N	N	N	N

Table continues on the next page...

Table 14-3. Composition and 2D Hardware Features (continued)

Feature	Support
Alpha blending modes	Java2 Porter-Duff, Chroma Key, Pattern Mask
Alpha blending during filter blit	Not supported
Transparency	Supported by monochrome mask, chroma key or pattern mask
Dithering	2D dither support
Image scaling	Filter Blit FIR resampling filter with up to 9 taps, One Pass Filter with 3/5 taps
Rotation	90 / 180 / 270 degrees with mirror
Clipping	one clipping rectangle supported for all bit blit primitives.
Text rendering	Monochrome expansion
Rendering size	32k x 32k raster 2D coordinate system
Compression	Lossless, tiled compression support

14.2.2.4 Composition and 2D Operations and Features

14.2.2.4.1 Line

The LINE operation draws a line. The coordinates for two points are given - start point and end point and the end point is not drawn.

Lines are rendered using the Bresenham algorithm. The Bresenham algorithm has the advantage of using integer arithmetic and has no accumulation of rounding errors.

In the case of line, only ROP2 and ROP4 are supported. It operates on pattern and destination. The pattern should have a transparency mask in order to use ROP4.

Clipping is supported for lines on a per pixel basis.

the figure below shows the operation in more detail.

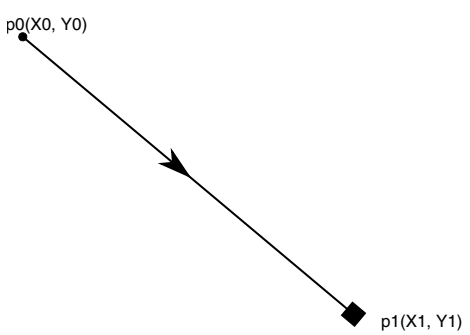

Figure 14-3. Line

14.2.2.4.2 Rectangle Fill and Clear

Rectangle fill suffuses a rectangle area with a given color. Essentially rectangle fill is a pattern fill, where an 8x8 pattern is initialized with the specified color. It supports ROP2 and ROP4 with the pattern and destination as its inputs. If ROP4 is used, the pattern should have a transparency mask.

Clear is similar to rectangle fill except that it does not use a pattern. A 32-bit clear value with 4-bit byte mask is used to fill the entire rectangle area.

Both rectangle fill and clear support clipping, which is performed on a per primitive basis.

14.2.2.4.3 Bit Blit

Bit blit transfers data from one area of a memory (source) to another area of the memory (destination). The source and destination can be from the same or from different memory locations. Both source and destination must be described by a rectangular area. The source and destination rectangles can be the same size (most bit blits are of this nature) or they can be different sizes, in which case the operation becomes a stretch or shrink blit.

Bit blit supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color.

Clipping can be performed on a primitive basis.

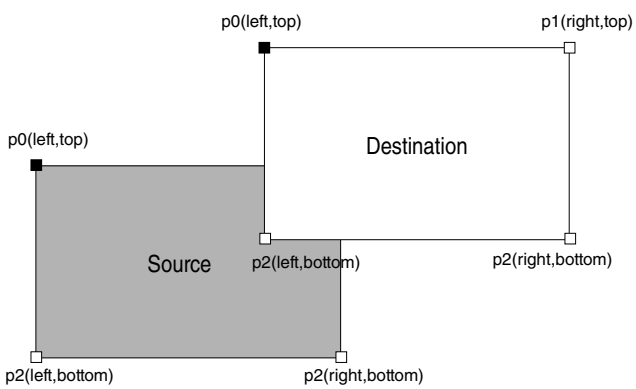

Figure 14-4. Bit Blit

14.2.2.4.4 Stretch Blit

The stretch blit primitive performs a bit blit operation with stretch or shrink. The modified Bresenham algorithm is used to generate corresponding coordinates for fast stretching. The stretch factor is specified in a 15.0 fixed-point format. Stretch blit is not

allowed to overlap, that is, no part of source and destination can share any piece of memory. Non-stretch blits can overlap. For stretch blit clipping is performed on a per pixel basis.

14.2.2.4.5 Monochrome Expansion and Mask Blit

Monochrome expansion and mask blit are different operations, although both use the bit stream from the command buffer. And both can be the source for ROP4 source selection. This means that each output pixel can be a combination of source, pattern, monochrome mask (for masked blits) and destination.

Monochrome expansion

For monochrome expansion, the bit from the stream is used to switch on/off a solid color that is defined in a register. This mechanism enables the use of just one bit per pixel to represent colors. In effect, the MONO EXPANSION primitive increases color representation from one bit per pixel to multiple bits per pixel. A typical application for mono color is font drawing.

Monochrome expansion does not support overlapping of the source and destination. It is the responsibility of the driver to make sure that the command will never be executed on overlapping source and destination.

Mask Blit

For mask blit, the bit from the stream is used to toggle on/off a color in the source frame buffer. Mask blit takes its color source from memory and its monochrome mask from the command stream. Clipping is supported and is performed on a per pixel basis.

14.2.2.4.6 YUV Output for 2D Operations

YUV output is available for packed or planar YUV input formats per the following table.

Table 14-4. YUV Output Support for Packed or Planar YUV Source per 2D Operation

2D Operation	Destination
Bit blit	Packed YUV
One Pass Filter	Packed YUV
Multi-source	Packed YUV (no scaling)
Multi-destination	Planar YUV
Stretch blit	NO
Two Pass Filter	NO

14.2.2.4.7 ARGB Data Conversion

The pixels read from source or destination will be expanded into A8R8G8B8 format to maintain lossless pixel operations. The resulting pixels will be converted into the destination format.

14.2.2.4.8 YUV to RGB Conversion

YUV data can be converted into 8-bit per component RGB format at the output of the cache only. Once converted, there is no way back to YUV format. GPU supports BT.601 and BT.709 YUV to RGB color conversion standards.

In BT.601, the YUV to RGB conversion is done using the following approximation:

```
16 ≤ Y ≤ 235
16 ≤ U ≤ 240
16 ≤ V ≤ 240

A = Y – 16 B = U – 128 C = V – 128
R = clip((298*A + 410*C + 128) >> 8)
G = clip((298*A – 101*B – 209*C + 128) >> 8)
B = clip((298*A + 519*B + 128) >> 8)
```

The Y, U and V components are clamped prior to the conversion. Y is clamped between 16 and 235, inclusively. U and V are clamped between 16 and 240, inclusively.

In BT.709, the R, G, B equations are slightly changed to:

```
R = clip((298*A + 461*C + 128) >> 8)
G = clip((298*A – 55*B – 137*C + 128) >> 8)
B = clip((298*A + 543*B + 128) >> 8)
```

14.2.2.4.9 Color Index Input Conversion Support

Color index is supported for source data only. A look-up table with 256 entries is provided for indexing the data. The table is fully programmable. The conversion is done when pixels are read out of the cache.

14.2.2.4.10 Source/Destination Pre-multiply Support

The GPU supports pre-multiply source alpha or global alpha, or source global color for global colorizing.

On destination, the GPU supports destination pre-multiply and destination alpha.

On destination, the GPU supports destination pre-multiply destination alpha, destination de-multiply alpha.

Table 14-5. Pre-multiplied modes

Microsoft Alpha Blending	Equation
S:Fix Alpha	D.C=A*S.C+(1-A)*D.C
	D.A=A*S.A+(1-A)*D.A
S:Per-Pixel	D.C=S.C+(1-S.A)*D.C
	D.A=S.A+(1-S.A)*D.A
S:Fix+Per-Pixel	D.C=A*S.C+(1-S.A)*D.C
	D.A=A*S.A+(1-S.A)*D.A
S:Per-Pixel	D.C=S.A*S.C+(1-S.A)*D.C
	D.A=S.A+(1-S.A)*D.A
S:Fix+Per-Pixel	D.C=A*S.A*S.C+(1-S.A)*D.C
	D.A=A*S.A+(1-S.A)*D.A

NOTE

D: Destination

S: Source

A: Alpha

C: Color

14.2.2.4.11 Source/Destination Pre-multiply Support

The GPU supports alpha blending together with ROP. Alpha blending function is performed on ROP function result source.

The general alpha blending equations are:

$$Cd = Fs * Cs' + Fd * Cd'$$
$$Ad = Fs * As'' + Fd * Ad''$$

Where, Cs' is the source color component (adjusted for NPM if necessary)

Cd' is the destination color component (adjusted for NPM if necessary)

As'' is the modified source alpha component

Ad'' is the modified destination alpha component

Fs is fraction of the source that contributes to the final value

Fd is fraction of the destination that contributes to the final value

The blending is done in four logical stages:

1. Transparent/opaque conversion - In this stage, the incoming alpha (source or destination independently) can be inverted if needed to match the internal alpha rule. Internally, an alpha of 0 means transparent, while an alpha of “0xFF” means opaque. External content might follow the opposite rule. The output of the block is either As (Ad for destination) or 1-As (1-Ad for destination).
2. Global value substitution - A global alpha value from a register can be used to substitute or scaled the incoming alpha. An incoming alpha As can pass-through, be directly substituted by Ags (global alpha) or scaled by the global alpha value (As * Ags). The source and destination have distinct global alpha values.
3. Blending factor generation - At this stages, the blending factors are generated (refer to table below). Each alpha can take the values 0, 1, A or 1-A depending on the blending mode.
4. Final blending - This is the final stage which implements the operations described by equations.
5.

The stages are shown in the figure below:

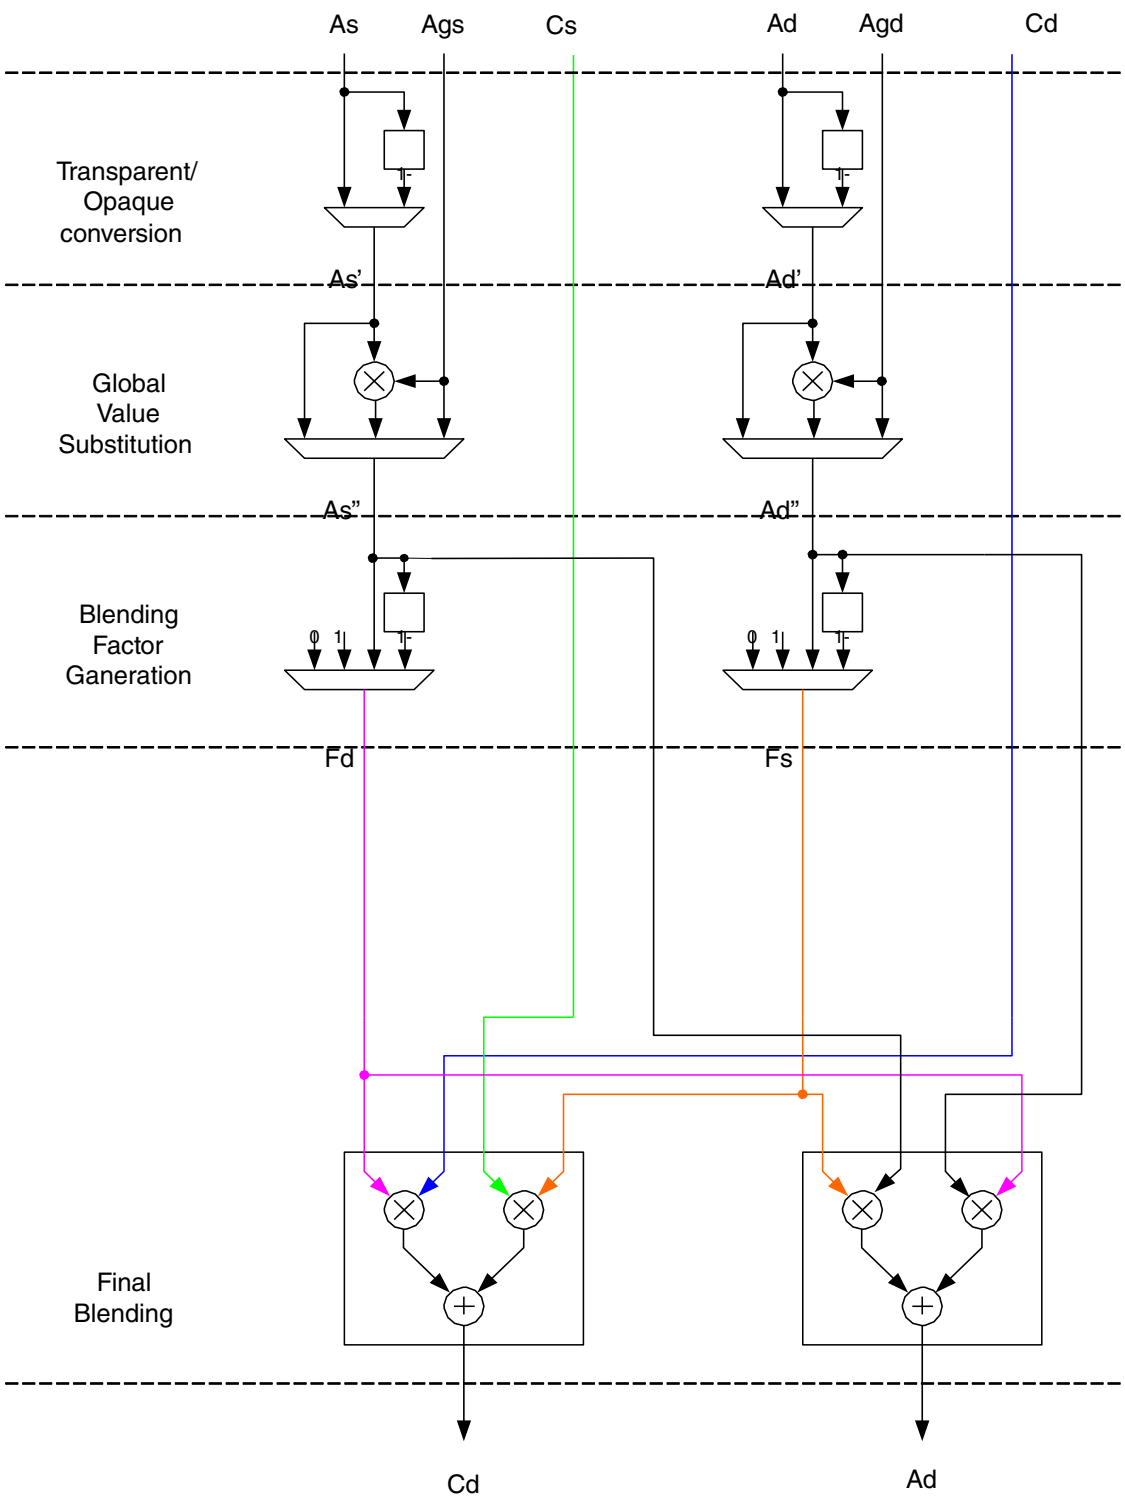

Figure 14-5. Alpha Blender for One Pixel

The fractions take the values described in the following table, depending on the blending mode:

Table 14-6. Blending Modes Fractions Description

Blending Mode	Fs	Fd
Clear	0	0
SRC	1	0
DST	0	1
SRC_OVER	1	1 – As”
DST_OVER	1 – Ad”	1
SRC_IN	Ad”	0
DST_IN	0	As”
SRC_OUT	1 – Ad”	0
DST_OUT	0	1 – As”
SRC_ATOP	Ad”	1 – As”
DST_ATOP	1 – Ad”	As”
XOR	1 – Ad”	1 – As”

14.2.2.4.12 Dither

Color intensity at any point of an image can be thought of as a real number between 0.0 and 1.0 at each location. However, in reality only a discrete number of intensity levels can be represented. This discretization leads to a total error in the color intensities of an image equal to the square root of the sum of the squares from each point.

This error results in contouring. In an image where intensities change slowly, this will cause noticeable jumps. Dithering can be used to diffuse the intensity across neighboring pixels.

In dithering mode pixels are scanned in order, and errors in calculating a pixel's intensity are distributed (i.e., diffused) to neighboring pixels to keep the overall intensity of the image closer to the input intensity.

Dithering is supported for 16-bit color destination formats. The dither table is programmable by software.

14.2.2.4.13 Multi-Source Blending

Up to 8 sources are supported. Programmable block size guarantees cache efficiency so each source is read once and each destination is written once. It supports 90, 180, 270 degree destination and source rotation and mirror with different block size to have high

cache efficiency. It also supports ROP2, ROP3, and ROP4 which includes source, destination and pattern, and an optional transparency color. Alpha blending between every source is supported.

14.2.2.4.14 GPU Cache Management

SW cache flush is supported to flush the GPU cache to memory. Auto-flush of GPU cache is also supported. SW sets up the auto-flush interval, and HW will do the cache flush automatically at programmable intervals.

14.3 3D Graphics Processing Unit (GPU3D)

14.3.1 Overview

The graphics processing unit (GPU) provides high performance, high quality graphics, low power consumption, and the smallest silicon footprint for its class. The dynamic power consumption is minimized by extensive use of multi-level hierarchical clock gating.

An optimized software stack, complete software development tools, and a growing application ecosystem are supported by a robust graphics pipeline designed for industry-standard APIs, and with full support for Android, Linux, and Windows embedded development platforms. The GPU supports the following graphics APIs:

- OpenGL ES 2.0/1.1
- EGL 1.4
- OpenGL 2.1
- OpenVG 1.1

14.3.1.1 Block Diagram

A block diagram and a description of the functional blocks of the complete graphics pipeline is given below.

- Host Interface - Allows GCCORE to communicate with external memory and the CPU through AXI or AHB bus. In this block data crosses clock domain boundaries.
- Memory Controller - Internal memory management unit that controls the block-to-host memory request interface.
- Graphics Pipeline Front End - Inserts high level primitives and commands into the graphics pipeline.

- Ultra-threaded Unified Shader - SIMD processor that performs as both vertex shader and fragment shader. When used as a vertex shader it performs geometry transformations and lighting computations. When used as a fragment shader it applies texture data and computes color values for each pixel. The GPU has one (1) such vec4 shader.
- 3D Rendering Engine - Converts triangles and lines into pixels. Computes slopes of color attributes and texture coordinates. Performs clipping.
- Texture Engine - Retrieves texture information from memory upon request by the fragment shader. Performs interpolation and filtering, and transfers the computed value to the fragment shader or the vertex shader. This GCCORE texture unit can process one pixel or one vertex /cycle.
- Pixel Engine/Resolve - Pixel engine does alpha blending and visible surface determination. Resolve does tiling and de-tiling. This GCCORE Pixel Engine can process one pixel/cycle.

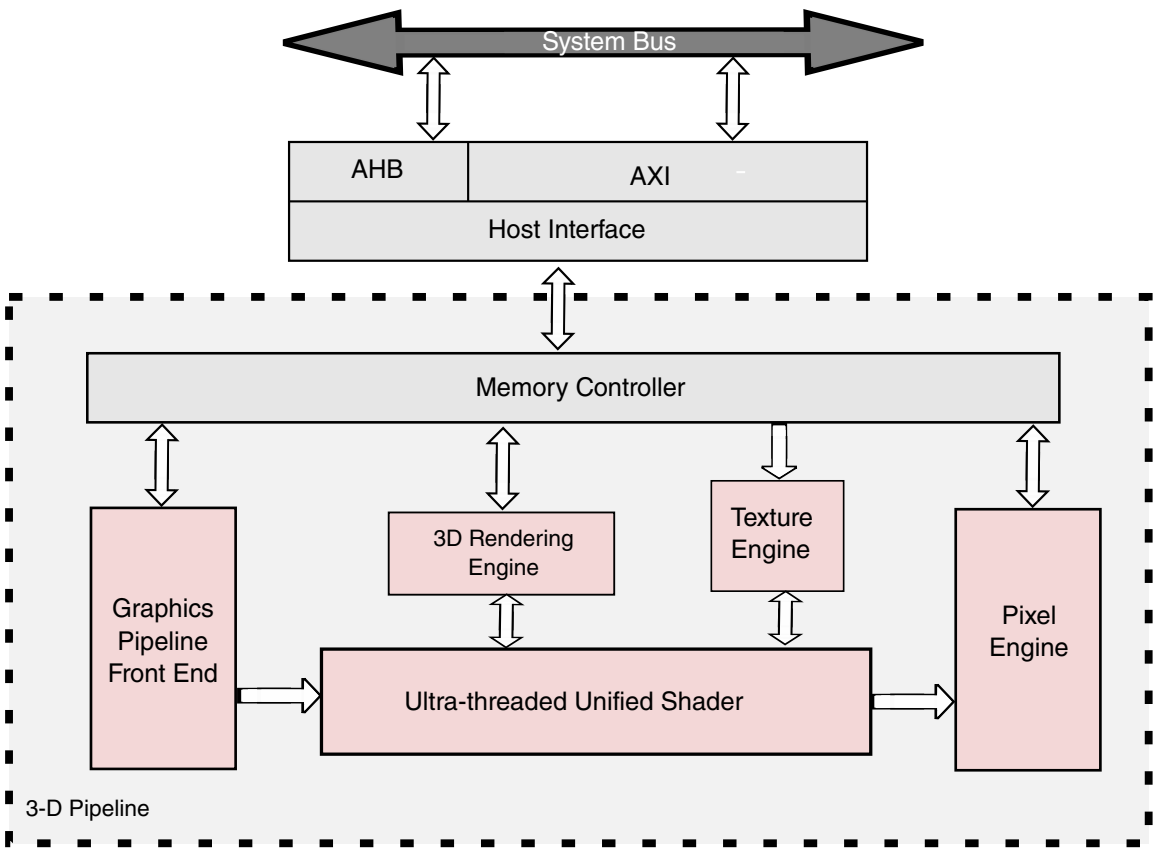

Figure 14-6. GPU Block Diagram

14.3.2 GPU Features

The features of the GPU 3D unit include:

- OpenGL ES 2.0 / 1.1 compliance, including extensions; OpenVG 1.1
- IEEE 32-bit floating-point pipeline
- Ultra-threaded, unified vertex and fragment (pixel) shaders
- Low bandwidth at both high and low data rates
- Low CPU loading
- Up to 12 programmable elements per vertex
- Dependent texture operation with high-performance
- Alpha blending
- Depth and stencil compare
- Point sampling, bi-linear sampling, tri-linear filtering, and cubic textures
- Resolve and fast clear
- 8k x 8k texture size and 8k x 8k rendering target
- 4 Vertex DMA streams
- MMU functionality supported

The following table describes API support and select architectural features of the GPU:

Table 14-7. GPU Architecture Features

Feature	GPU Support
Primary API	OpenGL ES 2.0 / 1.1
Additional APIs	OpenVG 1.1 DirectX 11 (9_3) OpenGL 2.1
Other graphics support	EGL 1.4
Drivers	OpenGL ES 2.0 / 1.1 OpenVG 1.1 EGL 1.4 DirectX 11 (9_3) OpenGL 2.1
Operating systems	Windows Embedded Compact 7, Embedded CE 6 Embedded Linux Android 5.x / 4.x / 3.x
Z (depth)	Early Z support included
Stencil	Early stencil support included
GLSL ES Shader languages	1.0
Shader model compatibility	SM3.0
Shader types and execution units	One programmable Scalable Ultra-threaded Unified Shader (SIMD4: ctl-flow,tx-load) one instruction issue per shader per clock; IEEE 32-bit floating-point pipeline supports long shader instructions
FSAA anti-aliasing mechanisms	High quality MSAA 4x

14.3.2.1 GPU Host and Memory Interface Features

Table 14-8. GPU host and memory interface features

Feature	GPU Support
AHB interface	32-bit
AXI interface	1 64-bit AXI interface for external memory access
Virtual memory support	Yes
Code and data memory location restrictions	Unrestricted; arbitrary memory reads and writes
Physical address	32 bits
Resource locks with CPU	Semaphore lock
TLB	4 cache lines per requestor

14.3.2.2 GPU Power Management Features

Table 14-9. Power management features

Feature	GPU Support
Low power CMOS technology compatible	Yes
Automatic clock gating of flip flops and rams	Yes
Global clock gating of unused macro blocks	Yes
Software controlled effective clock frequency without changing the PLL	Yes

14.3.2.3 GPU Command Processor Features

Table 14-10. GPU command processor features

Feature	GPU Support
Counters	Variety of hardware counters for performance profiling

14.3.2.4 Texture processing

Table 14-11. Texture Processing Features

Feature	GPU Support
Fixed-point input texture formats	A8, L8, I8, A8L8, ARGB4, XRGB4, ARGB8, XRGB8, ABGR8, XBGR8, R5G6B5, A1RGB5, X1RGB5, YUY2, UYVY, D16, D24X8, A8_OES, DXT1, DXT2, DXT3, DXT4, DXT5, ETC1. All fixed-point formats are filtered.

14.3.3 Usage Mode

The GPU should be programmed through the NXP provided driver. NXP does not provide support for software that directly programs the GPU registers. APIs for programming the GPU through the software driver are described in separate driver documentation.

Chapter 15
Video Processing Unit (VPU)

15.1 VPU G1 (VPU_G1)

15.1.1 Overview

This block details the VPU G1 hardware based decoders and API. The decoders are able to decode H.264, VP8. The decoders conform to the H.264 Baseline, Main and High profile, and VP8 Main Profile

NOTE

The overall performance and capabilities of the decoders is system dependent. Formats and features that are presented depend on the chip configuration.

15.1.2 Features (G1)

The API is implemented on top of the VPU G1 decoder H.264 and VP8. The features of the decoders are noted in the following sections.

15.1.2.1 Decoder Features

The VPU G1 decoder has the following features:

- H.264 baseline profile, levels 1-4.1 decoding
  - Byte stream input
  - NAL unit input
- VP8 decoding
- Video post-processing features
  - Frame rotation 90 degrees left/right
  - Frame mirroring horizontally/vertically
  - Frame cropping

- Frame conversion from YCbCr formats to 16-bit or 32-bit RGB formats
- Frame scaling with maximum up-scaling factor of 3
- Two rectangular or alpha blending masks for output frame

The post-processing features can be used in pipeline with the decoder. The post-processing features can also be used as stand-alone, without performing any decoding.

- H.264 main and high profile, levels 1-4.1 decoding
- VP8 decoding

15.1.3 Video Frame Storage Format

This chapter describes the different input and output picture storage formats supported by the decoder and post-processor. Notice that some of the formats are only used for input or output.

15.1.3.1 YCbCr 4:2:0 Planar Format

In the planar format each video sample component forms one memory plane. The luminance and both chrominance planes must be stored in a linear and contiguous memory block as shown in Figure 3. The luminance samples are stored in raster-scan order (Y0Y1Y2Y3Y4….). The chrominance samples are stored in two planes also in raster scan order (Cb0Cb1Cb2Cb3… and Cr0Cr1Cr2Cr3…).

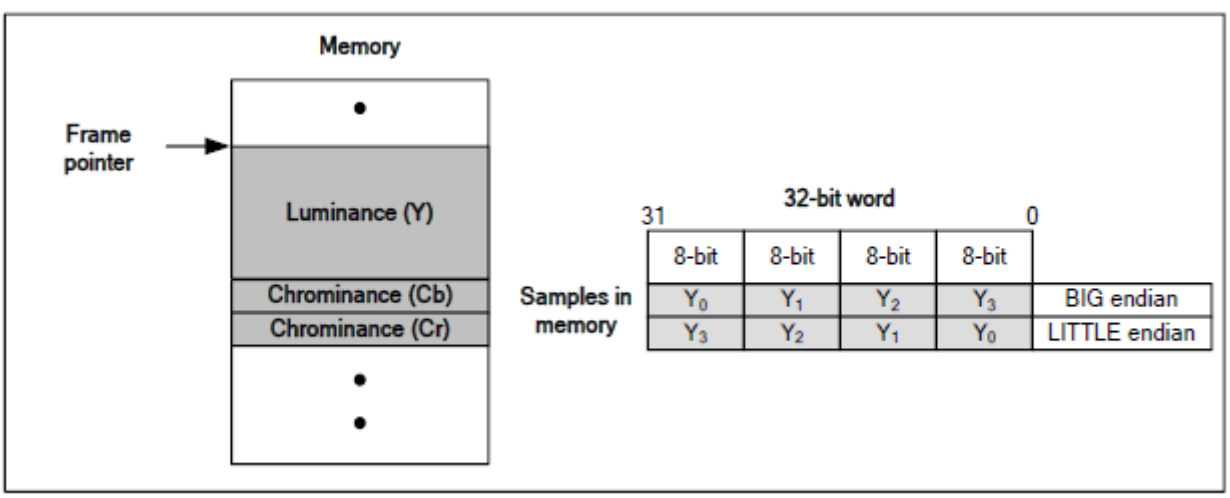

Figure 15-1. YCBCR 4:2:0 Planar Format External Memory Usage

The YCbCr 4:2:0 planar format is supported only as an input format for the postprocessor. In this format each pixel takes 12 bits of memory.

15.1.3.2 YCbCr 4:2:0 Semi-Planar Format

In semi-planar YCbCr 4:2:0 format the luminance samples form one plane in memory, and chrominance samples form another. The luminance and chrominance planes must be stored in a linear and contiguous memory block as presented in the following figure. The luminance pixels are stored in raster-scan order Y0Y1Y2Y3Y4…. The interleaved chrominance CbCr samples are stored in raster-scan order in memory as Cb0Cr0Cb1Cr1Cb2Cr2Cb3....

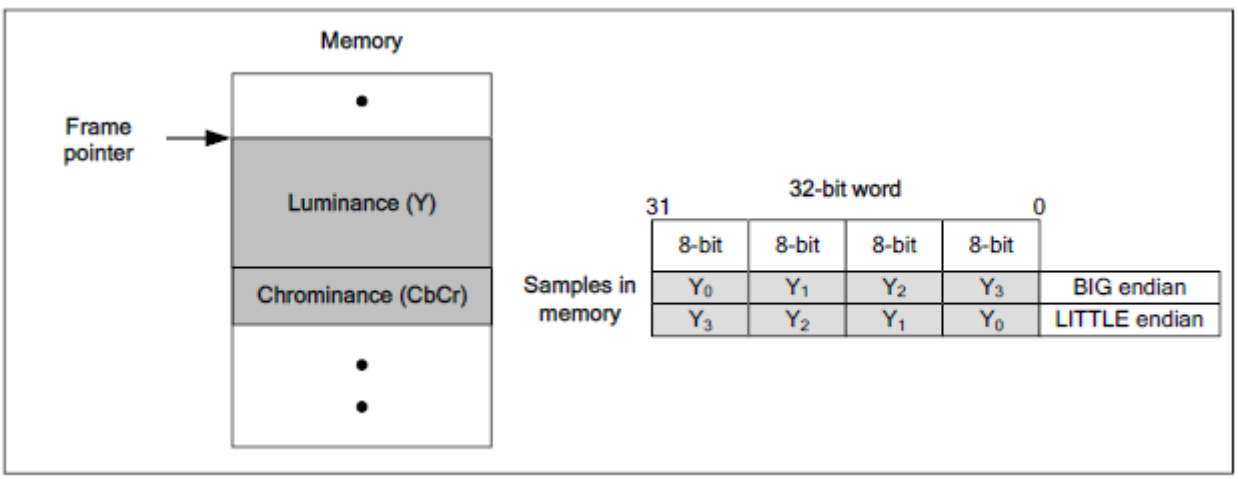

Figure 15-2. YCBCR 4:2:0 Planar Format External Memory Usage

The YCbCr 4:2:0 semi-planar format is supported both as an input and as an output format for the post-processor. In this format each pixel takes 12 bits of memory. As the chrominance components are interleaved, the bus load caused by this format can be slightly lower than with the planar format due to the reduced amount of non-sequential memory addressing.

15.1.3.3 YCbCr 4:2:2 Interleaved Format

In the interleaved YCbCr 4:2:2 format the pixel samples form a single plane in which the data has to be stored linearly and contiguously as shown in Figure 5. The pixel data is in raster scan order and the chrominance samples are interleaved between the luminance samples as Y0Cb0Y1Cr0Y2Cb1Y3Cr1….

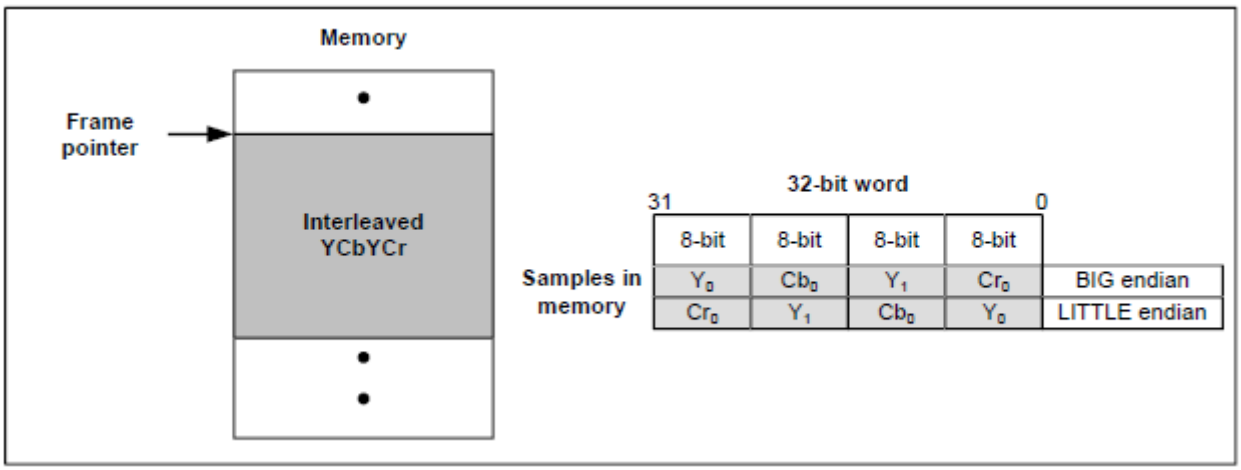

Figure 15-3. YCBCR 4:2:2 Interleaved Format External Memory Usage

The YCbCr 4:2:2 interleaved format is supported both as an input and as an output format for the post-processor. In this format each pixel takes 16 bits of memory. Although there is more data to be transferred than in the 4:2:0 formats, the interleaved format is bus effective as there are no non-sequential memory accesses caused by the plane changes.

15.1.3.4 G2 Decoder Tiled 4x4 Format

The output picture of the decoder is in semi-planar YCbCr 4:2:0 4x4 tiled format, i.e. luminance data forms one plane in memory, and chrominance data forms another. The distinction from raster scan format is that the output picture is grouped into tiles, which are then stored linearly and contiguously in the memory. The chrominance tiles have to be stored right after the luminance tiles in external memory as shown in Figure 6.

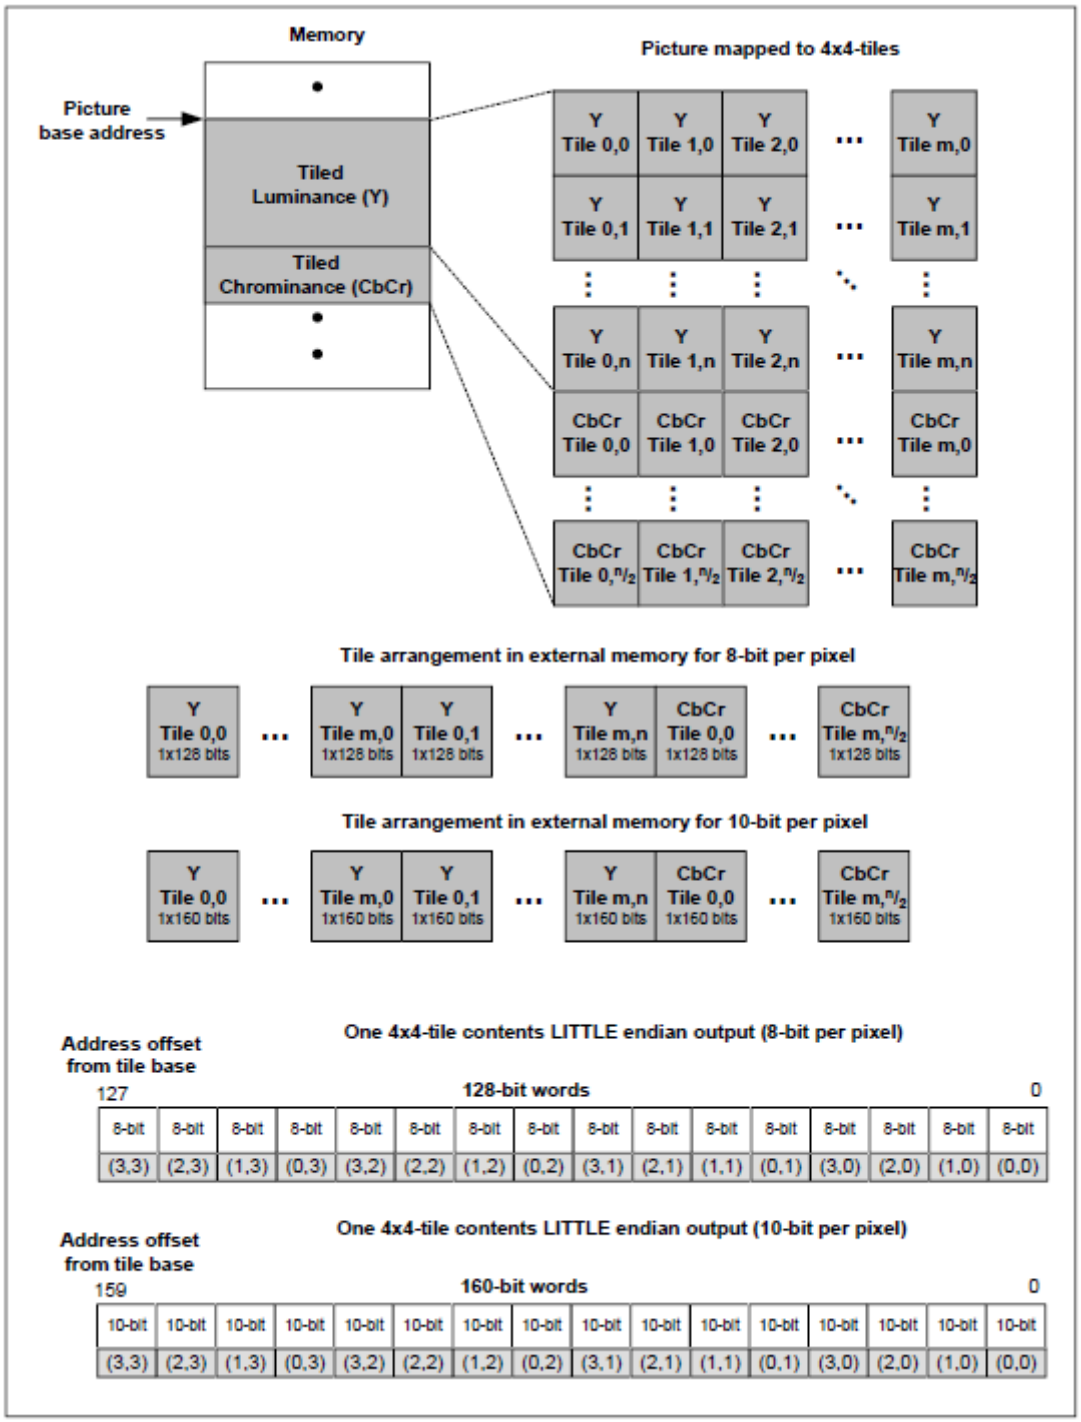

Figure 15-4. Tiled 4x4 Format External Memory Usage

15.1.3.5 RGB 16bpp Format

In this format each pixel is represented by 16 or less bits containing the red, blue and green samples. There are several 16bpp formats which use different number of bits for each sample. For example the RGB 5-5-5 format uses 5 bits for each sample and 1 bit is left unused or can represent a transparency flag, where RGB 5-6-5 uses 6 bits for the G sample and 5 bits for R and B samples. Common for all 16bpp types is that two pixels fit into one 32-bit space.

The data has to be stored linearly and contiguously in the memory as shown in Figure 7. The order of the sample bytes is always defined with a 16 bit word which will define the byte order in the memory. The pixel samples are stored in raster-scan order.

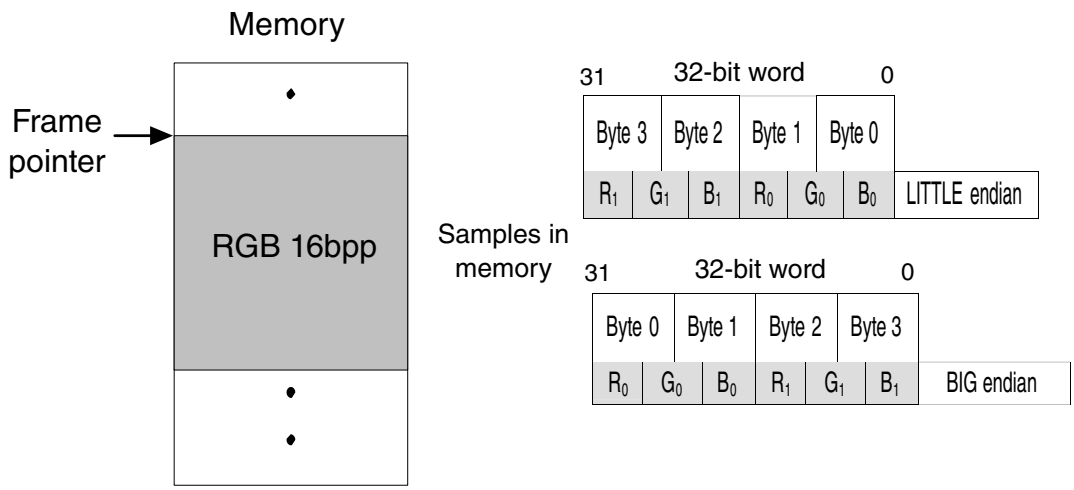

Figure 15-5. RGB 16bpp Format External Memory Usage

The RGB 16bpp formats are supported only as post-processor output formats.

15.1.3.6 RGB 32bpp Format

Any RGB format that has its pixels represented by more than 16 bits each is considered to be of 32bpp type. Typically in this format each pixel is represented by three bytes containing a red, blue and green sample and a 4th byte which can be empty or hold an alpha blending value. Common for all 32bpp types is that only one pixel fit into one 32-bit space.

The data has to be stored linearly and contiguously in the memory as shown in Figure 8. The order of the sample bytes is always defined on a 32 bit word and that will define the byte order in the memory (for example, ARGB order means that on a little endian system

the B sample will be stored in the lowest offset byte followed by the G, R and A samples. In a big endian system the A sample will be on the lowest offset byte). The pixel samples are stored in raster-scan order.

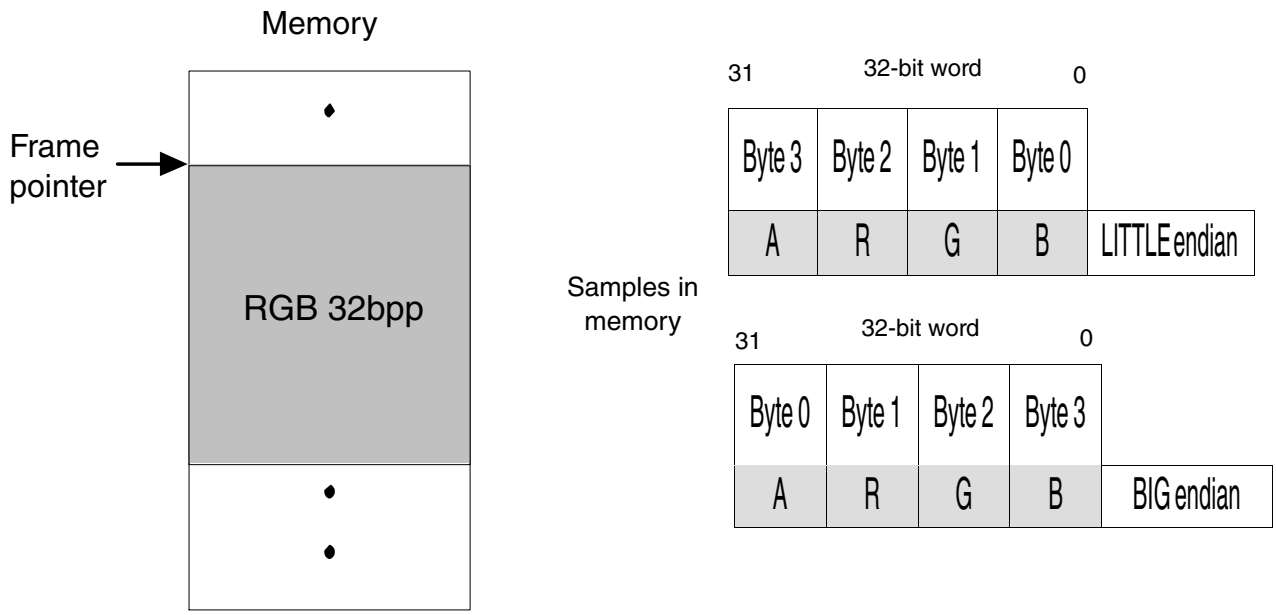

Figure 15-6. RGB 32bpp Format External Memory Usage

15.1.5 VPU G1 Memory Map/Register Definition

15.1.5.1 VPU_G1 common registers descriptions

15.1.5.1.1 VPU_G1 common registers memory map

VPU_G1 base address: 3830_0000h

Offset	Register	Width (In bits)	Access	Reset value
4h	Interrupt register decoder (SWREG1)	32	RW	0000_0000h
8h	Device configuration register decoder (SWREG2)	32	RW	0000_0000h

Table continues on the next page...

Offset	Register	Width (In bits)	Access	Reset value
Ch	Decoder control register 0 (decmode,picture type etc) (SWREG3)	32	RW	0000_0000h
30h	Base address for RLC data (RLC) / stream start address/decoded end addr register (VLC) (SWREG12)	32	RW	0000_0000h
34h	Base address for decoded picture (SWREG13)	32	RW	0000_0000h
A0h	Base address for standard dependent tables (SWREG40)	32	RW	0000_0000h
A4h	Base address for direct mode motion vectors (SWREG41)	32	RW	0000_0000h
C0h	Error concealment register (SWREG48)	32	RW	0000_0000h
C4h	Prediction filter tap register for H264 (SWREG49)	32	RW	0000_0000h
C8h	Synthesis configuration register decoder 0 (SWREG50)	32	RO	Table 15-
CCh	Reference picture buffer control register (SWREG51)	32	RW	0000_0000h
D0h	Reference picture buffer information register 1 (SWREG52)	32	RO	0000_0000h
D4h	Reference picture buffer information register 2 (SWREG53)	32	RO	0000_0000h
D8h	Synthesis configuration register decoder 1 (SWREG54)	32	RO	0000_0000h
DCh	Reference picture buffer 2 / Advanced prefetch control register (SWREG55)	32	RW	0000_0000h
E0h	Reference buffer information register 3 (SWREG56)	32	RO	0000_0000h
E4h	Decoder fuse register (SWREG57)	32	RO	Table 15-
E8h	Device configuration register decoder 2 + Multi core control register (SWREG58)	32	RW	0000_0000h
ECh	H264 Chrominance 8 pixel interleaved data base (SWREG59)	32	RW	0000_0000h
F0h	Interrupt register post-processor (SWREG60)	32	RW	0000_0000h
F4h	Device configuration register post-processor (SWREG61)	32	RW	0000_0100h
F8h	Deinterlace control register (SWREG62)	32	RW	0000_0000h
FCh	Base address for reading post-processing input picture luminance (top field/frame) (SWREG63)	32	RW	0000_0000h
100h	Base address for reading post-processing input picture Cb/Ch (top field/frame) (SWREG64)	32	RW	0000_0000h
104h	Base address for reading post-processing input picture Cr (SWRE G65)	32	RW	0000_0000h
108h	Base address for writing post-processed picture luminance/RGB (SWREG66)	32	RW	0000_0000h
10Ch	Base address for writing post-processed picture Ch (SWREG67)	32	RW	0000_0000h
110h	Register for contrast adjusting (SWREG68)	32	RW	0000_0000h
114h	Register for colour conversion and contrast adjusting/YUYV 422 channel orders (SWREG69)	32	RW	0000_0000h
118h	Register for colour conversion 0 (SWREG70)	32	RW	0000_0000h
11Ch	Register for colour conversion 1 + rotation mode (SWREG71)	32	RW	0000_0000h
120h	PP input size and -cropping register (SWREG72)	32	RW	0000_0000h
124h	PP input picture base address for Y bottom field (SWREG73)	32	RW	0000_0000h
128h	PP input picture base for Ch bottom field (SWREG74)	32	RW	0000_0000h
13Ch	Scaling register 0 ratio and padding for R and G (SWREG79)	32	RW	0000_0000h
140h	Scaling ratio register 1 and padding for B (SWREG80)	32	RW	0000_0000h

Table continues on the next page...

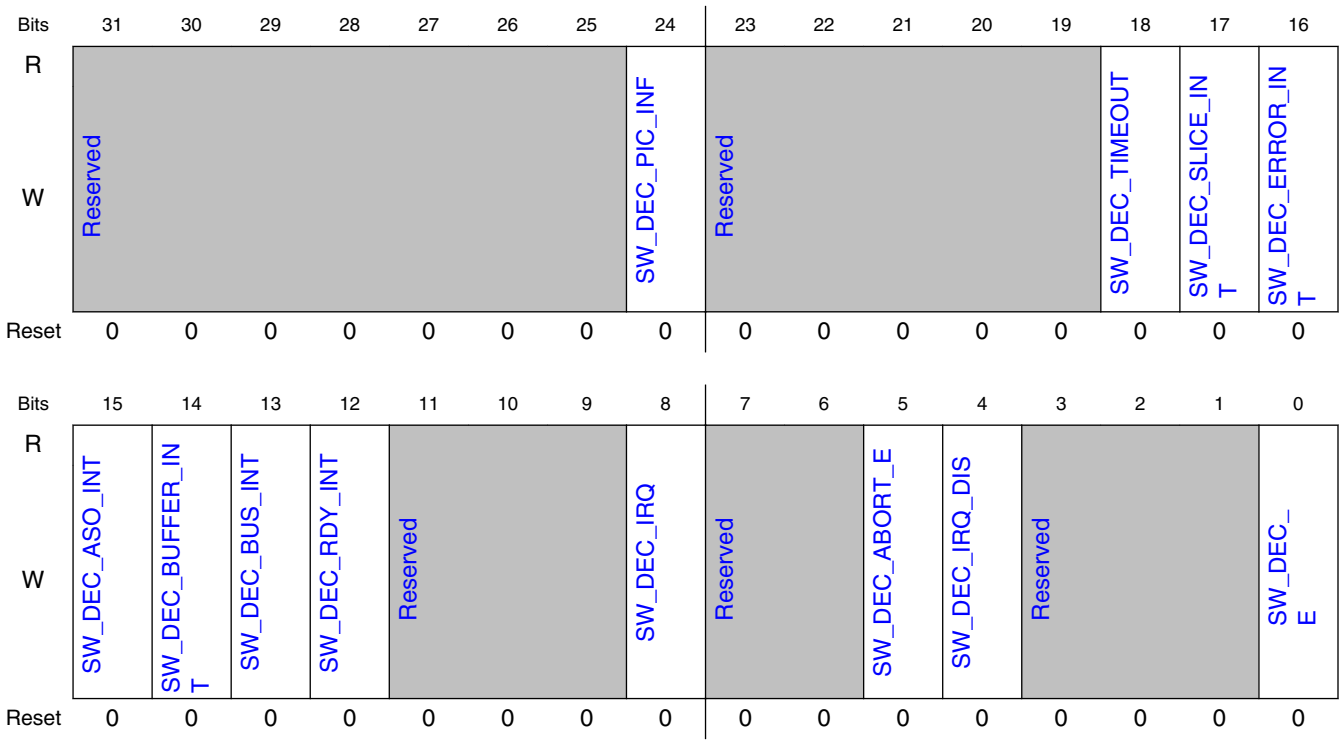
Offset	Register	Width (In bits)	Access	Reset value
144h	Scaling ratio register 2 (SWREG81)	32	RW	0000_0000h
148h	Rmask register (SWREG82)	32	RW	0000_0000h
14Ch	Gmask register (SWREG83)	32	RW	0000_0000h
150h	Bmask register (SWREG84)	32	RW	0000_0000h
154h	Post-processor control register (SWREG85)	32	RW	0000_0000h
158h	Mask 1 start coordinate register (SWREG86)	32	RW	0000_0000h
15Ch	Mask 2 start coordinate register + Mask extensions (SWREG87)	32	RW	0000_0000h
160h	Mask 1 size and PP original width register (SWREG88)	32	RW	0000_0000h
164h	Mask 2 size register + mask extensions (SWREG89)	32	RW	0000_0000h
168h	PiP register 0 (SWREG90)	32	RW	0000_0000h
16Ch	PiP register 1 and dithering control (SWREG91)	32	RW	0000_0000h
170h	Display width and PP input size extension register (SWREG92)	32	RW	0000_0000h
174h	Base address for alpha blend 1 gui component (SWREG93)	32	RW	0000_0000h
178h	Base address for alpha blend 2 gui component (SWREG94)	32	RW	0000_0000h
17Ch	Alpha blend input cropping register (scanline for cropping) (SWREG95)	32	RW	0000_0000h
18Ch	PP fuse register (SWREG99)	32	RO	Table 15-
190h	Synthesis configuration register post-processor (SWREG100)	32	RO	Table 15-
198h	Base address for H264 decoded chroma picture (SWREG102)	32	RW	0000_0000h
19Ch	Base address for reference chroma picture index 0 (SWREG103)	32	RW	0000_0000h
1A0h	Base address for reference chroma picture index 1 (SWREG104)	32	RW	0000_0000h
1A4h	Base address for reference chroma picture index 2 (SWREG105)	32	RW	0000_0000h
1A8h	Base address for reference chroma picture index 3 (SWREG106)	32	RW	0000_0000h
1ACh	Base address for reference chroma picture index 4 (SWREG107)	32	RW	0000_0000h
1B0h	Base address for reference chroma picture index 5 (SWREG108)	32	RW	0000_0000h
1B4h	Base address for reference chroma picture index 6 (SWREG109)	32	RW	0000_0000h
1B8h	Base address for reference chroma picture index 7 (SWREG110)	32	RW	0000_0000h
1BCh	Base address for reference chroma picture index 8 (SWREG111)	32	RW	0000_0000h
1C0h	Base address for reference chroma picture index 9 (SWREG112)	32	RW	0000_0000h
1C4h	Base address for reference chroma picture index 10 (SWREG113)	32	RW	0000_0000h
1C8h	Base address for reference chroma picture index 11 (SWREG114)	32	RW	0000_0000h
1CCh	Base address for reference chroma picture index 12 (SWREG115)	32	RW	0000_0000h
1D0h	Base address for reference chroma picture index 13 (SWREG116)	32	RW	0000_0000h
1D4h	Base address for reference chroma picture index 14 (SWREG117)	32	RW	0000_0000h
1D8h	Base address for reference chroma picture index 15 (SWREG118)	32	RW	0000_0000h

15.1.5.1.2 Interrupt register decoder (SWREG1)

15.1.5.1.2.1 Offset

Register	Offset
SWREG1	4h

15.1.5.1.2.2 Diagram



15.1.5.1.2.3 Fields

Field	Function
31-25 —	Reserved.
24 SW_DEC_PIC_INF	B slice detected. This signal is driven high during picture ready interrupt if B-type slice is found. This bit does not launch interrupt but is used to inform SW about h264 tools.
23-19 —	Reserved.
18 SW_DEC_TIMEOUT	Interrupt status bit decoder timeout. When high the decoder has been idling for too long. HW will self reset. Possible only if timeout interrupt is enabled

Table continues on the next page...

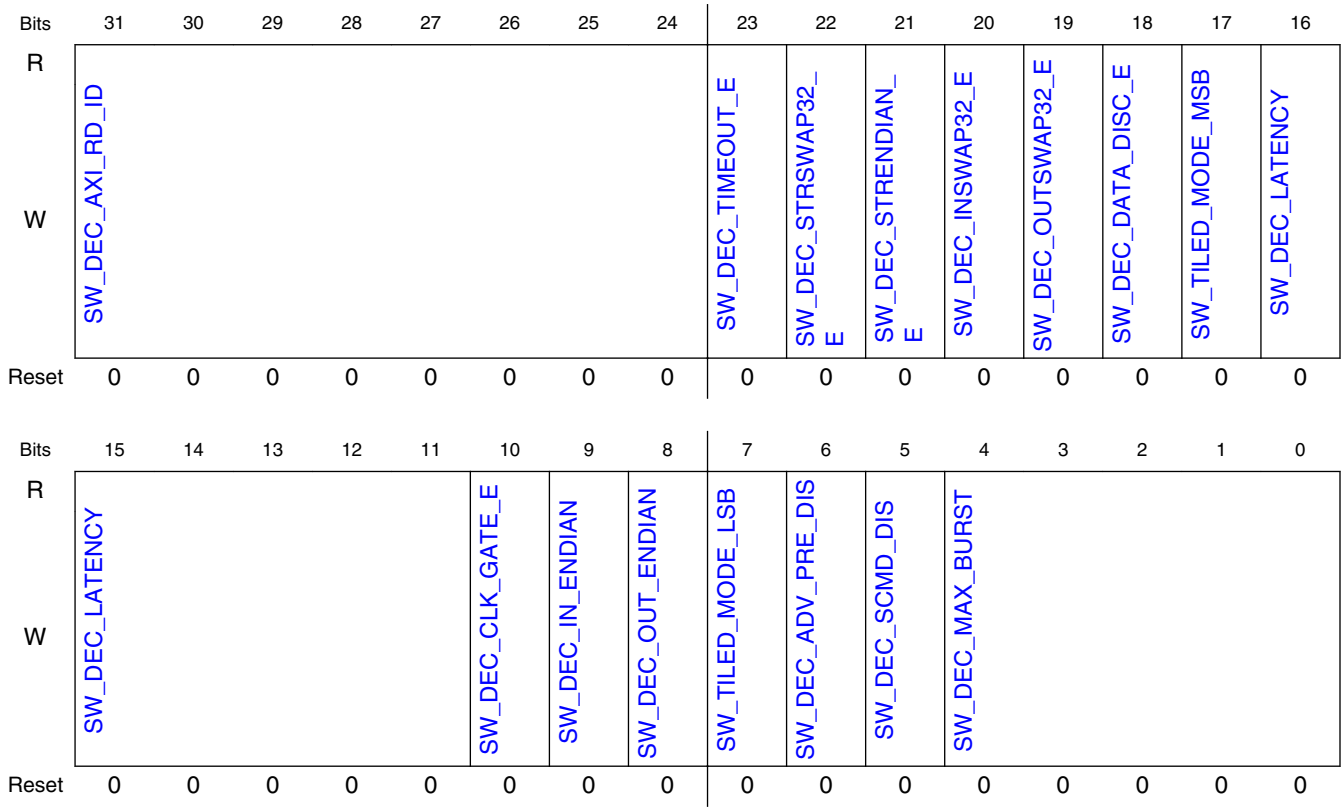
Field	Function
17 SW_DEC_SLICE_INT	Interrupt status bit dec_slice_decoded. When high SW must set new base addresses for sw_dec_out_base and sw_jpg_ch_out_base before resetting this status bit. Used for VP8 web-p modes
16 SW_DEC_ERROR_INT	Interrupt status bit input stream error. When high, an error is found in input data stream decoding. HW will self reset.
15 SW_DEC_ASO_INT	H264: Interrupt status bit ASO (Arbitrary Slice Ordering) detected. When high, ASO detected in input data stream decoding. HW will self reset. VP8: Error detected in Residual data. HW returns MB number in error concealment register for MB it detected it
14 SW_DEC_BUFFER_INT	Interrupt status bit input buffer empty. When high, input stream buffer is empty but picture is not ready. HW will not self reset.
13 SW_DEC_BUS_INT	Interrupt status bit bus. Error response from bus.
12 SW_DEC_RDY_INT	Interrupt status bit decoder. When this bit is high decoder has decoded a picture. HW will self reset.
11-9 —	Reserved.
8 SW_DEC_IRQ	Decoder IRQ. When high, decoder requests an interrupt. SW will reset this after interrupt is handled.
7-6 —	Reserved.
5 SW_DEC_ABORT_E	Abort decoding enable. Setting this bit high will cause HW to abort decoding and safely to reset itself down. After abort is complete the corresponding interrupt status is set and this bit is set low as well as the decoder enable.
4 SW_DEC_IRQ_DIS	Decoder IRQ disable. When high, there are no interrupts concerning decoder from HW. Polling must be used to see the interrupt statuses.
3-1 —	Reserved.
0 SW_DEC_E	Decoder enable. Setting this bit high will start the decoding operation. HW will reset this when picture is processed or ASO or stream error is detected or bus error or timeout interrupt is given.

15.1.5.1.3 Device configuration register decoder (SWREG2)

15.1.5.1.3.1 Offset

Register	Offset
SWREG2	8h

15.1.5.1.3.2 Diagram



15.1.5.1.3.3 Fields

Field	Function
31-24 SW_DEC_AXI_RD_ID	Read ID used for decoder reading services in AXI bus (if connected to AXI).
23 SW_DEC_TIMEOUT_E	Timeout interrupt enable. If enabled HW may return timeout interrupt in case HW gets stuck while decoding picture.
22 SW_DEC_STRSWAP32_E	Decoder input 32bit data swap for stream data (may be used for 64 bit environment): 0b - no swapping of 32 bit words 1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled))
21 SW_DEC_STRENDIAN_E	Decoder input endian mode for stream data: 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
20	Decoder input 32bit data swap for other than stream data (may be used for 64 bit environment): 0b - no swapping of 32 bit words

Table continues on the next page...

Field	Function
SW_DEC_INSWAP32_E	1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled))
19 SW_DEC_OUTSWAP32_E	Decoder output 32bit data swap (may be used for 64 bit environment): 0b - no swapping of 32 bit words 1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled))
18 SW_DEC_DATA_DISC_E	Data discard enable. Precise burst lengths are used with reading services. Extra data is discarded internally. Note. If AHB maxburst 17 is used data discard cannot be enabled (causes conflict)
17 SW_TILED_MODE_MSB	Tiled mode msb. Concatenated to Tiled mode lsb which form 2 bit tiled mode. 0b - Tiled mode not enabled 1b - Tiled mode enabled for 8x4 tile size
16-11 SW_DEC_LATENCY	Decoder master interface additional latency. Can be used to slow down decoder HW between services in steps of 8 clock cycles: 0 = no latency 1 = minimum 8 cycles of IDLE between services 2 = minimum 16 cycles of IDLE between services . . . 63 = minimum latency of 504 cycles of IDLE between services
10 SW_DEC_CLK_GATE_E	Decoder dynamic clock gating enable: 0b - Clock is running for all structures 1b - Clock is gated for decoder structures that are not used. Note: Clock gating value can be changed only when decoder is disabled.
9 SW_DEC_IN_ENDIAN	Decoder input endian mode for other than stream data: 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
8 SW_DEC_OUT_ENDIAN	Decoder output endian mode: 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
7 SW_TILED_MODE_LSB	Tiled mode lsb. Concatenated to Tiled mode msb which form 2 bit tiled mode. Defined in tiled_mode_msb
6 SW_DEC_ADV_PRE_DIS	Advanced PREFETCH mode disable (advanced reference picture reading mode for video)
5 SW_DEC_SCMD_DIS	9170 decoder and later->: AXI Single Command Multiple Data disable. 9170 axi wrapper supports this mode by default (where only the first addresses of the burst are given from address generator). This bit is used to disable the feature (possible SW workaround if something is not working correctly)
4-0 SW_DEC_MAX_BURST	Maximum burst length for decoder bus transactions. Valid values: AHB: 1, 4, 8, 16 and 17. Other values will result in INCR type (undefined length) for all transfers. INCR used for lengths 2 and 3.

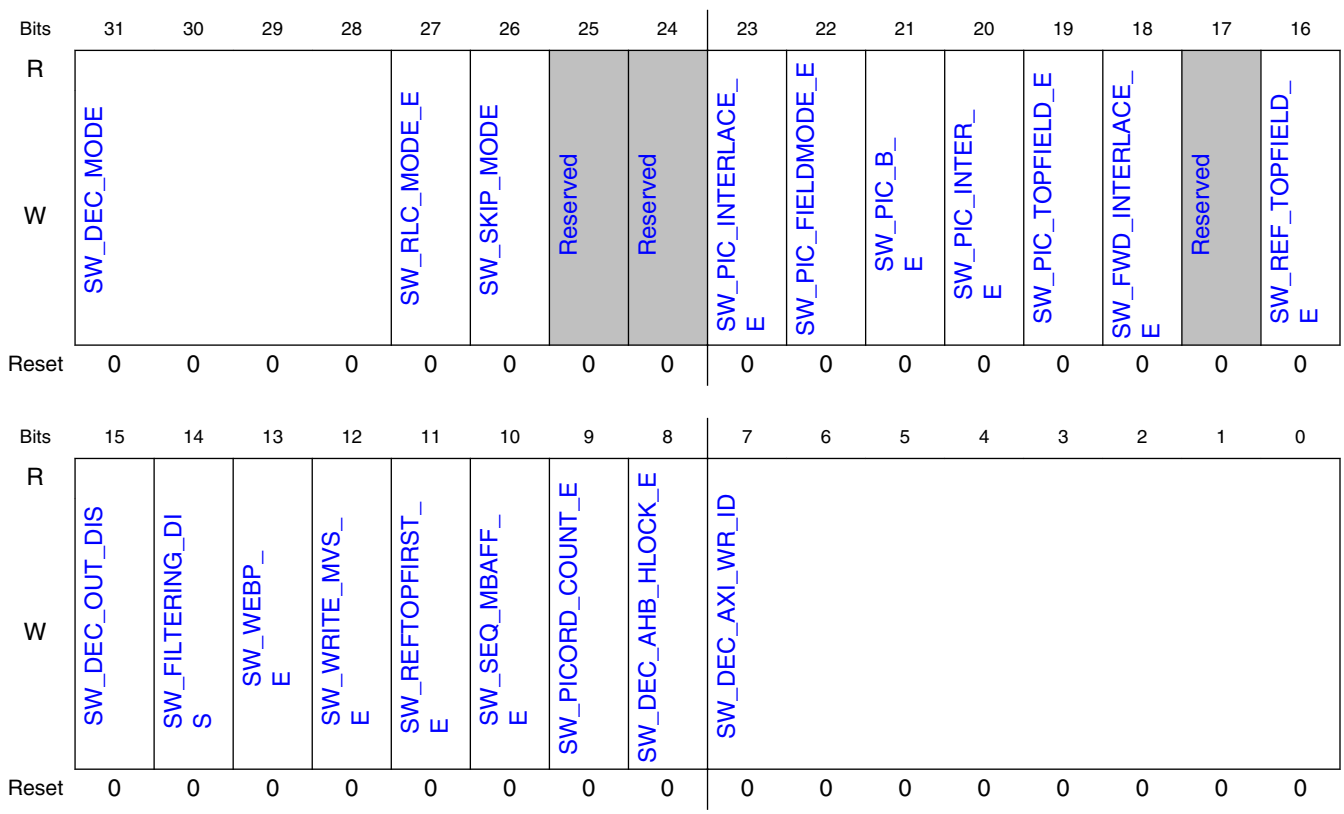
Field	Function
	17 = fixed bursts are used when possible. INCR bursts are used for lengths 2, 3, 5, 6, 7, 9, 10, 11, 12, 13, 14 and 15. OCP: 16-31 AXI: 1-16

15.1.5.1.4 Decoder control register 0 (decmode,picture type etc) (SWREG3)

15.1.5.1.4.1 Offset

Register	Offset
SWREG3	Ch

15.1.5.1.4.2 Diagram



15.1.5.1.4.3 Fields

Field	Function
31-28 SW_DEC_MODE	Decoding mode: 0000b - H.264 0001b - Reserved 0010b - Reserved 0011b - Reserved 0100b - Reserved 0101b - Reserved 0110b - Reserved 0111b - Reserved 1000b - Reserved 1001b - Reserved 1010b - VP8 1011b - Reserved 1100b - Reserved 1101b - Reserved 1110b - Reserved 1111b - Reserved
27 SW_RLC_MODE_E	RLC mode enable: 0b - HW decodes video from bit stream (VLC mode) + side information 1b - HW decodes video from RLC input data + side information (Differential MV's, separate DC coeffs, Intra 4x4 modes, MB control). Valid only for H.264 Baseline.
26 SW_SKIP_MODE	VP8: • 0 : HW decodes mb_coeff_skip -flag • 1 : HW does not decode mb_coeff_skip -flag
25 —	Reserved.
24 —	Reserved.
23 SW_PIC_INTERLACE_E	Coding mode of the current picture: 0b - progressive 1b - interlaced
22 SW_PIC_FIELDMODE_E	Structure of the current picture (residual structure) 0b - Frame structure. For H264, this means MBAFF structured picture for interlaced sequence 1b - Field structure
21 SW_PIC_B_E	B picture enable for current picture: 0b - picture type is I or P depending on sw_pic_inter_e 1b - picture type is B depending on sw_pic_inter_e (not valid for H264 since it is slice based information)
20 SW_PIC_INTER_E	Picture type. Please also see SW_PIC_B_E. 0b - Intra type (I) 1b - Inter type (P)
19 SW_PIC_TOPFIELD_E	If field structure is enabled, this bit informs which one of the fields is being decoded: 0b - bottom field 1b - top field
18 SW_FWD_INTERLACE_E	Coding mode of forward reference picture **NOTE:** For backward reference picture, the coding mode is always the same as for current picture. 0b - progressive

Table continues on the next page...

Field	Function
	1b - interlaced
17 —	Reserved.
16 SW_REF_TOPFIELD_E	Indicates which field should be used as reference if sw_ref_frames = '0': 0b - bottom field 1b - top field
15 SW_DEC_OUT_DIS	Disable decoder output picture writing: 0b - Decoder output picture is written to external memory 1b - Decoder output picture is not written to external memory
14 SW_FILTERING_DIS	De-block filtering disable: 0b - filtering is enabled for current picture 1b - filtering is disabled for current picture
13 SW_WEBP_E	SW_WEBP_E: Webp enable for VP8: • '0' = Normal VP8 • '1' = WEBP picture SW_MVC_E: Multi View Coding enable. Possible for H264 only.
12 SW_WRITE_MVS_E	Direct mode motion vector write enable for current picture / VPX motion vector write enable for error concealment purposes: 0b - Writing disabled for current picture 1b - The direct mode motion vectors are written to external memory. H264 direct mode motion vectors are written to DPB aside with the corresponding reference picture. Other decoding mode dir mode mvs are written to external memory starting from sw_dir_mv_base.
11 SW_REFTOPFIRST_E	Indicates which FWD reference field has been decoded first. 0b - FWD reference bottom field 1b - FWD reference top field
10 SW_SEQ_MBAFF_E	Sequence includes MBAFF coded pictures
9 SW_PICORD_COUNT_E	h264_high config: Picture order count table read enable. If enabled HW will read picture order counts from memory in the beginning of picture
8 SW_DEC_AHB_HLOCK_E	AHB master HLOCK enable. When high the service is locked to decoder as long as it needs the bus (whenever decoder requests the bus it will be granted)
7-0 SW_DEC_AXI_WR_ID	Write ID used for decoder writing services in AXI bus (if connected to AXI)

15.1.5.1.5 Base address for RLC data (RLC) / stream start address/ decoded end addr register (VLC) (SWREG12)

15.1.5.1.5.1 Offset

Register	Offset
SWREG12	30h

15.1.5.1.5.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

15.1.5.1.5.3 Fields

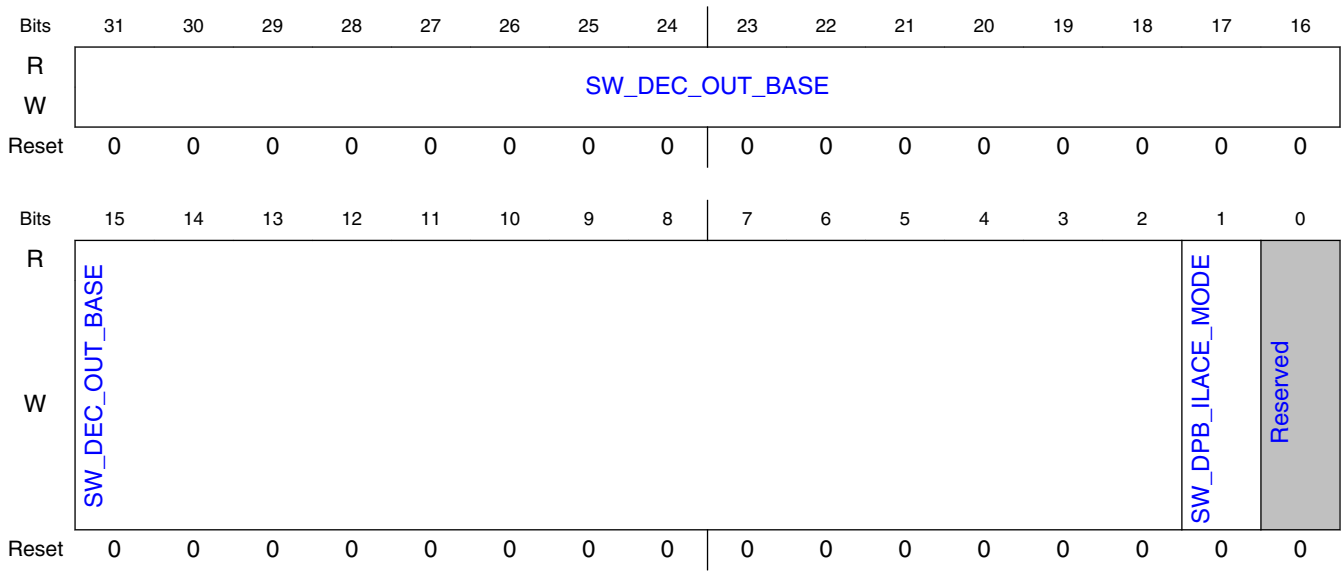
Field	Function
31-0 SW_RLC_VLC_BASE	RLC mode: Base address for RLC data (swreg3.sw_rlc_mode_e = 1). VLC mode: Stream start address / end addr+I288ess with byte precision (swreg4.rlc_mode_en = 0), start bit number in swreg5.stream_start_bit. When sw_dec_buffer_int is high or sw_dec_e is low this register contains HW return value of last_byte_address where stream has been read (and used) in accuracy of byte. For debug purposes the last_byte_address is also written when stream error/ASO is detected even though it may not be accurate. VP8: This base address is used as sw_dct_strm0_base including DCT stream for MB rows 0,2n.

15.1.5.1.6 Base address for decoded picture (SWREG13)

15.1.5.1.6.1 Offset

Register	Offset
SWREG13	34h

15.1.5.1.6.2 Diagram



15.1.5.1.6.3 Fields

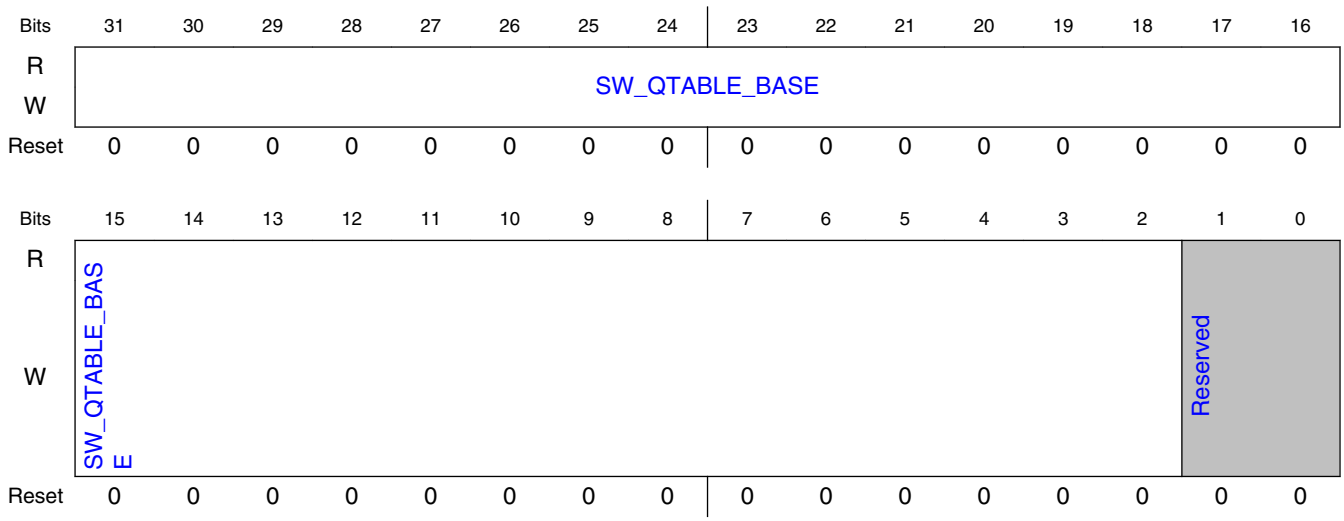
Field	Function
31-2 SW_DEC_OUT_BASE	Video: Base address for decoder output picture. Points directly to start of decoder output picture or field.
1 SW_DPB_ILACE_MODE	DPB ilaced mode: '0' : DPB consist of ilaced/progressive frames '1' : DPB consist of progressive frames / separate fields. This mode requires config support from HW
0 —	Reserved.

15.1.5.1.7 Base address for standard dependent tables (SWREG40)

15.1.5.1.7.1 Offset

Register	Offset
SWREG40	A0h

15.1.5.1.7.2 Diagram



15.1.5.1.7.3 Fields

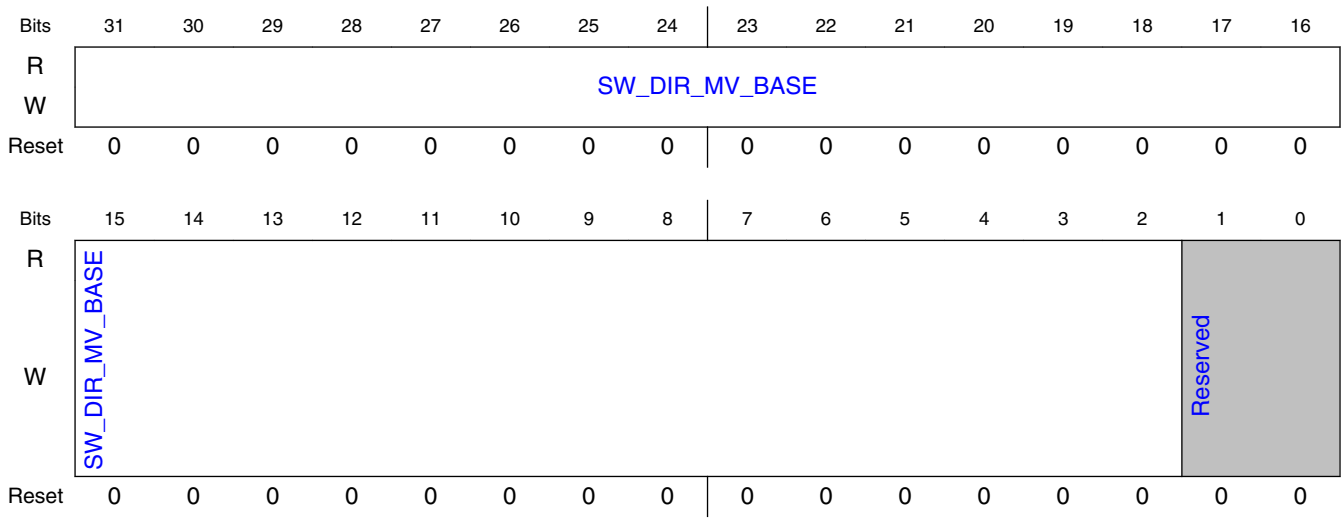
Field	Function
31-2 SW_QTABLE_BASE	Base address for standard dependent tables: H.264: base address for various tables VP8: base address for stream decoding tables
1-0 —	Reserved.

15.1.5.1.8 Base address for direct mode motion vectors (SWREG41)

15.1.5.1.8.1 Offset

Register	Offset
SWREG41	A4h

15.1.5.1.8.2 Diagram



15.1.5.1.8.3 Fields

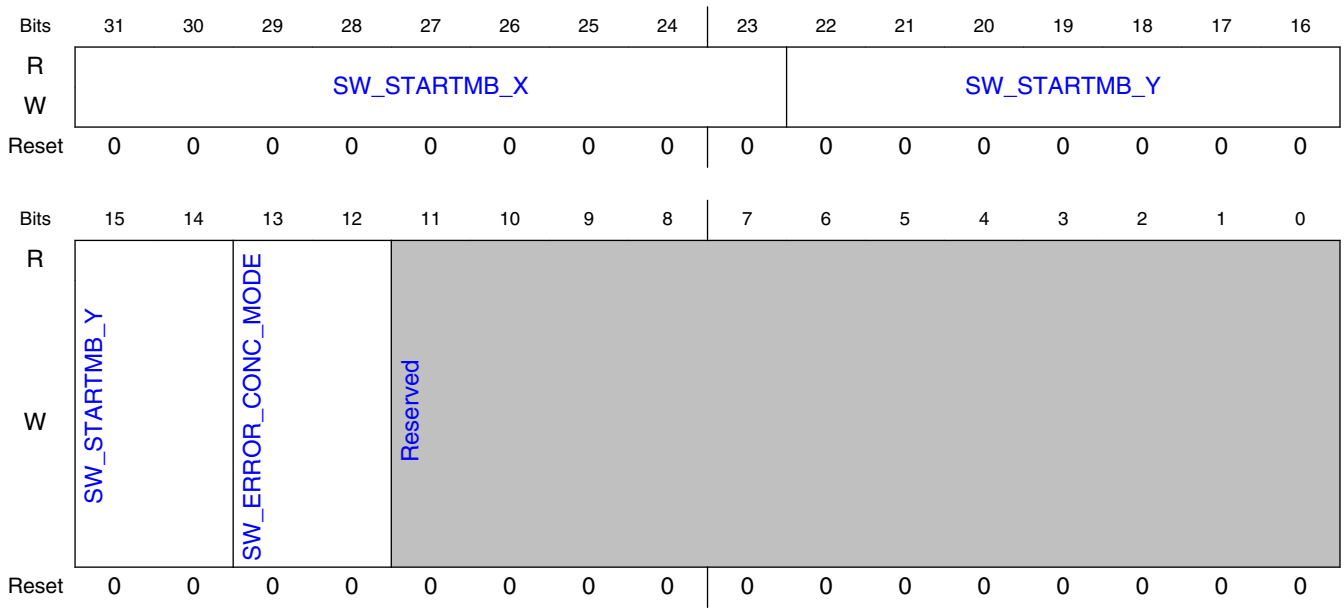
Field	Function
31-2 SW_DIR_MV_BASE	Direct mode motion vector write/read base address. For H264 this is used only for direct mode motion vector write base. VP8: Motion vectors are written for error concealment purposes if sw_write_mvs is high. In error concealment mode motion vectors are read from this base address
1-0 —	Reserved.

15.1.5.1.9 Error concealment register (SWREG48)

15.1.5.1.9.1 Offset

Register	Offset
SWREG48	C0h

15.1.5.1.9.2 Diagram



15.1.5.1.9.3 Fields

Field	Function
31-23 SW_STARTMB_X	Start MB from SW for X dimension. Used in error concealment case as HW return value if HW founds an error or in HW init mb for error concealment if SW enables error concealment
22-14 SW_STARTMB_Y	Start MB from SW for Y dimension. Used in error concealment case as HW return value if HW founds an error or in HW init mb for error concealment if SW enables error concealment
13-12 SW_ERROR_CONC_MODE	Error concealment mode: 00b - disabled (normal decoding mode) 01b - enabled for direct mode MV usage starting from MB defined by sw_startmb_x, sw_startmb_y
11-0 —	Reserved.

15.1.5.1.10 Prediction filter tap register for H264 (SWREG49)

27-26 —	Reserved.
25-24 SW_DEC_H264_PROF	Decoding format support, H.264 00b - not supported 01b - supported up to baseline profile 10b - supported up to high profile labeled stream with restricted high profile tools (Tools that are used in Hantro 7280, 8270 encoder) 11b - supported up to high profile

Table continues on the next page...

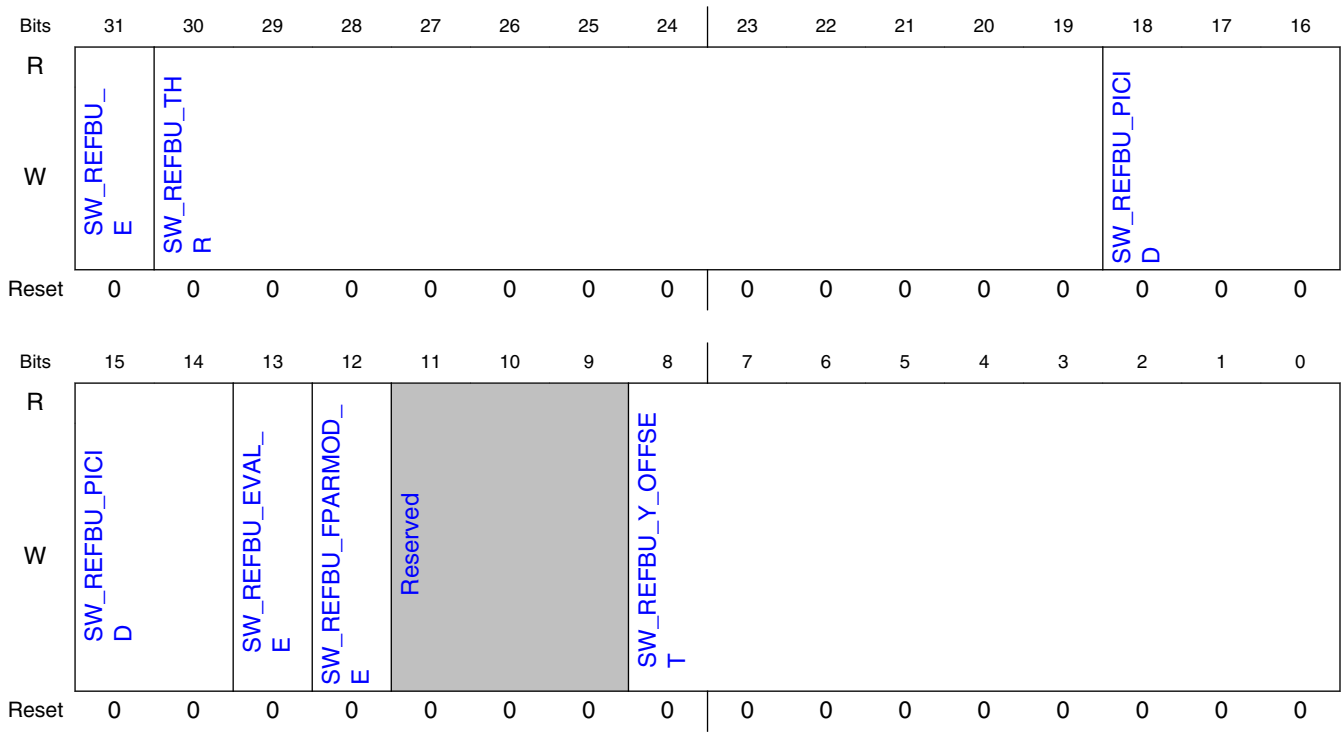
Field	Function
23 —	Reserved.
22 —	Reserved.
21 SW_DEC_OBUFF_LEVEL	Decoder output buffer level: 0b - 1 MB buffering is used 1b - 4 MB buffering is used
20 SW_REF_BUFF_EXIST	Reference picture buffer usage: 0b - not supported 1b - reference buffer is used
19-16 SW_DEC_BUS_STRD	Connected to standard bus: 0000b - error 0001b - AHB master, AHB slave 0010b - OCP master, OCP slave 0011b - AXI master, AXI slave 0100b - AXI master, APB slave 0101b - AXI master, AHB slave
15-14 SW_DEC_SYNTH_LAN	00b - error 01b - vhdl 10b - verilog
13-12 SW_DEC_BUS_WIDTH	00b - error 01b - 32 bit bus 10b - 64 bit bus 11b - 128 bit bus
11 SW_DEC_SOREN_PROF	Decoding format support, Sorenson 0b - not supported 1b - supported
10-0 SW_DEC_MAX_OWIDTH	Max configured decoder video resolution that can be decoded. Informed as width of the picture in pixels.

15.1.5.1.12 Reference picture buffer control register (SWREG51)

15.1.5.1.12.1 Offset

Register	Offset
SWREG51	CCh

15.1.5.1.12.2 Diagram



15.1.5.1.12.3 Fields

Field	Function
31 SW_REFBU_E	Refer picture buffer enable: 0b - refer picture buffer disabled 1b - refer picture buffer enabled. Valid if picture size is QVGA or more.
30-19 SW_REFBU_THR	Reference buffer disable threshold value (cache miss amount). Used to buffer shut down (if more misses than allowed)
18-14 SW_REFBU_PICID	The used reference picture ID for reference buffer usage
13 SW_REFBU_EVAL_E	Enable for HW internal reference ID calculation. If given threshold level is reached by any picture_id after first MB row, that picture_id is used for reference buffer fill for rest of the picture
12 SW_REFBU_FPARMOD_E	Field parity mode enable. Used in refbufferd evaluation mode. 0b - use the result field of the evaluation 1b - use the parity mode field
11-9 —	Reserved.
8-0 SW_REFBU_Y_OFFSET	Y offset for refbufferd. This coordinate is used to compensate the global motion of the video for better buffer hit rate

15.1.5.1.13 Reference picture buffer information register 1 (SWREG52)

15.1.5.1.13.1 Offset

Register	Offset
SWREG52	D0h

15.1.5.1.13.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29 SW_DEC_DIVX_PROF	DIVX Support: 0b - not supported 1b - supported
28 SW_REF_BUFF2_EXIST	Reference picture buffer 2 usage: 0b - not supported 1b - reference buffer 2 is used
27-26 —	Reserved.
25	ROM implementation type (If design includes ROMs) 0b - ROMs are implemented from actual ROM units

Table continues on the next page...

Field	Function
SW_DEC_RTL_ROM	1b - ROMs are implemented from RTL
24 —	Reserved.
23 SW_DEC_VP8_PROF	Decoding format support, VP8 0b - not supported 1b - supported
22 —	Reserved.
21 —	Reserved.
20 SW_DEC_MVC_PROF	Decoding format support, MVC 0b - not supported 1b - supported
19 SW_DEC_WEBP_E	Decoding format support, Web-p 0b - not supported bigger than 1080p resolution 1b - supported upto 16kx16k pixel resolution (defined max)
18-17 SW_DEC_TILED_L	Tiled mode support level 00b - not supported 01b - supported with 8x4 tile size for progressive content 10b - supported with 8x4 tile size for progressive/ilaced content
16 SW_DEC_VP8S_ARCH	VP8 Architecture type (for prediction) 0b - Same prediction architecture as for other decoding formats 1b - Dedicated small architecture for VP8 (refbuffer cannot be used either)
15-14 SW_DEC_MAX_OW_EXT	Max configured decoder video resolution that can be decoded. This is the MSB part of the configuration signal
13-12 SW_DEC_ERRCO_LEVEL	Decoder error concealment support level: 00b - Error concealment not supported (only error detection) 01b - VP8 direct mode motion vector error concealment supported
11 SW_VP8_STRIDE_E	Decoder output stride support for VP8. Separate base addresses for Y/C data and possibility to set scanline bigger than picture width: 0b - not supported, Y and C tables attached. 1b - supported, Y and C tables can be set freely.
10 SW_DPB_FIELD_E	DPB field separate mode support for ilaced content: 0b - Not supported. For ilaced content, DPB is ilaced frame order. 1b - Supported. For ilaced content, DPB can consist of ilaced frames or separate fields (TOP/BOT).
9-7 SW_DEC_CORE_AM	Decoder core amount. If other than 0, the multicore can be used. Each individual cores can be identified from corresponding core ID register: 000b - single core decoder 001b - dual core decoder 010b - 3 core decoder 011b - 4 core decoder 100b - 5 core decoder 101b - 6 core decoder 110b - 7 core decoder 111b - 8 core decoder

Table continues on the next page...

Field	Function
6-0 —	Reserved.

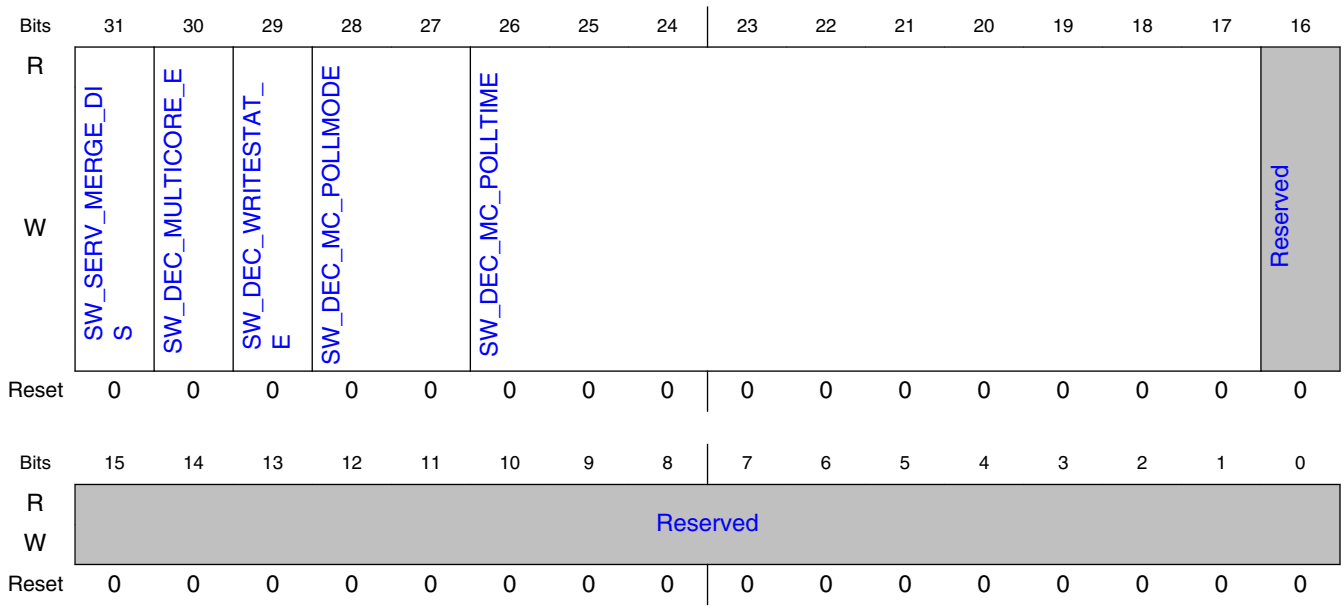
15.1.5.1.19 Device configuration register decoder 2 + Multi core control register (SWREG58)

15.1.5.1.19.1 Offset

Register	Offset
SWREG58	E8h

15.1.5.1.19.2 Diagram



15.1.5.1.19.3 Fields

Field	Function
31 SW_SERV_MERGE_DIS	Decoder service merge disable: 0b - HW merges simultaneous sub-block requests internally if they are same type (read or write). 1b - decoder serves one sub-block per service and merging is disabled.
30 SW_DEC_MULTICORE_E	Decoder multi core enable: 0b - Multi core disabled or only one core exists in design. 1b - Multi core enable. Each reference picture status must be verified from external memory status field before usage. 128 bits status word exists after each reference picture and include picture proceeding coordinates Y and X.
29 SW_DEC_WRITESTAT_E	Decoder write statusword enable. Must be high if multi core decoding enabled. HW writes output picture data proceeding to external memory after picture data (and after H264 direct mode MVS if they exist)
28-27 SW_DEC_MC_POLLMODE	Decoder multicore status reading mode: 00b - HW internal status polling mechanism is used. Status of reference picture is read only when required coordinate for the reference picture is not big enough. If the status is still not big enough after reading it the HW waits N clock cycles per pixel from the coordinate difference. The N is defined by the sw_dec_mc_polltime (range 0...4). 01b - Dummy status polling mechanism is used for all reference pictures. HW reads status of all reference pictures at frequency defined by sw_dec_mc_polltime.
26-17 SW_DEC_MC_POLLTIME	sw_dec_mc_polltime definition depends on sw_dec_mc_mode. if mode is 0 (HW internal mechanism) the sw_dec_mc_polltime: • 0 = 1/4 cycles per pixel • 1 = wait 1/2 cycles per pixel • 2 = wait one cycle per pixel • 3 = wait 2 cycles per pixel • 4=wait 4 cycles per pixel

Table continues on the next page...

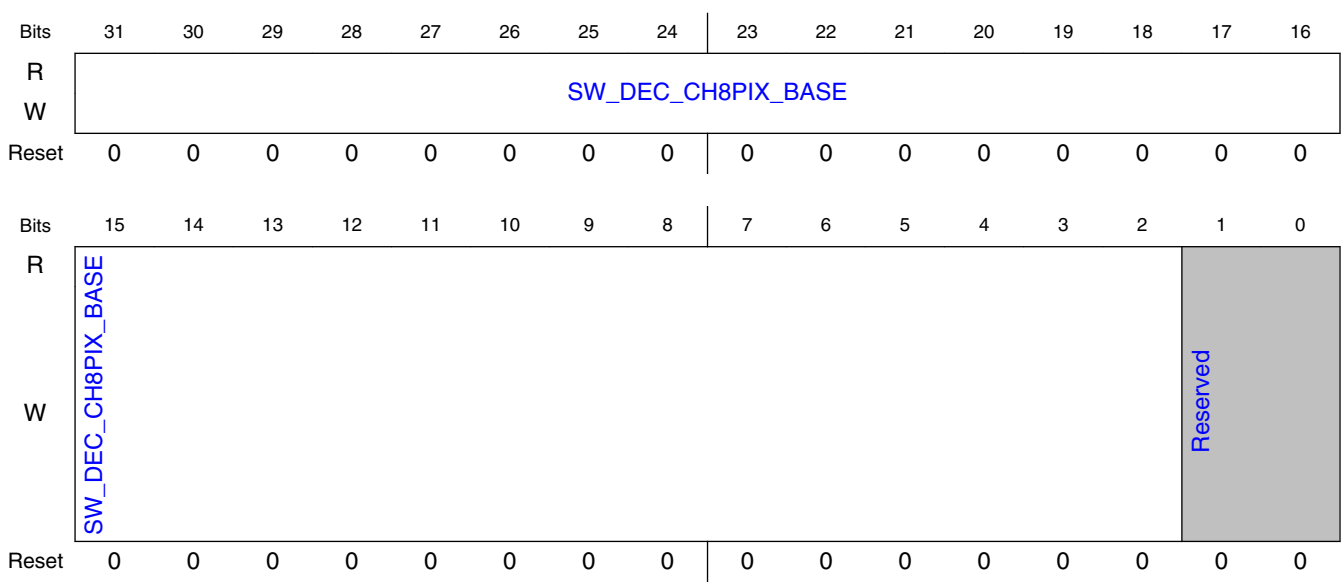
Field	Function
	For dummy polling mechanism the sw_dec_mc_polltime defines the amount cycles between status reads x1024: • 0 = wait 1024 cycles between status reading • 1 = wait 2048 cycles between status reading • 2 = wait 3072 cycles between status reading • N = wait (N+1)x1024 cycles
16-0 —	Reserved.

15.1.5.1.20 H264 Chrominance 8 pixel interleaved data base (SWREG59)

15.1.5.1.20.1 Offset

Register	Offset
SWREG59	ECh

15.1.5.1.20.2 Diagram



15.1.5.1.20.3 Fields

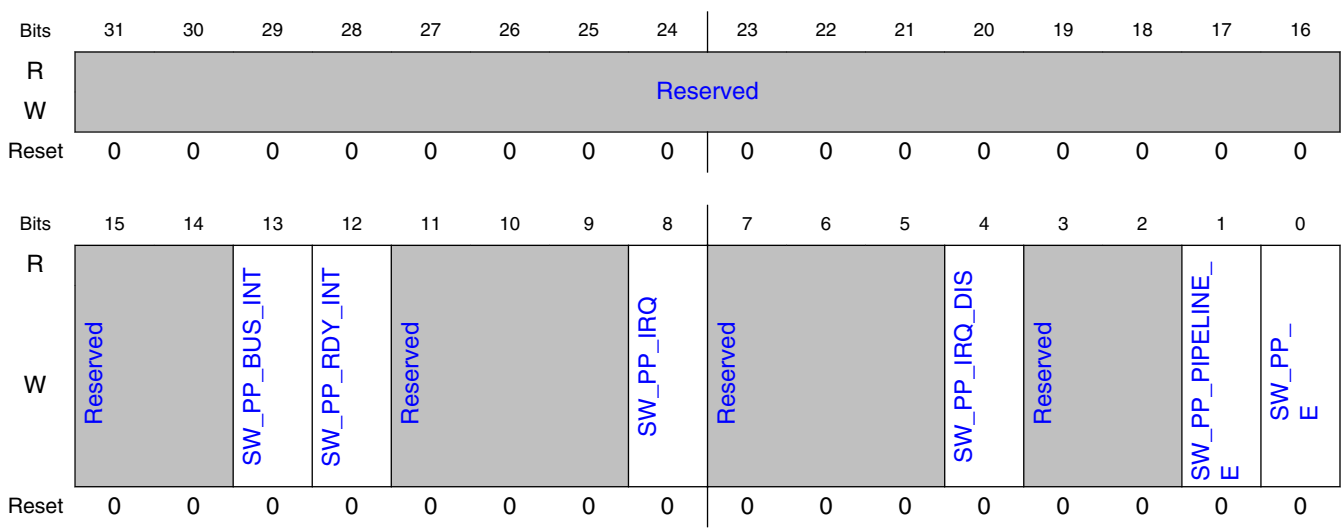
SWREG60	F0h

15.1.5.1.21.2 Diagram



15.1.5.1.21.3 Fields

Field	Function
31-14 —	Reserved.
13 SW_PP_BUS_INT	Interrupt status bit bus. Error response from bus. In pipeline mode this bit is not used

Table continues on the next page...

Field	Function
12 SW_PP_RDY_INT	Interrupt status bit pp. When this bit is high post processor has processed a picture in external mode. In pipeline mode this bit is not used.
11-9 —	Reserved.
8 SW_PP_IRQ	Post-processor IRQ. SW will reset this after interrupt is handled. HINTpp is not used for pp if IRQ disable pp is high (sw_pp_irq_n_e = 1). In pipeline mode this bit is not used
7-5 —	Reserved.
4 SW_PP_IRQ_DIS	Post-processor IRQ disable. When high, there are no interrupts from HW concerning post processing. Polling must be used to see the interrupt
3-2 —	Reserved.
1 SW_PP_PIPELINE_E	Decoder – post-processing pipeline enable: 0b - Post-processing is processing different picture than decoder or is disabled 1b - Post-processing is performed in pipeline with decoder
0 SW_PP_E	External mode post-processing enable. This bit will start the post-processing operation. Not to be used if PP is in pipeline with decoder (sw_pp_pipeline_e = 1). HW will reset this when picture is post-processed.

15.1.5.1.22.3 Fields

Field	Function
31-24 SW_PP_AXI_RD_ID	Read ID used for AXI PP read services (if connected to AXI)
23-16 SW_PP_AXI_WR_ID	Write ID used for AXI PP write services (if connected to AXI)
15 SW_PP_AHB_HLOCK_E	AHB master HLOCK enable. When high the service is locked to pp as long as it needs the bus (whenever pp requests the bus it will be granted)
14 SW_PP_SCMD_DIS	9170 decoder: AXI Single Command Multiple Data disable. 9170 axi wrapper supports this mode by default (where only the first addresses of the burst are given from address generator). This bit is used to disable the feature (possible SW workaround if something is not working correctly)
13 SW_PP_IN_A2_ENDSEL	Endian/swap select for Alpha blend input source 2: 0b - Use PP in endian/swap definitions (sw_pp_in_endian, sw_pp_in_swap) 1b - Use Ablend source 1 endian/swap definitions (sw_pp_in_a1_endian, sw_pp_in_a1_swap)
12 SW_PP_IN_A1_SWAP32	Alpha blend source 1 input 32bit data swap (may be used for 64 bit environment): 0b - no swapping of 32 bit words 1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled))
11 SW_PP_IN_A1_ENDIAN	Alpha blend source 1 input data byte endian mode. 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
10	PP input 32bit data swap (may be used for 64 bit environment):

Table continues on the next page...

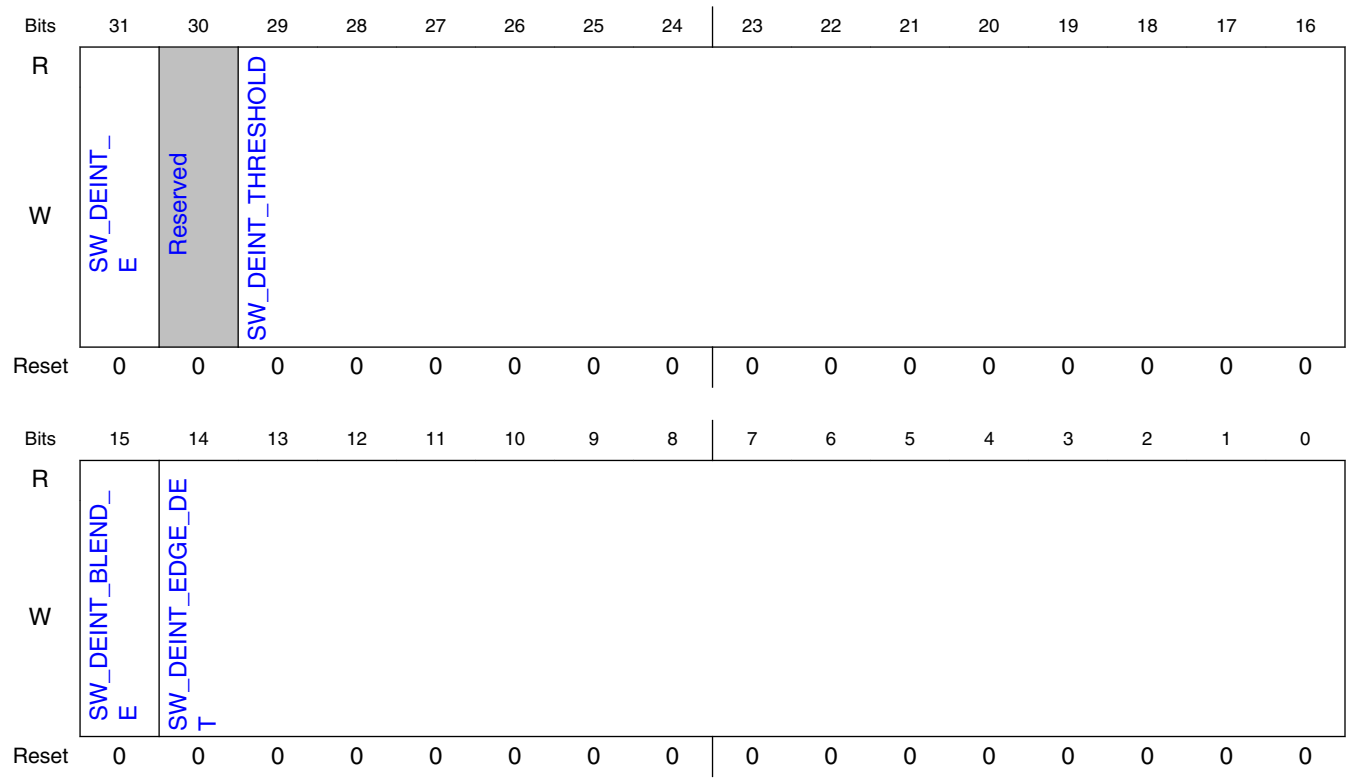
Field	Function
SW_PP_IN_SWAP32_E	0b - no swapping of 32 bit words 1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order(also little endian should be enabled))
9 SW_PP_DATA_DISC_E	PP data discard enable. Precise burst lengths are used with reading services. Extra data is discarded internally. Note. If AHB maxburst 17 is used data discard cannot be enabled (causes conflict)
8 SW_PP_CLK_GATE_E	PP dynamic clock gating enable. **NOTE:** Clock gating value can be changed only when PP is not enabled. 0b - Clock is running for all PP structures 1b - Clock is gated from PP structures that are not used
7 SW_PP_IN_ENDIAN	PP input picture byte endian mode. Used only if PP is in standalone mode. If PP is running pipelined with the decoder, this bit has no effect. 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
6 SW_PP_OUT_ENDIAN	PP output picture endian mode for YCbCr data or for any data if config value SW_PP_OEN_VERSION = 1. **NOTE:** For SW_PP_OEN_VERSION=0, 16 bit RGB data, this bit works as pixel swapping bit. For 32 bit RGB, this bit has no meaning. 0b - Big endian (0-1-2-3 order) 1b - Little endian (3-2-1-0 order)
5 SW_PP_OUT_SWAP32_E	PP output data word swap (may be used for 64 bit environment): 0b - no swapping of 32 bit words 1b - 32 bit data words are swapped (needed in 64 bit environment to achieve 7-6-5-4-3-2-1-0 byte order (also little endian should be enabled))
4-0 SW_PP_MAX_BURST	Maximum burst length for PP bus transactions. Valid values: AHB: 1, 4, 8 , 16 and 17. Other values will result in INCR type (undefined length) transfers. 17 = fixed bursts are used when possible. INCR bursts for others. OCP: 16-31 AXI: 1-16

15.1.5.1.23 Deinterlace control register (SWREG62)

15.1.5.1.23.1 Offset

Register	Offset
SWREG62	F8h

15.1.5.1.23.2 Diagram



15.1.5.1.23.3 Fields

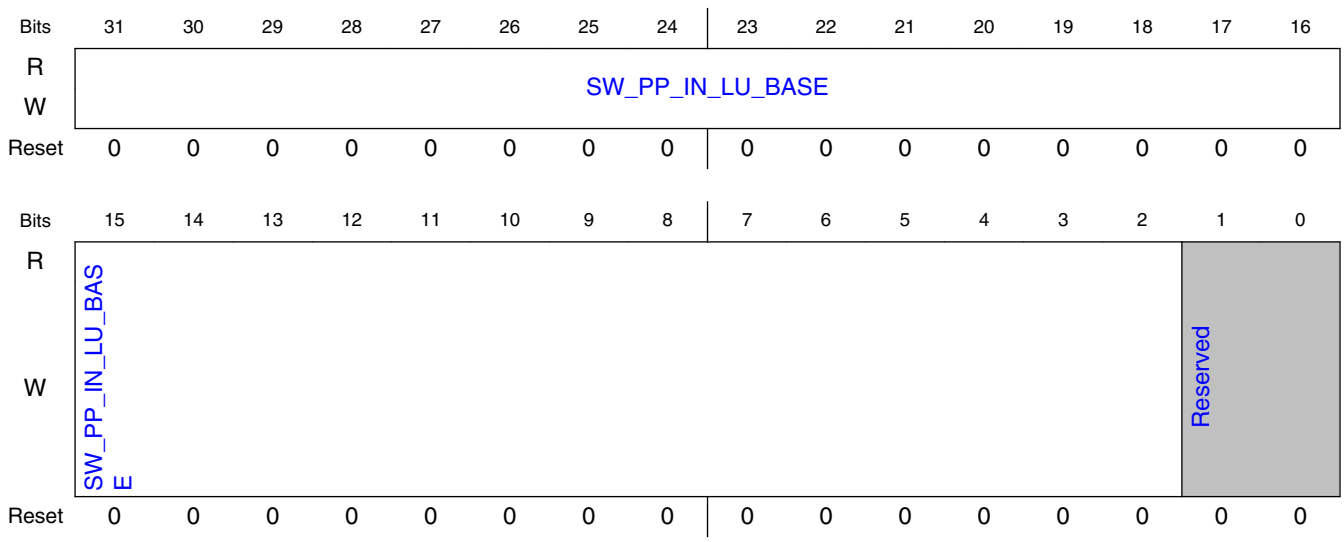
Field	Function
31 SW_DEINT_E	De-interlace enable. Input data is in interlaced format and deinterlacing needs to be performed
30 —	Reserved.
29-16 SW_DEINT_THRESHOLD	Threshold value used in deinterlacing
15 SW_DEINT_BLEND_E	Blend enable for de-interlacing
14-0 SW_DEINT_EDGE_DET	Edge detect value used for deinterlacing

15.1.5.1.24 Base address for reading post-processing input picture luminance (top field/frame) (SWREG63)

15.1.5.1.24.1 Offset

Register	Offset
SWREG63	FCh

15.1.5.1.24.2 Diagram



15.1.5.1.24.3 Fields

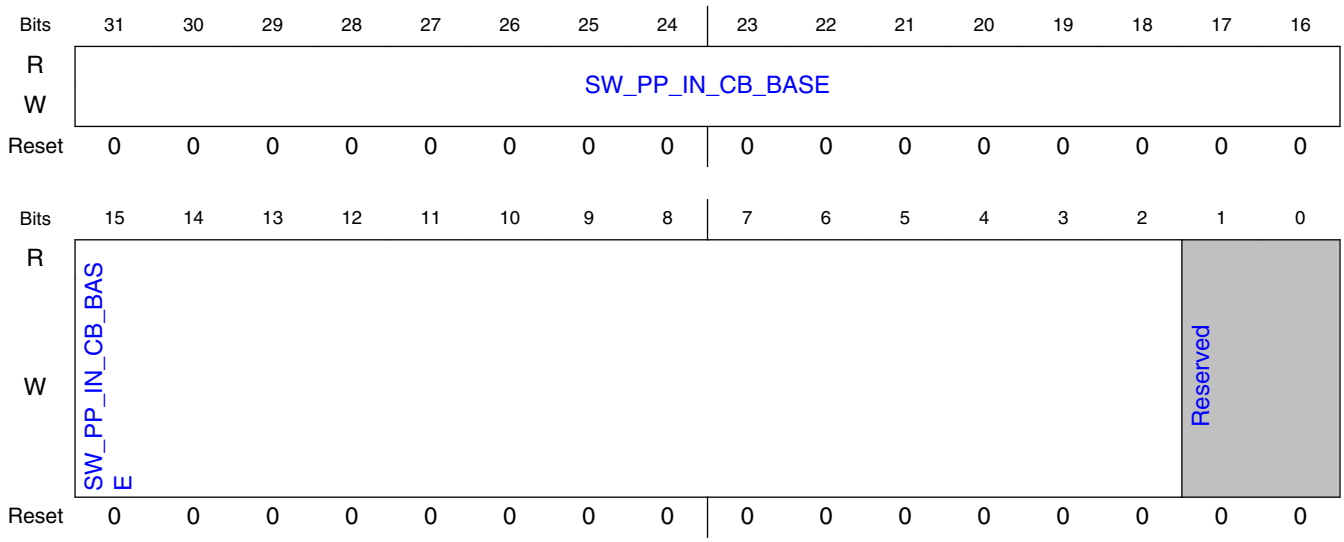
Field	Function
31-2 SW_PP_IN_LU_BASE	Base address for post-processing input luminance picture. If PP input picture is fetched from fields this base address is used to point to top field of the picture. Used in external mode only.
1-0 —	Reserved.

15.1.5.1.25 Base address for reading post-processing input picture Cb/Ch (top field/frame) (SWREG64)

15.1.5.1.25.1 Offset

Register	Offset
SWREG64	100h

15.1.5.1.25.2 Diagram



15.1.5.1.25.3 Fields

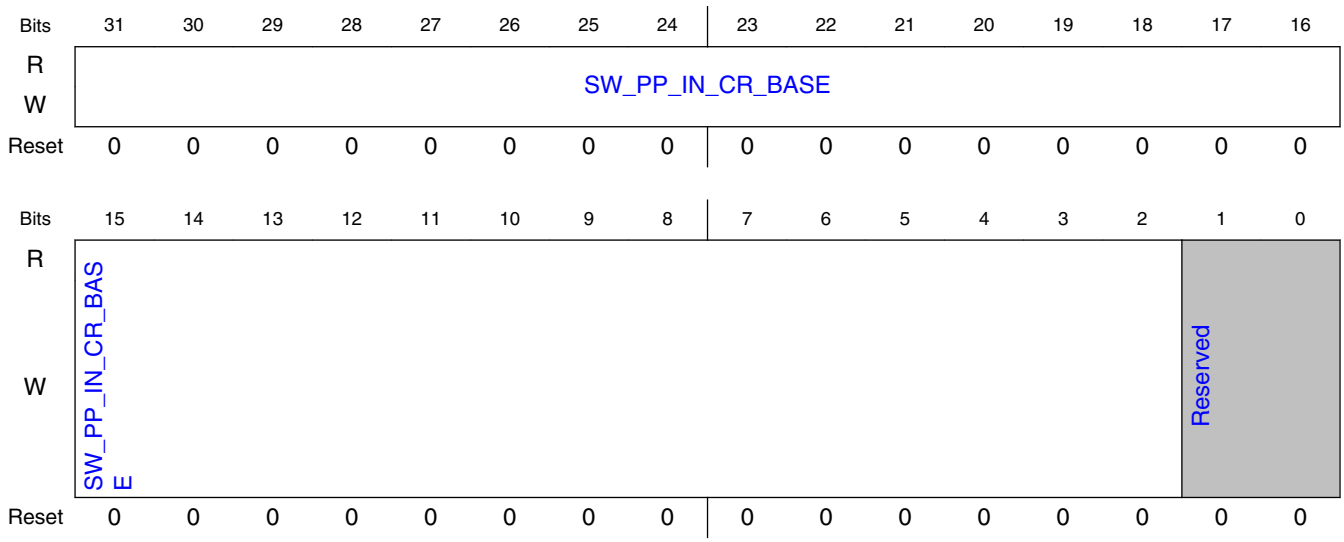
Field	Function
31-2 SW_PP_IN_CB_BASE	Base address for post-processing input Cb picture or for both chrominance pictures (if chrominances interleaved). If PP input picture is fetched from fields this base address is used to point to top field of the picture. Used in external mode only
1-0 —	Reserved.

15.1.5.1.26 Base address for reading post-processing input picture Cr (SWREG65)

15.1.5.1.26.1 Offset

Register	Offset
SWREG65	104h

15.1.5.1.26.2 Diagram



15.1.5.1.26.3 Fields

Field	Function
31-2 SW_PP_IN_CR_BASE	Base address for post-processing input cr picture. Used in external mode only
1-0 —	Reserved.

15.1.5.1.27 Base address for writing post-processed picture luminance/RGB (SWREG66)

15.1.5.1.27.1 Offset

Register	Offset
SWREG66	108h

15.1.5.1.27.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_PP_OUT_LU_BASE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_PP_OUT_LU_BASE															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.27.3 Fields

Field	Function
31-0 SW_PP_OUT_LU_BASE	Base address for post-processing output picture (luminance/YUYV/RGB). NOTE: Bits 2:0 are used to adjust the post-processor output to start from zertain byte (1:0 for 32 bit bus). These bits can be other than zero only if Pixel Accurate PP output configuration is enabled

15.1.5.1.28 Base address for writing post-processed picture Ch (SWREG67)

15.1.5.1.28.1 Offset

Register	Offset
SWREG67	10Ch

15.1.5.1.28.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.28.3 Fields

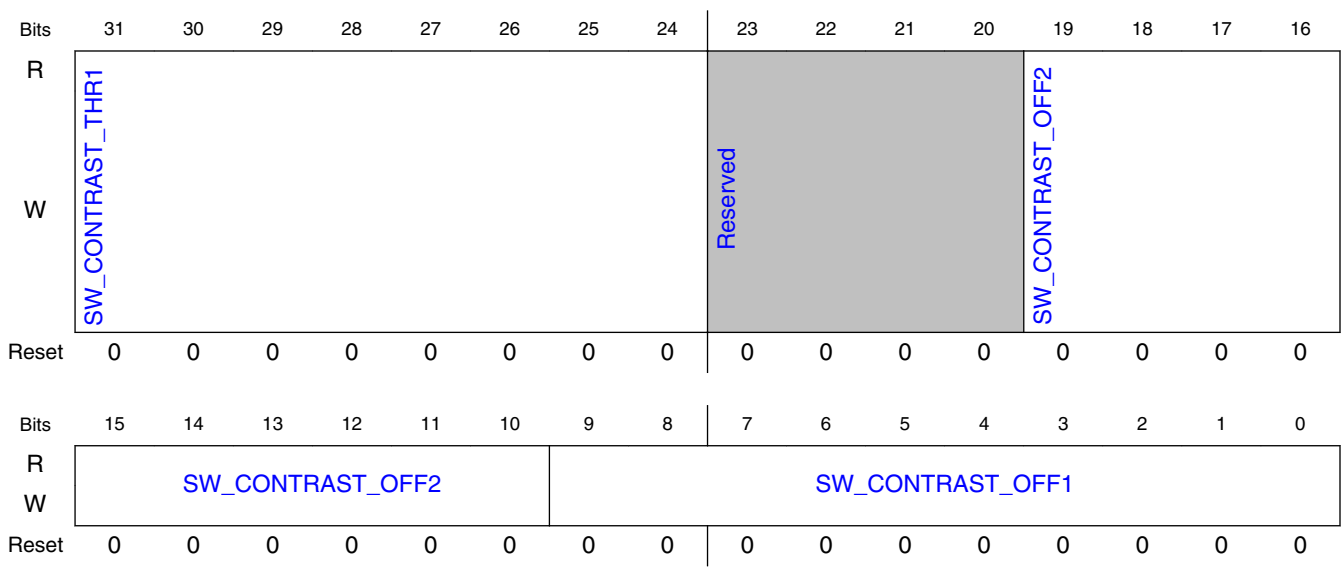
Field	Function
31-0 SW_PP_OUT_CH_BASE	Base address for post-processing output chrominance picture (interleaved chrominance). NOTE: Bits 2:0 are used to adjust the post-processor output to start from zertain byte (1:0 for 32 bit bus). These bits can be other than zero only if Pixel Accurate PP output configuration is enabled

15.1.5.1.29 Register for contrast adjusting (SWREG68)

15.1.5.1.29.1 Offset

Register	Offset
SWREG68	110h

15.1.5.1.29.2 Diagram



15.1.5.1.29.3 Fields

Field	Function
31-24 SW_CONTRAST_THR1	Threshold value 1, used with contrast adjusting

Table continues on the next page...

Field	Function
23-20 —	Reserved.
19-10 SW_CONTRAST_OFF2	Offset value 2, used with contrast adjusting
9-0 SW_CONTRAST_OFF1	Offset value 1, used with contrast adjusting

15.1.5.1.30 Register for colour conversion and contrast adjusting/YUYV 422 channel orders (SWREG69)

15.1.5.1.30.1 Offset

Register	Offset
SWREG69	114h

15.1.5.1.30.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_PP_IN_START_CH	SW_PP_IN_CR_FIRST	SW_PP_OUT_START_CH	SW_PP_OUT_CR_FIRST	SW_COLOR_COEFFA2										SW_COLOR_COEFFA1	
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_COLOR_COEFFA1								SW_CONTRAST_THR2							
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.30.3 Fields

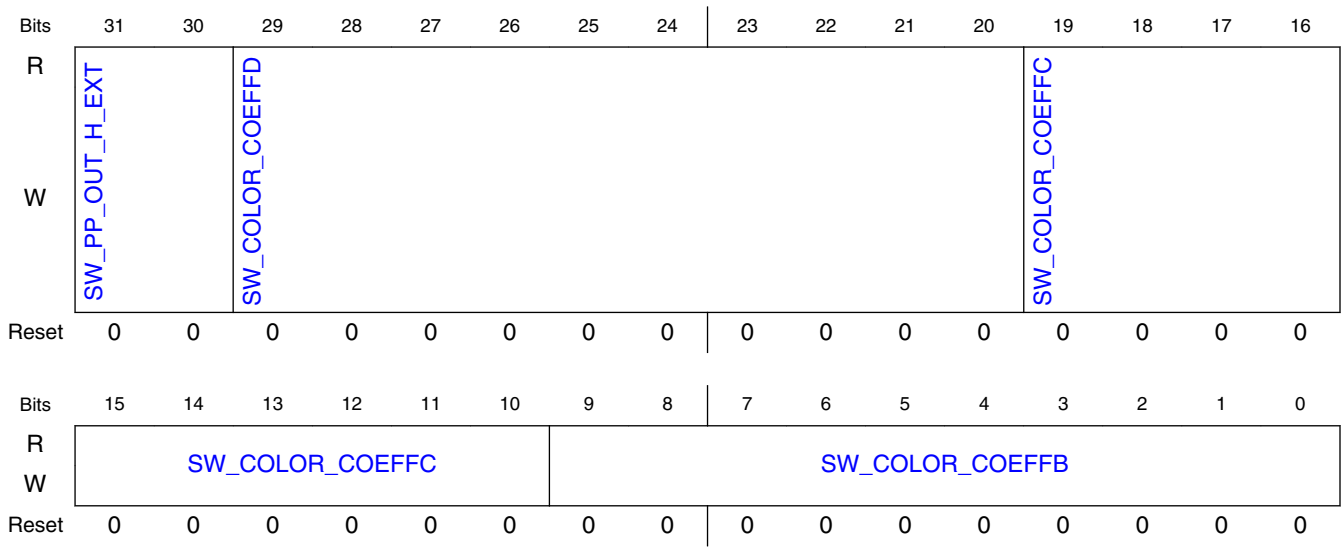
Field	Function
31 SW_PP_IN_START_CH	For YUYV 422 input format. Enable for start_with_chrominance. 0b - the order is Y0CbY0Cr or Y0CrY0Cb 1b - the order is CbY0CrY0 or CrY0CbY0
30 SW_PP_IN_CR_FIRST	For YUYV 422 input format. Enable for Cr first (before Cb). 0b - the order is Y0CbY0Cr or CbY0CrY0 (if 420 semiplanar chrominance: CbCrCbCr) 1b - the order is Y0CrY0Cb or CrY0CbY0 (if 420 semiplanar chrominance: CrCbCrCb)
29 SW_PP_OUT_START_CH	For YUYV 422 output format. Enable for start_with_chrominance. 0b - the order is Y0CbY0Cr or Y0CrY0Cb 1b - the order is CbY0CrY0 or CrY0CbY0
28 SW_PP_OUT_CR_FIRST	For YUYV 422 output format. Enable for Cr first (before Cb). 0b - the order is Y0CbY0Cr or CbY0CrY0 1b - the order is Y0CrY0Cb or CrY0CbY0
27-18 SW_COLOR_COEFFA2	Coefficient a2, used with Y pixel to calculate all color components
17-8 SW_COLOR_COEFFA1	Coefficient a1, used with Y pixel to calculate all color components
7-0 SW_CONTRAST_THR2	Threshold value 2, used with contrast adjusting

15.1.5.1.31 Register for colour conversion 0 (SWREG70)

15.1.5.1.31.1 Offset

Register	Offset
SWREG70	118h

15.1.5.1.31.2 Diagram



15.1.5.1.31.3 Fields

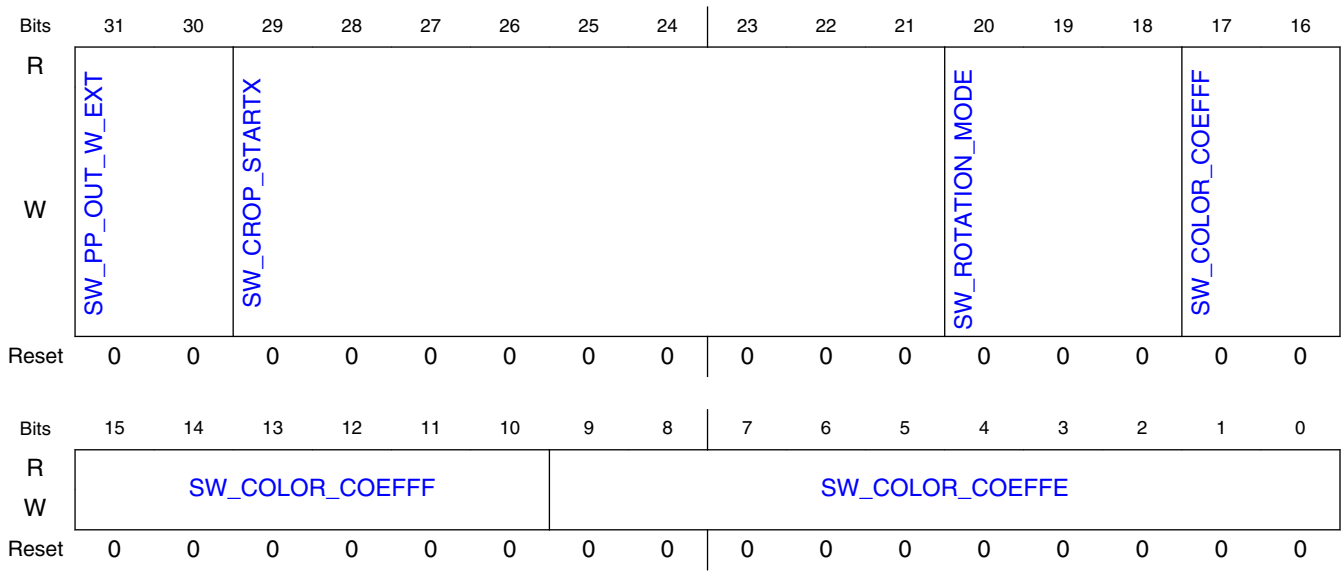
Field	Function
31-30 SW_PP_OUT_H_EXT	Extended output height for 4k resolution
29-20 SW_COLOR_COEFFD	Coefficient d, used with Cb to calculate green component value
19-10 SW_COLOR_COEFFC	Coefficient c, used with Cr to calculate green component value
9-0 SW_COLOR_COEFFB	Coefficient b, used with Cr to calculate red component value

15.1.5.1.32 Register for colour conversion 1 + rotation mode (SWREG71)

15.1.5.1.32.1 Offset

Register	Offset
SWREG71	11Ch

15.1.5.1.32.2 Diagram



15.1.5.1.32.3 Fields

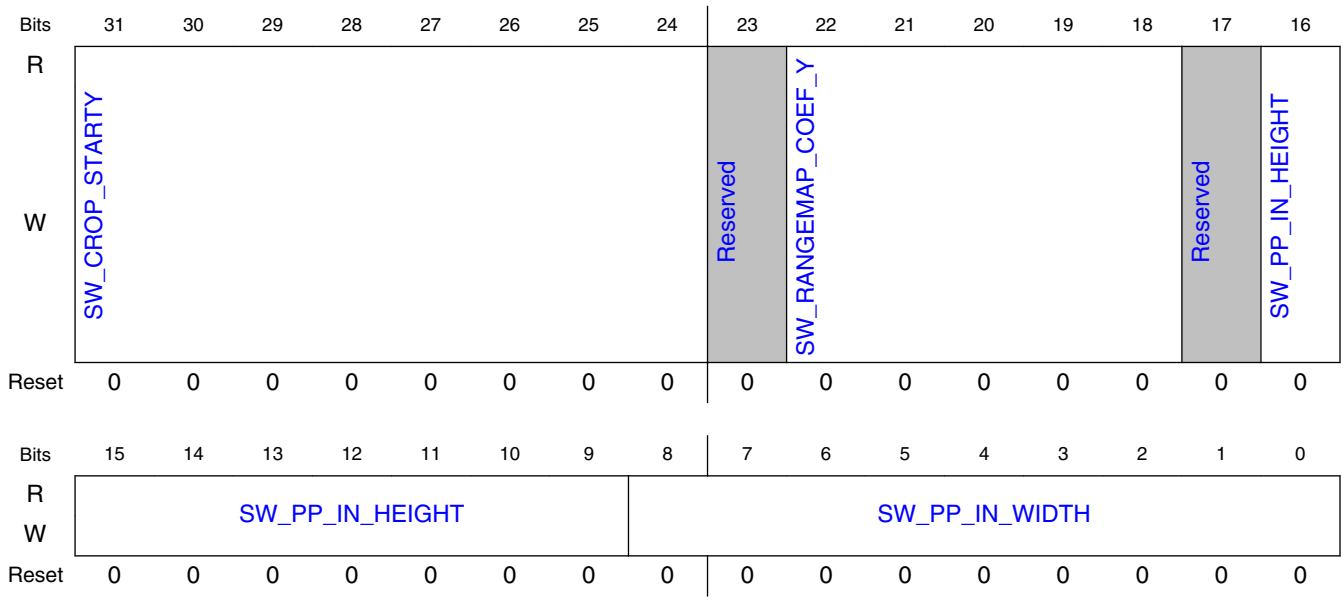
Field	Function
31-30 SW_PP_OUT_W_EXT	Extended output width for 4k resolution
29-21 SW_CROP_STARTX	Start coordinate x for the cropped area in macroblocks.
20-18 SW_ROTATION_MODE	Rotation mode: 000b - rotation disabled 001b - rotate + 90 010b - rotate – 90 011b - horizontal flip (mirror) 100b - vertical flip 101b - rotate 180
17-10 SW_COLOR_COEFFF	Coefficient f, used with Y to adjust brightness
9-0 SW_COLOR_COEFFE	Coefficient e, used with Cb to calculate blue component value

15.1.5.1.33 PP input size and -cropping register (SWREG72)

15.1.5.1.33.1 Offset

Register	Offset
SWREG72	120h

15.1.5.1.33.2 Diagram



15.1.5.1.33.3 Fields

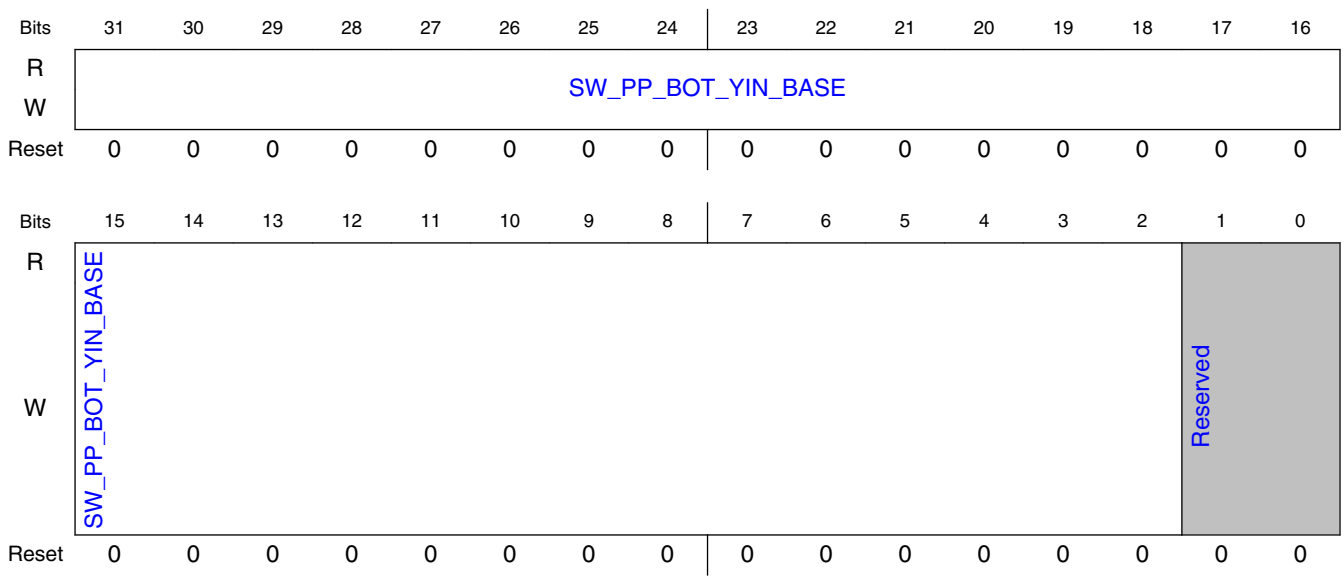
Field	Function
31-24 SW_CROP_STARTY	Start coordinate y for the cropped area in macroblocks.
23 —	Reserved.
22-18 SW_RANGEMAP_COEF_Y	Range map value for Y component
17 —	Reserved.
16-9 SW_PP_IN_HEIGHT	PP input picture height in MBs. Can be cropped from a bigger input picture in external mode
8-0 SW_PP_IN_WIDTH	PP input picture width in MBs. Can be cropped from a bigger input picture in external mode

15.1.5.1.34 PP input picture base address for Y bottom field (SWREG73)

15.1.5.1.34.1 Offset

Register	Offset
SWREG73	124h

15.1.5.1.34.2 Diagram



15.1.5.1.34.3 Fields

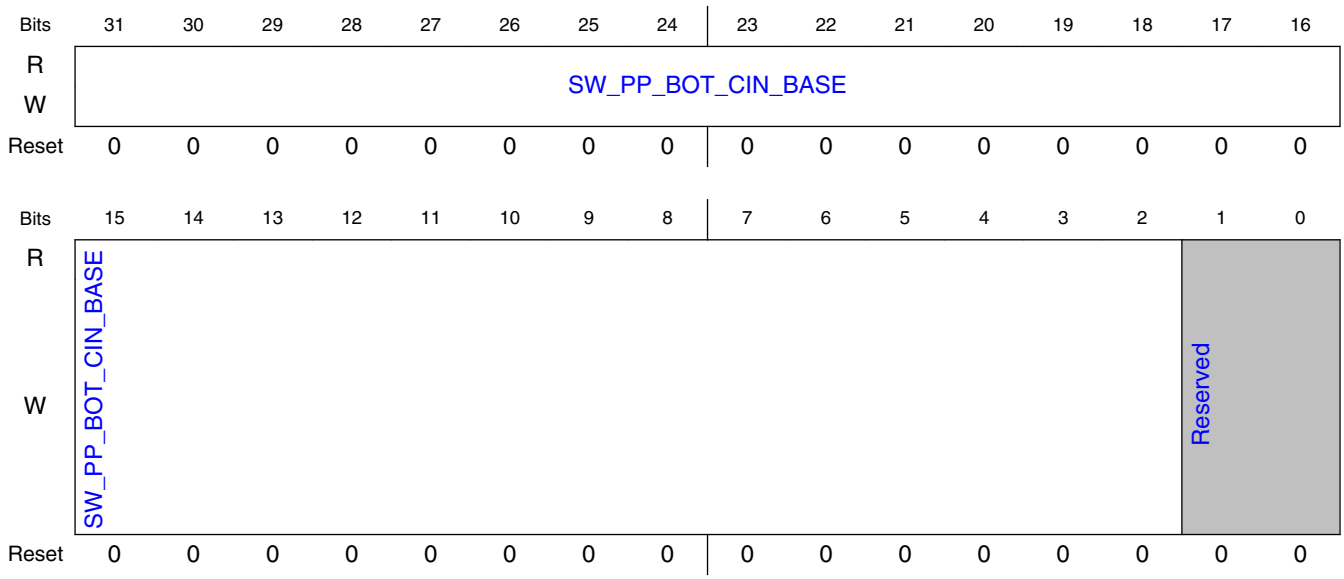
Field	Function
31-2 SW_PP_BOT_YIN_BASE	PP input Y base for bottom field
1-0 —	Reserved.

15.1.5.1.35 PP input picture base for Ch bottom field (SWREG74)

15.1.5.1.35.1 Offset

Register	Offset
SWREG74	128h

15.1.5.1.35.2 Diagram



15.1.5.1.35.3 Fields

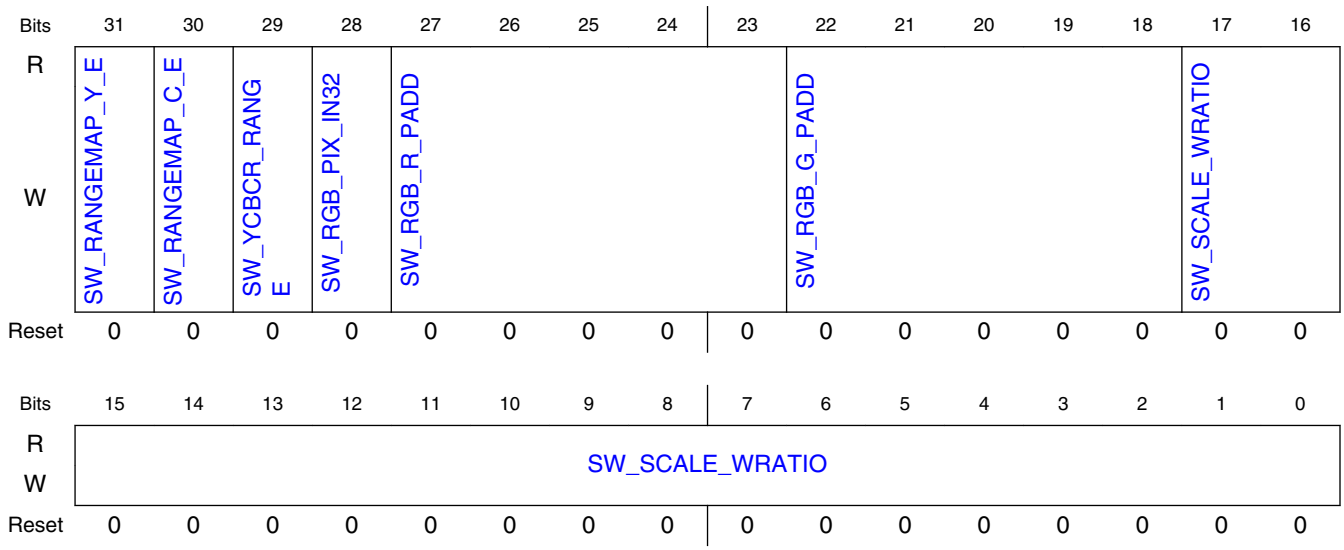
Field	Function
31-2 SW_PP_BOT_CIN_BASE	PP input C base for bottom field (mixed chrominance)
1-0 —	Reserved.

15.1.5.1.36 Scaling register 0 ratio and padding for R and G (SWREG79)

15.1.5.1.36.1 Offset

Register	Offset
SWREG79	13Ch

15.1.5.1.36.2 Diagram



15.1.5.1.36.3 Fields

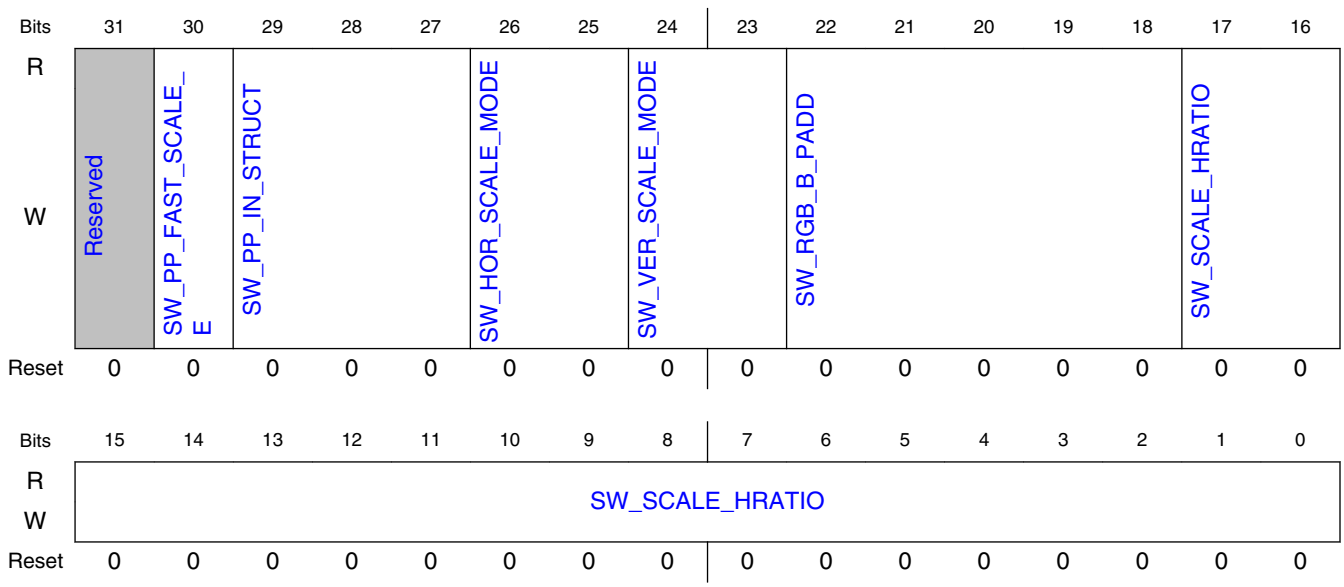
Field	Function
31 SW_RANGEMAP_Y_E	Range map enable for Y component
30 SW_RANGEMAP_C_E	Range map enable for chrominance component
29 SW_YCBCR_RANGE	Defines the YCbCr range in RGB conversion: 0b - 16…235 for Y, 16…240 for Chrominance. 1b - 0…255 for all components
28 SW_RGB_PIX_IN32	RGB pixel amount/ 32 bit word 0b - 1 RGB pixel/32 bit 1b - 2 RGB pixels/32 bit
27-23 SW_RGB_R_PADD	Amount of ones that will be padded in front of the R-component
22-18 SW_RGB_G_PADD	Amount of ones that will be padded in front of the G-component
17-0 SW_SCALE_WRATIO	Scaling ratio for width (outputw-1/inputw-1)

15.1.5.1.37 Scaling ratio register 1 and padding for B (SWREG80)

15.1.5.1.37.1 Offset

Register	Offset
SWREG80	140h

15.1.5.1.37.2 Diagram



15.1.5.1.37.3 Fields

Field	Function
31 —	Reserved.
30 SW_PP_FAST_SCALE_E	0b - fast downscaling is not enabled 1b - fast downscaling is enabled. The quality of the picture is decreased but performance is improved.
29-27 SW_PP_IN_STRUCT	PP input data picture structure: 000b - Top field / progressive frame structure: Read input data from top field base address /frame base address and read every line. 001b - Bottom field structure: Read input data from bottom field base address and read every line. 010b - Interlaced field structure: Read input data from both top and bottom field base address and take every line from each field. 011b - Interlaced frame structure: Read input data from both top and bottom field base address and take every second line from each field. 100b - Ripped top field structure: Read input data from top field base address and read every second line.

Table continues on the next page...

Field	Function
	101b - Ripped bottom field structure: Read input data from bottom field base address and read every second line.
26-25 SW_HOR_SCALE_MODE	Horizontal scaling mode: 00b - Off 01b - Upscale 10b - Downscale
24-23 SW_VER_SCALE_MODE	Vertical scaling mode: 00b - Off 01b - Upscale 10b - Downscale
22-18 SW_RGB_B_PADD	Amount of ones that will be padded in front of the B-component
17-0 SW_SCALE_HRATIO	Scaling ratio for height (outputh-1/inputh-1)

15.1.5.1.38 Scaling ratio register 2 (SWREG81)

15.1.5.1.38.1 Offset

Register	Offset
SWREG81	144h

15.1.5.1.38.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_WSCALE_INVRA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_HSCALE_INVRA															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.38.3 Fields

Field	Function
31-16	Inverse scaling ratio for width, or ch (inputw-1 / outputw-1)

Table continues on the next page...

Field	Function
SW_WSCALE_INVRA	
15-0 SW_HSCALE_INVRA	Inverse scaling ratio for height or cv (inputh-1 / outputh-1)

15.1.5.1.39 Rmask register (SWREG82)

15.1.5.1.39.1 Offset

Register	Offset
SWREG82	148h

15.1.5.1.39.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_R_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_R_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.39.3 Fields

Field	Function
31-0 SW_R_MASK	Bit mask for R component (and alpha channel)

15.1.5.1.40 Gmask register (SWREG83)

15.1.5.1.40.1 Offset

Register	Offset
SWREG83	14Ch

15.1.5.1.40.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_G_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_G_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.40.3 Fields

Field	Function
31-0 SW_G_MASK	Bit mask for G component (and alpha channel)

15.1.5.1.41 Bmask register (SWREG84)

15.1.5.1.41.1 Offset

Register	Offset
SWREG84	150h

15.1.5.1.41.2 Diagram

Bits	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R W	SW_B_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bits	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	SW_B_MASK															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.1.41.3 Fields

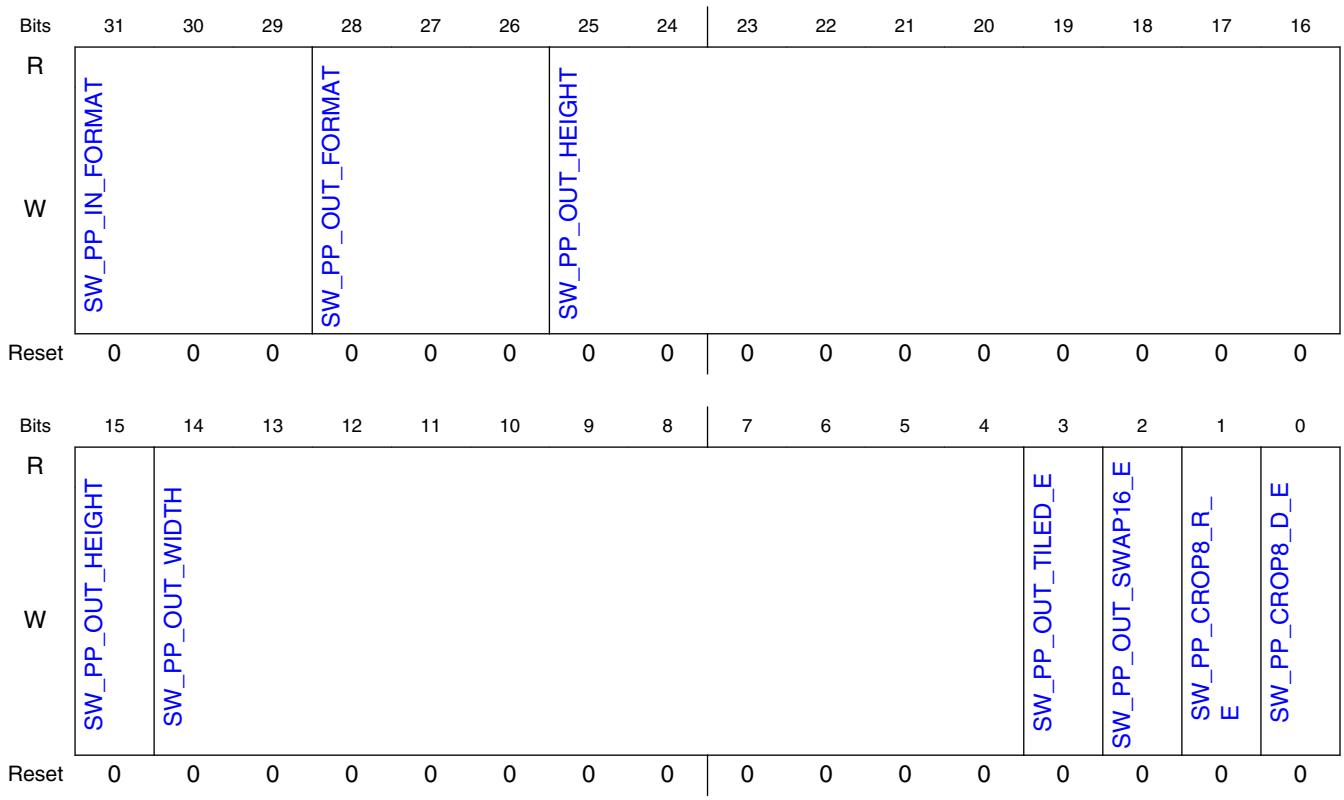
Field	Function
31-0 SW_B_MASK	Bit mask for B component (and alpha channel)

15.1.5.1.42 Post-processor control register (SWREG85)

15.1.5.1.42.1 Offset

Register	Offset
SWREG85	154h

15.1.5.1.42.2 Diagram



15.1.5.1.42.3 Fields

Field	Function
31-29 SW_PP_IN_FORMAT	PP input picture data format 000b - YUYV 4:2:2 interleaved (supported only in external mode) 001b - YCbCr 4:2:0 Semi-planar in linear raster-scan format 010b - YCbCr 4:2:0 planar (supported only in external mode) 011b - YCbCr 4:0:0 (supported only in pipelined mode) 100b - YCbCr 4:2:2 Semi-planar (supported only in pipelined mode) 101b - YCbCr 4:2:0 Semi-planar in tiled format (supported only in external mode (8170 decoder only) 110b - Reserved 111b - Escape pp input data format. Defined in swreg86.
28-26 SW_PP_OUT_FORMAT	PP output picture data format: 000b - RGB 001b - YCbCr 4:2:0 planar (Not supported) 010b - YCbCr 4:2:2 planar (Not supported) 011b - YUYV 4:2:2 interleaved 100b - YCbCr 4:4:4 planar (Not supported) 101b - YCh 4:2:0 chrominance interleaved 110b - YCh 4:2:2 (Not supported) 111b - YCh 4:4:4 (Not supported)

Table continues on the next page...

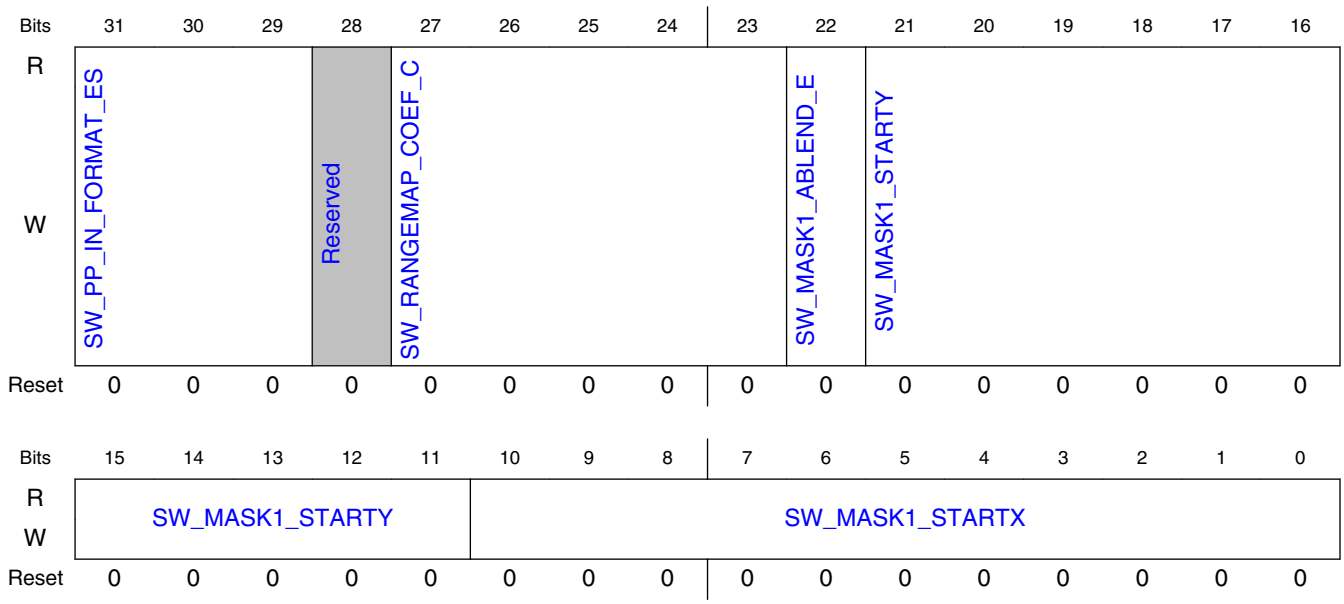
Field	Function
25-15 SW_PP_OUT_HEIGHT	Scaled picture height in pixels (Must be dividable by 2 or by any if Pixel Accurate PP output configuration is enabled) Max scaled picture height is 1920 pixels or maximum three times the input source height minus 8 pixels
14-4 SW_PP_OUT_WIDTH	Scaled picture width in pixels. Must be dividable by 8 or by any if Pixel Accurate PP output configuration is enabled. Max scaled picture width is 1920 pixels or maximum three times the input source width minus 8 pixels
3 SW_PP_OUT_TILED_E	Tiled mode enable for PP output. Can be used only for YCbYCr 422 output format. Can be used only if corresponding configuration supports this feature. Tile size is 4x4 pixels.
2 SW_PP_OUT_SWAP16_E	PP output swap 16, swaps 16 bit half inside of 32 bit word. Can be used for 16 bit RGB to change pixel orders but is valid also for any output format. NOTE: requires that configuration of SW_PPD_OEN_VERSION=1
1 SW_PP_CROP8_R_E	PP input picture width is not 16 pixels multiple. Only 8 pixels of the most right MB of the unrotated input picture is used for PP input.
0 SW_PP_CROP8_D_E	PP input picture height is not 16 pixels multiple. Only 8 pixel rows of the most down MB of the unrotated input picture is used for PP input.

15.1.5.1.43 Mask 1 start coordinate register (SWREG86)

15.1.5.1.43.1 Offset

Register	Offset
SWREG86	158h

15.1.5.1.43.2 Diagram



15.1.5.1.43.3 Fields

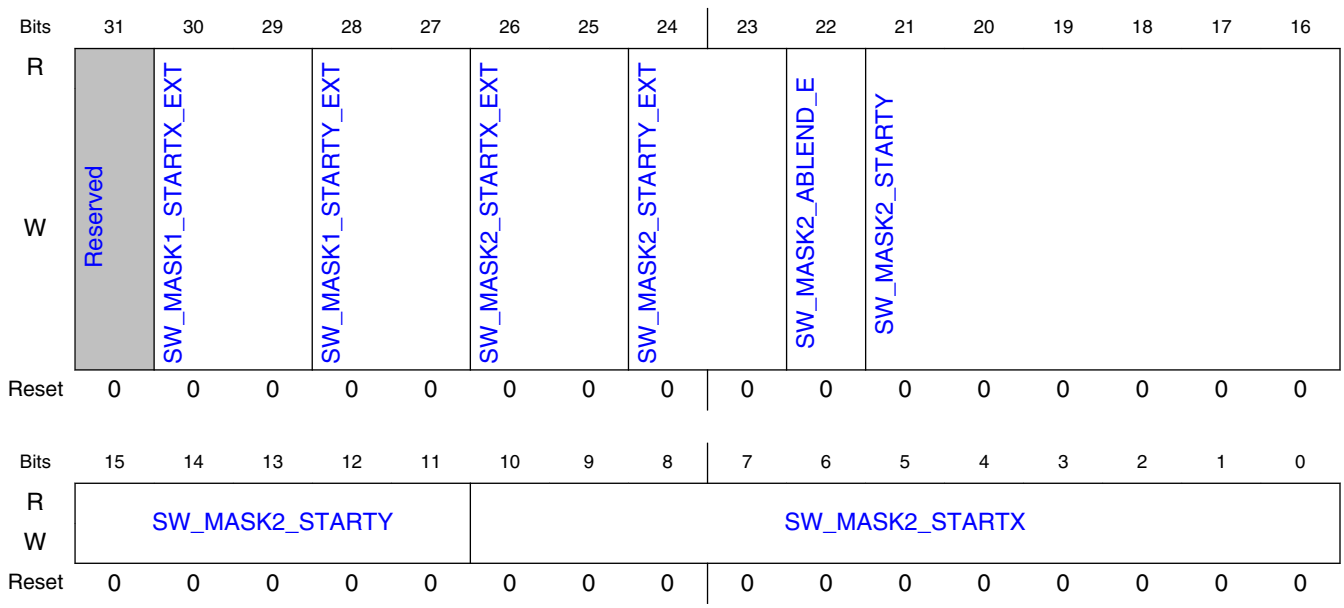
Field	Function
31-29 SW_PP_IN_FORMAT_ES	Escape PP in format. Used if sw_pp_in_format is defined to 7. 000b - YCbCr 4:4:4 001b - YCbCr 4:1:1
28 —	Reserved.
27-23 SW_RANGEMAP_COEF_C	Range map value for chrominance component
22 SW_MASK1_ABLEND_E	Mask 1 alpha blending enable. Instead of masking the output picture the alpha blending is performed. Alpha blending source can be found from alpha blend 1 base address. Alpha blending can be enabled only for RGB/ YUYV 422 data.
21-11 SW_MASK1_STARTY	Vertical start pixel for mask area 1. Defines the y coordinate. Coordinate 0,0 means the up-left corner in PP output luminance picture. See Table 47 for restrictions
10-0 SW_MASK1_STARTX	Horizontal start pixel for mask area 1. Defines the x coordinate. Coordinate 0,0 means the up-left corner in PP output luminance picture. See Table 47 for restrictions

15.1.5.1.44 Mask 2 start coordinate register + Mask extensions (SWREG87)

15.1.5.1.44.1 Offset

Register	Offset
SWREG87	15Ch

15.1.5.1.44.2 Diagram



15.1.5.1.44.3 Fields

Field	Function
31 —	Reserved.
30-29 SW_MASK1_STARTX_EXT	Extended coordinate upto 4k resolution
28-27 SW_MASK1_STARTY_EXT	Extended coordinate upto 4k resolution
26-25 SW_MASK2_STARTX_EXT	Extended coordinate upto 4k resolution

Table continues on the next page...

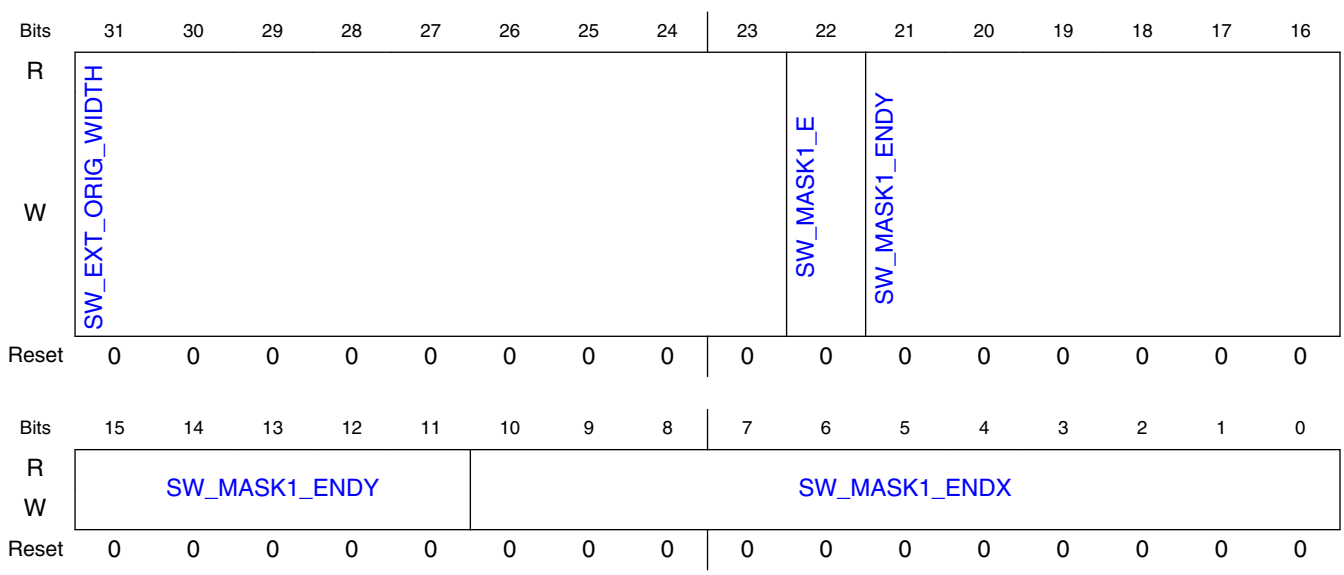
Field	Function
24-23 SW_MASK2_STARTY_EXT	Extended coordinate upto 4k resolution
22 SW_MASK2_ABLEND_E	Mask 2 alpha blending enable. Instead of masking the output picture the alpha blending is performed. Alpha blending source can be found from alpha blend 2 base address. Alpha blending can be enabled only for RGB/YUYV 422 data.
21-11 SW_MASK2_STARTY	Vertical start pixel for mask area 2. Defines the y coordinate. Coordinate 0,0 means the up-left corner in PP output Y picture. See Table 47 for restrictions
10-0 SW_MASK2_STARTX	Horizontal start pixel for mask area 2. Defines the x coordinate. Coordinate 0,0 means the up-left corner in PP output Y picture. See Table 47 for restrictions

15.1.5.1.45 Mask 1 size and PP original width register (SWREG88)

15.1.5.1.45.1 Offset

Register	Offset
SWREG88	160h

15.1.5.1.45.2 Diagram



15.1.5.1.45.3 Fields

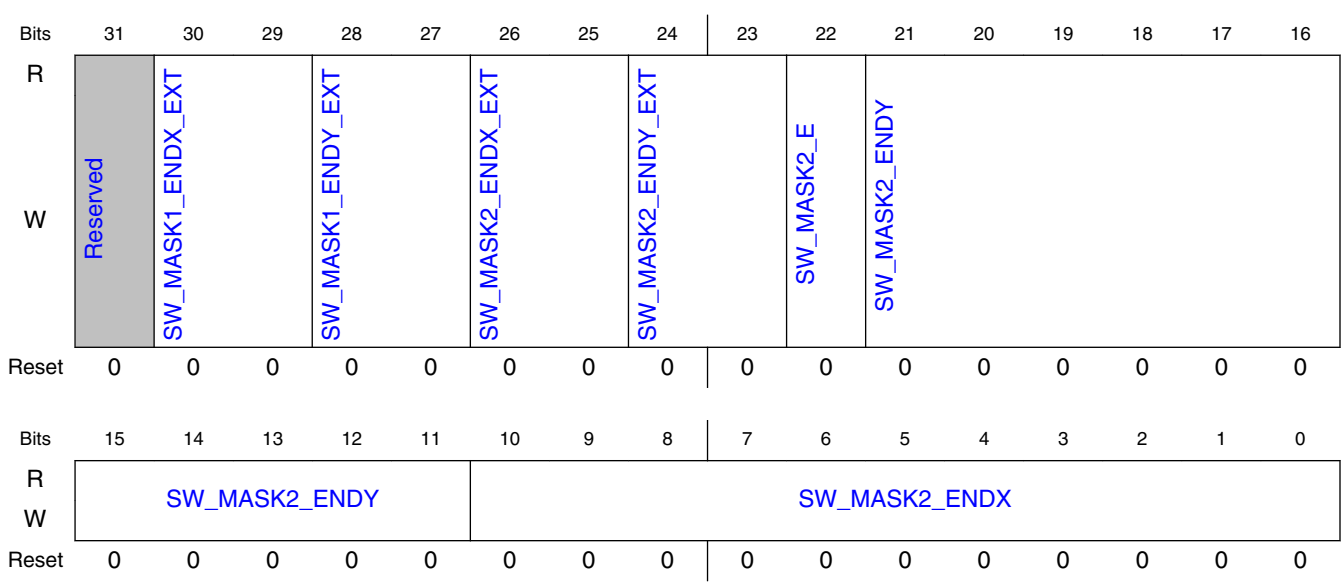
Field	Function
31-23 SW_EXT_ORIG_WIDTH	PP input picture original width in macro blocks.
22 SW_MASK1_E	Mask 1 enable. If mask 1 is used this bit is high
21-11 SW_MASK1_ENDY	Mask 1 end coordinate y in pixels (inside of PPD output picture). Range must be between [Mask1StartCoordinateY, ScaledHeight].
10-0 SW_MASK1_ENDX	Mask 1 end coordinate x in pixels (inside of PPD output picture). Range must be between [Mask1StartCoordinateX, ScaledWidth]

15.1.5.1.46 Mask 2 size register + mask extensions (SWREG89)

15.1.5.1.46.1 Offset

Register	Offset
SWREG89	164h

15.1.5.1.46.2 Diagram



15.1.5.1.46.3 Fields

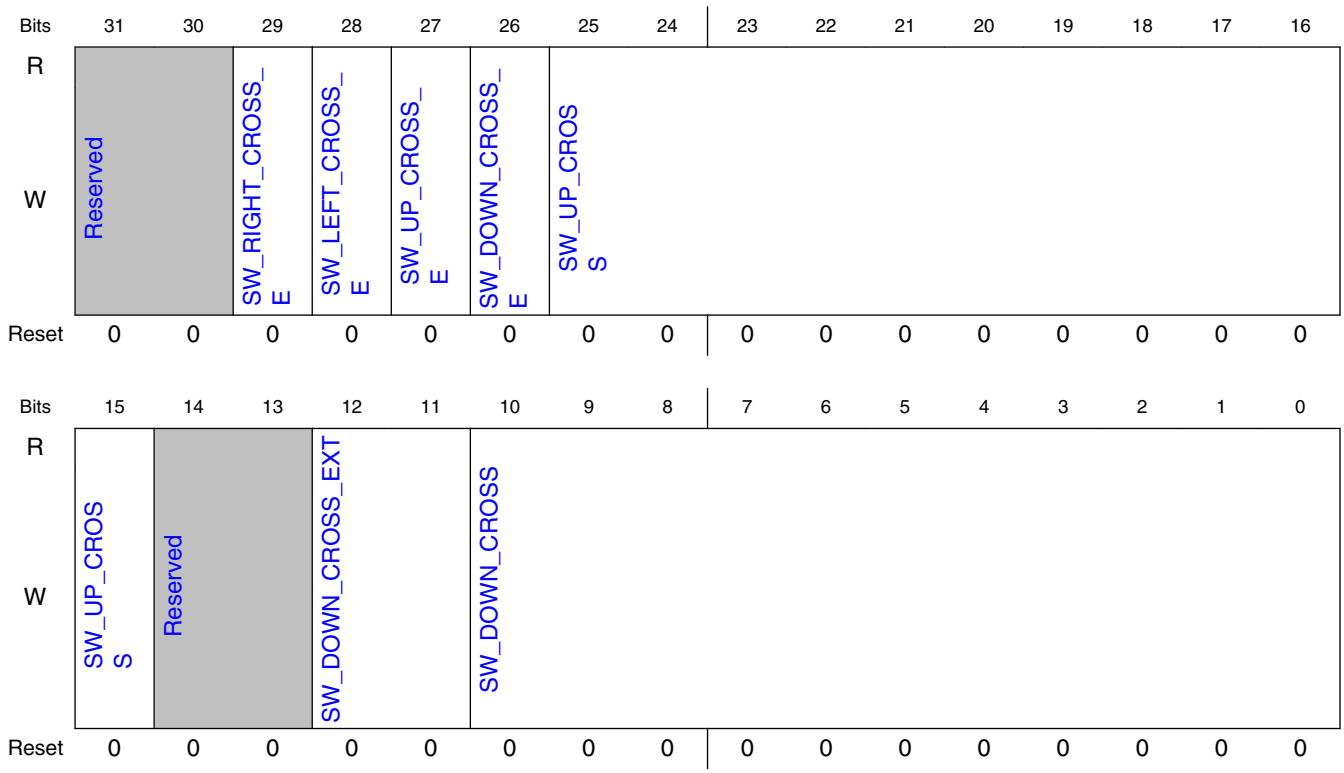
Field	Function
31 —	Reserved.
30-29 SW_MASK1_END X_EXT	Extended coordinate upto 4k resolution
28-27 SW_MASK1_END Y_EXT	Extended coordinate upto 4k resolution
26-25 SW_MASK2_END X_EXT	Extended coordinate upto 4k resolution
24-23 SW_MASK2_END Y_EXT	Extended coordinate upto 4k resolution
22 SW_MASK2_E	Mask 2 enable. If mask 1 is used this bit is high
21-11 SW_MASK2_END Y	Mask 2 end coordinate y in pixels (inside of PP output picture). Range must be between [Mask2StartCoordinateY, ScaledHeight].
10-0 SW_MASK2_END X	Mask 2 end coordinate x in pixels (inside of PP output picture). Range must be between [Mask2StartCoordinateX, ScaledWidth].

15.1.5.1.47 PiP register 0 (SWREG90)

15.1.5.1.47.1 Offset

Register	Offset
SWREG90	168h

15.1.5.1.47.2 Diagram



15.1.5.1.47.3 Fields

Field	Function
31-30 —	Reserved.
29 SW_RIGHT_CROSS_E	Right side overcross enable. 0b - No right side overcross 1b - Right side overcross
28 SW_LEFT_CROSS_E	Left side overcross enable. 0b - No left side overcross 1b - Left side overcross
27 SW_UP_CROSS_E	Upward overcross enable. 0b - No upward overcross 1b - Upward overcross
26 SW_DOWN_CROSS_E	Downward overcross enable. 0b - No downward overcross 1b - Downward overcross
25-15 SW_UP_CROSS	Amount of upward overcross (vertical pixels outside of display from the upper side). Range must be between [0, ScaledHeight].

Table continues on the next page...

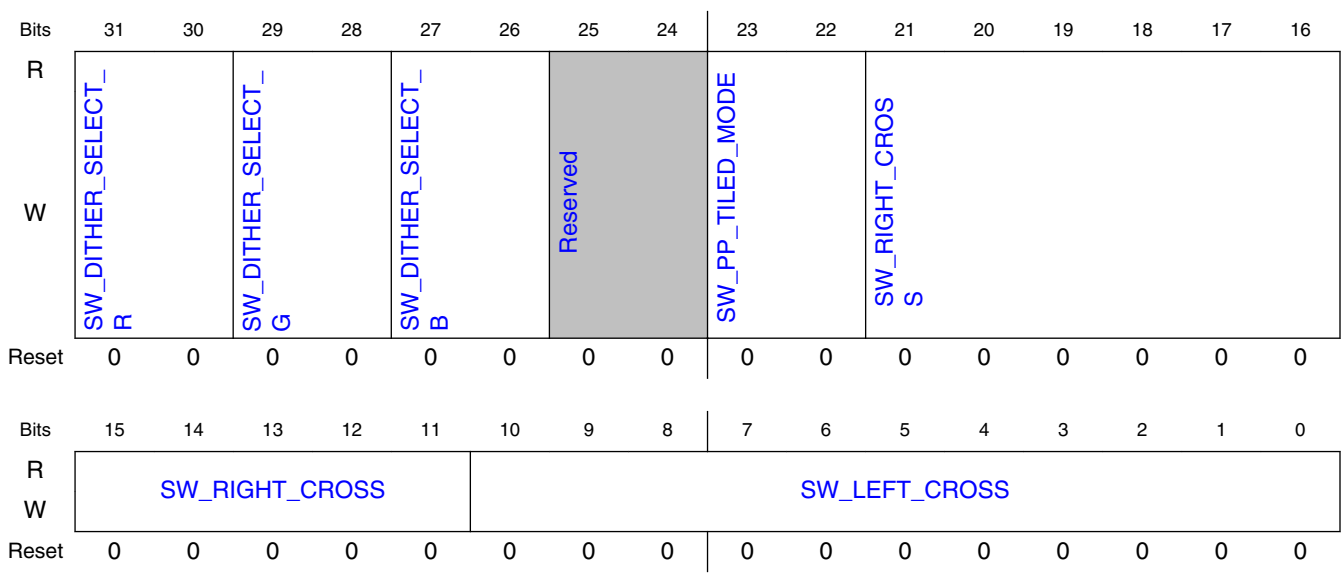
Field	Function
14-13 —	Reserved.
12-11 SW_DOWN_CROSS_EXT	Extended coordinate for 4k resolution
10-0 SW_DOWN_CROSS	Amount of downward overcross (vertical pixels outside of display from the down side). Range must be between [0, ScaledHeight].

15.1.5.1.48 PiP register 1 and dithering control (SWREG91)

15.1.5.1.48.1 Offset

Register	Offset
SWREG91	16Ch

15.1.5.1.48.2 Diagram



15.1.5.1.48.3 Fields

Field	Function
31-30	Dithering control for R channel: 00b - dithering disabled

Table continues on the next page...

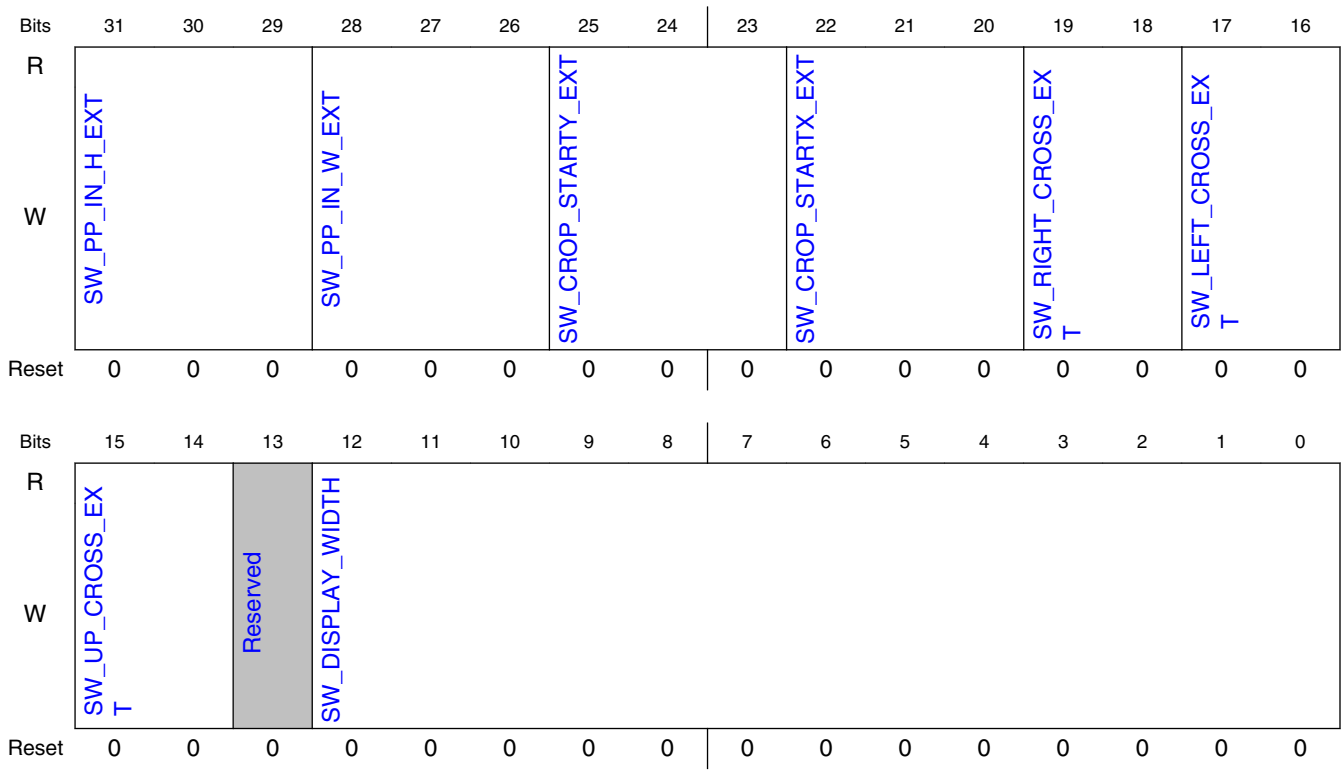
Field	Function
SW_DITHER_SELECT_R	01b - use four-bit dither matrix 10b - use five-bit dither matrix 11b - use six-bit dither matrix
29-28 SW_DITHER_SELECT_G	Dithering control for G channel: 00b - dithering disabled 01b - use four-bit dither matrix 10b - use five-bit dither matrix 11b - use six-bit dither matrix
27-26 SW_DITHER_SELECT_B	Dithering control for B channel: 00b - dithering disabled 01b - use four-bit dither matrix 10b - use five-bit dither matrix 11b - use six-bit dither matrix
25-24 —	Reserved.
23-22 SW_PP_TILED_MODE	Input data is in tiled mode (at the moment valid only for YCbCr 420 data, pipeline or external mode): 00b - Tiled mode not used 01b - Tiled mode enabled for 8x4 sized tiles
21-11 SW_RIGHT_CROSS	Amount of right side overcross (Horizontal pixels outside of display from the right side). Range must be between [0, ScaledWidth].
10-0 SW_LEFT_CROSS	Amount of left side overcross (Horizontal pixels outside of display from the left side). Range must be between [0, ScaledWidth].

15.1.5.1.49 Display width and PP input size extension register (SWREG92)

15.1.5.1.49.1 Offset

Register	Offset
SWREG92	170h

15.1.5.1.49.2 Diagram



15.1.5.1.49.3 Fields

Field	Function
31-29 SW_PP_IN_H_EXT	Extended PP input height. Used with WEBP
28-26 SW_PP_IN_W_EXT	Extended PP input width. Used with WEBP
25-23 SW_CROP_STARTY_EXT	Extended PP input crop start coordinate x. Used with WEBP
22-20 SW_CROP_STARTX_EXT	Extended PP input crop start coordinate y. Used with WEBP
19-18 SW_RIGHT_CROSS_EXT	Extended coordinate for 4k resolution
17-16 SW_LEFT_CROSS_EXT	Extended coordinate for 4k resolution

Table continues on the next page...

Field	Function
15-14 SW_UP_CROSS_EXT	Extended coordinate for 4k resolution
13 —	Reserved.
12-0 SW_DISPLAY_WIDTH	Width of the display in pixels. Max 4k (depends on HW config support)

15.1.5.1.50 Base address for alpha blend 1 gui component (SWREG93)

15.1.5.1.50.1 Offset

Register	Offset
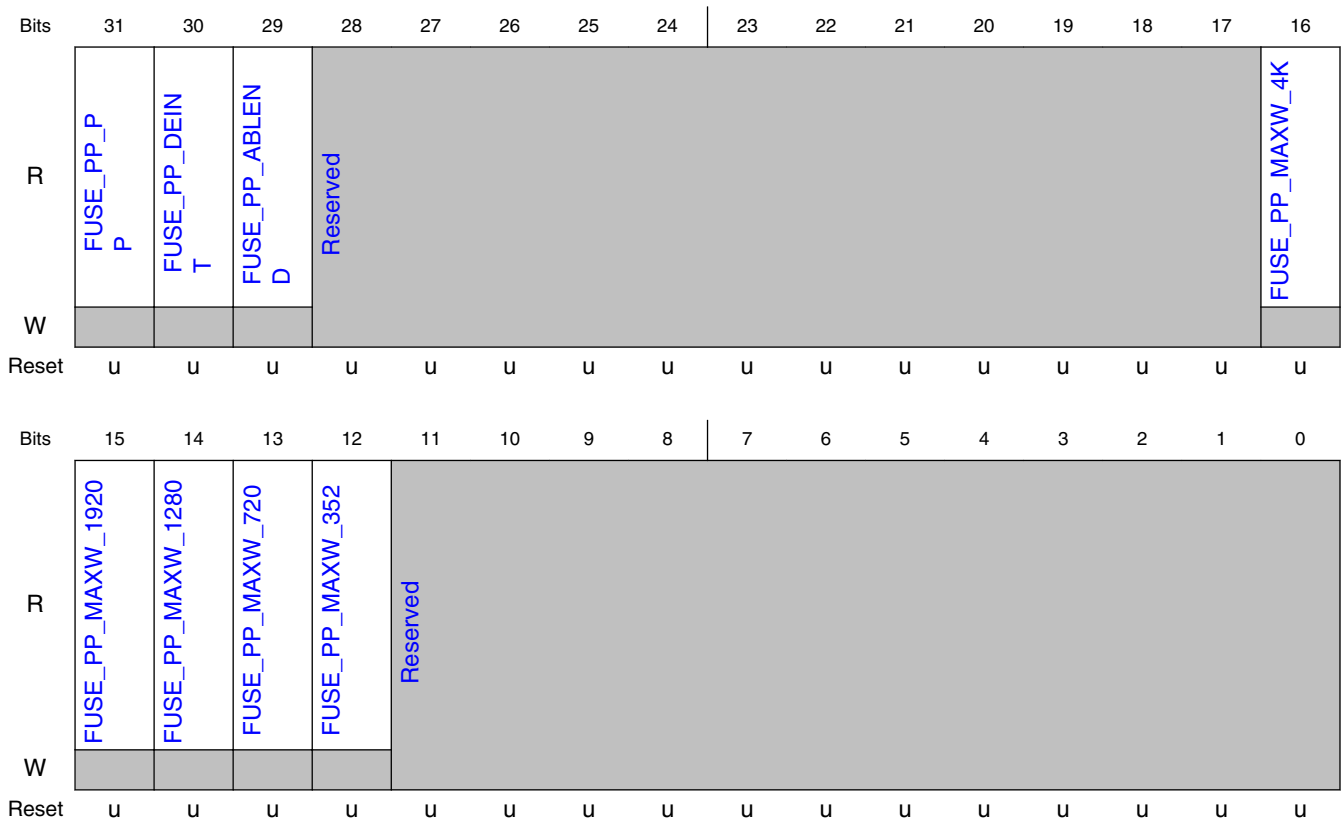
SWREG99	18Ch

15.1.5.1.53.2 Diagram



15.1.5.1.53.3 Fields

Field	Function
31 FUSE_PP_PP	1 = PP enabled
30 FUSE_PP_DEINT	1 = Deinterlacing enabled
29 FUSE_PP_ABLEND	1 = Alpha Blending enabled
28-17 —	Reserved.
16 FUSE_PP_MAXW_4K	1 = Max PP output width up to 4096 pixels enabled. Priority coded with priority 1
15 FUSE_PP_MAXW_1920	1 = Max PP output width up to 1920 pixels enabled. Priority coded with priority 2

Table continues on the next page...

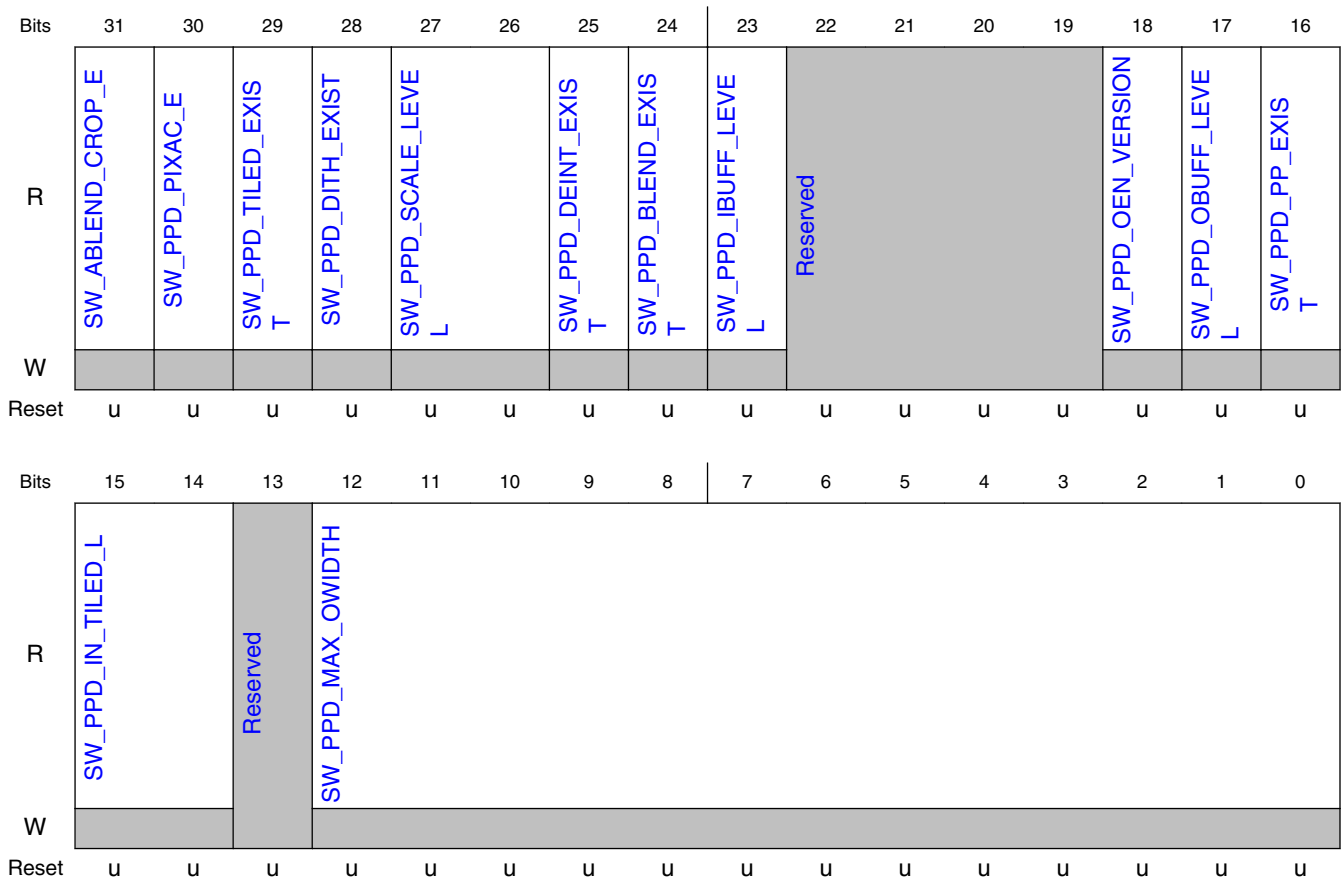
Field	Function
14 FUSE_PP_MAX W_1280	1 = Max PP output width up to 1280 pixels enabled. Priority coded with priority 3
13 FUSE_PP_MAX W_720	1 = Max PP output width up to 720 pixels enabled. Priority coded with priority 4
12 FUSE_PP_MAX W_352	1 = Max PP output width up to 352 pixels enabled. Priority coded with priority 5
11-0 —	Reserved.

15.1.5.1.54 Synthesis configuration register post-processor (SWREG100)

15.1.5.1.54.1 Offset

Register	Offset
SWREG100	190h

15.1.5.1.54.2 Diagram



15.1.5.1.54.3 Fields

Field	Function
31 SW_ABLEND_CROP_E	Alpha blending support for input cropping: 0b - Not supported. External memory must include the exact image of the area being alpha blended. 1b - Supported. External memory can include a picture from blended area can be cropped. Requires usage of swreg95.
30 SW_PPD_PIXAC_E	Pixel Accurate PP output mode exists: 0b - PIP, Scaling and masks can be adjusted by steps of 8 pixels (width) or 2 pixels (height) 1b - PIP, Scaling and masks can be adjusted by steps of 1 pixel for RGB and 2 pixels for subsampled chroma formats (by using bus specific write strobe functionality)
29 SW_PPD_TILED_EXIST	PP output YCbYCr 422 tiled support (4x4 pixel tiles) 0b - Not supported 1b - Supported
28 SW_PPD_DITH_EXIST	Dithering exists: 0b - No 1b - Yes
27-26	Scaling support:

Table continues on the next page...

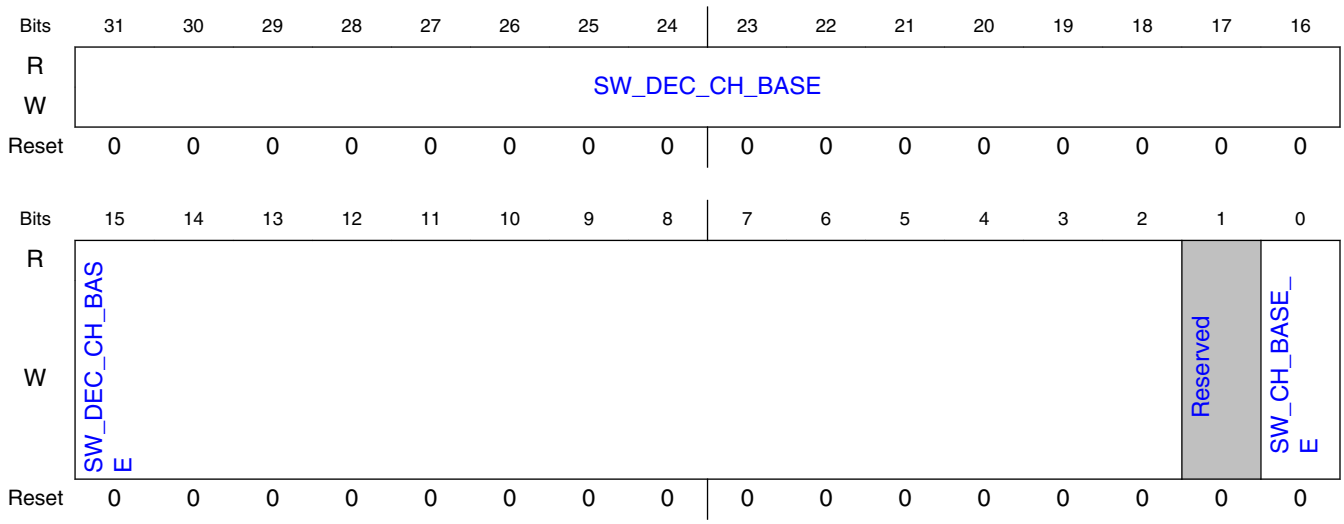
Field	Function
SW_PPD_SCALE_LEVEL	00b - No scaling 01b - Scaling with lo performance architecture 10b - Scaling with high performance architecture 11b - Scaling with high performance architecture + fast downscaling enabled
25 SW_PPD_DEINT_EXIST	De-interlacing exits: 0b - No 1b - Yes
24 SW_PPD_BLEND_EXIST	Alpha blending exists: 0b - No 1b - Yes
23 SW_PPD_IBUFF_LEVEL	PP input buffering level: 0b - 1 MB input buffering is used 1b - 4 MB input buffering is used
22-19 —	Reserved.
18 SW_PPD_OEN_VERSION	PP output endian version: 0b - Endian mode supported for other than RGB 1b - Endian mode supported for any output format
17 SW_PPD_OBUFF_LEVEL	PP output buffering level: 0b - 1 unit output buffering is used 1b - 4 unit output buffering is used
16 SW_PPD_PP_EXIST	PPD exists: 0b - No 1b - Yes
15-14 SW_PPD_IN_TILED_L	PPD input tiled mode support level 00b - not supported 01b - 8x4 tile size supported
13 —	Reserved.
12-0 SW_PPD_MAX_OWIDTH	Max supported PP output width in pixels

15.1.5.1.55 Base address for H264 decoded chroma picture (SWREG102)

15.1.5.1.55.1 Offset

Register	Offset
SWREG102	198h

15.1.5.1.55.2 Diagram



15.1.5.1.55.3 Fields

Field	Function
31-2 SW_DEC_CH_BASE	Valid only if chroma address separate mode is enabled. H264: Base address for decoder output chroma picture. Points directly to start of decoder output chroma picture or field.
1 —	Reserved.
0 SW_CH_BASE_E	chroma address separate mode enable: 0b - HW outputs decoded chroma picture to the end of decoded luma picture. HW calculates the chroma picture address according to sw_dec_base and luma data length. 1b - HW outputs decoded chroma picture to independent memory address

15.1.5.1.56 Base address for reference chroma picture index 0 (SWREG103)

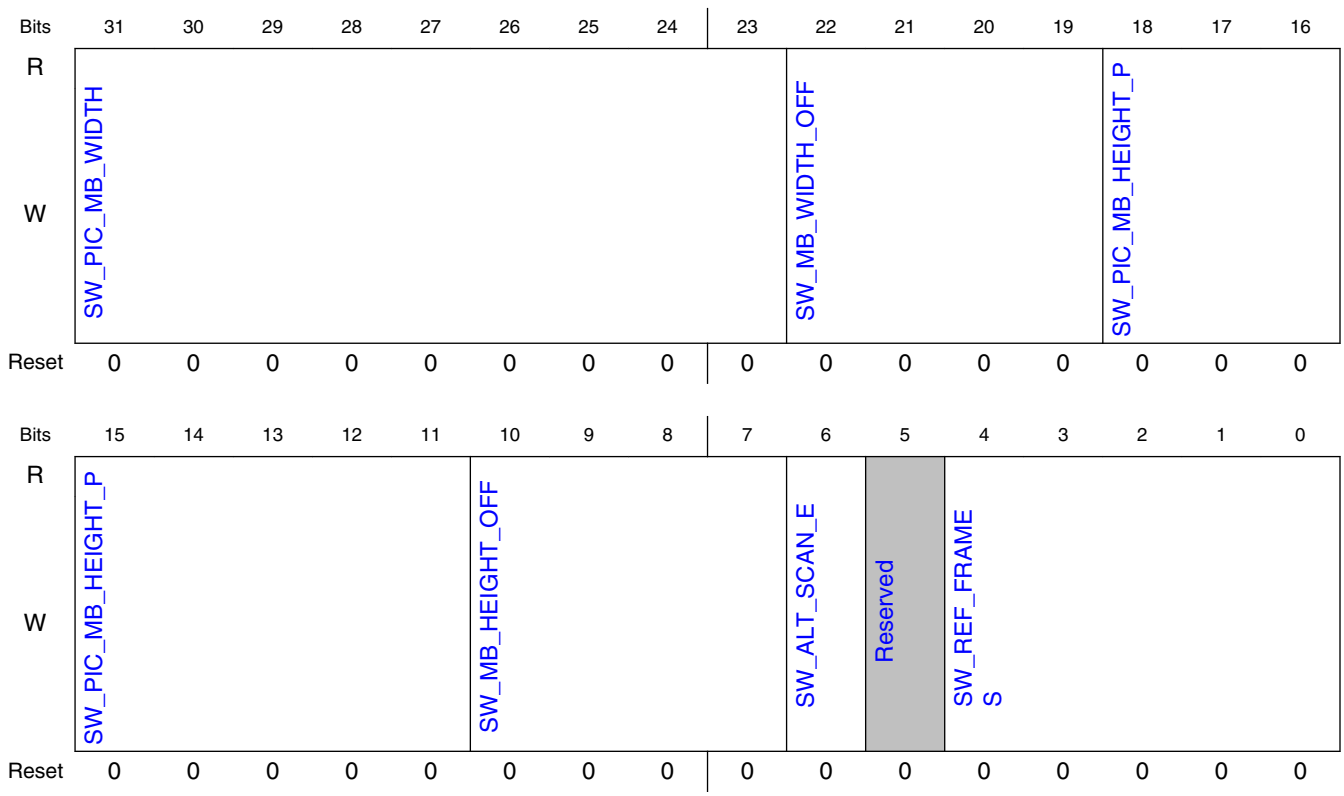
74h	Base address for reference picture index 15 / VP6 scan maps / VP7,VP8 DCT stream 7 base (SWREG29)	32	RW	0000_0000h
78h	Reference picture numbers for index 0 and 1 (H264 VLC) / VP6 scan maps / VP7,VP8 loop filter mb level adjusts (SWREG30)	32	RW	0000_0000h
7Ch	Reference picture numbers for index 2 and 3 (H264 VLC) / VP6 scan maps / VP7,VP8 loop filter ref pic level adjusts (SWREG31)	32	RW	0000_0000h
80h	Reference picture numbers for index 4 and 5 (H264 VLC) / VP6 scan maps / VP7,VP8 loop filter levels (SWREG32)	32	RW	0000_0000h
84h	Reference picture numbers for index 6 and 7 (H264 VLC) / VP6 scan maps / VP7,VP8 quantization values (SWREG33)	32	RW	0000_0000h
88h	Reference picture numbers for index 8 and 9 (H264 VLC) / MPEG4, VC1, VPx prediction filter taps (SWREG34)	32	RW	0000_0000h
8Ch	Reference picture numbers for index 10 and 11 (H264 VLC) / VC1, VPx prediction filter taps (SWREG35)	32	RW	0000_0000h
90h	Reference picture numbers for index 12 and 13 (H264 VLC) / VC1, VPx prediction filter taps (SWREG36)	32	RW	0000_0000h
94h	Reference picture numbers for index 14 and 15 (H264 VLC) / VPx prediction filter taps (SWREG37)	32	RW	0000_0000h
98h	Reference picture long term flags (H264 VLC) / VPx prediction filter taps (SWREG38)	32	RW	0000_0000h
9Ch	Reference picture valid flags (H264 VLC) / VPx prediction filter taps (SWREG39)	32	RW	0000_0000h
A8h	bi_dir initial ref pic list register (0-2) / VP6 prediction filter taps / Progressive JPEG Cb ACDC coefficient base (SWREG42_H264)	32	RW	0000_0000h
ACh	bi-dir initial ref pic list register (3-5) / VP6 prediction filter taps / Progressive JPEG Cr ACDC coefficient base (SWREG43_H264)	32	RW	0000_0000h
B0h	bi-dir initial ref pic list register (6-8) / VP6 prediction filter taps (SWREG44_H264)	32	RW	0000_0000h
B4h	bi-dir initial ref pic list register (9-11) / VP6 prediction filter taps (SWREG45)	32	RW	0000_0000h
B8h	bi-dir initial ref pic list register (12-14) / VP7,VP8 quantization values (SWREG46)	32	RW	0000_0000h
BCh	bi-dir and P fwd initial ref pic list register (15 and P 0-3) / VP7,VP8 quantization values (SWREG47)	32	RW	0000_0000h

15.1.5.2.2 Decoder control register 1 (picture parameters) (SWREG4)

15.1.5.2.2.1 Offset

Register	Offset
SWREG4	10h

15.1.5.2.2.2 Diagram



15.1.5.2.2.3 Fields

Field	Function
31-23 SW_PIC_MB_WIDTH	Picture width in macroblocks = ((width in pixels + 15) /16)
22-19 SW_MB_WIDTH_OFF	The amount of meaningfull horizontal pixels in last MB (width offset) 0 if exactly 16 pixels multiple picture and all the horizontal pixels in last MB are meaningfull
18-11	Picture height in macroblocks =((height in pixels+15)/16). Picture height is informed as size of the (progressive) frame also for single field (of interlaced content) is being decoded

Table continues on the next page...

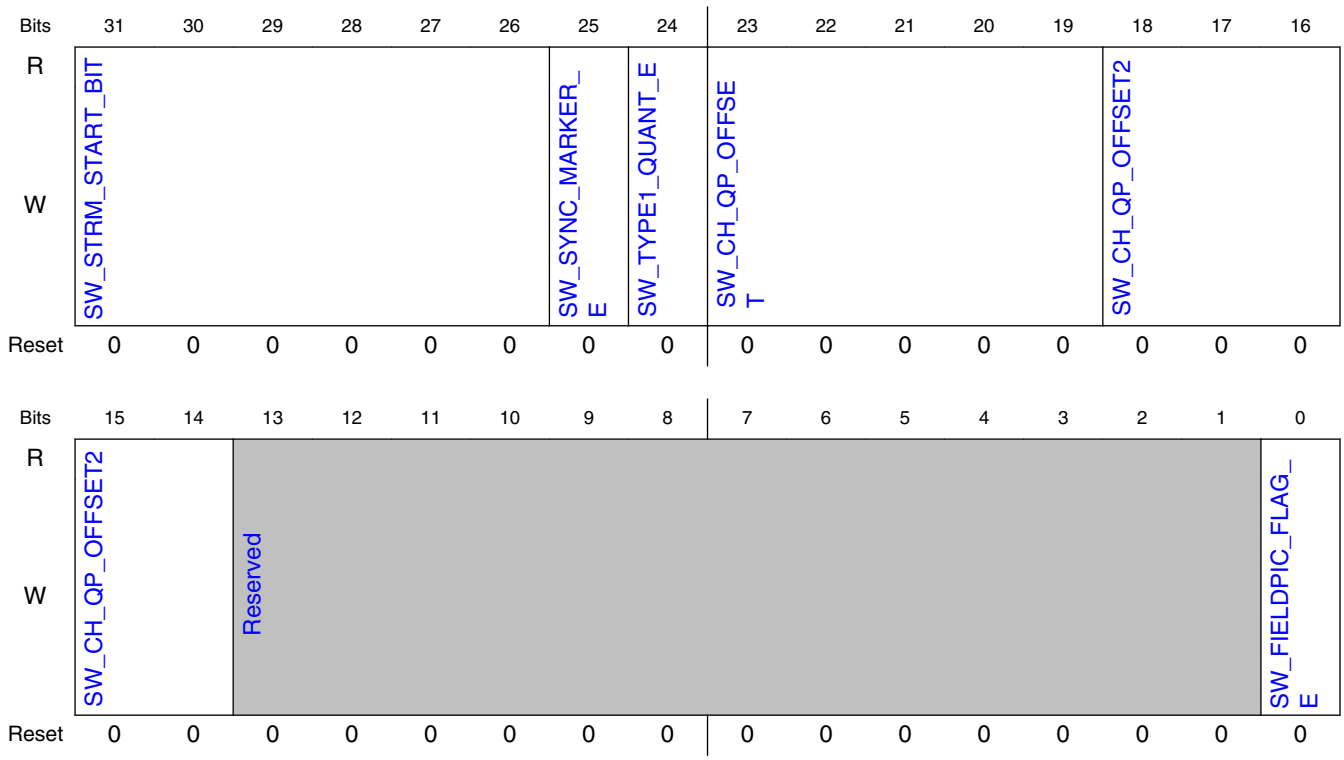
Field	Function
SW_PIC_MB_HEIGHT_P	
10-7 SW_MB_HEIGHT_OFF	The amount of meaningful vertical pixels in last MB (height offset 0 if exactly 16 pixels multiple picture and all the vertical pixels in last MB are meaningfull
6 SW_ALT_SCAN_E	indicates alternative vertical scan method used for interlaced frames
5 —	Reserved.
4-0 SW_REF_FRAMES	H.264: num_ref_frames, maximum number of short and long term reference frames in decoded picture buffer VC-1: num_ref semantics

15.1.5.2.3 Decoder control register 2 (stream decoding table selects) (SWREG5)

15.1.5.2.3.1 Offset

Register	Offset
SWREG5	14h

15.1.5.2.3.2 Diagram



15.1.5.2.3.3 Fields

Field	Function
31-26 SW_STRM_START_BIT	Exact bit of stream start word where decoding can be started (assosiates with sw_rlc_vlc_base)
25 SW_SYNC_MARKER_E	Sync markers enable For progressive JPEG, this indicates that there are restart markers in the stream after restart interval steps. 0b - synch markers are not used 1b - synch markers are used.
24 SW_TYPE1_QUANT_E	MPEG4: Type 1 quantization enable • '0' = type 2 inverse Q method • '1' = type 1 inverse Q method (Q-tables used) H264 (h264_high config): scaling matrix enable • '0' = normal transform • '1' = use scaling matrix for transform (read from external memory)
23-19 SW_CH_QP_OFFSET	Chroma Qp filter offset. (For H.264 this offset concerns Cb only)
18-14	Chroma Qp filter offset for cr type

Table continues on the next page...

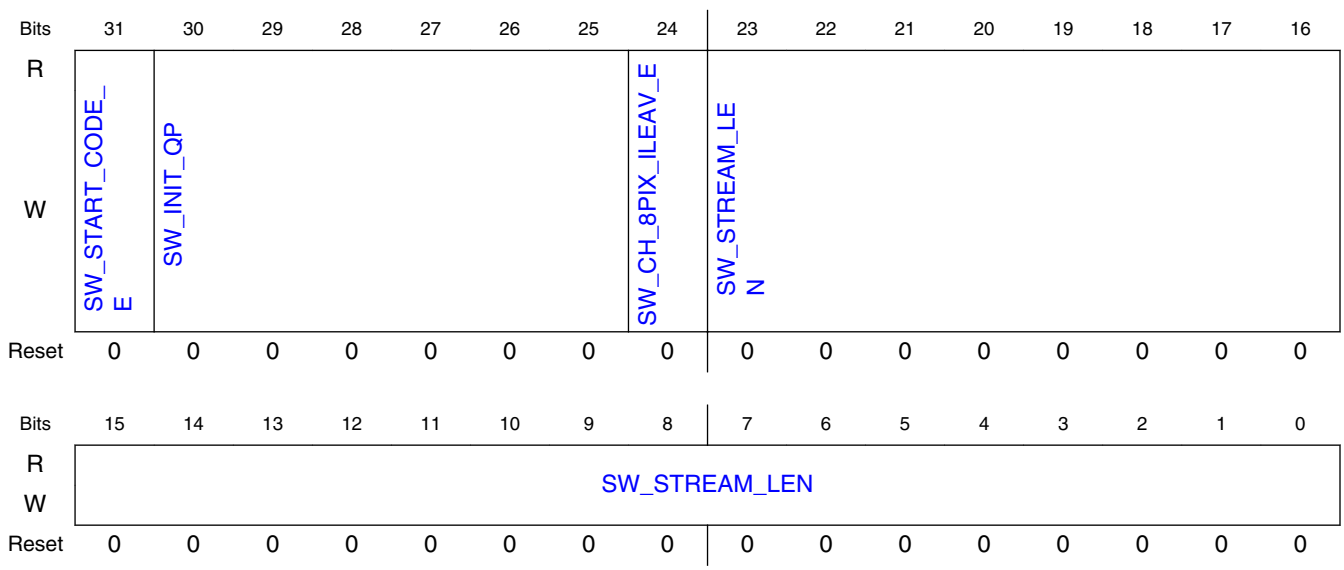
Field	Function
SW_CH_QP_OFFSET2	
13-1 —	Reserved.
0 SW_FIELDPIC_FLAG_E	Flag for streamd that field_pic_flag exists in stream

15.1.5.2.4 Decoder control register 3 (stream buffer information) (SWREG6)

15.1.5.2.4.1 Offset

Register	Offset
SWREG6	18h

15.1.5.2.4.2 Diagram



15.1.5.2.4.3 Fields

Field	Function
31	Bit for indicating stream start code existence: 0b - stream doesn't contain start codes

Table continues on the next page...

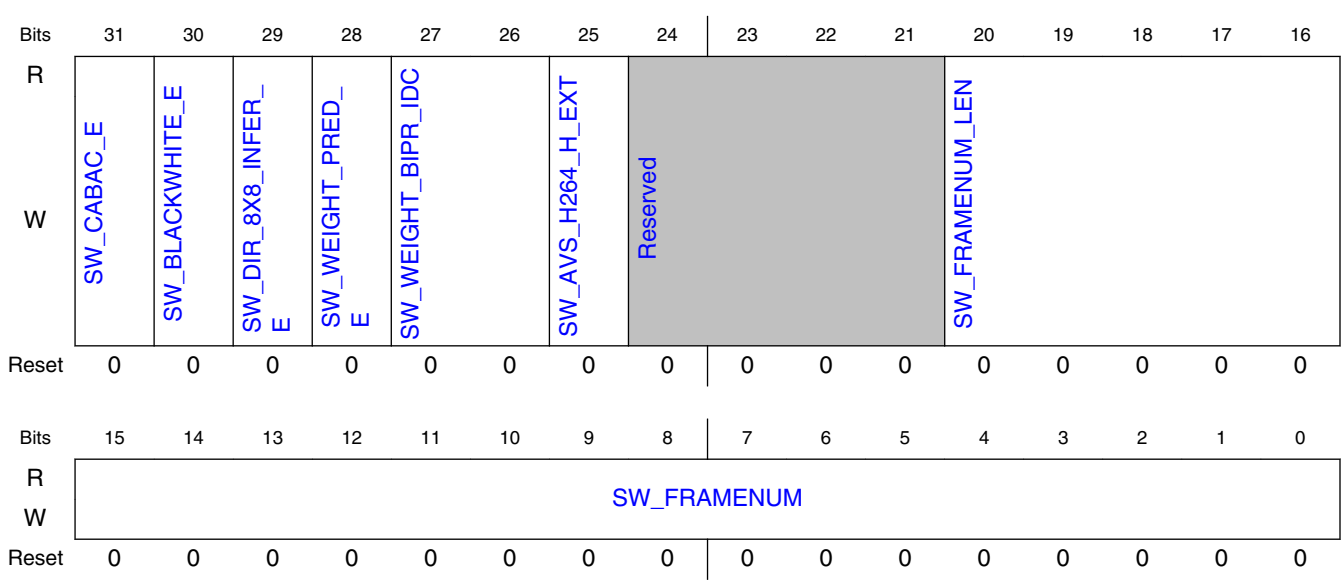
Field	Function
SW_START_CODE_E	1b - stream contains start codes
30-25 SW_INIT_QP	Initial value for quantization parameter (picture quantizer).
24 SW_CH_8PIX_ILEAV_E	Enable for additional chrominance data format writing where decoder writes chrominance in group of 8 pixels of Cb and then corresponding 8 pixels of Cr. Data is written to sw_dec_ch8pix_base. Cannot be used if tiled mode is enabled
23-0 SW_STREAM_LEN	Amount of stream data bytes in input buffer. If the given buffer size is not enough for finishing the picture the corresponding interrupt is given and new stream buffer base address and stream buffer size information should be given (assosiates with sw_rlc_vlc_base). For VC-1/VP6 the buffer must include data for one picture/slice of the picture For H264/MPEG4/H263/MPEG2/MPEG1 the buffer must include at least data for one slice/VP of the picture For JPEG the buffer size must be a multiple of 256 bytes or the amount of data for one picture.

15.1.5.2.5 Decoder control register 4 (H264, VC-1, VP6 and progressive JPEG control) (SWREG7)

15.1.5.2.5.1 Offset

Register	Offset
SWREG7	1Ch

15.1.5.2.5.2 Diagram



15.1.5.2.5.3 Fields

Field	Function
31 SW_CABAC_E	CABAC enable
30 SW_BLACKWHITE_E	0b - 4:2:0 sampling format 1b - 4:0:0 sampling format (H264 monochroma)
29 SW_DIR_8X8_INFER_E	Specifies the method to use to derive luma motion vectors in B_skip, B_Direct_16x16 and B_direct_8x8_inference_flag (see direct_8x8_inference flag)
28 SW_WEIGHT_PRED_E	Weighted prediction enable for P slices
27-26 SW_WEIGHT_BIPR_IDC	weighted prediction specification for B slices: 00b - default weighted prediction is applied to B slices 01b - explicit weighted prediction shall be applied to B slices 10b - implicit weighted prediction shall be applied to B slices
25 SW_AVS_H264_H_EXT	Resolution extension to support 4k resolution for AVS/H264. Used as MSB of sw_pic_mb_height
24-21 —	Reserved.
20-16 SW_FRAMENUM_LEN	H.264: Bit length of frame_num in data stream RV: frame size length. Informs how many bits in stream are used for frame size (HW discards these bits)
15-0 SW_FRAMENUM	current frame_num, used to identify short-term reference frames. Used in reference picture reordering

15.1.5.2.6 Decoder control register 5 (H264, VC-1, VP6, Progressive JPEG and RV control) (SWREG8)

15.1.5.2.6.1 Offset

Register	Offset
SWREG8	20h

15.1.5.2.6.2 Diagram

W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.1.5.2.6.3 Fields

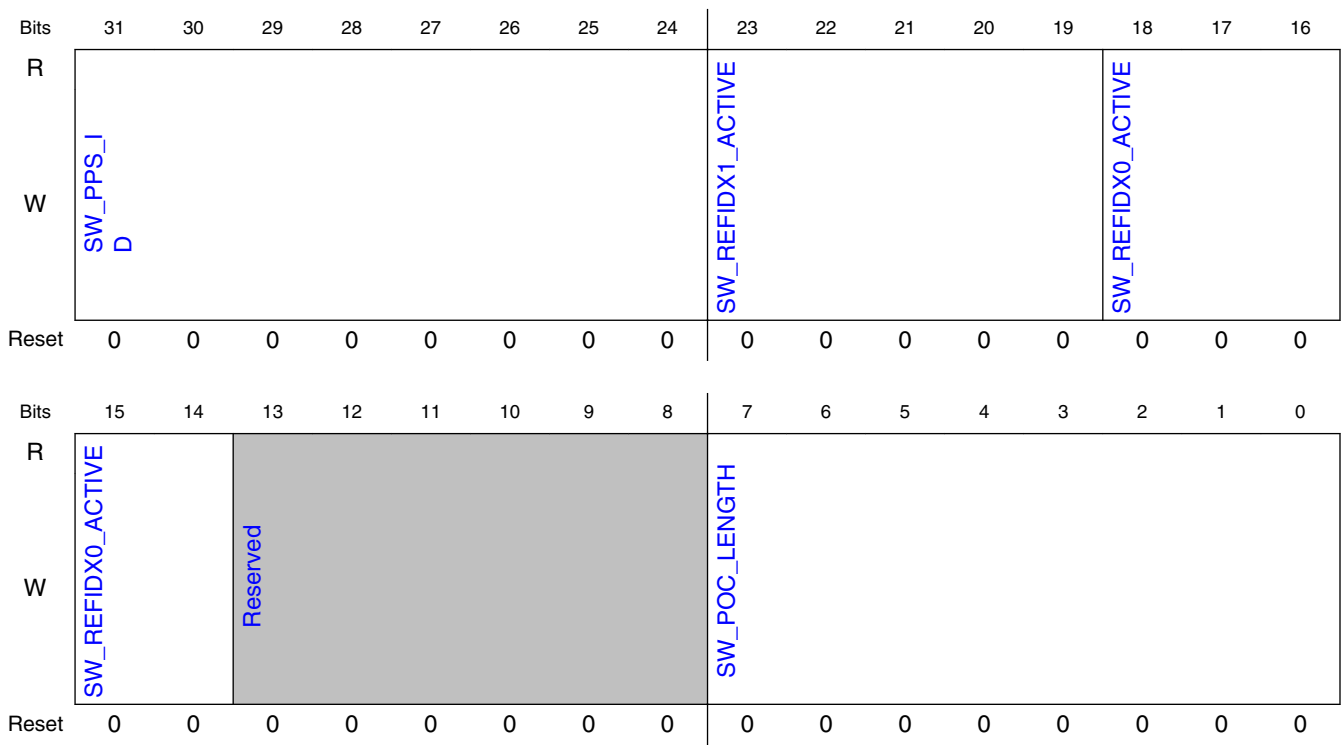
Field	Function
31 SW_CONST_INTRA_E	constrained_intra_pred_flag equal to 1 specifies that intra prediction uses only neighbouring intra macroblocks in prediction. When equal to 0 also neighbouring inter macroblocks are used in intra prediction process.
30 SW_FILT_CTRL_PRES	deblocking_filter_control_present_flag indicates whether extra variables controlling characteristics of the deblocking filter are present in the slice header.
29 SW_RDPIC_CNT_PRES	redundant_pic_cnt_present_flag specifies whether redundant_pic_cnt syntax elements are present in the slice header.
28 SW_8X8TRANS_FLAG_E	8x8 transform flag enable for stream decoding
27-17 SW_REFPIC_MK_LEN	Length of decoded reference picture marking bits
16 SW_IDR_PIC_E	IDR (instantaneous decoding refresh) picture flag.
15-0 SW_IDR_PIC_ID	idr_pic_id, identifies IDR (instantaneous decoding refresh) picture

15.1.5.2.7 Decoder control register 6 / base address for MB-control (RLC) / VC-1 intensity control 0/ VP6,VP7,VP8 ctrl-stream length/ RV pic slice amount (SWREG9)

15.1.5.2.7.1 Offset

Register	Offset
SWREG9	24h

15.1.5.2.7.2 Diagram



15.1.5.2.7.3 Fields

Field	Function
31-24 SW_PPS_ID	pic_parameter_set_id, identifies the picture parameter set that is referred to in the slice header.
23-19 SW_REFIDX1_ACTIVE	Specifies the maximum reference index that can be used while decoding inter predicted macro blocks.

Table continues on the next page...

Field	Function
18-14 SW_REFIDX0_ACTIVE	Specifies the maximum reference index that can be used while decoding inter predicted macro blocks. This is same as in previous decoders (width increased with q bit)
13-8 —	Reserved.
7-0 SW_POC_LENGTH	Length of picture order count field in stream

15.1.5.2.8 Base address for differential motion vector base address (RLC-mode) /H264 P initial fwd ref pic list register (4-9)/ VC-1 intensity control 1/ VP7 and VP8 segmentation base register (SWREG10)

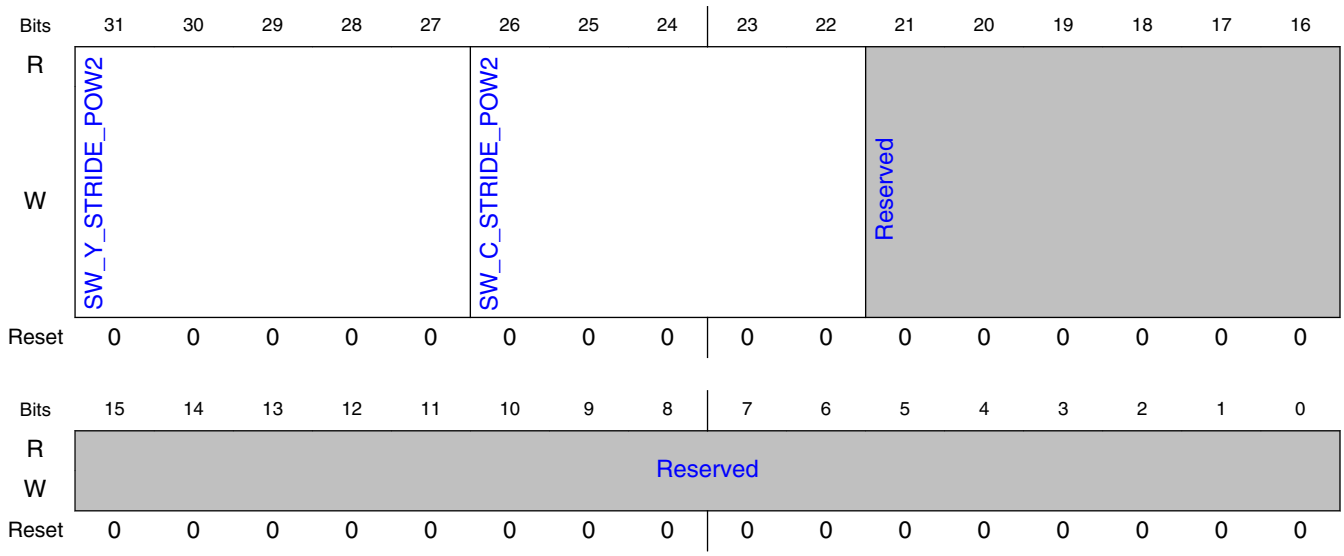
31-2 SW_VP8_DEC_CH_BASE	VP8 video base address for decoder output chrominance data (if vp8 stride configuration is enabled)
1 SW_VP8_STRIDE_E	VP8 stride enable. Can be set high only if HW configuration supports strides. Y and C strides are used instead of picture width. Separate chrominance base addresses are used instead of internal chrominance offsets. 0b - Not enabled 1b - Enabled
0 SW_VP8_CH_BASE_E	VP8 separate chrominance enable: 0b - Write/Read chrominance data from internal offset after the luminance data 1b - Write/Read chrominance data from separate base addresses given by SW

15.1.5.3.4 Base address for reference picture index 7 / MPEG4 TRB/TRD delta 1 / List of VLC code lengths in second JPEG AC table / VP6/VP7 scan maps (SWREG21_VP8)

15.1.5.3.4.1 Offset

Register	Offset
SWREG21_VP8	54h

15.1.5.3.4.2 Diagram



15.1.5.3.4.3 Fields

Field	Function
31-27 SW_Y_STRIDE_POW2	VP8 Y stride length informed by 2^n (n=sw_y_stride_pow2). Valid range 10-17 for 32 bit bus and 10-18 for 64 bit bus
26-22 SW_C_STRIDE_POW2	VP8 C stride length informed by 2^n (n=sw_c_stride_pow2). Valid range 10-17 for 32 bit bus and 10-18 for 64 bit bus
21-0 —	Reserved.

15.1.5.4 VPU_G1 VP7/VP8 decoder register descriptions

15.1.5.4.1 VPU_G1 VP7/VP8 decoder memory map

VPU_G1_VP7_VP8 base address: 3830_0000h

Offset	Register	Width (In bits)	Access	Reset value
10h	Decoder control register 1 (picture parameters) (SWREG4_JPEG_VP7_VP8)	32	RW	0000_0000h
14h	Decoder control register 2 (stream decoding table selects) (SWREG5_VP7_VP8)	32	RW	0000_0000h
18h	Decoder control register 3 (stream buffer information) (SWREG6_VP7_VP8)	32	RW	0000_0000h
1Ch	Decoder control register 4 (H264, VC-1, VP6 and progressive JPEG control) (SWREG7_VP7_VP8)	32	RW	0000_0000h
28h	Base address for differential motion vector base address (RLC-mode) /H264 P initial fwd ref pic list register (4-9)/ VC-1 intensity control 1/ VP7 and VP8 segmentation base register (SWREG10_VP7_VP8)	32	RW	0000_0000h
2Ch	Decoder control register 7 (VLC) / base address for H.264 intra prediction 4x4 / base address for MPEG-4 DC component (RLC) / H264 P initial fwd ref pic list register (10-15) / VC-1 intensity control 2 (SWREG11_VP7_VP8)	32	RW	0000_0000h
38h	Base address for reference picture index 0 / base address for JPEG decoder output chrominance picture (SWREG14_VP7_VP8)	32	RW	0000_0000h
3Ch	Base address for reference picture index 1 / JPEG control (SWREG15_VP7_VP8)	32	RW	0000_0000h
48h	Base address for reference picture index 4 / VC1 control / MPEG4 MVD control/ List of VLC code lengths in first JPEG AC table / VC-1 intensity control 4 / VP6/VP7, VP8 Golden refer picture base (SWREG18_VP7_VP8)	32	RW	0000_0000h

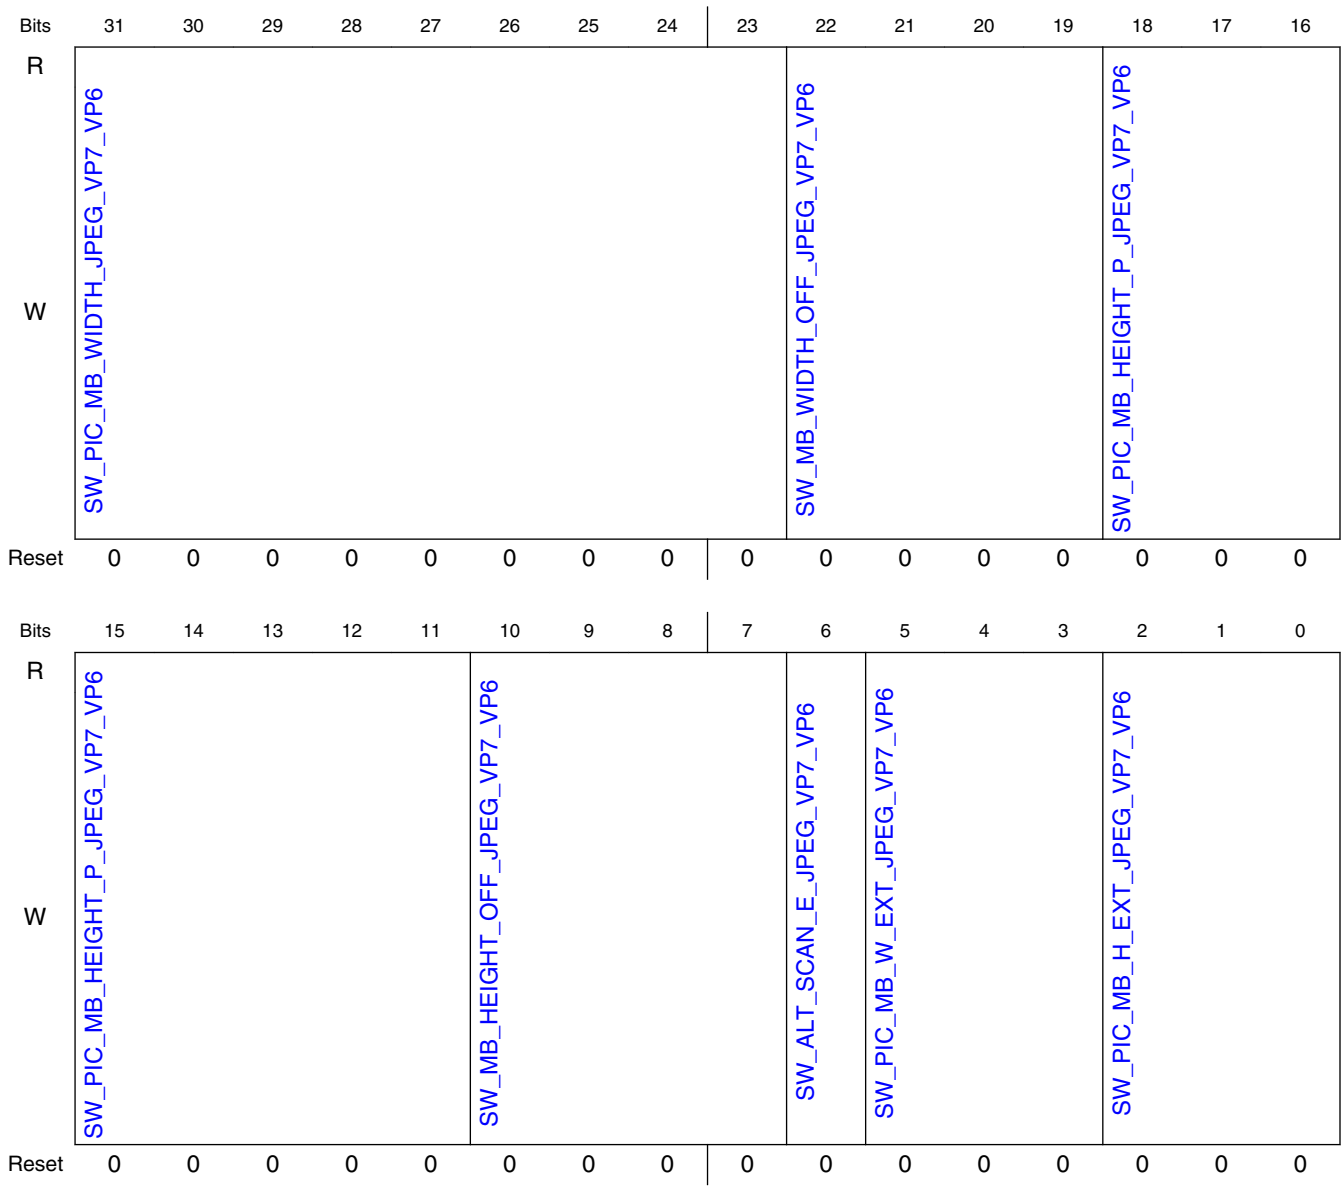
B8h	bi-dir initial ref pic list register (12-14) / VP7,VP8 quantization values (SWREG46_VP7_VP8)	32	RW	0000_0000h
BCh	bi-dir and P fwd initial ref pic list register (15 and P 0-3) / VP7,VP8 quantization values (SWREG47_VP7_VP8)	32	RW	0000_0000h

15.1.5.4.2 Decoder control register 1 (picture parameters) (SWREG4_JPEG_VP7_VP8)

15.1.5.4.2.1 Offset

Register	Offset
SWREG4_JPEG_VP7_VP8	10h

15.1.5.4.2.2 Diagram



15.1.5.4.2.3 Fields

Field	Function
31-23 SW_PIC_MB_WIDTH_JPEG_VP7_VP6	Picture width in macroblocks = ((width in pixels + 15) /16)
22-19	The amount of meaningfull horizontal pixels in last MB (width offset) 0 if exactly 16 pixels multiple picture and all the horizontal pixels in last MB are meaningfull

Table continues on the next page...

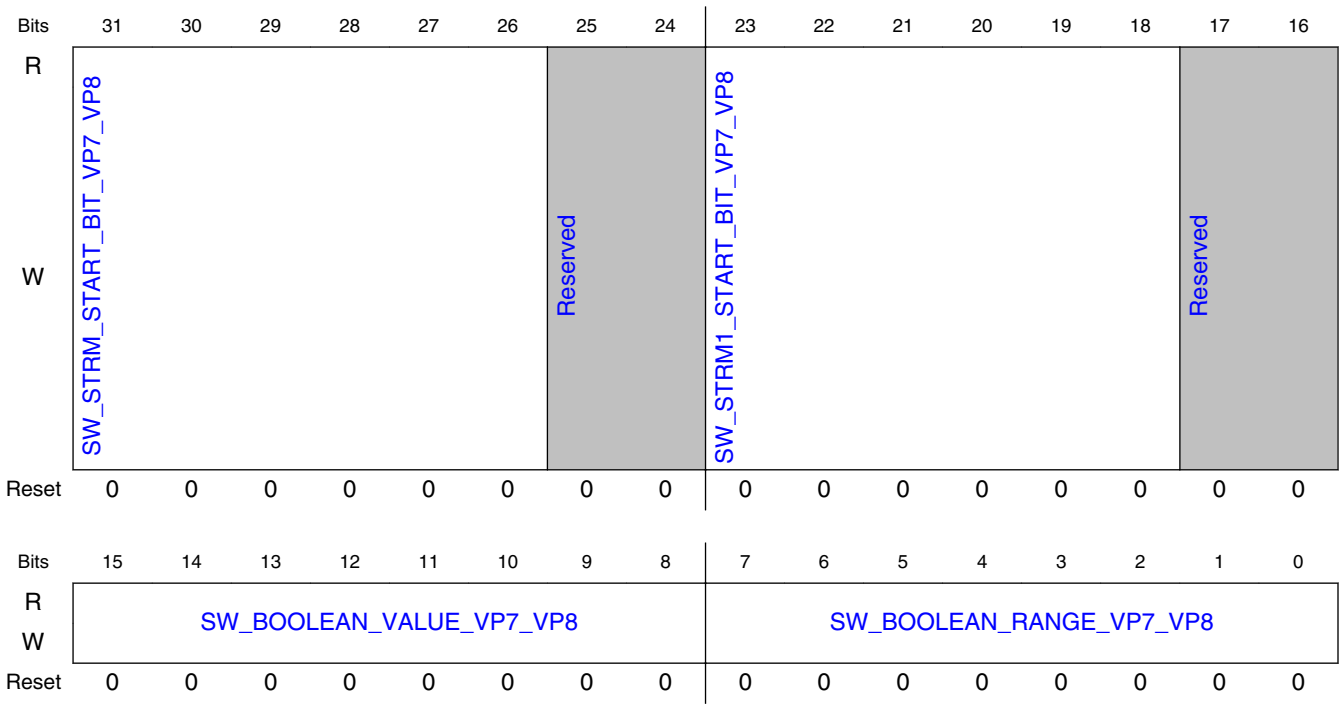
Field	Function
SW_MB_WIDTH_OFF_JPEG_VP7_VP6	
18-11 SW_PIC_MB_HEIGHT_P_JPEG_VP7_VP6	Picture height in macroblocks =((height in pixels+15)/16). Picture height is informed as size of the (progressive) frame also for single field (of interlaced content) is being decoded
10-7 SW_MB_HEIGHT_OFF_JPEG_VP7_VP6	The amount of meaningful vertical pixels in last MB (height offset 0 if exactly 16 pixels multiple picture and all the vertical pixels in last MB are meaningfull
6 SW_ALT_SCAN_E_JPEG_VP7_VP6	indicates alternative vertical scan method used for interlaced frames
5-3 SW_PIC_MB_W_EXT_JPEG_VP7_VP6	Picture mb width extension. If sw_pic_mb_width does not fit to 9 bits then these bits are used to increase the range upto 11 bits (used as 3 msb)
2-0 SW_PIC_MB_H_EXT_JPEG_VP7_VP6	Picture mb height extension. If sw_pic_mb_height_p does not fit to 9 bits then these bits are used to increase the range upto 11 bits (used as 3 msb). For 4k video one bit is used for extension (bit 0)

15.1.5.4.3 Decoder control register 2 (stream decoding table selects) (SWREG5_VP7_VP8)

15.1.5.4.3.1 Offset

Register	Offset
SWREG5_VP7_VP8	14h

15.1.5.4.3.2 Diagram



15.1.5.4.3.3 Fields

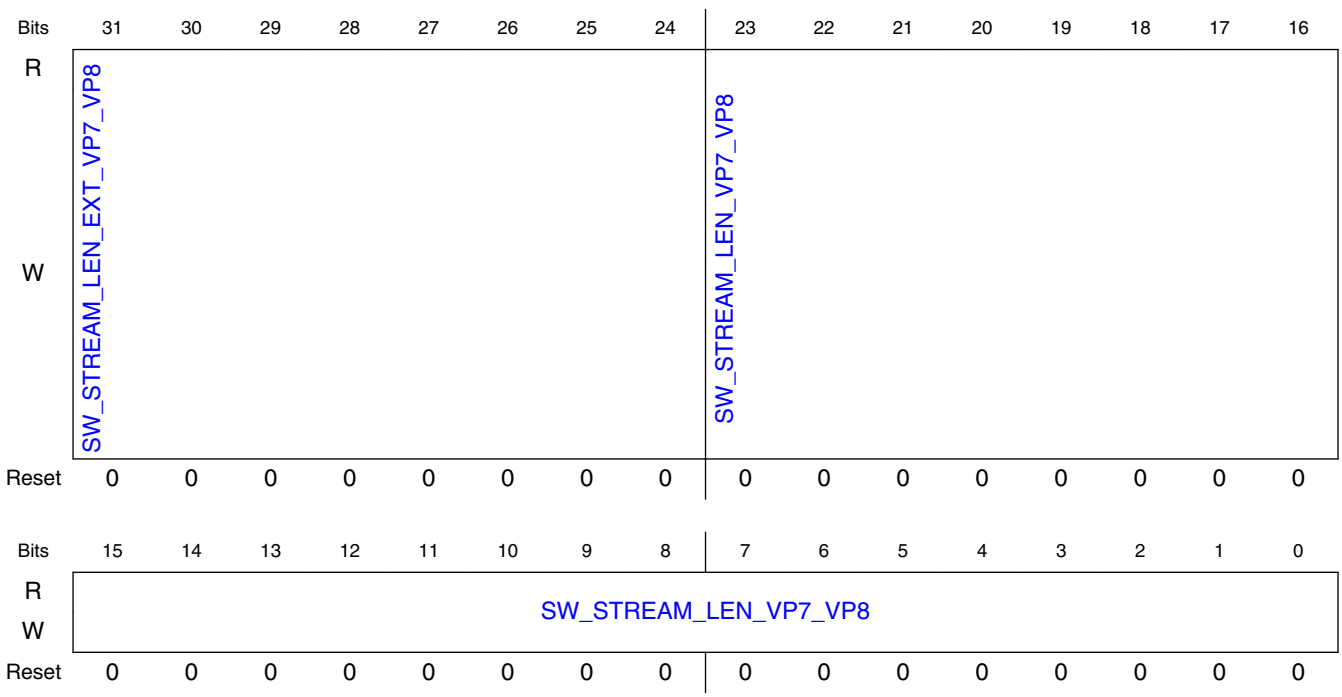
Field	Function
31-26 SW_STRM_START_BIT_VP7_VP8	Exact bit of stream start word where decoding can be started (assosiates with sw_rlc_vlc_base)
25-24 —	Reserved.
23-18 SW_STRM1_START_BIT_VP7_VP8	Start bit for ctrl-stream (needed if multistream is enabled, assosiates with sw_bitpl_ctrl_base)
17-16 —	Reserved.
15-8 SW_BOOLEAN_VALUE_VP7_VP8	Initial value for boolean dec
7-0 SW_BOOLEAN_RANGE_VP7_VP8	Initial range for boolean dec

15.1.5.4.4 Decoder control register 3 (stream buffer information) (SWREG6_VP7_VP8)

15.1.5.4.4.1 Offset

Register	Offset
SWREG6_VP7_VP8	18h

15.1.5.4.4.2 Diagram



15.1.5.4.4.3 Fields

Field	Function
31-24 SW_STREAM_LEN_EXT_VP7_VP8	Extended stream length for WEBP/VP8
23-0 SW_STREAM_LEN_VP7_VP8	Amount of stream data bytes in input buffer. If the given buffer size is not enough for finishing the picture the corresponding interrupt is given and new stream buffer base address and stream buffer size information should be given (assosiates with sw_rlc_vlc_base). For VC-1/VP6 the buffer must include data for one picture/slice of the picture For H264/MPEG4/H263/MPEG2/MPEG1 the buffer must include at least data for one slice/VP of the picture For JPEG the buffer size must be a multiple of 256 bytes or the amount of data for one picture.

15.1.5.4.5 Decoder control register 4 (H264, VC-1, VP6 and progressive JPEG control) (SWREG7_VP7_VP8)

15.1.5.4.5.1 Offset

Register	Offset

15.2 VPU G2 (VPU_G2)

15.2.1 Overview

This block details the G2 hardware-based decoder and API. The decoder is able to decode HEVC standard Main/Main 10 profile compatible video streams, and Google's VP9 Profile 0 compatible video streams. The G2 decoder conforms to the HEVC Main/ Main 10 profiles and can decode streams up to level 5.1.

15.2.2 Video Frame Storage Format

The HW decoder may support two storage formats for frames, raster-scan, tiled without being compressed and compressed output. The application using the decoder may specify upon initialization which format is preferred, depending on HW support. The tiled format generally speaking offers better bus utilization and performance, however the decoder output must be converted back to raster-scan format prior to displaying it, except that GPU supports tiled format displaying. This postprocessing is beyond the scope of G2 decoder.

15.2.2.1 Raster-scan format

The output picture of the decoder is in semi-planar YCbCr 4:2:0 format, i.e. luminance data forms one plane in memory, and chrominance data forms the other. The output picture has to be stored linearly and contiguously in the memory. The interleaved

chrominance block has to be stored right after the luminance block in external memory as shown in Figure . The number of bytes in one luminance row must be divisible by 16, which means there will be padded 0 in the right edge when necessary.

The interleaved chrominance is stored raster-scanned in memory in Cb0Cr0Cb1Cr1Cb2Cr2Cb3… format.

The decoder output picture for interlaced sequence is always stored as an interlaced frame where even lines belongs to top field and odd lines belongs to bottom field of the frame.

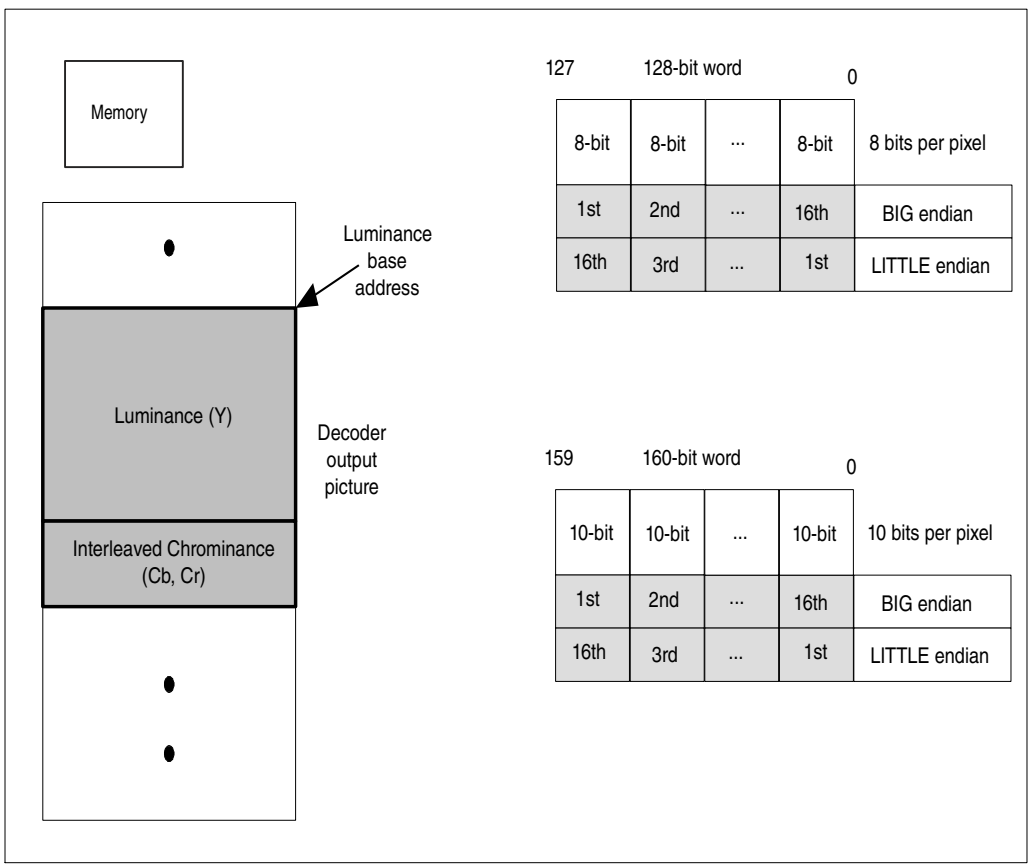

Figure 15-7. External Memory Usage

As an example the luminance pixels of a QCIF sized (176 x 144) frame with each pixel in 8 bits are numbered as presented in Table 1. Table 2 shows the storage of the luminance pixel data of the QCIF sized video frame in raster-scan order (in little endian mode).

Table 15-1. Pixel numbers of the luminance data of the QCIF video frame

0	1	2	3	4	5	6	7	…	172	173	174	175
176	177	178	179	180	181	182	183	…	348	349	350	351
::												::
25200	25201	25202	25203	25204	25205	25206	25207	…	25340	25341	25342	25343

The storage of the luminance pixel data of a QCIF video frame in raster-scan order. All pixels of a pixel row are stored in consecutive memory locations.

Table 15-2. Pixel Memory Locations

Address offset (decimal)	128-bit words(Pixel data of the luminance component. Each byte contains data for one pixel. Number in table are pixel numbers)			
0	15	...	1	0
16	31	...	17	16
32	47	...	33	32
48	63	...	49	48
64	79	...	65	64

25296	25311	...	25297	25296
25312	25327	...	25313	25312
25328	25343	...	25329	25328

15.2.2.2 Tiled format

The output picture of the decoder is in semi-planar YCbCr 4:2:0 4x4 tiled format, i.e. luminance data forms one plane in memory, and chrominance data forms another. The distinction from raster scan format is that the output picture is grouped into tiles, which are then stored linearly and contiguously in the memory. The chrominance tiles have to be stored right after the luminance tiles in external memory as shown in Figure . The number of luminance pixels in one row must be divisible by 16.

The chrominance is stored into tiles in interleaved Cb0Cr0Cb1Cr1Cb2Cr2Cb3… format.

Figure contains example external memory usage when using 4x4 tiles, which is used in G2 decoder.

Below is an example code of converting tiled YCbCr 4:2:0 output picture back to raster scan format. The code is in generalized form, i.e. can function on arbitrary tile sizes as long as the picture dimensions are multiple of tile sizes. In the example, chrominance data is interleaved into 4x4 tile so that one 4x4 tile contains one 2x4 block of Cb and Cr each. Output is YCbCr 4:2:0 semiplanar.

```
void ConvertTiledToRaster( DecPicture decPicture, u32 tileWidth,
            u32 tileHeight, u8 *pOutput )
            {
            u32 i, j;
            u32 k, l;
            u32 s, t;
            u8 *pIn;
            pIn = decPicture.pOutputPicture;
            /* loop all tile rows for luminance */
            for( i = 0 ; i < decPicture.frameHeight ; i += tileHeight )
```

```
{
t = 0;
s = 0;
/* loop all tiles in one row */
for( j = 0 ; j < decPicture.frameWidth ; j += tileWidth )
{
/* copy one tile */
for( k = 0 ; k < tileHeight ; ++k )
{
for( l = 0 ; l < tileWidth ; ++l )
{
pOutput[ k*decPicture.frameWidth + l + s ] = pIn[t++];
}
}
/* move to next horizontal tile */
s += tileWidth;
}
/* move to next tile row */
pOutput += decPicture.frameWidth * tileHeight;
pIn += decPicture.frameWidth * tileHeight;
}
/* setup pointers to chrominance data */
pIn = decPicture.pOutputPicture +
decPicture.frameWidth * decPicture.frameHeight;
/* loop all tile rows for chrominance */
for( i = 0 ; i < decPicture.frameHeight/2 ; i += tileHeight )
{
t = 0;
s = 0;
/* loop all tiles in one row */
for( j = 0 ; j < decPicture.frameWidth ; j += tileWidth )
{
/* copy one tile */
for( k = 0 ; k < tileHeight ; ++k )
{
for( l = 0 ; l < tileWidth ; ++l )
{
pOutput[ k*decPicture.frameWidth + l + s ] = pIn[t++];
}
}
/* move to next horizontal tile */
s += tileWidth;
}
/* move to next tile row */
pOutput += decPicture.frameWidth * tileHeight;
pIn += decPicture.frameWidth * tileHeight;
}
}
```

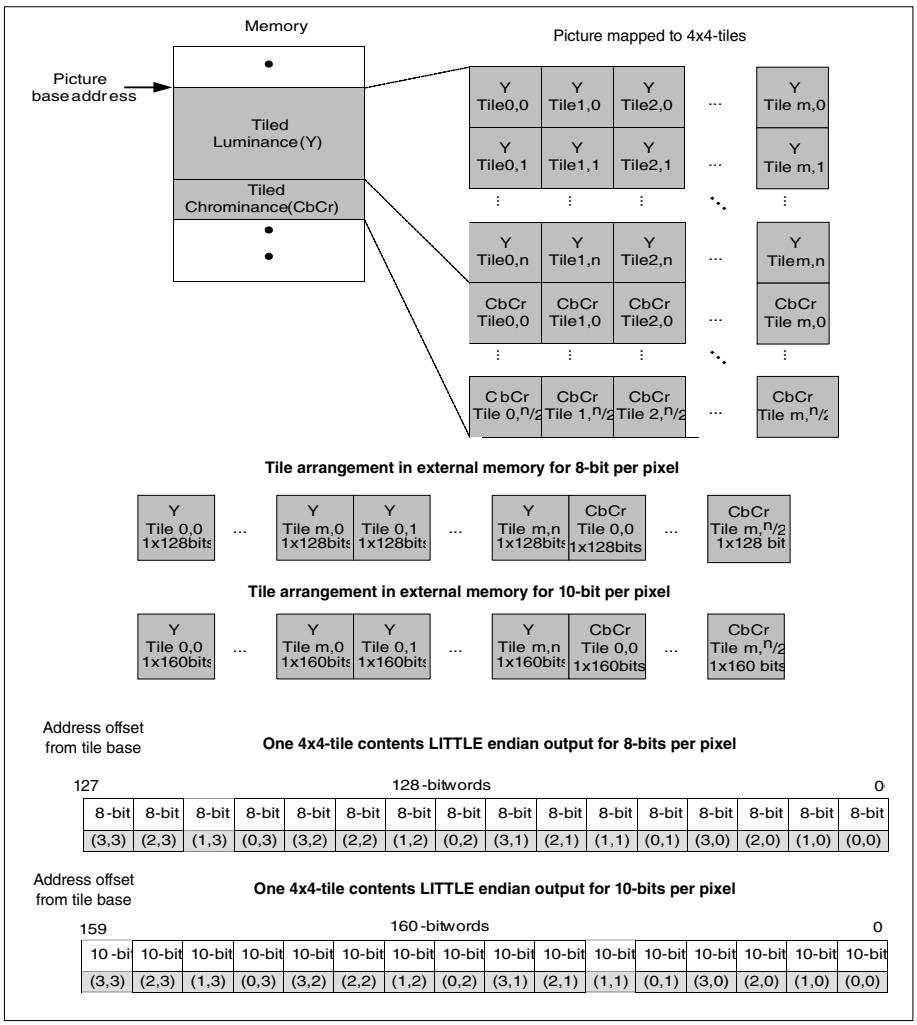

Figure 15-8. External Memory Usage in 4x4 Tiled Reference Picture Mode

15.2.2.3 Compressed format

G2 decoder supports compressed tiled output, when reference buffer compression (RFC) is enabled when synthesis, and user allows compressed reference frame output directly.

Reference frame compression is a feature added in G2 decoder to compress frame buffer so that the bandwidth of storing/loading reference frame can be reduced, especially when the resolution of decoded stream is of high definition.

When compression is enabled, the picture is divided into CBS rows, which is further divided into continuous CBS groups. Each CBS group is composed of 16 CBS. The luminance CBS is composed of 1 8x8 coded block (CB), which one chrominance CBS is composed of two 8x4 coded blocks, with cb CB first then cr CB following. The compression is performed to each CB in the CBS. The first CB's compressed data is

saved from the same offset of that CBS in raster scan buffer. And the compressed output of following CBs in the CBS row is saved continuously. That means there may be gaps between the compressed data of each CBS row.

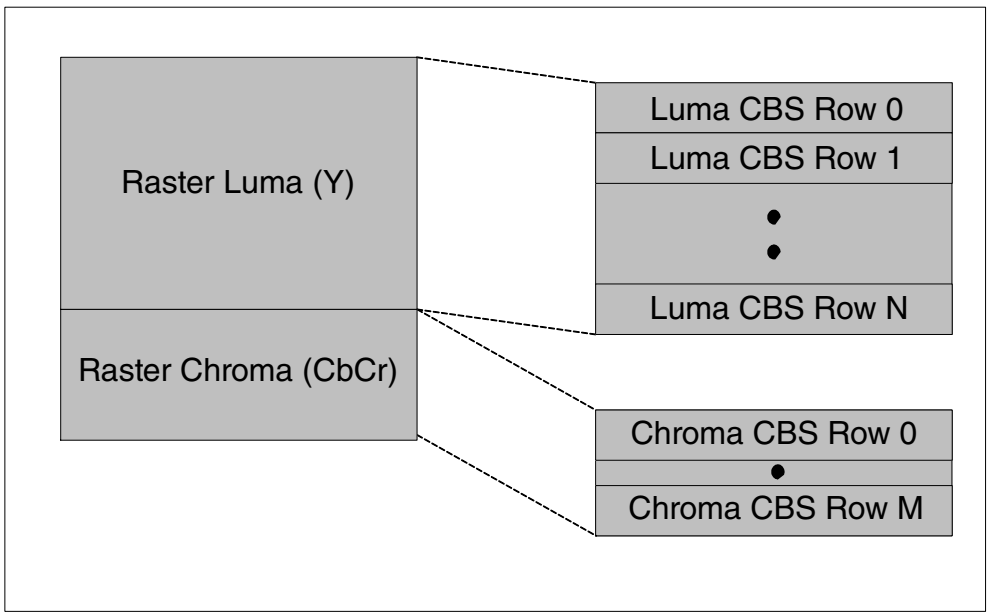

Figure 15-9. Raster scan picture mapped to CBS rows

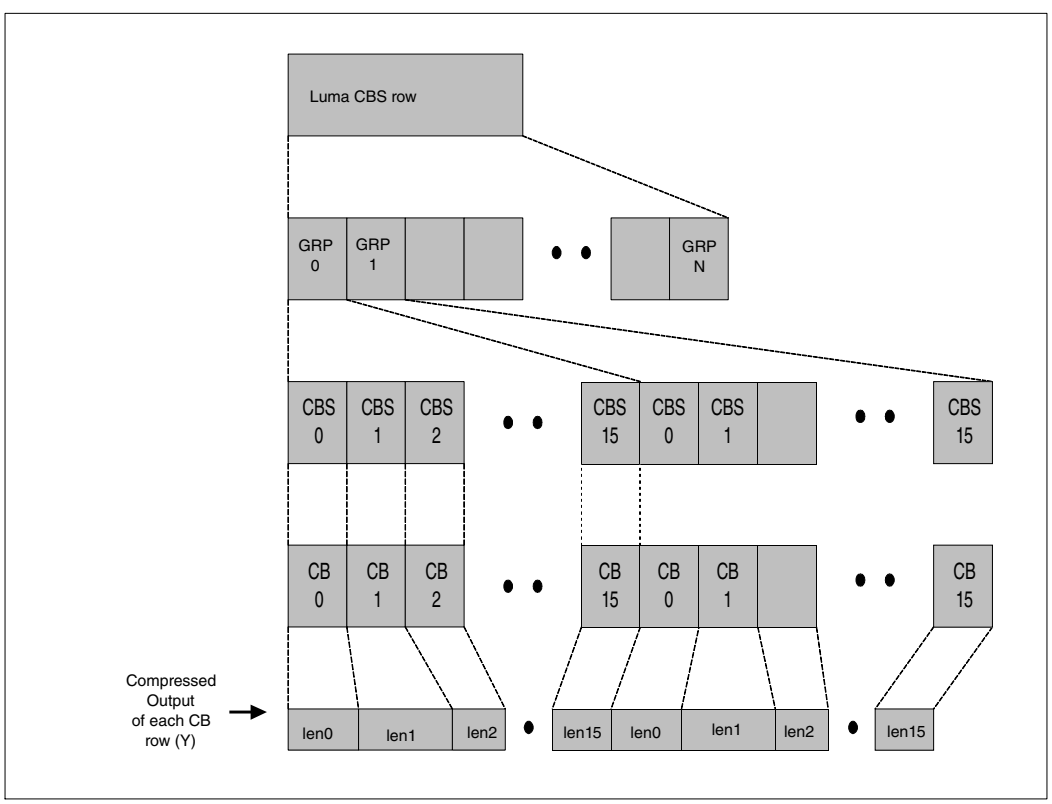

Figure 15-10. Compression performed to each Luma CBS row

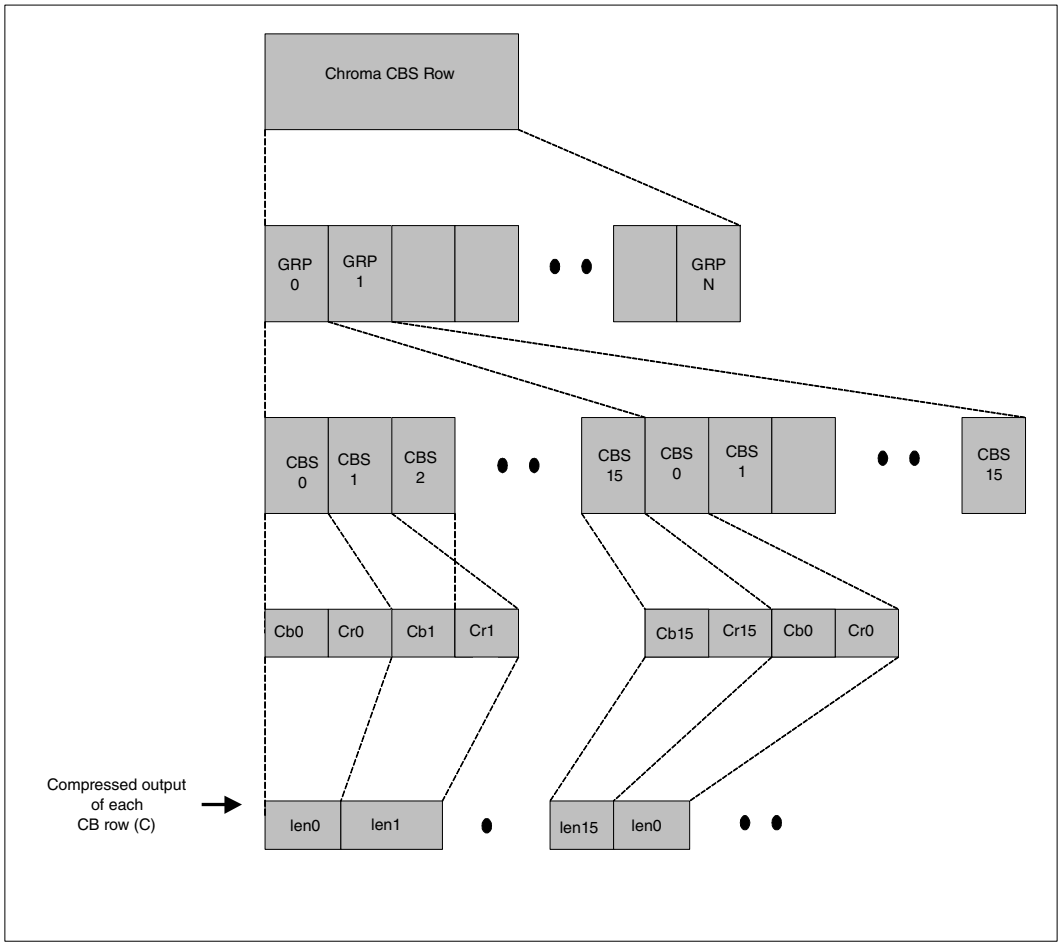

Figure 15-11. Compression performed to each Chroma CBS row

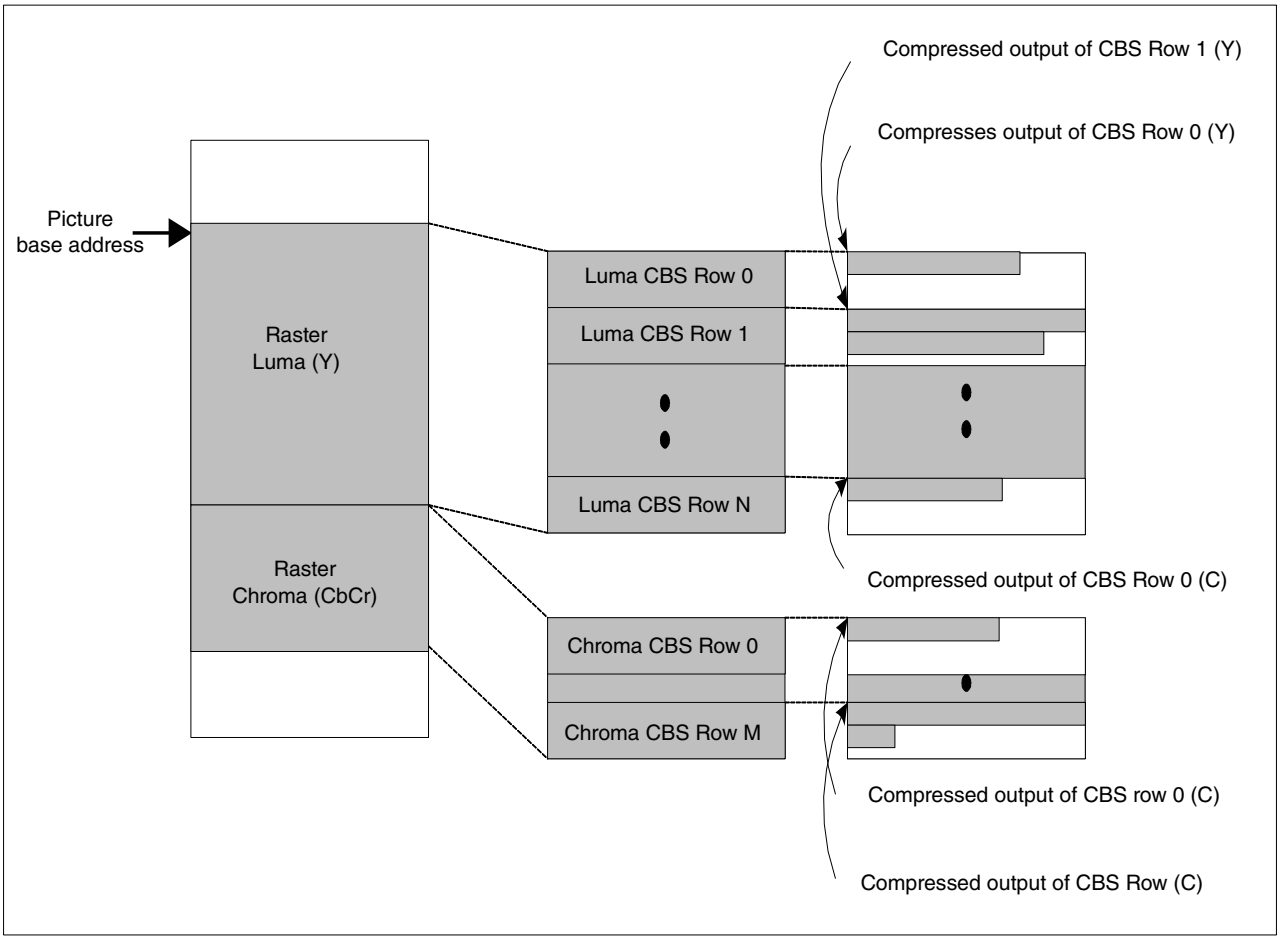

Figure 15-12. Map of external memory in RFC output buffer

Corresponding to each CBS group the starting offset of first compressed CBS output is saved in two bytes in CBS table, followed by the length of each CBS compress output, which is saved in 7 bits. So the table length of each CBS group information is 2+7*16/8=16 bytes.

This 16 bytes for each CBS group in compression table is mapped as shown in the following table. Here, X[n] means the bit-n of the length of CBS X in CBS group.

Table 15-3. Storage of the compression cache table for each CBS group

Byte	Bit7	Bit6	Bit5	Bit4	Bit 3	Bit 2	Bit 1	Bit 0
0	Offset[7:0]							
1	Offset[15:8]							
2	1[0]	0[6]	0[5]	0[4]	0[3]	0[2]	0[1]	0[0]

15.2.3 Interface Functions

This chapter describes the API declared in decapi.h, the definition of API in “software \source\common\decapi.c” of the release package.

Common numeric data types are declared in basetype.h as follows:

- **u8** – unsigned 8 bits integer value
- **i8** – signed 8 bits integer value
- **u16** – unsigned 16 bits integer value
- **i16** – signed 16 bits integer value
- **u32** – unsigned 32 bits value
- **i32** – signed 32 bits value

15.2.3.1 DecGetBuild

Syntax

```
struct DecSwHwBuild DecGetBuild(void)
```

Purpose

Returns the hardware and software build information of the decoder. Does not require the creation of a decoder instance.

Parameters

None.

Return value

DecSwHwBuild -- A structure containing the build information of the decoder.

```
struct DecSwHwBuild {
        u32 sw_build;                                   /* Software build ID */
        u32 hw_build;                                   /* Hardware build ID */
        struct DecHwConfig hw_config;          /* Hardware configuration */
};
```

Function	Description
sw_build	The internal release version of the Hantro HW HEVC software.
hw_build	The internal release version of the Hantro HW hardware.

DecHwConfig -- A structure containing the hardware-supported configuration.

```
struct DecHwConfig {
     u32 mpeg4_support;
     u32 custom_mpeg4_support;
     u32 h264_support;
     u32 vc1_support;
     u32 mpeg2_support;
     u32 jpeg_support;
     u32 jpeg_prog_support;
     u32 max_dec_pic_width;
     u32 max_dec_pic_height;
     u32 pp_support;
     u32 pp_config;
     u32 max_pp_out_pic_width;
     u32 sorenson_spark_support;
     u32 ref_buf_support;
     u32 tiled_mode_support;
     u32 vp6_support;
     u32 vp7_support;
     u32 vp8_support;
     u32 vp9_support;
     u32 avs_support;
     u32 jpeg_esupport;
     u32 rv_support;
     u32 mvc_support;
     u32 webp_support;
     u32 ec_support;
     u32 stride_support;
     u32 field_dpb_support;
     u32 hevc_support;
     u32 double_buffer_support;
     u32 hevc_main10_support;
     u32 vp9_10bit_support;
     u32 ds_support;
     u32 rfc_support;
     u32 ring_buffer_support;
};
```

Function	Description
mpeg4_support	Hardware support for MPEG-4 decoding. Possible values: • MPEG4_NOT_SUPPORTED – decoding not supported • MPEG4_SIMPLE_PROFILE – simple profile decoder • MPEG4_ADVANCED_SIMPLE_PROFILE – advanced simple profile decoder (includes • simple profile)
custom_mpeg4_support	Hardware support for DivX®decoding. Possible values:

Table continues on the next page...

Function	Description
	• MPEG4_CUSTOM_NOT_SUPPORTED – decoding not supported • MPEG4_CUSTOM - DivX Home Theater Profile QualifiedTM decoder available
h264_support	Hardware support for H.264 decoding. Possible values: • H264_NOT_SUPPORTED – decoding not supported • H264_BASELINE_PROFILE – baseline profile decoder • H264_MAIN_PROFILE – main profile decoder (includes baseline profile) • H264_HIGH_PROFILE – high profile decoder (includes baseline and main profile)
vc1_support	Hardware support for VC-1 decoding. Possible values: • VC1_NOT_SUPPORTED – decoding not supported. • VC1_SIMPLE_PROFILE – simple profile decoder • VC1_MAIN_PROFILE – main profile decoder (includes simple profile) • VC1_ADVANCED_PROFILE – advanced profile decoder (includes main profile)
mpeg2_support	Hardware support for MPEG-2 (includes MPEG-1) decoding. Possible values: • MPEG2_NOT_SUPPORTED – decoding not supported • MPEG2_MAIN_PROFILE – main profile decoder
jpeg_support	Hardware support for JPEG decoding. Possible values: • JPEG_NOT_SUPPORTED – decoding not supported • JPEG_BASELINE – baseline decoder
jpeg_prog_support	Hardware support for progressive JPEG decoding. Possible values: • JPEG_NOT_SUPPORTED – decoding not supported • JPEG_PROGRESSIVE – progressive decoder available
max_dec_pic_width	Maximum decoded picture's width for video decoders. The value is given in pixel units.
max_dec_pic_height	Maximum decoded picture's height for video decoders. The value is given in pixel units.
pp_support	Hardware support for video post-processing. Possible values: • PP_NOT_SUPPORTED – post-processing not supported. • PP_SUPPORTED – post-processing supported in hardware.
pp_config	Post-processing functions available. This is a bitwise list of the following values: • PP_DITHERING, PP_SCALING, PP_DEINTERLACING, and • PP_ALPHA_BLENDING. The availability of all these post-processor functions is • dependent on the hardware build.
max_pp_out_pic_width	Maximum output picture's width for the post-processor. The value is given in pixel units.

Table continues on the next page...

Function	Description
sorenson_spark_support	Hardware support for Sorenson Spark decoding. Possible values: • SORENSON_SPARK_NOT_SUPPORTED – decoding not supported • SORENSON_SPARK_SUPPORTED – decoder available
ref_buf_support	Hardware includes reference buffer handling speedup logic. Possible values: • REF_BUF_NOT_SUPPORTED – logic not available • REF_BUF_SUPPORTED – logic available for progressive pictures (flag) • REF_BUF_INTERLACED – logic available for interlaced pictures (flag) • REF_BUF_DOUBLE – logic available for buffering two reference pictures (flag) • Multiple values are possible using bitwise OR operation of valid flags.
tiled_mode_support	Hardware includes support for handling reference pictures in tiled mode to optimize bus utilization. Possible values: • TILED_NOT_SUPPORTED – tiled reference picture support not available • TILED_8x4_SUPPORTED – tiled reference picture support for 8x4 tiles available • TILED_8x4_ILACED_SUPPORTED – tiled reference picture support for 8x4 tiles • available also for interlaced pictures.
vp6_support	Hardware support for VP6 decoding. Possible values: • VP6_NOT_SUPPORTED – decoding not supported • VP6_SUPPORTED – decoder available
vp7_support	Hardware support for VP7 decoding. Possible values: • VP7_NOT_SUPPORTED – decoding not supported • VP7_SUPPORTED – decoder available
vp8_support	Hardware support for VP8 decoding. Possible values: • VP8_NOT_SUPPORTED – decoding not supported • VP8_SUPPORTED – decoder available
vp9_support	Hardware support for VP9 decoding. Possible values: • VP9_NOT_SUPPORTED – decoding not supported • VP9_SUPPORTED – decoder available
avs_support	Hardware support for AVS decoding. Possible values: • AVS_NOT_SUPPORTED – decoding not supported • AVS_SUPPORTED – decoder available
jpeg_esupport	Hardware support for baseline JPEG decoding up to 67 Mpixel images, and 4:1:1 and 4:4:4 sampling. Possible values: • JPEG_EXT_NOT_SUPPORTED – decoding not supported • JPEG_EXT_SUPPORTED – decoder available
rv_support	Hardware support for RV decoding. Possible values:

Table continues on the next page...

Function	Description
	• RV_NOT_SUPPORTED – decoding not supported • RV_SUPPORTED – decoder available
mvc_support	Hardware support for MVC decoding. Possible values: • MVC_NOT_SUPPORTED – decoding not supported • MVC_SUPPORTED – decoder available
webp_support	Hardware support for WebP decoding. Possible values: • WEBP_NOT_SUPPORTED – decoding not supported • WEBP_SUPPORTED – decoder available
ec_support	Hardware support for error concealment. Possible values: • EC_NOT_SUPPORTED – error concealment not supported • EC_SUPPORTED – error concealment available
stride_support	Hardware support for separate Y and C strides. Possible values: • STRIDE_NOT_SUPPORTED – strides not supported • STRIDE_SUPPORTED – strides available
field_dpb_support	Hardware support for field-mode DPB. Possible values: • FIELD_DPB_NOT_SUPPORTED – field-mode DPB not supported • FIELD_DPB_SUPPORTED –field-mode DPB available
hevc_support	Hardware support for HEVC decoding. Possible values: • HEVC_NOT_SUPPORTED – decoding not supported • HEVC_SUPPORTED – decoder available
double_buffer_support	Hardware support for decoder internal reference double buffering. Possible values: • DOUBLE_BUFFER_NOT_SUPPORTED – internal reference double buffering not • supported • DOUBLE_BUFFER_SUPPORTED – internal reference double buffering available
hevc_main10_support	Hardware support for HEVC main10 profile decoding. Possible values: • 0 – decoding not supported • 1 – decoder available
vp9_10bit_support	Hardware support for VP9 10 bits decoding. Possible values: • 0 – decoding not supported • 1 – decoder available
ds_support	Hardware support for decoder down scale outputting. Possible values: • 0 – decoding not supported • 1 – decoder available
rfc_support	Hardware support for reference frame compression. Possible values: • 0 – decoding not supported • 1 – decoder available
ring_buffer_support	Hardware support for ring buffer. Possible values:

Function	Description
	• 0 – decoding not supported • 1 – decoder available

15.2.3.2 DecInit

Syntax

```
enum DecRet DecInit(enum DecCodec codec,
                                  DecInst* decoder,
                                  struct DecConfig config,
                                  struct DecClientHandle callbacks)
```

Purpose

DecInit initializes a new decoder instance based on the given codec type. If parameter noOutputReordering is set to a non-zero value the decoder will not provide output pictures in display order but in decoding order (unless decoding order and display order is the same). Outputting pictures in decode order will lower the memory consumption of the decoder in case the number of reference frames used by the stream is less than the maximum number allowed by the profile and level of the stream.

Parameters

```
enum DecCodec codec
                  Codec type to be initialized.
                  enum DecCodec {
                  DEC_VP9,
                  DEC_HEVC
                  };
             DecInst * decoder
                  Pointer to the location where DecInit returns a decoder instance. This
instance is later
                  passed to other decoder API functions.
             struct DecConfig config
                  Decoder initialization parameters.
                    struct DecConfig {
                    u32 disable_picture_reordering;
                    enum DecPictureFormat output_format;
                    struct DWL dwl;
                    const void* dwl_inst;
                    u32 max_num_pics_to_decode;
                    enum DecErrorConcealment concealment_mode;
                    struct DecDownscaleCfg dscale_cfg;
                    u32 use_video_compressor;
                    u32 use_ringbuffer;
                    u32 use_8bits_output;
             }
             u32 disable_picture_reordering
                 Flag to disable the reordering of output frames. When set to a non-zero
value the
                 decoder will not provide output pictures in display order but in decoding
order (unless
                 decoding order and display order is the same).
             enum DecPictureFormat output_format
                  Format of the output picture.
```

```
                    enum DecPictureFormat {
                     DEC_OUT_FRM_TILED_4X4 = 0,
                     DEC_OUT_FRM_RASTER_SCAN = 1,
                     DEC_OUT_FRM_PLANAR_420 = 2
                     };
                    DEC_OUT_FRM_TILED_4X4 - Tiled 4x4 format
                    DEC_OUT_FRM_RASTER_SCAN - raster scan format (a.k.a semi-planar)
                    DEC_OUT_FRM_PLANAR_420 - planar format
               struct DWL dwl
                    Decoder wrapper layer functionality.
               const void* dwl_inst
                    Pointer to a DWL instance, which should be instantiated by calling DWLInit
in
                    advance.
               u32 max_num_pics_to_decode
                    Limits the maximum pictures number to be decoded, 0 for unlimited.
               enum DecErrorConcealment concealment_mode
                    Flag to determine which error concealment method to use. When set to
                    DEC_INTRA_FREEZE the decoder will conceal every frame after an error has
been
                    detected in the bitstream, until the next IDR (key frame) frame is
decoded. When set to
                    DEC_PICTURE_FREEZE, the decoder will conceal only the frames having errors
in the
                    bitstream.

                    enum DecErrorConcealment {
                    DEC_PICTURE_FREEZE = 0,
                    DEC_INTRA_FREEZE = 1
                    };
               struct DecDownscaleCfg dscale_cfg
                    Down scale parameters.
                    struct DecDownscaleCfg {
                      u32 down_scale_x;
                      u32 down_scale_y;
                    };
                    u32 down_scale_x
                        Down scale ratio in horizontal direction. Possible value: 2, 4, 8.
Available
                        value:2, 4, 8, which means down scaled to 1/2, 1/4 or 1/8
respectively. 1
                        means no scaling.
                    u32 down_scale_y
                        Down scale ratio in vertical direction. Possible value: 2, 4, 8.
Available value:2,
                        4, 8, which means down scaled to 1/2, 1/4 or 1/8 respectively. 1 means
no
                        scaling.
```

NOTE

If the down scale ratio in one direction is set to 1, no matter what the value is in the other direction, no down scale will be performed in both directions.

```
               u32 use_video_compressor
                   Flag to enable reference buffer compression. Set 0 to bypass reference
buffer
                   compression, or when reference buffer compression is not supported. When
set to 1,
                   the decoded reference buffer will be saved in compressed format.
               u32 use_ringbuffer
                   Flag to indicate decoder use ring buffer or not. Set 1 to enable ring
buffer. When set to
                   0, ring buffer will be disabled.
                   Stream ring buffer mode is an alternative storage for stream. In this mode,
frame
```

stream data usually doesn’t start from buffer head but follow a previous frame stream
data. When stream data goes to stream buffer end, it must turnaround to buffer head to
save left stream data. It requires a whole frame stream data saved in stream buffer and
stream data start address is byte-aligned.
Below figure shows how stream data is stored in stream buffer if ring buffer mode.

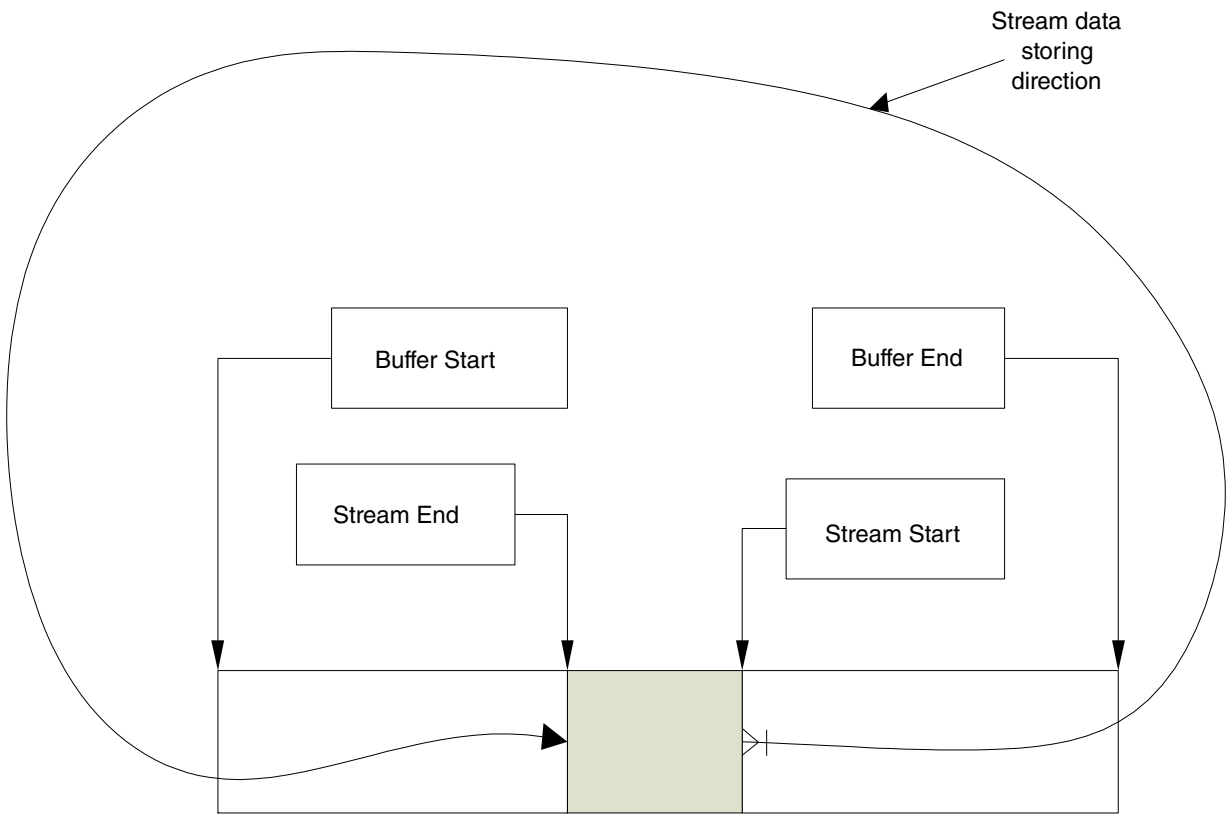

Figure 15-13. Data storage in Stream buffer in Ring Buffer Mode

u32 use_8bits_output
Flag to force 8 bit per pixel output when it's a stream with higher bit depth, e.g., HEVC
Main10 profile stream. The conversion is based on following rule:

Table 15-4. Rule for conversion

Bit depth of original pixel	Original pixel	8bit output
9	XXXXXXXX0	XXXXXXXX
	XXXXXXXX1	XXXXXXXX+1
10	XXXXXXXX00	XXXXXXXX
	XXXXXXXX01	XXXXXXXX
	XXXXXXXX10	XXXXXXXX+1
	XXXXXXXX11	XXXXXXXX+1

struct DecClientHandle callbacks
Callback interfaces that client should provide to facilitate the decoder

```
to inform the client that
                    there is any events or state changing in decoder.
                    struct DecClientHandle {
                           ClientInst client;
                           ClientInitialized* Initialized;
                           ClientHeadersDecoded* HeadersDecoded;
                           ClientBufferDecoded* BufferDecoded;
                           ClientPictureReady* PictureReady;
                           ClientEndOfStream* EndOfStream;
                           ClientReleased* Released;
                           ClientNotifyError* NotifyError;
                    };
                    typedef const void* ClientInst;
                           Opaque pointer to the client.
                    typedef void ClientInitialized(ClientInst inst);
                           Function to notify the client that decoder has successfully
initialized.
                    typedef void ClientHeadersDecoded(ClientInst inst,
                                struct DecSequenceInfo sequence_info);
                           Function to notify about successful decoding of the stream
parameters. Decoder
                           expects client to provide needed buffers through
DecSetPictureBuffers function to
                           continue decoding the actual stream.
                    typedef void ClientBufferDecoded(ClientInst inst,
                                                     struct DecInput* input);
                           Function to notify client that a buffer has been consumed by the
decoder and it can be
                           handled freely by the client.
                    typedef void ClientPictureReady(ClientInst inst,
                                                    struct DecPicture picture);
                           Function to notify about picture that is ready to be outputted.
Client is expected to notify
                           the decoder when it has finished processing the picture, so
decoder can reuse the
                           picture buffer for another picture.
                    typedef void ClientEndOfStream(ClientInst inst);
                            Function to notify the client that all the pending pictures
have been outputted and
                            decoder can be safely shut down.
                    typedef void ClientReleased(ClientInst inst);
                           Function to notify the client that decoder has shut down.
                    typedef void ClientNotifyError(ClientInst inst,
                                                   u32 pic_id,
                                                   enum DecRet rv);
                           Function to notify client about error in the decoding process.
```

Return

```
DEC_OK
                API function returned successfully.
            DEC_PARAM_ERROR
                Bad input parameters.
            DEC_MEMFAIL
                The decoder was not able to allocate memory.
            DEC_FORMAT_NOT_SUPPORTED
                Format is not supported in hardware. See DecGetBuild.
```

15.2.3.3 DecDecode

Syntax

```
enum DecRet DecDecode(DecInst decInst,
        DecInput *pInput)
```

Purpose

This function will push a COMMAND_DECODE command to the decoding thread, along with the input stream parameters, which will inform the decoding thread to decode one or more NAL units from the current stream for HEVC or element stream for VP9. The input buffer should contain one of the following:

1. Exactly one NAL unit and nothing else.
2. One or more NAL units in byte stream format, as defined in Annex B of the standard [1].
3. Or for VP9 at least one whole frame bit stream data.

The decoder automatically detects the format of the stream data and decodes NAL units until the whole buffer is processed or decoding of a picture is finished for HEVC. For VP9 if there is not enough bit stream data in input buffer, HW decoder will return TIMEOUT error.

Parameters

DecInst*decInst* - A decoder instance created earlier with an DecInit call.

DecInput **pInput* - Pointer to the decoder input structure.

```
struct DecInput {
               struct DWLLinearMem buffer; /* Pointer to the input buffer. */
               u32 data_len;
        };
```

struct DWLLinearMem buffer -- Linear buffer descriptor.

```
struct DWLLinearMem {
                  u32 *virtual_address;
                  u32 bus_address;
                  u32 size;
                  u32 logical_size;
          };
```

Function	Description
*virtual_address	Pointer to the virtual address of stream linear buffer.
bus_address	Bus address of the linear buffer. NOTE: The start of the stream buffer must be in a 128-bit aligned position or accessible for reading from the previous 128-bit aligned position.
size	Physical size of the linear buffer, which is rounded to page multiple.
logical_size	Physical size of the linear buffer, which is rounded to page multiple.

Table continues on the next page...

Function	Description
datalen	Number of bytes contained in the buffer stream buffer. The length can be represented on maximum 32 bits. Valid range: [0, (2^32-1)]

Return value

DEC_OK - The COMMAND_DECODE is successfully pushed to decoder thread's input queue.

DEC_PARAM_ERROR - Error in calling parameters.

DEC_NOT_INITIALIZED - Decoder instance is not initialized. Stream decoding is not started. DecInit must be called before decoding can be started.

15.2.3.4 DecSetPictureBuffers

Syntax

```
enum DecRet DecSetPictureBuffers(DecInst dec_inst,
               const struct DWLLinearMem* buffers,
               u32 num_of_buffers)
```

Purpose

DecSetPictureBuffers assigns picture buffers for the decoder. When decoder has finished decoding the stream headers and knows which types of buffers and how many of them it will need, it will inform that through the HeadersDecoded callback. Buffers must not be written into until client has successfully called DecRelease or decoder has requested new set of buffers through HeadersDecoded callback.

Parameters

DecInst*decInst* - A decoder instance created earlier with an DecInit call.

const struct DWLLinearMem* buffers - Linear buffer to be assigned to the decoder.

u32 num_of_buffers - Number of buffers to be assigned to the decoder.

Return value

DEC_OK - Successfully set picture buffers.

DEC_PARAM_ERROR - Error in calling parameters.

15.2.3.5 DecPictureConsumed

Syntax

```
enum DecRet DecPictureConsumed(DecInst decInst,
        struct DecPicture picture)
```

Purpose

DecPictureConsumed informs the decoder that the client has finished processing a specific picture, which was previously sent to client through the PictureReady callback.

Parameters

DecInst*decInst* - A decoder instance.

DecPicture *pOutput - Pointer to the location used to return the picture parameters. The picture parameters are valid only when the return value indicates that an output picture is available.

```
struct DecPicture {
               struct DecSequenceInfo sequence_info;
               struct DWLLinearMem luma;
               struct DWLLinearMem chroma;
               struct DecPictureInfo picture_info;
               struct DWLLinearMem dscale_luma;
               struct DWLLinearMem dscale_chroma;
               u32 dscale_width;
               u32 dscale_height;
               u32 dscale_stride;
          };
          struct DecSequenceInfo sequence_info
                struct DecSequenceInfo {
                   u32 pic_width;
                   u32 pic_height;
                   u32 sar_width;
                   u32 sar_height;
                   struct DecCropParams crop_params;
                   enum DecVideoRange video_range;
                   u32 matrix_coefficients;
                   u32 is_mono_chrome;
                   u32 is_interlaced;
                   u32 num_of_ref_frames;
                   u32 bit_depth_luma;
                   u32 bit_depth_chroma;
                   u32 pic_stride;
                };
```

Function	Description
picture_width	Decoded picture width in pixels.
picture_height	Decoded picture height in pixels.
sar_width	Horizontal size of the sample aspect ratio.
sar_height	Vertical size of the sample aspect ratio.
struct DecCropParams crop_param	Cropping parameters for the picture.

Table continues on the next page...

Function	Description

	struct DecCropParams {
	u32 crop_left_offset;
	u32 crop_out_width;
	u32 crop_top_offset;
	u32 crop_out_height;
	};

crop_left_offset	Left offset for cropping process, i.e. number of luminance samples removed from the left edge of the picture (always a multiple of 2).
crop_out_width	Width of the picture in luminance samples after cropping is performed.
crop_top_offset	Top offset for cropping process, i.e. number of luminance samples removed from the top edge of the picture (always a multiple of 2).
crop_out_height	Height of the picture in luminance samples after cropping is performed.
Enum DecVideoRange video_range	YUV sample video range. Possible value: • DEC_VIDEO_RANGE_NORMAL - sample range [16, 235] • DEC_VIDEO_RANGE_FULL - sample range [0, 255]
matrix_coefficients	Matrix coefficients RGB->YUV conversion.
is_mono_chrome	Flag to indicate whether sequence is of monochrome.
is_interlaced	Flag to indicate whether sequence is interlaced.
num_of_ref_frames	Maximum number of reference frames.
bit_depth_luma	Bit depth of stored pixels for luma plane.
bit_depth_chroma	Bit depth of stored pixels for chroma plane.
pic_stride	Stride of the picture as stored in memory in bytes.
struct DWLLinearMem luma	Linear buffer for luma pixels.
struct DWLLinearMem chroma	Linear buffer for chroma pixels.

struct DecPictureInfo picture_info	Picture specific information.
	struct DecPictureInfo {
	enum DecPicCodingType pic_coding_type;
	u32 is_corrupted;
	enum DecPictureFormat format;
	u32 cycles_per_mb;
	u32 pic_id;
	};

enum DecPicCodingType pic_coding_type	Picture coding type. Possible value: • DEC_PIC_TYPE_I - key frame • DEC_PIC_TYPE_P - P frame • DEC_PIC_TYPE_B - B frame
is_corrupted	Flag indicates whether picture is corrupted.
enum DecPictureFormat format	Color format of the picture. Refer to DecPictureFormat in 4.2.
cycles_per_mb	Average decoding time in cycles per mb.

Table continues on the next page...

Function	Description
pic_id	Identifier for the picture to be decoded.
struct DWLLinearMem dscale_luma	Linear buffer for luma pixels in down scaled output.
struct DWLLinearMem dscale_chroma	Linear buffer for chroma pixels in down scaled output.
dscale_width	Width of down scaled output in pixels.
dscale_height	Height of down scaled output in pixels.
dscale_stride	Stride of a pixel line in down scaled output in bytes.

Return value

DEC_OK - No pictures available for display.

DEC_PARAM_ERROR - Error in calling parameters.

DEC_NOT_INITIALIZED - Decoder instance is not initialized. DecInit must be called before decoding can be started.

15.2.3.6 DecEndOfStream

Syntax

```
enum DecRet DecEndOfStream (DecInst decInst)
```

Purpose

DecEndOfStream sends a COMMAND_END_OF_STREAM command to the decoder thread to inform the decoder that it should not be expecting any more input stream and finish decoding and outputting all the buffers that are currently pending in the component. Once decoder has finished outputting the pending pictures it will notify the client about it by calling the EndOfStream callback.

Parameters

DecInst*decInst* - A decoder instance.

Return value

DEC_OK - API function returned successfully

DEC_PARAM_ERROR - Error in calling parameters.

DEC_INITFAIL - Decoder instance is not initialized.

15.2.3.7 DecRelease

Syntax

```
void DecRelease(DecInst decInst)
```

Purpose

DecRelease sends a COMMAND_RELEASE command to decoder thread, which will finally close the decoder instance decInst and releases all internally allocated resources. This function must not be called twice for the same instance.

Parameters

DecInst*decInst* - A decoder instance to be released.

Return value

None.

15.2.4 Decoder Application Examples

Purpose

The purpose of the following examples is to show how to implement client's callback functions, as long as using G2 decoder API to implement a simple decoder with demuxer to decode both HEVC and VP9 streams. InitializedCb, HeadersDecodedCb, BufferDecodedCb, PictureReadyCb, EndOfStreamCb, ReleasedCb, and NotifyErrorCb are the system/application dependent callback functions, which are provided by client to the decoder wrapper.

The examples are simplified, e.g. they do not take errors into consideration.

NOTE

Program code in the examples should be considered as pseudo code and may not compile as such.

```
            void SetupDefaultParams(struct TestParams* params);
            int ParseParams(int argc, char* argv[], struct TestParams* params);
            void* CreateDemuxer(struct Client* client);
            void ReleaseDemuxer(struct Client* client);
            void PostProcessPicture(struct Client* client, struct DecPicture* picture);

            static void DispatchBufferForDecoding(struct Client* client, struct DecInput*
buffer)
            {
             enum DecRet rv;
             i32 size = buffer->buffer.size;
             memset(buffer->buffer.virtual_address, 0, size);
             i32 len = client->demuxer.ReadPacket(client->demuxer.inst, (u8*)buffer-
>buffer.virtual_address, &size);
             if (len <= 0) {/* EOS or error. */
```

```
              /* If reading was due to insufficient buffer size, try to realloc with
sufficient size. */
              if (size > buffer->buffer.size) {
               i32 i;
               for (i = 0; i < GetStreamBufferCount(client); i++) {

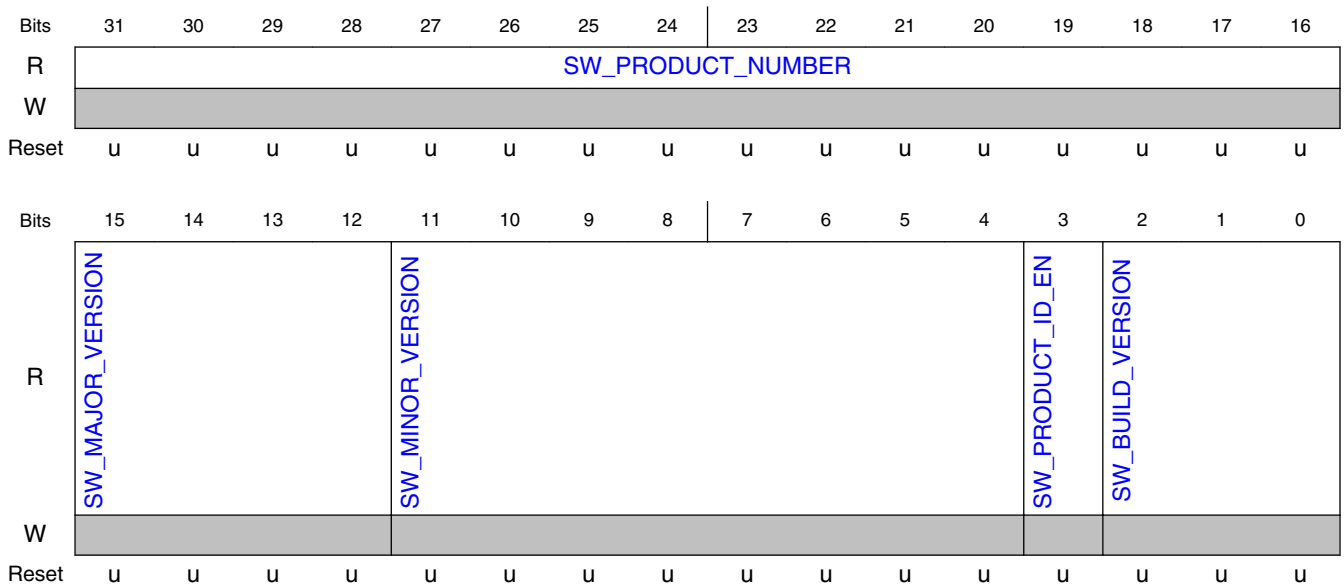
15.2.5.1.2 ID register (read only) (SWREG0)

15.2.5.1.2.1 Offset

Register	Offset
SWREG0	0h

15.2.5.1.2.2 Diagram



15.2.5.1.2.3 Fields

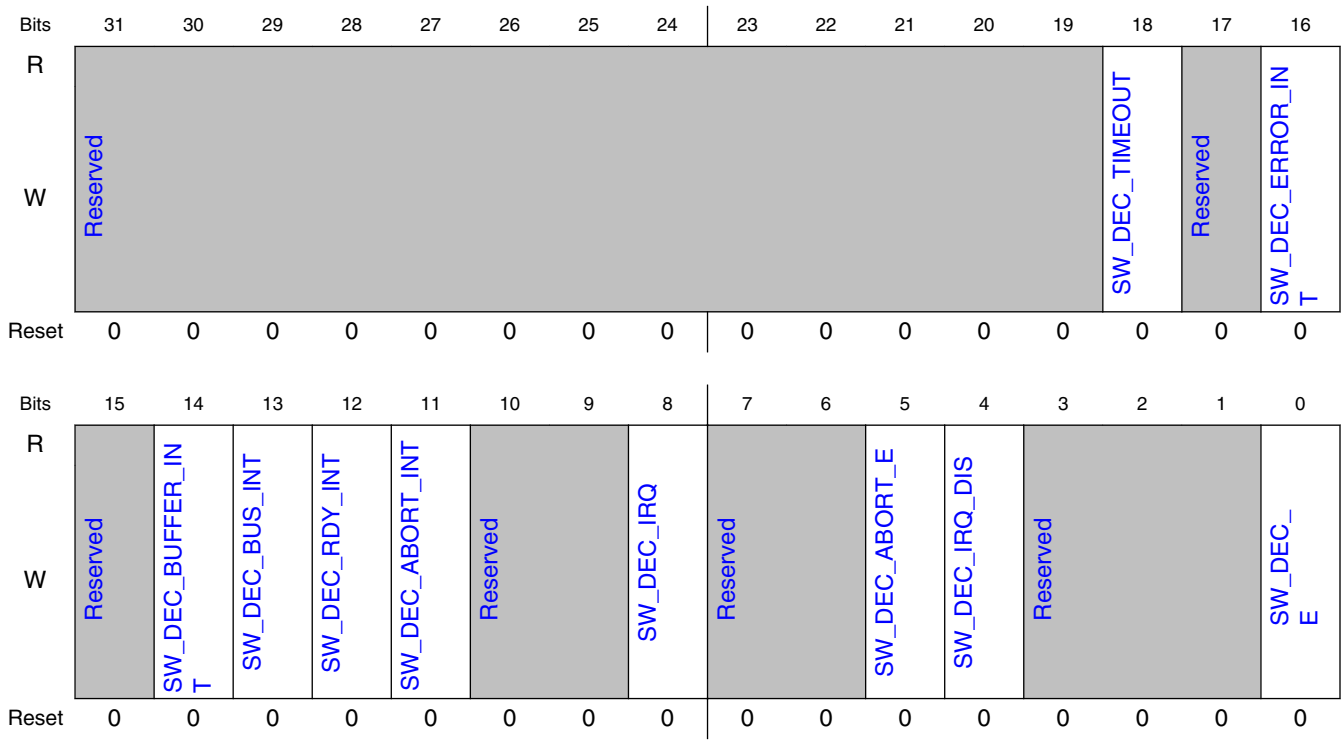
Field	Function
31-16 SW_PRODUCT_NUMBER	Product number (g2)
15-12 SW_MAJOR_VERSION	Major version
11-4 SW_MINOR_VERSION	Minor version
3 SW_PRODUCT_ID_EN	ASCII type product ID enable
2-0 SW_BUILD_VERSION	Build version (core number)

15.2.5.1.3 Interrupt register decoder (SWREG1)

15.2.5.1.3.1 Offset

Register	Offset
SWREG1	4h

15.2.5.1.3.2 Diagram



15.2.5.1.3.3 Fields

Field	Function
31-19 —	Reserved.
18 SW_DEC_TIMEOUT	Interrupt status bit decoder timeout. When high the decoder has been idling for too long. HW will self reset. Possible only if timeout interrupt is enabled
17 —	Reserved.
16 SW_DEC_ERROR_INT	Interrupt status bit input stream error. When high an error is found in input data stream decoding. HW will self reset.
15	Reserved.

Table continues on the next page...

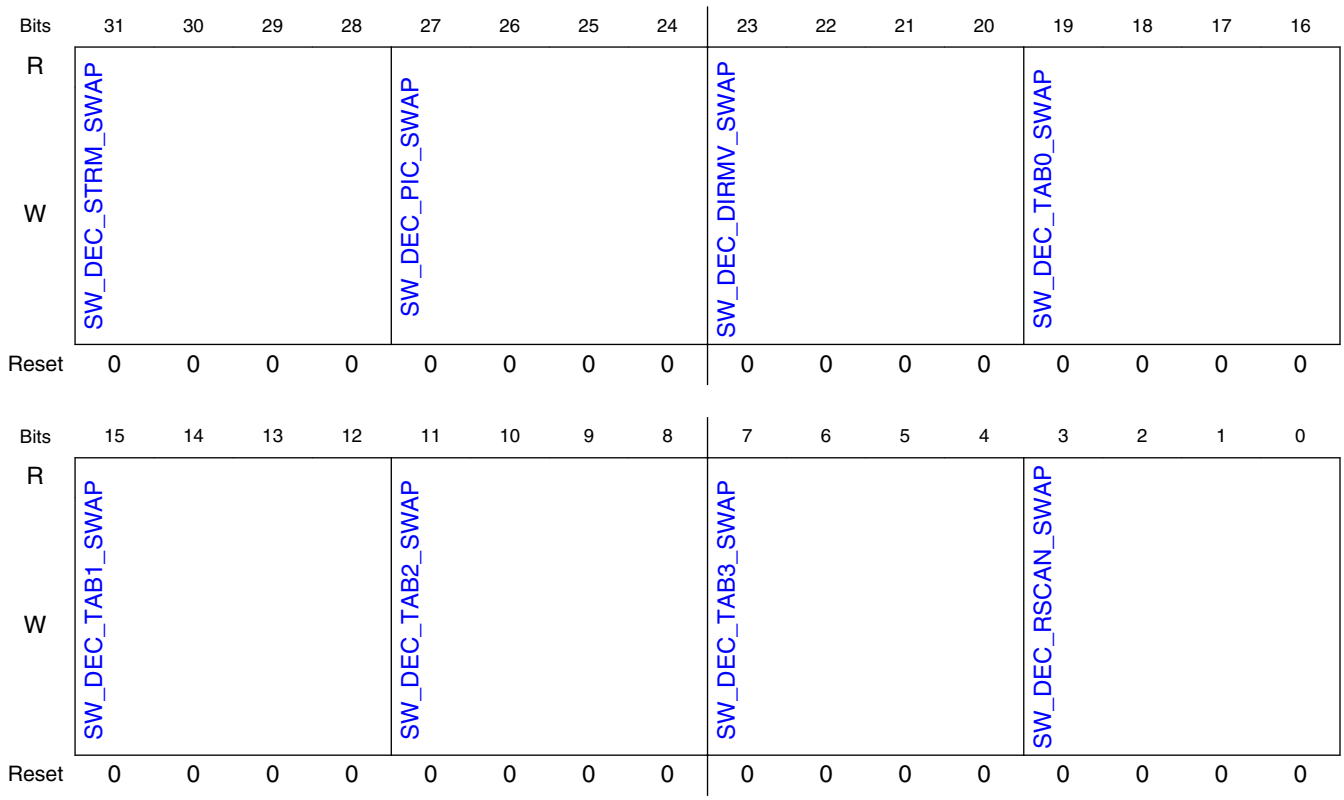
Field	Function
—	
14 SW_DEC_BUFFER_INT	Interrupt status bit input buffer empty. When high input stream buffer is empty but picture is not ready. HW will not self reset.
13 SW_DEC_BUS_INT	Interrupt status bit bus. Error response from bus. HW will self reset.
12 SW_DEC_RDY_INT	Interrupt status bit decoder. When this bit is high decoder has decoded a picture. HW will self reset.
11 SW_DEC_ABORT_INT	Interrupt status bit decoding aborted. When this bit is high decoder has aborted the current picture decoding as SW requested (sw_dec_abort_e). Decoder self reset and sw_dec_abort_e written low
10-9 —	Reserved.
8 SW_DEC_IRQ	Decoder IRQ. When high decoder requests an interrupt. SW will reset this after interrupt is handled.
7-6 —	Reserved.
5 SW_DEC_ABORT_E	Abort decoding enable. Setting this bit high will cause HW to abort decoding and safely to reset itself down. After abort is complete the corresponding interrupt status is set and this bit is set low as well as the decoder enable.
4 SW_DEC_IRQ_DIS	Decoder IRQ disable. When high there are no interrupts concerning decoder from HW. Polling must be used to see the interrupt statuses.
3-1 —	Reserved.
0 SW_DEC_E	Decoder enable. Setting this bit high will start the decoding operation. HW will reset this when picture is processed or ASO or stream error is detected or bus error or timeout interrupt is given.

15.2.5.1.4 Data configuration register decoder (SWREG2)

15.2.5.1.4.1 Offset

Register	Offset
SWREG2	8h

15.2.5.1.4.2 Diagram



15.2.5.1.4.3 Fields

Field	Function
31-28 SW_DEC_STRM_SWAP	Byte swap configuration for stream data 4 Bit byte order vector to control byte locations inside HW internal 128 bit data vector. For 64 and 32 bit external bus widths, the data is first gathered to 128 bit width and then bytes swapped accordingly: Bit 0: 8 bit swap Bit 1: 16 bit swap Bit 2: 32 bit swap Bit 3: 64 bit swap '0000' = 0-1-2-3-4-5-6-7-8-9-10-11-12-13-14-15 '0001' = 1-0-3-2-5-4-7-6... '0010' = 2-3-0-1-6-7-4-5... '0011' = 3-2-1-0-7-6-5-4... '0100' = 4-5-6-7-0-1-2-3... ... '0111' = 7-6-5-4-3-2-1-0 '1000' = 8-9-10-11-12-13-14-15-0-1-2-3-4-5-6-7... ...

Table continues on the next page...

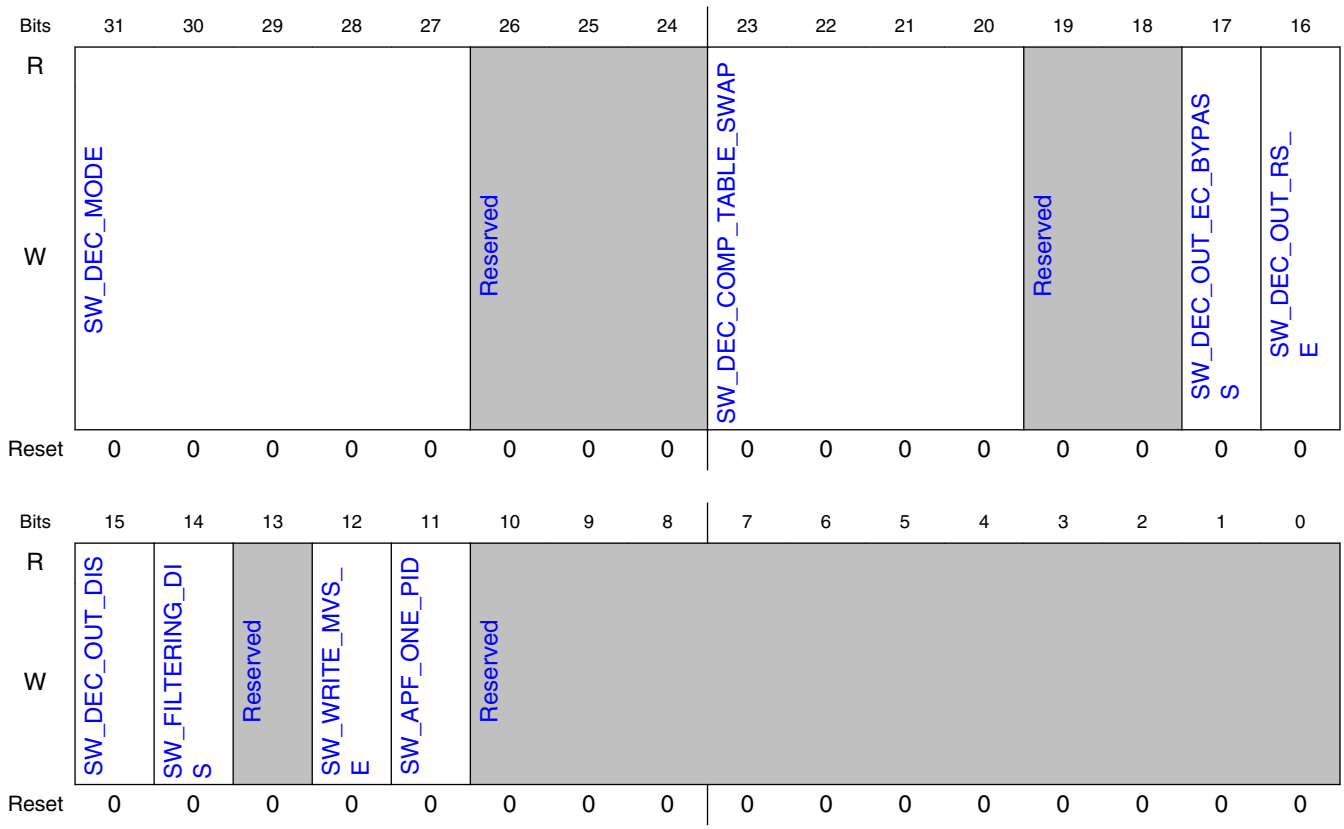
Field	Function
	'1111'=15-14-13-12-11-10-9-8-7-6-5-4-3-2-1-0
27-24 SW_DEC_PIC_SWAP	Byte swap configuration for decoder reference output picture data
23-20 SW_DEC_DIRMV_SWAP	Byte swap configuration for direct mode MV data (read/write)
19-16 SW_DEC_TAB0_SWAP	Byte swap configuration for VP9 stream propability tables
15-12 SW_DEC_TAB1_SWAP	Byte swap configuration for HEVC scaling lists / VP9 segmentation map read/write
11-8 SW_DEC_TAB2_SWAP	Byte swap configuration for VP9 CTX counter values
7-4 SW_DEC_TAB3_SWAP	Byte swap configuration for tile sizes
3-0 SW_DEC_RSCAN_SWAP	Byte swap for raster scan output picture data

15.2.5.1.5 Decoder control register 0 (SWREG3)

15.2.5.1.5.1 Offset

Register	Offset
SWREG3	Ch

15.2.5.1.5.2 Diagram



15.2.5.1.5.3 Fields

Field	Function
31-27 SW_DEC_MODE	Decoding mode: 00000-01011b - Reserved 01100b - HEVC 01101b - VP9 01110-11111b - Reserved
26-24 —	Reserved.
23-20 SW_DEC_COMP_TABLE_SWAP	Byte swap configuration for compress table data
19-18 —	Reserved.
17 SW_DEC_OUT_EC_BYPASS	Compress bypass

Table continues on the next page...

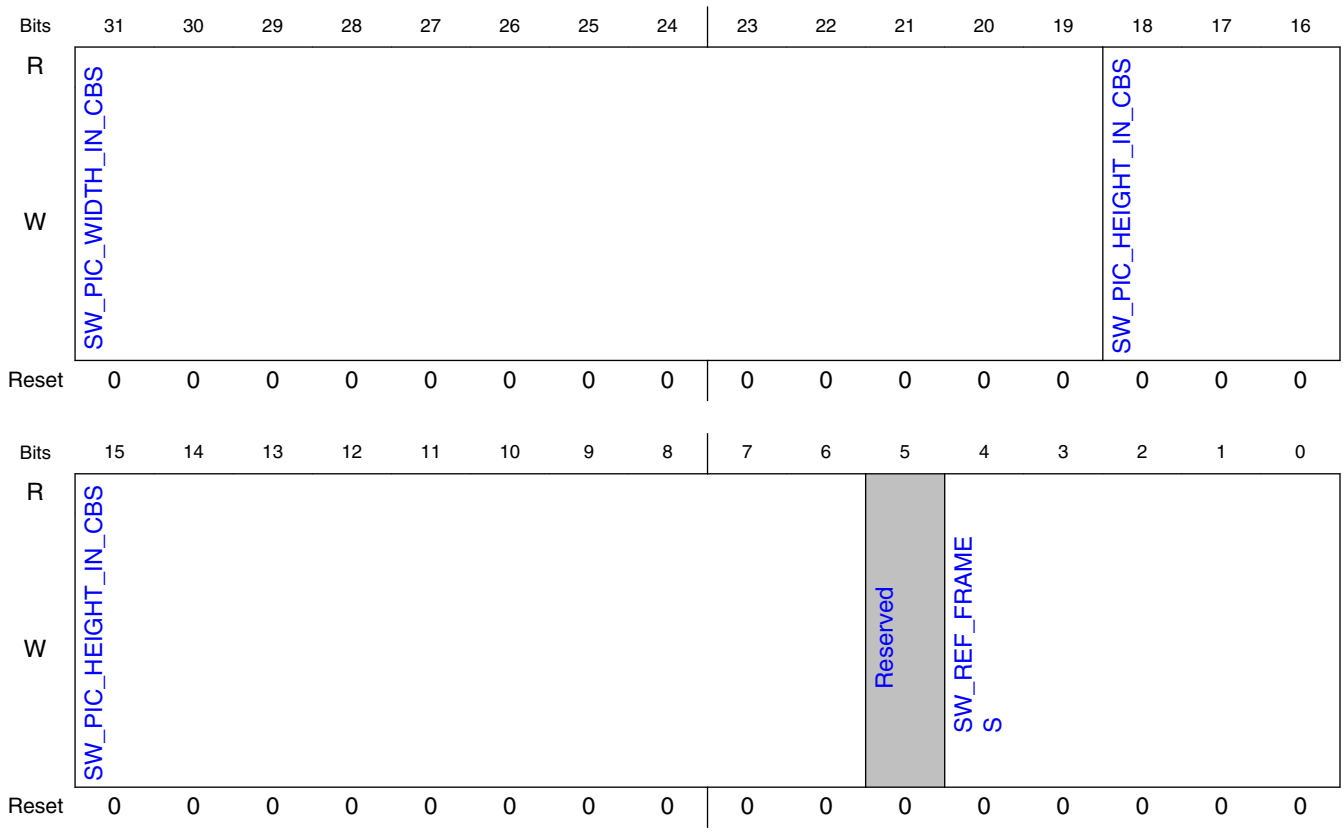
Field	Function
16 SW_DEC_OUT_RS_E	Raster scan output enable. If high decoder writes the raster scan output if the configuration of Decoder includes PP raster scan output
15 SW_DEC_OUT_DIS	Disable decoder output picture writing 0b - Decoder output picture is written to external memory 1b - Decoder output picture is not written to external memory
14 SW_FILTERING_DIS	De-block filtering disable 0b - Filtering is enabled for current picture 1b - Filtering is disabled for current picture
13 —	Reserved.
12 SW_WRITE_MVS_E	Direct mode motion vector write enable for current picture 0b - Writing disabled for current picture. 1b - The direct mode motion vectors are written to external memory. HEVC/VP9 direct mode motion vectors are written to DPB aside with the corresponding reference picture. Other decoding mode dir mode mvs are written to external memory starting from sw_dir_mv_base.
11 SW_APF_ONE_PID	Prefetch partitions that have the same pic_id together
10-0 —	Reserved.

15.2.5.1.6 Decoder control register 1 (SWREG4)

15.2.5.1.6.1 Offset

Register	Offset
SWREG4	10h

15.2.5.1.6.2 Diagram



15.2.5.1.6.3 Fields

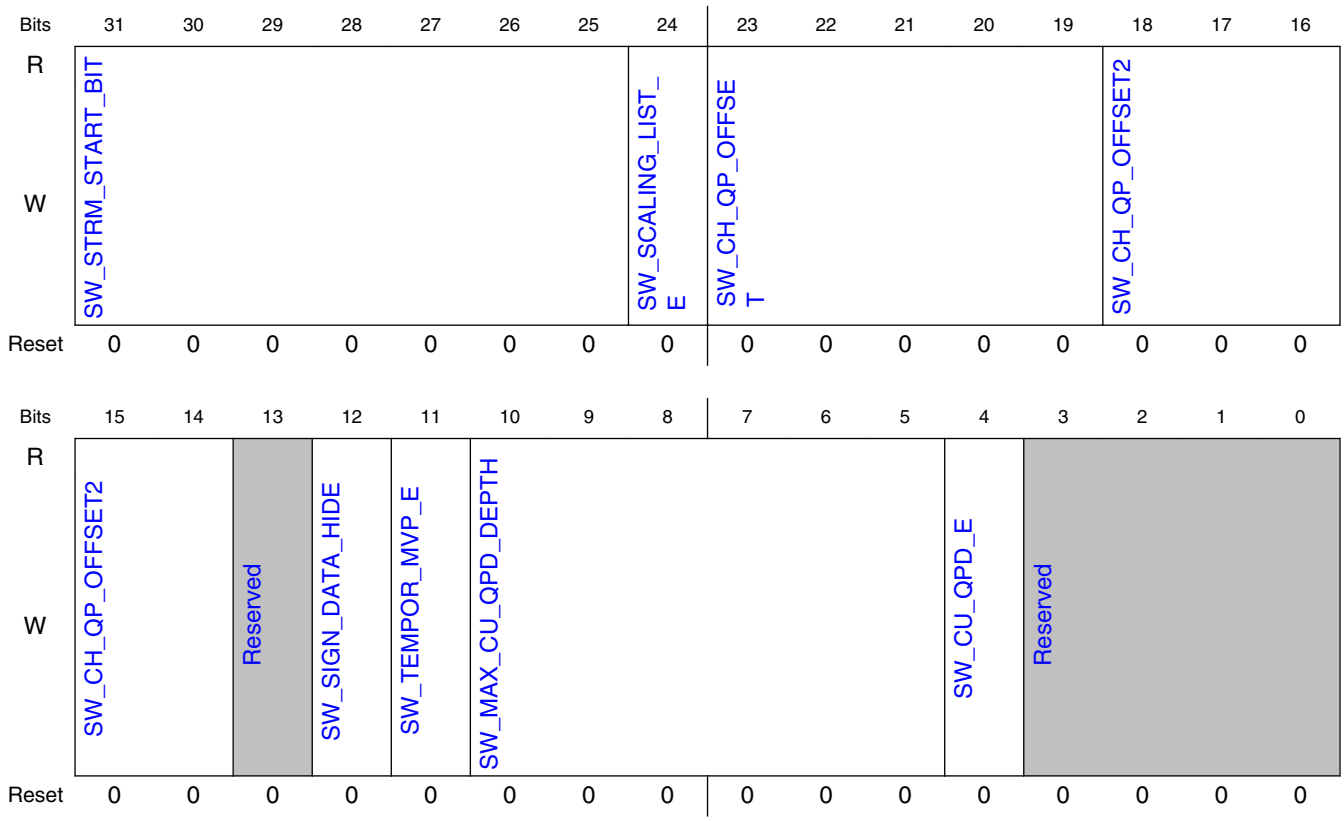
Field	Function
31-19 SW_PIC_WIDTH_IN_CBS	Picture width in min coded blocks (min = 8pix)
18-6 SW_PIC_HEIGHT_IN_CBS	Picture height in min coded blocks (min = 8pix)
5 —	Reserved.
4-0 SW_REF_FRAMES	HEVC: num_ref_frames maximum number of short and long term reference frames in decoded picture buffer

15.2.5.1.7 Decoder control register 2 (SWREG5)

15.2.5.1.7.1 Offset

Register	Offset
SWREG5	14h

15.2.5.1.7.2 Diagram



15.2.5.1.7.3 Fields

Field	Function
31-25 SW_STRM_START_BIT	Exact bit of stream start word where decoding can be started (assosiates with sw_rlc_vlc_base)
24 SW_SCALING_LIST_E	Scaling matrix enable 0b - Normal transform 1b - Use scaling matrix for transform (read from external memory)
23-19 SW_CH_QP_OFFSET	Chroma Qp filter offset. (For HEVC this offset concerns Cb only)

Table continues on the next page...

Field	Function
18-14 SW_CH_QP_OFFSET2	Chroma Qp filter offset for cr type
13 —	Reserved.
12 SW_SIGN_DATA_HIDE	Flag for stream decoding
11 SW_TEMPOR_MVP_E	Temporal mvp enable
10-5 SW_MAX_CU_QPD_DEPTH	Max CU qp delta depth
4 SW_CU_QPD_E	CU qp delta enable
3-0 —	Reserved.

15.2.5.1.8 Decoder control register 3 (SWREG6)

15.2.5.1.8.1 Offset

Register	Offset
SWREG6	18h

R W	SW_STREAM_LEN															
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

15.2.5.1.8.3 Fields

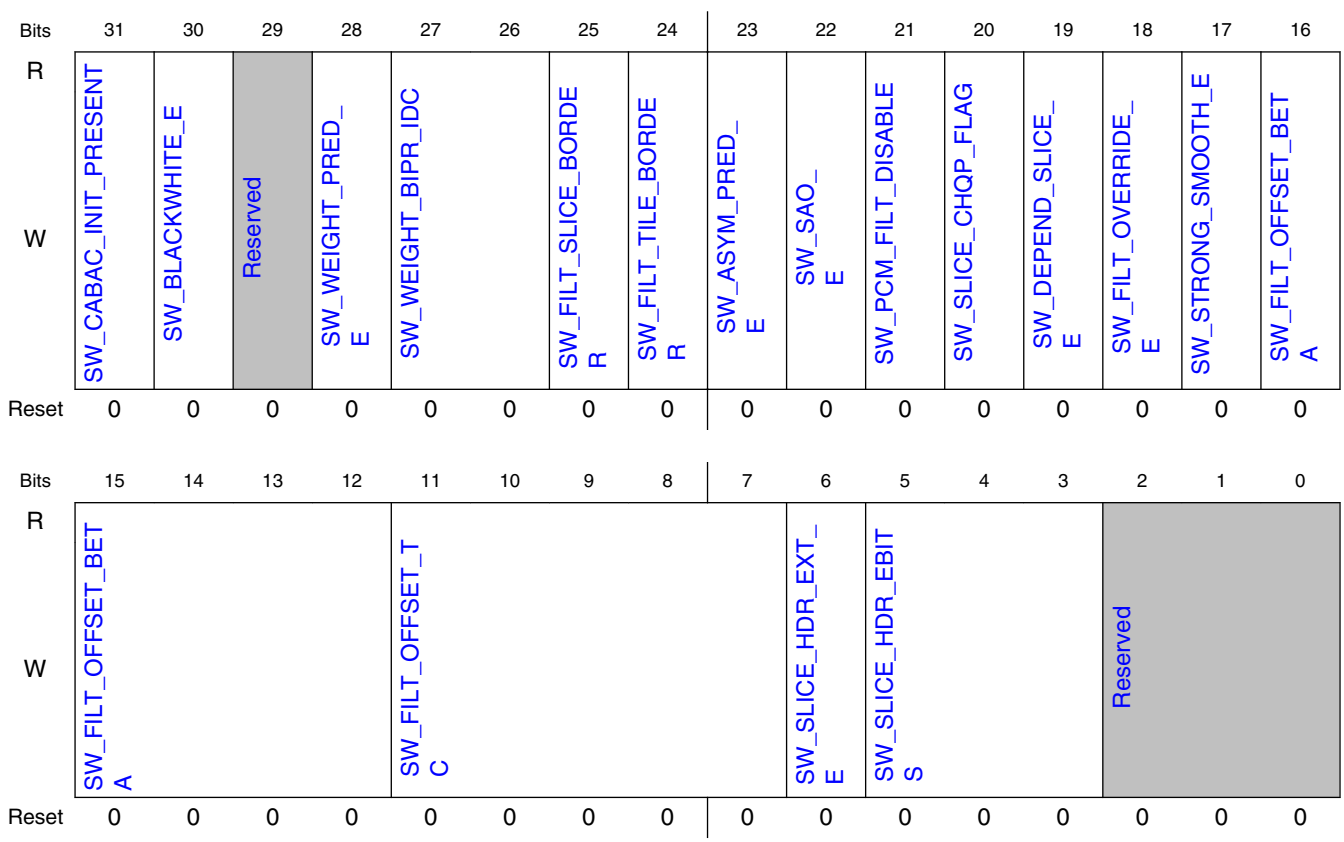
Field	Function
31-0 SW_STREAM_LEN	Amount of stream data bytes in input buffer. If the given buffer size is not enough for finishing the picture the corresponding interrupt is given and new stream buffer base address and stream buffer size information should be given (assosiates with sw_rlc_vlc_base). For HEVC the buffer must include at least data for one slice/VP of the picture

15.2.5.1.9 Decoder control register 4 (SWREG7)

15.2.5.1.9.1 Offset

Register	Offset
SWREG7	1Ch

15.2.5.1.9.2 Diagram



15.2.5.1.9.3 Fields

Field	Function
31 SW_CABAC_INIT_PRESENT	CABAC init present enable for stream decoding
30 SW_BLACKWHITE_E	Sampling 0b - 4:2:0 sampling format 1b - 4:0:0 sampling format (H264 monochroma)
29 —	Reserved.
28 SW_WEIGHT_PRED_E	Weighted prediction enable for P slices
27-26 SW_WEIGHT_BIPR_IDC	Weighted prediction specification 00b - Default weighted prediction is applied to B slices 01b - Explicit weighted prediction shall be applied to B slices 10b - NA 11b - NA
25 SW_FILT_SLICE_BORDER	Filter enable over slice border
24 SW_FILT_TILE_BORDER	Filter enable over tile border
23 SW_ASYM_PRED_E	Asymmetric prediction flag for stream decoding
22 SW_SAO_E	Sample Adaptive Offset enable for stream decoding
21 SW_PCM_FILT_DISABLE	Disable for PCM loop filtering
20 SW_SLICE_CHQP_FLAG	Slice header flag for chroma QP present (if it is included in slice header)
19 SW_DEPEND_SLICE_E	Dependent slice enable
18 SW_FILT_OVERRIDE_E	Filter override enable
17 SW_STRONG_SMOOTH_E	Strong smoothing enable
16-12	Filter beta offset (declared as div2)

Table continues on the next page...

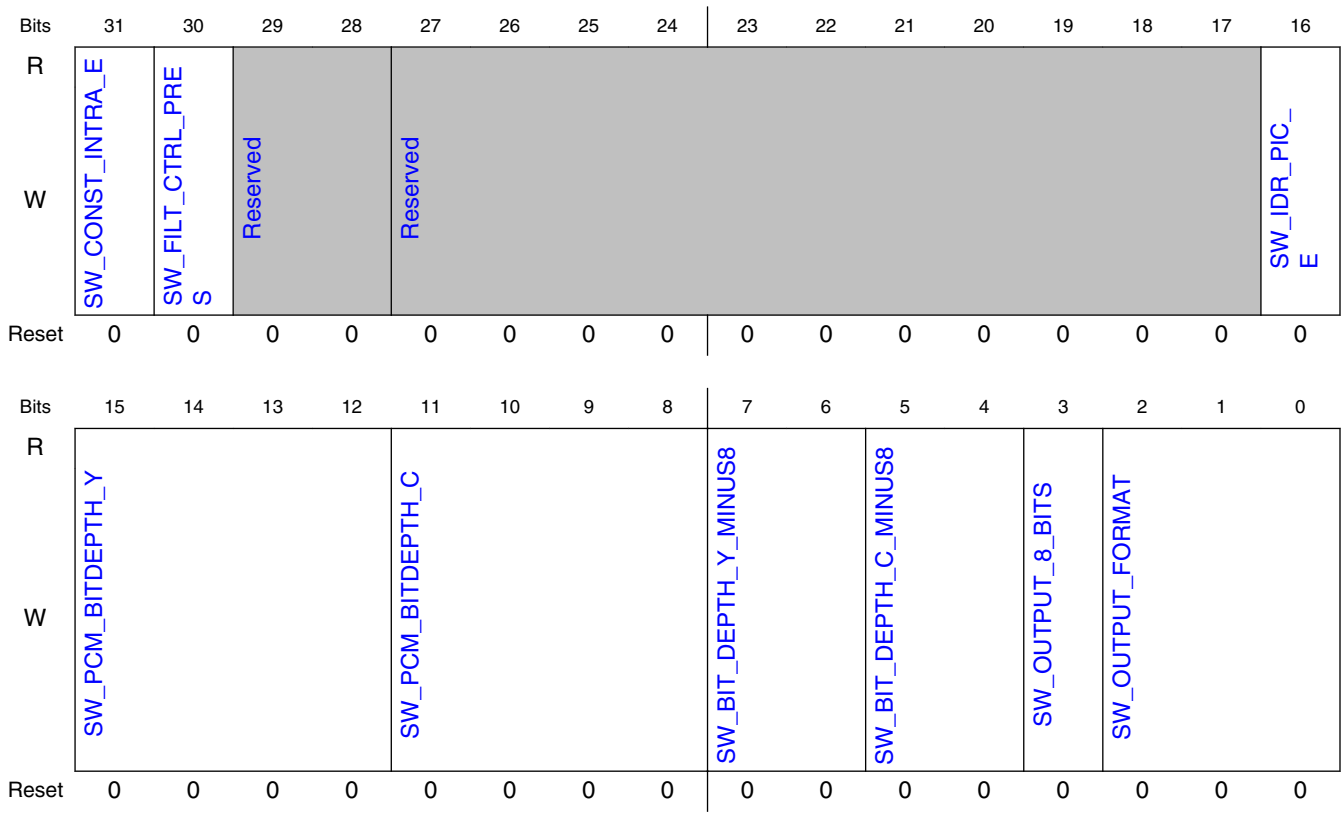
Field	Function
SW_FILT_OFFSET_BETA	
11-7 SW_FILT_OFFSET_TC	Filter tc offset (declared as div2)
6 SW_SLICE_HDR_EXT_E	Slice header extension enable. Reserved for future use
5-3 SW_SLICE_HDR_EBITS	Number of extra slice header bits (if enabled slice header extension)
2-0 —	Reserved.

15.2.5.1.10 Decoder control register 5 (SWREG8)

15.2.5.1.10.1 Offset

Register	Offset
SWREG8	20h

15.2.5.1.10.2 Diagram



15.2.5.1.10.3 Fields

Field	Function
31 SW_CONST_INTRA_E	constrained_intra_pred_flag equal to 1 specifies that intra prediction uses only neighbouring intra macroblocks in prediction. When equal to 0 also neighbouring inter macroblocks are used in intra prediction process.
30 SW_FILT_CTRL_PRES	deblocking_filter_control_present_flag indicates whether extra variables controlling characteristics of the deblocking filter are present in the slice header.
29-28 —	Reserved.
27-17 —	Reserved.
16 SW_IDR_PIC_E	IDR (instantaneous decoding refresh) picture flag.
15-12 SW_PCM_BITDEPTH_Y	Bit depth for PCM Y data
11-8	Bit depth for PCM C data

Table continues on the next page...

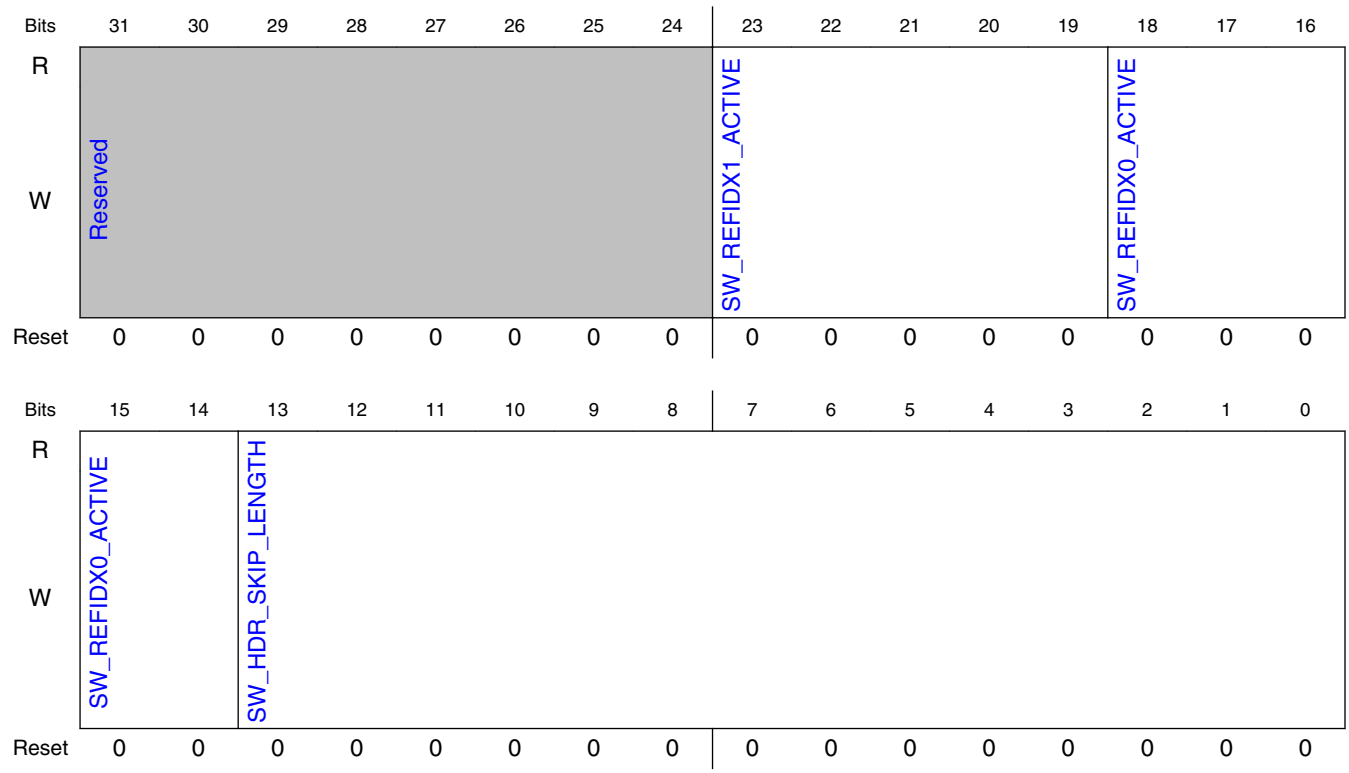
Field	Function
SW_PCM_BITDEPTH_C	
7-6 SW_BIT_DEPTH_Y_MINUS8	Bit depth of luma samples minus 8
5-4 SW_BIT_DEPTH_C_MINUS8	Bit depth of chroma samples minus 8
3 SW_OUTPUT_8_BITS	enable rasterscan output force to 8 bit(only for hevc main10 and vp9 10bit)
2-0 SW_OUTPUT_FORMAT	Raster scan and down scale output data format 000b - Each pixel in 10 bits when luma or chroma pixel bit depth is larger than 8; or 8 bits when both luma and chroma pixel bit depth are 8 bits. (default) 001b - Store in P010 format when luma or chroma pixel bit depth is larger than 8. 010b - A customized format: please refer to register SWREG23[6].

15.2.5.1.11 Decoder control register 6 (SWREG9)

15.2.5.1.11.1 Offset

Register	Offset
SWREG9	24h

15.2.5.1.11.2 Diagram



15.2.5.1.11.3 Fields

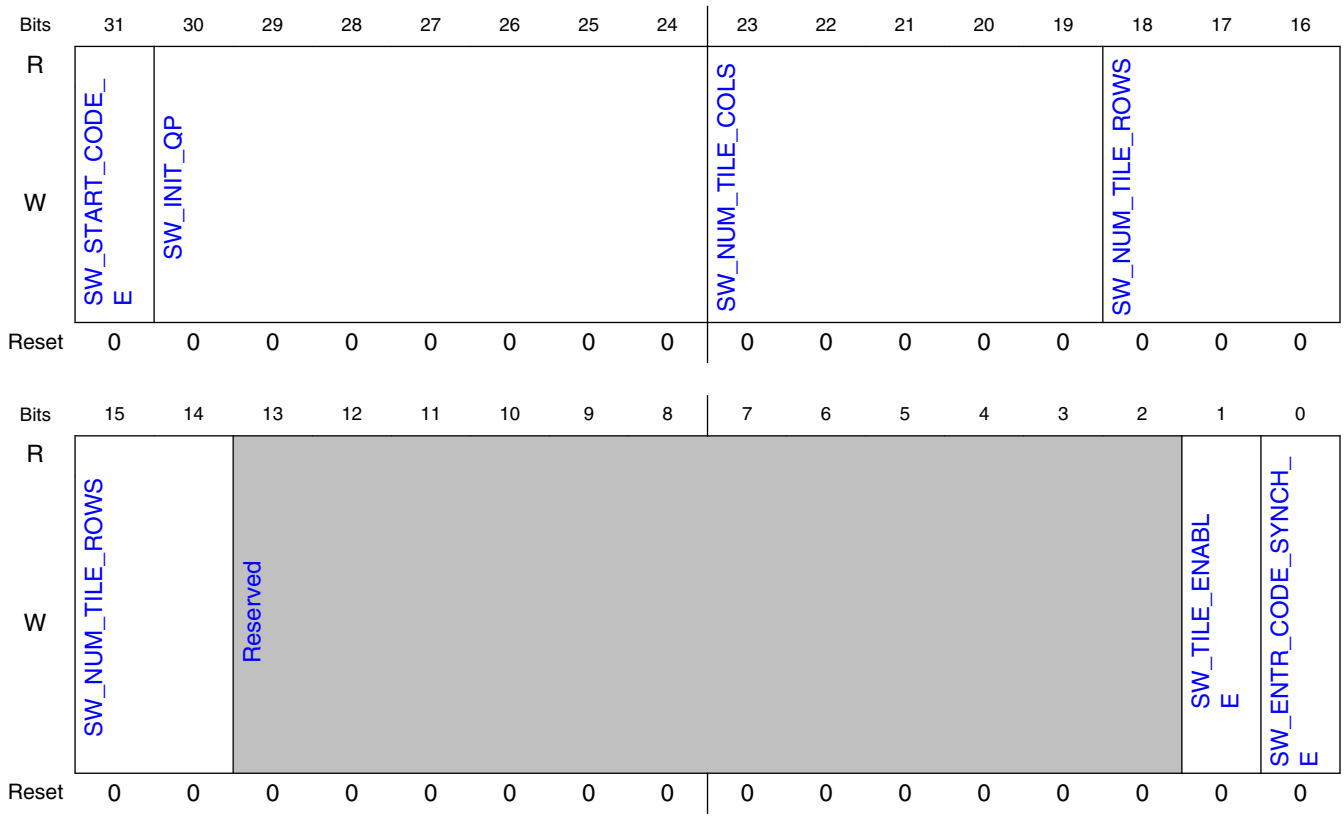
Field	Function
31-24 —	Reserved.
23-19 SW_REFIDX1_ACTIVE	Specifies the maximum reference index that can be used while decoding inter predicted macro blocks.
18-14 SW_REFIDX0_ACTIVE	Specifies the maximum reference index that can be used while decoding inter predicted macro blocks. This is same as in previous decoders (width increased with q bit)
13-0 SW_HDR_SKIP_LENGTH	Length of slice header skip length (bytes used by sw)

15.2.5.1.12 Decoder control register 7 (SWREG10)

15.2.5.1.12.1 Offset

Register	Offset
SWREG10	28h

15.2.5.1.12.2 Diagram



15.2.5.1.12.3 Fields

Field	Function
31 SW_START_CODE_E	Bit for indicating stream start code existence 0b - Stream does not contain start codes 1b - Stream contains start codes
30-24 SW_INIT_QP	Initial value for quantization parameter (picture quantizer).
23-19 SW_NUM_TILE_COLS	Number of tile columns in picture
18-14	Number of tile rows in picture

Table continues on the next page...

Field	Function
SW_NUM_TILE_ROWS	
13-2 —	Reserved.
1 SW_TILE_ENABLE	Tile enable
0 SW_ENTR_CODE_SYNCH_E	Entropy coding synchronization enable (Possible parallel cabac decoding)

15.2.5.1.13 Decoder control register 8 (SWREG11)

26-24 —	Reserved.
23-21 SW_FILT_SHARPNESS	Filter sharpness value
20 —	Reserved.
19 SW_FILT_TYPE	Filter Type

Table continues on the next page...

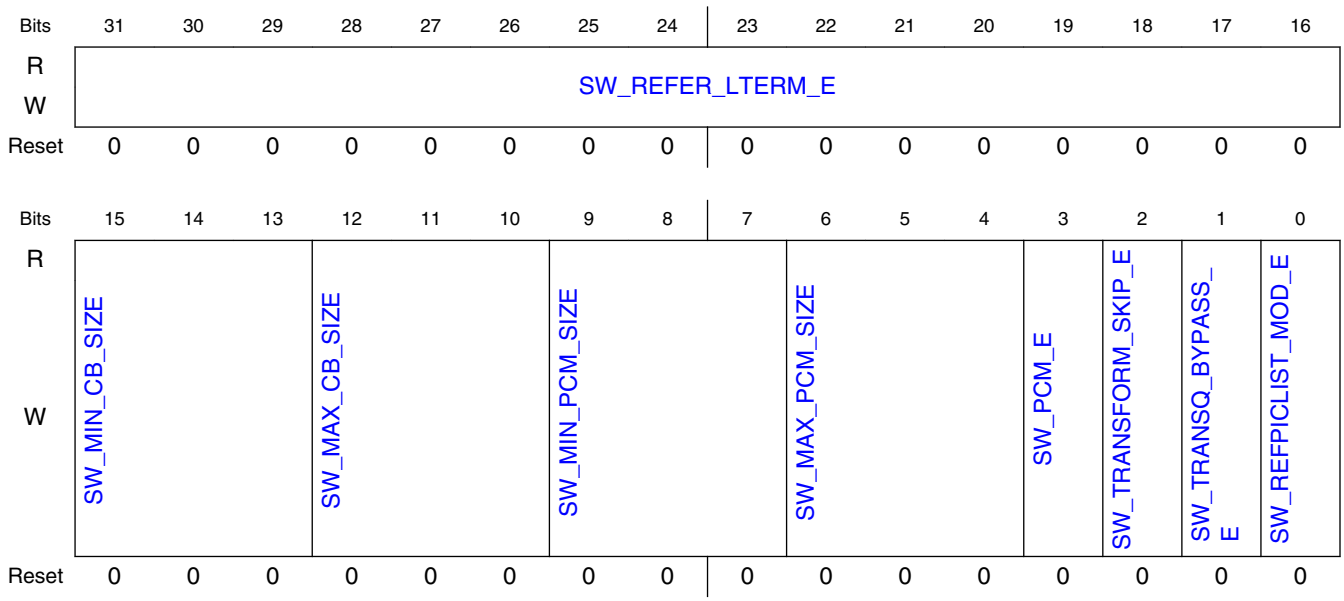
Field	Function
18-11 —	Reserved.
10-8 SW_MCOMP_FILT_TYPE	Inter prediction filter type to stream decoder 000b - Eight tap smooth 001b - Eight tap 010b - Eight tap sharp 011b - Bilinear 100b - Switchable
7 SW_HIGH_PREC_MV_E	High precision MV prediction enable
6 —	Reserved.
5-4 SW_COMP_PRED_MODE	Prediction Comp Type 00b - Single prediction only 01b - COMP prediction only 10b - Hybrid prediction
3 —	Reserved.
2 SW_GREF_SIGN_BIAS	Golden reference picture sign bias used for motion vector decoding
1 —	Reserved.
0 SW_AREF_SIGN_BIAS	Alternate reference picture sign bias used for motion vector decoding

15.2.5.1.14 Decoder control register 9 (SWREG12)

15.2.5.1.14.1 Offset

Register	Offset
SWREG12	30h

15.2.5.1.14.2 Diagram



15.2.5.1.14.3 Fields

Field	Function
31-16 SW_REFER_LTERM_E	Long term flag for reference picture index Definition: Bit 31 for picture index 0 Bit 30 for picture index 1 etc.
15-13 SW_MIN_CB_SIZE	CodedBlock min size (2^N): 011b - 8 pix 100b - 16 pix 101b - 32 pix 110b - 64 pix
12-10 SW_MAX_CB_SIZE	CodedBlock max size (2^N): 011b - 8 pix 100b - 16 pix 101b - 32 pix 110b - 64 pix
9-7 SW_MIN_PCM_SIZE	PCM min size (2^N): 011b - 8 pix 100b - 16 pix 101b - 32 pix 110b - 64 pix
6-4 SW_MAX_PCM_SIZE	PCM max size (2^N): 011b - 8 pix 100b - 16 pix 101b - 32 pix 110b - 64 pix
3 SW_PCM_E	IPCM MBs flag

Table continues on the next page...

Field	Function
2 SW_TRANSFORM_SKIP_E	Transform skipping flag
1 SW_TRANSQ_BYPASS_E	Transform bypass flag (lossless mode)
0 SW_REFPICLIST_MOD_E	Refpic list reordering flag

15.3 VPU H1 (VPU_H1)

15.3.1 Overview

This block describes the features and functionality of the VPU H1 VP8/H.264/MVC video encoder.

15.3.1.1 Block Diagram

The block diagram of the VPU H1 encoder is shown below.

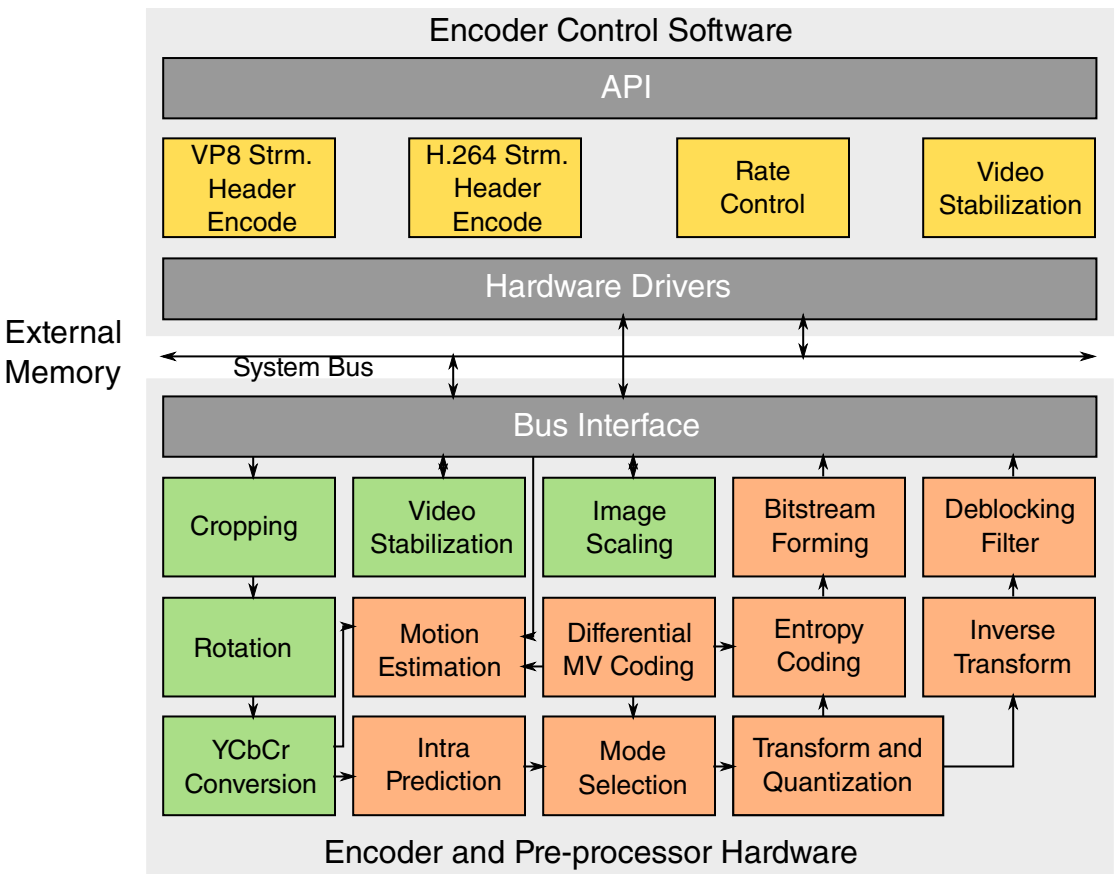

Figure 15-14. VPU H1 Encoder Block Diagram

15.3.1.2 Features

The supported standards, profiles and levels are presented in the table below.

Table 15-5. Supported Standards, Profiles and Levels

Standard	Encoder support
VP8	VP8
H.264 Profile and level	Baseline Profile, levels 1 – 5.1 Main Profile, levels 1 - 5.1 High Profile, levels 1 - 5.1
MVC extension to H.264	Stereo High

The supported VP8 and H.264 video tools are shown in the tables below.

Table 15-6. Supported VP8 Tools

Tool	Encoder support
Frame Types	I, P, Golden and droppable frames
Basic coding tools	14 intra prediction modes 4x4 transform Loop filter: normal, simple and off Error resilience: o Stream mode with no cumulative probability updates
Motion estimation	Configurable search area : - vertical ±30 pixels, horizontal ±126 pixels or - vertical ±14 pixels, horizontal ±126 pixels Pixel accuracy: ½ or ¼ MB and Sub-MB partitions: 16x16, 16x8, 8x16, 8x8 and 4x4 Algorithm: Indexed motion estimation Reconstruction filter: bicubic and bilinear
Number of reference frames	Up to 2
Maximum number of segments	Up to 4 different quantization parameters per frame
Maximum number of residual partitions	5 (control + up to 4 residual partitions)

Table 15-7. Supported H.264 / MVC Tools

Tool	Encoder support
Slices	I and P slices Programmable slice type (mixed I and P slices in one frame)
Fr types	Progressive Interlaced fields
Entropy encoding	CAVLC CABAC Mixed CAVLC (for intra frames) / CABAC (for inter frames

Table continues on the next page...

Table 15-7. Supported H.264 / MVC Tools (continued)

Tool	Encoder support
Basic	Error resilience: o Constrained intra prediction o Slices, multiple of macroblocks rows Maximum motion vector length: o Vertical +-126 pixels o Horizontal +-30 pixels Motion vector pixel accuracy: o ¼ or ½ pixels Macroblock and sub-macroblock partitions: o 16x16, 8x16, 16x8, 8x8, 4x8, 8x4 and 4x4 12 intra prediction modes o 4x4 and 8x8 transforms
Number of reference frames	Up to 2
Maximum number of segments	Up to 4 different quantization parameters per frame
Maximum number of slice groups	1

Table 15-8. VP8 / H.264 / MVC Features

Feature	Encoder support
Input data format	YCbCr formats: o YCbCr 4:2:0 planar o YCbCr 4:2:0 semi-planar o YCrCb 4:2:0 semi-planar o YCbYCr 4:2:2 raster-scan 1) o CbYCrY 4:2:2 raster-scan 1) RGB formats:1) o RGB444 and BGR444 o RGB555 and BGR555 o RGB565 and BGR565 o RGB888 and BRG888 o RGB101010 and BRG101010
Output data format	VP8: o VP8 bitstream H.264/MVC: o Byte unit stream o NAL unit stream
Supported image size	144 x 96 to 4080 x 4080 Step size 4 pixels
Maximum frame rate	Unlimited by the hardware 30 fps at 1920 x 1080 for VP8 60 fps at 1920 x 1080 for H.264
Bit rate	Minimum: 10kbps Maximum: 40 Mbps at 1080p 60 fps
Motion detection	Encoder outputs the best matching motion vector, the motion estimation quality information (a SAD value) and other coding information for each macroblock
Region-of-interest	Two user definable rectangular areas with separate quantizer setting
Region-of-intra	One user definable rectangular area coded as intra
Cyclic Intra Refresh	Supported

Preprocessing is pipelined with the encoder and it can be used only with the VPU H1 encoder. Preprocessing features are presented in the table below.

Table 15-9. Supported Standards, Profiles and Levels

Feature	Encoder support
RGB to YCbCr 4:2:0 color space conversion	BT.601, BT.709 or user defined coefficients conversion for RGB: o RGB444 and BGR444 o RGB555 and BGR555 o RGB565 and BGR565 o RGB888 and BRG888 o RGB101010 and BRG101010
YCbCr 4:2:2 to YCbCr 4:2:0 color space conversion	YCbCr formats: o YCbCr 4:2:0 planar o YCbCr 4:2:0 semi-planar o YCrCb 4:2:0 semi-planar o YCbYCr 4:2:2 raster-scan o CbYCrY 4:2:2 raster-scan
Cropping	Video - from 8192 x 8192 to any supported encoding size
Rotation	90 or 270 degrees
Image down-scaling	Proprietary averaging filter Arbitrary, non-integer scaling ratio separately for both dimensions Unlimited down-scaling ratio (e.g. from 1080p to QCIF)

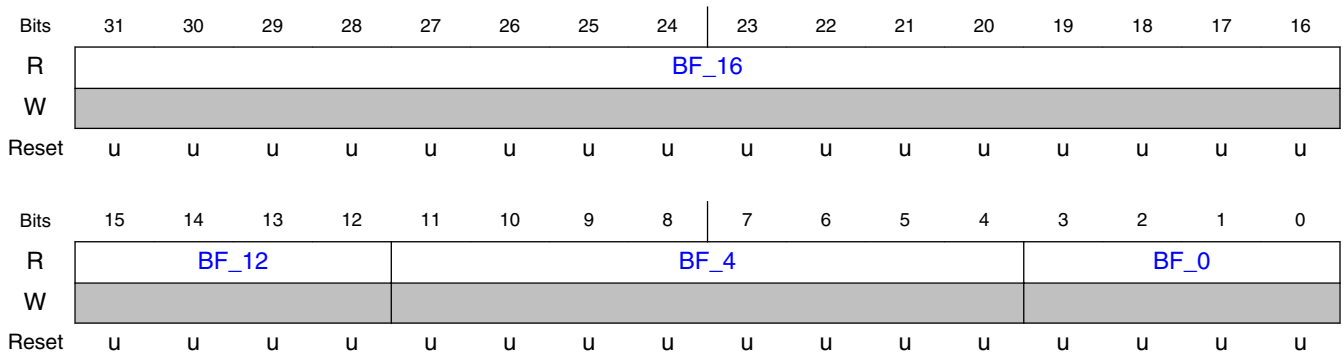
15.3.2.1.2.1 Offset

Register	Offset
SWREG0	0h

15.3.2.1.2.2 Diagram



15.3.2.1.2.3 Fields

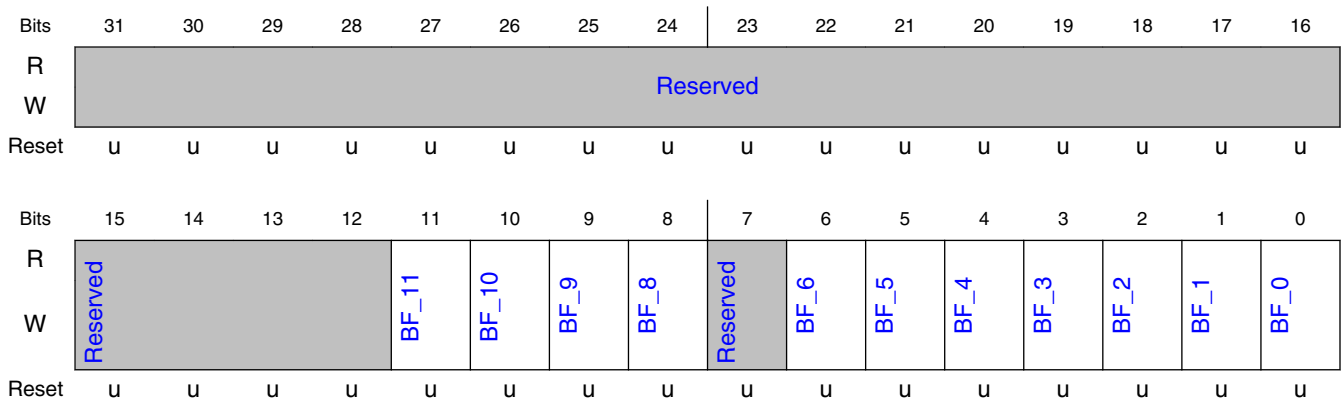
Field	Function
31-16 BF_16	Product ID
15-12 BF_12	Major number
11-4 BF_4	Minor number
3-0 BF_0	Build number defined in synthesis.

15.3.2.1.3 VPU H1 Register 1 (SWREG1)

15.3.2.1.3.1 Offset

Register	Offset
SWREG1	4h

15.3.2.1.3.2 Diagram



15.3.2.1.3.3 Fields

Field	Function
31-12 —	Reserved.
11 BF_11	IRQ Compressed reference buffer overflow status bit.
10 BF_10	IRQ line buffer status bit. One line buffer reading has been done.
9 BF_9	IRQ stream format fuse status bit. Format disabled by fuse.
8 BF_8	IRQ slice ready status bit. Slice is ready but frame encoding continues.
7 —	Reserved.
6 BF_6	IRQ HW timeout status bit. HW encoding failed.
5 BF_5	IRQ buffer full status bit. bufferFullInterrupt
4 BF_4	IRQ SW reset status bit.
3 BF_3	IRQ bus error status bit.
2 BF_2	IRQ frame ready status bit. Encoder has finished a frame.
1 BF_1	IRQ disable. No interrupts from HW. SW must use polling.

Table continues on the next page...

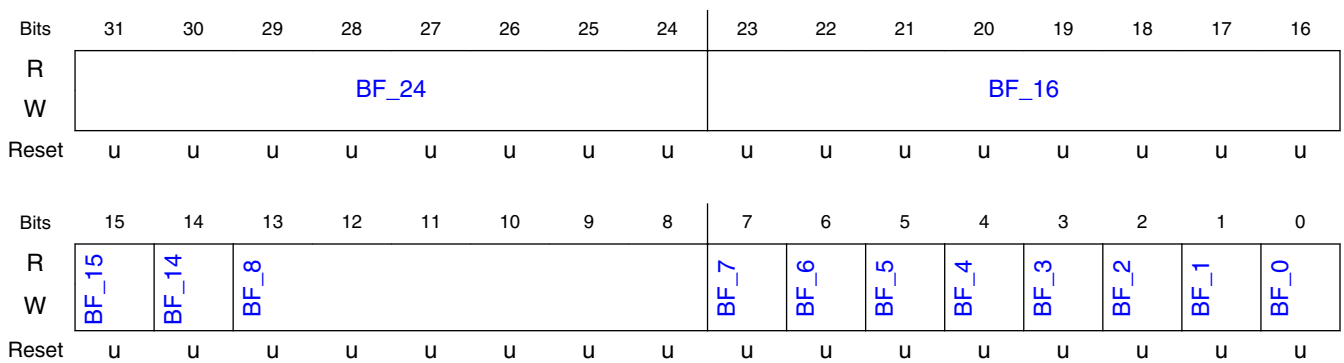
Field	Function
0 BF_0	HINTenc Interrupt from HW. SW resets at IRQ handler.

15.3.2.1.4 VPU H1 Register 2 (SWREG2)

15.3.2.1.4.1 Offset

Register	Offset
SWREG2	8h

15.3.2.1.4.2 Diagram



15.3.2.1.4.3 Fields

Field	Function
31-24 BF_24	AXI Write ID
23-16 BF_16	AXI Read ID
15 BF_15	Enable output stream swap 16-bits
14 BF_14	Enable input swap 16-bits
13-8 BF_8	Burst length. 0=incremental. 4=max BURST4.

Table continues on the next page...

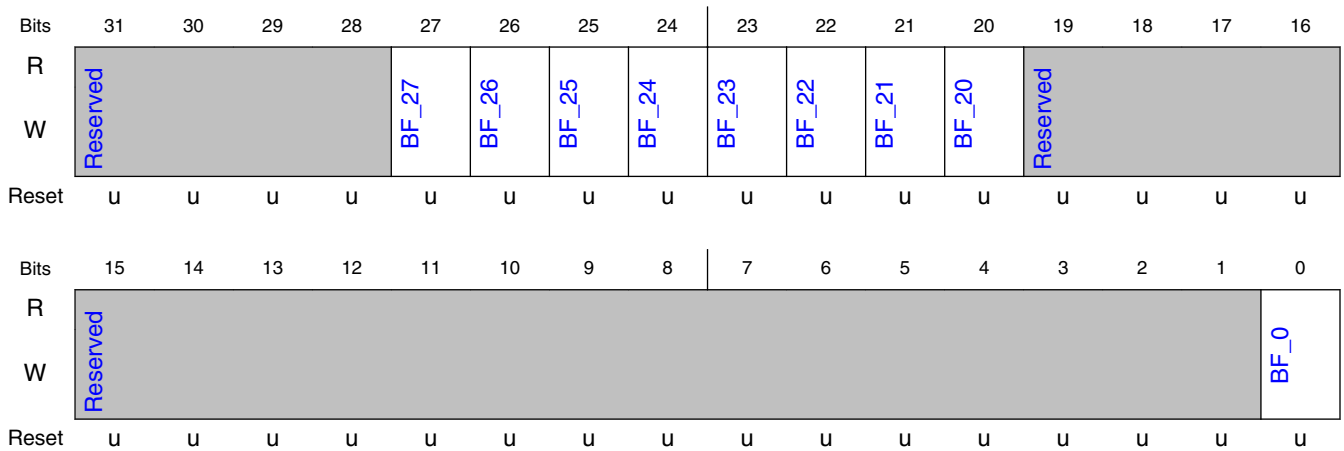
Field	Function
	8=max BURST8. 16=max BURST16.
7 BF_7	Disable burst mode for AXI
6 BF_6	Burst incremental. 1=INCR burst allowed. 0=use SINGLE burst.
5 BF_5	Enable burst data discard. 2 or 3 long reads are using BURST4
4 BF_4	Enable clock gating
3 BF_3	Enable output stream swap 32-bits
2 BF_2	Enable input swap 32-bits
1 BF_1	Enable output stream swap 8-bits
0 BF_0	Enable input swap 8-bits

15.3.2.1.5 VPU H1 Register 3 (SWREG3)

15.3.2.1.5.1 Offset

Register	Offset
SWREG3	Ch

15.3.2.1.5.2 Diagram



15.3.2.1.5.3 Fields

Field	Function
31-28 —	Reserved.
27 BF_27	Enable output scaled image swap for 8-bits
26 BF_26	Enable output scaled image swap for 16-bits
25 BF_25	Enable output scaled image swap for 32-bits
24 BF_24	Enable output MV (MB info) swap for 8-bits
23 BF_23	Enable output MV (MB info) swap for 16-bits
22 BF_22	Enable output MV (MB info) swap for 32-bits
21 BF_21	Chunk size for input picture read. 0=4 MBs. 1=1 MB.
20 BF_20	Disable dual channel AXI. 0=use two channels. 1=use single channel.
19-1 —	Reserved.
0 BF_0	Enable MB bus timing info output.

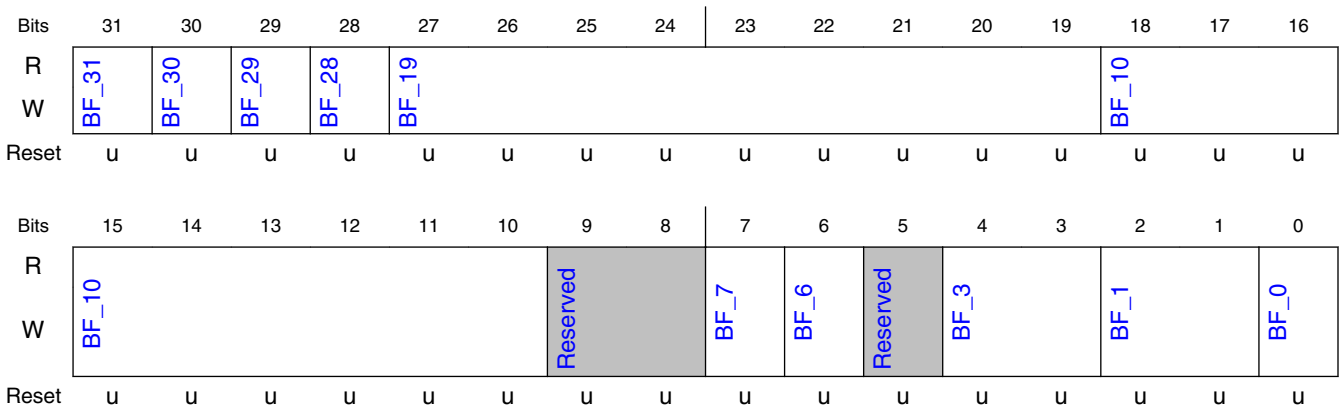
31-0 BF_0	Base address for input picture cr

15.3.2.1.15 VPU H1 Register 14 (SWREG14)

15.3.2.1.15.1 Offset

Register	Offset
SWREG14	38h

15.3.2.1.15.2 Diagram



15.3.2.1.15.3 Fields

Field	Function
31 BF_31	Enable interrupt for timeout
30 BF_30	Enable writing MV and SAD of each MB to BaseMvWrite
29 BF_29	Enable writing size of each NAL unit to BaseControl, nalSizeWriteOut
28 BF_28	Enable interrupt for slice ready
27-19 BF_19	Encoded width. lumWidth (macroblocks) H264:[9..255] JPEG:[6..511]
18-10 BF_10	Encoded height. lumHeight (macroblocks) H264:[6..255] JPEG:[2..511]
9-8 —	Reserved.
7 BF_7	Size of buffer used when writing reconstructed image. 0=1 MB buffered (write burst for every MB). 1=4 MBs buffered (write burst for every fourth MB).
6 BF_6	Disable writing of reconstructed image. recWriteDisable
5 —	Reserved.
4-3 BF_3	Encoded picture type. frameType. 0=INTER. 1=INTRA(IDR).

Table continues on the next page...

Field	Function
	2=MVC-INTER. 3=MVC-INTER(ref mod).
2-1 BF_1	Encoding mode. streamType. 1=VP8. 2=JPEG. 3=H264.
0 BF_0	Encoder enable

15.3.2.1.16 VPU H1 Register 15 (SWREG15)

15.3.2.1.16.1 Offset

Chapter 16
Low Speed Communication and Interconnects

16.1 I2C Controller (I2C)

16.1.1 Overview

This chapter describes block-level operation and programming of I2C. The chapter is intended for a block-driver software developer. To understand how the block is integrated at the SoC level, a system software developer should see discussions of the block in the appropriate SoC-level chapter(s).

References: This document assumes an understanding of the following document:

- *The I2C Bus Specification*, Version 2.1, by Philips Semiconductor

The Inter IC (I2C) provides functionality of a standard I2C slave and master. The I2C is designed to be compatible with the standard NXP I2C bus protocol.

NOTE

Four independent I2C channels are available.

I2C is a two-wire, bidirectional serial bus that provides a simple, efficient method of data exchange, minimizing the interconnection between devices. This bus is suitable for applications requiring occasional communications over a short distance between many devices. The flexible I2C standard allows additional devices to be connected to the bus for expansion and system development. See the connection diagram in the figure below.

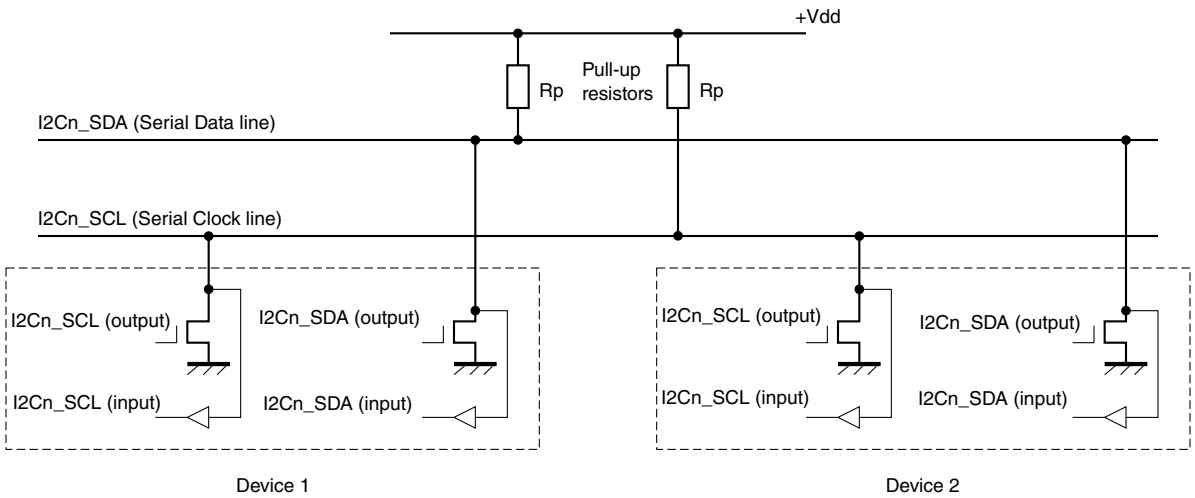

Figure 16-1. Connection of devices to I2C bus

The I2C interface speed is dependent on the I2C bus loading and timing characteristics. For pin requirement details, see *The I2C Bus Specification*. The I2C system is a true multimaster bus including arbitration and collision detection that prevents data corruption if multiple devices attempt to control the bus simultaneously. This feature supports complex applications with multiprocessor control and can be used for rapid testing and alignment of end products through external connections to an assembly-line computer. The figure below shows the block diagram of I2C.

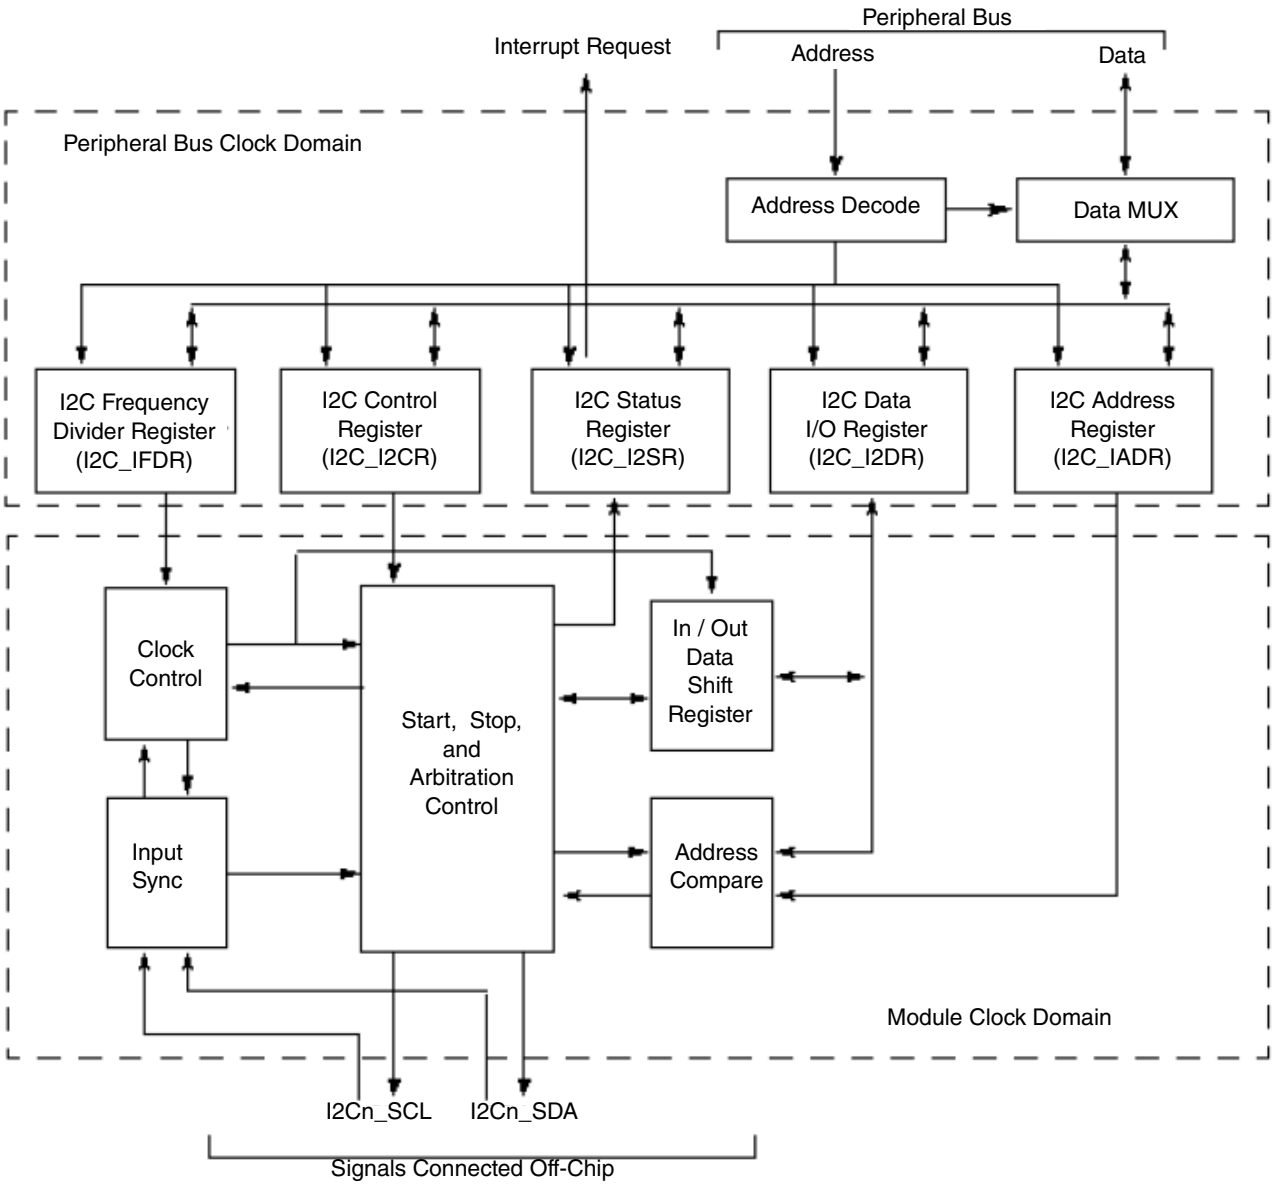

Figure 16-2. I2C block diagram

16.1.1.1 Features

The I2C has the following key features:

- Compatibility with I2C bus standard
- Multimaster operation
- Software programmability for one of 64 different serial clock frequencies
- Software-selectable acknowledge bit
- Interrupt-driven, byte-by-byte data transfer
- Arbitration-lost interrupt with automatic mode switching from master to slave

- Calling address identification interrupt
- Start and stop signal generation/detection
- Repeated Start signal generation
- Acknowledge bit generation/detection
- Bus-busy detection

16.1.1.2 Modes and operations

The I2C operates primarily in two functional modes: Standard mode and Fast mode.

- In Standard mode, I2C supports the data transfer rates up to 100 kbits/s.
- In Fast mode, data transfer rates up to 400 kbits/s can be achieved. Per block operation, there is no special configuration required for Fast or Standard mode. It is the data transfer rate that distinguishes Standard and Fast mode.

16.1.2 Functional description

This section provides a complete functional description of the block.

16.1.2.1 I2C system configuration

After a reset, the I2C defaults to Slave Receive operations. Thus, when not operating as a master or responding to a slave transmit address, the I2C defaults to the Slave Receive state.

For exceptions, see Initialization sequence.

NOTE

The I2C is designed to be compatible with the Philips™ I2C bus protocol. For information on system configuration, protocol, and restrictions, see the *I2C Bus Specification*, version 2.1, by Philips Semiconductors. The I2C supports Standard and Fast modes only.

16.1.2.2 Arbitration procedure

If multiple devices simultaneously request the bus, the bus clock is determined by a synchronization procedure in which the low period equals the longest clock-low period among the devices, and the high period equals the shortest. A data arbitration procedure determines the relative priority of competing devices.

A device loses arbitration if it sends logic high while another sends logic low; it immediately switches to Slave Receive mode and stops driving I2Cn_SDA. In this case, the transition from master to Slave mode does not generate a Stop condition. Meanwhile, hardware sets the arbitration lost bit in the I2C Status register (I2C_I2SR[IAL] to indicate loss of arbitration).

16.1.2.3 Clock synchronization

Because wire-AND logic is used, a high-to-low transition on SCL affects devices connected to the bus. Devices start counting their low period when the master drives SCL low. When a device clock goes low, it holds SCL low until the Clock High state is reached. However, the low-to-high change in this device clock may not change the state of SCL if another device clock is still in its low period. Therefore, the device with the longest low period holds the synchronized clock SCL low.

Devices with shorter low periods enter a High Wait state during this time (see Figure 16-3). When all devices involved have counted off their low periods, the synchronized clock SCL is released and pulled high. There is then no difference between device clocks and the state of SCL, so all of the devices start counting their high periods. The first device to complete its high period pulls SCL low again.

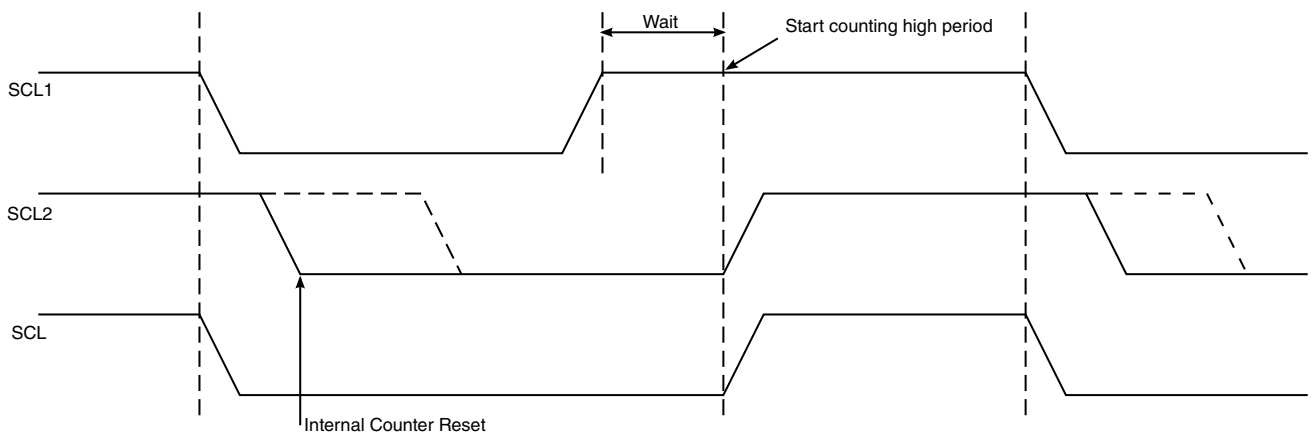

Figure 16-3. Synchronized clock SCL

16.1.2.4 Handshaking

The clock synchronization mechanism can be used as a handshake in data transfers. Slave devices can hold SCL low after completing one byte transfer (9 bits). In such a case, the clock mechanism halts the bus clock and forces the master clock into a Wait state until the slave releases SCL.

16.1.2.5 Clock stretching

Slaves can use the clock synchronization mechanism to slow down the transfer bit rate. After the master has driven SCL low, the slave can drive SCL low for the required period and then release it. If the slave SCL low period is longer than the master SCL low period, the resulting SCL bus signal low period is stretched.

16.1.2.6 Peripheral bus accesses

I2C is a 16-bit block. Only half-word accesses should be performed to the block.

16.1.2.7 Generation of transfer error on IP bus

If an address is received on the peripheral slave bus interface but it is not implemented, an access error is generated.

16.1.2.8 Reset

The I2C can be reset in the following ways:

- Global reset: A hard asynchronous reset of the whole I2C
- Software reset: An internal reset for the whole I2C (except for I2C_IADR and I2C_IFDR registers) initiated by deasserting the I2C_I2CR[IEN] bit

16.1.2.9 Interrupts

There is only one interrupt from the block, which is enabled by setting the I2C_I2CR[IIEN] bit.

The interrupt is generated in any one of the following conditions:

- One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock).
- An address is received that matches its own specific address in Slave Receive mode.
- Arbitration is lost.

16.1.2.10 Byte order

The block only supports the Little-Endian mode.

16.1.3 Initialization

NOTE

Ensure the input select pins for IOMUXC are configured correctly for I2C.

16.1.3.1 Initialization sequence

Before the interface can transfer serial data, registers must be initialized, as listed here.

1. Set the data sampling rate (I2C_IFDR[IC] to obtain SCL frequency from the system bus clock.
2. Update the address in the (I2C_IADR) to define its slave address (address can range from 0 to 0x7f).
3. Set the I2C enable bit (I2C_I2CR[IEN]) to enable the I2C bus interface system.
4. Modify the bits in the I2C_I2CR to select Master/Slave mode, Transmit/Receive mode, and Interrupt-Enable or not.

16.1.3.2 Generation of Start

After completion of the initialization procedure, serial data can be transmitted by selecting the Master Transmit mode. On a multimaster bus system, the busy bus (I2C_I2SR[IBB]) must be tested to determine whether the serial bus is free. If the bus is free (IBB = 0), the Start signal and the first byte (the slave address) can be sent. The data written to the data register comprises the address of the desired slave and the LSB indicates the transfer direction.

The free time between a Stop and the next Start condition is built into the hardware that generates the Start cycle. Depending on the relative frequencies of the system clock and the SCL period, it may be necessary to wait until the I2C is not busy after writing the calling address to the data register (I2C_I2DR), before proceeding to load data into the data register (I2C_I2DR).

16.1.3.3 Post-transfer software response

Sending or receiving a byte sets the data transferring bit (I2C_I2SR[ICF]), which indicates one byte of communication is finished. Upon completion, the interrupt status (I2C_I2SR[IIF]) is also set. An external interrupt is generated if the interrupt enable (I2C_I2CR[IIEN]) is set. The software must first clear the interrupt status (I2C_I2SR[IIF]) in the interrupt routine.

See the flow chart in Figure 16-5.

The data transferring bit (I2C_I2SR[ICF]) is cleared either by reading from I2C_I2DR in Receive mode or by writing to this register in Transmit mode.

The software can service the I2C I/O in the main program by monitoring the interrupt status (I2C_I2SR[IIF]) if the interrupt enable is deasserted. In this case, the interrupt status should be polled in the data transferring bit (I2C_I2SR[ICF]) because the operation is different when arbitration is lost.

When an interrupt occurs at the end of the address cycle, the master is always in Transmit mode; that is, the address is sent. If Master Receive mode is required, then I2C_I2CR[MTX] should be toggled and a dummy read of the I2C_I2DR register must be executed to trigger receive data.

During Slave-mode address cycles (I2C_I2SR[IAAS] = 1), the slave read/write bit I2C_I2SR[SRW] is read to determine the direction of the next transfer. The transmit/receive bit (I2C_I2CR[MTX]) should also be programmed accordingly. For Slave-mode data cycles (IAAS = 0), SRW is invalid. MTX should be read to determine the current transfer direction.

16.1.3.4 Generation of Stop

A data transfer ends when the master signals a Stop, which can occur after all data is sent.

For a master receiver to terminate a data transfer, it must inform the slave transmitter by not acknowledging the last data byte. This is done by setting the transmit acknowledge bit (I2C_I2CR[TXAK]) before reading the next-to-last byte. Before the last byte is read, a Stop signal must be generated.

16.1.3.5 Generation of Repeated Start

After the data transfer, if the master still requires the bus, it can signal another Start followed by another slave address without signaling a Stop.

16.1.3.6 Slave mode

In the slave interrupt service routine (see Figure 16-5), the block addressed as slave bit (IAAS) should be tested to check if a calling of its own address has just been received. If IAAS is set, software should set the Transmit/Receive mode select bit (I2C_I2CR[MTX]) according to the I2C_I2SR[SRW]. Writing to the I2C_I2CR clears the IAAS automatically. The only time IAAS is read as set is from the interrupt at the end of the address cycle where an address match occurred; interrupts resulting from subsequent data transfers will have IAAS cleared. A data transfer can now be initiated by writing information to I2C_I2DR for slave transmits, or read from I2C_I2DR in Slave Receive mode. A dummy read of I2C_I2DR in Slave Receive mode releases SCL, allowing the master to send data.

In the slave transmitter routine, the receive acknowledge bit (I2C_I2SR[RXAK]) must be tested before sending the next byte of data. Setting RXAK means an end-of-data signal from the master receiver, after which the software must switch it from Transmit to Receiver mode. Reading the data register (I2C_I2DR) then releases SCL so the master can generate a Stop signal.

16.1.3.7 Arbitration lost

If several devices try to engage the bus at the same time, one becomes master. Hardware immediately switches devices that lose arbitration to Slave Receive mode. Data output to 12Cn_SDA stops, but 12Cn_SCL is still generated until the end of the byte during which arbitration is lost. An interrupt occurs at the falling edge of the ninth clock of this transfer if the arbitration is lost (I2C_I2SR[IAL] = 1), and the Slave mode is selected (I2C_I2CR[MSTA] = 0).

See the flow chart in Figure 16-5.

If a device that is not a master tries to transmit or do a Start, hardware inhibits the transmission, clears MSTA without signaling a Stop, generates an interrupt to the Arm platform, and sets I2C_I2SR[IAL] to indicate a failed attempt to engage the bus. When considering these cases, the slave service routine should first test I2C_I2SR[IAL], and the software should clear it if it is set.

For Multimaster mode, when an I2C is enabled when the bus is busy and asserts Start, the I2C_I2SR[IAL] bit gets set only for 12Cn_SDA=0, 12Cn_SCL=0/1, 12Cn_SDA=1, and 12Cn_SCL=0; but not for 12Cn_SDA=1 and I2Cn_SCL=1, which is the equivalent of Bus Idle state.

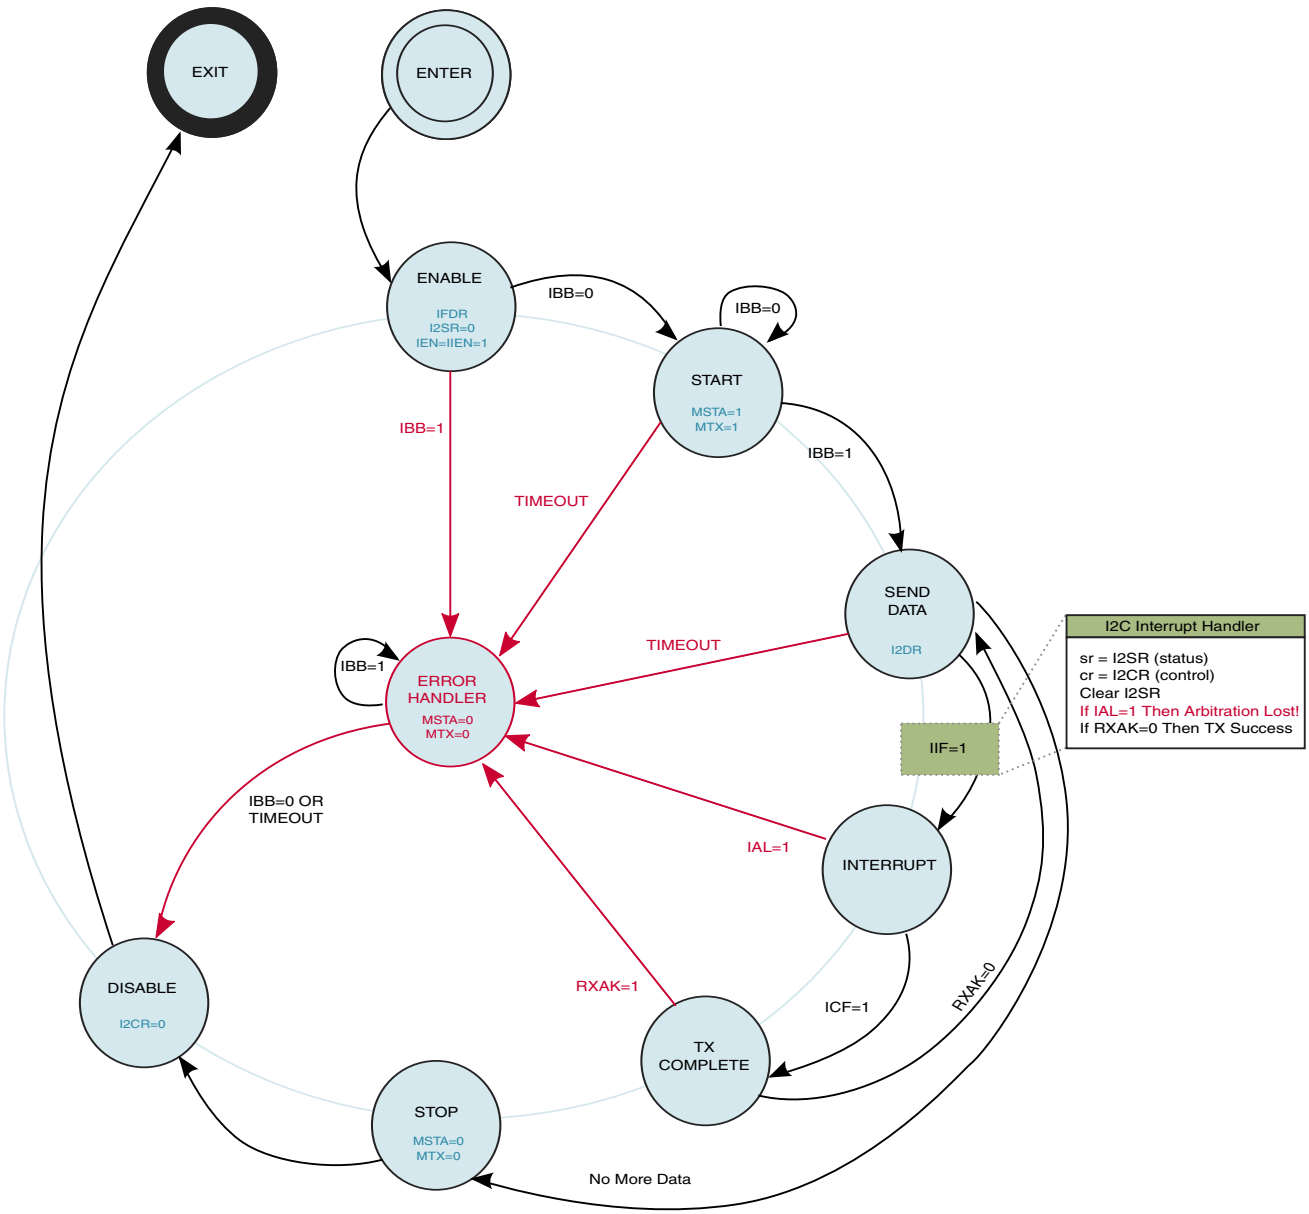

Figure 16-4. I2C Programming state diagram

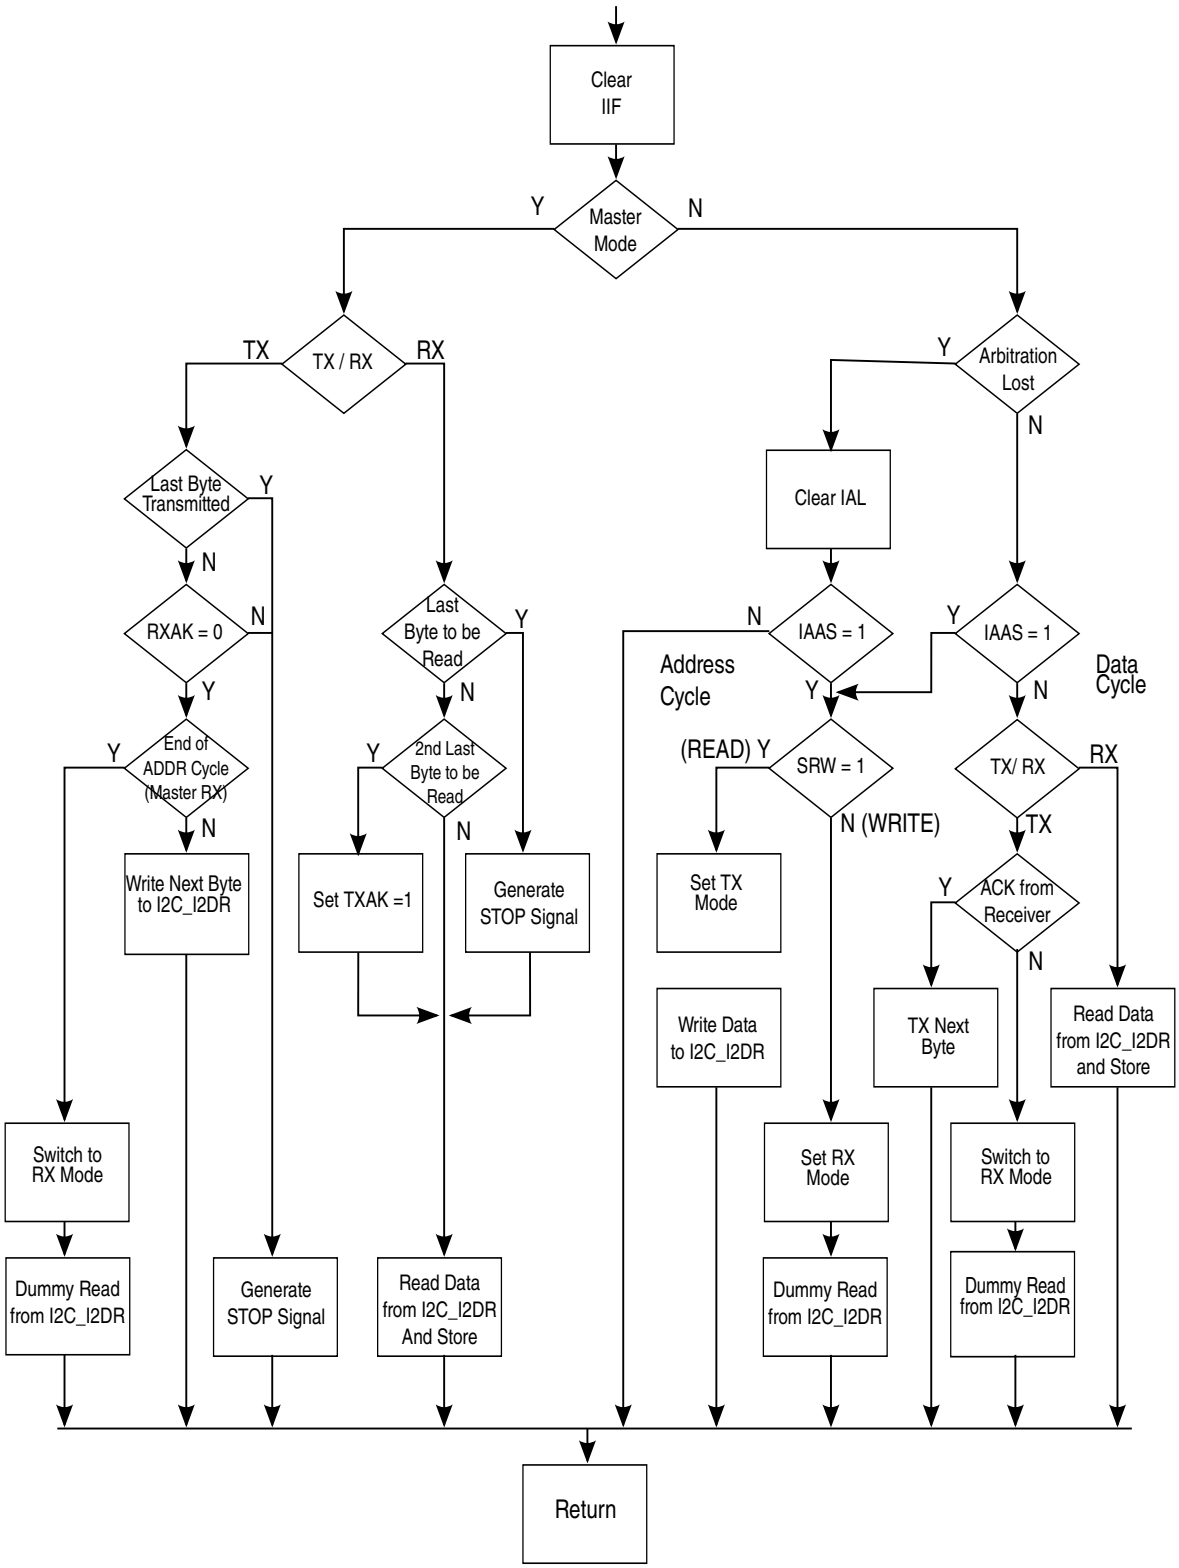

Figure 16-5. Flowchart of typical I2C interrupt routine

NOTE

For a Repeated Start only, the Stop-generation stage does not occur in Master mode. A loop repeats itself without stopping for the next start.

For Master Receive mode, I2C is programmed as Master Transmit during Address mode and after slave address transfer; the MTX bit should be cleared and a dummy read on the I2C_I2DR register should be performed so I2C can read the next receive data.

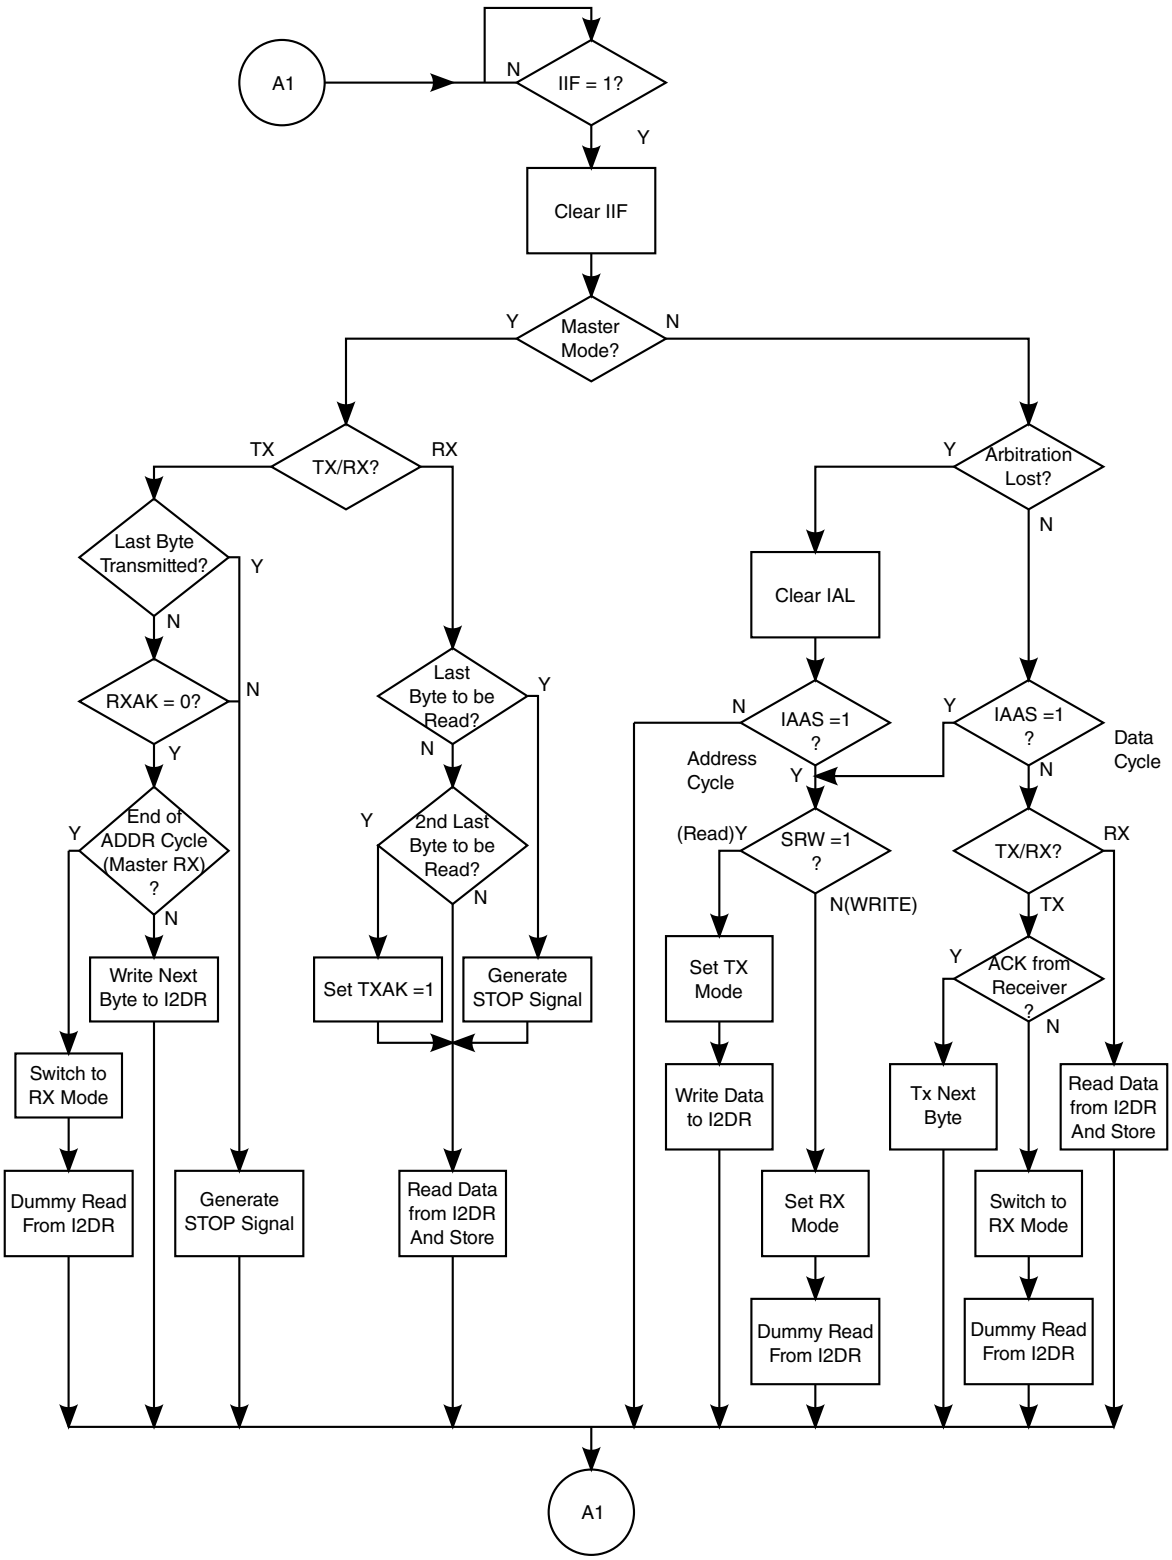

Figure 16-6. Flowchart for typical I2C polling routine

NOTE

The timeout value depends on the bus frequency at which I2C is operating. The minimum timeout for polling the IIF bit at a maximum I2C bus frequency of 400 kHz is T_{min} = 25 µs (=2.5 x 10 µs). This value can be calculated for any bus frequency. The formula is $T_{min} = 10/F_{SCL}$, where F_{SCL} is the frequency of the I2C clock (SCL).

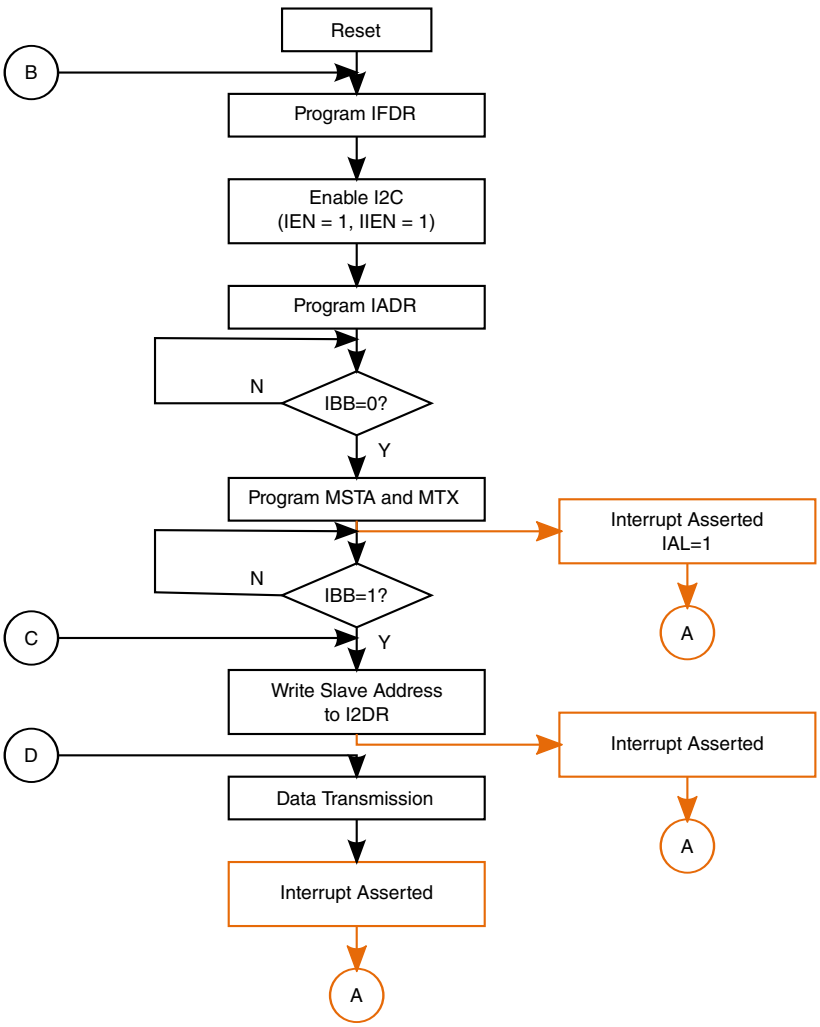

Figure 16-7. Detailed flowchart of a typical I2C Master Transmit mode, part 1

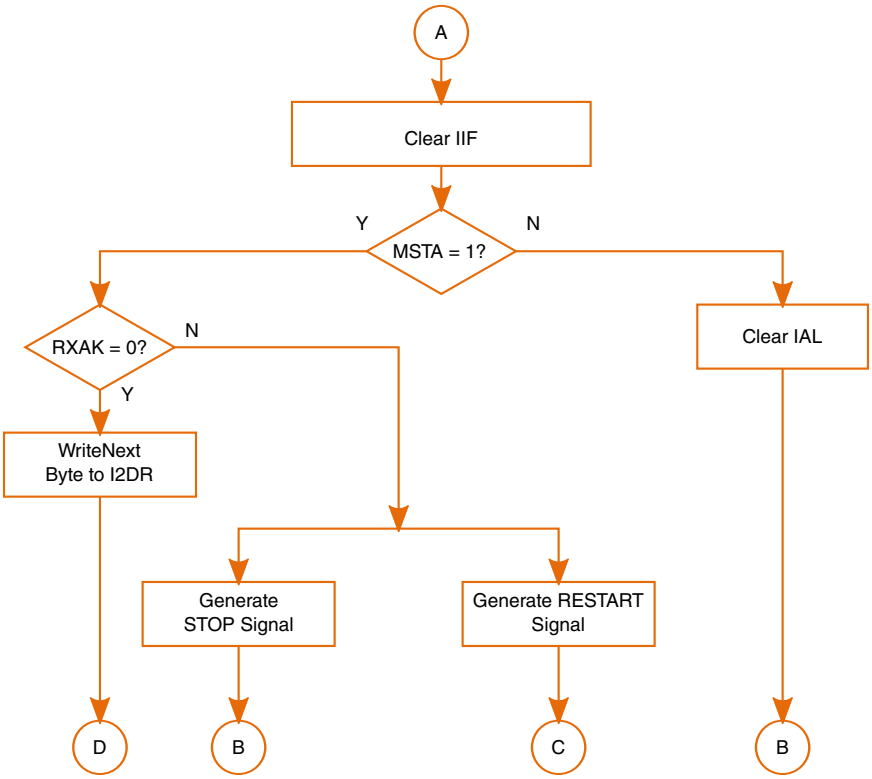

Figure 16-8. Detailed flowchart of a typical I2C Master Transmit mode, part 2

Figure 16-7 and Figure 16-8 show the Master Transmit mode operation with interrupt subroutine. If an interrupt is generated and the MSTA bit is 0, then bus arbitration is lost and IAL is set. Software can clear the IAL bit and reprogram I2C. If the MSTA bit is 1, then it is a transfer-generated interrupt. In this case, software can check the RXAK bit for a data receive acknowledgement by the slave and, accordingly, decide to do one of the following:

- Generate a STOP
- Generate a REPEATED START by writing to the I2C_I2CR register
- Perform the next data transfer by writing to the I2C_I2DR register

NOTE

The IBB bit is asserted by a Start condition on the bus, and it is deasserted by a Stop condition on the bus. Therefore, if arbitration is lost due to an unexpected Stop condition during transfer, then IBB is cleared. If arbitration is lost due to a data mismatch, then it is not cleared. Software should always clear the IEN bit and then set it if arbitration is lost.

16.1.4 Software restriction

Software should ensure that there is a delay of at least two module clock cycles after it sets the I2C_I2CR[RSTA] bit and before writing to the I2C_I2DR register. The maximum possible clock period of the module clock is 78 ns.

16.1.5 I2C Memory Map/Register Definition

The I2C contains five 16-bit registers.

NOTE

Registers at offsets 0x0002, 0x0006, 0x000A, and 0x000E are reserved for future additions.

16.1.5.1 I2C Address Register (I2Cx_IADR)

Address: Base address + 0h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								ADR							0
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_IADR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7–1 ADR	Slave address. Contains the specific slave address to be used by the I2C. Slave mode is the default I2C mode for an address match on the bus. **NOTE:** The I2C_IADR holds the address to which the I2C responds when addressed as a slave. The slave address is not the address sent on the bus during the address transfer. The register is not reset by a software reset.
0 Reserved	This read-only field is reserved and always has the value 0.

16.1.5.2 I2C Frequency Divider Register (I2Cx_IFDR)

The I2C_IFDR provides a programmable prescaler to configure the clock for bit-rate selection. The register does not get reset by a software reset.

The following table describes the divider and register values for the register field "IC."

Table 16-1. I2C_IFDR Register Field Values

IC	Divider	IC	Divider	IC	Divider	IC	Divider
0x00	30	0x10	288	0x20	22	0x30	160

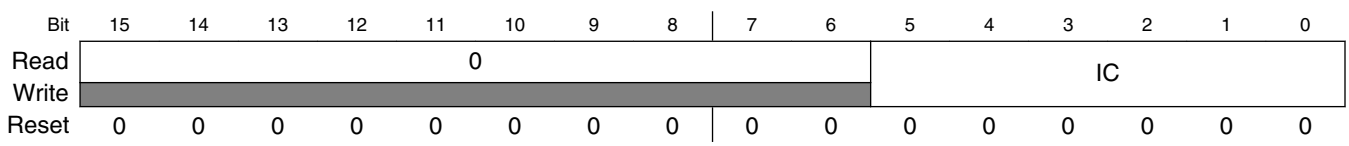
Address: Base address + 4h offset



I2Cx_IFDR field descriptions

Field	Description
15–6 Reserved	This read-only field is reserved and always has the value 0.
IC	I2C clock rate. Prescales the clock for bit-rate selection. Due to potentially slow I2Cn_SCL and I2Cn_SDA rise and fall times, bus signals are sampled at the prescaler frequency. The serial bit clock frequency may be lower than IPG_CLK_ROOT divided by the divider shown in the I2C Data I/O Register. **NOTE:** The IC value should not be changed during the data transfer, however, it can be changed before a Repeat Start or Start programming sequence in I2C. The I2C protocol supports bit rates of up to 400 kbps. The IC bits need to be programmed in accordance with this constraint.

16.1.5.3 I2C Control Register (I2Cx_I2CR)

The I2C_I2CR is used to enable the I2C and the I2C interrupt. It also contains bits that govern operation as a slave or a master.

Address: Base address + 8h offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read	IEN	IIEN	MSTA	MTX	TXAK	0	0	
Write						RSTA		
Reset	0	0	0	0	0	0	0	0

I2Cx_I2CR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 IEN	I2C enable. Also controls the software reset of the entire I2C. Resetting the bit generates an internal reset to the block. If the block is enabled in the middle of a byte transfer, Slave mode ignores the current bus transfer and starts operating when the next Start condition is detected. Master mode is not aware that the bus is busy, so initiating a start cycle may corrupt the current bus cycle, ultimately causing either the current master or the I2C to lose arbitration. Subsequently, bus operation returns to normal. 0 The block is disabled, but registers can still be accessed. 1 The I2C is enabled. This bit must be set before any other I2C_I2CR bits have an effect.
6 IIEN	I2C interrupt enable. **NOTE:** If data is written during the Start condition, that is, just after setting the I2C_I2CR[MSTA] and I2C_I2CR[MTX] bits, then the ICF bit is cleared at the falling edge of SCLK after Start. If data is written after the Start condition and falling edge of SCLK, then the ICF bit is cleared as soon as data is written. 0 I2C interrupts are disabled, but the status flag I2C_I2SR[IIF] continues to be set when an Interrupt condition occurs. 1 I2C interrupts are enabled. An I2C interrupt occurs if I2C_I2SR[IIF] is also set.
5 MSTA	Master/Slave mode select bit. If the master loses arbitration, MSTA is cleared without generating a Stop signal. **NOTE:** The module clock should be on for writing to the MSTA bit. **NOTE:** The MSTA bit is cleared by software to generate a Stop condition; it can also be cleared by hardware when the I2C loses the bus arbitration.

Table continues on the next page...

I2Cx_I2CR field descriptions (continued)

Field	Description
	0 Slave mode. Changing MSTA from 1 to 0 generates a Stop and selects Slave mode. 1 Master mode. Changing MSTA from 0 to 1 signals a Start on the bus and selects Master mode.
4 MTX	Transmit/Receive mode select bit. Selects the direction of master and slave transfers. 0 Receive. When a slave is addressed, the software should set MTX according to the slave read/write bit in the I2C status register (I2C_I2SR[SRW]). 1 Transmit. In Master mode, MTX should be set according to the type of transfer required. Therefore, for address cycles, MTX is always 1.
3 TXAK	Transmit acknowledge enable. Specifies the value driven onto I2Cn_SDA during acknowledge cycles for both master and slave receivers. **NOTE:** Writing TXAK applies only when the I2C bus is a receiver. 0 An acknowledge signal is sent to the bus at the ninth clock bit after receiving one byte of data. 1 No acknowledge signal response is sent (that is, the acknowledge bit = 1).
2 RSTA	Repeat start. Always reads as 0. Attempting a repeat start without bus mastership causes loss of arbitration. 0 No repeat start 1 Generates a Repeated Start condition
Reserved	This read-only field is reserved and always has the value 0.

16.1.5.4 I2C Status Register (I2Cx_I2SR)

The I2C_I2SR contains bits that indicate transaction direction and status.

Address: Base address + Ch offset

Bit	15	14	13	12	11	10	9	8
Read	0							
Write								
Reset	0	0	0	0	0	0	0	0

Bit	7	6	5	4	3	2	1	0
Read	ICF	IAAS	IBB	IAL	0	SRW	IIF	RXAK
Write								
Reset	1	0	0	0	0	0	0	1

I2Cx_I2SR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
7 ICF	Data transferring bit. While one byte of data is transferred, ICF is cleared. 0 Transfer is in progress. 1 Transfer is complete. This bit is set by the falling edge of the ninth clock of the last byte transfer.
6 IAAS	I2C addressed as a slave bit. The Arm platform is interrupted if the interrupt enable (I2C_I2CR[IIEN]) is set. The Arm platform must check the slave read/write bit (SRW) and set its Transfer/Receive mode accordingly. Writing to I2C_I2CR clears this bit. 0 Not addressed 1 Addressed as a slave. Set when its own address (I2C_IADR) matches the calling address.
5 IBB	I2C bus busy bit. Indicates the status of the bus. **NOTE:** When I2C is enabled (I2C_I2CR[IEN] = 1), it continuously polls the bus data (SDA) and clock (SCL) signals to determine a Start or Stop condition. 0 Bus is idle. If a Stop signal is detected, IBB is cleared. 1 Bus is busy. When Start is detected, IBB is set.
4 IAL	Arbitration lost. Set by hardware in the following circumstances (IAL must be cleared by software by writing a "0" to it at the start of the interrupt service routine): • I2Cn_SDA input samples low when the master drives high during an address or data-transmit cycle. • I2Cn_SDA input samples low when the master drives high during the acknowledge bit of a data-receive cycle. For the above two cases, the bit is set at the falling edge of the ninth I2Cn_SCL clock during the ACK cycle. • A Start cycle is attempted when the bus is busy. • A Repeated Start cycle is requested in Slave mode. • A Stop condition is detected when the master did not request it. **NOTE:** Software cannot set the bit. 0 No arbitration lost. 1 Arbitration is lost.
3 Reserved	This read-only field is reserved and always has the value 0.
2 SRW	Slave read/write. When the I2C is addressed as a slave, IAAS is set, and the slave read/write bit (SRW) indicates the value of the R/W command bit of the calling address sent from the master. SRW is valid only when a complete transfer has occurred, no other transfers have been initiated, and the I2C is a slave and has an address match. 0 Slave receive, master writing to slave 1 Slave transmit, master reading from slave
1 IIF	I2C interrupt. Must be cleared by the software by writing a "0" to it in the interrupt routine. **NOTE:** The software cannot set the bit. 0 No I2C interrupt pending. 1 An interrupt is pending.

Table continues on the next page...

I2Cx_I2SR field descriptions (continued)

Field	Description
	This causes a processor interrupt request (if the interrupt enable is asserted [IIEN = 1]). The interrupt is set when one of the following occurs: • One byte transfer is completed (the interrupt is set at the falling edge of the ninth clock). • An address is received that matches its own specific address in Slave Receive mode. • Arbitration is lost.
0 RXAK	Received acknowledge. This is the value received from the I2Cn_SDA input for the acknowledge bit during a bus cycle. 0 An "acknowledge" signal was received after the completion of an 8-bit data transmission on the bus. 1 A "No acknowledge" signal was detected at the ninth clock.

16.1.5.5 I2C Data I/O Register (I2Cx_I2DR)

In Master Receive mode, reading the data register allows a read to occur and initiates the next byte to be received. In Slave mode, the same function is available after it is addressed.

Address: Base address + 10h offset

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Read	0								DATA							
Write																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

I2Cx_I2DR field descriptions

Field	Description
15–8 Reserved	This read-only field is reserved and always has the value 0.
DATA	Data Byte. Holds the last data byte received or the next data byte to be transferred. Software writes the next data byte to be transmitted or reads the data byte received. **NOTE:** The core-written value in I2C_I2DR cannot be read back by the core. Only data written by the I2C bus side can be read.

16.2 Universal Asynchronous Receiver/Transmitter (UART)

16.2.1 Overview

Universal Asynchronous Receiver/Transmitter (UART) provides serial communication capability with external devices through a level converter and an RS-232 cable or through use of external circuitry that converts infrared signals to electrical signals (for reception) or transforms electrical signals to signals that drive an infrared LED (for transmission) to provide low speed IrDA compatibility.

UART supports NRZ encoding format , RS485 compatible 9 bit data format and IrDA-compatible infrared slow data rate (SIR) format.

Figure 16-9 is the UART block diagram.

The "Module Clock" is the UART_CLK which comes from CCM. The "Peripheral Clock" is the IPG_CLK which comes from CCM.

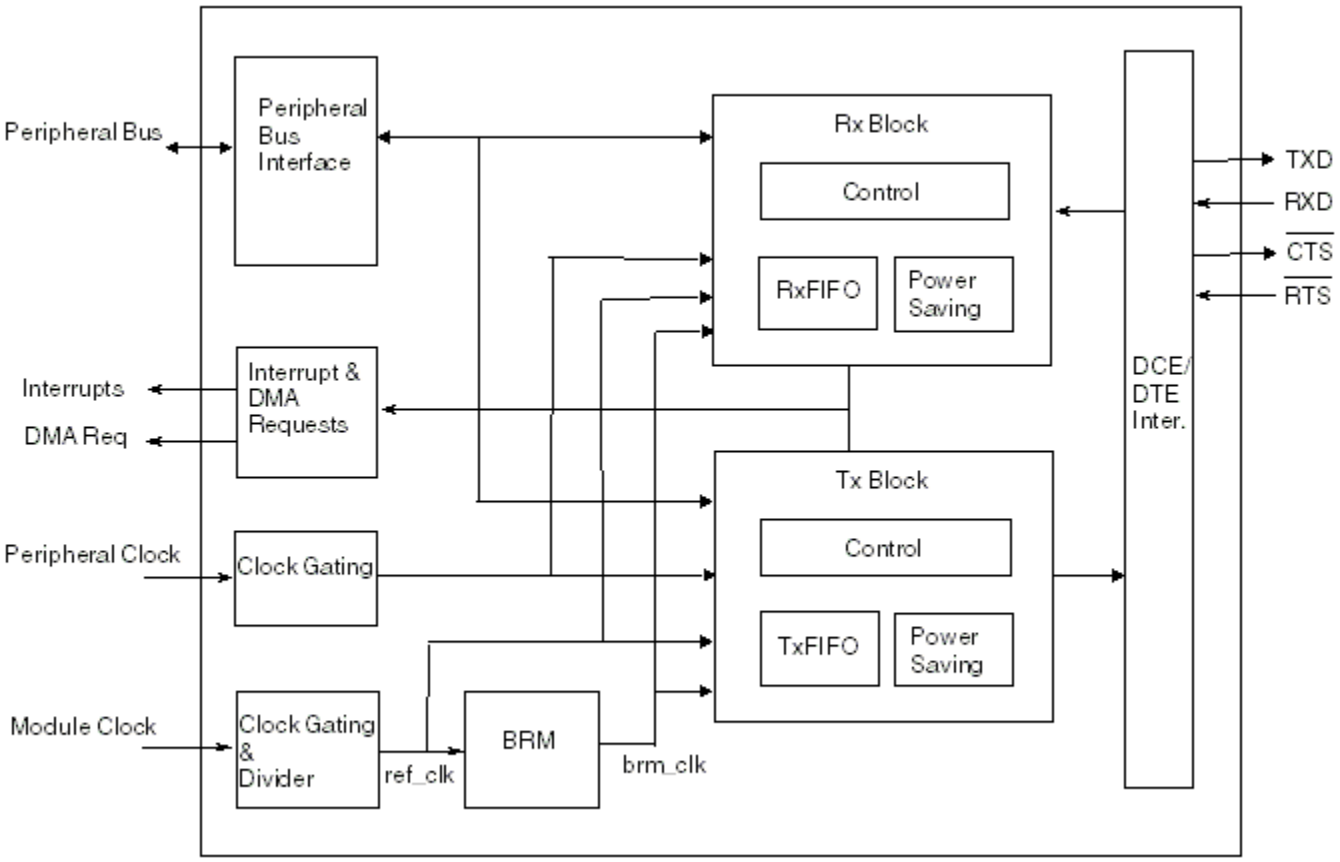


Figure 16-9. UART Block Diagram

16.2.1.1 Features

The UART includes the following features:

- High-speed TIA/EIA-232-F compatible, up to Mbit/s
- Serial IR interface low-speed, IrDA-compatible (up to 115.2 Kbit/s)
- 9-bit or Multidrop mode (RS-485) support (automatic slave address detection)
- 7 or 8 data bits for RS-232 characters, or 9 bit RS-485 format
- 1 or 2 stop bits
- Programmable parity (even, odd, and no parity)
- Hardware flow control support for request to send (RTS_B) and clear to send (CTS_B) signals
- RS-485 driver direction control via CTS_B signal
- Edge-selectable RTS_B and edge-detect interrupts
- Status flags for various flow control and FIFO states
- Voting logic for improved noise immunity (16x oversampling)
- Transmitter FIFO empty interrupt suppression

- UART internal clocks enable/disable
- Auto baud rate detection (up to 115.2 Kbit/s)
- Receiver and transmitter enable/disable for power saving
- RX_DATA input and TX_DATA output can be inverted respectively in RS-232/ RS-485 mode
- DCE/DTE capability
- RTS_B, IrDA asynchronous wake (AIRINT), receive asynchronous wake (AWAKE) interrupts wake the processor from STOP mode
- Maskable interrupts
- Two DMA Requests (TxFIFO DMA Request and RxFIFO DMA Request)
- Escape character sequence detection
- Software reset (SRST_B)
- Two independent, 32-entry FIFOs for transmit and receive
- The peripheral clock can be totally asynchronous with the module clock. The module clock determines baud rate. This allows frequency scaling on peripheral clock (such as during DVFS mode) while remaining the module clock frequency and baud rate.

16.2.1.2 Modes of operation

- Serial RS-232NRZ mode
- 9-bit RS-485 mode
- IrDA mode

To set UART in different modes, see the table below.

Table 16-2. UART mode definition

MDEN (UMCR[0])	IREN (UCR1[7])	UART Mode	Descriptioin
0	0	RS-232	RXD/TXD data is serial RS-232 NRZ format
0	1	IrDA (Interface)	RXD/TXD data is IrDA-compatible infrared slow data rate (SIR) format
1	0	RS-485	RXD/TXD data is RS485 compatible 9 bit data format
1	1	Undefined	Undefined

16.2.2 Functional Description

This section provides a complete functional description of the block.

16.2.2.1 Interrupts and DMA Requests

See the following table for the lists of all interrupt and DMA signals and associated interrupt and DMA sources of the UART. See register description section for explanation of interrupt/DMA enable and status.

Table 16-3. Interrupts and DMA

Interrupt/DMA Output	Interrupt/DMA Enable	Enable Register Location	Interrupt/DMA Flag	Flag Register Location
interrupt_uart	RRDYEN	UCR1 (bit 9)	RRDY	USR1 (bit 9)
	IDEN	UCR1 (bit 12)	IDLE	USR2 (bit 12)
	DREN	UCR4 (bit 0)	RDR	USR2 (bit 0)
	RXDSEN	UCR3 (bit 6)	RXDS	USR1 (bit 6)
	ATEN	UCR2 (bit 3)	AGTIM	USR1 (bit 8)
interrupt_uart	TXMPTYEN	UCR1 (bit 6)	TXFE	USR2 (bit 14)
	TRDYEN	UCR1 (bit 13)	TRDY	USR1 (bit 13)
	TCEN	UCR4 (bit 3)	TXDC	USR2 (bit 3)
interrupt_uart	OREN	UCR4 (bit 1)	ORE	USR2 (bit 1)
	BKEN	UCR4 (bit 2)	BRCD	USR2 (bit 2)
	WKEN	UCR4 (bit 7)	WAKE	USR2 (bit 7)
	ADEN	UCR1 (bit 15)	ADET	USR2 (bit 15)
	ACIEN	UCR3 (bit 0)	ACST	USR2 (bit 11)
	ESCI	UCR2 (bit 15)	ESCF	USR1 (bit 11)
	ENIRI	UCR4 (bit 8)	IRINT	USR2 (bit 8)
	AIRINTEN	UCR3 (bit 5)	AIRINT	USR1 (bit 5)
	AWAKEN	UCR3 (bit 4)	AWAKE	USR1 (bit 4)
	FRAERREN	UCR3 (bit 11)	FRAERR	USR1 (bit 10)
	PARERREN	UCR3 (bit 12)	PARITYERR	USR1 (bit 15)
	RTSDEN	UCR1 (bit 5)	RTSD	USR1 (bit 12)
	RTSEN	UCR2 (bit 4)	RTSF	USR2 (bit 4)
	DTREN (DCE)	UCR3 (bit 13)	DTRF	USR2 (bit 13)
	RI (DTE)	UCR3 (bit 8)	RIDELT	USR2 (bit 10)
	DCD (DTE)	UCR3 (bit 9)	DCDDELT	USR2 (bit 6)
	DTRDEN	UCR3 (bit 3)	DTRD	USR1 (bit 7)
	SADEN	UMCR (bit 3)	SAD	USR1 (bit 3)
dma_req_rx	RXDMAEN	UCR1 (bit 8)	RRDY	USR1 (bit 9)
	ATDMAEN	UCR1 (bit 2)	AGTIM	USR1 (bit 8)
	IDDMAEN	UCR4 (bit 6)	IDLE	USR2 (bit 12)
dma_req_tx	TXDMAEN	UCR1 (bit 3)	TRDY	USR1 (bit 13)

16.2.2.2 Clocks

This section describes clocks and special clocking requirements of the UART.

16.2.2.2.1 Clock requirements

UART module receives 2 clocks, *peripheral_clock* and *module_clock*. The *peripheral_clock* is used as write clock of the TxFIFO, read clock of the RxFIFO and synchronization of the modem control input pins. It must always be running when UART is enabled. There is an exception in stop mode (see Clocking in Low-Power Modes).

The *module_clock* is for all the state machines, writing RxFIFO, reading TxFIFO, etc. It must always be running when UART is sending or receiving characters.This clock is used in order to allow frequency scaling on *peripheral_clock* without changing configuration of baud rate (*module_clock* staying at a fixed frequency).

The constraints on *peripheral_clock* and *module_clock* are as follows:

- *peripheral_clock* and *module_clock* can totally be asynchronous. They can also be synchronous.
- Due to the 16x oversampling of the incoming characters, *module_clock* frequency must always be greater or equal to 16x the maximum baud rate. For example, if max baud rate is 4 Mbit/s, *module_clock* must be greater or equal to 4 M x 16 = 64 MHz.

NOTE

The restriction that *peripheral_clock* frequency must be higher or equal to 16x baud rate has been removed. There is no limitation on *peripheral_clock* frequency to baud rate.

16.2.2.2.2 Maximum Baud Rate

The max baud rate the UART can support is determined by the max frequency of the module_clock.

For example, if the SoC can provide the fastest module_clock 66.5 MHz, the UART can transmit and receive serial data with the maximum baud rate 66.5M/16 = 4.15 Mbit/s.

The UART supports serial IR interface low speed. In the low speed IrDA mode, the max baud rate is 115.2 Kbit/s. To support the 115.2 Kbit/s, module_clock frequency must be higher or equal to 1.8432 MHz.

16.2.2.2.3 Clocking in Low-Power Modes

The UART supports 2 low-power modes: DOZE and STOP.

In STOP mode (input pin *stop_req* is at '1'), the UART doesn't need any clock. In this mode the UART can wake-up the Arm platform with the asynchronous interrupts (see Low Power Modes).

- If before entering in STOP mode the software has enabled RTSDEN interrupt, when RTS will change state (put at '0' by external device started to send), the asynchronous interrupt will wake-up the system, *peripheral_clock* and *module_clock* will be provided to the UART before first start bit, so that no data will be lost.
- If RTS doesn't change state (already at '0' before entering in STOP mode), then wake-up interrupt (AWAKE) will be sent at the arrival of first Start bit (on falling edge). In this case, the UART must receive the *peripheral_clock* and *module_clock* during the first half of start bit to correctly receive this character (for example, at 115.2 Kbit/s, UART must receive *peripheral_clock* and *module_clock* at maximum 4.3 microseconds after falling edge of Start bit). If the UART receives *peripheral_clock* and *module_clock* too late, first character will be lost, and so should be dropped. Also, if autobaud detection is enabled, the first character won't be correctly received and another autobaud detection will need to be initiated.

In Doze mode, UART behavior is programmable through DOZE bit (UCR1[1]). If DOZE bit is set to '1', then UART is disabled in Doze mode, and in consequence, UART clocks can be switched-off (after being sure UART is not transmitting nor receiving). On the contrary, if DOZE bit is set to '0', UART is enabled and it must receive *peripheral_clock* and *module_clock* .

16.2.2.3 General UART Definitions

Definitions of terms that occurs the following discussions are given in this section.

- Bit Time-The period of time required to serially transmit or receive 1 bit of data (1 cycle of the baud rate frequency).
- Start bit-The bit time of a logic 0 that indicates the beginning of a data frame. A start bit begins with a 1-to-0 transition, and is preceded by at least 1 bit time of logic 1.
- Stop bit-1 bit time of logic 1 that indicates the end of a data frame.
- BREAK-A frame in which all of the data bits, including the stop bit, are logic 0. This type of frame is usually sent to signal the end of a message or the beginning of a new message.
- Mark - When no data is being sent, the serial port's transmit pin's voltage is 1 and is said to be in a MARK state.

- Space - The serial port can also be forced to keep the transmit pin at a 0 and is said to be the SPACE or BREAK state.
- Frame-A start bit followed by a specified number of data or information bits and terminated by a stop bit. The number of data or information bits depends on the format specified and must be the same for the transmitting device and the receiving device. The most common frame format is 1 start bit followed by 8 data bits (least significant bit first) and terminated by 1 stop bit. An additional stop bit and a parity bit also can be included.
- Framing Error-An error condition that occurs when the stop bit of a received frame is missing, usually when the frame boundaries in the received bit stream are not synchronized with the receiver bit counter. Framing errors can go undetected if a data bit in the expected stop bit time happens to be a logic 1. A framing error is always present on the receiver side when the transmitter is sending BREAKs. However, when the UART is programmed to expect 2 stop bits and only the first stop bit is received, this is not a framing error by definition.
- Parity Error-An error condition that occurs when the calculated parity of the received data bits in a frame does not match the parity bit received on the RX_DATA input. Parity error is calculated only after an entire frame is received.
- Idle-One in NRZ encoding format and selectable polarity in IrDA mode.
- Overrun Error-An error condition that occurs when the latest character received is ignored to prevent overwriting a character already present in the UART receive buffer (RxFIFO). An overrun error indicates that the software reading the buffer (RxFIFO) is not keeping up with the actual reception of characters on the RX_DATA input.

16.2.2.3.1 RTS_B - UART Request To Send

The UART Request To Send input controls the transmitter. The modem or other terminal equipment signals the UART when it is ready to receive by setting '0' on the RTS_B pin.

Normally, the transmitter waits until this signal is active (low) before transmitting a character, however when the Ignore RTS (IRTS) bit is set, the transmitter sends a character as soon as it is ready to transmit. An interrupt (RTSD) can be posted on any transition of this pin and can wake the Arm platform from STOP mode on its assertion. When RTS_B is set to '1' during a transmission, the UART transmitter finishes transmitting the current character and shuts off. The contents of the TxFIFO (characters to be transmitted) remain undisturbed. The operation of this input is the same regardless of whether the UART is in DTE or DCE mode.

16.2.2.3.2 RTS Edge Triggered Interrupt

The input to the RTS_B pin can be programmed to generate an interrupt on a selectable edge.

See the table below for summary of the operation of the RTS edge triggered interrupt (RTSF).

To enable the RTS_B pin to generate an interrupt, set the request to send interrupt enable (RTSEN) bit (UCR2[4]) to 1. Writing 1 to the RTS_B edge triggered interrupt flag (RTSF) bit (USR2[4]) clears the interrupt flag. The interrupt can occur on the rising edge, falling edge, or either edge of the RTS_B input. The request to send edge control (RTEC) field (UCR2[10:9]) programs the edge that generates the interrupt. When RTEC is set to 0x00 and RTSEN = 1, the interrupt occurs on the rising edge (default). When RTEC is set to 0x01 and RTSEN = 1, the interrupt occurs on the falling edge. When RTEC is set to 0x1X and RTSEN = 1, the interrupt occurs on either edge. This is a synchronous interrupt. The RTSF bit is cleared by writing 1 to it. Writing 0 to RTSF has no effect.

Table 16-4. RTS_B Edge Triggered Interrupt Truth Table

RTS_B	RTSEN	RTEC [1]	RTEC [0]	RTSF	Interrupt Occurs On…	interrupt_uart
X	0	X	X	0	Interrupt disabled	1
1->0	1	0	0	0	Rising edge	1
0->1	1	0	0	1	Rising edge	0
1->0	1	0	1	1	Falling edge	0
0->1	1	0	1	0	Falling edge	1
1->0	1	1	X	1	Either edge	0
0->1	1	1	X	1	Either edge	0

There is another RTS_B interrupt that is not programmable. The status bit RTSD asserts the *interrupt_uart* interrupt when the RTS_B delta interrupt enable = 1. This is an asynchronous interrupt. The RTSD bit is cleared by writing 1 to it. Writing 0 to the RTSD bit has no effect.

16.2.2.3.3 CTS_B - Clear To Send

This output pin serves two purposes. Normally, the receiver indicates that it is ready to receive data by asserting this pin (low). When the CTS_B trigger level is programmed to trigger at 32 characters received and the receiver detects the valid start bit of the 33 character, it de-asserts this pin. The operation of this output is the same regardless of whether the UART is in DTE or DCE mode.

16.2.2.3.4 Programmable CTS_B Deassertion

The CTS_B output can also be programmed to deassert when the RxFIFO reaches a certain level. Setting the CTS trigger level (UCR4[15:10]) at any value less than 32 deasserts the CTS_B pin on detection of the valid start bit of the N + 1 character (where N is the trigger level setting). However, the receiver continues to receive characters until the RxFIFO is full.

16.2.2.3.5 TX_DATA - UART Transmit

This is the transmitter serial output. When operating in RS-232/RS-485 mode, NRZ encoded data is transmitted, and the data can be inverted (controlled by INVT (UCR3[1])) before transmitted. When operating in infrared mode, a 3/16 bit-period pulse is output for each 0 bit transmitted, and no pulse is output for each 1 bit transmitted.

For RS-232/RS-485 applications, this pin must be connected to an RS-232/RS-485 transmitter. The operation of this output is the same regardless of whether the UART is in DTE or DCE mode. See Figure 16-10.

16.2.2.3.6 RX_DATA - UART Receive

This is the receiver serial input. When operating in RS-232/RS-485 mode, NRZ encoded data is expected, and the data can be inverted (controlled by INVR (UCR4[9])) before sampled. When operating in infrared mode, a narrow pulse is expected for each 0 bit received and no pulse is expected for each 1 bit received.

External circuitry must convert the IR signal to an electrical signal. RS-232/RS-485 applications require an external RS-232/RS-485 receiver to convert voltage levels. The operation of this input is the same regardless of whether the UART is in DTE or DCE mode. See the figure below.

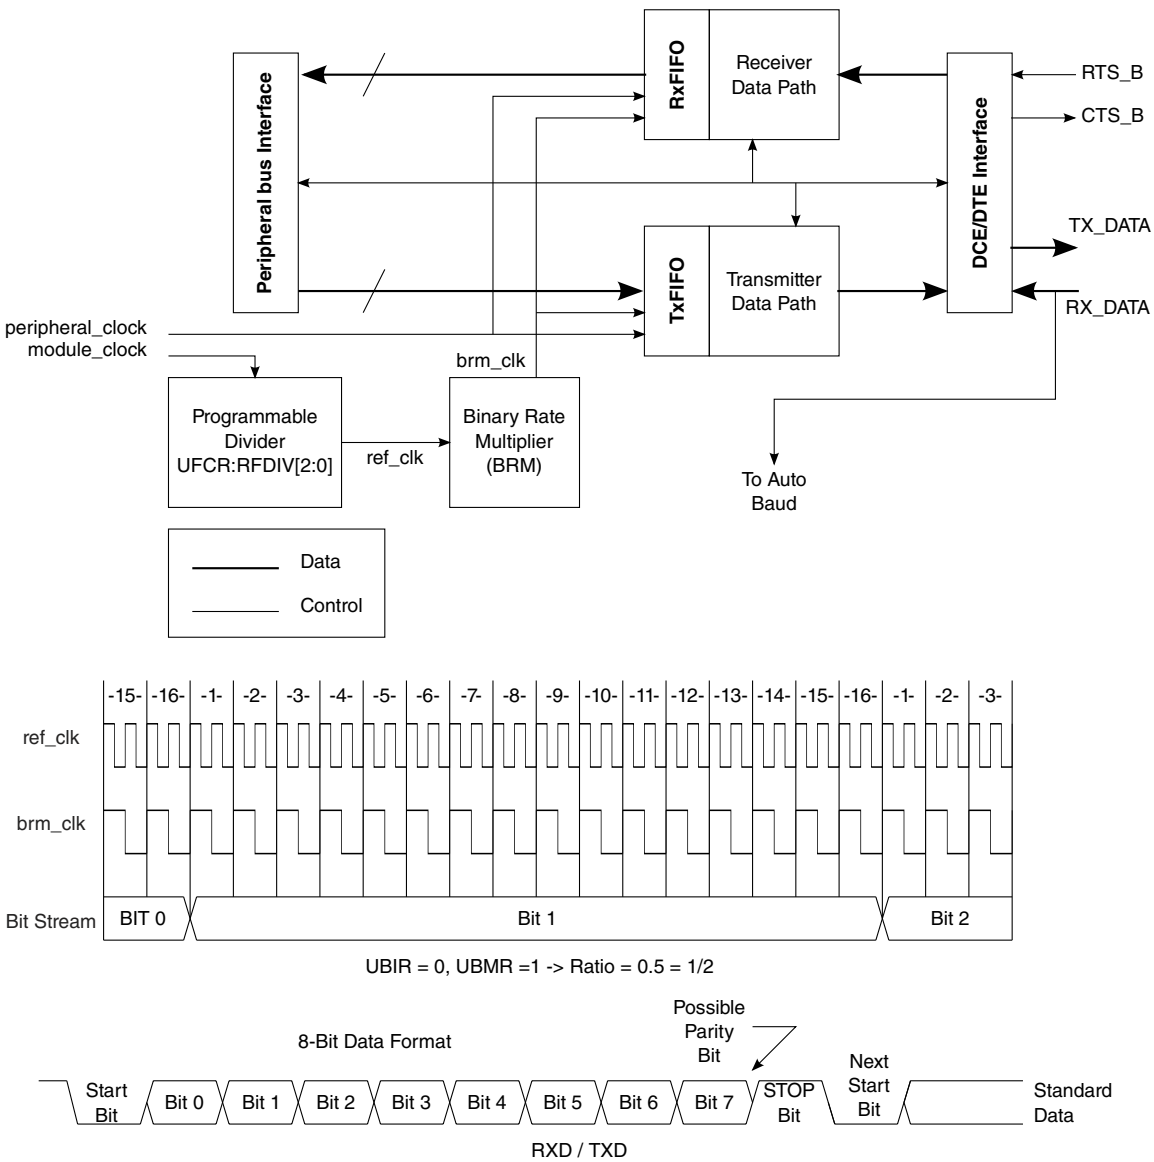

Figure 16-10. UART Simplified Block and Clock Generation Diagrams

16.2.2.4 Transmitter

The transmitter accepts a parallel character from the Arm platform and transmits it serially. The start, stop, and parity (when enabled) bits are added to the character.

When the ignore RTS bit (IRTS) is set, the transmitter sends a character as soon as it is ready to transmit. RTS_B can be used to provide flow-control of the serial data. When RTS_B is set to '1', the transmitter finishes sending the character in progress (if any), stops, and waits for RTS_B to be set to '0' again. Generation of BREAK characters and parity errors (for debugging purposes) is supported. The transmitter operates from the clock provided by the Binary Rate Multiplier(BRM). Normal NRZ encoded data is transmitted when the IR interface is disabled.

The transmitter FIFO (TxFIFO) contains 32 bytes. The data is written to TxFIFO by writing to the UTXD register with the byte data to the [7:0] bits. The data is written consecutively if the TxFIFO is not full. It is read (internally) consecutively if the TxFIFO is not empty. TXFULL bit (UTS[4]) can be used to control whether TXFIFO is full or not. The TxFIFO can be written regardless of the transmitter is disabled or enabled. If the UART is disabled, user can still write data into the TxFIFO correctly. But in this case the write access will yield to a transfer error.

16.2.2.4.1 Transmitter FIFO Empty Interrupt Suppression

The transmitter FIFO empty interrupt suppression logic suppresses the TXFE interrupt between writes to the TxFIFO.

When TxFIFO is empty, the software can either send one or several characters. If the software sends one character, it would write the character into the UTXD register, then that character is immediately transferred to the transmitter shift register, assuming the transmitter is already enabled. Without interrupt suppression logic, the TXFE interrupt flag would be set immediately. But, with this logic, the interrupt flag is set when the last bit of the character has been transmitted, for example, before the transmission of the parity bit (if exists) and the stop bit(s).

So, the suppression logic doesn't immediately send the TXFE interrupt flag. It allows the software to write another character to the TxFIFO before the interrupt flag is asserted.

When the transmitter shift register empties before another character is written to the TxFIFO, the interrupt flag is asserted. Writing data to the TxFIFO would release the interrupt flag. The interrupt flag is asserted on the following conditions:

- System Reset
- UART software reset

- When a single character has been written to Transmitter FIFO and then the Transmitter FIFO and the Transmitter Shift Register become empty until another character is written to the Transmitter FIFO
- The last character in the TxFIFO is transferred to the shift register, when TxFIFO contains two or more characters. See the figure below.

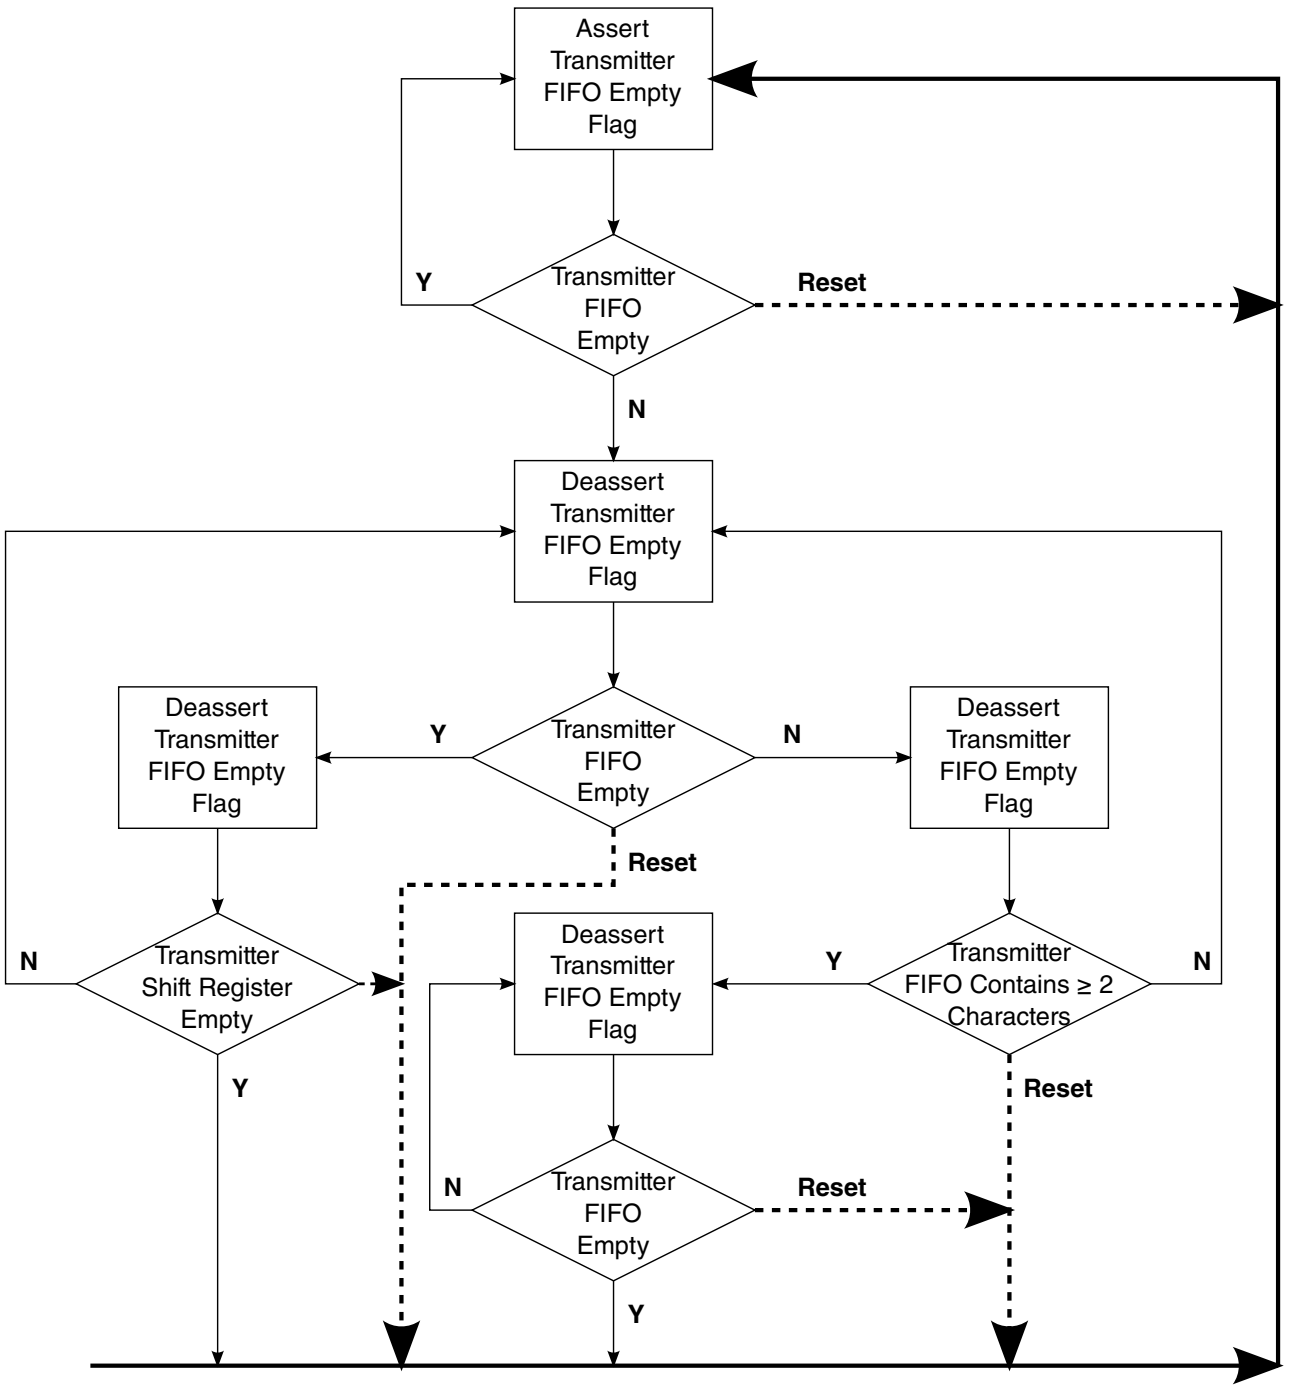

Figure 16-11. Transmitter FIFO Empty Interrupt Suppression Flow Chart

16.2.2.4.2 Transmitting a Break Condition

Asserting SNDBRK bit of the UCR1 Register forces the transmitter to send a break character (continuous zeros). The transmitter will finish sending the character in progress (if any) before sending break until this bit is reset.

The user is responsible to ensure that this bit is high for long enough to generate a valid BREAK. The transmitter samples SNDBRK after every bit is transmitted. Following completion of the BREAK transmission, the UART will transmit two mark bits. The user can continue to fill the FIFO and any character remaining will be transmitted when the break is terminated.

16.2.2.5 Receiver

See the figure below for the receiver flow chart.

The receiver accepts a serial data stream and converts it into parallel characters. When enabled, it searches for a start bit, qualifies it, and samples the following data bits at the bit-center.

Jitter tolerance and noise immunity are provided by sampling at a 16x rate and using voting techniques to clean up the samples. Once the start bit is found, the data bits, parity bit (if enabled), and stop bits (either 1 or 2 depending on user selection) are shifted in. Parity is checked and its status reported in the URXD register when parity is enabled. Frame errors and BREAKs are also checked and reported. When a new character is ready to be read by the Arm platform from the RxFIFO, the receive data ready (RDR = USR2[0]) bit is asserted and an interrupt is posted (if DREN = UCR4[0] = 1). If the receiver trigger level is set to 2 (RXTL[5:0] = UFCR[5:0] = 2), and 2 chars have been received into RxFIFO, the receiver ready interrupt flag (RRDY = USR1[9]) is asserted and an interrupt is posted if the receiver ready interrupt enable bit is set (RRDYEN = UCR1[9] = 1). If the UART Receiver Register (URXD) is read once, and in consequence there is only 1 character in the RxFIFO, the interrupt generated by the RDR bit is automatically cleared. The RRDY bit is cleared when the data in the RxFIFO falls below the programmed trigger level.

Normal NRZ encoded data is expected when the IR interface is disabled. The RxFIFO contains 32 half-word entries. Characters received are written consecutively into this FIFO. If the FIFO is full and a 33rd characters is received, this character will be ignored and the USR2[ORE] bit will be set.

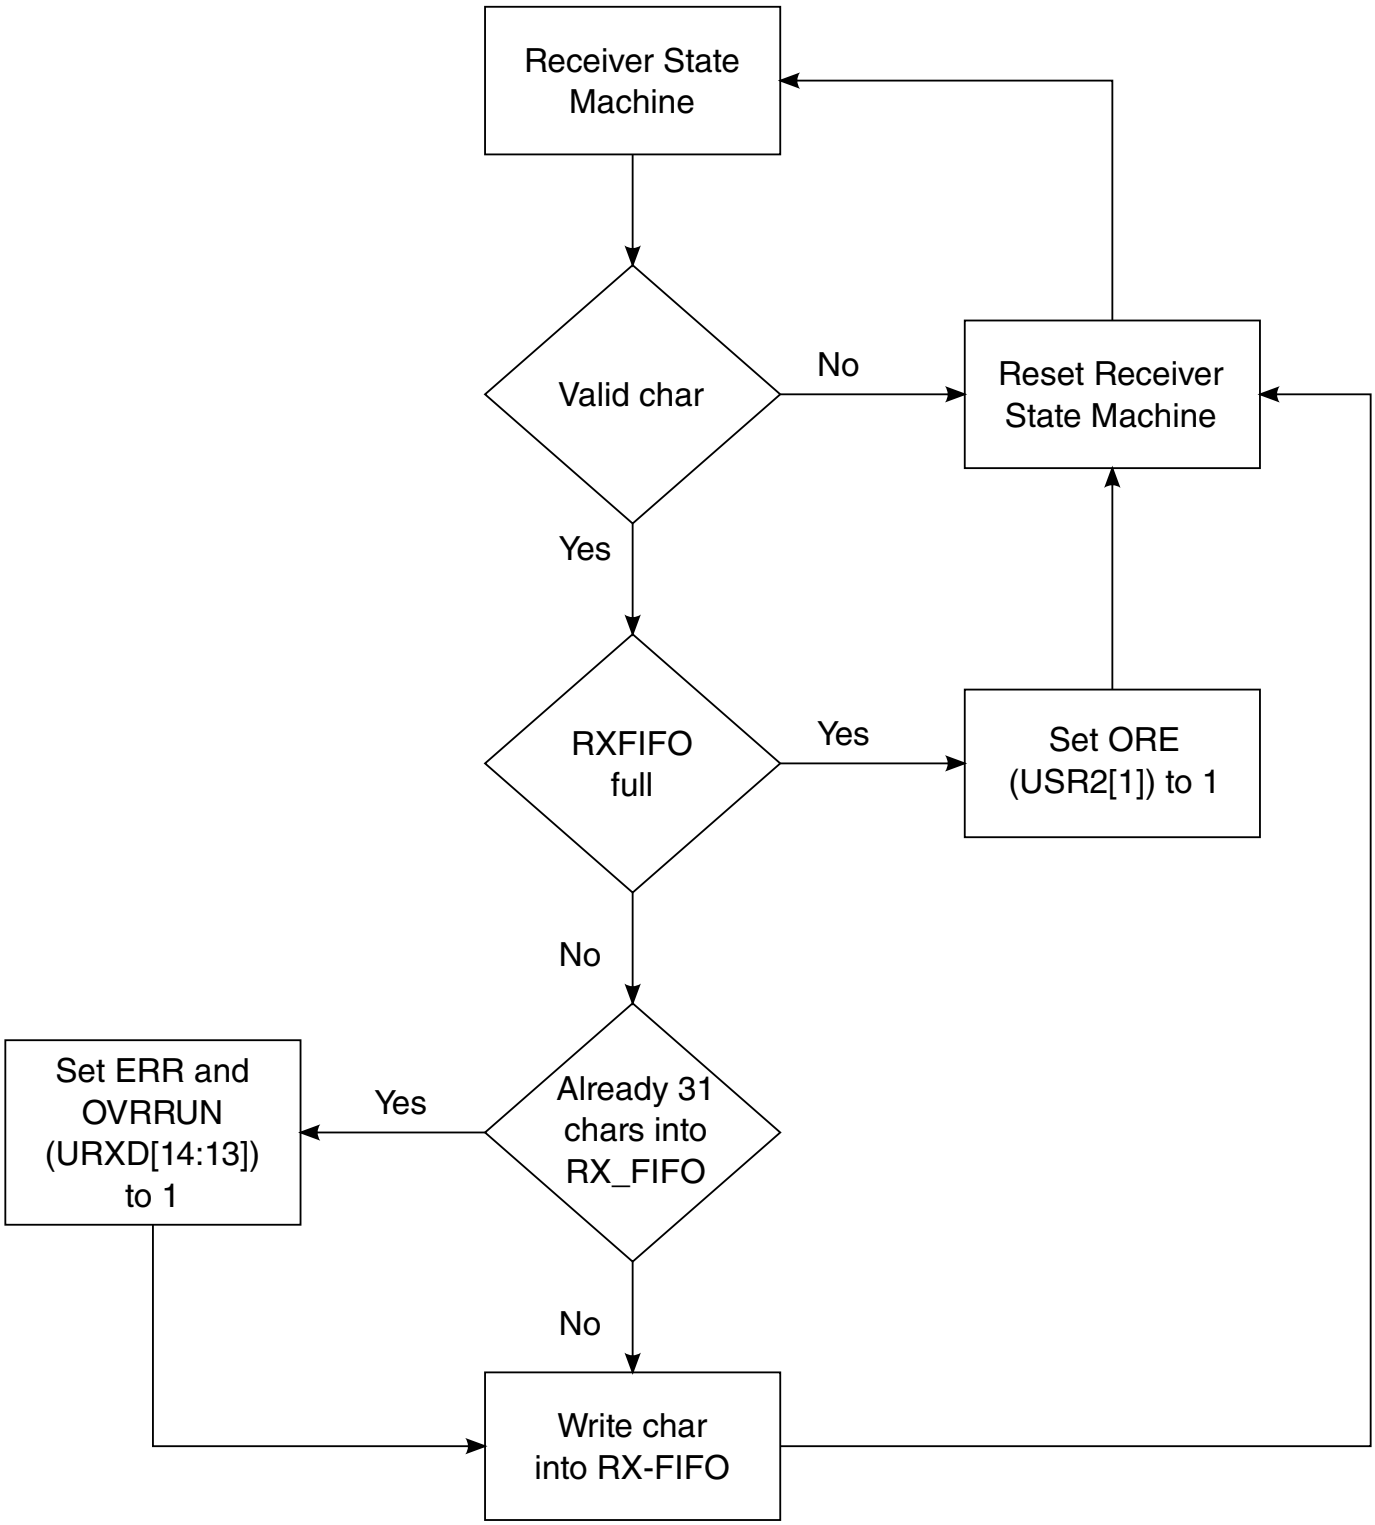

Figure 16-12. Receiver Flow Chart

16.2.2.5.1 Idle Line Detect

The receiver logic block includes the ability to detect an idle line. Idle lines indicate the end or the beginning of a message.

For an idle condition to occur:

- RxFIFO must be empty and
- RX_DATA pin must be idle for more than a configured number of frames (ICD[1:0] = UCR1[11:10]).

When the idle condition detected interrupt enable (IDEN = UCR1[12]) is set and the line is idle for 4 (default), 8, 16, or 32 (maximum) frames, the detection of an idle condition flags an interrupt (see the table below). When an idle condition is detected, the IDLE (USR2[12]) bit is set. Clear the IDLE bit by writing 1 to it. Writing 0 to the IDLE bit has no effect.

Table 16-5. Detection Truth Table

IDEN	ICD [1]	ICD [0]	IDLE	*interrupt_uart*
0	X	X	0	1
1	0	0	asserted after 4 idle frames	asserted after 4 idle frames
1	0	1	asserted after 8 idle frames	asserted after 8 idle frames
1	1	0	asserted after 16 idle frames	asserted after 16 idle frames
1	1	1	asserted after 32 idle frames	asserted after 32 idle frames
NOTE: This table assumes that no other interrupt is set at the same time this interrupt is set for the *interrupt_uart* signal. This table shows how this interrupt affects the *interrupt_uart* signal.				

During a normal message there is no idle time between frames. When all of the information bits in a frame are logic 1s, the start bit ensures that at least one logic 0 bit time occurs for each frame so that the IDLE bit is not asserted.

16.2.2.5.2 Aging Character Detect

The receiver block also includes the possibility to detect when at least one character has been sitting into the RxFIFO for a time corresponding to 8 characters. This aging character capability allows the UART to inform the Arm platform that there is less character into the RxFIFO than the Rx trigger and, no new character has been detected on the RXD line.

The aging capability is a timer which starts to count as soon as the RxFIFO is not empty and its trigger level is not reached (RRDY=0). This counter is reset when either a RxFIFO read is performed or another character starts to present on the RXD line. If none of those two events occurs, the bit AGTIM (USR1[8]) is set when the counter has

measured a time corresponding to 8 characters. AGTIM is cleared by writing a 1 to it. AGTIM can flag an interrupt to Arm platform on *interrupt_uart* if ATEN (UCR2[3]) has been set.

To summarize, AGTIM is set when:

- There is at least one character into RxFIFO.
- No read has occurred on RxFIFO and RXD line has stayed high, for a time corresponding to 8 characters.
- The RxFIFO trigger is not reached (RRDY=0)

16.2.2.5.3 Receiver Wake

The WAKE bit (USR2[7]) is set when the receiver detects a qualified Start bit. For this, two conditions must be fulfilled, firstly a falling edge on RX_DATA line must be detected and secondly the RX_DATA line must stays at low level for more than a half-bit duration.

When the wake interrupt enable WKEN (UCR4[7]) bit is enabled, the receiver flags an interrupt (*interrupt_uart*) if the WAKE status bit is set. The WAKE bit is cleared by writing 1 to it. Writing 0 to the WAKE bit has no effect. The WAKE status bit can be asserted in either serial RS-232 mode or IR mode. The generation of the WAKE interrupt needs the clock *module_clock* .

When the asynchronous wake interrupt (AWAKE) is enabled (AWAKEN = UCR3[4] = 1), and the Arm platform is in STOP mode, and UART clocks have been shut-off, then a falling edge detected on the receive pin (RX_DATA) asserts the AWAKE bit (USR1[4]) and the *interrupt_uart* interrupt to wake the Arm platform from STOP mode. Re-enable UART clocks and clear the AWAKE bit by writing 1 to it. Writing 0 to the AWAKE bit has no effect. When IR interface is enabled (UCR1[7]=1), the AWAKE bit is always not asserted. The generation of the asynchronous AWAKE interrupt does not need any clocks.

In IR mode, if the asynchronous IR WAKE interrupt is enabled (AIRINTEN = UCR3[5] = 1), and if the Arm platform is in STOP mode (UART clocks are off when Arm platform in STOP mode), then the detection of a falling edge on the receive pin (RXD_IR), asserts the AIRINT bit (USR1[5]), and the *interrupt_uart* interrupt. This interrupt wakes the Arm platform from STOP mode. Software re-enables UART clocks and clear the AIRINT bit by writing 1 to it. Writing 0 to the AIRINT bit has no effect. When IR interface is disabled (UCR1[7]=0), the AIRINT bit is always not asserted. The generation of the asynchronous AIRINT interrupt does not need any clocks.

Recommended procedure for programming the asynchronous interrupts is to first clear them by writing 1 to the appropriate bit in the UART Status Register 1 (USR1). Poll or enable the interrupt for the Receiver IDLE Interrupt Flag (RXDS) in the USR1. When asserted, the RXDS bit indicates to the software that the receiver state machine is in the idle state, the next state is idle, and the RX_DATA pin is idle (high). After following this procedure, enable the asynchronous interrupt and enter STOP mode.

16.2.2.5.4 Receiving a BREAK Condition

A BREAK condition is received when the receiver detects all 0s (including a 0 during the bit time of the stop bit) in a frame. The BREAK condition asserts the BRCD bit (USR2[2]) and writes only the first BREAK character to the RxFIFO. Clear the BRCD bit by writing 1 to it. Writing 0 to the BRCD bit has no effect.

Asserting BRCD would generate an interrupt on *interrupt_uart*. The interrupt generation can be masked using the control bit BKEN (UCR4[2]). Receiving a break condition will also effect the following bits in the receiver register URXD:

URXD(11) = BRK. While high this bit indicates that the current char was detected as a break.

URXD(12) = FRMERR. The frame error bit will always be set when BRK is set.

URXD(10) = PRERR. If odd parity was selected the parity error bit will also be set when BRK is set.

URXD(14) = ERR. The error detect bit indicates that the character present in the rx data field has an error status. This can be asserted by a break.

16.2.2.5.5 Vote Logic

The vote logic block provides jitter tolerance and noise immunity by sampling with respect to a 16x clock (*brm_clk*) and using voting techniques to clean up the samples. The voting is implemented by sampling the incoming signal constantly on the rising edge of the *brm_clk*.

See Figure 16-13. The receiver is provided with the majority vote value, which is 2 out of the 3 samples. For examples of the majority vote results of the vote logic, see the following table.

Table 16-6. Majority Vote Results

Samples	Vote
000	0

Table continues on the next page...

Table 16-6. Majority Vote Results (continued)

Samples	Vote
101	1
001	0
111	1

The vote logic captures a sample on every rising edge of *brm_clk*, however the receiver uses 16x oversampling to take its value in the middle of the sample character.

The receiver starts to count when the Start bit is set however it does not capture the contents of the RxFIFO at the time the Start bit is set. The start bit is validated when 0s are received for 7 consecutive 1/16 of bit times following the 1-to-0 transition. Once the counter reaches 0xF, it starts counting on the next bit and captures it in the middle of the sampling frame (see Table 16-6). All data bits are captured in the same manner. Once the stop bit is detected, the receiver shift register (SIPO_OUT) data is parallel shifted to the RxFIFO.

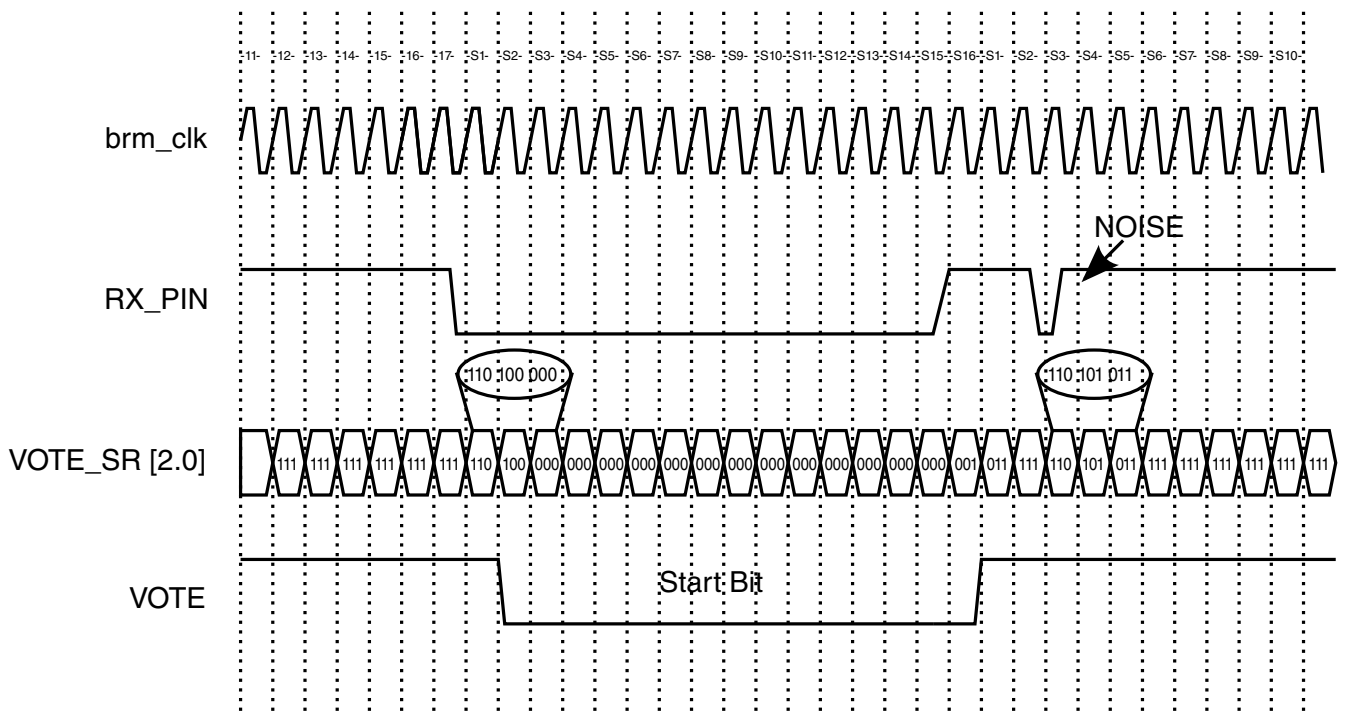

Figure 16-13. Majority Vote Results

A new feature has been recently implemented, it allows to re-synchronize the counter on each edge of RX_DATA line. This is automatic and allows to improve the immunity of UART against signal distortion.

There is a special case when the *brm_clk* frequency is too low and is unable to capture a 0 pulse in IrDA. In this case, the software must set the IRSC (UCR4[5]) bit so that the reference clock (after internal divider) is used for the voting logic. The pulse is validated by counting the length of the pulse.

Refer to Infrared Interface for more details.

16.2.2.5.6 Baud Rate Automatic Detection Logic

When the baud rate automatic detection logic is enabled, the UART locks onto the incoming baud rate. To enable this feature, set the automatic detection of baud rate bit (ADBR = UCR1[14] = 1) and write 1 to the ADET bit (USR2[15]) to clear it.

When ADET=0 and ADBR =1, the detection starts. Then, once the beginning of start bit (transition from 1-to-0 of RX_DATA) has been detected, UART starts a counter (UBRC) working at reference frequency. Once the end of start bit is detected (transition from 0-to-1 of RX_DATA), the value of UBRC - 1 is directly copied into UBMR register. UBIR register is filled with 0x000F.

So, at the end of start bit, registers gets following values:

```
UBRC = number of reference clock periods (after divider) during Start bit.
UBIR = 0x000F
UBMR = UBRC - 1
```

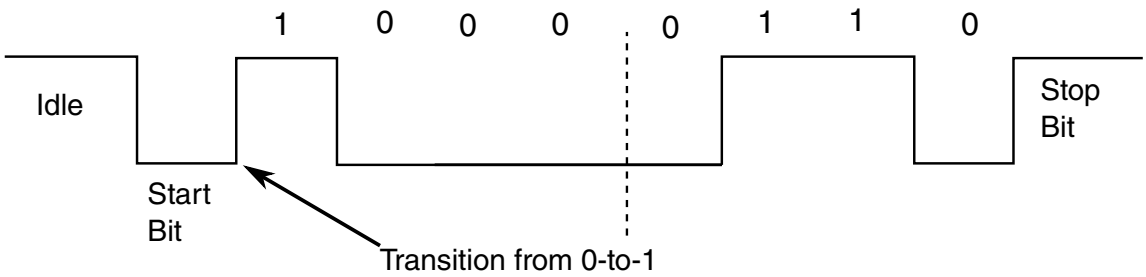
The updated values of the 3 registers can be read.

See Table 16-7 for list of parameters for baud rate detection and Figure 16-14 for baud rate detection protocol diagram.

If any of the UART BRM registers are simultaneously written by the baud rate automatic detection logic and by the peripheral data bus, the peripheral data bus would have lower priority.

Table 16-7. Baud Rate Automatic Detection

ADBR	ADET	Baud Rate Detection	*interrupt_uart*
0	X	Manual Configuration	1
1	0	Auto Detection Started	1
1	1	Auto Detection Complete	0
NOTE: This table assumes that no other interrupt is set at the same time this interrupt is set for the *interrupt_uart* signal.			



Note: LSB Transmitted first.

Figure 16-14. Baud Rate Detection Protocol Diagram

16.2.2.5.6.1 Baud Rate Automatic Detection Protocol

The receiver must receive an ASCII character "A" or "a" to verify proper detection of the incoming baud rate. When an ASCII character "A" (0x41) or "a" (0x61) is received and no error occurs, the Automatic Detect baud rate bit is set (ADET=1) and if the interrupt is enabled (ADEN=UCR1[15]=1), an interrupt *interrupt_uart* is generated.

When an ASCII character "A" or "a" is not received (because of a bit error or the reception of another character), the auto detection sequence restarts and waits for another 1-to-0 transition.

As long as ADET = 0 and ADBR = 1, the UART continues to try to lock onto the incoming baud rate. Once the ASCII character "A" or "a" is detected and the ADET bit is set, the receiver ignores the ADBR bit and continues normal operation with the calculated baud rate.

The UART interrupt is active (*interrupt_uart* = 0) as long as ADET = 1 and ADBR = 1. This can be disabled by clearing the automatic baud rate detection interrupt enable bit (ADEN = 0). Before starting an automatic baud rate detection sequence, set ADET = 0 and ADBR = 1.

The RxFIFO must contain the ASCII character "A" or "a" following the automatic baud rate detection interrupt.

The 16-bit UART Baud Rate Count Register (UBRC) is reset to 4 and stays at 0xFFFF when an overflow occurs. The UBRC register counts (measures) the duration of start bit. When the start bit is detected and counted, the UART Baud Rate Count Register retains its value until the next automatic baud rate detection sequence is initiated.

The Baud Rate Count Register counts only when auto detection is enabled.

16.2.2.5.6.2 New Baud Rate Determination

In order to fight against the problems caused by the distortion and the noise on the RX_DATA line, the duration of the baud rate measurement has been extended.

Previously, as described above, this determination was based on the measurement of the START bit duration. Now, this measurement is based on the duration of START bit + bit0. Bit0 is the first bit following the START bit. In fact, the counter which is started at the falling edge of START bit is no longer stopped at next rising edge (end of START bit), but it is stopped at the next falling edge (end of bit0). As the character sent is always a "A" (41h) or a "a" (61h), this second falling edge will always be present and it will indicate the end of bit0. Once this counter is stopped, the result is divided by 2 and used by the BRM to determine the incoming baud rate.

NOTE

UBRC register contains the result of this division by two, in consequence it reflects the measurement of the duration of one bit.

16.2.2.5.6.2.1 New Autobaud Counter Stopped bit and Interrupt

A new bit has been added in USR2 register: ACST (USR2[11]). This bit is set immediately after the determination of the baud rate.

So,

- if ADNIMP is not set (default), ACST is set to 1 after the end of bit0,
- If ADNIMP is set to 1, ACST is set to 1 at the end of START bit.

If ACIEN (UCR3[0]) is set to 1, ACST will flag an interrupt on *interrupt_uart* signal. This interrupt informs the Arm platform that the BRM has just been set with the result of the bit length measurement. If needed, the Arm platform can perform a read of UBMR (or UBRC) register and determine by itself the baud rate measured. Then the Arm platform has the possibility to correct the BRM registers with the nearest standardized baud rate.

NOTE

ACST is set only if ADBR is set to 1, for example, the UART is autobauding.

Clear the ACST bit by writing 1 to it. Writing 0 to the ACST bit has no effect.

16.2.2.6 Escape Sequence Detection

An escape sequence typically consists of 3 characters entered in rapid succession (such as +++). Because these are valid characters by themselves, the time between characters determines if it is a valid escape sequence.

Too much time between two of the "+" characters is interpreted as two "+" characters, and not part of an escape sequence.

The software chooses the escape character and writes its value to the UART Escape Character Register (UESC). The software must also enable escape detection feature by setting ESCEN (UCR2[11]) to 1. The hardware compares this value to incoming characters in the RxFIFO. When an escape character is detected, the internal escape timer starts to count. The software specifies a time-out value for the maximum allowable time between 2 successive escape characters (see the table below). The escape timer is programmable in intervals of 2 ms to a maximum interval of 8.192 seconds.

Table 16-8. Escape Timer Scaling

UTIM Register	Maximum Time Between Specified Escape Characters
0x000	2 ms
0x001	4 ms
0x002	6 ms
0x003	8 ms
0x004	10 ms
...	...
0F8	498 ms
0F9	500 ms
...	...
9C3	5 s
...	...
FFD	8.188 s
FFE	8.190 s
FFF	8.192 s
NOTE: To calculate the time interval: (UTIM_Value + 1) x 0.002 = Time_Interval Example: (09C3 + 1) x 0.002 = 5 s.	

The escape sequence detection feature is available for all the reference frequencies. Before using Escape Sequence Detection, the user must fill the ONEMS register. This 24-bit register must contain the value of the UART internal frequency divided by 1000. The internal frequency is obtained after the UART internal divider which is applied on *module_clock* clock.

Example I:

- If the input clock *module_clock* frequency is 66.5 MHz.
- And if the input clock *module_clock* is divided by 2 with the internal divider: UFCR[9:7] = 3'b100

$$ONEMS = \frac{66.5 \times 10^6}{2 \times 1000} = 33250 = 81E2h$$

Figure 16-15. Calculation of Frequency for ONEMS Register

Example II:

- If the input clock *module_clock* frequency is 66.5 MHz.
- And if the input clock *module_clock* is divided by 1with the internal divider: UFCR[9:7] = 3'b101

$$ONEMS = \frac{66.5 \times 10^6}{1000} = 66500 = 103C4h$$

Figure 16-16. Calculation of Frequency for ONEMS Register

The escape sequence detection interrupt is asserted when the escape sequence interrupt enable (ESCI) bit is set and an escape sequence is detected (ESCF set). Clear the ESCF bit by writing 1 to it. Writing 0 to the ESCF bit has no effect.

16.2.3 Binary Rate Multiplier (BRM)

The BRM sub-block receives *ref_clk* (*module_clock* clock after divider). From this clock, and with integer and non-integer division, BRM generates a 16x baud rate clock .

The UART transmitte will shift data out based on this 16x baud rate clock. The UART receiver will sample the serial data line based on this 16x baud rate clock. The input and output frequency ratio is programmed in the UART BRM Incremental Register (UBIR) and UART BRM MOD Register (UBMR). The output frequency is divided by the input frequency to produce this ratio. For integer division, set the UBIR = 0x000F and write the divisor to the UBMR register. All values written to these registers must be one less than the actual value to eliminate division by 0 (undefined), and to increase the maximum range of the registers.

Updating the BRM registers requires writing to both registers. The UBIR register must be written before writing to the UBMR register. If only one register is written to by the software, the BRM continues to use the previous values.

The following examples show how to determine what values are to be programmed into UBIR and UBMR for a given reference frequency and desired baud rate. The following equation can be used to help determine these values:

$$\text{BaudRate} = \frac{\text{Ref Freq}}{\left(16 \times \frac{\text{UBMR} + 1}{\text{UBIR} + 1} \right)}$$

Figure 16-17. Frequency and Baud Rate for UBIR and UBMR

With:

Reference Frequency (Hz): UART Reference Frequency (*module_clock* after RFDIV divider)

Baud Rate (bit/s): Desired baud rate.

Integer Division ÷ 21

Reference Frequency = 19.44 MHz

UBIR = 0x000F

UBMR = 0x0014

Baud Rate = 925.7 kbit/s

NOTE

Observe that each value written to the registers is one less than the actual value.

Non-Integer Division

```
Reference Frequency = 16 MHz
Desired Baud Rate = 920 Kbits/s
```

$$\frac{UBMR + 1}{UBIR + 1} = \frac{RefFreq}{16 \times BaudRate} = \frac{16 \times 10^6}{16 \times 920 \times 10^3} = 1.087$$

```
Ratio = 1.087 = 1087 / 1000
UBIR = 999 (decimal)= 0x3E7
UBMR = 1086 (decimal)= 0x43E
Non-Integer Division
Reference Frequency = 25 MHz
Desired Baud Rate = 920 kbit/s
Ratio = 1.69837 = 625 / 368
UBIR = 367 (decimal)= 0x16F
UBMR = 624 (decimal)= 0x270
```

Non-Integer Division

```
Reference Frequency: 30 MHz
Desired Baud Rate = 115.2 kbit/s
Ratio = 16.276043 = 65153 / 4003
UBIR = 4002 (decimal) = 0x0FA2
UBMR = 65152 (decimal) = 0xFE80
```

16.2.4 Infrared Interface

16.2.4.1 Generalities-Infrared

The Infrared interface is selected when IREN (UCR1[7]) is set to 1.

The Infrared Interface is compatible with IrDA Serial Infrared Physical Layer Specification. In this specification, a "zero" is represented by a positive pulse, and a "one" is represented by no pulse (line remains low).

In the UART:

In TX: For each "zero" to be transmitted, a narrow positive pulse which is 3/16 of a bit time is generated. For each "one" to be transmitted no pulse is generated (output is low). External circuitry has to be provided to drive an Infrared LED.

In RX: When receiving, a narrow negative pulse is expected for each "zero" transmitted while no pulse is expected for each "one" transmitted (input is high).

NOTE

Rx part of IR block expects to receive an inverted signal compared to IrDA specification. Circuitry external to the IC transforms the Infrared signal to an electrical signal.

The IR interface has an edge triggered interrupt (IRINT). This interrupt validates a zero bit being received. This interrupt is enabled by writing a "one" to ENIRI bit.

The behavior of Infrared Interface is determined by 3 bits INVT (UCR3[1]), INVR (UCR4[9]) and IRSC (UCR4[5]).

16.2.4.2 Inverted Transmission and Reception bits (INVT & INVR)

The values of INVT and INVR depend of the IrDA transceiver connected on the TXD_IR and RXD_IR pins of the UART. If this transceiver is not inverting on both paths Tx and Rx, a Zero is represented by a positive pulse and a One is represented by no pulse (line remains low). In this case, the bit INVT must be set to 0 and the bit INVR must be set to 1 (because Rx IR block expects an inverted signal).

On the contrary user must set INVT=1 and INVR=0 if both paths of the transceiver are inverting, that is, a Zero is represented as a negative pulse and a One is represented by no pulse (line remains high). The transceiver can also be inverting on only one path (Tx or Rx), in this case INVT and INVR must be together equal to 1 or to 0, depending on which path is inverted.

16.2.4.3 InfraRed Special Case (IRSC) Bit

The value to apply to IRSC bit is based on 2 parameters: the baud rate and the Minimum Pulse Duration (MPD) of the transceiver.

According to IrDA Standard Specification, for SIR (Serial IR) baud rates from 2.4 Kbit/s to 115.2 Kbit/s this nominal pulse duration is equal to 3/16 of a bit duration (at the selected baud rate). But, for all the baud rates a Minimum Pulse Duration is also specified. According to IrDA Standard, a Zero is represented by a light pulse, so the IrDA transceiver can't emit a light pulse shorter than the MPD. For SIR, the MPD is constant and equal to 1.41 µs.

But user must take into account the electrical MPD associated with the transceiver on the receiver path. Typically this value is 2.0 µs, but for some manufacturers MPD can go down to 1.0 µs.

In order to understand the meaning of IRSC bit, one must understand how the RX path works in IrDA mode.

When the UART is in IrDA mode, a Zero is not only detected by the state of the RXD_IR line, but also with the duration of the pulse. This pulse duration can be measured with 2 different clocks. In this case, clock is selected with the IRSC bit.

- If IRSC = 0, the clock used is the BRM clock.
- If IRSC = 1, the clock used is the UART internal clock (UART clock after the divider (RFDIV)).

In normal operation, IRSC=0. This means that at any time, the user must ensure that the frequency of BRM_clock is high enough to measure the pulse. The pulse must last at least 2 BRM clock cycles. If this condition is not fulfilled, IRSC must be set to 1.

Let's examine two examples, for a Minimum Pulse Duration equal to the MPD from the IrDA SIR specification (i.e., 1.41 µs).

1: Calculation of BRM Clock Period (Clock Period < 1.41 µs)

The user wants to receive IrDA data at 115.2 Kbit/s. The UBIR and UBMR registers are set in order to create the BRM_clock with a frequency of 16*baud rate = 16 * 115.2K = 1.843 MHz. But at the same time, in order to correctly detect the pulse, the user must be sure that 2* BRM_clock period is lower than 1.41 µs. Lets check:

BRM_clock period = 1/1843000 = 542 ns

So 2*BRM_clock period = 1.09 µs < 1.41 µs. It is fine.

2: Calculation of BRM Clock Period (Clock Period > 1.41 µs)

This time the user wants to receive at 19.2 Kbit/s. So, the BRM_clock is set to 16*19200 = 307.2 kHz. Let's check if 2* BRM_clock period < 1.41 µs:

1. BRM_clock period =1/307200 = 3.25 µs

   So 2*BRM_clock period = 6.50 µs >> 1.41 µs. It doesn't work.

   So, in this case, the BRM clock can't be used to measure the pulse duration and the user must select the UART internal clock by setting IRSC =1.

NOTE

Like for Escape character detection, when IR Special Case is enabled (IRSC=1), the UART must measure a duration. In order to do that, the user must fill the ONEMS register. Refer to Escape Sequence Detection.

16.2.4.4 IrDA interrupt

Serial infrared mode (SIR) uses an edge triggered interrupt flag IRINT (USR2[8]). When INVR =0, detection of a falling edge on the RXD pin asserts the IRINT bit. When INVR=1, detection of a rising edge on the RXD pin asserts the IRINT bit. When IRINT and ENIRI bits are both asserted, the *interrupt_uart* interrupt is asserted. Clear the IRINT bit by writing 1 to it. Writing 0 to the IRINT bit has no effect.

16.2.4.5 Conclusion about IrDA

Before using the UART in IrDA, the baud rate limit must be calculated. This baud rate limit will inform the user if IRSC bit has to be set or not.

Let's determine this limit:

As already described, if IRSC = 0, the following condition must always be fulfilled

$$2 \times BRMClockPeriod < MinPulseDuration$$

Figure 16-18. Calculation of Baud Rate

So,

$$BRMClockFrequency > \frac{2}{MPD}$$

So, knowing BRM_clock frequency = 16 * Baud Rate, we get:

$$BaudRate > \frac{1}{8 \times MinPulseDuration}$$

So, the user needs to set IRSC = 0 when:

- If Minimum Pulse Duration = 2.5 us and Baud Rate > 50 Kbit/s.
- If Minimum Pulse Duration = 2.0 us and Baud Rate > 62.5 Kbit/s.
- If Minimum Pulse Duration = 1.41 us and Baud Rate > 88.6 Kbit/s.

NOTE

For baud rates lower than the limit, IRSC must be set to1.

16.2.4.6 Programming IrDA Interface

16.2.4.6.1 High Speed

As an example, the following sequence can be used to program the IrDA interface in order to send and receive characters at 115.2 Kbit/s.

Assumptions:

- Input UART clock = 90 MHz
- Internal clock divider = 3 (divide Input UART clock by 3)
- Baud rate = 115.2 Kbit/s
- IrDA transceiver is not inverting on both channels: for Tx and Rx, a Zero is represented by a positive pulse, and a One is represented by no pulse (line stays low).
- Interrupt: Sent to Arm platform when 1 char is received into the Rx FIFO (RDR)

Registers values and Programming orders:

```
UCR1 = 0x0085
UCR1[7] = IREN = 1: Enable IR interface
UCR1[0] = UARTEN = 1: Enable UART
UTS = 0x0000
UFCR = 0x0981
TXTL[5:0] = 0x02: Default value
RFDIV[2:0] = 0x3: Divide Input UART clock by 3 (resulting internal clock  is 30 MHz)
RXTL[5:0] = 0x01: Default value
UBIR = 0x0202
UBMR = 0x20BE Baud rate = 115.2 kbit/s with internal clock = 30 MHz
UCR2 = 0x4027
UCR2[14] = IRTS = 1: Ignore level of RTS input signal
UCR2[5] = WS = 1: Characters are 8-bit length
UCR2[2] = TXEN = 1: Enable Rx path
UCR2 [1] = RXEN = 1: Enable Tx path
UCR2[0] = SRST_B = 1: No software reset
UCR3 = 0x0000

         UCR4 = 0x8201
CTSTL[5:0] = 0x20: Default value
UCR4[9] = INVR = 1: Inverted Infrared Reception (because IrDA transceiver is not inverting)
UCR4[1] = DREN = 1: To enable RDR interrupt (sent when one char is received)
```

The UART is ready to send a character as soon as there is a write into UTXD register. And an interrupt will be sent to Arm platform when a character is received.

16.2.4.6.2 Low Speed

This time, we keep the same assumptions but the speed is now 9.6 Kbit/s. So, this baud rate is below the limit (even with a Min. Pulse Duration of 2.5 us) and thus IRSC must be set to 1.

Assumptions:

- Input UART clock = 90 MHz
- Internal clock divider = 3 (divide Input UART clock by 3)
- Baud rate = 9.6 Kbit/s
- IrDA transceiver is not inverting on both channels: for Tx and Rx, a Zero is represented by a positive pulse, and a One is represented by no pulse (line stays low).
- Interrupt: Sent to Arm platform when 1 char is received into the Rx FIFO (RDR).

Registers values and Programming orders:

```
UCR1 = 0x0085
UCR1[7] = IREN = 1: Enable IR interface
UCR1[0] = UARTEN = 1: Enable UART
UFCR = 0x0981
UFCR[15:10] = TXTL[5:0] = 0x02: Default value
RFDIV[2:0] = 0x3: Divide Input UART clock by 3 (resulting internal clock  is 30 MHz)
UFCR[5:0] = RXTL[5:0] = 0x01: Default value
UBIR = 0x00FF
UBMR = 0xC354 Baud rate = 9.6 kbit/s with internal clock = 30 MHz
UCR2 = 0x4027
UCR2[14] = IRTS = 1: Ignore level of RTS input signal
UCR2[5] = WS = 1: Characters are 8-bit length
UCR2[2] = TXEN = 1: Enable Rx path
UCR2 [1] = RXEN = 1: Enable Tx path
UCR2[0] = SRST_B = 1: No software reset
UCR3 = 0x0000
UCR3[1] = INVT = 0: Positive pulse represents 0.
UCR4 = 0x8221
UCR4[15:10] = CTSTL[5:0] = 0x20: Default value
UCR4[9] = INVR = 1: Inverted Infrared Reception (because IrDA transceiver is not inverting)
UCR4[5] = IRSC = 1: Because data rate is below the limit and thus the UART internal clock is
used to measure the pulse duration.
UCR4[1] = DREN = 1: To enable RDR interrupt (sent when one char is received)
```

The UART is now ready to send a character as soon as there is a write into UTXD register. An interrupt will be sent to Arm platform when a character is received.

16.2.5 9-bit RS-485 Mode

16.2.5.1 Generalities

The UART provides a 9-bit mode to facilitate multidrop (RS-485) network communication. To enable this mode, set MDEN bit in the UMCR register to 1. When 9-bit RS-485 mode is enabled, UART transmitter can transmit the ninth bit (9^{th} bit) set by TXB8, and UART receiver can differentiate between data frames (9^{th} bit = 0) and address frames (9^{th} bit = 1).

The CTS_B pin can be used to control RS-485 output driver outside the chip.

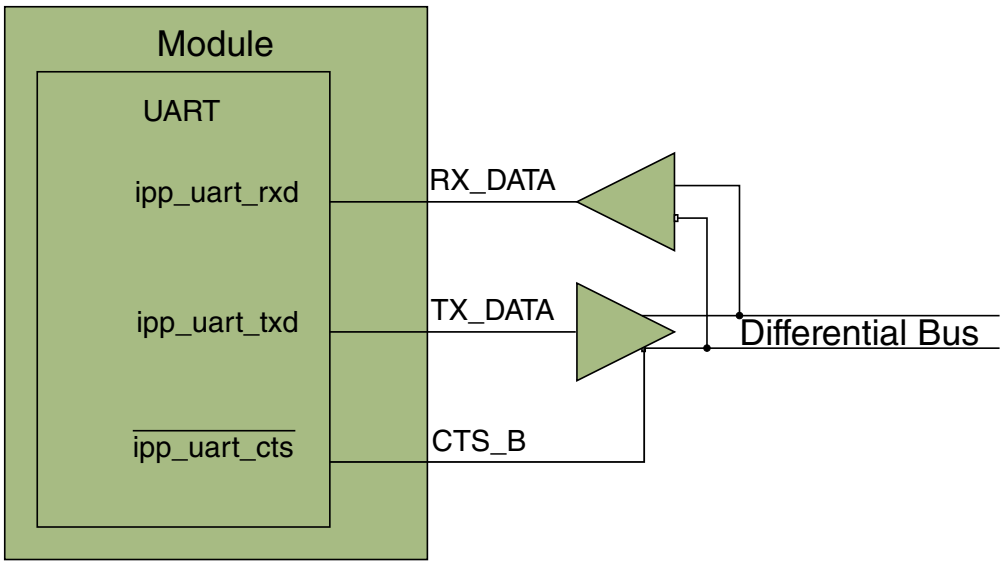


Figure 16-19. RS-485 driver connection (UART in DCE mode)

16.2.5.2 Transmit 9-bit RS-485 frames

To transmit 9-bit RS-485 frames, user need to enable parity (PREN=1) to enable trasmitting the ninth data bit, set 8-bit data word size (WS=1), and write TXB8 (UMCR[2]) as the 9th bit (bit [8]) to be transmitted (write '0' to TXB8 to transmit a data frame, write '1' to transmit a address frame). The other data bit [7:0] is written to TxFIFO by writing to the UTXD same as normal RS-232 operation.

16.2.5.3 Receive 9-bit RS-485 frames

To receive 9-bit RS-485 frames, user need to enable parity (PREN=1) to enable receiving the ninth data bit, set 8-bit data word size (WS=1). The receiver will save the 9-bit data to RxFIFO, and user should read the 9th databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX_DATA (URXD[7:0]).

There are two slave address detect modes, normal detect mode and automatic detect mode, and can be selected by SLAM (UMCR[1]).

16.2.5.3.1 RS-485 Slave Address Normal Detect Mode

To enable Normal Detect mode, clear SLAM (UMCR[1] to 0). The receiver ignores all data frames (9th bit = 0) until an address frame is received (9th bit = 1). At that time, the slave address detected (SAD = USR1[3]) bit is asserted and the *interrupt_uart* interrupt is

generated (if SADEN = UMCR[3] = 1). The address byte and sebsequent bytes are all put into RxFIFO along with their 9th bit. The UART will also generate DMA request *dma_req_rx* when the RxFIFO reaches the selected threshold (controlled by RXTL) if receive ready DMA (RXDMAEN = UCR1[8]) request is enabled.

User should read the 9th databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX_DATA (URXD[7:0]).

In this mode, once the UART has detected a 9th bit is equal to '1', it will always save the subsequent frames to RxFIFO. So the software must decide whether the address and data in RxFIFO are needed or not.

16.2.5.3.2 RS-485 Slave Address Automatic Detect Mode

To enable Automatic Detect Mode, set SLAM (UMCR[1]) to 1. The receiver tries to detect an address byte (frame 9th bit = 1) that matches the programmed SLADDR (UMCR[15:8]) character. If the received byte is a data or an address byte that does not match the programmed SLADDR character, the receiver will discard these data.

Once the UART receives a matching address byte, it will assert the slave address detected (SAD = USR1[3]) bit and the *interrupt_uart* interrupt will be generated (if SADEN = UMCR[3] = 1). The address byte and sebsequent bytes are all put into RxFIFO along with their 9th bit. If receive ready DMA(RXDMAEN = UCR1[8]) request is enabled, the UART will also generate DMA request *dma_req_rx* when the RxFIFO reaches the selected threshold (controlled by RXTL).

If another address byte is received and this address byte does not match SLADDR character, the receiver will discard the address byte and subsequent data byte. If the address byte again matches SLADDR character, the receiver will put this address byte and subsequent data byte in the RxFIFO along with their 9th bit.

User should read the 9th databit (bit [8]) by reading the PRERR (URXD[10]) bit, and read data bit [7:0] by reading the RX_DATA (URXD[7:0]).

See Initialization for 9-bit RS-485 programming guide.

16.2.6 Low Power Modes

These modes are controlled by the signals *doze_req* and *stop_req*. The control/status/data registers won't change when getting in/out of low power modes.

Table 16-9. UART Low Power State Operation

	Normal State (*doze_req* = 1'b0 & *stop_req* = 1'b0)	Doze State (*doze_req* = 1'b1)		Stop State (*stop_req* = 1'b1)
		DOZE bit = 0	DOZE bit = 1	
UART-Clock	ON	ON	ON	OFF
UART Serial / IrDA	ON	ON	OFF	OFF

16.2.6.1 UART Operation in System Doze Mode

While in Doze State (when *doze_req* input pin is set to 1'b1), the UART behavior depends on the DOZE (UCR1[1]) control bit.

While the DOZE bit is negated, the UART serial interface is enabled. While the system is in the Doze State, and the DOZE bit is asserted, the UART is disabled. If the Doze State is entered with the DOZE bit asserted while the UART serial interface was receiving or transmitting data, it will complete the receive/transmit of the current character and signal to the far-end transmitter/receiver to stop sending/receiving.

16.2.6.2 UART Operation in System Stop Mode

The internal baud rate clocks of the transmitter and receiver are gated off if the *stop_req* signal to UART is asserted. Even though the clocks at the input of the UART continue to run during system Stop mode, the UART will not do any transmission or reception.

The following UART interrupts wake the Arm platform processor from STOP mode:

- RTS (RTSD)
- IrDA Asynchronous WAKE (AIRINT)
- Asynchronous WAKE (AWAKE)
- RI (RIDELT in DTE mode only)
- DCD (DCDDELT in DTE mode only)
- DTR (DTRD in DCE mode only)
- DSR (DTRD in DTE mode only)

When an asynchronous WAKE (awake) interrupt exits the Arm platform from STOP mode, make sure that a dummy character is sent first because the first character may not be received correctly.

16.2.6.3 Power Saving Method in UART

The RXEN (UCR2[1]), TXEN (UCR2[2]) and UARTEN (UCR1[0]) bits are set by the user and provide software control of low-power modes.

Setting the UARTEN (UCR1[0]) bit to 0 shuts off the receiver and transmitter logic and the associated clocks.

If the UART is used only in transmit mode, UARTEN and TXEN must be set to 1. If the UART is used only in receive mode, UARTEN and RXEN must be set to 1. Setting TXEN or RXEN to 0 allows to save a lot of power.

16.2.7 UART Operation in System Debug State

The bit UTS [11] controls whether the UART will respond to the input signal *debug_req*, or whether it will continue to run as normal.

If the UART is programmed to respond to *debug_req*:

1. The UART will halt all operations upon detecting the *debug_req* input.
2. A transfer in progress, either to/from a core (using the IP Bus interface) or to/from an external device, will be completed before halting. This means a single byte/word transfer, not an entire FIFO. Reception of any further data from an external device will be disabled.
3. Internal registers will continue to be writable and readable using the IP Bus interface. A read will leave the contents unaffected.
4. The RX FIFO is affected in debug mode in the following way:
   - All writes into the RX FIFO are prevented.
   - The bit RXDBG (UTS[9]) is used to select the readability of the RX FIFO during debug mode:

     RXDBG = 0: hold the read pointer at the location it had upon entering debug mode, and URXD register returns only the data value at that location, no matter how many reads attempted.

RXDBG = 1, selectable at any time: Allow to read the characters received in Rx FIFO. It will not be possible to re-read previously read locations, nor will it be possible to readjust the read pointer to the value it had prior to entering debug mode.

16.2.8 Reset

This section describes how to reset the block and explains special requirements related to reset.

16.2.8.1 Hardware reset

All of registers, FIFOs, state machines and sequential elements can be reset to their initial values by hardware reset or power on reset.

16.2.8.2 Software reset

The status registers USR1 and USR2, BRM registers UBIR and UBMR, TxFIFO and RxFIFO, and transmitter and receiver state machines can be reset by software reset. Internal logic will keep the software reset asserted for about 4 *module_clock* cycles.

Programmer can follow the following software reset sequence:

1. Clear the SRST_B bit (UCR2[0])
2. Wait for software reset complete: poll SOFTRST bit (UTS[0]) until it is 0.
3. Re-program baud rate registers: Re-write UBIR and UBMR.

16.2.9 Transfer Error

The UART can generate a transfer error on the peripheral bus in the following cases:

- Core is writing into a read-only register.
- Core is accessing (read or write) an unused location within the assigned address space reserved to UART.
- Core is writing into UTXD register with transmit interface disabled (TXEN=0 or UARTEN=0)
- Core is reading URXD register with receive interface disabled (RXEN=0 or UARTEN=0)

16.2.10 Functional Timing

This section includes timing diagrams for functional signaling.

16.2.10.1 IrDA Mode

According to IrDA specification, the low speed (115.2Kbit/s and below) IR frame format is compatible with UART frame.

In this figure, an example data 0x65 is used.

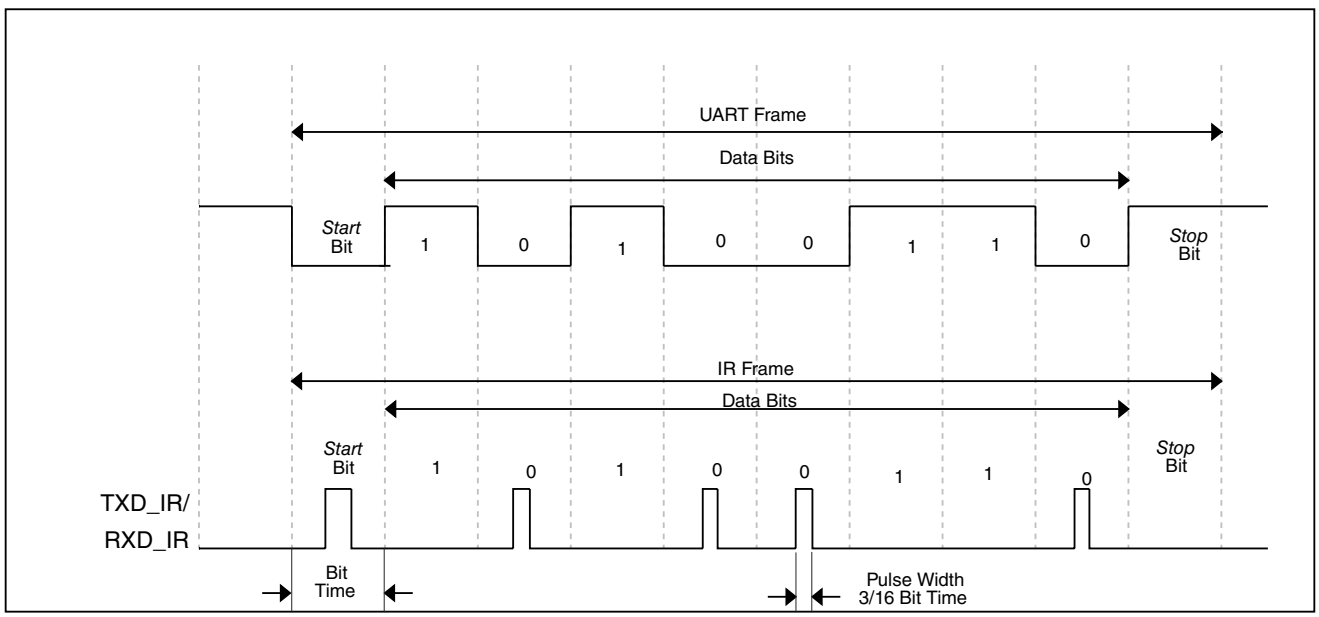

Figure 16-20. Timing diagram of Low Speed IR (<=115.2 Kbit/s) Data Line

16.2.11 Initialization

16.2.11.1 Programming the UART in RS-232 mode

As an example, the following sequence can be used to program the UART in order to send and receive characters in RS-232 mode.

Assumptions:

- Input uart clock = 100 MHz
- Baud rate = 921.6 Kbps

- Data bits = 8 bits
- Parity = Even
- Stop bits = 1 bit
- Flow control = Hardware

Main program:

1. UCR1 = 0x0001

   Enable the UART.

2. UCR2 = 0x2127

   Set hardware flow control, data format and enable transmitter and receiver.

3. UCR3 = 0x0704

   Set UCR3[RXDMUXSEL] = 1.

4. UCR4 = 0x7C00

   Set CTS trigger level to 31,

5. UFCR = 0x089E

   Set internal clock divider = 5 (divide input uart clock by 5). So the reference clock is 100 MHz/5 = 20 MHz.

   Set TXTL = 2 and RXTL = 30.

6. UBIR = 0x08FF
7. UBMR = 0x0C34

   In the above two steps, set baud rate to 921.6Kbps based on the 20MHz reference clock.

8. UCR1 = 0x2201

   Enable the TRDY and RRDY interrupts.

9. UMCR = 0x0000

   UMCR stay at default value 0x0000

Interrupt service routine for the transmitter:

- Write characters into UTXD

The TRDY interrupt will be automatically de-asserted when the data level of the TxFIFO exceeds the TXTL=2. Note: For the first time the interrupt may be de-asserted after 4 characters are written into the TxFIFO because of the shift register.

Interrupt service routine for the receiver:

- Read characters from URXD

The RRDY interrupt will be automatically de-asserted when the data level of the RxFIFO is below the RXTL=30.

16.2.11.2 Programming the UART in 9-bit RS-485 mode

As an example, the following sequence can be used to program the UART in order to send and receive frames in RS-485 mode.

Assumptions:

- Input uart clock = 100 MHz
- Baud rate = 5 Mbps

Main program:

1. UCR1 = 0x0001

   Enable the UART.

2. UCR2 = 0x4127

   Set software flow control ($\overline{\text{CTS}}$ pin is controlled by UCR2[12]), enable parity(enable 9^{th} bit rxd/txd), 8-bit word size , and enable transmitter and receiver.

3. UCR4 = 0x7C00

   Set CTS trigger level to 31,

4. UFCR = 0x0A9E

   Set RFDIV = 5 (divide input uart clock by 1), so the reference clock is 100 MHz. Set UART in DCE mode (RS-485 driver connection outside the chip is the same as Figure 16-19)

   Set TXTL = 2 and RXTL = 30.

5. UBIR = 0x0003
6. UBMR = 0x0004

   In the above two steps, set baud rate to 5 Mbps based on the 100 MHz reference clock.

7. UCR1 = 0x2001 when UART as a master ,

   or UCR1 = 0x0201 (or 0x0101) when UART as a slave.

Enable TRDY interrupt when UART as a master, enable RRDY interrupt or DMA request when UART as a slave.

8. UMCR = 0xA50B

   Enable 9-bit RS-485 mode, enable SAD interrupt, set automatic slave address detect mode, set slave address is 0xA5.

Interrupt service routine for the transmitter:

- Transmit data: write its ninth bit (bit[8]) to UMCR[2], write its bit [7:0] into UTXD[7:0]

The TRDY interrupt will be automatically de-asserted when the data level of the TxFIFO exceeds the TXTL=2.

Note: For the first time the interrupt may be de-asserted after 4 characters are written into the TxFIFO because of the shift register.

Interrupt service routine for the receiver:

- Receive data: read its ninth bit (bit[8]) from URXD[10] , read its bit [7:0] from URXD[7:0].

Note: in RS-485 mode, URXD[10] bit is not the parity error, instead it holds the ninth bit (bit[8]) of the received data.

The SAD interrupt can not de-assert automatically, it needs MCU write 1 to USR1[3] to clear it . The RRDY interrupt or DMA request will be automatically de-asserted when the data level of the RxFIFO is below the RXTL=30.

16.2.13 UART Memory Map/Register Definition

UART supports 8-bit, 16-bit and 32-bit accesses to 32-bit memory-mapped addresses. Any access to unmapped memory location will yield a transfer error.

All registers except the ONEMS described in this section are 16-bit registers. The ONEMS register is a 24-bit register.

- For 32-bit write accesses, the upper two bytes will not be taken into account.
- For 32-bit read accesses the upper two bytes will return 0.

The ONEMS register is expanded from 16 bits to 24 bits in order to support the high frequency of the BRM internal clock *ref_clk* (*module_clock* after divider). The ONEMS register can be accessed as 8 bits, 16 bits or 32 bits.

- For 32-bit write accesses, the most significant byte of the ONEMS will be discarded.
- For 32-bit read accesses, the most significant byte of the ONEMS will be read as 0.

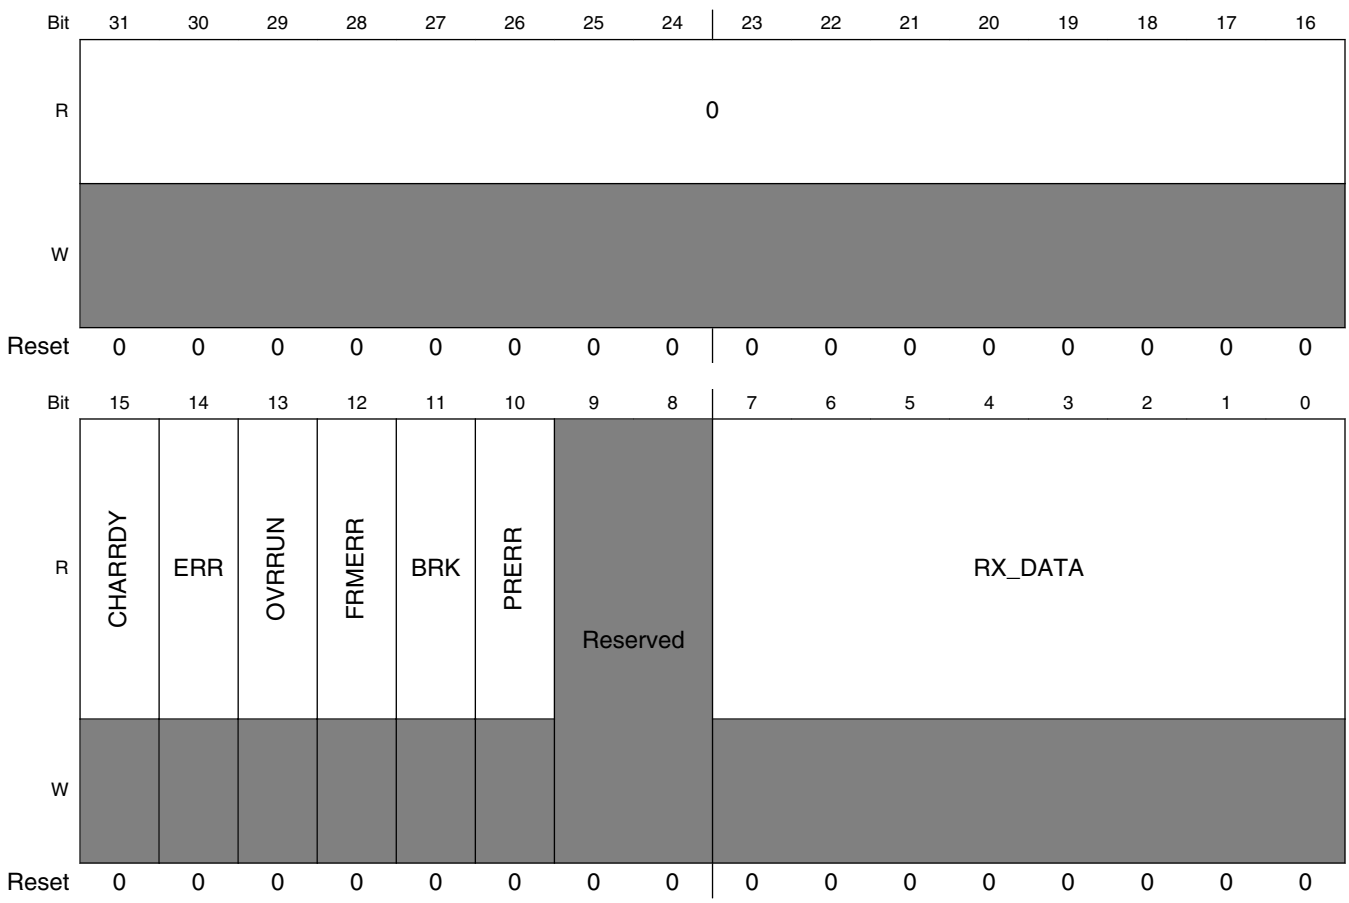
16.2.13.1 UART Receiver Register (UARTx_URXD)

NOTE

The UART will yield a transfer error on the peripheral bus when core is reading URXD register with receive interface disabled (RXEN=0 or UARTEN=0).

Address: Base address + 0h offset



UARTx_URXD field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 CHARRDY	Character Ready. This read-only bit indicates an invalid read when the FIFO becomes empty and software tries to read the same old data. This bit should not be used for polling for data written to the RX FIFO. 0 Character in RX_DATA field and associated flags are invalid. 1 Character in RX_DATA field and associated flags valid and ready for reading.

Table continues on the next page...

UARTx_URXD field descriptions (continued)

Field	Description
14 ERR	**Error Detect.** Indicates whether the character present in the RX_DATA field has an error (OVRRUN, FRMERR, BRK or PRERR) status. The ERR bit is updated and valid for each received character. 0 No error status was detected 1 An error status was detected
13 OVRRUN	**Receiver Overrun.** This read-only bit, when HIGH, indicates that the corresponding character was stored in the last position (32nd) of the Rx FIFO. Even if a 33rd character has not been detected, this bit will be set to '1' for the 32nd character. 0 No RxFIFO overrun was detected 1 A RxFIFO overrun was detected
12 FRMERR	**Frame Error.** Indicates whether the current character had a framing error (a missing stop bit) and is possibly corrupted. FRMERR is updated for each character read from the RxFIFO. 0 The current character has no framing error 1 The current character has a framing error
11 BRK	**BREAK Detect.** Indicates whether the current character was detected as a BREAK character. The data bits and the stop bit are all 0. The FRMERR bit is set when BRK is set. When odd parity is selected, PRERR is also set when BRK is set. BRK is valid for each character read from the RxFIFO. 0 The current character is not a BREAK character 1 The current character is a BREAK character
10 PRERR	**In RS-485 mode, it holds the ninth data bit (bit [8]) of received 9-bit RS-485 data** **In RS232/IrDA mode, it is the Parity Error flag**. Indicates whether the current character was detected with a parity error and is possibly corrupted. PRERR is updated for each character read from the RxFIFO. When parity is disabled, PRERR always reads as 0. 0 = No parity error was detected for data in the RX_DATA field 1 = A parity error was detected for data in the RX_DATA field
9–8 -	This field is reserved. **Reserved**
RX_DATA	**Received Data**. Holds the received character. In 7-bit mode, the most significant bit (MSB) is forced to 0. In 8-bit mode, all bits are active.

16.2.13.2 UART Transmitter Register (UARTx_UTXD)

NOTE

The UART will yield a transfer error on the peripheral bus when core is writing into UART_URXD register with transmit interface disabled (TXEN=0 or UARTEN=0).

Memory space between UART_URXD and UART_UTXD registers is reserved. Any read or write access to this space will be considered as an invalid access and yield a transfer error.

Address: Base address + 40h offset

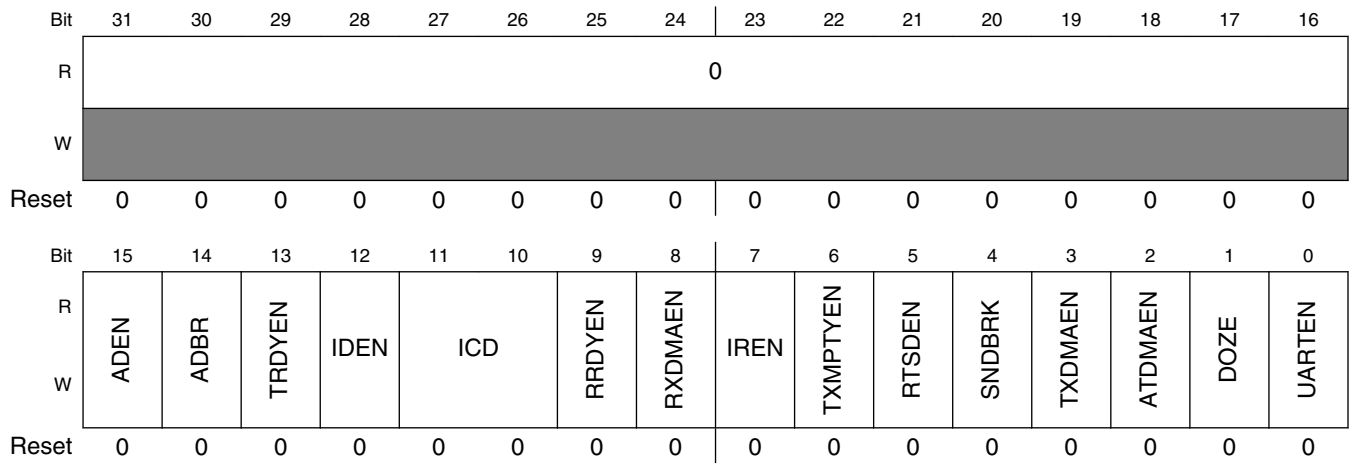
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																0								TX_DATA							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

UARTx_UTXD field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 Reserved	This read-only field is reserved and always has the value 0.
TX_DATA	**Transmit Data**. Holds the parallel transmit data inputs. In 7-bit mode, D7 is ignored. In 8-bit mode, all bits are used. Data is transmitted least significant bit (LSB) first. A new character is transmitted when the TX_DATA field is written. The TX_DATA field must be written only when the TRDY bit is high to ensure that corrupted data is not sent.

16.2.13.3 UART Control Register 1 (UARTx_UCR1)

Address: Base address + 80h offset



UARTx_UCR1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ADEN	**Automatic Baud Rate Detection Interrupt Enable**. Enables/Disables the automatic baud rate detect complete (ADET) bit to generate an interrupt (*interrupt_uart* = 0). 0 Disable the automatic baud rate detection interrupt 1 Enable the automatic baud rate detection interrupt
14 ADBR	**Automatic Detection of Baud Rate**. Enables/Disables automatic baud rate detection. When the ADBR bit is set and the ADET bit is cleared, the receiver detects the incoming baud rate automatically. The ADET flag is set when the receiver verifies that the incoming baud rate is detected properly by detecting an ASCII character "A" or "a" (0x41 or 0x61). 0 Disable automatic detection of baud rate 1 Enable automatic detection of baud rate
13 TRDYEN	**Transmitter Ready Interrupt Enable**. Enables/Disables the transmitter Ready Interrupt (TRDY) when the transmitter has one or more slots available in the TxFIFO. The fill level in the TXFIFO at which an interrupt is generated is controlled by TxTL bits. When TRDYEN is negated, the transmitter ready interrupt is disabled. **NOTE:** An interrupt will be issued as long as TRDYEN and TRDY are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TRDY interrupt. 0 Disable the transmitter ready interrupt 1 Enable the transmitter ready interrupt
12 IDEN	**Idle Condition Detected Interrupt Enable**. Enables/Disables the IDLE bit to generate an interrupt (*interrupt_uart* = 0). 0 Disable the IDLE interrupt 1 Enable the IDLE interrupt

Table continues on the next page...

UARTx_UCR1 field descriptions (continued)

Field	Description
11–10 ICD	**Idle Condition Detect**. Controls the number of frames RXD is allowed to be idle before an idle condition is reported. 00 Idle for more than 4 frames 01 Idle for more than 8 frames 10 Idle for more than 16 frames 11 Idle for more than 32 frames
9 RRDYEN	**Receiver Ready Interrupt Enable**. Enables/Disables the RRDY interrupt when the RxFIFO contains data. The fill level in the RxFIFO at which an interrupt is generated is controlled by the RXTL bits. When RRDYEN is negated, the receiver ready interrupt is disabled. 0 Disables the RRDY interrupt 1 Enables the RRDY interrupt
8 RXDMAEN	**Receive Ready DMA Enable**. Enables/Disables the receive DMA request *dma_req_rx* when the receiver has data in the RxFIFO. The fill level in the RxFIFO at which a DMA request is generated is controlled by the RXTL bits. When negated, the receive DMA request is disabled. 0 Disable DMA request 1 Enable DMA request
7 IREN	**Infrared Interface Enable**. Enables/Disables the IR interface. See the IR interface description in Infrared Interface, for more information. Note: MDEN(UMCR[0]) must be cleared to 0 when using IrDA interface. See Table 16-2 0 Disable the IR interface 1 Enable the IR interface
6 TXMPTYEN	**Transmitter Empty Interrupt Enable**. Enables/Disables the transmitter FIFO empty (TXFE) interrupt. *interrupt_uart*. When negated, the TXFE interrupt is disabled. **NOTE:** An interrupt will be issued as long as TXMPTYEN and TXFE are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TXFE interrupt. 0 Disable the transmitter FIFO empty interrupt 1 Enable the transmitter FIFO empty interrupt
5 RTSDEN	**RTS Delta Interrupt Enable**. Enables/Disables the RTSD interrupt. The current status of the RTS_B pin is read in the RTSS bit. 0 Disable RTSD interrupt 1 Enable RTSD interrupt
4 SNDBRK	**Send BREAK**. Forces the transmitter to send a BREAK character. The transmitter finishes sending the character in progress (if any) and sends BREAK characters until SNDBRK is reset. Because the transmitter samples SNDBRK after every bit is transmitted, it is important that SNDBRK is asserted high for a sufficient period of time to generate a valid BREAK. After the BREAK transmission completes, the UART transmits 2 mark bits. The user can continue to fill the TxFIFO and any characters remaining are transmitted when the BREAK is terminated. 0 Do not send a BREAK character 1 Send a BREAK character (continuous 0s)
3 TXDMAEN	**Transmitter Ready DMA Enable**. Enables/Disables the transmit DMA request *dma_req_tx* when the transmitter has one or more slots available in the TxFIFO. The fill level in the TxFIFO that generates the *dma_req_tx* is controlled by the TXTL bits.

Table continues on the next page...

UARTx_UCR1 field descriptions (continued)

Field	Description
	NOTE: A DMA request will be issued as long as TXDMAEN and TRDY are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the transmit DMA request. 0 Disable transmit DMA request 1 Enable transmit DMA request
2 ATDMAEN	**Aging DMA Timer Enable**. Enables/Disables the receive DMA request *dma_req_rx* for the aging timer interrupt (triggered with AGTIM flag in USR1[8]). 0 Disable AGTIM DMA request 1 Enable AGTIM DMA request
1 DOZE	**DOZE**. Determines the UART enable condition in the DOZE state. When *doze_req* input pin is at '1', (the Arm Platform executes a doze instruction and the system is placed in the Doze State), the DOZE bit affects operation of the UART. While in the Doze State, if this bit is asserted, the UART is disabled. See the description in Low Power Modes. 0 The UART is enabled when in DOZE state 1 The UART is disabled when in DOZE state
0 UARTEN	**UART Enable**. Enables/Disables the UART. If UARTEN is negated in the middle of a transmission, the transmitter stops and pulls the TXD line to a logic 1. UARTEN must be set to 1 before any access to UTXD and URXD registers, otherwise a transfer error is returned. This bit can be set to 1 along with other bits in this register. There is no restriction to the sequence of programing this bit and other control registers. 0 Disable the UART 1 Enable the UART

16.2.13.4 UART Control Register 2 (UARTx_UCR2)

Address: Base address + 84h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
R	0															
W																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R W	ESCI	IRTS	CTSC	CTS	ESCEN	RTEC		PREN	PROE	STPB	WS	RTSEN	ATEN	TXEN	RXEN	SRST
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

UARTx_UCR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ESCI	**Escape Sequence Interrupt Enable**. Enables/Disables the ESCF bit to generate an interrupt. 0 Disable the escape sequence interrupt 1 Enable the escape sequence interrupt
14 IRTS	**Ignore RTS Pin**. Forces the RTS input signal presented to the transmitter to always be asserted (set to low), effectively ignoring the external pin. When in this mode, the RTS pin serves as a general purpose input. 0 Transmit only when the RTS pin is asserted 1 Ignore the RTS pin
13 CTSC	CTS **Pin Control**. Controls the operation of the CTS_B module output. When CTSC is asserted, the CTS_B module output is controlled by the receiver. When the RxFIFO is filled to the level of the programmed trigger level and the start bit of the overflowing character (TRIGGER LEVEL + 1) is validated, the CTS_B module output is negated to indicate to the far-end transmitter to stop transmitting. When the trigger level is programmed for less than 32, the receiver continues to receive data until the RxFIFO is full. When the CTSC bit is negated, the CTS_B module output is controlled by the CTS bit. On reset, because CTSC is cleared to 0, the CTS_B pin is controlled by the CTS bit, which again is cleared to 0 on reset. This means that on reset the CTS_B signal is negated. 0 The CTS_B pin is controlled by the CTS bit 1 The CTS_B pin is controlled by the receiver
12 CTS	**Clear to Send**. Controls the CTS_B pin when the CTSC bit is negated. CTS has no function when CTSC is asserted. 0 The CTS_B pin is high (inactive) 1 The CTS_B pin is low (active)
11 ESCEN	**Escape Enable**. Enables/Disables the escape sequence detection logic. 0 Disable escape sequence detection 1 Enable escape sequence detection
10–9 RTEC	**Request to Send Edge Control**. Selects the edge that triggers the RTS interrupt. This has no effect on the RTS delta interrupt. RTEC has an effect only when RTSEN = 1 (see Table 16-4). 00 Trigger interrupt on a rising edge 01 Trigger interrupt on a falling edge 1X Trigger interrupt on any edge
8 PREN	**Parity Enable**. Enables/Disables the parity generator in the transmitter and parity checker in the receiver. When PREN is asserted, the parity generator and checker are enabled, and disabled when PREN is negated. 0 Disable parity generator and checker 1 Enable parity generator and checker
7 PROE	**Parity Odd/Even**. Controls the sense of the parity generator and checker. When PROE is high, odd parity is generated and expected. When PROE is low, even parity is generated and expected. PROE has no function if PREN is low. 0 Even parity 1 Odd parity

Table continues on the next page...

UARTx_UCR2 field descriptions (continued)

Field	Description
6 STPB	**Stop**. Controls the number of stop bits after a character. When STPB is low, 1 stop bit is sent. When STPB is high, 2 stop bits are sent. STPB also affects the receiver. 0 The transmitter sends 1 stop bit. The receiver expects 1 or more stop bits. 1 The transmitter sends 2 stop bits. The receiver expects 2 or more stop bits.
5 WS	**Word Size**. Controls the character length. When WS is high, the transmitter and receiver are in 8-bit mode. When WS is low, they are in 7-bit mode. The transmitter ignores bit 7 and the receiver sets bit 7 to 0. WS can be changed in-between transmission (reception) of characters, however not when a transmission (reception) is in progress, in which case the length of the current character being transmitted (received) is unpredictable. 0 7-bit transmit and receive character length (not including START, STOP or PARITY bits) 1 8-bit transmit and receive character length (not including START, STOP or PARITY bits)
4 RTSEN	**Request to Send Interrupt Enable.** Controls the RTS edge sensitive interrupt. When RTSEN is asserted and the programmed edge is detected on the RTS_B pin (the RTSF bit is asserted), an interrupt will be generated on the *interrupt_uart* pin. (See Table 16-4.) 0 Disable request to send interrupt 1 Enable request to send interrupt
3 ATEN	**Aging Timer Enable**. This bit is used to enable the aging timer interrupt (triggered with AGTIM) 0 AGTIM interrupt disabled 1 AGTIM interrupt enabled
2 TXEN	**Transmitter Enable**. Enables/Disables the transmitter. When TXEN is negated the transmitter is disabled and idle. When the UARTEN and TXEN bits are set the transmitter is enabled. If TXEN is negated in the middle of a transmission, the UART disables the transmitter immediately, and starts marking 1s. The transmitter FIFO cannot be written when this bit is cleared. 0 Disable the transmitter 1 Enable the transmitter
1 RXEN	**Receiver Enable**. Enables/Disables the receiver. When the receiver is enabled, if the RXD input is already low, the receiver does not recognize BREAK characters, because it requires a valid 1-to-0 transition before it can accept any character. 0 Disable the receiver 1 Enable the receiver
0 SRST	**Software Reset**. Once the software writes 0 to SRST_B, the software reset remains active for 4 *module_clock* cycles before the hardware deasserts SRST_B. The software can only write 0 to SRST_B. Writing 1 to SRST_B is ignored. 0 Reset the transmit and receive state machines, all FIFOs and register USR1, USR2, UBIR, UBMR, UBRC , URXD, UTXD and UTS[6-3]. 1 No reset

16.2.13.5 UART Control Register 3 (UARTx_UCR3)

Address: Base address + 88h offset

UARTx_UCR3 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–14 DPEC	This bit is not used in this chip.
13 DTREN	This bit is not used in this chip.
12 PARERREN	**Parity Error Interrupt Enable. Enables/Disables the interrupt. When asserted, PARERREN causes the PARITYERR bit to generate an interrupt.** 0 Disable the parity error interrupt 1 Enable the parity error interrupt
11 FRAERREN	**Frame Error Interrupt Enable. Enables/Disables the interrupt. When asserted, FRAERREN causes the FRAMERR bit to generate an interrupt.** 0 Disable the frame error interrupt 1 Enable the frame error interrupt
10 DSR	This bit is not used in this chip.
9 DCD	This bit is not used in this chip.
8 RI	This bit is not used in this chip.
7 ADNIMP	**Autobaud Detection Not Improved-. Disables new features of autobaud detection (See Baud Rate Automatic Detection Protocol, for more details).** 0 Autobaud detection new features selected 1 Keep old autobaud detection mechanism

Table continues on the next page...

UARTx_UCR3 field descriptions (continued)

Field	Description
6 RXDSEN	Receive Status Interrupt Enable. Controls the receive status interrupt (*interrupt_uart*). When this bit is enabled and RXDS status bit is set, the interrupt *interrupt_uart* will be generated. 0 Disable the RXDS interrupt 1 Enable the RXDS interrupt
5 AIRINTEN	Asynchronous IR WAKE Interrupt Enable. Controls the asynchronous IR WAKE interrupt. An interrupt is generated when AIRINTEN is asserted and a pulse is detected on the RXD pin. 0 Disable the AIRINT interrupt 1 Enable the AIRINT interrupt
4 AWAKEN	Asynchronous WAKE Interrupt Enable. Controls the asynchronous WAKE interrupt. An interrupt is generated when AWAKEN is asserted and a falling edge is detected on the RXD pin. 0 Disable the AWAKE interrupt 1 Enable the AWAKE interrupt
3 DTRDEN	This bit is not used in this chip.
2 RXDMUXSEL	RXD Muxed Input Selected. Selects proper input pins for serial and Infrared input signal. **NOTE:** In this chip, UARTs are used in MUXED mode, so that this bit should always be set.
1 INVT	Invert TXD output in RS-232/RS-485 mode, set TXD active level in IrDA mode. In RS232/RS-485 mode(UMCR[0] = 1), if this bit is set to 1, the TXD output is inverted before transmitted. In **IrDA mode**, when INVT is cleared, the infrared logic block transmits a positive IR 3/16 pulse for all 0s and 0s are transmitted for 1s. When INVT is set (INVT = 1), the infrared logic block transmits an active low or negative infrared 3/16 pulse for all 0s and 1s are transmitted for 1s. 0 **TXD is not inverted** 1 **TXD is inverted** 0 **TXD** Active low transmission 1 **TXD** Active high transmission
0 ACIEN	**Autobaud Counter Interrupt Enable.** This bit is used to enable the autobaud counter stopped interrupt (triggered with ACST (USR2[11]). 0 ACST interrupt disabled 1 ACST interrupt enabled

16.2.13.6 UART Control Register 4 (UARTx_UCR4)

Address: Base address + 8Ch offset

UARTx_UCR4 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–10 CTSTL	**CTS Trigger Level**. Controls the threshold at which the CTS_B pin is deasserted by the RxFIFO. After the trigger level is reached and the CTS_B pin is deasserted, the RxFIFO continues to receive data until it is full. The CTSTL bits are encoded as shown in the Settings column. Settings 0 to 32 are in use. All other settings are Reserved. 000000 0 characters received 000001 1 characters in the RxFIFO ... — ... — 100000 32 characters in the RxFIFO (maximum)
9 INVR	**Invert RXD input in RS-232/RS-485 Mode, d**etermine **RXD input** logic level being sampled in **In IrDA mode.** **In RS232/RS-485 Mode(UMCR[0] = 1), if this bit is set to 1, the RXD input is inverted before sampled.** **In IrDA mode**,when cleared, the infrared logic block expects an active low or negative IR 3/16 pulse for 0s and 1s are expected for 1s. When INVR is set (INVR 1), the infrared logic block expects an active high or positive IR 3/16 pulse for 0s and 0s are expected for 1s. 0 **RXD input is not inverted** 1 **RXD input is inverted** 0 **RXD** active low detection 1 **RXD** active high detection
8 ENIRI	**Serial Infrared Interrupt Enable**. Enables/Disables the serial infrared interrupt. 0 Serial infrared Interrupt disabled 1 Serial infrared Interrupt enabled

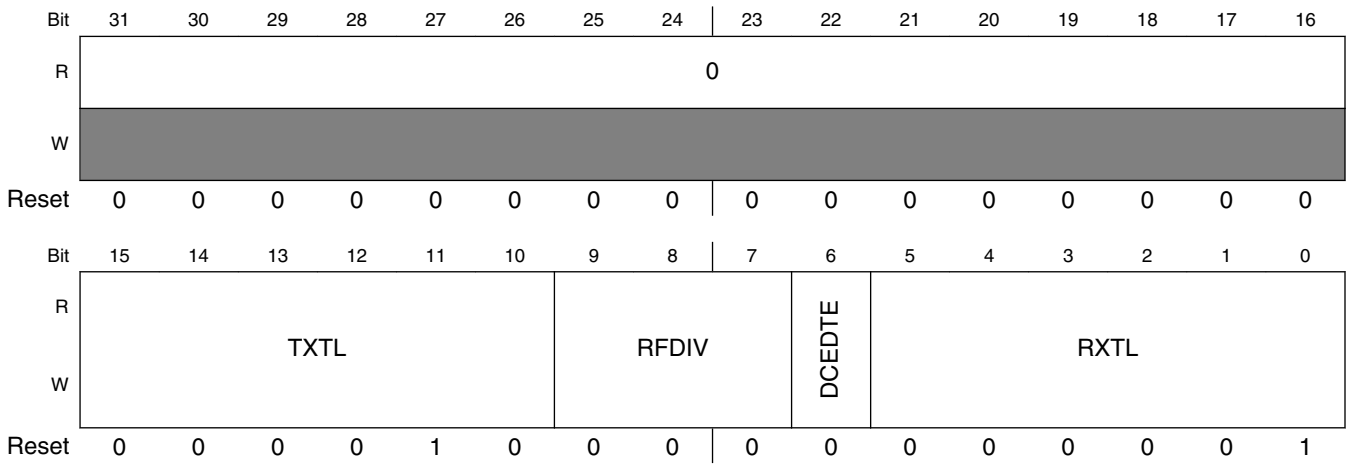
Table continues on the next page...

UARTx_UCR4 field descriptions (continued)

Field	Description
7 WKEN	**WAKE Interrupt Enable**. Enables/Disables the WAKE bit to generate an interrupt. The WAKE bit is set at the detection of a start bit by the receiver. 0 Disable the WAKE interrupt 1 Enable the WAKE interrupt
6 IDDMAEN	**DMA IDLE Condition Detected Interrupt Enable** Enables/Disables the receive DMA request *dma_req_rx* for the IDLE interrupt (triggered with IDLE flag in USR2[12]). 0 DMA IDLE interrupt disabled 1 DMA IDLE interrupt enabled
5 IRSC	**IR Special Case**. Selects the clock for the vote logic. When set, IRSC switches the vote logic clock from the sampling clock to the UART reference clock. The IR pulses are counted a predetermined amount of time depending on the reference frequency. See InfraRed Special Case (IRSC) Bit. 0 The vote logic uses the sampling clock (16x baud rate) for normal operation 1 The vote logic uses the UART reference clock
4 LPBYP	**Low Power Bypass**. Allows to bypass the low power new features in UART. To use during debug phase. 0 Low power features enabled 1 Low power features disabled
3 TCEN	**TransmitComplete Interrupt Enable**. Enables/Disables the TXDC bit to generate an interrupt (*interrupt_uart* = 0) **NOTE:** An interrupt will be issued as long as TCEN and TXDC are high even if the transmitter is not enabled. In general, user should enable the transmitter before enabling the TXDC interrupt. 0 Disable TXDC interrupt 1 Enable TXDC interrupt
2 BKEN	**BREAK Condition Detected Interrupt Enable**. Enables/Disables the BRCD bit to generate an interrupt. 0 Disable the BRCD interrupt 1 Enable the BRCD interrupt
1 OREN	**Receiver Overrun Interrupt Enable**. Enables/Disables the ORE bit to generate an interrupt. 0 Disable ORE interrupt 1 Enable ORE interrupt
0 DREN	**Receive Data Ready Interrupt Enable**. Enables/Disables the RDR bit to generate an interrupt. 0 Disable RDR interrupt 1 Enable RDR interrupt

16.2.13.7 UART FIFO Control Register (UARTx_UFCR)

Address: Base address + 90h offset



UARTx_UFCR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–10 TXTL	**Transmitter Trigger Level**. Controls the threshold at which a maskable interrupt is generated by the TxFIFO. A maskable interrupt is generated whenever the data level in the TxFIFO falls below the selected threshold. The bits are encoded as shown in the Settings column. Settings 0 to 32 are in use. All other settings are Reserved. 000000 Reserved 000001 Reserved 000010 TxFIFO has 2 or fewer characters ... — ... — 011111 TxFIFO has 31 or fewer characters 100000 TxFIFO has 32 characters (maximum)
9–7 RFDIV	Reference Frequency Divider. Controls the divide ratio for the reference clock. The input clock is *module_clock*. The output from the divider is *ref_clk* which is used by BRM to create the 16x baud rate oversampling clock (*brm_clk*). 000 Divide input clock by 6 001 Divide input clock by 5 010 Divide input clock by 4 011 Divide input clock by 3 100 Divide input clock by 2 101 Divide input clock by 1 110 Divide input clock by 7 111 Reserved
6 DCEDTE	**DCE/DTE mode select**. Select UART as data communication equipment (DCE mode) or as data terminal equipment (DTE mode).

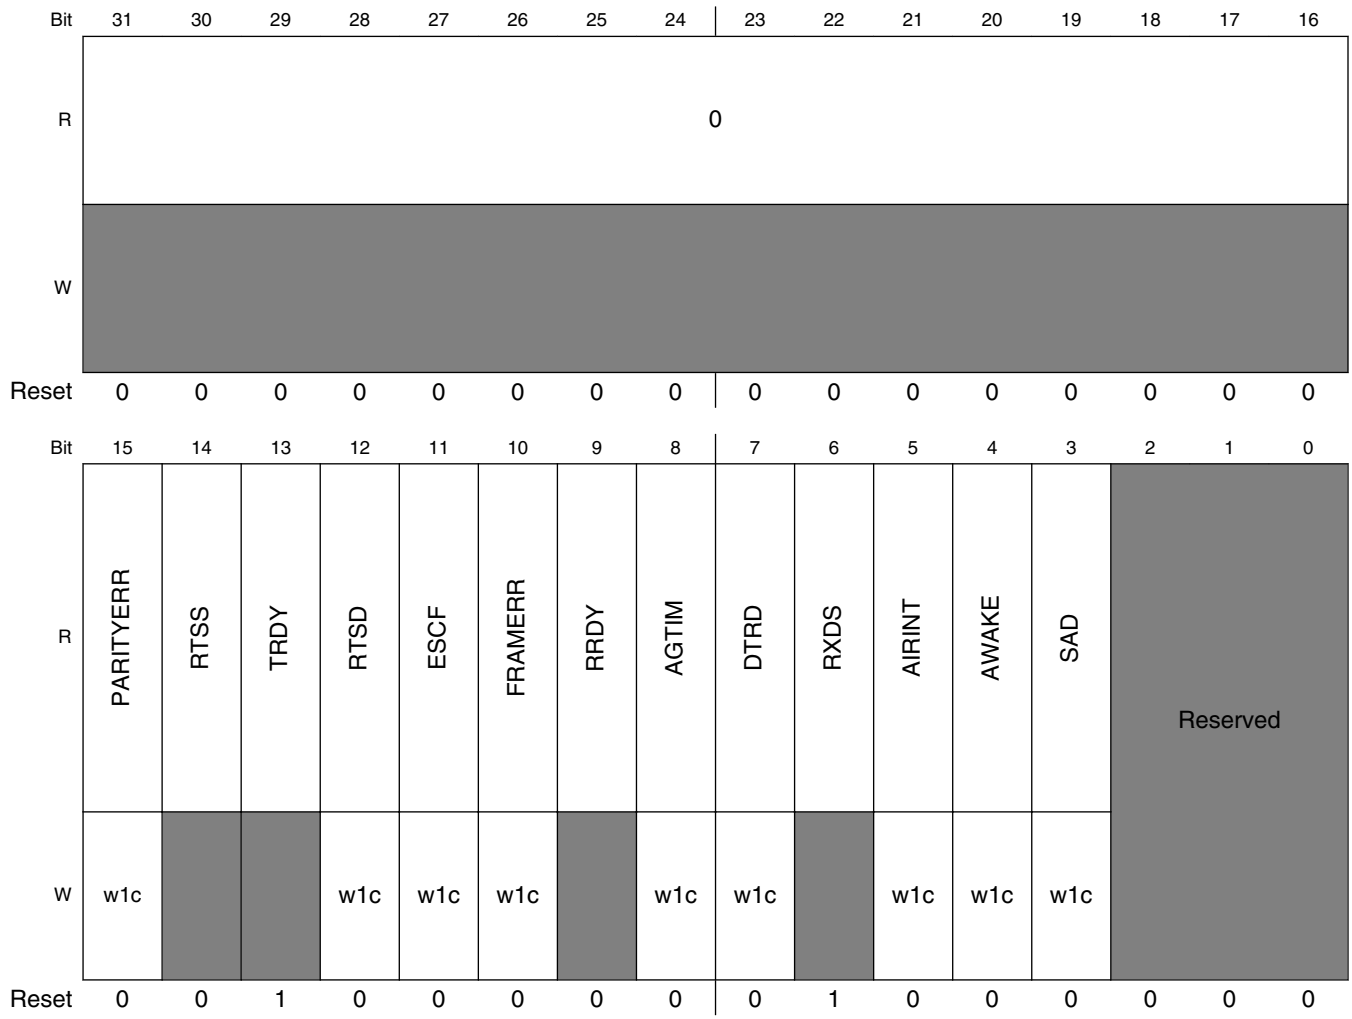
Table continues on the next page...

UARTx_UFCR field descriptions (continued)

Field	Description
	0 DCE mode selected 1 DTE mode selected
RXTL	**Receiver Trigger Level**. Controls the threshold at which a maskable interrupt is generated by the RxFIFO. A maskable interrupt is generated whenever the data level in the RxFIFO reaches the selected threshold. The RXTL bits are encoded as shown in the Settings column. Setting 0 to 32 are in use. All other settings are Reserved. 000000 0 characters received 000001 RxFIFO has 1 character ... — ... — 011111 RxFIFO has 31 characters 100000 RxFIFO has 32 characters (maximum)

16.2.13.8 UART Status Register 1 (UARTx_USR1)

Address: Base address + 94h offset



UARTx_USR1 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 PARITYERR	**Parity Error Interrupt Flag**. Indicates a parity error is detected. PARITYERR is cleared by writing 1 to it. Writing 0 to PARITYERR has no effect. When parity is disabled, PARITYERR always reads 0. At reset, PARITYERR is set to 0. 0 No parity error detected 1 Parity error detected (write 1 to clear)
14 RTSS	RTS_B **Pin Status**. Indicates the current status of the RTS_B pin. A "snapshot" of RTS_B is taken immediately before RTSS is presented to the data bus. RTSS cannot be cleared because all writes to RTSS are ignored. At reset, RTSS is set to 0.

Table continues on the next page...

UARTx_USR1 field descriptions (continued)

Field	Description
	0 The RTS_B module input is high (inactive) 1 The RTS_B module input is low (active)
13 TRDY	**Transmitter Ready Interrupt / DMA Flag**. Indicates that the TxFIFO emptied below its target threshold and requires data. TRDY is automatically cleared when the data level in the TxFIFO exceeds the threshold set by TXTL bits. At reset, TRDY is set to 1. 0 The transmitter does not require data 1 The transmitter requires data (interrupt posted)
12 RTSD	**RTS Delta.** Indicates whether the RTS_B pin changed state. It (RTSD) generates a maskable interrupt. When in STOP mode, RTS assertion sets RTSD and can be used to wake the processor. The current state of the RTS_B pin is available on the RTSS bit. Clear RTSD by writing 1 to it. Writing 0 to RTSD has no effect. At reset, RTSD is set to 0. 0 RTS_B pin did not change state since last cleared 1 RTS_B pin changed state (write 1 to clear)
11 ESCF	**Escape Sequence Interrupt Flag**. Indicates if an escape sequence was detected. ESCF is asserted when the ESCEN bit is set and an escape sequence is detected in the RxFIFO. Clear ESCF by writing 1 to it. Writing 0 to ESCF has no effect. 0 No escape sequence detected 1 Escape sequence detected (write 1 to clear).
10 FRAMERR	**Frame Error Interrupt Flag**. Indicates that a frame error is detected. The *interrupt_uart* interrupt will be generated if a frame error is detected and the interrupt is enabled. Clear FRAMERR by writing 1 to it. Writing 0 to FRAMERR has no effect. 0 No frame error detected 1 Frame error detected (write 1 to clear)
9 RRDY	**Receiver Ready Interrupt / DMA Flag**. Indicates that the RxFIFO data level is above the threshold set by the RXTL bits. (See the RXTL bits description in UART FIFO Control Register (UART_UFCR) for setting the interrupt threshold.) When asserted, RRDY generates a maskable interrupt or DMA request. RRDY is automatically cleared when data level in the RxFIFO goes below the set threshold level. At reset, RRDY is set to 0. 0 No character ready 1 Character(s) ready (interrupt posted)
8 AGTIM	Ageing Timer Interrupt Flag. Indicates that data in the RxFIFO has been idle for a time of 8 character lengths (where a character length consists of 7 or 8 bits, depending on the setting of the WS bit in UCR2, with the bit time corresponding to the baud rate setting) and FIFO data level is less than RxFIFO threshold level (RXTL in the UFCR). Clear by writing a 1 to it. 0 AGTIM is not active 1 AGTIM is active (write 1 to clear)
7 DTRD	This bit is not used in this chip.
6 RXDS	Receiver IDLE Interrupt Flag. Indicates that the receiver state machine is in an IDLE state, the next state is IDLE, and the receive pin is high. RXDS is automatically cleared when a character is received. RXDS is active only when the receiver is enabled. 0 Receive in progress 1 Receiver is IDLE

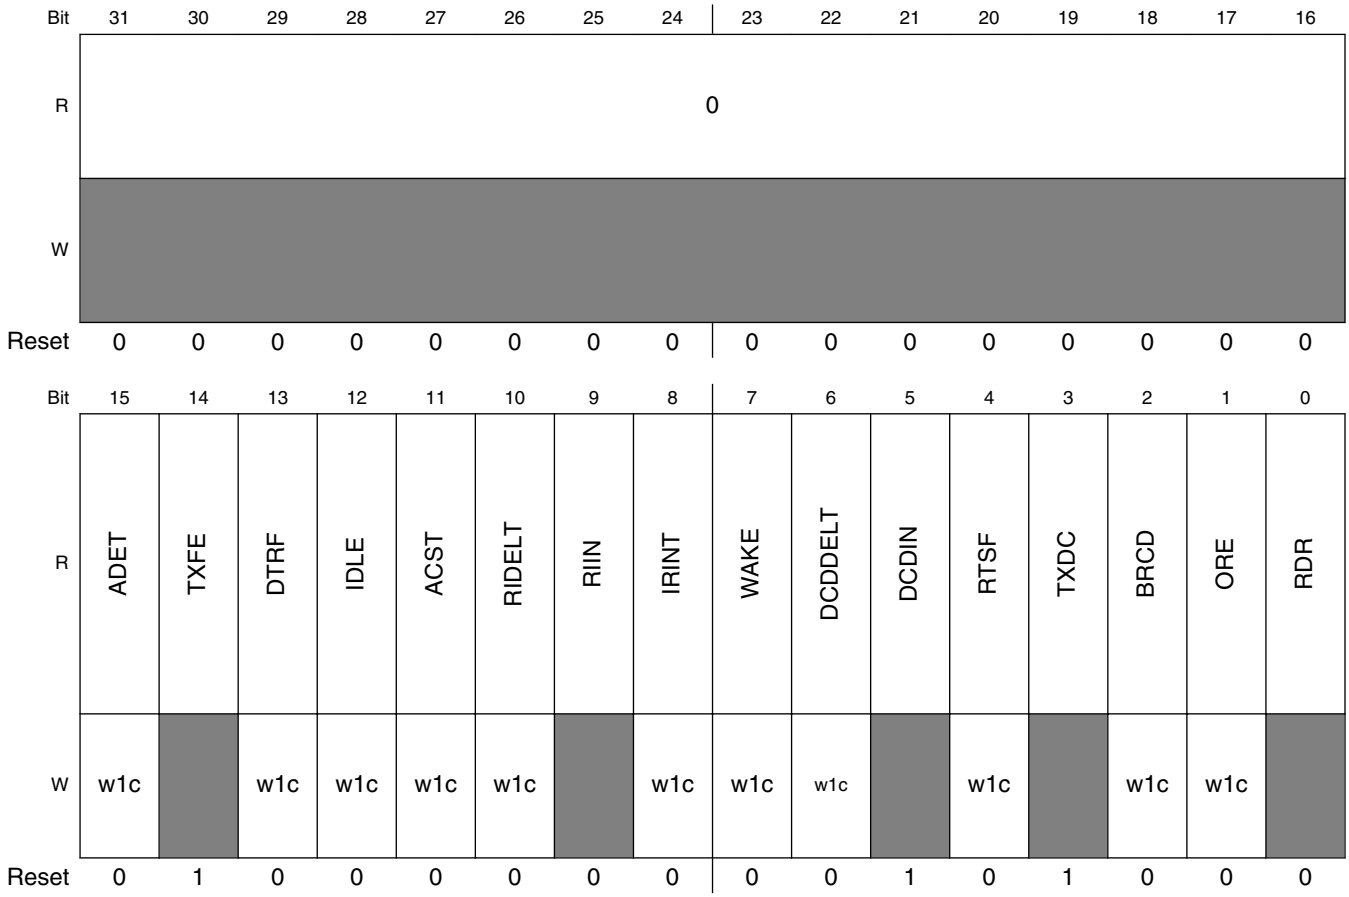
Table continues on the next page...

UARTx_USR1 field descriptions (continued)

Field	Description
5 AIRINT	Asynchronous IR WAKE Interrupt Flag. Indicates that the IR WAKE pulse was detected on the RXD pin. Clear AIRINT by writing 1 to it. Writing 0 to AIRINT has no effect. 0 No pulse was detected on the RXD IrDA pin 1 A pulse was detected on the RXD IrDA pin
4 AWAKE	Asynchronous WAKE Interrupt Flag. Indicates that a falling edge was detected on the RXD pin. Clear AWAKE by writing 1 to it. Writing 0 to AWAKE has no effect. 0 No falling edge was detected on the RXD Serial pin 1 A falling edge was detected on the RXD Serial pin
3 SAD	RS-485 Slave Address Detected Interrupt Flag. Indicates if RS-485 Slave Address was detected . SAD was asserted in RS-485 mode when the SADEN bit is set and Slave Address is detected in RxFIFO (in Nomal Address Detect Mode, the 9th data bit = 1; in Automatic Address Detect Mode, the received charater matches the programmed SLADDR). 0 No slave address detected 1 Slave address detected
-	This field is reserved. Reserved

16.2.13.9 UART Status Register 2 (UARTx_USR2)

Address: Base address + 98h offset



UARTx_USR2 field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15 ADET	**Automatic Baud Rate Detect Complete**. Indicates that an "A" or "a" was received and that the receiver detected and verified the incoming baud rate. Clear ADET by writing 1 to it. Writing 0 to ADET has no effect. 0 ASCII "A" or "a" was not received 1 ASCII "A" or "a" was received (write 1 to clear)
14 TXFE	**Transmit Buffer FIFO Empty**. Indicates that the transmit buffer (TxFIFO) is empty. TXFE is cleared automatically when data is written to the TxFIFO. Even though TXFE is high, the transmission might still be in progress. 0 The transmit buffer (TxFIFO) is not empty 1 The transmit buffer (TxFIFO) is empty
13 DTRF	This bit is not used in this chip.

Table continues on the next page...

UARTx_USR2 field descriptions (continued)

Field	Description
12 IDLE	**Idle Condition**. Indicates that an idle condition has existed for more than a programmed amount frame (see Idle Line Detect. An interrupt can be generated by this IDLE bit if IDEN (UCR1[12]) is enabled. IDLE is cleared by writing 1 to it. Writing 0 to IDLE has no effect. 0 No idle condition detected 1 Idle condition detected (write 1 to clear)
11 ACST	**Autobaud Counter Stopped**. In autobaud detection (ADBR=1), indicates the counter which determines the baud rate was running and is now stopped. This means either START bit is finished (if ADNIMP=1), or Bit 0 is finished (if ADNIMP=0). See New Autobaud Counter Stopped bit and Interrupt, for more details. An interrupt can be flagged on *interrupt_uart* if ACIEN=1. 0 Measurement of bit length not finished (in autobaud) 1 Measurement of bit length finished (in autobaud). (write 1 to clear)
10 RIDELT	This bit is not used in this chip.
9 RIIN	This bit is not used in this chip.
8 IRINT	**Serial Infrared Interrupt Flag.** When an edge is detected on the RXD pin during SIR Mode, this flag will be asserted. This flag can cause an interrupt which can be masked using the control bit ENIRI: UCR4 [8]. 0 no edge detected 1 valid edge detected (write 1 to clear)
7 WAKE	**Wake**. Indicates the start bit is detected. WAKE can generate an interrupt that can be masked using the WKEN bit. Clear WAKE by writing 1 to it. Writing 0 to WAKE has no effect. 0 start bit not detected 1 start bit detected (write 1 to clear)
6 DCDDELT	This bit is not used in this chip.
5 DCDIN	This bit is not used in this chip.
4 RTSF	**RTS Edge Triggered Interrupt Flag. Indicates if** a programmed edge is detected on the RTS_B pin. The RTEC bits select the edge that generates an interrupt (see Table 16-4). RTSF can generate an interrupt that can be masked using the RTSEN bit. Clear RTSF by writing 1 to it. Writing 0 to RTSF has no effect. 0 Programmed edge not detected on RTS_B 1 Programmed edge detected on RTS_B (write 1 to clear)
3 TXDC	**Transmitter Complete**. Indicates that the transmit buffer (TxFIFO) and Shift Register is empty; therefore the transmission is complete. TXDC is cleared automatically when data is written to the TxFIFO. 0 Transmit is incomplete 1 Transmit is complete
2 BRCD	**BREAK Condition Detected**. Indicates that a BREAK condition was detected by the receiver. Clear BRCD by writing 1 to it. Writing 0 to BRCD has no effect. 0 No BREAK condition was detected 1 A BREAK condition was detected (write 1 to clear)
1 ORE	**Overrun Error**. When set to 1, ORE indicates that the receive buffer (RxFIFO) was full (32 chars inside), and a 33rd character has been fully received. This 33rd character has been discarded. Clear ORE by writing 1 to it. Writing 0 to ORE has no effect.

Table continues on the next page...

UARTx_USR2 field descriptions (continued)

Field	Description
	0 No overrun error 1 Overrun error (write 1 to clear)
0 RDR	**Receive Data Ready**-Indicates that at least 1 character is received and written to the RxFIFO. If the URXD register is read and there is only 1 character in the RxFIFO, RDR is automatically cleared. 0 No receive data ready 1 Receive data ready

16.2.13.10 UART Escape Character Register (UARTx_UESC)

Address: Base address + 9Ch offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																								ESC_CHAR							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	1	1

UARTx_UESC field descriptions

Field	Description
31–8 Reserved	This read-only field is reserved and always has the value 0.
ESC_CHAR	**UART Escape Character**. Holds the selected escape character that all received characters are compared against to detect an escape sequence.

16.2.13.11 UART Escape Timer Register (UARTx_UTIM)

Address: Base address + A0h offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																				TIM											
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

UARTx_UTIM field descriptions

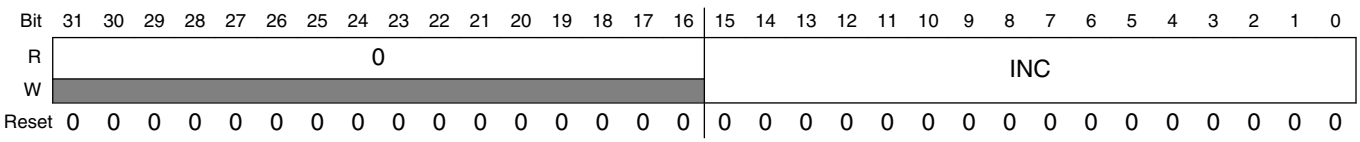
Field	Description
31–12 Reserved	This read-only field is reserved and always has the value 0.
TIM	UART Escape Timer. Holds the maximum time interval (in ms) allowed between escape characters. The escape timer register is programmable in intervals of 2 ms. See Escape Sequence Detection and Table 16-8 for more information on the UART escape sequence detection. Reset value 0x000 = 2 ms up to 0xFFF = 8.192 s.

16.2.13.12 UART BRM Incremental Register (UARTx_UBIR)

This register can be written by both software and hardware. When enabling the automatic baud rate detection feature hardware can write 0x000F value into the UBIR after finishing detecting baud rate. Hardware has higher priority when both software and hardware try to write it at the same cycle[3].

Please note software reset will reset the register to its reset value.

Address: Base address + A4h offset



UARTx_UBIR field descriptions

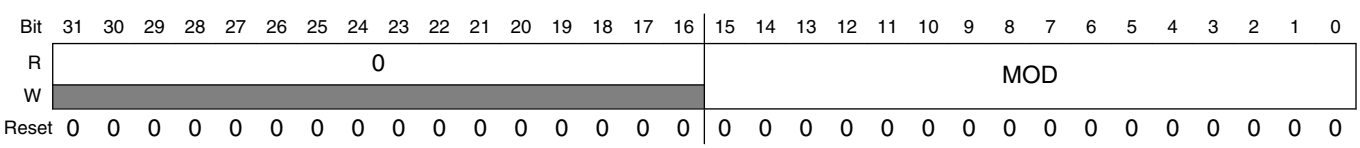
Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
INC	Incremental Numerator. Holds the numerator value minus one of the BRM ratio (see Binary Rate Multiplier (BRM)). The UBIR register MUST be updated before the UBMR register for the baud rate to be updated correctly. If only one register is written to by software, the BRM will ignore this data until the other register is written to by software. Updating this field using byte accesses is not recommended and is undefined.

16.2.13.13 UART BRM Modulator Register (UARTx_UBMR)

This register can be written by both software and hardware. When enabling the automatic baud rate detection feature hardware can write a proper value into the UBMR based on detected baud rate. Hardware has higher priority when both software and hardware try to write it at the same cycle[4].

Please note software reset will reset the register to its reset value.

Address: Base address + A8h offset



3. Note: The write priority in the new design is not same as the original UART. In the orginal design, software has higher priority than hardware when writing this register at the same time.
4. Note: The write priority in the new design is not same as the original UART. In the orginal design, software has higher priority than hardware when writing this register at the same time.

UARTx_UBMR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
MOD	**Modulator Denominator.** Holds the value of the denominator minus one of the BRM ratio (see Binary Rate Multiplier (BRM)). The UBIR register MUST be updated before the UBMR register for the baud rate to be updated correctly. If only one register is written to by software, the BRM will ignore this data until the other register is written to by software. Updating this register using byte accesses is not recommended and undefined.

16.2.13.14 UART Baud Rate Count Register (UARTx_UBRC)

Address: Base address + ACh offset

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0																BCNT															
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

UARTx_UBRC field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
BCNT	**Baud Rate Count Register.** This read only register is used to count the start bit of the incoming baud rate (if ADNIMP=1), or start bit + bit0 (if ADNIMP=0). When the measurement is done, the Baud Rate Count Register contains the number of UART internal clock cycles (clock after divider) present in an incoming bit. BCNT retains its value until the next Automatic Baud Rate Detection sequence has been initiated. The 16 bit Baud Rate Count register is reset to 4 and stays at hex FFFF in the case of an overflow.

16.2.13.15 UART One Millisecond Register (UARTx_ONEMS)

NOTE

This register has been expanded from 16 bits to 24 bits. In previous versions, the 16-bit ONEMS can only support the maximum 65.535MHz (0xFFFFx1000) *ref_clk*. To support 4Mbps Bluetooth application with 66.5MHz *module_clock*, the value 0x103C4 (66.5M/1000) should be written into this register. In this case, the 16 bits are not enough to contain the 0x103C4. So this register was expanded to 24 bits to support high frequency of the *ref_clk*.

Address: Base address + B0h offset

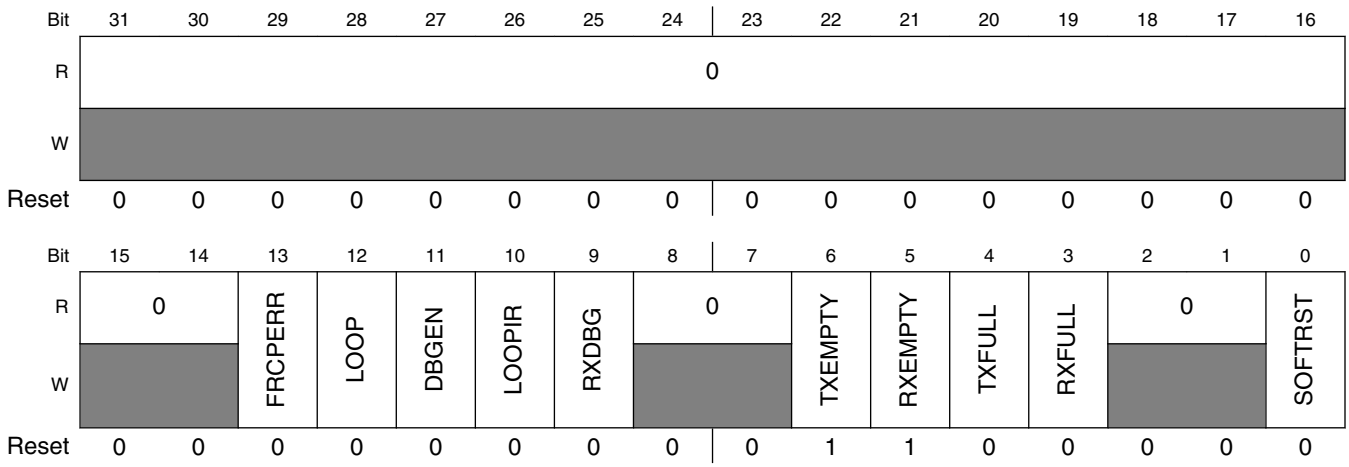
Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
R	0								ONEMS																							
W																																
Reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

UARTx_ONEMS field descriptions

Field	Description
31–24 Reserved	This read-only field is reserved and always has the value 0.
ONEMS	**One Millisecond Register.** This 24-bit register must contain the value of the UART internal frequency (*ref_clk* in Figure 16-9) divided by 1000. The internal frequency is obtained after the UART BRM internal divider (F (*ref_clk*) = F(*module_clock*) / RFDIV). In fact this register contains the value corresponding to the number of UART BRM internal clock cycles present in one millisecond. The ONEMS (and UTIM) registers value are used in the escape character detection feature (Escape Sequence Detection) to count the number of clock cycles left between two escape characters. The ONEMS register is also used in infrared special case mode (IRSC = UCR4[5] = 1'b1), see InfraRed Special Case (IRSC) Bit.

16.2.13.16 UART Test Register (UARTx_UTS)

Address: Base address + B4h offset



UARTx_UTS field descriptions

Field	Description
31–14 Reserved	This read-only field is reserved and always has the value 0.
13 FRCPERR	Force Parity Error. Forces the transmitter to generate a parity error if parity is enabled. FRCPERR is provided for system debugging. 0 Generate normal parity 1 Generate inverted parity (error)
12 LOOP	Loop TX and RX for Test. Controls loopback for test purposes. When LOOP is high, the receiver input is internally connected to the transmitter and ignores the RXD pin. The transmitter is unaffected by LOOP. If RXDMUXSEL (UCR3[2]) is set to 1, the loopback is applied on serial and IrDA signals. If RXDMUXSEL is set to 0, the loopback is only applied on serial signals. 0 Normal receiver operation 1 Internally connect the transmitter output to the receiver input
11 DBGEN	This bit is not used in this chip. debug_enable_B**.** This bit controls whether to respond to the *debug_req* input signal. 0 UART will go into debug mode when *debug_req* is HIGH 1 UART will not go into debug mode even if *debug_req* is HIGH
10 LOOPIR	**Loop TX and RX for IR Test (LOOPIR)**. This bit controls loopback from transmitter to receiver in the InfraRed interface. 0 No IR loop 1 Connect IR transmitter to IR receiver
9 RXDBG	This bit is not used in this chip. **RX_fifo_debug_mode.** This bit controls the operation of the RX fifo read counter when in debug mode. 0 rx fifo read pointer does not increment 1 rx_fifo read pointer increments as normal

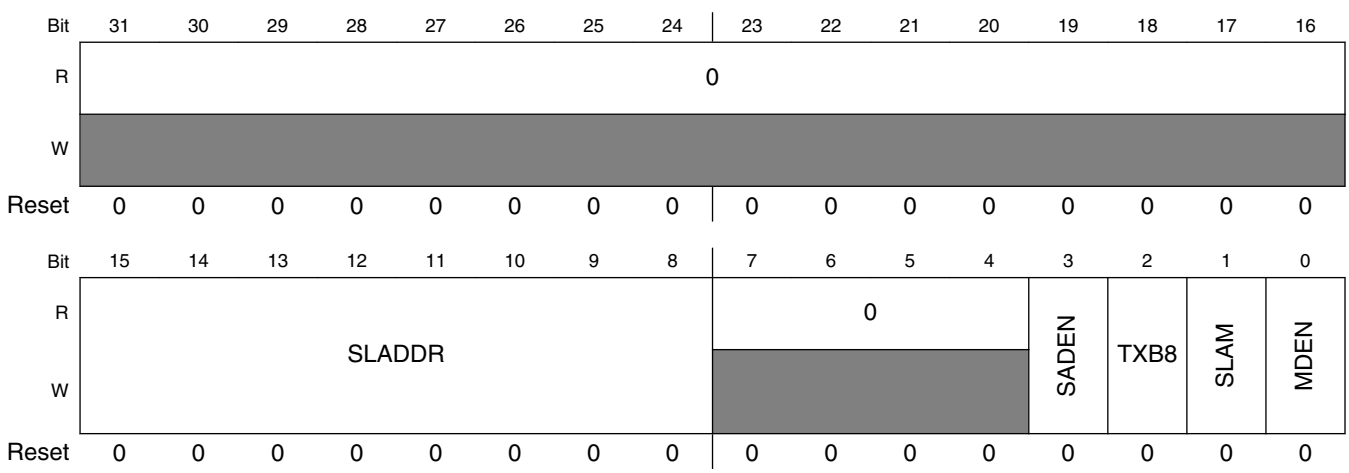
Table continues on the next page...

UARTx_UTS field descriptions (continued)

Field	Description
8–7 Reserved	This read-only field is reserved and always has the value 0.
6 TXEMPTY	TxFIFO Empty. Indicates that the TxFIFO is empty. 0 The TxFIFO is not empty 1 The TxFIFO is empty
5 RXEMPTY	RxFIFO Empty. Indicates the RxFIFO is empty. 0 The RxFIFO is not empty 1 The RxFIFO is empty
4 TXFULL	TxFIFO FULL. Indicates the TxFIFO is full. 0 The TxFIFO is not full 1 The TxFIFO is full
3 RXFULL	RxFIFO FULL. Indicates the RxFIFO is full. 0 The RxFIFO is not full 1 The RxFIFO is full
2–1 Reserved	This read-only field is reserved and always has the value 0.
0 SOFTRST	Software Reset. Indicates the status of the software reset (SRST_B bit of UCR2). 0 Software reset inactive 1 Software reset active

16.2.13.17 UART RS-485 Mode Control Register (UARTx_UMCR)

Address: Base address + B8h offset



UARTx_UMCR field descriptions

Field	Description
31–16 Reserved	This read-only field is reserved and always has the value 0.
15–8 SLADDR	RS-485 Slave Address Character. Holds the selected slave adress character that the receiver wil try to detect.
7–4 Reserved	This read-only field is reserved and always has the value 0.
3 SADEN	RS-485 Slave Address Detected Interrupt Enable. 0 Disable RS-485 Slave Address Detected Interrupt 1 Enable RS-485 Slave Address Detected Interrupt
2 TXB8	Transmit RS-485 bit 8 (the ninth bit or 9th bit). In RS-485 mode, software writes TXB8 bit as the 9th data bit to be transmitted. 0 0 will be transmitted as the RS485 9th data bit 1 1 will be transmitted as the RS485 9th data bit
1 SLAM	RS-485 Slave Address Detect Mode Selection. 0 Select Normal Address Detect mode 1 Select Automatic Address Detect mode
0 MDEN	9-bit data or Multidrop Mode (RS-485) Enable. 0 Normal RS-232 or IrDA mode, see Table 16-2 for detail. 1 Enable RS-485 mode, see Table 16-2 for detail
